Gllman Moulton, West Somerville, Massachusetts, U.S.A., 4th September, 1906; 6 years. Filed 19th June, 1906. Receipt No. 137,067 .
Claim.-1. A ventilator comprising a span board having an oponing therein, a deflecting box or casing supported by said board and provided with outlet openings, valvular shutter mounted in said box or casing and having a preponderant side, and means for positively adjusting said shutter.
2. A ventilator comprising a span board having an opening therein, a deflecting box or casing supported by said board, s sliding top for said casing provided with outlet openings, a shutter pivotally mounted in said box or casing and having a preponderant side, and means for positively adjusting said shutter.
3. A vtntilator comprising a span board having an opening therein, a deffecting box or casing supported by sald board and provided with outlet openings, a valvular shutter mounted in said box or casing and having a preponderant side, and an arm mounted in said casing and provided with a detent adapted to engage said shutter.
4. A ventilator comprising a span board having an opening therein, a deflector box or casing supported by said board and provided with outlet openings, a valvular shutter mounted in said box or casing and having a weight secured to one side thereof, and adjusting means adapted to engage the opposite edge of said shutter.
5. A ventllator comprising a span board having an opening therein, extension pieces for said board, a deflector box or casing supported by said board and provided with outlet openings, a valvular shutter mounted in said box or casing and having a preponderant side, and means for positively adjusting said shutter.

No. 100,880. Logging sled. Traineau d billots.

Alexander D. McDonell, Mediord, Wisconsin, U.S.A., 4th September, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,168.
Claim.-1. In a logging sled, a medially disposed transverse beam, a roller in the front end of the sled, the roller being provided with a tongue, dralt chains secured to sald beam and passing the ends of the roller by which the chains are held in place apart from each other and coming together in front of the roller, and means for connecting the front ends of the chains and coupling them to a hauling device.
2. A sled having a medially disposed transverse fixed beam, draft chains secured at their rear ends to this medially disposed sled beam, a roller provided with a tongue, and a coupling device on the tongue at a distance in front of the sled to which the chains at their front ends are directly secured and which coupling device is adapted to couple the chains up to a hauling means.
3. A sled having a fixed medially disposed transverse beam, draft chalns secured to the beam, plate links in the chain provided with longitudinal slots, a roller in the front end of the sled, said roller having pin pivot terminals that pass through the slots in the plate links, and means for coupling the chains at their front ends to a hauling means.
4. In a sled, a roller, a tongue fixed to the roller. an extension tongue secured detachably to the tongue and having means for securing it detachably to a hauling means, and means other than the tongue secured to the sled at the rear of the roller adapted to be attached in front of the roller detachably to the hauling means for pulling the sled along. 5. In a sled, a roller having a thereto secured rigid tongue, a detachable tongue extension having furcate legs adapted to straddle and fit on the tongue, a band on the ends of the legs also adapted to fit on the tongue, sald tongue extension being provided with pin holes for pins to secure it to the tongue, and to a hauling means.
6. In combination, a sled with a medially disposed fixed beam, draft chains secured at a distance apart severally to the beam, a tongue roller interposed between the chains keeping them apart at the front end of the sled a distance substantially equal to the width of the sled, and a coupling device to which the front ends of the chains are secured near together and having means for coupling it to a hauling means.
7. In combination, a plurality of sleds one following another, a roller between and mounted in the front ends of the runners of each sled, a single transverse beam mexlially on and secured to the runners, a pair of sled connecting chains attached at a distance apart to the beam of the preceding sled and at their rear ends to the beam of the following sled, said chains being crossed medially and held apart by the roller of the following sled.

No. 100,881. Traction Sled. Traineau d traotion.

James McGillis, Chippewa Falls, Wisconsin, U.S.A., 4th September, 1906; 6 years. Filed 23rd March, 1906. Receipt No. 134,213.
Claim.-1. In a traction sled the combination with a frame supported on fixed runners, of a crank shaft, a movable runner, a spring hanger connecting the crank and the movable runner, and means to drive the shaft.
2. In a traction sled the combination with a runner supported frame, of a crang shaft, means to drive the shaft, a movable runner, a spring hanger having one end connected to the runner and its opposite end connected to the crank, and a guard member carrled by the runner and loosely embracing the hanger.
3. In a traction sled the combination with a frame supported on fixed runners, means to drive the shaft, a spring hanger connecting the crank and the movable runner, a guideway, and means upon the movable runner to engage the guldeway and support the movable runner in an elevated position when travelling forward.
4. In a traction sled the combination with a frame having a fixed runner, of a movable runner working at one side of the fixed runner, means for working the movable runner back and forth, a cam track carried by the movable runner and working upon the track during the forward moviment of the movable runner to elevate the same.
5. In a traction sled, the combination with a runner supported frame, of a movable runner, a crank shaft, means for driving the crank shaft, a flexible hanger connected to the crank and the runner, a guide member carried by the runner, and a track located in the forawrd path of the guide member to elevate the movable runner during its forward movement.
6. In a traction sled, the combination with a frame having a pair of fixed runners, a pair of shafts mounted transversely of the frame and provided with cranks respectively located at the inner and outer sides of the individual runners, the members of each pair of cranks being disposed at opposite sides of the adjacent shaft, means for simultaneously rotating the shafts in the same direction, movable runners working back and forth at opposite sides of the respective fixed runners, spring links having their forward ends connected to the respective movable runners and inclined upwardly and rearwardly therefrom with their upper ends pivotally connected to the adjacent cranks, looped guards carried by the movable runners and loosely embracing the respective spring links, anti-friction guide rollers carried by the movable runners and located between the latter and the respective fixed runners, and tracks carried upon opposite sides of the fixed runners and located in the paths of the forward movements of the rollers to elevate the movable runners when moving forwardly.
7. In a traction sled, the combination with a frame supported on fixed runners, of a movable runner, a crank shaft upon the frame, a spring hanger connecting the movable runner and the crank, a guideway upon the fixed runner, and a guide carried by the movable runner and working upon the upper side of the guideway to support the movable runner in an elevated position, when moving forwardly and running at the under side of the guideway during the rearward movement of the runner to prevent elevation thereof.
8. In a traction sled, the combination of fixed runners, movable runners working at opposite sides of each fixed runner, means for raising and lowering and at the same time working the movable runners back and forth, guide members carried by opposite side of the movable runners, tracks carried upon opposite sides of the fixea runners for co-operation with adjacent guides of the movable runners, and other tracks supported at the outer sides of the movable runners in co-operative relation with the adjacent guldes.
9. In a traction sled, the combination with a fixed runner having a substantially horizontal irame extending around the top thereof, of movable runners working at upposite sides of the fixed runner, means to raise and lower and at the same time work the movable runners back and forth, tracks upon opposite sides of the fixed runner, tracks hung from the frame at the outer sides of the movable runners, and guide members carried by opposite sides of the movable runners for engagement with the respective tracks.

No. 100,882. Fur Trimmer.
Appareil d̀ arranger les fourrures.

Albert Frederick Schnaufer, Toronto, Ontario, Canada, 4th September, 1906; 6 years. Filed 10th April, 1906. Receipt No. 134,797.
Claim.-1. In a fur trimming machine, the combination with the main frame, the stationary cutting plate and the co-acting cutting cylinder, of a swinging frame pivotally secured to the main frame, and a compression spring extending between the swinging frame and the main frame, and on which the fur is designed to rest during the cutting operation, as and for the purpose specified.
2. In a fur cutting machine, the combination with the main frame, the stationary cutting plate and the co-acting cutting cylinder, of a swinging frame pivotally secured to the main frame comprising arms pivotally secured to the base of the main frame, a cross connecting bar connecting the ends of the arms together, and a roller journalled between the arms over which the fur is designed to be passed, as and for the purpose specified.
3. n a fur cutting machine the combination with the main supporting frame, the stationary cutting plate and the coacting cutting cylinder, of a swinging frame comprising bars pivotally secured to the base of the main frame, a cross connecting bar, a cross roller journalled between the arms and means for regulating the forward swing of the arms igainst the knives, as and for the purpose specifled.
4. In a fur cutting machine the combination with the main supporting frame, the stationary cutting plare and the coacting cutting cylinder, of a swinging frame comprising bars pivotally secured to the base of the main frame, a cross connecting bar, arc-shaped bars connected to the swinging bars and designed to pass through holes in the main Prame, and a roller journalled on supports adjustably secured to the arcshaped bars, as and for the purpose specified.
5. In a fur cutting machine the combination with the main frame, the stationary cutting plate and the co-acting cutting cylinder, of a swinging frame pivotally secured to the main frame comprising arms pivotally secured to the main frame, arc-shaped bars secured to the arms and designed to pass through an opening in the main frame, standards adjustably sccured to the bars, a roller journalled between the standards and collars forming limiting stops adjustably secured to the arc-shaped bars, as and for the purpose specified.
6. In a fur cutting machine, a swinging frame comprising piroted slde bars, a cross connecting bar, arc-shaped supporting bars and a roller adjustably journalled in bearings adjustably secured between the arc-shaped bars, as and for the purpose specified.
7. In a fur cutting machine, a swinging frame designe 1 to be pivotally secured to the body of the machine, and a compression spring extending between the frame and thr body. as and for the purpose specifled.
8. In a fur cutting machine, a swinging frame comprising pivoted side bars, a cross connecting bar and a roller journalled between the bars, as and for the purpose specified.
10. In a fur cutting machine, a swinging frame comprisin: pivoted side bars, a cross connecting bar, arc-shaped sup porting bars and a roller journalled between the arc-shaped bars, as and for the purpose specified.

No. 100,883. Gange for Saw Blade Edges.
Jauge pour le tranchement do lames de soies.

Seneca Edward Smith, Victoria, British Columbia, Canada, 4th September, 1906; 6 years. Filed 14th May, 1906. Receipt No. 135,859.
Claim.-1. As a means for detecting any deviation from a straight line in the edye of a saw blade, the combination with a bench or support having stop members secured thercto against which the edge of the blade may be pressed, of a gauge bearing on the edge of the blade between the supports that will indicate any deviation of the edge of the saw from a straight line between the point of contact on the stops.
2. In a device of the class described the combination with a bench or support for a saw blade having stops spaced a convenient distance apart, against which the edge of the blade may be pressed, of a member endwise slidable against the edge of the blade midway between the supports, and means connected to the stem whereby any deviation of the edge of the blade from a siraight line between the supports will be indicated and its amount determined.
3. In a device of the class described the combination with a bench or support, of adjustable stops spaced a convenient distance apart offering an elongated bearing surface to the edge of a saw blade pressed against them, a gauge member endwise slldable in a support against the edge of such blade. a pointer pivotally connected to the slidable member and fulcrumed to said support on a pin adjacent so that endwise movement of the slidable member will be multiplied to the cad of the pointer, and a spring to pressthe slidable member In contact with the edge of a blade against the supports.

\section*{No. 100,884. Cab Rnmner. Patin de voitures.}

James W. Sorenson, Grayling, Michigan, U.S.A., 4th September, 1906 ; 6 years. Filed 20th June, 1906. Receipt No. 137,085.
Claim.-1. A runner of the character described, having upwardly curved front and rear ends, the front end having a downwardly curved portion terminating in a vertically pendent shank, rectangular in cross section, the rear end terminating in an inwardly extending horizontal shank, rectangular in cross section, and socket members for receiving the axle spindles. sald socket members having rectangular apertures to receive the vertical and horizontal shanks, and set screws for holding the same in their adjusted position, substantially as shown and described.
2. A runner of the character described, having its front ends curved upwardly, backwardly and downwardly, and ter-

minating in a vertical shank having a plurality of adjusting apertures, and said runner having its rear end curved upwardly and terminating in an inwardly extending horizontal shank, T-shaped bearing boxes slidable on either shank ends, said bearing boxes having set screws for clamping them in their different adjustments and having portions to receive the axle spindles, substantially as shown and described.
3. A runner of the character described, having its front end bent into a circular shape and terminating into a vertical downwardly projecting shank portion rectangular in cross section and having its rear end bent up into a semi-circle and terminating in an inwardly projecting horizontal shank portion, rectangular in cross section, and a pair of T-shapel socket members. each consisting of a cylindrical bearing portion to receive an axle spindle, a set screw for co-operating with sald bearing portion, and each of said bearing members, having squared apertures for receiving the shank portions of the runners, and a set screw for co-operating with said squared apertures for holding the bearing members, adjustable on the runners, substantially as shown and described.

\section*{No. 100,885. Controller for Vehicles. \\ Controleur pour téhicutes.}

Alexander Winton, Cleveland, Ohio, U.S.A., 4th September, 1906; 6 years. Filed 17th January, 1906. Receipt No. 131,969.
Claim.-1. A controller for self-propelled vehicles, including a rotatable steering tube, a concentrically arranged longitudinaliy movable member carried by the tube, a spiral cam carried by the tube and adapted to be oscillated therewith, means for oscillating the cam independent of the tube, a controller for the engine, and a connection between the controller and said longitudinally movable member.
2. A controlling mechanism for self-propelled vehicles comprising a rotatable steering tube, a concentrically arranged longitudinally movable member exterior said tube, a spiral cam adapted to oscillate in said tube, a member connected with said cam and extending through and beyond the upper end of the tube, a handle for oscillating the cam independently of the tube, means for locking the cam to said tube, and a controller connection connected with said longitudinally movable exterior member.
3. A controlling mechanism for self-propelled vehicles comprising a rotatable steering tube, a longitudinally movable sleeve surrounding said tube and rotatable therewith, a cam within said tube and operatively connected with said sleeve, an operating member for the cam extending through the upper end of said tube, means for locking said member and thereby the cam to said tube, and a controller connfection non-rotatably mounted on said sleeve.
4. A controller for explosive engines, including a rotatable steering tube, an oscillatable spiral cam within the tube, a icngitudinally movable sleeve surrounding the tube, the tube provided with a longitudinal opening, the sleeve having an operative engagement with said cam through the said opening, a member connected with the cam and extending through the tube and beyond the upper end thereof, a member connected with the steering tube for oscillating it, a handle connected with the cam member, means for locking the handle to said tube operating member, the said sleeve having a groove, a ring loosely placed in the groove, means for holding the ring against rotation, a controller for the engine, and a connection between the ring and said controller.
5. A controller for explosive engines, including a steering tube, two independently oscillatable spiral cams located in the tube, one above the other, a tube connected with the upper cam and extending through the steering tube and beyond the upper end thereof, a handle connected with the tube, a rod passing through the said tube and connected to the lower cam, the upper end of the rod extending beyond the said cam tube, a handle connected with the extended end of the rod, longitudinally movable sleeves surrounding the steering tube and operatively connected respectively with the said cams through the steering tube, two controllers for the engine, and separate operative connections connecting the respective sleeves with the respective controllers.

No. 100,886. Driving Shaft for Motor Vehicles.
Arbre de commande pour téhicules motcur.

Alexander Winton, Cleveland. Ohio, U.S.A., 4th September. 1:06; 6 years. Filed 28th May, 1906. Recelpt No. 136,328.
Claim.-1. In a motor vehicle, the combination of a driving engine, a vehicle driving shaft operatively connected therewith, and a connecting shaft provided with an intermediate transversely yiclding portion.
2. In a motor vehicle, the combination of an explosive engine provided with a crank shaft. a vehicle drlving shaft, a connecting shaft provided with two universal joints, the connecting shaft provided with a transversely yielding portion located between said universal joints.
3. In a motor vehicle, the combination of a motor, a yieldingly supported vehicle driving shaft, a connecting shaft extending longitudinal the vehicle, one end of the ocnnecting shaft operatively connected with the vehicle driving shaft and its opposite end operatively connected with the motor driving shaft, the longitudinally extending connecting shaft constructed to longitudinally expand and contract for the purpose described.
4. In a motor vehicle the combination of motor having a driving shaft, a yieldingly supported vohicle driving shaft, a connecting shaft having one end operatively connected with the whicle driving shaft and its opposite end adapted to be operatively connerted with the motor shaft, said connecting shaft adapted to yield in a direction transverse its axis and to expand and contract in a direction longitudinal its axis, for the purpose described.
5. In a motor vehicle, the combination of a motor having a driving shaft, a vehicle driving shaft, and a longitudinally expanding and contracting shaft connecting the motor and the vehicle driving shaft.
6. In a motor vehicle, the combination of a motor having a driving shaft, a vehicle driving shaft, and a longitudinally expanding and transversely yielding shaft connecting the sbaft and the vebicle driving shaft.
7. In a motor vehicle, the combination of a motor having a driving shaft, a vehicle driving shaft, and a two-part shaft connecting the motor and vehicle driving shafts, the two parts of the connecting shaft having interposed yielding members, for the purpose described.

\section*{No. 100,887. Pulveriser and Grinding Mill. Pulvérisatcur et broyeur.}

James Wheeler Fuller, Jr., Catasauqua, Pennsylvania, U.S.A., 11th September. 1906; 18 years. Filed 17 th August. 1906. Receipt No. 138,754.
Claim.-1. In a pulverizing or grinding mill, separating, collecting and discharging chambers in communication with each other, grinding means, rotatable means to create a suction action of air above said grinding means, and eald separating. collecting and discharging chambers respectively in communication with said grinding means and discherge spouts of the mill.
2. In a pulverizing or grinding mill, grinding means, rolatable blades or wings arranged at different angular positions with respect to each other to create a suction action of air and arranged to permit of the free descent of matter to be ground to said grinding means, separating. collecting and discharging chambers communicating with each other. and respectively connected with said grinding means and discharge spouts of the mill.
3. In a pulverizing or grinding mill, grinding means, separating, collecting an discharging chambers connected with each other and with discharge spouts of the mill and rotatable means located above the grinding means for creating and maintaining a suction action of air, the construction and arrangement being such as to permit of free passage of matter to be ground to said grinding means, of separation of finely divided or ground matter from the coarser matter, in the separating chamber by the force of air from said rotatable means lifting the finely divided or ground matter into the collecting and discharging chambers and spouts of the mill, and the conveying of the coarser matter by gravity back into the path of said grinding means.
4. In a pulverizing or grinding mill, grinding means, rotatable means located above the grinding means for creating and maintaining currents of air, and separating. collecting and discharging chambers in communication with each other. the currents of air created by said rotatable means adapted to lift ground matter vertically and radially into the separating chamber, wherein the finely divided or ground matter is separated from the coarser matter, and the former then lifted by the force of the air into the collecting and discharging chambers and the latter conveyed back into the path of said grinding means.
j. In a pulverizing or grinding mill, grinding means, rotatable wings or blades located above the grinding means, and said blades or wings arranged at different angular positions with respect to each other, separating, collecting and discharging chambers connected with each other, said separating and collecting chambers closed at the top but connected with each other by an adjustable inlet device and the series of said chambers respectively in communication With said grinding means and discharge snouts of the mill.
6. In a pulverizing or grinding mill, grinding means. rotatable wings or blades arranged at different angular positions with respect to cach other and above said grinding means, separating, collecting and discharging chambers conpected with each other and respectively in communication
with said grinding means and discharge spouts of said discharging chamber of said mill.
7. In a pulverizing or grinding mill, grinding means, separating, collecting and discharging chambers communicating with each other, wings or blades located above said grinding means and permitting of free descent of matter to be ground to the grinding means, and when rotated elevation of ground matter vertically and discharging transversely into said separating chamber wherein by force of the impelled air separating in said chamber the finer matter from the coarser matter and discharging said tinely divided or ground matter in the collecting chamber into the discharging chamber and then through the discharge spouts of the mill, and at the same time, returning from the separating chamber the coarser matter back into the path of sald grinding means.
8. In a pulverizing or grinding mill, casings arranged concentrically in relation to each other and forming respectively suction, separating and collecting chambers and means interposed between the separating and collecting chambers for increasing or decreasing the area of the separating chamber.
9. In a pulverizing or grinding mill, a casing, a second casing surrounding the same, means slidably arranged on said second casing for increasing or decreasing the heighth thereof and in conjunction with said second casing forming baffing walls, and means arranged in said first casing for generating currents of air and raising and forcing ground matter with the air from the first casing against the baffing walls of the second casing to permit of separation of the finer matter from the coarser matter and discharge of said finer matter by the impelled air.
10. In a pulverizing or grinding mill, grinding means, separating, collecting and discharging chambers communicating with each other, wings or blades located above said grinding means and permitting of free descent of mattor to be ground to the grinding means, and when rotated, elevation of ground matter vertically and discharging transversely into said separating chamber, wherein by the force of the impelled air separating in said chamber the finer matter rrom the coarser matter and discharging said flnely divided or ground matter in the collecting chamber into the discharging chamber and then through the discharge spouts of the mill, and at the same time, returning from the separating chamber the coarser matter back into the path of sald grinding means, and said slidable means determining the degree of fineness of the separated ground matter, by increasing or decreasing the length of travel thereof in the exit of the same from said second casing.
11. In a pulverizing or grinding mill, a casing, two concentrically arranged casings surrounding the same, means for connecting the outer casing with the inner casing and forming a deflecting wall for air, and means arranged in the inner casing for generating currents of air and forcing the air as well as raising and discharging ground matter against the intermediate casing to separate the finely ground matter from the coarser matter therein and permit in conjunction with said deflecting means the discharge of said finer matter from the intermediate chamber into the outer chamber of said casings by the currents of air generated in the inner chamber of said casings.
12. In a pulverizing or grinding mill, a casing having a discharge for finely ground matter therein, two concentrically arranged casings surrounding deflecting means for air connecting the outer of sald casings with the inner casing at their upper ends, means forming a part of said inner casing and carrying the outer and Intermediate casings and having passageways connecting the intermediate with the inner of said casings and the outer casing with the dischargea, means arranged in the inner of said casings for generating currents of air and forcing air and raising and discharging ground matter against the intermediate of said casings to separate the finely ground matter from the coarser matter therein, and permit of discharge of the finer matter from the intermediate of aaid casings to and through the outer casing by said deflecting means and from the outer of said casings through the discharges of the outer of said casings by the currents of air and of the return of the coarser matter from the intermediate of said casings to the inner of said casings, by gravity.
13. In a pulverizing or grinding mill, a casing forming a discharge chamber with outlets or spouts, grinding means located adjacent to said chamber, but separated therefrom by the grinding ring and acessories of said means, a channelled nelled casting supported about said grinding means and casting supported about said grinding means and carrying casings constituting separating and collecting chambers of the mill and connected with each other, adjustable means for lacreasing or decreasing the length of the wall separating sald two chambers from each other. an air and matter defecting roof above the casing of said chambers and means located above the grinding means for creating and maintainlig currents of air for lifting ground matter and deflecting
the same against the casing between said separating and collecting chambers.
14. In a pulverizing or grinding mill, grinding means, means for creating and maintalning currents of air within a central chamber, concentrically arranged casings surrounding said chamber and constituting separating and collecting chambers of the mill in communication with each other, and said chambers connected with said grinding means and with discharge outlets or spouts of the mill.
15. In a pulverizing or grinding mill, a grinding means, means for creating and maintaining currents of air within a central chamber to lift by said means and the alr created thereby, ground matter vertically and radially from sald means concentrically arranged casings surrounding said chamber and constituting separating and collecting chambers of the mill in communication with each other and said chambers connected with said grinding means and discharge out lets or spouts of the mill.
16. In a pulverizing or grinding mill, grinding means ro- \(^{\text {ro }}\) tatable means for creating currents of air within a central chamber to lift by said means and air creating thereby, ground matter vertically and radially from said means, concentrically arranged casings supported from a channelled casting above said grinding means and constituting the separating and collecting chambers of said mill, means adjustably connected with the casings separating said two communlcating chambers with each other to control the length of travel of separated fine matter from coarse matter in the separating chamber prior to its discharge into the collecting chamber impelled by the air, under pressure, and said two chambers connecting with said grinding means and with the discharge outlets or spouts of the mill.

\section*{No. 100,888. Pulverizing and Grinding Mill.} Pulvérisatcur et broyeur.

James Wheeler Fuller. Jr., Catasaqua, Pennsylvania, U.S.A., 11th September, 1906. 6 years. Filed 20th August, 1906. Receipt No. 138.817 .
Claim.-1. In a pulverizing or grinding mill, a casing having outlets, grinding means arranged within the casing below the outlets, a second casing surrounding the first casing and outlets thereof, air current generating means arranged within the Inner casing above the grinding means, means for controlling the outlets of the inner casing. and means for controlling the position of all of the outlets controlling means from a given point.
2. In a pulverizing or grinding mill, a casing having outlets, grinding means arranged within the casing below the outlets, a second casing surrounding the first casing and outlets thereof, air current generating means arranged within the inner casing above the grinding means, means for controlling the outlets of the inner casing, and means for simultanepusly actuating the outlet controlling means and holding at a uniform position within the inner casing.
3. In a pulverizing or grinding mill, casings arranged concentrically with respect to each other and forming suction, separating and collecting chambers, the inner one of said casings having peripheral outlets, grinding means arranged within the inner casing below the outlets, air current generating means arranged within the inner casing, means for controlling the outlets of the inner casing and by the same the exit of air therefrom, and means for closing the upper end of the outer casing and deflecting air rising in the separating chamber in a downward direction into the collecting chamber.
4. In a pulverizing or grinding mill, casings arranged concentrically with respect to each other, a partition wall arranged between sald casings to form communicating, separating and collecting chambers outside the inner casing. means adjustably connected with the partition wall for de-
creasing or increasing the height thereof, the inner of the asings having peripheral outlets, grinding means arranged w:thin the inner casing below the outlets, air current generating means arranged within said inner casing, means for controlling the outlets of the inner casing and by the same the current of air striking the partition wall, and means for closing the upper end of the outer casing and deflecting the air in a downward direction in the collecting chamber.
5. In a pulverized or grinding mill, a casing having peripheral outlets, grinding means arranged within the casing below the outlets, air current generating means arranged within the inner casing above the grinding means, a series of superposed deflector slats guarding each outlet of the inner casing, means for moving sald deflector slats in the casing to vary the angle of discharge through said outlets, and means for simultaneously actuating the moving means for each series of said slats to hold the same in a uniform position in the outlets of the inner casing.
6. In a pulverizing or grinding mill, a casing having peripheral outlets, grinding means arranged within the casing below the outlets, air current generating means arranged within the inner casing above the grinding means, a series of superposed deflector slats guarding each outlet of the inner casing, means for moving said deflector slats in the casing to vary the angle of discharge through said outlets, means for simultaneously actuating the moving means for each series of said slats to hold the same in a uniform position in the outlets of the inner casing, an outer casing surrounding the inner casing, a partition wall separating the inner casing from the outer casing to form communicating separating and collecting chambers, means carried by said partition wall to increase or decrease the height thereof, and a cap carried by the casings for deflecting air coming from the separating chamber in a downward direction into the collecting chamber.
7. In a pulverizing or grinding mill, a casing having posts forming peripheral outlets therein, slats arranged in said outlets and carried by said posts, means removably arranged in said posts for locking the slats thereto, means for connecting the slats with each other, and actuating means for said connecting means to control the position of the slats.
8. In a pulverizing or grinding mill, a casing having posts forming peripheral outlets therein, a series of slats arranged in each of the outlets and carried by the posts, means arranged in the posts for removably locking the slats thereto, means for connecting the slats of one series with the other, means for engaging the connecting means to actuate the slats. and means carried by the casing for actuating the engaging means of each serles of slats from a given point, and thereby to insure uniformity of position of each of the series of slats.

No. 100,889. Pad for Horses. Bourrelct pour harnais.

Seble A. Ladd, Duane, New York, U.S.A., 11th September, 1906: 6 years. Filed 13th August, 1906. Receipt No. 138,624.
Claim.-1. A sweat pad for horses composed of an outside and inside layer of cloth, as drilling, and an intermediate layer of composite stuffing, said layers being perforated through and through and quilted, the lines of all quilting stitches crossing in the perforations.
2. A sweat pad for horses composed of suitable coverings of cloth, and an inner stuffing, said layers or plies being perforated through and through and finished by cross quilting. the cross quilting lines of stitches crossing the perforations as, described, and hooks being connected with the outer edges.
3. A sweat pad for harness perforated through and through and quilted by lines of cross stitches, the latter crossing in cach perforation.

\section*{No. 100,890. Horse Training Device.}

\section*{Apparcil pour cntrainer les chevalux.}

Samuel 13. Arthurs, Brookville. Pennsylvania, U.S.A., 11th September, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 1:3, 143.
Claim.-1. A horse trainer embodying a revoluble mast, a horizontal frame supported by sald mast and consisting of
a plurality of radially disposed arms, extensions slidaby mounted in the arms of sald frame bars detach-

ably connected to said arms, separate bars detachably connected to said extensions, a brake band carried by said frame, and engaging posts mounted adjacent to said mast and engaged by said brake band, means to operate said brake band, and a belt wheel carried by said mast.
2. A horse trainer and exerciser embodying a revoluble mast, radially disposed arms supported by sald mast, extensions slidiably mounted in sald arms, bars detachably connected to said arms, separate bars detachably connected to said extensions, a platform carried by said arms, and means to retard the movement of said mast, substantially as described.
3. A hoise trainer embodying a mast, a socket spider carried by said mast, a plurality of radially disposed arms supported by said socket spider and said mast, extensions slidably mounted in said arms, bars detachably connected to said arms, and separate bars detachably connected to said extensions, substantially as described.
4. A horse trainer and exerciser embodying a revoluble mast, radially disposed arms carried by said mast, and means to retard the movement of sald mast, substantially as described.
5. In a horse trainer, a revoluble mast, a plurality of arms projecting radially from the mast near the base thereof, main guy wires attached to said mast to steady the same and hold it in a vertical position, inner guy wires attached at their upper ends to the mast and at their lower ends to said radially projecting arms to support the latter, and bars detachably connected to said arms.
6. In a horse trainer, a revoluble mast, power transmitting mechanism carried by the mast, a plurality of radially disposed arms carried by the mast, bars detachably connected to said arms, Inner guy wires connected to the mast and to said arms for supporting the latter, a plurality of anchor posts, a clearance post located adjacent each anchor post, and main guy wires connected at their upper ends to the mast and at their lower ends to the anchor posts, said guy wires intermediate their ends being looped around the clearance posts.
7. A horse trainer and exerciser embodying a revoluble mast, power, transmitting mechanism carried by said mast, a plurality of stalls arranged around the mast and means to retard the movement of said mast.
8. A horse trainer and exerciser, embodying a revoluble mast, power transmitting mechanism carried by said mast, anchoring means for steadying the mast and holding the same in a vertical position, a plurality of radially disposed arms carried by said mast, detachable means for forming one or more stalls between each pair of arms, and means supforting the arms from the mast.
9. In a horse trainer and exerciser, a revoluble mast, a plurallty of radially disposed arms carried by said mast, bars detachably connected to said arms, extension arms engaging the first-named arms, and separate bars detachably connected to said extension arms.
10. In a horse trainer and excriser, a revoluble mast, power transmitting mechanism carried by the mast, means for forming one or more stalls adjacent to the mast, and a brake for retarding the movement of the mast.
11. In a horse trainer and exerciser, a revoluble mast. a plurality of radially extending arms carried by said mast. means for forming one or more stalls between each pair of arms, extension arms engaging the first-named arms, and nueans for forming one or more stalls between each pair of extension arms.

No. 100,891. Door Chate. Chute.

Theodore F. Clark, Seattle, Washington, U.S.A., 11th September, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,977.
Claim.-1. The combination with the casing frame, of a chute having a sliding hinge connection therewith whereby the bottom of the chute will be caused to entirely cover the opening of said frame when closed and be protruded into said opening when the chute is tilted down for use.
2. The combination with the casing frame, of a chute having a sliding hinge connection therewith whereby the bottom of the chute will be caused to entirely cover the opening of said frame when closed and be protruded into said opening when the chute is tllted down for use, and means to automatically lock said chute in its closed position.
3. The combination with the casing frame, of a chute having a sliding hinge connection therewith whereby the bottom said frame when closed and be protruded into said opening When the chute is tilted down for use, mears to automatically lock said chute in its closed position, and means to limlt the extent of the outward tilting of the chute.
4. The combination with a casing frame having an inclined bottom, and the journal attachments secured to the frame, of the chute having sides adapted to enter the opening of said frame and a bottom of greater width and length than the corresponding dimensions of said opening, said chute bottom being formed with a taper at one end, a horizontally disposed rod secured to sald chute bottom and projecting into the said attachments, bars secured to said chute sides, a bar connecting the said bars, and a latch bar suspended from the top of the said frame and adapted to engage with said second-named bar.
5. The combination with a casing frame having an inclined bottom, and the journal attachments secured to the frame, of the chute having sides adapted to enter the opening of said frame and a bottom of greater width and length than the corresponding dimensions of said opening, said chute bottom being formed with a taper at one end, a horizontally disposed rod secured to said chute bottom and projecting into the said attachment, diagonally disposed bars secured to said chute sides, a bar connecting the said bars, and a latch bar suspended from the top of the said frame and adapted to engage with said second-named bar.
6. The combination with a casing frame having an inclined bottom, and the journal attachments secured to the frame, of the chute having sides adapted to enter the opening of said frame and a bottom of greater width and length than the corresponding dimensions of said opening, said chute bottom being formed with a taper at one end, a horizontally disposed rod secured to said chute bottom and projecting into the said attachments, diagonally disposed bars secured to said chute side and terminating in bends, a bar connecting the said bars, and a latch bar suspended from the top of the said frame and adapted to engage with said secondnamed bar.
7. The combination with a casing frame having an inclined bottom, and the journal attachments secured to the frame, of the chute having truncated sides adapted to enter the opening of said frame, and a bottom of greater width and length than the corresponding dimensions of said opening, sald chute bottom being formed with a taper at one end, a horizontally disposed rod secured to said chute bottom and projecting into the said attachments, diagonally disposed bars secured to said chute sides and terminating in bends, a bar connecting the sald bars, and a latch bar suspended from the top of the said frame and adapted to engage with sald second-named bar.

9-11
8. The combination wilh a casing frame having an inclined bottom and flanged inner and outer edges, and the journal attachments secured to the frame, of the chute having truncater sides adapted to enter the opening of sald frame, and a bottom of greater width and length than the corresponding dimensions of said opening, said chute bottom being formed With a taper at one end, a horizontally disposed rod secured to said chute bottom and projecting into the said attachments, diagonally disposed bars secured to said chute sides and terminating in bends, a bar connecting the sald bars and a latch bar suspended from the top of the said frame and adapted to engage with said second-named bar.

No. 100,892. Gyrating Machine.
Machine à giration.

George William Combs and Frederick David Combs, co-Inventors, both of Leavenworth, Kansas, U.S.A., 11th September, 1906; 6 years. Filed 14th August, 1906. Receipt No. 138,686.
Claim.-1. A gyrating machine consisting of a plurality of sieve boxes, independent bridge trees connecting the boxes in diagonal pairs and provided with centrally disposed bearings, and a centrally arranged shaft having for each pair oppositely disposed cranks journalled in the bearings.
2. A gyrating machine consisting of a plurality of vertically arranged sieve boxes, diagonally extending independent bridge trees connecting the boxes in diagonal pairs and provided with centrally disposed bearings, and a centrally arranged vertical shaft having for each pair of boxes oppositely disposed cranks journalled in the bearings
3. A gyrating machine consisting of a plurality of sieve boxes, bridge trees connecting the boxes in diagonal pairs and provided with centrally disposed bearings, a centrally arranged shaft having oppositely disposed cranks journalled in the bearings, a hanger having two bearings in which the upper portion of the shaft is journalled, a cap secured to the upper end of the shaft, anti-friction balls interposed between the cap and the adjacent bearings of the hanger, and means for rotating the shaft from a point between the bearings.
4. A gyrating machine consisting of a plurality of sieve boxes, bridge trees connecting the boxes in diagonal pairs and provided with centrally disposed bearings, a centrally arranged vertical maia shaft having oppositely disposed cranks journalled in the bearings, a hanger having two bearings, a drive shaft journalled therein, a short section of shafting arranged between the main and the driving shafts, and universal joints connecting the adjacent ends of the shafting.
5 . \(\Lambda\) gyrating machine consisting of four boxes, bridge trees arranged in duplicate pairs extending at right angles to each other and connecting the boxes in diagonal pairs. centrally disposed bearings formed integral with the bridge trees, and a centrally arranged shaft having two like sets of oppositely disposed cranks journailed in the bearings.
6. A gyrating machine consisting of a plurality of sleve boxes, diagonally extending bridge trees connecting the boxes in diagonal pairs and provided with centrally disposed bearings, a centrally arranged shaft having oppositely disposed cranks journalled in the bearings, and means for preventing the shaft from gyrating consisting of a member connected by universal joints with one extreme end of the shaft and a stationary object.
7. A gyrating machine consisting of a plurality of sleve boxes, diagonally extending bridge trees connecting the boxes in diagonal pairs and provided with centrally disposed bearings, a centrally arranged shaft having oppositely disposed cranks journalled in the bearings, a spring, and universal connections at its opposite ends to a stationary obfect and the lower end of the shaft to prevent the latter from gyrating.
8. In a gyrating machine, a plurality of sieve boxes loosely supported driving mechanism leading to said shaft.

No. 100,893. Ash Sifter and Bucket. Tamis d cendres et seau.

Charles W. Conradt, West Chester, Pennsylvania, U.S.A., 11th September, 1906; 6 years. Flled 13th August, 1906. Receipt No. 138,621.
Claim.-1. In an ash sifter, the combination with an outer receptacle having an inverted T -shaped slot extending downwardly from its upper edge to a point above the bottom thereof, of supporting strips secured at intervals against the inner face of the receptacle below the slot, and having their upper end portions bent inwardly in a common horizontal plane, a sifting member located within the outer receptacle upon the inwardly bent portions of the strips, a handle carried by the sifting member and extending outwardly through the horlzontal portion of the T-shaped slot, and being of a size to just pass through the stem of the slot, and a cover removably engaged over the outer receptacle and extending downwardly to close the whole of the stem of the T-shaped slot, said handle being removable longitudinally of the horizontal portion of the slot, to oscillate the inner receptacle.
2. An ash sifter comprising an outer receptacle having a door in its lower portion and having an inverted T-shaped slot in its upper portion dlametrically opposite from the door, the stem of the slot opening through the upper edge of the receptacle, supports for the sifting member and extending outwardly through the horizontal portion of the slot, and being of a size to just pass through the stem of the slot, sald handle being movable longitudinally of the horizontal portion of the slot to oscillate the sifting member, a cover fitted upon the outer receptacle and closing the end of the slot, and a bail pivoted to the outer receptacle at points midway between the vertical plane of the door and the slot, said handle of the sifting member extending beyond the outer rcceptacle for manipulation to move the receptacle with respect to the bail.

\section*{No. 100,894. Radiator. Radiatcur.}

Samuel Drew, Rochester, New York, U.S.A., 11th September, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,492.
Claim.-1. In a heating drum and in combination with the body portion thereof, a deflector adapted to produce eddy currents in practically horizontal planes in the gases passing therethrough.
2. In a heating drum and in combination with the body portion thereof, a deflector adapted to produce eddy currents i:! practically horizontal planes in the gases passing therethrough and detachable means for supporting such deflector i: operative position.
3. In a heating drum and in combination with the body porion thereof. a deflector adapted to produce eddy curreuts in practically horizontal planes in the gases passing therethrough and detachable means for supporting such de-
flector in operative position and for holding the parts of such drum together.

4. In a heating drum and in combination with the body portion thereof, a deflector adapted to produce eddy currents in practically horizontal planes in the gases passing therethrough and detachable means for supporting such deflector il operative position and for holding the parts of such drum together and adapted to be held in place by such deflector.
5. In a heating drum and in combination with the body portion thereof, a deflector adapted to produce eddy currents in practically horizontal planes in the gases passing therethrough and detachable and elastic means adapted by its resiliency to hold such deffector in operative position and permit the removal of the same.
6. In a heating drum and in combination with the body portion thereof, a deflector adapted to produce eddy currents in practically horizontal planes in the gases passing therethrough and detachable and elastic means adapted by its resiliency to hold such deflector in operative position and permit the removal of the same and adapted also to hold the parts of such drum together.
7. In a heating drum and in combination with the body portion thereof, a deflector adapted to produce eddy currents in practically horizontal planes in the gases passing therethrough and detachable and elastlc means adapted by its resiliency to hold such deflector in operative position and permit the removal of the same and adapted also to hold the parts of such drum together and to be held in place by such deffector.
8. In a heating drum and in combination with the body portion thereof, a deflector and detachable means for supporting such deflector in operative position and for holding the parts of such drum together and adapted to be held in place by such deflector.
6. In a heating drum and in combination with the body portion thereof, a deflector and detachable and elastic means adapted by its resiliency to hold such deflector in operative position and permit the removal of the same.
10. In a heating drum and in combination with the body portion thereof, a deflector and detachable and elastic means adapted by its resiliency to hold such deflector in operative position and permit the removal of the same and adapted also to hold the parts of such drum together.
11. In a heating drum and in combination with the body portion thereof, a deffector and detachable and elastic means adapted by its resiliency to hold such deflector in operative portion thereof, a deflector and detachable and elastic means to hold the parts of such drum together and to be held in place by such deflector.

\section*{No. 100,895. Turntable. Table tournantc.}

Charles K. Ernst, Buffalo, New York, U.S.A, 11th September, 1906; 6 years. Filed 17th August, 1906. Receipt No. 138,763.
Claim.-1. The combination of a fixed hollow bearing box having an open upper end provided with a circular race, a turntable arranged above the bearing box and having a cenier post depending into the bearing box, anti-friction supporting bearings for the turntable arranged between the same and the circular race at the upper end of the bearing box, and a center bearing betwern the lower end of said crater post and the lower portion of the bearing box, substantially as set forth.
2. The combination of a fixed hollow metal bearing box having an open upper end provided at its rim with a circular
race, a turntable arranged above the bearing box and having a center post depending into said box, anti-friction sup-

porting bearings for the turntable arranged in said circular race and bearing against a circular face on the turntable and a center bearing for the turntable consisting of a bearing member removably secured to the bottom of the bearing box and provided with means for engaging the lower end of said center post. substantially as set forth.
3. The combination of a fixed hollow metal bearing box having an open upper end provided with a circular race, a turntable arranged above the bearing box and having a center post depending into said box, braces for said center post also arranged within said bearing box, anti-friction supporting bearings for the turntable arranged between the same and said circular race at the upper end of the bearing box, and a center bearing between the lower end of said center post and the lower portion of the bearing box, substantially as set forth.
4. The combination of a fixed hollow bearing box having ai: open upper end, a turntable having a horizontal bearing plate arranged above the bearing box, a center post depending below said bearing plate into the bearing box, braces connecting sald bearing plate and the depending portion of the bearing post and located within the bearing box, antifriction bearings arranged between the upper open end of the bearing box and said bearing plate and a center bearing between the lower end of said center post and the lower portion of the bearing box, substantially as set forth.
5. The combination of a flexd hollow bearing box having an open end, a turntable frame comprising a hub and floor supporting members secured to said hub, said hub consisting of a horizontal bearing plate provided with upwardly projecting parts to which the floor supporting members are secured ard a center post which depends from said bearing plate into the bearing box and braces connecting the center post and bearing plate and located within the bearing box, anti-friction bearings arranged between the open upper end of the bearing box and sald bearing plate and a center bearing between the lower end of said center post and the lower portion of the bearing box, substantially as set forth.
6. The combination of a fixed hollow bearing box having an open upper end, a turntable frame comprising a hub, radial noor suporting members secured to said hub and a rim conpecting the outer ends of said floor supporting members, said bub consisting of a horizontal bearing plate and a center post depending from said bearing plate into the box bearing parts extending upwardly from said bearing plate to which the sald radial floor supporting members are secured and braces connecting said center post and sald bearing plate and located within the bearing box, anti-friction bearings arranged between the upper end of the bearing box and said bearing plate and a center bearing between the lower end of said center post and the lower portion of the bearing box, substantially as set forth.
7. The combination of a fixed hollow bearing box having an open upper end provided with a circular race, a turntable arranged into the bearing box and having a center post depending into the bearing box, anti-friction supporting bearings for the turntable between the same and the circular race at the upper end of the bearing box, anti-friciton retaining bearings arranged between the upper end of the bearing box and a depending portion of the turntable and a center bearing between the lower end of said center post and the lcwer portion of the bearing box, substantially as set forth.

No. 100,896. Steam Heating System.
Système de chauffage de la chaleur.

Frank C. Goff, Denver, Colorado, U.S.A., 11th September, 1906; 6 years. Filed 13th August, 1906. Recelpt No. 138,633.
Claim.-1. In a heating system the combination of a radiaing device, a discharge pipe, a valve device interposed between the outlet of the radiating device and discharge pipe, a pressure motor for operating the valve plece of sald valve device, the motor having its opposite sides acted upon respectively by the pressures within the valve device on the outlet side of the radiator and discharge pipe and means located in the radiating device outside of or beyond the inlet side of the valve device and controlled by conditions at the point of location, to automatically control the pressures on the outer side only of said motor.
2. In a fluid system the combination of a discharge pipe connected with the system, a valve device for controlling the fluld discharge through the pipe, a pressure motor for operaling the valve plece of said valve device, said motor having its opposite sides acted on respectively by the pressures within the valve device on the outlet slde of the system and discharge pipe and means located within the system outside of or beyond the inlet side of the valve device and controlled by conditions at the place of location, whereby the pressure on the outer side only of the motor is regulated or controlled.
3. In a heating system the combination of a heater or radiator, a discharge pipe, a valve device in said discharge fipe having a suitable valve casing provided with a port for the discharge of the water, a fluid pressure motor controlling said port, the valve casing being provided with a fluid pressure chamber on the outside of said motor, a passage connecting the said fluid pressure chamber only with a portion of the pressure system beyond the valve casing and means located within the last-named portion of the system for controlling said passage, said means being adapted to be controlled by the collection of water of condensation within the system outside of or beyond the valve device.
4. In a steam heating apparatus the combination of a radlating device, a return for the air and water of condensation leading therefrom, a valve device interposed between the outlet of the radiating device and the return, a pressure motor for operating the valve piece of said valve device and having its opposite sides acted upon respectively by the pressures in the radiator outlet and return and means automatically controlled by the conditions within the radiating device outside of or beyond the valve device to control the differential pressure acting on the outer side only of the motor.

\section*{No. 100,897. Apparatus for Handling Cans.} Apparcil d manier les boittes de fer blanc.
Swan Johnson, Melrose Park, Illinois, U.S.A., 11th September, 1906; 6 years. Filed 15th August, 1906. Receipt No. 138,720.
Claim.-1. In an apparatus for handling articles in combination, a table, a removable tray thereon, means to feed the articles to the table, and means to transfer the same from the table to the tray.
2. In an apparatus for handling articles in combination, a table. a removable tray thereon, means to feed the articles to the table and the tray and constructed to transfer the articles from the former to the latter.
3. In an apparatus for handling articles in combination, a table, a removable tary thereon, a transfer frame movable over the table and tray and having guides for the articles and means to feed the articles to the said frame.
4. In an apparatus for handling articles in combination, a table having inclined tracks at the ends, a removable tray
on the table between said ends, a transfer frame movable upon said tracks and having dopending ribs, and means to

feed articles to the table under the frame between said ribs.
5. A carrying tray for articles having a discharging slide secured thereto and movable back and forth thereon, substantially as described.
6. A carrying tray for articles, comprising the bottom frame \(H\) having a handle, and the discharging slide I secured to the frame, and having the handle \(i\) extending thereover.
7. In an apparatus for handiling articles in combination, a table having a bed plece at the rear thereof, and inclined tracks at the ends, a removable tray on the table, in front of said bed plece and between the tracks, a transferring frame movable back and forth on the tracks over the bed piece and tray, and having depending ribs and means to feed the articles onto the bed piece under said frame and between the ribs.
8. In an apparatus of the kind stated, the movable transferring frame having depending longitudinal ribs and friction gulde strips extending between said ribs, substantially as described.
9. In an apparatus for handling articles in combination, a table having a bed piece at the rear thereof and inclined tracks at the ends, a leed chute at the end of the table, delivering the articles in rows onto the bed piece. a removable tray on the table in front of the bed plece, and a transfer frame movable back and forth on the tracks and having depending ribs between which the articles are received and rear extension at the ends which close the chute when the frame is drawn forward.
10. In an apparatus of the kind stated the movable transfer frame having longitudinal depending ribs forming ways to recelve articles, and stops on the frame between the ribs, adjustable to vary the length of the ways.
11. In an apparatus for handling parkages or articles, in combination, a receiver and means to deliver articles thereto, a removable carrier supported adjacent to the receiver, means to transfer the articles from the recelver to the carrier, and means to discharge the articles from the carrier.
12. In an apparatus for handling articles. in combination, a receiver oden at one side, means to deliver articles to the receiver a removable carrier supported adjacent the open side the receiver and having means to discharge articles therefrom. and mcans to simultaneously transfer the articles from the recelver to the carricr.
13. In an apparatus for handling articles, in combination, a receiver, means to deliver articles thereto in orderly arrangement, a removable carrier supported adjacent to the receiver, means to simultaneously transfer the articles from the receiver to the carrier in the same orderly arrangement, and means to discharge articles from the carrior in the same arrangement.
14. A carrying tray for articles, comprising a frame having a handle, and a discharging slide attached to the frame and movable back and forth thereon, and having a handle extending thereover, and arranged to assist in carrying the frame.

\section*{No. 100,898. Can. Boite de fer blanc.}

Joseph Montpetit, Montreal, Quebec, Canada, 11th Scptember, 1906; 6 years. Filed 18th August, 1306. Receipt No. 138,792 .
Claim.-1. The herein described method which consists in stamping from a can body a plurality of lips, and placing under the lips ball ears.
2. The hereln described method which consists in stamping from a can converging lips and a horizontal lip, and disposing between sald lips ears having converging outer edges and a horizontal upper edge.
3. The herein described method which consists in securing a bail ear to a can body and providing the bail ear with

a projecting portion adapted to be turned down over the edge of the can.
4. In a can, the combination comprising a body provided with stamped lips, and ears disposed under the lips.
5. In a can, the combination co:nprising a body provided with stamped lips, and ears secured by the lips and provided with projecting ingers adapted to be turned over the upper edge of the body.
6. In a cam, the combination comprising a body having on its opposite sides converging lips and adjacent its upper edge horizontal lips, ears provided with inclined sides and a horizontal upper edge disposed under sald lips, and means carried by the ears for securing a closure on the can.
7. In a can, the combination comprising a body having stamped lips, ears disposed under the lips and provided with openings, and a bail disposed through said cars.

No. 100,899. Device Ror Preventing Train Robberies.
Apparcil pour empêcher le pillage des convois de chemins de fer.

John C. Pillsbury, Whitefield, New Hampshire, U.S.A., 11th September, 1906 ; 6 years. Filed 13th August, 1906. Receipt No. 138,623.
Claim.-1. In a device of the class described, the combination with an engine including a boller, and a tender, of a tubing connected with the boiler and extending forwardly of the engine upon both sides and exteriorly thereto, and rearwardly and directed unon both sides of the tender, the tubing being provided with a series of nozzles to permit the exit of steam from the tubing, and a single valve in the line of the tubing to permit steam passing through all of the nozzles of the latter.
2. In a device of the class deseribed, the combination with an engine including a boiler, and a tender, of a tubing associated with the boller and directed forwardly and rearwardly thercof and provided with a series of nozzles to promit the exit of steam therefrom, and a single valve crinnected with the tubing to cause the exit of steam through the various nozzles of the tubing.

\section*{No. 100,900. Stand for Washing Machines.}

Plateforme pour machine d laver.
Norman J. Spencer, Vancouver, British Columbia, Canada, 11th September, \(1!n G ; 6\) years. Filled 20th August, 1906. Receipt No. 138,823.
Claim.-1. The combination with a washing machine, of a standard frame on which the washer is pivotally mounted, a wash tub support beneath the washer susceptible of being folded against the standard frame, and means for securing the washer to the upper edge of a wash tub on the support. 2. The combination with a washing machine, of a standard frame to which the washer is pivotally connected by links
to each end of the base board of the washer, a wash tub support beneath susceptible of being folded up against the

standard frame and having leg members extending to the floor, and means for resting and staying in the base board of the washer to the upper edge of and just within a wash tub on the support.
3. In combination a washing machine comprising a base board having upwardly projecting side frames, a relatively large diameter corrugated roller the axle of which passes through vertically elongated apertures in the side frames and is rotatable in bearings connected to the side frames and vertically movable upward against the resistance of springs, a series of smaller diameter rollers corrugated and plain rotatable in the side frames beneath the larger roller, links secured to the base board and pivotally connected to the standards, of a support frame, means for supporting a wash tub beneath the washer, said means being articulated and hinged to the standard frame so as to fold up against it when not required, and means for securing the base board of the washer to the upper edge of a wash tub on the support, said means comprising loops pivotally connected to each end of the base board and having downwardly turned ends.
4. In combination an open center standard frame having provision for the reception of an ironing board therein, a washing machine pivotally connected to the standard frame, a wash tub support beneath the washer susceptible of being folded against the standard frame, and an Ironing board removably secured to the standard frame opposite to the washer and outwardly supported from the floor by a frame susceptible of being folded against the standard frame when not in use.
5. The combination with a washing machine pivotally mounted on a standard frame, of a wash tub support beneath the washer, a wringer the rollers of which are rotatably mounted between the side frames of the standard on the side opposite to the washer, a receiving plate pivotally mounted on each side of the rollers, spreader plates having convex upper edges on each side of the rollers. a water chute pivotally mounted beneath the rollers, and susceptlble of being inclined to either side and an iron board removably secured to the standard frame below the wringer.
6. The combination with a central standard frame, of a washer pivotally mounted thereto on one side, a wringer on the opposite side, a tup support beneath the washer comprising a slat connected frame pivotally mounted on the side frames of the standard and a leg frame pivotally connected to the end of the slat connected frame, an froning board removably connected to the standard frame beneath the wringer, said ironing board supported outwardly by a slat connected frame pivotally mounted to the standard irame and having a leg frame and a strut irame pivotally connected to its other end, clothes rods suspended from the side frame of the standard and susceptible of being horizontally secured thereto and radially spread apart, and an iron stand hinged to the upper end of the side standards and susceptible of being turned over the upper end thereof.

No. 100,901. Sawmill Dog. Renard de scierics.

William Henry Trout, Milwaukee, Wisconsin, U.S.A., 11th September, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,646.
Claim.-1. In a sawmill dog the combination with a standard, of a plate guided and movable obliquely towards and from the face of the standard and cylindrical teeth secured in said plate and having on one side plane oblique faces arranged parallel with the line of movement of the plate, substantially as described.
2. In a sawmill dog the combination with a dog plate having threaded sockets or holes, of adjustable cylindrical teeth threaded in said sockets or holes and having points formed hy plane faces intersecting their cylindrical faces obliquely and set screws threaded in said plate and engaging the shanks of the teeth, substantially as described.
3. In a sawmill dog the combination with a standard, of a plate guided and movable obliquely towards and from the working face of the standard and having oblique sockets or holes, cylindrical teeth threaded in said sockets or holes and having plane bevelled or oblique faces forming their points and set parallel with the direction of movement of said plate and set screws threaded in said plate and engaging longitudinal grooves in the shanks of said teeth, substantially as described.
4. In a sawmill dog the combination of a standard provided with transverse gulde pins, dog plates provided with teeth and having obliquely and reversely arranged guide slots through which sald pins pass and an operating lever connected with said plates arranged to move them in opposite directions, substantially as described.
5. In a sawmill the combination of a standard provided with transverse guide pins, dog plates provided with teeth and having obliquely and reversely arranged guide slots through which said pins pass and an operating lever pivoted directly to one of said plates and connected with the other by a link, substantially as described.
6. In a sawmill dog the combination of a recessed standard provided with transverse guide ping held at the ends in sleeves threaded in the sides of the standard, and dor plates provided with teeth and having reversely arranged oblique guide slots through which said pins pass, the inner ends of sald sleeves forming bearings for the outer faces of said plates, substantially as described.
7. In a sawmill dog the combination of a recessed standard provided with guide pins passing transversely through it and held at the ends in sleeves which are threaded and adjustable endwise in the sides of the standard, rollers mounted on said pins and dog plates provided with tecth and having oblique guide slots adapted to work with said rollers, substantially as described.
8. In a sawmill dog the combination of a recessed standard provided with guide pins passing transversely through it. dog plates provided with teeth and having oblique gulde slots through which said pins pass and face plates attached to the standard with their inner edges in position to guide and support the teeth against lateral displacement, substantially as described.

\section*{No. 100,902. Sawmill Dog. Renard de 8 deries.}

William Henry Trout, Milwaukee, Wisconsin, U.S.A., 11th September, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,647.
Claim.-1. In combination with a sawmill carriage knee, a standard connected with said knee parallel with its working face and movable independently of the knee forward and
lackward towards and from the saw line, a dog vertically adjustable on said standard and means tending to carry said

standard and dog back out of working position, substantially as described.
2. The combination with a sawmill carriage knee, of a standard hinged or pivoted at one side thereof to said knee in a line parallel with its working face and movable independently thereof towards and from the plane of the saw, a spring tending to swing said standard back from the saw plane, a dog vertically adjustable on said standard, a lever for operating said dog and steps for limiting the forward and backward movement of the standard and dog with relation to the knce, substantially as described.
3. The combination with a sawmill carriage knee, of a standard connected with said knee and movable independently thereof parallel with its face towards and from the saw plane, a dog adjustable vertically on said standard, means tending to raise the dog on said standard and means tending to move the standard away from the saw plane, substantially as described.
4. The combination with a sawmill carriage knee, of a slandard having two legs, one of which is hinged to said hnce parallel with its face, a dog adjustable vertically on the other leg, a lever for operating said dog, a spring tending to swing said standard and dog away from the saw plane and a counterweight connected with the log and tending to lift it on said standard, substantially as described.
5. The combination with a sawmill carriage knee, of a standard connected with said knee parallel with its face and movable relatively thereto towards and from the saw plane, upper and lower dogs movable vertically on said standard and means for adjustably connecting said dogs and forcing them towards and from each other, substantially as described.
6. The combination with a sawmill carriage knee, of a standard connected therewith and movable independently thereof towards and from the saw plane. upper and lower dogs mounted and vertically movable on said standard, the lower dog being provided with an upwardly extending rack and the upper dog with a pawl adapted to work with said rack and an operating lever connected with said upper dog and with said pawl, substantially as described.
7. The combination with a sawmill carriage knee, of a standard connected therewith and movable independently theroof towards and from the saw plane means tending to move said standard away from saw plane, upper and lower dogs mounted and vertically movable on said standard, the lower dog being attached to a rack parallel with the standard and the upper dog having a pawl normally held by a spring in engagement with said rack and a lever connected with the upper dog and said pawl and adapted to disconnect the pawl from the rack and to move the dogs towards and from each other when the pawl engages said rack, substantially as described.
s. The combination with a sawmill carriage knee, of a standard connected therewith and movable towards and from the saw plane, upper and lower dogs mounted and vertically adjustable on said standard and means for connecting the upper dog with the lower dog and for forcing said dogs when so connected towards and from each other and a counterweight connected with the lower dog and overbalancing the same but underbalancing the two dogs when they are connerted together, substantially as described.
!. Thr combination with a sawmill carriage knee, of a standard pivotally connected therewith and movable towards and from the saw plane, a dog mounted and vertically adjustable on said standard and a guide arm connecting the dog with a guide way on the knee and adapted to maintain the working face of the dog in all positions of the standard parallel with the face of the dog, in all positions of the standard parallel with the face of the knee, substantially as deseribed.
10. The combination with a sawmill carriage knee, of a standard pivotally connected therewith and movable towards and from the saw plane, upper and lower dogs mounted and
movable vertically on said standard, the lower dog being attached to a rack parallel with the standard and the upper dog being provided with an operating lever and with a pawl connected with said lever and adapted to work with said rack, and a guide arm connecting the standard with a guide way on the knee and having a sliding connection with the lower dog adapted to maintain the working faces of the dogs parallel with the working face of the knee in all positions of the standard, substantially as described.
11. In combination with a sawmill carriage knee, of a standard pivotally connected therewith and movable towards and from the saw plane, a dog mounted and vertically adjustable on said standard, steps for limiting the movement of said standard in its extreme positions and a special lock or stop for intermediate positlons of the standard, substantially as described.
12. The combination with a sawmill carriage knee, of a tubular standard having parallel legs, one of which is hinged or pivoted to said knee, dogs mounted and vertically adjustable on the other leg, the lower dog belng attached to a rack extending upwardly therefrom parallel with the standard and the upper dog having a lever and a pawl connected therewith for engaging the rack and connecting and operating the dogs and a lever fulcrumed to the upper part of the standard and connected at one end with the lower dog and at the other with a counterweight which is enclosed and movable up and down in the pivot leg of the standard, substantially as described.
13. The combination with a sawmill carriage knee, of a standard connected therewith and movable independently thereof towards and from the saw plane, dogs mounted and movable vertically on said standard means for connecting said dogs and moving them towards and from each other and an auxiliary dog detachably fitted to said upper dog and having a tooth adapted to be secured between and behind the teeth of said upper dog which are arranged on opposite sides of said standard for quarter sawing. substantially as described.
14. The combination with a sawmill carriage knee of a standard pivotally connected therewith and movable towards and from the saw plane, a spring tending to move and hold the standard away from the saw plane, dogs mounted and vertically movable on said standard which is free to turn therein, means for connecting and disconnecting said dogs and for moving them towards and from each other, a guide arm pivoted to said standard and having a sliding connection with the lower dog parallel with said standard and a guide way engaping said guide arm and adapted to maintain the working faces of the dogs parallel with the face of the knee in all positions of the standard. substantially as described.

No. 100,903. Work Folder. Portc-outrage.

Addie Ann Whitman, Boston, Massachusetts, U.S.A.. 11th September, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,674.
Claim.-A work holder comprising a bed jaw formed to bear on a table, its upper surface forming a jaw face, an arm extending downwardly from the front edge of the jaw and inwardly under the jaw, said arm having an adjustable attaching device for engagement with the table, a, U-shaped arm extending from one of the side edges of the bed and overhanging the jaw face of the bed, said overhanging arm being in a plane substantially at a right angle to the plane of the downwardly extending arm and presenting an unobstructed space for the passage of the work, and a lever pivoted to said overhanging arm and having a jaw adapted to co-operate with the bed jaw, the arrangement of the overhanging arm being such that the bed jaw is unobstructed at its rear edge, so that the work can project indefinitely backward from the rear edge, the lever being pivoted to swing in a direction transverse to the plane of the overhanging arm, whereby the work at one side of the point of engagement of the jaws may be rolled up within the space afforded by the overhanging arm and moved along through said space.

No. 100,904. Golosh. Galoches.

Alfred Edwin Nicholls and James Gunning Silly, co-inventors, both of Christchurch, New Zealand, 11th September,
1906; 6 years. Filed 8th August, 1906. Recelpt No. 138,511.
Claim.-In goloshes, a wearing sheet of leather placed upon the outside face of the heel and secured in position by means of rivets or other fastenings passing through it, through the heel, and through a sheet of leather laid upon the inside face of the heel, substantially as specified.

No. 100,905. Broadcast Device for Planters and Fertilizer Distributorm..
Appareil de semis pour plantation, distributeur, ctc.

Benjamin Franklin Cranwell, Charles F. F. Allan, and Joseph Henry Trudgeon, co-inventors, all of Auckland, New Zealand, 11th September, 1906 ; 6 years. Filed 18th August, 1906. Receipt No. 138,810 .
Claim.-1. A broadcast attachment for planters and like machines consisting of a tubular tapering body having an interior baffle lip between its end and an opposing distributing or scattering lip at its lower end.
2. A broadcast attachment for planters, fertilizer distributors and the like consisting of a tubular tapering body provided with an interior baffle lip at its forward portion, having a downward inclination, and a wider distributing or scattering lip at its lower or discharge end, extending from the rear of the said body at an inclination in a forward direction.
3. As an improved article of manufacture, a broadcast attachment for planters, fertilizer distributors and the like, consisting of a tubular tapering body wider at its lower end ard open at both ends, the rear of the said body being flat and its forward portion convexed, a spreading or baffle lip located within the said body and secured to its forward portion and having a downward and rearward inclination, and a wider distributing or scattering lip located at the lower end of said body, extending from the back thereof downwardly and forwardly, said distributing or scattering lip being of a length corresponding to the full width of the said body at its discharge end.

\section*{No. 100,906. Sawset. Fer à contourner.}

Samuel L. Hawn and Abraham Coan, assignee of a half interest, both of Crisman, Colorado, U.S.A., 11th September, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,249.
Claim.-1. In a setting device, a hammer, a spring handle therefor, a controlling lever, a trigger pivotally mounted on sald lever and having a shoulder to engage with the handle,
a plate having a slot therein within which the trigger is arranged to travel, and a spring secured to said plate and ar-

ranged to hold the trigger against one wall of the slot whereby the trigger is caused to disengage the hammer.
2. In a saw setting device the combination with a suitable support, and an anvil carried by said support, of a leaf spring having one end mounted on the support, a saw setting tool formed integral with the other end of said leaf spring and thereby held suspended over the anvil, a second leaf spring having one end mounted on the support, a hammer carricd by sald second leaf spring, and means for automatically raising and releasing said second leaf spring and hammer.
3. In a saw setting device, a hammer, a spring handle therefor, a controlling lever, a spring for returning the lever to its starting position, a trigger pivotally mounted on said lever and having a shoulder engaging with the handle whereby said handle is raised and released, a plate having a slot within which the trigger is arranged to travel, and a spring arranged to hold the trigger against one wall of the slot whereby the trigger is caused to disengage the hammer.
4. In a saw setting device, an anvil, a saw setting tool movably mounted above said anvil, a hammer mounted above the saw setting tool and adapted to engage therewith, a hammer head, a flexible handle for said hammer head, a support having one end of said handle rigidly secured thereto, a second support, a lever mounted thereon, a spring actuating said lever, a trigger pivotally mounted on the lever and arranged to operate the handle, a plate adjustably mounted on said second support and having a slot therein within which the upper end of the trigger is arranged to travel, and a spring secured to said plate and arranged to hold said trigger in place.
5. In a saw setting device, a suitably mounted bed plate, a vertical crosspiece secured thereto, an anvil secured thereto. a setting tool movably mounted above the anvil, a hammer head mounted above the anvil, a flexible handle for said hammer head, a lever pivoted on the crosspiece, a spring secured to the bed plate and arranged to control one end of the lever, a trigger pivotally mounted on said lever and arranged to throw the handle into and out of operation, a plate adjustably mounted on said crosspiece and overhanging the same, a slot in said plate within which the upper end of the trigger is arranged to travel, a support rigidly secured to the bed plate and having one end of the flexible handle rigidly mounted thereon, and a spring secured to said plate and to the upper end of said trigger and adapted to control the same.
6. In a screw setting device, an anvil mounted on a suitably support, a hammer head mounted above said anvil, a spring handle having the hammer head secured to one end thereof, a rigid support having the other end of the handle mounted thereon, a second support, a lever pivotally mounted on said second support, a spring controlling one end of the lever, a trigger pivotally mounted on said lever and adapted to raise and release the handle, a plate adjustably mounted on the top of said second support and having a slot therein within which the upper end of the trigger is arranged to travel, a spring secured to said plate and arranged to control the upper end of said trigger, and means for actuating said lever.

\section*{No. 100,907. Loose Leat Binder.}

Reliure à feuilles mobiles.
The Business Systems, Limited, assignee of Daniel Smith Baird, all of Toronto. Ontario. Canada, 11th September, 1906; 6 years. Filed 31st July, 1905. Receipt No. 127,310.

Claim.-1. A loose leaf binder comprising in its construction a binder back consisting of a middle member and two laterally movable side members located at opposite sides of
the middle member, an operating screw mounted in bearings connected to the binder back, two wrist plates pivoted with-
in the binder back, a slide nut movable on the operating screw, a link actuated by the slide nut and pivotally connected with the wrist plates whereby it will oscillate them during the movement of the slide nut, two sets of links pivotally connected to the wrist plates on opposite sides of the wrist plate pivot and pivotally connected to their respective movable side members at substantially right angles to the length of the operating screw whereby the links of cach set may move in substantially parallel planes during the oscillation of the wrist plates and during said movement constantly exert their lines of force on said movable side members at substantially right angles to the length of the screw.
2. A loose leaf binder comprising in its construction a binder back consisting of a middle member and two laterally movable side members located at opposite sides of the middle member, an operating screw mounted in bearings connected to the binder back, two wrist plates pivoted within the binder back, a slide nut movable on the operating screw, a link actuated by the slide nut and pivotally connected with the wrist plates whereby it will oscillate them during the movement of the slide nut and two sets of links having their inner ends pivotally connected to the wrist plates on opposite sides of the wrist plate pivots and at the same distance therefrom and having their outer ends plvotally connected to their respective side members on lines passing diametrically through the wrist plate pivots at substantially right angles to the length of the operating screw whereby the links of each set may move in substantially parallel planes during the oscillation of the wrist plates and during the said movement constantly exert their lines of force on said movable side members at substantially right angles to the length of the operating screw.
3. A loose leaf binder comprising in its construction a binder back consisting of a middle member and two laterally movable side members located on opposite sides of the middle member, an operating screw operatively mounted in the binder back, two wrist plates pivoted within the binder back, a slide nut movable on the operating screw, a lillin actuated by the slide nut and pivotally connected with the wrist plate's whereby it will oscillate them during the movement of the slide nut and two sets of links connected to the wrist plates and to their respective movable side members.

\section*{No. 100,808. Fumigator. Fumigatoire.}

John Brown, Niagara Falls, and William McLean, Lockport, assignce of a half interest, both in New York, U.S.A.. 11th September, 1906; 6 years. Filed 26th April, 1906. Receipt No. 135,286.
claim.-1. A fumigating attachment, comprising a door adapted to be applied to an elevator leg or similar chamber and provided with movable end and side extensions, and a fumigating spout or conduit connected with said door and adapted to communicate with the interior of the elevator leg, substantially as set forth.
2. In a fumigating apparatus, the combination of an elevator \(1 \cdot \mathrm{~g}\) or similar chamber provided with an opening having one of its horizontal edges undercut, a door provided at one end with a movable extension and at its opposite end with a tenon adapted to engage with said undercut edge and on opposite sides of said tenon with horizontally swinging extensions, and a fumigating spout or conduit connected with said door and communicating with the interior of the elevator leg, substantially as set forth.
3. A fumigating attachment, comprising a door adapted to be applied to an elevator leg or similar chamber and

provided at one end with a vertically swinging extension and at its opposite end with a tenon and horisontally swinging extensions arranged on opposite sides of the tenon, and a fumigating spout or conduit connected with the door and adapted to communicate with the interior of the elevator leg, substantially as set forth.
4. In a fumigating apparatus, the combination of an elevator leg or similar chamber having an opening provided with a bevelled upper edge and a bevelled undercut lower edge, a door applied to said opening and provided at its upper edge with a bevelled extension, a vertically swinging bail connecting said extension with the body of the door, the door being provided at its lower edge with a bevelled tenon adayted to interlock with said undercut edge and on opposite sides of said tenon with horizontally swinging extensions having bevelled lower edges and a fumigating spout or conduit connected with the door and adapted to communicate with the interior of the elevator leg, substantially as set forth.

No. 100,909. Means of Purifying and Regulating Water.
Moyen pour purifler et régler l'eau.

Joseph S. L. Wharton, William S. Hallwell and John C. Jones, doing business under the firm name of The Harrison Safety Boiler Works, assignee of Joseph Willard Gamble, all of Philadelphia, Pennsylvania, U.S.A., 11th September, 1906; 6 years. Filed 28th April, 1906. Receipt No. 135,366 .
Claim.-1. A filter, and a passage about the same opening into the outlet from the filter, and containing an obstruction adapted to be diminished as the resistance of the filter increases.
2. A filter and a passage about the same opening into the outlet from the fllter, and containing a loaded valve normally closed, but adapted to open when the resistance of the filter equals its own load.
3. A filter and a passage about the same opening into the outlet from the filter, and containing a resistance automatically diminishing or increasing as the resistance of the filter increases or diminishes.
4. A filter and a by-pass about the same opening into the outlet from the filter, and having a resistance therein greater than the normal resistance of the filter, adapted to be automatically overcome and established according as the resistance of the fller exceeds or falls below itself.
5. A filter and a by-pass about the same opening into the outlet from the filter, and having an adjustable resistance therein, adapted to diminish as the resistance of the filter increases.
6. The combination of a water heater, a filter beyond the heater, and an automatic by-pass about the filter so placed as to take water from a point approximately close to the filter on the supply side, and discharging on the outlet side. 7. The combination of a heater, a filter, and a conduit having its inlet covered by a hood vented at the top and opening below the water line near the fllter bed, and having an outlet opening into the outlet of the heater.
8. The combination of a heater, a filter, and a conduit vented at the top and opening above and near the filter bed. and having an outlet opening into the outlet of the heater, and provided with means for exerting a resistance greater than the normal resistance of the filter ped.
9. The combination of a water purifier, and a by-pass comprising a hood, a vent in said hood, a conduit, the inlet of which is located within the hood above the normal water line, and the outlet of which communicates with the outlet of the purifier.
10. The combination of a water heater, a chemical feeder, a filter, and means for automatically supplementing the out flow through the filter through an increment of chemically treated water taken from a point near the fller and increasing in quantity according as the resistance of the fllter increases.
11. The combination of a heater, a chemical supply, a filter, and a by-pass around the filter to the outlet thereof, containing a resistance adapted to automatically vary inversely as the resistance of the filter.
12. The combination of a water heater, a chemical supply, a filter and means for automatically supplanting the outficw through the filter by an increment of chemically treated water, varying inversely as the supply passing through the filter.
13. The combination of a hrater, a chemical supply, a filter, a conduit having an inlet at the water line of the heater, and a closed hood vented at the top covering the inlet and opening below the water line near the filter bed, the outlet to the conduit opening into the outlet of the heater.
14. The combination of a heater, a chemical supply, a filter, a conduit having a closed hood vented at the top covering the inlet to the conduit, and opening below the water line near the filter bed, and a loaded valve having a resistance greater than the normal resistance of the filter.
15. The combination of a heater, a chemical supply and feeder, a filter, and means for automatically supplementing the outflow from the filter by an increment of chemically treated but unflitered water.
16. The combination of a chemical water purifier and heater, a horizontal filter, and means for automatically and adjustably supplementing the outflow from the filter with ap increment of chemically treated but unfiltered water.
17. The method of heating, purifying and regulating water, which consists in automatically supplying water and a puritying chemical to a heater in proportion as the water is discharged therefrom, heating the solution, filtering the water, discharging the same, and automatically supplementing the quantity of filtered water discharged by such an increment of heated but unfiltered water as will keep substantially uniform at all times the ultimate quantity discharged form the heater.
18. The method of heating, purifying and regulating water which consists in automatically supplying water and a purifying chemical to a heater in proportion as the water is discharged therefrom, heating the solution, filtering the water, and automatically supplementing the quantity of water passing through the filter, by an increment of unfiltered but heated water, varying in quantity inversely as the quantity passing through the filter.
19. The method of heating. purifying and regulating water which consists in heating the water, precipitating the impurities therein, filtering the water. and automatically supplementing the quantity of filtered water by an increment of unfltered water varying inversely as the quantity flltered.
20. The method of heating and regulating water, which consists in heating the water, filtering the same, and automatically supplementing the quantity of filtered water by an increment of unfiltered but heated water varying inversely as the quantity filtered.

\section*{No. 100,910. Vacuum Breaker for Condenserm.}

\section*{Frein à vacuum pour condensturs.}

The International Steam Pump Company, assignee of Bronson C. Woodford, both of New York City, New York, U.S.A.. 11th September, 1906 ; 6 years. Filed 8th January, 1906. Receipt No. 131,634.
Claim.-1. The combination with a condenser, of a vacuum breaker having an air inlet valve exposed to atmospheric
pressure on its outer side, a valve actuating piston, a control valve and passages for varying the pressure on sald pis-

ton to open and close the air inlet valve and a float and connections for actuating said control valve to secure the opening of the air inlet valve when the liquid in the condenser reaches a certain level.
2. The combination with a condenser, of a vacuum breaker having the inlet valve exposed to atmosphere pressure on its outer side, a piston connected to said valve and exposed to atmospheric pressure tending to open the valve. a control valve and passages for connecting the opposite side of the piston with the atmospheric or condensing chamber and a float and connections for actuating said control valve.
3. In a condenser vacuum breaker, the comblnation with the air inlet valve \(b\) of piston \(c\) connected to the valve \(b\), said valve and piston being exposed to atmospheric pressure on their adjacent sides, pressure chamber 19 on the opposite side of said piston, passages for connecting said chamber 19 with the atmospheric or the condenser and float actuated control valve a controlling said passages, substantially as described.
4. In a condenser vacuum breaker, the combination with the air inlet valve \(b\) of piston \(c\) connected to the valve \(b\), said valve and piston being exposed to atmospheric pressure on their adjacent sides, pressure chamber 19 on the opposite side of said piston, passages 16, 17, 18 for connecting said pressure chamber with the atmosphere of the condenser, control valve a controlling said passages, float \(F\) and link 15 connecting said float to control valve \(a\) for actuating said control valve.

\section*{No. 100,911. Governor for Engines.}

Gourerneur pour machines à vapeur.

The Pickering Governor Company, assignce of Richard \(H\). Pascall, all of Portland, Connecticut, U.S.A., 11th September, 1906; 6 years. Filed 14th March, 1906. Receipt No. 133,900.
Claim.-1. A governor for steam engines and the like comprising the valve chamber, the valve and its stem, the governor head and means for adjusting the valve vertically independently of the governor head comprising a non-rotary nut and an adjusting rod threaded into said nut with its end connected with the end of the valve setm and connections between the top flange of the governor head and sald adjusting rod to cause them to move together vertically, as and for the purposes specified.

2, A governor for steam engines and the like comprising the valve chamber, the valve and its stem, yielding means normally exerting an upward pressure on said valve. the governor head, and means for adjusting the valve vertically independently of the governor head comprising a non-rotary nut and an adjusting rod threaded into said nut with its end connected with the end of the valve stem and connections between the top flange of the governor head and said adjusting rod to cause them to move together vertically, as and for the purpose specified.
3. A governor for steam engines and the like comprising the valve chamber, the valve and its stem, yielding means normally exerting an upward pressure on said valve, the governor head and means for adjusting the valve vertically independently of the governor head comprising a non-rotary nut, an adjusting rod threaded into said nut with its end connected with the end of said valve stem and a bonnet nut secured to the top flange of the head and having engagement with said nut whereby sald nut takes its vertical movement from the vertical movement of said governor cap.
4. A governor for steam engines and the like comprising the valve chamber, the valve and its stem, ylelding means normally exerting an upward pressure on said valve, the governor head. and means for adjusting the valve vertically independently of the governor head comprising a nut splined to a non-rotary part of the governor and adapted for lengthwise movement thereof, an adjusting rod threaded into sald nut with its end connected with said valve stem and connections between said nut and the top flange of the governor head to cause them to travel together vertically.
5. In a governor the cap and base rings and two or more springs secured thereto, the plane of attachment of said spring to said rings being angularly disposed with reference to the axis of the governor.
6. In a governor the cap and its rings having peripheral slots the bottoms of which are angularly disposed with relation to the axis of the governor and springs having their ends firmly secured to the bottoms of sald slots and weights attached to said springs.
7. A governor for steam engines and the like comprising a valve chamber, a valve and its stem, a governor head and means for adjusting the valve vertically independently of the governor head comprising an adjusting rod threaded in a non-rotary part with its end connected with the end of said valve stem and engaging points on the end of said adjusting rod.

No. 100,912. Rock Drill. Foret à roche.

The Ingersoll-Rand Company, New York City, New York, assignee of Arthur Henry Gibson, Easton, Pennsylvania, both in U.S.A., 11th September, 1906; 6 years. Filed 19th January, 1906. Receipt No. 132,029.
Claim.-1. The combination with a rock drill cylinder having a rear extension, of a piston having a hollow tail rod extended into and entirely inclosed by sald rear extension, a sleeve surrounding the tail rod forming an annular chamber within the rear extension, a riffe bar telescoping within the tall rod and a port leading from the annular chamber to the air space within the sleeve and tall rod.
2. The combination with a rock drill cylinder having a rear extension, of a piston having a hollow tall rod extended into and entirely inclosed by said rear extension, a sleeve surrounding the tail rod forming an annular chamber within the rear extension, a rifie bar telescoping within the tall rod, a port leading from the annular chamber to the air space within the sleeve and tall rod and an aperture leading from the annular chamber to the exterior.
3. The combination with a rock drill cylinder having a rear extension, of a plston having a hollow tall rod extended into and entirely inclosed by said rear extension, a hollow sleeve surrounding the tall rod, a washer surrounding the tail rod for preventing as much as possible the leakage of air past the same from the piston chamber and a rifle bar telescoplng within the hollow tail rod.

No. 100,913. Channelling Machine.
Machine ì rainure.

The Ingersoll-Rand Company, New York City, New York. assignee of Arthur H. Gibson, Easton, Pennsylvania both in U.S.A., 11th September, 1906; 6 years. Filed 4th June, 1906. Receipt No. 136,519.
Claim.-1. A tool cylinder having a piston chamber therein, a piston having heads in sald chambers, air feeding tubes said cylinder having front and back ports for the two chambers communicating with their respective tubes and an auxiliary back port for one chamber communicating with the tube other than the one with which the other back port communicates, and a valve for opening and closing said auxiliary back port.
2. A tool cylinder having piston chambers therein, a piston having heads in said chambers, air feeding tubes, said cylinder having front ports for the chambers communicating with one air tube, back ports for the chambers communicating with the other tube, and an auxiliary back port for one of said chambers communicating with the first-named air tube and a valve for opening and closing the said auxiliary back port.
3. A tool cylinder having piston chambers therein, a piston having heads in said chambers. air feeding tubes, sald cylinder having front ports for the chambers communicating with one air tube, back ports for the chambers communicating with the other air tube, and an auxiliary back port for one of said chambers communicating with the first-named air tube and a manually operated valve for opening and closing the auxiliary back port.
4. A tool cylinder having front and back piston chambers therein, a piston having heads in said chambers, alr feeding tubes, said cylinder having front and back ports for the two chambers communicating with their respective tubes and an auxiliary back port for the back piston chamber communicating with the tube other than the one which the other back port in said chamber communicates and a valve for opening and closing the auxiliary back port.
5. A tool cylinder having front and back piston chambers therein, a piston having heads in said chambers, air feeding tubes, said cylinder having front ports for the chambers ccmmunicating with one air tube, back ports for the chambers communicating with the other air tube and an auxiliary back port for the back chamber communicating with the first-named air tube and a valve for opening and closing the auxiliary back port.
6. A tool cylinder having piston chambers therein, a piston having heads in sald chambers, air feeding tubes, sald cylinder having front ports for the chambers communicating with one air tube, an intermediate front port for one chamber communicating with said air tube, an auxiliary back port for said other chamber communicating with said air tube and back ports for both chambers communicating with the other air tube, a valve for opening and closing the front port for one chamber and a valve for opening and closing the auxiliary back port for the other chamber.
7. A tool cylinder having piston chambers therein, a piston having heads in said chambers, air feeding tubes, said cylinder having front ports for the chambers communicating with one alr tube, an Intermediate front port for one chamber communicating with said air tube, an auxiliary back port for sald other chamber communicating with said air tube and back ports for both chambers communicating with the other air tube, a manually operated valve for opening and closing the front port for one chamber and a manually operated valve for opening and closing the auxiliary back port for the other chamber.
8. A tool cylinder having front and back piston chambers therein, a plston having heads in said chambers, air feeding tubes, sald cylinder having front ports leading from the said chambers to one air tube, an intermediate front port for the front chamber communicating with said air tube, an auxi-
lary back port for the back piston chamber communicating with said air tube and back ports for the front and back chambers communicating with the other air tube, a valve for opening and closing the front port for the front piston chamber and a valve for opening and closing the auxiliary back port for the back piston chamber.
9. A tool cylinder having front and back piston chambers therein, a piston having heads in said chambers, alr feeding tubes. said cylinder having front ports leading from the said chambers to one air tube, an intermediate front port for the front chamber communicating with said air tube, an auxiliary back port for the back piston chamber communicating with said air tube and back ports for the front and back chambers communicating with the other air tube, a manually operated valve for opening and closing the front port for the front plston chamber, and a manually operated valre for opening and closing the auxiliary back port for the back piston chamber.

No. 100,914. Cock for Steam Cylinders. Robinet pour cylindres à vapeur.

Swan Anderson, Ottumwa, Iowa, U.S.A., 11th September, 1906; 6 years. Filed 14th May, 1906. Receipt. No. 135,917.

Clain.-1. A cylinder drain cock including a casing provided with draining openings and having a valve seat in advance of sald openings, a direct seating valve arranged to close against the seat and there hold in part by the pressure: of the piston actuating fluid in the cylinder, said casing heing provided also with a pair of allgning cyllnders, pistons arranged in said cylinders and connected to the valve, and valved connections leading to said cylinders to permit the operation of either piston and the opening or closing of the valve.
2. A cylinder drain cock comprising a casing including a pair of aligned cylinders, said casing being provided with drain openings and having a valve seat in advance of said orenings, a pair of pistong arranged in the cylinders, a stem connecting the pistons, a direct seating valve carried by the stem and arranged to be held to its seat in part by the reressure of the piston actuating fluid in the cylinder, aid valved conneotions leading to the cylinders to permit operatina of either piston and the opening or closing of the valve.
3. The combination with a source of steam supply and a source of compressed air supply, of a drain cock provided with opposed and aligned cylinders and an inlet communicating with the cylinders one of said cylinders being provided with an exhaust aperture and with a valve seat at its inner end. a valve proportioned to close the end of the cylinder ond the exhaust aperture and carrying aligned pistons movable within the cylinders and to open and close the valve, and means to selectively admit steam or compressed air to either cylinder to move the valve in either direction.

\section*{No. 100,915. Cover for Shaving Mugs. Couvercle pour pots a barbe.}

Samuel J. Connies, Brooklyn, New York, U.S.A., 11th September, 1906 ; 6 years. Filed 4th May, 1906. Receipt No. 135,539.
Claim.-1. The combination of a receptacle, a cover thercfor having a portion thereof cut away, a member projecting from the receptacle and passing through the cut away portion of the cover, and a movable leaf located upon th., cover and adapted to fit closely around the member projecting from the receptacle.
2. The combination of a receptacle, a cover therefor having a portion thereof cut away, a member projecting from the receptacle and passing through the cut away portion of
the cover, and a pair of movable leaves located upon opposite sides of the cut away portion of the cover and adapted

to fit closely about the member projecting from the receptacle.
3. The combination of a receptacle, a cover therefor havIng a portion thereof cut away, a member projecting from the receptacle and passing through the cut away portion of the cover, and a pair of movable leaves located upon opposite sides of the cut away portion of the cover, the said movable leaves being provided upon their adjacent edges with notches which are adapted to fit closely about the member projecting from the receptacle.
4. The combination of a receptacle, a cover therefor having a portion thereof cut away, a member projecting from the receptacle and passing through the cut away portion of the cover, and a pair of leaves pivoted to the cover an 1 located upon the opposite sides of the cut away portion: thereof, said leaves being adapted to fit closely about the member projecting from the receptacle.
5. The combination of a receptacle, a cover therefor having a portion thereof cut away, a member projecting from the receptacle and passing through the cut away portion of the cover, and a pair of leaves pivoted to the cover and located upon opposite sides of the cut away portion thereof the pivoted leaves being provided upon their adjacent edges with notches which are adapted to fit around the member projecting from the receptacle.

No. 100,916. Dispensing Apparatus for Beverates. Appareil d distribuer les breuvages.

John Campbell Cory, New York City, New York, U.S.A., 11th September, 1906 ; 6 years. Filed 7th May, 1906. Recelpt No. 135,647.
Claim.-1. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle, means for retaining the receptacle in sald case and means for permitting the decanting of the liquid from the receptacle and for preventing the refilling of the receptacle while it is in said case, substantially as described.
2. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle means for permitting the decanting of the liquid from the receptacle and for preventing the refiling of the receptacle while it is in sald case and means for preventing the removal of thte receptacle from the case so long as the said receptacle remains intact, substantially as described.
3. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle, means for permitting the decanting of the liquid from the receptacle and for preventing refilling of the receptacle while it is in said case and means for preventing the removal of the receptacle from the case so long as the said receptacle remains intact, said
case being so arranged as to permit the destruction of the liquid receptacle therein without injury to said case and the retaining means being adapted to release said receptacle upon a substantial destruction thereof, substantially as described.
4. A dispensing apparatus for liquids and the like comprising a case for a liquid receptacle, said case having a movable section adapted to be locked in place and to permanently retain the receptacle in said case when so locked, means associated with said case for permitting the decanting of the liquid in the receptacle and for preventing the refilling thereof while it is in said case, said means being so arranged as to permit of the destruction of the liquid receptacle therein without injury to the said case and means for releasing the movable section upon a substantial destruction of the liquid receptacle, substantially as described.
5. A dispensing apparatus for liquids and the like comprising a case for a liquid receptacle, said case having a movable section adapted to be locked in place and to permanently retain the receptacle in said case when so locked, means associated with said case for permitting the decanting of the liquid from the receptacle and for preventing the refilling thereof while it is in said case, and means for releasing the movable section upon a substantial destruction of the liquid receptacle and automatic means for destroying said receptacle, substantially as described.
6. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle, means for retaining the receptacle in said case, an outlet from said receptacle through said case for permitting the decanting of the liquid in the receptacle and means for preventing the passage of liquid into said receptacle while it is in said case and for deverting it through an overflow device attached to said case, substantially as described
7. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle means for retaining the receptacle in said case, an outlet from said receptacle through said case for permitting the decanting of the liquid in the receptacle, means including a check valve in said outlet for preventing the passage of liquid into said receptacle while it is in said case and for diverting it through an overflow device attached to said case and means for preventing the removal of the receptacle from the case so long as the said receptacle remains intact, substantially as described.
8. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle means for retaining the receptacle in said case. an outlet from said receptacle through said case for permitting the decanting of the liquid in the receptacle, means for preventing the passage of liquid into said receptacle while it is in said case and for diverting it through an overflow device attached to said case means for preventing the removal of the receptacle from said case so long as the said receptacle remains intact and means for removing the cork from said receptacle, substantially as described.
9. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle means for retaining the receptacle in said case, means associated with said case for permitting the decanting of the liquid from the receptacle and for preventing the refilling of the receptacle while it is in said case, said case being so arranged as to permit the destruction of the liquid receptacle therein without injury to the said case and the retaining means being adapted to release said receptacle upon a substantial destruction thereof, and a single lever for releasing and retaining means and operating the receptacle rupturing means, substantially as described.
10. A dispensing apparatus for liquids and the like comprising a case for the liquid receptacle, said case having a movable section adapted to be locked in place and to permanently retain the receptacle in said case when so locked, an outlet from said receptacle through said case for permitting the decanting of the liquid in the receptacle means for cooling the liquid while it is being decanted, means including a check valve and an overflow device for preventing the passage of liquid into said receptacle while it is in said case and means for releasing the movable section upon a substantial destruction of the liquid receptacle, substantially as described.
11. A beverage dispensing apparatus comprising means for holding a bottle, means for decanting its contents and automatic means acting to rupture the bottle before it is released, substantially as described.
12. A beverage dispensing apparatus comprising means for holding a bottle, means for decanting its contents, means for preventing the refllling of the bottle and means acting automatically to rupture it before it is released from the holder, substantially as described.
13. A beverage dispensing apparatus comprising the combination of means for holding a bottle, means for withdrawing the cork , means for decanting its contents and means for automatically destroying the bottle before it is released from automatically destroying the bottle befo
the holder, sub inly as described.
14. A beverage dispensing apparatus, comprising the combination of a bottle holder, means for withdrawing the cork, means for decanting the contents of the bottle, means for preventing back flow into the bottle, means for replacing the cork in the bottle, substantially as described.
15. A beverage dispensing apparatus, comprising the combination of a bottle holder, means for withdrawing the cork, means for destroying the bottle after its contents are withdrawn, and means for preventing the bottle fragments from falling into the operative parts of the mechanism, substantially as described.
16. A beverage dispensing apparatus, comprising the combination of a reciprocating rod carrying a corkscrew, a sleeve partly enveloping the rod, reciprocating therewith and haring a rack on its periphery, a pinion meshing with the rack, a spring actuated bottle breaking hammer, and means cooperating with the pinion to trip the hammer, substantially as described.
17. A beverage dispensing apparatus, comprising the combination of a casing, a bottle holder within the casing, a door closing the casing, means whereby the bottle is clamped in the holder upon closure of the door, means within the casing for automatically locking the door, means for decanting the contents of the bottle, a bottle breaking hammer and means for automatically tripping the hammer and unlocking the door when the contents of the bottle have bees decanted, substantially as described.
18. A beverage dispensing apparatus, comprising the combination of a casing, a bottle holder therein, a closure door therefor, interior means for automatically locking the door when closed, means for decanting the contents of a bottle mounted in the holder, means for releasing the door, and means for automatically rupturing the bottle on release of the door, substantially as described.
19. A beverage dispensing apparatus, comprising a case, means for permanently holding a bottle therein, means to release said bottle which destroy the bottle before releasing it, stopper discharging means, means for decanting the liquid and means to prevent refilling of said bottle by tipping or inverting the apparatus, substantially as described.
20. A beverage dispensing apparatus, comprising a case, means for permanently holding a bottle therein, means to release said bottle which destroy the bottle before releasing it, stopper discharging means, means for decanting the liquid and means to prevent refilling of said bottle by flooding the apparatus, substantially as described.
21. In a device of the character described, an emergency valve movably supported in the case, and adapted to close the fluid channel, means for obstructing the access of surreptitiously introduced devices from without the case to said valve and means for automatically closing the said valve if the case is tipped, inverted or flooded, substantially as described.
22. For use in a device of the character described, a bottle made of glass or other frangible material and formed with an integral puncturing recess, substantially as described.
23. In a device of the character described, an outlet for the fluid comprising a reservoir, a bridged outlet therefrom, projecting wings extending therein, and a channel communicating with said reservoir, substantially as described.
24 . In a device of the character described, an outlet for the fluid comprising a reservoir, a bridged outlet therefrom, projecting wings extending therein, a channel communicating with said reservoir, a perforated rear wall to said reservoir, a deflecting wing projecting downward and outward below said channel and guiding surreptitiously liquid through the perforations, substantially as described.
25. In a device of the character described, an outlet for the fluid comprising a reservoir, a bridged ouclet therefrom, projecting wings extending therein, a channel communicating with said reservoir, a perforated rear wall to said reservoir, a deflecting wing projecting downward and outward below said channel and guiding surreptitious liquid through the perforations, an emergency valve adapted to close the outlet to said channel and means to operate same, said deflecting wing likewise protecting said emergency valve, a service valve in said channel normally closed and means for operating same, substantially as described.
26. A portable dispensing apparatus for beverages comprising a casing, means for locking a receptacle thereto, means for fracturing the receptacle which in operating automatically release the lock after fracturing the receptacle, means for decanting the liquid, and a handle for the device, substantially as described.
27. A portable dispensing apparatus for beverages comprising a casing, means for locking a receptacle thereto, means for fracturing the receptacle which in operating auto matically release the lock after fracturing the receptacle, means for decanting the liquid comprising a fluid channel, service valve therein normally closed, and means for opening the valve automatically, operated by tipping the devic to decant the liquid, an emergency valve and a gravity operating weight for automatically closing the same if the de-
vice is tipped sidewise and a float for automatically closing the same if the device is inverted, substantially as described.
28. A beverage dispensing apparatus comprising a casing, means for locking a bottle thereto, means within the casing for destroying the bottle, a connection between the destroying means and the lock, whereby the latter is released after the receptacle is destroyed, means for decanting the liquid, automatically operating means to prevent reflling of the bottle and a vertically movable cork removing rod, adapted to discharge the cork into the bottle, substantially as described.
29. A beverage dispensing apparatus comprising a support for the bottle, means for decanting the liquid from the botthe through said support, means for preventing reflling of the bottle while connected with said support, and means for preventing the removal of the bottle from said support so long as the bottle remains intact, substantially as described.
30. A beverage dispensing apparatus comprising means for rigidly securing a liquid receptacle thereto, means for decanting its contents and for preventing the reflling of the receptacle whlle it is in its secured position, and means for releasing the receptacle adapted to operate upon the rupture thereof, substantially as described

No. 100,917. Bell Ringer for Locomotives.
Sonneur de cloches pour locomotives.

Richard Moore Crosby, Tacoma, Washington, U.S.A., 11th
September, 1906; 6 years. Filed 19th January, 1906. Rece!pt No. 132,033.
Cloim.-1. In an apparatus of the class described the com. bination of a fixed piston, a piston cylinder slidably mominted thereon having a closed upper end forming a piston chamber provided with an exhaust passage leading therefrom, on: of such m:ribers having an inlet passage leading to surt pision chamber, and means for opening and closing such inle: and exhaust passages.

2 In an apparatus of the class described the combination of a piston, a piston cylinder slidably mounted thereon having a closed upper end forming a piston chamber provide. with an exhaust passage leading theroirom, one of such members having an inlet passage leading to such piaion chamber and the other having an inlet passage commun'inting with a source of fluid supply, such inlet passages being adapted to be connected and disconnected by the movesnen: of the cylinder with relation to the niston
3. In an apparatus of the class described the combination of a piston, a piston cylinder slidably mounted thercoa iaving a closed upper end forming a plston chamber prov.ded with an exhaust passage leading therefrom, one of such mombers having an inlet passage leading to such pisiny. chamber and adapted to communicate with a sjurce of flui.i supply, and a sleeve valve mounted in the piston cylinder and movable into and out of engagement with such oibaust and inlet passages.
4. In an apparatus of the class described the combination. of a piston provided with a fluid inlet passage, a piston cylinder slidably mounted thereon having a closed upper end forming a piston chamber provided with an exhaust passage leading therefrom and having an inlet passage communirating with such piston chamber and adapted to be moved with the cylinder into and out of connection with the inlet passage in the piston, and means for opening and closing the exhaust passage.
5. In an apparatus of the class described the combination of a piston provided with a fluld inlet passage, a piston cylinder slldably mounted thereon forming a piston chamber provided with an exhaust passage leading therefrom and having an inlet passage communicating with such piston chamber and adapted to be moved with the cylinder into and out of connection with the inlet passage in the piston,
and a sleeve valve slidably mounted in engagement with the inner wall of such cylinder and movable into and out of closed engagement with the exhaust and inlet passages in such cylinder.
6. In an apparatus of the class described the combination of a piston, a piston cylinder slldably mounted thereon provided with an upper portion closing the upper end and extending beyond the main body portion of such cylinder adapted to engage the bell crank of a bell to be operated thereby, such cylinder forming a piston chamber having an exhaust passage leading therefrom and one of such members having an inlet passage leading into such piston chamber, and means for opening and closing such inlet and exhaust passages.
7. In an apparatus of the class described the combination ot a piston, a piston cylinder slidably mounted thereon forming a piston chamber provided with an exhaust passage leading therefrom, one of such members having an inlet passage communicating with the piston chamber, and means for partially closing the admission passage before the exhaust passage is onen during the stroke in one direction and movable into position to partially close the exhaust passages during the return movement before the admission passage is open.
8. In an apparatus of the class described the combination of a fixed piston, a piston cylinder slidably mounted thereon having a closed upper end forming a piston chamber provided with an exhaust passage, such piston and cylinder being provided with inlet passages communicating with a scurce of fluid under pressure, and means for opening and closing such exhaust and inlet passages.
9. In an apparatus of the class described the combination of a piston provided with an admission passage communicating with a suitable source of fluid under pressure, a piston cylinder provided with a closed upper end and open lower end mounted upon such piston and having an exhaust passage and an admission passage adapted to communicate with such admission in the piston when the cylinder is in one position and movable out of communication with such admission passage when the cylinder is in a second position, and a slecve valve slidably mounted in such cylinder for covering and uncovering such exhaust and admission passages
10. In an apparatus of the class described, the combination of a piston provided with a fluid inlet passage and having an annular recess and an annular shoulder above and below such recess, a piston cylinder in sliding engagement with such piston having a closed upper end and side walls forming a piston chamber and provided with a passage in its side walls leading to such chamber and adapted to communicate with such inlet passage in the piston, and a sleeve valve mounted in the recess between the piston and cylinder walls movable with the cylinder into and out of engagement with the shoulders upon the piston for opening and closing the fluid passage.
11. In an apparatus of the class described, the combination of a fixed piston having a fluid inlet passage and provided with an annular recess having annular shoulder portions forming the upper and lower ends of such recess, a cylinder closed at its upper end slldably mounted upon such piston forming a piston chamber having a pasasge communicating with the space formed by such recess and provided with a passage having its lower end movable into and out of communication with the inlet passage of the piston and its upper end opening into the recessed portion of the piston, and a sleeve valve mounted in slidable engagement with the inner wall of such piston cylinder and movable into and out of engagement with the upper end of such fluid passage in the cylinder.
12. In an apparatus of the class described the combination of a fixed piston having a fluid inlet passage provided with an annular recess having annular shoulder portions at the upper and lower ends of such recess, a cylinder closed at its upper end slidably mounted upon such piston forming a piston chamber having a passage communicating with the space formed by such recess and provided with an exhaust passage leading from the recess and an inlet passage having its lower end movable into and out of communlcation with the inlet passage of the piston and its upper end opening into the recessed portion of the piston, and a valve slidaury mounted in the recess formed between the piston and the walls of the piston cylinder and movable with the piston cylinder into and out of engagement with the shouldered portions of the piston for opening and closing the inlet and exhaust passages in the cylinder.
13. In an apparatus of the class described the combination of a piston and piston cylinder mounted in sliding engagement with each other and provided with fluid inlet and exhaust passages, and means for partially closing the admission passage before the exhaust passage is open during the upward movement of the cylinder and movable into position to partially close the exhaust passage before the admis-
sion passage is open during the downward movement of the cylinder.
14. In an apparatus of the class described the combination of a piston and piston cylinder mounted in sliding engagement with each other and provided with fluid inlet and exhaust passages, and a piston ring slidably mounted in engagement with the inner surface of the piston cylinder movable into position to partlally close the admission passage before the exhaust passage is open during the upward movement of the cylinder and movable into position to partially close the exhaust passage before the admission passage is open during the downward movement of the cylinder.

No. 100,918. Pouch. Sac.

Uberto Deroix Ezell, Kimball, Texas, U.S.A., 11th September, 1906 ; 6 years. Filed 5th May, 1906. Receipt No. 135,576.
Claim.-1. A pouch adapted to be applied to the male organ, a ring adapted to be fitted around the cervix immediately above the corona, and posterior and anterior cords connecting the pouch and ring, the anterior cord being longer then the posterior cord to permit the application of the ring.
2. A pouch adapted to be applied to the male organ, an clastic ring adapted to be fitted around the cervix immediately above the corona, and posterior and anterior elasic cords connecting the pouch and ring. the anterior cord being longer than the posterior cord to permit the application of the ring.
3. A pouch adapted to be applied to the male organ, said pouch being reduced to provide a flaring entrance, an elastic ring adapted to be fitted around the cervix Immediately above the corona, and posterior and anterior elastic cords connecting the pouch and ring, the anterior cord being longer than the posterior cord to permit the application of the ring.

No. 100,919. Engine. Machinc d vapeur.

Charles E. Hastings. Grimin, California, U.S.A., 11th September, 1906 : 6 years. Filed 6th December, 1905. Receipt No. 130.740
Claim.-1. An engine comprising a steam chest, steam cylinders arranged on opposite sides thereof and communi--ating therewith, a longitudinally shiftable and rotary valve strm extending into the steam chest and having a longitudinal passage formed with a lateral vent, a steam rhamber surrounding the stem and communicating with the lateral vent, said chamber being elongated to maintain connection with the lateral vent, under any longitudinal adis"tment of the stem, and the rotary valve shiftable in the
steam chest and mounted on the vaive stem, said vaive having a plurality of inlet ports communicating with the end of the steam chest and a plurality of exhaust ports communicating with the longitudinal passage in the valve stem.
2. An engine comprising a steam chest, steam cylinders arranged at opposite sides thereof and communicating therewith, a rotary valve working in the steam chest and shiftable endwise therein, a valve stem provided with a steam exhaust passage leading from the valve outward and provided with a lateral vent, and a steam chamber surrounding the atem and communicating with the lateral vent, said chamber being elongated to maintain communlcation with the exhaust passage under any adjustment of the valve.

No. 100,920. Rook Delll. Foret d roche.

Henry Hellmen and Lewis Condict Bayles, co-inventors, both of Johannesturg, Transvaal, South Africa, 11th September, 1906; 6 years. Filed 8th August, 1905. Receipt No. 127,533.
Claim.-1. In a rock drilling machine or engine of the nature indicated the combination of a casing, a power cylinder slidingly and rotatively carried by said casing, percussive apparatus in the power cylinder, a drill or bit operatively carried at the forward end of the power cylinder and in such manner that it is compelled to rotate therewith, a rearward extension or tail pipe connected to the power cylinder, and means for imparting rotary motion to the power cylinder in one direction, substantially as described.
2. In a rock drilling machine or engine the combination of a casing, a power cylinder slidingly and rotatively carried by said casing. precussive apparatus in the power cylinder. a drill or bit operatively carried at the forward end of the power cylinder, packing between the casing and power cylinder or its connections which packing by confining the actuating fluid at its rear utilizes the pressure of said fluid to fced the drill, a rearward extension or tall pipe revolubly connected to the power cylinder and means located in said extension or tail pipe or between it and the nower cylinder for imparting an intermittent rotary motion to the latter, substantially as described.
3. In a rock drilling machine or engine of the nature indicated in combination, a power cylinder, a reciprocating precussive member therein, a drill or bit positioned at the forward end of said cylinder, a casing slidingly supporting the power cylinder, said casing being constructed with forwardly directed exhaust ports surrounding said cylinder. substantially as and for the purposes described.
4. In a rock drilling machine or engine of the nature indicated in combination, a power cylinder, a casing surrounding said power cylinder, a split sleeve surrounding the casing and adjustable longitudinally thereof. and means for decreasing the internal diameter of said spllt sleeve to grip the casing, substantially as described.
5. In a rock drilling machine or engine of the nature isdicated in combination, a power cylinder, a casing in which said cylinder is slidingly and rotatively carried, a drill or bit carried at the forward end of said power and in such manner that it is compelled to rotate therewith, a reciprocating precussive member in the power cylinder, an impact piece loosely positioned in the forward end of the power cylinder at the rear of the drill or bit, said impact piece being constructed with a longitudinal port for permitting a quantity of the actuating fluid to pass therethrough, a water swivel located at the forawrd end of the power cylinder, said swivel serving to conduct water to a hole formed longitudinally of the drill or bit to the cutting extremity of which it is carried by the fluid passing through the impact piece, substantially as and for the purposes described.
6. In a drilling or boring machine or engine of the nature indicated in combination, a power cylinder, a casing slidisgly and rotatively supporting said cylinder, a drill or bit carried at the forward end of said cylinder, a reciprocating percussive member in said cylinder, a valve for alternately admitting the actuating fluid to either end of said cylinder, a rearward extension or tail pipe revolubly attached to the rear of the power cylinder, a reciprocating member in said tail pipe adapted to be operated by the actuating fluid, and means actuated by said reciprocating member to impart an intermittet rotary motion in one direction to the power cylinder and drill or bit, substantially as described.
7. In a rock drilling machine or engine of the nature indicated, in combination, a power cylinder a casing slidingly and rotatively carrying said power cylinder, a reciprocating percussive member in said cylinder, a drill or bit carried at the forward end of said cylinder in such manner that it is compelled to rotate in unison therewith, a valve for admitling the actuating fluid alternately to either end of the power cylinder, a rearward extension or tail pipe rotatably attached to the power cylinder, a piston in said tail pipe and a valve for alternately admitting the actuating fluid to edther side of said piston, and mechanism actuated by the piston in the tail pipe which imparts an intermittent rotary motion to the power cylinder, substantially as described.
8. In a rock drilling machine or engine of the nature indicated, a power cylinder, a casing rotatively supporting the same, packing between said casing and cylinder which by confining the actuating fluid at its rear utilises the pressure of said fluid to feed the drill, a reciprocating percussive member \(n\) the power cylinder, a drill or bit carried at the forward end of the power cylinder in such manner that it is compelled to rotate therewith, a valve for admitting the actuating fluid to either end of the power cylinder to actuate the percussive member, a rearward extension or tail pipe, rotatably attached to the rear of the power cylinder, a cylinder in said extension or tail pipe, a piston in sald cylinder and a valve for admitting the actuating fluid to either end of the cylinder to actuate said piston, ratchet mechanism between the power cylinder and tail pipe or rearward extenslon which operates to impart an intermittent rotary motion to the power cylinder and drill or bit, and means for rotating by hand the tail pipe or rearward extension, power cylinder and drill or bit independent of the automatic rotation, substantially as described.
9. In a rock drilling machine or engine of the nature indicated, in combination, a protective casing, a power cylinder slidingly and rotatively carried therein, a tail pipe or rearward extension rotatively attached to the rear of the power cylinder, a clamping device arranged around said tail pipe or extension at the rear of the casing, said device comprising a split strap or band having one extremity constructed with a slot into which the other extremity projects and a key placed in the slot which when driven in one direction tightens the strap or band round the tail plpe or extension and when driven in the reverse direction loosens the band or strap, thereby permitting it to be adjusted longitudinally of the tail pipe or extension, substantially as and for the purroses described.
10. In a rock drilling machine or engine of the nature indicated, in combination, a power cylinder, a casing in which said power cybinder is slidingly and rotatively mounted, said casing being constructed with forwardly directed exhaust ports surrounding the cylinder, a clamp comprising a split sleeve adjustable longitudinally of the casing, a reciprocating percussive member in the power cylinder, a valve carried by the power cylinder which serves for admitting the actuating fiuld to the power cylinder, an impact piece positioned in the forward end of the power cylinder and formed with a port along which a quantity of the actuating fluid may fass from the power cylinder, a bit positioned at the front end of the power cylinder and in front of sald impact piece, a swivel carried at the front end of the power cylinder which serves for conducting water to the port in the impact piece sarves for condich the actuating fluid passes from the power cylin-
der, a drill or bit having a longitudinal port along which water is conducted from the swivel to the bottom of the hole through the medium of the actuating fluid passing through the impact piece, packing located between the casing and power cylinder or its connections for utilising the pressure of the actuating fluid to feed the drill, a cylindrical piece rigidly attached to the rear end of the power cylinder, said piece being constructed with internal ratchet teeth, a rearward extension or tail pipe rotatably connected to the power cylinder, a cylinder in said tail pipe or extension and a piston in said cylinder, a rifle nut carried by said piston, a riffe bar working through said rifie nut, said rifle bar carrying pawls engaging the ratchet teeth in the cylindrical piece, a valve arranged in the extension or tail pipe for admitting the actuating fluid to operate the piston, pawls which serve by engaging teeth in the cap at the rear of the casing to prevent said tail pipe rotating in one direction, and means for rotating it in the reverse direction to rotate the power cylinder and drill or bit by hand, substantially as and for the purposes described
11. In a rock drilling machine or engine of the nature indicated, the combination of a casing and a power cylinder slidingly and rotatively supported therein. a reciprocating percussive member in said cylinder, means for admitting the actuating fluid alternately to either end of sald cylinder, an impact piece loosely positioned in the forward end of the cylinder, a drill or bit operatively carried at the front end of sald impact piece, the power cylinder being constructed with a port or ports normally closed by the inner end of the impact piece, which when said impact piece is driven forward by the reciprocating percussive member serve as exhaust ports for the actuating fluid and prevent said percussive member being propelled on its rearward stroke until the impact piece is moved in a rearward direction to close sald ports, substantially as and for the purpose described.
12. In a rock drilling machine or engine of the nature indicated, in combination a power cylinder, a casing slidingly and rotatively supporting said cylinder, said casing being constructed at the forward end with exhaust ports surrounding said cylinder, a clamp consisting of a split sleeve adjustable longitudinally of said casing, a percussive reciprocating member in the power cylinder. a valve for alternately admitting the actuating fluid to either end of said cylinder, a valve box and valve box cap enclosing said valve, packing between the casing and cylinder or valve box cap for utilising the pressure of the actuating fluid to feed the drill, an impact piece in the forward end of the power cylinder, a port through said impact piece along which a quantity of the actuating fluid may pass from the power cylinder to and along the drill or bit to the cutting end, a water swivel arranged at the forward end of the power cylinder for conducting water to the drill or bit along which it is conducted by the actuating fluid. means for compelling the drill bit to rotate in unison with the power cylinder, a rearward extension or tail pipe rotatably attached to the rear end of the power cylinder, a cylinder in said tall pipe, a piston in said cylinder, a rifle nut carried by said piston, a rifle bar working through said rifle nut, ratchet mechanism actuated by said rifle bar to impart an intermittent rotary motion to the power cyllnder and drill or bit in one direction, a valve and valve box in the tail plpe or rearward extension which serves for admitting the actuating fluid to elther side of the piston, pawls carried by a plece fixed to the tail pipe, said pawls being adapted to engage teeth provided on a part rigidly attached to the casing which operates to prevent said tail pipe rotating in one direction whilst permitting it to be rotated in the opposite direction to permit said tail pipe, power cylinder and drill or blt to be rotated by hand independent of the automatic power rotation, substantially as described.
13. In a rock drilling machine or engine of the nature indicated, in combination a power cylinder, a casing in which said power cylinder is slidingly and rotatively carried, a drill or bit carried at the forward end of said power cylinder and in such manner that it is compelled to rotate therewith, a reciprocating percussive member in the power cylinder, an impact piece loosely positioned in the forward end of the power cylinder at the rear of the drill or bit, said impaat plece being constructed with a longltudinal port for permitting a quantity of the actuating fluid to pass therethrough to and along the drill or bit to the cutting extremity thereof, substantially as described.

No. 100,921. Fair Fastener. Attache pour cheveux.
Frank B. Rogers and Charles H. Dittmer, co-inventors, both of Maddux, Montana, U.S.A., 11th September, 1906; 6 years. Filed 7th May, 1906. Recipt No. 135,614.

Claim.-A hair fastener comprising a pair of forked pins, the prongs of which are presented towards each other, the
head of one of said pins having an opening, and the head of the other pin a socket, and a pin slidably mounted in the

aforesaid opening, and extensible into the socket, and removably secured therein.

No. 100,922. Match Box. Boite al allumettes.

Thomas H. Pace, Richmond, Virginia, U.S.A., 11th September, 1906; 6 years. Filed 25th April, 1906. Receipt No. 135,260. Claim.-1. A match box comprising side plates, blocks between said plates, an intermediate pivoted match receptacle between said plates, an elastic connection between the inner lower end of said receptacle and one of said blocks, and a trigger for normally holding the receptacle in an inward position against sald elastle connection, substantially as described.
2. A match box comprising side plates, blocks holding the same in their separated position, a receptacle between said plates, a ball and socket connection between said receptacle and one of said blocks, means normally tending to throw the receptacle into an outward position and locking means for normally holding the receptacle in an inward position between the plates, substantially as described.
3. A match box comprising side plates, blocks holding said plates in their separated position, a receptacle between said plates, a ball and socket connection between said receptacle and one of said blocks, locking means normally tending to throw the receptacle into an outward position, and a trigger having a ball and socket connection with one of said blocks and having a downwardly extending member adapted to engage and hold the receptacle in an inward position between the plates, substantially as described.
4. A match box comprising side plates, blocks holding the same in their separated position, a match receptacle pivoted between said plates intermediate its ends, means normally tending to throw the receptacle in an outward position and locking means for normally holding the receptacle in an inward or closed position, substantially as described.
5. A match box comprising side plates, blocks holding the same in their separated positions, a match receptacle between said plates, a ball and socket connection between said receptacle and one of said blocks, means normally tending to throw the receptacle in an outward position, and a trigger having a ball and socket connection with one of sald blocks, and means carried by the trigger for holding the receptacle in an inward position, substantially as described.
6. A match box comprising plates in the form of human fingers and spaced apart by blocks, a match receptacle pivoted to said block between the plates, intermediate its ends. an elastic connection between the lower end of said block and receptacle and normally tending to throw the upper end outwardly, and a cap pivoted between the upper end of said plates and having a downward extending member adapted to elngage the upper end of the receptacle and normally hold it in an inward position, substantially as described.

No. 100,923. Engine and Boiler.
Machine a vaptur et chaudiere.

Dexter M. Small, Providence, Rhode Island, U.S.A., 11th September, 1906; 6 years. Filed 3rd April, 1906. Receipt No. 134,557.
Claim.-1. In an engine of the class described the combination with cylinder \(A\), of a heating device thereunder. the heat from which is automatically applied thereto when piston is down and then removed when piston has been raised to its adjusted limit.
No. 100,924. Disinfecting Apparatus. Appareil désinfectant.

Plerre Lassablière, No. 2 Boulevard Brune, Paris, France, 11th September, 1906. 6 years. Flled 28th November, 1905. Receipt No. 130,500.
Claim.-1. A process of disinfection by means of gaseous formic aldehyde, which consists in the production and utllization of gaseous formic aldehyde in a continuous manner. and at a pressure of between 7 and 12 atmospheres, substantially as specified.
2. An apparatus for carrying out the process of disinfection by means of gaseous formic aldehyde, comprising a pressure chamber \(a\), a valve \(k\) for maintaining the pressure between predetermined limits, and an escape valve \(i\) for controlling the closure of the escapement, substantially as specified.

\section*{No. 100,925. Burial Cagket. Cercueil.}

Charles C. Adams, Kalamazoo, Michigan, U.S.A., 11th September, 1906; 6 years. Filed 3rd August, 1906. Receipt No. 138,385 .
Claim.-1. In a burial casket the combination of a shell, a cover or tod hinged thereto at the back, a movably sup-
ported bottom links connecting said bottom to said cover a pair of counterbalance springs secured to sald bottom, rollers arranged at each end of said bottom, cords connecting said springs to said shell arranged over said rollers, said cords being connected to said shell at the bottom thereof, and an inner casket carried by said bottom, for the purpose specified.
2. In a burial casket, the combination of a shell, a cover or top hinged thereto at the back, a movably supported bottom. links connecting said bottom to said cover, a counterbalance spring connected to said bottom and to said shell, and an inner casket carried by said bottom, for the purpose specified.
3. In a burial casket, the combination of an outer shell, an inner casket, and means for relatively adjusting said outer shell and said inner casket, for the purpose specified.
4. In a burial casket, the combination of a shell, a cover or top hinged thereto at the back, a movably supported bottom, links connecting said bottom to said cover, a pair of counterbalance springs secured to sald bottom. rollers arranged at each end of said bottom, and cords connecting said springs to said shell, arranged over said rollers, said cords being connected to sald shell at the bottom thercof, for the purpose specifled.
5. In a burial casket, the combination of a shell, a cover or top hinged thereto at the back, a movably supported bottom, links connecting said bottom to said cover, and a counterbalance spring connected to said bottom and to said shell, for the purpose specified.
6. In a burial casket, the combination of a shell. a suitable cover therefor, a bottom, sald bottom and shell being adjustablv supported in relation to each other. and a counterbalance spring connected to said shell and to said bottom, for the purpose specified.

No. 100,926. Cntter for Tobacco. Cou/eau d tabao.

Bernhard Baron. 5 St. James Place, London, England, 11th September, 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,844.
Claim.-1. In apparatus for cutting cake or leaf tobacco and in combination, a crosshead, a knife blade adjustably mounted thereon, guide rods for said crosshead, and means operated from the crosshead shaft for feeding the tobacco beneath the knife, substantlally as described.
2. In apparatus for cutting cake or leaf tobacco and in combination, a reciprocating knife blade, a shaft for driving same, a grooved plate adapted to be rotated by said shaft, a block adjustably mounted in said plate, a ratchet arm connected to said block, and a rachet wheel adapted to be operated from the rachet arm and to impart feed motion to the tobacco, substantially as described.
3. In apparatus for cutting cake or leat tobacco and in combination a reciprocating knife blade, a shaft for driving same, a rachet wheel operated from said shaft and feeding devices for the tobacco operated from said rachet wheel, substantially as described.

\section*{No. 100,927. Feed Mechanism for Oigarette Making Machines.}

Jécanisme d'alimentation pour machine à faire des cigarettes.
Bernhard Baron, 5 St. James Place. London, England, 11th September, 1906; 6 years. Filed 18th June, 1906. Recelpt No. 135,003.
Claim.-1. In apparatus for feeding tobacco to cigarette making machines and in combination, a feed hopper. carding cylinders therein a belt beneath the same adapted to receive any tobacco falling behind the lower carding cylinder and carry it forward for admixture with that carried over by the cylinder, substantially as described.
2. In apparatus for feeding tobacco to cigarette making machines and in combination, a feed hopper, carding cylin-

machines and in cumbination a feed hopper, carding cylinder a belt beneath same adapted to receive any tobacco falling from said plate and carry it forward for admixture with that carried over by the cylinder, substantially as described.
3. In apparatus for feeding tobacco to cigarette making machines and in combination a feed hopper, carding cylinders therein, a doffing cylinder for removing the tobacco from the carding cylinder and a belt beneath the latter adapted to receive any tobacco falling behind the carding cylinder and carry it forward for admixture with that removed by the doffing cylinder, substantially as described.
4. In apparatus for feeding tobacco to cigarette making machlnes and in combination a feed hopper, carding cylinders therein presser fingers adapted to lightly hold tho tobacco to the lower carding cylinder. a doffing cylinder adapted to remove said tobacco and a belt beneath the carding cylinder adapted to receive any tobacco falling behind same an carry it forward for admixture with that removed by the doffing cylinder, substantially as described.
5. Ino apparatus for feeding tobacco to cigarette making machines and in combination a leed hopper, carding and doffing cylinders therein, a thrower for receiving the tobacco from the doffing cylinder and a belt beneath the carding cylinder adapted to receive the tobacco from the thrower. substantially as described.
6. In apparatus for feeding tobacco to cigarette making machines and in combination a feed hopper, carding cylinders therein, a belt forming part of the bottom of the hopper and adapted to carry any fine particles of cobacco to the lower carding cylinder, a plate in close proximity to the cylinder and the belt, and a second travelling belt beneath said plate adapted to receive any particles of tobacco falling from sald plate, and carry same forward to be mixed with the tobacco carried over by the cylinder, substantially as described.
7. In apparatus for feeding tobacco to cigarette making machines and in combination a feed hopper, carding cylinders therein, a belt forming part of the bottom of the hopper, a doffing cylinder and a second travelling belt adapted to receive any tobacco falling between the first belt and the cyllnder and carry same forward to be mixed with that removed by the doffing cylinder, substantially as described.
8. In apparatus for feeding tobacco to cigarette making machines and in combination a feed hopper, carding cylinders therein, a belt forming part of the bottom of the hopper, a plate in close proximity to the lower carding cylinder and to the belt, a travelling belt beneath sald plate adapted to receive any particles of tobacco falling from sald plate and carry same forward, and a doffing cyllinder adapted to remove the tobacco from the lower carding cylinder, substantially as described.
9. In apparatus for feeding tobacco to cigarette making machines and in combination a feed hopper, carding cylinders therein, a belt forming part of the bottom of the hopper, a second belt below same, a doffing cylinder adapted to remove the tobacco from the lower carding cylinder, and a thrower adapted to receive said tobacco and throw same iorward onto the lower belt, substantially as described.
10. In apparatus for leeding tobacco to clgarette making machines and in combination, a hopper, carding cylinders therein, a belt forming part of the bottom of the hopper, a plate in close proximity to the lower carding cylinder and to the belt, a second belt below same, a doffing cylinder adapted to remove the tobacco from the carding cylinder and a thrower adapted to recelve said tobacco and throw same forward into the lower belt. substantially as described.
11. In apparatus for feeding tobacco to clgarette making machines and in combination a hopper, carding cylinders

\footnotetext{
9-18
}
therein, a belt forming part of the bottom of the hopper, a second belt adapted to receive and carry forward any tobacco falling thereon. presser fingers adapted to lightly hold the tobacro to the lower carding cylinder, a dofling cylinder adapted to remove said tobacco, and means for delivering same to the lower travelling belt, substantially as described.
12. In apparatus for feeding tobacco to clgarette making machines and in combination, a feed hopper, carding cylinders therein. a belt formine part of the bottom of the hopper, a plate in close proximity to the lowr carding rylinder and said belt a lower belt adapted to receive and carry forward any particles falling from said plate, presser fingers adapted to lightly hold the tobacco to the lower carding cylinder, a doffing cylinder adapted to remove same and means for delivering same to the lower belt, substantially as described.

\section*{No. 100,928. Press for Leaf Tobacco.}

Presse pour tabao en feuilles.

Bernhard Baron, 4 to 8 St. James Place, Aldgate, London, England. 11th September, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,090.

C'laim.--1. In apparatus for pressing leaf tobacco, a mould one part of which is removable, means for compressing the tobacco therein, and clamps adapted to hold the mould in a closed condition or to release one part thereor, substantially as described.
2. In apparatus for pressing leaf tobacco. a mould one part of which is removable, pivoted arms carrying presser plates, and means for holding the inner ends of said arms while pressure is being exertid. substantlally as described.
3. In apparatus for pressing leaf tobacco, a mould one part of which is removable, clamps adapted to hold the mould in a closed condition or to release one part thereof and pivoted arms carrying pressure plates, substantially as described.
4. In apparatus for pressing leaf tobacco, a mould one part of which is removable, clamps adapted to hold the mould in its closed condition or to release one part thereof, pivoted arms carrying presser plates, and means for holding the inner ends of said arms while pressure is being exerted, substantally as described.

No. 100,929. Cigarette Making Machine.
Wachine a fairc des cigarettes.

Canaan de Cazen, 1496 Notre Dame Street, Montreal, Quebec, Canada, 11th September, 150t; 6 years. Filed 18th June, 1516. Receipt No. 137,006.

Claim.-1. A clgarette making machine comprising a feed mechanism having a belt carrier travelling on rollers jour-
nalled in the sides of a casing, said belt carrier having rows of picks projecting from its outer surfaces, and a belt travelling on rollers journalled in said casing above the aforesaid belt carrier and having rows of picks projecting from its outer surface, a forming tube, a guideway from sald feed to said forming tube, a frame supporting sald parts, and means for operating, as and for the purpose specifled.
2. A cigarette making machine comprising a feed mechanism having an endless carrier suitably arranged in the lower part of a casing, said carrier having picks inclined forwardly in the direction of travel, and a belt arranged above the aforesaid carrier in said casing have its face opposing the aforesaid carrier travelling in an opposite direction, sald carrier having picks inclined rearwardly to the direction of travel, a forming tube, a guideway from said feed to said fcrming tube, a frame supporting said parts, and means for operating, as and for the purpose specified.
3. A cigarette making machine comprising a feed mechanism, a forming tube, a guideway from said feed to said forming tube, means for carrying a ribbon of paper through said tube, a stamping table over which said paper passes, a stamp beneath said table, means for shearing, means for engaging and operating said stamp one time to every two operatlons of said shearing mechanism, a frame supporting sald parts, and a main driving shaft journalled from said frame, as and for the purpose specifled.
4. A cigarette making machine comprising a feed mechanism, a forming tube, a rotating wheel forming a guldeway from said feed to said forming tube, a shaft sultably journalled and operatively connected to the shaft of sald rotating wheel, a pulley on the aforesaid shaft, a ribbon belt extending around said pulley and through sald forming tube, a roller suitably journalled having a roll of paper in ribbon form mounted thereon, a plurality of rollers over which said paper passes to said forming tube, a pivoted arm having a roller at the end thereof resting against the paper between the stamping table and forming tube, a shearing mechanism, a stamping mechanism, means for operating said stamping mechanism one time to every two operations of the shearing mechanism, a frame having a plurality of bearings and supporting the various parts, and a main shaft journalled in bearings from the frame, as and for the purpose specifled.
5. In a cigarette making machine, the combination with the frame supporting a table, a casing containing a feed mechanism supportcd above said table, and a forming tube, of a rotating wheel journalled in the frame of the machine beneath said fecd mechanism and having a plain arc-shaped surface to its rim extending without interruption from side to side, a ring mounted on said wheel at each side of said rim, and forming a passage from said feed to said forming tube, and a main driving shaft, as and for the purpose specified.
6. In a cigarette making machine, the comblnation with the frame supporting a table, and a casing containing a feed mechanism supported above said table and a forming tube. of a rotating wheel having an arc-shaped periphery to its rim, a pair of rings mounted on said rim and having annular tlanges forming a guideway from said feed to said forming tube, a plurality of pins ex:ending through the frame of the machine and adjustably secured therein, and having rollers journalled at the ends thereof engaging the said rings, a rotating wedge turning on a shaft adjustably held in the frame diametrically opposite said guideway and extending between said flanges, and a main driving shaft, as and for the purpose specified.
- In a cikarette making machine, in combination a frame supporting a table, a feed mechanism supported thereabove, a forming tube, a shaft extending across sald frame, a pulley mounted on said shaft, a ribbon belt extending around said pulley and through said forming tube, a roll of paper in ribbon form mounted on a roller journalled in the frame of said machine and extending to said ribbon belt, a plurality of rollers guiding said paper, a pivoted arm having a roller journalled at the end thereof engaging said paper intermediate of the distance between two of said rollers, a self-inking stamp through which said ribbon of paper extends, means for of crating the plunger of said stamp co-incidentally with the operation of the other parts of the machine, and a main driving shaft, as and for the purpose specified.
8. In a cigarette making machine, in combination, a frame supporting a table, a feed mechanism supported thereabove, a forming tube, a shaft extending across said frame, a pulley mounted on said shaft, a ribbon belt extending around said p,ulley and through said forming tube, a roll of paper in ribbon form mounted on a roller journalled in the frame and extending to sald ribbon belt, a plurality of rollers gulding said paper, a pivoted arm having a roller journalled at the end thereof engaging said paper intermediate of the distance hotween two of said rollers, a self-inking stamp over which salid ribbon of paper extends, a lever plvoted in the frame and encaging the plunger of sald stamp, an eccentric mounted on the driving shaft, and a strap encircling sald eccentric
and having an arm therefrom pivotally connected with said lever, and a main driving shaft, as and for the purpose specified.
9. In a cigarette making machine, in combination a frame supporting a table, a feed mechanism supported thereabove, a forming tube, and a shaft extending across said frame, a pulley mounted on said shaft and turned thereby, a ribbon extending around said pulley and through said enveloping tube, a roll of paper in ribbon form mounted on a roller jcurnalled in the frame of sa!d machine and extending to said ribbon belt, a plurality of rollers gulding said paper, a plvoted arm having a roller journalled at the end thereof engaging said paper intermediate of the distance between two oi said rollers. a self-inking stamp secured to a bracket from the machine, a lever pivoted in the frame of the machine having a projection from the end thereof engaging the plunger of sald stamp. an eccentric mounted on the main driving skaft, a strap encircling said eccentric, having an arm therefrom pivotally connected to said lever, and a main driving shaft, as and for the purpose specifled.
10. In a device of the class described, in combination. a frame having a plurality of bearings, a casing supported above sald frame, a plurality of belt carriers, turning on rollers journalled in the sides of said casing. a sprocket and ctain mechanism connecting the shafts of said rollers, a main driving shaft journalled in bearings in brackets from the side of the frame. a shaft parallel with said main driving shaft furnalled in brackets in the side of the frame thereabove, a sprocket and chain mechanism connecting said shafts, a sprocket and chain mechanism connecting the upper shaft and the aforesaid rollers, a rotating wheel journalled in suitable bearings beneath said feed mechanism forming a guideway from sald feed. a forming tube leading from said guidenay, a shaft journalled in bearings in said frame at right angles to the aforesaid shaft. having a pulley secured therecn, a sprocket and chain mechanism forming the operating connection between said shaft and the shaft of said rotating wheel beneath said feed mechanism, a gear mechanism forming the operating connection between the shaft above the main driving shaft and the shaft journalled at right angles thereto in the frame. a shearing mechanism, a cam on sald main driving shaft operating said shearing mechanism, a slid: ble table carrying said shearing mechanism, a stamping mechanism, an eccentric on said main driving shaft having an operating connection with sald slidable table and said stamping mechanism, a pasting mechanism, a belt and pulley ronnection thereto from the main shaft, and a belt and pulley connection from the shaft above the main shaft of said shearing mechanism, as and for the purpose specified.
11. In a cigarette making machine the combination with a prame, a forming tube supported therebv, and means for guiding the length of paper into said forming tube, of a box supported above said frame and having bearings in the upper and lower portions of the sides thereof, a pair of rollers fournalled in the upper bearings in said box, a belt carrier pxtending around said rollers and having a downward inclination in the direction of travel, a pair of rollers journalled in bearings in the lower portion of said box. a belt carrier extending therearound and having an upward inclination in its direction of travel, a hooper extending into sald box and having its discharge opening immediately over the lowermost carrier, a roller journalled in bearings in the lower portion of said box in proximity to the sald lowermost belt carrier and gathering the tobacco therefrom. and a hopper below sald roller having a discharge opening leading towards said forming tube, as and for the purpose specified.
12. In a clgarette making machine the combination with a frame, a forming tube supported thereby. and means for suiding the paper into said forming tube, of a box supported rbove said frame having bearings in the upper and lower dortions of the sides, a pair of rollers journalled in bearings in the lower portion of said side, a belt carrier extending around sald rollers and having a plurallty of picks projecting from the surface thereof inclined forwardly in the direction of travel of said carrier, a hopper extending into said box and having its discharge opening directly over sald carrier, a roller fournalled in bearings in the lower portion of sald box to one end of sald carrier and having picks meshing with the aforesald picks and gathering the tobacco from said arrier. a pair of rollers journalled in bearings in the upper portion of said box, a belt carrier extending around said rollers and located over the forward part of the aforesald helt rarrier and angularly inclined thereto, and having a plurality of picks projecting from the surface thereof inlined backwardly from the direction of travel of said carrier and means for guiding the tobacco from the first-named carrier into the machine, as and for the purpose specifled.
13. Ino a cigarette making machine the coinbination with the frame, a forming tube supported thereby and means for guiding the paper into sald forming tube, of a box supported above sald frame and having bearings in the upper and lower portions of its sides and adjustable parts hinged to the top
of said sides and bearings in said parts, a palr of rollers journalled in the bearings in the lower portion of sald sides, a belt carrier extending around sald rollers and having picks rojecting from the surface thereof inclined in the direction of travel of said carrier. a roller rotating in the opposite direction to the aforesaid rollers and having pleks meshing vith the aforesald picks and fournalled in bearings in the lower portion of said sides. a pair of rollers rotating in the same direction as the rollers of the aforesaid carrier, one of which is journalled in bearings in the upper portion of the ides and the other journalled in the bearings in the said adjustable parts, a belt carrier extending around said rollrrs and having picks projecting from its surface inclined rearwardly from the direction of travel of the said carrier. a hopper extending into the box and having the discharge opening immediately over the lowermost carrier, and a hopner receiving the tobacco from said lowermost carrier and the gathering roller and dropping the same into the machine, as and for the purpose specified.
14. In a cigarette making machine the combination with the frame, forming tube supported thercby means for gulding the length of paner into sald tube, and driving mechin nism. of a rotating wheel journalled in suitable bearings in said frame in allgnment with sald tube and having an arcshaped periphery. a ring of concave convex form mounted on said wheel at each side of said rim, a box supported by said frame above sald wheel having bearines in the upper and lower portions of the sides. a belt carrier extending around suitable rollers journalled in said lower hearings and having picks from the surface thereof inclined forwardly in the direction of travel of said carrier, a hopper extending into said box and emptying on to said carrier. a roller journalled in the sides of said box having picks moshing with the aforesaid picks at one end of said carrier and gathering the tobacco therefrom, and depositing it on sald rotating wheel between said rings, and a belt carrier extending around rollers journalled in the upper bearings in sald box and having picks inclined backwardly from the dircction of travel and extending into proximity with the aforesald belt carrier at the dellivery end of the latter, as and for the purpose speclfied
15. In a device of the class described in combination a frame sup-orted on suitable standards and raving an elevated nortion at one end thereof. a hopper box supported above sald elevated nortion, a plurality of bearings arranged in connection with the subdorting bars of said hopper box, a nair of rollers journalled in said bearings, a belt carrier extending around said rollers having picks projecting from its surface inclined forwardly in the direction of travel of said carrler being arranged in an upward incline. a palr of 1 ollers fournalled in said bearings above the bearings of the :foresald carrier, a belt extending around sald rollers and laving an upward incline from the dellvery end of sald carrier and picks projecting from its surface inclined backwardly in the direction of travel. the onposing surfaces of said carrier and belt moving in an opposite direction, a roller fournalled in said bearings at the end of the bars of the said hopper box and having picks projecting from its periphery meshing with the picks of said carrier and gathering tobacco from the sald carrier. a honjer beneath sald gathering roller recelving tobarco therefrom and having an upward extending portion hooding sald roller. forming mechanism supported by said frame receiving tobacco delivered from said hopper. and means for operating said feeding and forming mechanism coincidentally, as and for the purpose specifled.
16. In a device of the class described in combination a frame having an elevated portion at one end thereof. a hopder box supnorted above said elevated nortion and sultable bars arranged at right angles to said frame, a plurality of adjustable hoarings formed in and supported by said bars. a pair of rollers journalled in the lowermost of said bearines, a carrier encircline said rollers and having picks projecting from its surfacs inclined forwardly in the direction of travel and its unper side passing through said hopper box in an inclined upward direction, a pair of rollers journalled in the unnermost of said bearines having the inner roller thereof immediately above the roller at the dellvery end of said carrier. a belt havine picks profectine from its surface and extending around said upper rollers and inclined in an upper direction from its inner roller thereof, the opposing surfaces of the said belt and the said carrier travelling in an opposite direction. a roller journalled in the adjustable bearings, at the inner ends of the said supporting bars of the hopper box and having pleks from its periphery meshing with the picks of sald carrier and gathering tobacco therefrom, a hopper beneath said roller having an extension thereabove hooding said roller. a sorocket wheel mounted on the shaft of one of the belt rollers, a sprocket wheel mounted on the shaft of one of the carrier rollers, an idle roller journalled on a suitable pin projecting from one of said supporting bars, a main driving shaft iournalled in suitable bearings from said frame, a sprocket wheel on sald main shaft, a
hain exterding around said sprocket wheel on said main haft and over and under the aforesaid sprocket wheels and ver the said idle roller, a pulley on said gathering roller haft, a groovel pulley on said main shaft, and a belt extending from said prooved pulley to said pulley on said roller shaft, as and for the purpose specified.
1i. In a device of the class described, in combination a frame having an elevated portion to one end thereof, a hopier box, a pair of bars arranged at right angles to said frame and supported thereabove from said elevated portion and having slots at the ends thereof and intermediate of beir length and an upright therefrom opposite said intermediate slots, adjustable bearing blocks arranged in one of said end slots and in said intermediate slot, a roller jourcalled in said bearing blocks and having a sprocket wheel on the shaft thereof, a belt carrier extending around said rollers and having picks inclined forwardly in the direction oi travel and moving in an incline upward direction in said hopper box, adjustable bearing blocks in the slots at the other end of said bar, a roller journalled in said bearing hlocks and having picks from its periphery thereof meshing with the picks on sald carrier, bearing blocks supported by adjustable links secured to said bars and said upright portions therefrom, adjustable bearings at the upper end of said uprights from the bar, a roller journalled in said uprights and having a sprocket wheel on the shaft thereof, a roller journalled in said bearing blocks supported by said links, a belt cxtending around said rollers and having its opposing faces to said carrier travelling in an opposite direction and picks projecting from the surface inclined backwardly in the direction of travel, a driven shaft, a sprocket wheel mounted thereon, a chain connecting the aforesaid sprocket wheels and said sprocket wheel on the main shaft and driving the rollers of said belt and said carrier coincidentally, a hopper receiving tobacco from said carrier, and forming means sup ported by said frame, as and for the purpose specified.
18. In a device of the class described, in combination a frame. a hopper box arranged thereabove and to one end thereof, adjustable bearings supported independently of sald hopper box and rollers journalled therein, belts extending around two pairs of said rollers respectively and having their opposing faces moving in opposite directions and inclined angularly one from the other, the lower of said belts form ing the carrier for the tobacco from sald hopper and travelling over a suitably supported bridge within said hopper, a roller gathering the tobacco from said carrier, a hopper re ceiving the tobacco from said roller, a rotating guideway receiving tobacco from the latter hopper, a forming tube receiving the tobacco from said rotating guideway. and means for operating said feed mechanism and the forming mechanism coincidentally, as and for the purpose specified.
19. In a device of the class described, in combination a frame baving circular parts to one end thereof and arcshaped slots in said circular parts, a shaft journalled in suitable bearings arranged centrally in said circular parts of the frame, a wheel mounted on said shaft, rings secured on the sides of the rim forming an annular channel groove therebetween, rollers journalled on pins suitably set in said arcshaped slots and regulating the space at points circumfer entially between said links. a bracket supporting a bearing a: the front of said rotating guide wheel, a pressure wheel journalled in sald bearing and extending in rotation into said channel groove, a feed mechanism delivering tobacco to said channel groove, a forming mechanism receiving the tobacco from said channel groove, and means for operating the parts coincidentally, as and for the purpose specified.
20. In a device of the class described, in combination a frame having circular parts to one end thereof, bearings arranged centrally in said circular parts, a shaft rotating in said bearings, a wheel having an arc-shaped periphery to its rim mounted on said shaft and turning between said circular parts. a ring having a corresponding inner surface to said arc-shaped periphery mounted on each side of said rim, a plurality of rollers journalled on pins adjustably secured in said circular parts of the frame. said rollers having annular rooves engaging said rings and retaining them on sa'd wheel. and a central annular tongue formed by said grooves spacing said rings apart to form an annular channel groove around said wheel, rollers engaging the sides of said rings oposite the aforesaid rollers and journalled at the ends of mins adjustably arranged in said circular parts and project ing inwardly to said rings, an adjustable bearing supported from a bracket rigidly secured to the frame to the front of said wheel, a pressure wheel journalled in said bearing extending into said channel groove, a feed mechanism delivering tobacco into said channel groove, a forming mechanism receiving tobacco from said forming groove, a main shaft, and means from said main shaft for driving the various parts of the mechanism coincidentally, as and for the purpose specified.
21. In a device of the class described, in combination a frame supporting a table, a forming tube arranged longitu-
dinally on said table and having a length of paper travelling therethrough, a cylindrical paste receptacle arranged at right angles to said tube and having an opening at one end thereo and a journal orifice at the other end, a semi-circular member secured to the mouth opening of said cylinder and having a channel groove therein communicating with said mouth opening, a piston head in said cylindrical receptacle, automatic means for operating said piston head, a paste disc mounted at the top of a spindle journalled in suitable bearings secured to the frame of the machine, said paste disc turning in said semi-circular member and picking up paste herefrom and applying it to the paper along said forming tube, a feed mechanism, and means for operating the various parts coincidentally, as and for the purpose specified.
22. In a device of the class described, in combination a frame supporting a table, a forming tube longitudinally arranged on said table, receiving a length of paper travelling thcrethrough, a cylindrical paste receptacle having an adjustable mouth opening at one end thereof and secured on said table at right angles to said forming tube and a journal orifice in the other head, a semi-circular member secured over said mouth opening and having a channel groove therein, communicating therewith, a piston head travelling in said receptacle, a cover capping the outer end of said cylinder and having a journal orifice in alignment with the aforesaid jcurnal orifice, a ratchet wheel rotating between said cover and said head and having a hub journalled in said orifices and internally threaded. a spindle correspondingly threaded and extending through said head and secured to said plston head and having at its outer end a crank handle, a pendant arm hanging from said hub, a pawl secured to the end thereof and spring-held to said ratchet, a reciprocating rod se cured to said pendant arm, means for causing said rod to reciprocate, a bracket secured to said frame and supporting a vertical bearing, a spindle journalled in said vertical bearing and extending upwardly through the table, an adjustable point bearing supporting the lower end of said spindle, a disc mounted on the upper end of said spindle and turning in said semi-circular member and collecting paste therefrom and applying said paste to the paper travelling along said fcrming tube, a pulley mounted on said spindle below said table and having belt connection with the driving mechan ism, a feed mechanism, and means for driving the various parts coincidentally, as and for the purpose specified,
23. In a device of the class described, in cimbination, a frame a table slidably arranged on one end thereof, a link pivotally connected thereto, a vertical lever pivotally connocted to said link and having a journal orifice in the centre thereof, a shaft extending through said journal orifice and secured to the frame of the machine at each end there of, a toggle foint having one of its members pivotally connected to said lever at the lower end thereof and its other member pivotally connected to the frame of the machine, a shaft journalled in suitable bearings in the frame of the machine and extending thereacross. a main shaft driving the said shaft, an eccentric mounted on the shaft extending across the machine having its strap pivotally connected to one of the members of said toggle joint, an adj"stably arranged knife mounted on said table, a forming tube sup ported by said frame and delivering a string of cigarette under said knife means for onerating said knife on every movement of the table, a feeding machanism. and means for operating the various coincidentally, as and for the purpose snecified.
24. In a device of the class described, in combination a frame, a slidably arranged table at the end of said frame. a forming tube supported by said frame, automatic means for moving said slidable table backward and torward, a bracke nrojecting unwardly from said table, an arm having forked end and pivotally secured at the top of said bracket extending upwardly from said table and having an arcshaped slot therethrough and intermediately arranged to the length of said arm, said arm being set in any desire position in said arc-shaned slot, a spindle journalled suitable bearings in said fork-shaped end, a circular knife mounted on said spindle, a pulley mounted on said spind'e, a driving pulley connected by a suitable belt to the afore said pulley and supported by a bracket from the frame adjustable means for bringing the string of cigarette in celved from the forming tube into contact with said rotating knife, a feeding mechanism delivering tobacco to said forming tube, and means for operating the various parts coin cidentally, as and for the purpose specified.
25. In a device of the class described, in combination a frame, a table slidably arranged thereon at one end thereof, automatic means for sliding said table backwardly and forwardly, a bracket projecting unwardly from said table an arm projecting from said bracket having a forked end and supporting bearings, a spindle turning in said bearings. a knife mounted on said spindle at one end thereof, a pulley mounted on said spindle, a hracket intermediately arranged in the length of said arm having slots in its upwardly pro
jecting portions, a pin extending through said arm and through said slots and adjustably arranged in the latter, a bracket extending upwardly fiom the table below said knife, a forked arm pivotally secured to said bracket, a funnelshaped tube projecting inwi rdly from an orifice in one of the prongs of the latter forked arm, a tube extending outwardly from the orifice in the cther prong in alignment with said funnel-shaped tube, a pin pivotally secured to said forked arm beneath said knife having a reduced lower end extending through the table of the machine and a head or nut at the extreme lower end thereof, a spiral spring encircling the said reduced lower end of said rim between said table and said head or nut, a lever pivoted in a suitable bracket extending downwardly and extending across the table through a suitable gulde loop and having a roller journalled thereon, a threaded pin inserted in a correspondingly threaded orifice in the center of sald lever and normally abutting the head or nut at the lower end of said pin extending through the table, a crank lever pivoted intermediate of the length of its vertical section in the frame of i machine having at the lower end of said section a roller and at the extreme outer end of its horizonal section a fiattened portion engaging the roller on said lever, a main shaft, a cross shaft journalled in suitable bearings in the standards of the machine and operated by said main shaft. a cam mounted on said cross shaft and engaging the rol'er of sald crank lever and raising the forked arm under said knife upwardly thereto twice for every revolution of the said shaft, a grooved pulley on the main shaft. a pulley journalled in a bearing supported by a bracket from the machine and sultably operated from said grooved pulley on the main shaft and in turn driving the pulley on the spindle on which said knife is mounted, a feed mechanism delivering tobacco to a forming tube, and means for operating the various parts coincidentally, as and for the purpose specifled.
26. In a device of the class described, in combination a frame, a roll of cigarette paper journalled on a pin projecting from the frame, a bridge extending across said frame, a pair of upright brackets supported thereon, a table supported by sald brackets, a roller journalled in a bracknt rigidly secured at the end of said table over which said paper passes and along the under side of the table. vertical bearings supported by said bridge and vertical rods sliding in said bearings, and carrying at their upper ens a type plate having type mounted thereon and at the lower and having a pivotally secured link, an operating lever pivotally jolned to said link, said operating lever having a journnl orifice centrally arranged therein, a curved offset portion forming the other half of said lever. a shaft extending through said journal orifice from side to side of the frame, a main shaft, a cross shaft driven thereby, an eccentric mounted on sald cross shaft and having its strap pivotally sccured to the end of said curved portion of the lever. and operating the printing mechanism one for every revolution of said shaft, a plurality of rollers suitably arranged in the path of said paper to the forming tube, and means for frawing said paper through said forming tube, as and for the purpose specified.
27. In a device of the class described, in combination a frame. a forming tube supported thereby having a belt travelling therethrough, a roll of paper journalled on a pin projecting from the frame. a bridge extending across said frame, a pair of brackets supported on said bridge and having upwardly extending lugs, a table having a central oponing and secured to said brackets immediately beneath said upwardly extending lugs. a roller journalled in brackets secured to the end of sald table, rollers journalled in said brackets immediately at the forward and rear edges of said opening in the table, a roller journalled on a pin adjustably arranged in said lugs, said paper extending over and around sald rollers and along and under the table, vertical bearings supported on sald bridge, a pair of rods vertically sliding in said vertical bearings and carrying at the top end a type plate having sultable type mounted thereon and intermediate of the distance between sald type plate and said bearings, a projecting pin and a pivoted link at the lower end. a lever at one end pivotally secured to said link and at the other ind pivntally secured to an eccentric rod and in the center thereof having a journal orifice, a shaft extending through sald journal orifice and secured to the frame. a main shaft. a shaft journalled in suitable bearings extending across the machine and driven by sald main shaft, an eccentric mounted on said shaft and connected to said lever as aforcsaid. rank levers pivoted at their angles in brackets from said bridge having one of their sections slotted, and ink rollers journalled from the other sections, ink wells sccured to th. nd of sald tyne plate by suitable inclined pieces forming a path for said rollers from said type plate to said ink wells, a shaft extending across said machine secured to its midstandards, a sleeve encircling said shaft, a pendant arm ploted to said sleeve and having a roller at its lower ent
if an adjustable arm extending from said sleeve over which said paper passes on to the belt in said forming tube, and means for operating said machine. as and for the purpose specified.
28. In a device of the class described in combination a irame, a forming tube supported thercby, a roll of paper journalled on a pin projecting from the frame, a table suitably supported within sald frame, and along which said paper travels, means for printing said paper as it passes along said table, a plate having a plurality ot bearings supported at the further end of sald table, a roller journalled in ome of sald bearings over wilh sald piper passes, a bronze well supported on said bearing plate, and in which said roller turns, a rotary brush journalled in one of said bearings and brushing said paper as it passes theerealong, a main shaft. a shaft extending across the machine and oriven by said main shaft, pulleys respectively on the shafts of said roller and said rotary brush, pulleys on said cross shaft operatively connected to said pulleys on the rotary brush shaft and rollor shaft, an idle roller between said rotary brush and said roller suitably journalled on a pin projecting from said plate and around which said plate passes, a plurality of rollers suitably journalled and suitably supported in the path of said paper to sald forming tube, and means for driving the various parts of the machine coincidentally, as and for the purpose specified.
29. In a cigarette machine in combination with the frame supported on suitable standards, a hopper box supported on a suitable frame above the aforesaid and to one end thereof, a plurality of adjustable bearings supported in proximity to said box, a plurality of rollers suitably journalled in said bearings, a belt carrier extending around two of sald rollers and travelling in an inclined upward direction and having picks projecting from the surface thereof inclined forwardly in the direction of travel of said carrier, a belt extending around two other of the rollers and angularly arranged to the aforesaid carrier having picks projecting from its suriace inclined backwardly in the direction of travel, said belt at one end thereof being in proximity to the delivery end of said carrier and having its opposing face to sald carrler moving in an opposite direction thereto, a romb secured to the frame of said box and having teeth abutting said carrier between the picks, a sprocket wheel secured to the shaft of a roller of said carrier, a sprocket wheel secured to the shaft of a roller of said belt and a chain extending around said snrockets and around a sprocket wheel on the main shaft of the machine communicating the motion of said shaft to said rollers, a roller adjustably journalled in two of said bearings and having picks from the periphery thereof meshinog with the picks on the said carrier at one end and gathering the tobacco therefrom and delivering said tobacco into a hopper immediately therebeneath, said hopper having an upwardly extending portion hooding sald rollerand from which the cobacco is delivered to the forming parts of the machine, as and for the purpose specified.
30. In a cigarette machine in combination with the feed mechanism, a frame supporting a table and having circular larts at one end thereol and suitable standards and crosspleces supporting bearings, throughout the machine, a shaft journalled in bearings in the crosspieces extending between said circular parts, a wheel mounted on said shaft and turning theerwith between said circular parts of the frame, and having an arc-shaped perlphery to its rim and on each side of said rim having a ring mounted in which annular inner surfaces correspond to the surface of sald arc-shaped rim, said ring forming a channel guideway therebetween, a plurality of spacing rollers suitably fournalled and regulating the width of said annular channel in the wheel and retaining said rim on said wheel, a pressure wheel secured in suitably supported bearings to the front of said guide wheel and in rotation extending into said channel and pressing on the tobacco received from the feed mechanism into said channel guideway as the sald tobacco passes therealong on to the able and forming mechanism, and means for operating said shaft of said guide wheel coincidentally with the operation of the various parts of the machine, as,and for the purpose specifled.
31. In a cigarette machine in combination with the frame and a roll of cigarette paper journalled on a suitable pin projecting from sald frame, a table supported on a pair of brackets from a bridge extending across the frame of the machine, a guide roller journalled from a suitable bracket rigidly supported at one end of said table and over which the length of the paper from said roll passes along on the lower surface of said tabe, said table having an opening in the middle thereof and a plurality of rollers journalled in upwardly extending portions from the bracket under and over which said paper passes, a reciprocating type plate havins: suitable type mounted thereon and stamping said paper at intervals as it passes along said table, said type plate being supported on rods reciprocating in vertical bearings, said rods having at the lower end thereof, a crossplece and the link pivotally joined thereto, an operating lever pivotally
joind to said link, said operating lever having a central jour nal orifice mounted on a shaft extending across the machine ind at its outer end having pivotal connection to an eccentric strap rod, said eccentric strap rod encircling an eccenlic on a rotating shaft extending across the machine, means nperated by sald reciprocating rods for inking said type, a roller. journalled at the extreme of a pendant arm, and engaging said paper subsequent to its passage along the table, a gulde roller over which sald paper passes on to a ribhon belt travelling through the forming tube, said ribbon ielt extending around a plurality of rollers and a grooved nperating pulley mounted on a rotating shaft and along through the forming tube into which it carries the paper receiving a string of tobacco from a suitable feed mechanism and therewith passing into the forming tube to be suitably finished at the end of said tube, as and for the purpose specifled.
32. In a cigarette machine in combination with the forming tube having a length of paper passing therethrough and means for transporting said paper along the tube, a cylinder containing paste arranged at right angles to said forming tube and supported on said machine frame and having an opening in the head thereof adjacent to said forming tube and a vertical dovetailed groove in the said head, an adjusts.hle plate sliding in said groove and having a cylindrical projection in front of said opening forming the mouth of sald cylinder. a semf-circular member having a lug therefrom scured over said cylindrical projection. said lug having a passage therethrough leading into the channel groove forming the wall of sald semi-circular member, a ratchet wheel having its hub journalled in suitable bearings in the opposite head of the cylinder and a cover capping said head and turning between said cylinder head and said cover, a pendant arm from said hub extending through a slot in said cover and having a pawl plvotally secured to the end thereof and spring-held to sald ratchet wheel, a threaded spindle sccured to a piston head in said cylinder and extending through the correspondingly threaded hub of said ratchet wheel and having at the outer end a crank handle, a reciprocating rod rivotally secured to said pendant arm and during the operation of the machine constantly moving said pawl from tooth to tooth and thus rotating sald ratchet wheel. said recinrorating rod being secured to a moving part of the mechanism. a dise mounted on a suitably fournalled rotating spindle and turning in the said semi-circular member and gathering naste therefrom and applying paste to sald paper passing along the forming tube. and means for rotating said spindle. as and for the purnose specifled.
33. In a cigarette machine the combination with the formIng tube and a table supported by a suitable frame and a string of clearette formed by sald tubr. a table slidably arranged on the frame at the end of the aforesaid table. a link pivotally sccured to the inner end of sald table at one end and at the other to a vertirally arranged lever centrally pivoted intermediately of the height of the machine and at its lower end n!yoted to the onter member of a toegle joint. the inner member of sald toggle joint belng pivotally secured to the frame of the marhine. an ecrentric mounted on a rotating shaft in said marhine and having its rod plvotally connected to one of sa!d toggle joint member intermediate of its length, said eccentric at each revolution of said shaft causing said table to slide twice for every revolution of said shaft. a rotarv knife mounted on a spindle journalled in a bracket extending over said table. sald bearing members being vertically adjustable to raise ant lower said knife, a bracket secured to the top of sald table having a ploted forked arm extending therefrom, the prongs of sald fork be'ng one to cach side of sald knife, a funnel-shaped tube extending inwarldy from a prong of said fork to receive the string of cigarette from sald forming tube and a tube extending outwardly from the other prong and receiving the string of cigarette and thus bringing the space between said prongs with said cigarette, a pin pivotally secured to said forkel arm and extending through the table and having an encir-- ling spring exerting a downward spring pull on said arm, a wivoted lever extending across sald machine under said table and having a roller at the end thereof and an adjustable screw centrally arranged therein engaging the head of said pin under said table, a crank lever suitably pivoted on the frame of the machine having a flattened portion at the end of its horizontal section engaging the roller on sald lever and at the lower end of its vertical section having a roller attached thereto and engaged by a cam mounted on a rotating shaft in said marhinc. said ram engaging said roller rwice for cvery revolution of sald shaft and causing th. aljusting screw in the aforesaid lever to engage sald pin twise for every revolution of said shaft and consequently moving the said forked arm upwardly and bringing the strilg of clzarcte in contact with the rotating knife, as and for tho purpose specified.
34. In a cigarette machine in combination with the feed mechanism and forming tube, a rotating wheel having a flat
rim, mounted on each side of said rim, said ring having vertically flaring inner surfaces and secured on said whecl by set screws arranged at intervals and forming a central channel therebetween, said wheel being mounted on a rotating shaft journalled in sultable bearings in the frame of the machine and bringing said channel at one point therein immediately beneath the delivery point of said feed mechanism and at another point in alignment with the receiving end of said forming fube, and means for rotating said shaft as and onr the purpose epecified.
35. In a cigarette machine in combination with the frame supporting a table and having sultable standards and crosspicces. a main shaft extending longitudinally with the frame and journalled in a pair of brackets rigidly secured to the two end stindards of said frame and having mounted thereon a suitable driving pulley, and at one end a grooved pulley. intermediate of its length a friction disc and a grooved pulley towards the other end, a shaft arranged at right angles to the aforesaid shaft and jou rnalled in suitable bearings on the standards and having a friction wheel at one end engaged by said friction disc and at the other end a pinion anc intermediate of its length and between said standards a pluri lity of eccentries, pulleys and a cam, a shaft journalled in bearings in vertical alignment with the bearings of the last-named shaft and having a gear wheel at one end thereof operatively connected by an intermediate gear adjustably ju urnalled with the aforesald pinion, said upper shaft having between said standards a plurality of pulleys mounted thereon and at its other end a bevel gear. a shaft arranged longitudinally on the machine in bearings supported in rigic brackets in the side of the machine and above the jearings of the main shaft, said upper longitudinal shaft having a pinion at one end co-acting with the said bevel gear and a pinion at the other end co-acting with a bevel gear mour ted at the end of a cross shaft journalled in bearings in the standards at the feed end of the machine. and turniny the rotating guide wheel, sald longitudinal shaft having a sprocket wheel at the end thereof connected with and operating the feed mechanism, said shafts being rotated as shown through the connection of said driving pulley with a suitable power and in turn rotating the pulleys, eccentrics, cams and other pirts connected to the feed mechanism, and all the various other parts necessary to form and finish the cigarette, as and or the purpose specifled.

\section*{No. 100,930. Process of Dliminating Odour of Fish 011.}

Procédé pour éliminer les odeurs d'huile de poisson.

Alexandre de Hexiptinne, 56 ruc de la Vallee, Ghent, Belgium, 11th Se; tember, 1906; 6 years. Filed, 28th June, 1905. Recelpt No. 126,438.

Claim.-Whe herwin described process of eliminating the odour of fish ofl, which consists in subjecting a layer of oil to the act on of a silent electrical discharge in a confined almosphere of hylrogen.

No. 100,!31. Gasholder. (iniomitic.
William Gadd, 64 Barton Arcade, Manchester, England, 11th Septenber, 1906; 6 years. Filed loth January, 1906. Receipt No. 131,741.
C'laim.-In gasholders supported by spiral guides the combination therewith of vertical guides and a movable ring
formation arranged around the circle together with the necessary guide and grip rollers connected therewith for the

purpose of giving a vertical rise and fall to this class of gasholders in manner as hercin set forth.

No. 100,932. Method of Forming Epring Clipa. Méthode de former des trnailles a ressort.

Joshua Browning Hale, Providence, Rhode Island, U.S.A.,
11th September, 1906; 6 years. Filed 18th June, 1906. Receipt No. 136,997.
Claim.-1. The method of forming spring wire clips which consists in winding wire into an approximately circular spring coil and simultaneously bending each turn of the coil to form a projection extending beyond the circumferential plane of the body of the coil, and periodically severing a turn of the coll, whereby the uncoiling action of the severed portion of the coil will cause a separation of the said projections.
2. The method of forming spring wire clip; which consist in winding wire upon a rotating arbour to form an approximately circular spring coil, and simultaneously bending each turn of the coll to form an angular portion projecting beyond the circumferential plane of the body of the coil, and periodically severing a turn of the coil. whereby the uncoiling action of the severed part will cause a separation of said angular portions.
3. The method of forming spring clips which consists in winding wire into an approximately circular spring col and providing each turn of said coil with an irregular portion projecting beyond the circumferential plane of the body of the coil, and severing a turn of said coil at periodical intervals, whereby the uncoiling action of the severed parts will cause a separation of the angular portions of said severed part.
4. The method of forming spring clips which consists in winding a wire upon a rotating arbour provided with a longitudinal anvil or rib to form an approximately circular spring coll, the turns of which are provided with an angular portion projecting beyond the circumferential plane of the body of the coil, and finally severing a turn of said coil at periodical intervals, whereby the uncolling action of the severed part will cause a separation of the angular portions of sald severed part.
5. The method of forming spring clips which consists in winding wire into an approximately circular spring coil and providing each turn of said coil with an ear or projection extending beyond the circumferential plane of the body of said coil. and severing a turn of said coll at periodical intervals, whereby the uncoiling action of the severed part will cause a separation of the ears or projections of sald severed part.
6. The method of forming spring wire clips which consists in winding wire into a spring coil, simultaneously bending each turn to form an angular portion offset from the body portion of the strand, and periodically severing a turn of said coll at a point opposite said angular portions, whereby the uncolling action of the severed part will cause a separation of the angular portion of sald severed part.
7. The method of forming spring wire clips which consists in winding wire unon a rotating arbour to form a spring coil, bending each turn of the coll to form an angular member offset from the body of the coll, and periodically severing a turn of said coil at a point opposite sald angular members, whereby the uncoiling action of the severed part will cause a separation of the angular members of said severed part.
8. The method of forming spring wire clips which consists in winding wire into a spring coil, simultaneously bending each turn to form a plurality of aligned angular members offset from the body of the coil, and finally severing every other turn of the coil at a point opposite said angular members, whereby the uncoiling action of the severed part will cause a separation of the angular members of said severed part.
9. The method of forming spring clips which consists in winding wire into a spring coil, sinultaneously bending each turn to form a plurality of aligned angular members offset from the body of said coil and pressing in or straightening a portion of each turn of the coil, and finally severing every other turn of the coil, whereby the uncolling action of the severed part will cause a separation of the angular members of sald severed part.
10. The method of forming spring clips which consists in winding wire into a spring coil and bending the turns thereof to form a longitudinal rib made up of a plurality of aligned cars or projections offset from the body of the said coll, and severing a turn of said coil at periodical intervals, whercby the uncoiling action of the severed part will cause a scparation of the ears or projections of the severed part.

\section*{No. 100,933. Detergent. Procédé d nettoyage.}

Herbert Jackson, 10D Powis Terrace, Bayswater, London,
England, 11th September, 1906; 6 years. Filed 3rd April, 1906. Recelpt No. 134,567 .

Claim.-1. As a detergent, water containing not more than 2 per cent of ammonium oleate free from excessive ammonia.
2. As a detergent, a solution containing not more than 2 per cent of ammonia oleate made by adding olefc acid to water and then introducing ammonia in quantity only sufficient to dissolve the oleic acid.

No. 100,934. Machine for Attaching Fabric to Bozes.
Machinc pour attacher les tissus aux boites.

William Kahle, Boston, Massachusetts, U.S.A., 11th September, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135,467.
Claim.-1. In a machine for attaching fabric to boxes, a fabric holder comprising in its construction a plate provided with a recess in its upper face, a sheet of elastic material extending across said recess, and an elastic pad located beneath said sheet with an aperture therein of smaller area tnan sald recess, whereby the edges of said aperture project over said recess.
2. In a machine for attaching fabric to boxes. a fabric holder comprising in its construction a plate provided with a recess in its upper face, a sheet of elastic material extending across said recess, an elastic pad located beneath said sheet with an aperture therein of smaller area than said recess, whereby the edges of said aperture project over
said recess, and an elastic cushion in the bottom of said recess.
3. In a machine for attaching fabric to boxes, a fabric holder comprising in its construction a plate provided with a recess in its upper face, a sheet of elastic material extending across said recess, an elastic pad located beneath said sheet with an aperture therein of smaller area than said recess, whereby the edges of said aperture project over said recess, and a plurallty of spring actuated clamp fingers adapted to hold a piece of fabric against said sheet of elastic material.
4. In a machine for attaching fabric to boxes, a fabrid holder comprising in its construction a plate provided with a recess in its upper face, a sheet of elastic material extending across said recess, an elastic pad located beneath said sheet with an aperture therein of smaller area than said recess whereby the edges of said aperture projects over said recess.a plurality of spring actuated clamp figures adapted to hold a piece of fabric against said sheet of elastic material, and means to move said fingers out of contact with said fabric.
5. In a machine for attaching fabric to boxes, a fabric holder comprising in its construction a plate provided with a recess in its upper face, a sheet of elastic material extending across said recess, an elastic pad located beneath said sheet with an aperture therein of smaller area than said recess, whereby the edges of sald aperture project over said recess, a support for sald fabric holder, a plurally of spring actuated fingers pivoted to said plate adapted to hold the fabric against sald elastic sheet, and means to simultaneously rock said fingers out of contact with sald fabric.
6. In a machine for attaching fabric to boxes, a fabric holder comprising in its construction a plate provided with a recess in its upper face, a sheet of elastic material extending across said recess, an elastic pad located beneath said shect with an aperture therein of smaller area than said recess, whereby the edges of said aperture project over said recess, a support for said holder, a plurality of fingers pivoted to sald plate, a spring actuated stud engaging each of said fingers resnectively, and a slide adapted to engage sald studs anl simultaneosly move said fingers out of contact with said Iabric.
7. In a machine for attaching fabric to boxes. a fabric holder comprising in its construction a plate provided with a recess in its upper face, a sheet of elastic material extending across said recess, an elastic pad located beneath said sheet with an aperture therein of smaller area than said recess whereby the edges of said aperture project over said recess. a support to which said bolder is detachably fastened. and an clastic cushion in the bottom of said recess.
s. In a machine for attaching fabric to boxes, a fabric holder comprising in its construction a plate provided with a recess in one face thereof, a sheet of elastic material fast to said plate and extending across said recess, and an elastic pad with an aperture therein fast between said plate and -lastic sheet, the edges of said aperture projecting over said rucess.
9. In a machine for attaching fabric to boxes, a fabric holder comprising in its construction a plate provided with a recess in one face thereof, a sheet of elastic material fast to said plate and extending across said recess, an elastic pad with an aperture therein fast between said plate and elastic shert, the edges of said aperture projecting over said recess. and an elastic cushion detachably fastened to said plate at the bottom of said recess.
10. In a machine for attaching fabric to boxes. a fabric liolder providod with a recess in one face thereof, an elastic folding pad fast to said holder and extending across said recess. means to hold a piece of fabric against said folding liad, mechanism adapted to apply adhesive material to said labric. and a reciprocatory holder for a box in alignment with said fabric holder recess, whereby said fabric may be attached to said box and folded over the edges thereof.
11. In a machine for attaching fabric to boxes, a reciprocatory box holder comprising in its construction a holder for the base or top of said box, and a holder for a flange adapted io be fastened to said top, one of said holders movable toward and away from the other.
12. In a machine for attaching fabric to boxes, a reciprocatory box holder comprising in its construction a holder for the base or top of said box, a holder for a flange adapted to be fastoned to said top, one of said holders movable toward and away from the other, and a spring adapted to move sald holders apart
13. In a machine for attaching pabric to boxes, a fabric holder provided with a recess in one face thereof, an elastic folding pad fast to said holder and extending across said recess, means to hold a piece of fabric against said folding pad, a receptacle for adhesive material, i gluing pad, and mechanism to move said gluing pad from said receptacle into contact with said eabric.
14. In a machine for attaching fabric to boxes, a fabric loliler liroviled with a recess in one face thereof an elastic
folding pad fast to said holder and extending across said recess, means to hold a piece of fabric against said folding pad, a receptacle for adhesive material, a gluing pad, mechanism to move said gluing pad from said receptacle into contact with said fabric and vice versa, and means to impart a rotary motion to said gluing pad when the same is being moved as aforesaid.
15. In a machine for attaching fabric to boxes, a fabric holder provided with a recess in one face thereof, an elastic folding pad fast to said holder and extending across sald recess, means to hold a piece of fubric against said folding pad, a receptacle for adhesive material, a gluing pad, mechanism to move said gluing pad from sald receptacle into contact with said fabric, and a reciprocatory holder for a box in allgnment with said fabric holder recess, whereby said fabric may be attached to said box and folded over the edges thereof.
16. In a machine for attaching fabric to boxes, a yieldingly supported fabric holder provided with a recess in one face thereof, an elastic folding pad fast to sald holder and extend ing across said recess, means to hold a piece of fabric against said tolding pad, and means to move said holding means to release sald fabric.
17. In a machine for attaching fabric to boxes, a yleldingly supported fabric holder provided with a recess in one face thereof, an elastic folding pad fast to said holder and extending across sald recess, means to hold a piece of fabric against sald folding pad, and means operated by the movement of said yieldingly supported holder to release said fabric
18. In a machine for attaching fabric to boxes, a fabric holder consisting of a plate provided with a recess in one face thereof, and an elastic pad extending across said recess and having its edges fast to sald plate outside and adjacent to said recess, said pad having a flange on its lower face.
19. In a machine for attaching fabric to boxes, a fabric holder consisting of a plate provided with a recess in one face thereof and a pad formed of elastic sheet material fast to said plate and extending across said recess.
20. In a machine for ataching fabric to boxes, a fabric holder consisting of a plate provided with a recess in one face thereof and a sheet rubber pad fast to said plate and extending across said recess.
21. In a machine for attaching fabric to boxes, a fabric holder consisting of a plate provided with a recess in one face thereof and a pad formed of elastic sheet material extending across said recess, said pad having a flange upon its lower face.

\section*{No. 100,935. Pneumatic Cushion for Vehioles.} Coussinet pneumatique pour rofhicules.

Juchereau de St. Denis Le Moine, Ottawa, Ontario, Canada, 11th September, 1906 ; 6 years. Filed 20 th January, 1906. Receipt No. 132,088.
Claim.-A pneumatic cushioning device comprising an inner member supported from the axle having two annular grooves on the periphery thereof, an outer member secured to the vehicle body having two similar annular grooves on the inside thereof and an annular pneumatic cushion extending between the two members and provided with outwardly extending ribs which engage the sald grooves, as and for the purpose specifled.

\section*{No. 100,936. Mannfacture of Glue. Fabrication de colle forte.}

Christian Wilhelm Luther, 27 Grosse Pernantche Strasse. Reval, Ehstland, Russia, 11th September, 1906; 6 years. Filed 6th October, 1905. Recelpt No. 129,003.
Claim.-Manufacture of a glue suitable for the glueing of hyroscopic porous organic materials in particular wood
consisting in the combination of an albumen soluble in water, a polyvalent base, preferably caustic lime and water, such glue being then stored for a length of time untll it attains a gelatinous condition while stopping short of the maximum consistency so as to obtain a glue the cementing property of which can be calculated and is dependent upon temperature degree of concentration and age, substantially as described.

No. 100,937. Governor. Gouverneur.

The Canadian General Electric Company, Limited. Toronto. Ontario, Canada, assignee of Charles H. Worsey. Lynn, Massachusetts, U.S.A., 11th September, 1906 ; 6 years. Filed 24th March, 1906. Receipt No. 134,225.
Claim.-1. In a governing mechanism, the combination of vaives controlling the passage of fluids, a cam for each valve, a toothed disc for moving the cams which is common thereto, a constantly vibrating lever, means for transmitting motion from the vibrating lever to the toothed disc, a device responsive to load conditions for controlling the action of said means, as specifled.
2. In a governing mechanism, the combination of a piurality of valves controlling the passage of fluid, a cam for opening and closing each of the valves, a toothed disc common to the cams and valves, a shaft common to the disc and cams, a lever fastened to the shaft for rocking it, dogs carried by the lever which are arranged to move the disc in one direction or the other in response to load changes, a lever loosely mounted on the shaft, a shield plate pivotally supported thereon, a speed responsive device, and a connection between the speed responsive device and the shield glate, as specified.
3. In a sDeed governing mechanism, the combination of a valve controlling the passage of fluid, a cam for opening and closing the valve, a toothed disc for operating the cam, a vibrating member, dogs carried thercon, a shield plate moving in response to load charges, and a second toothed disc which co-onerates with the shield plate to control the dogs, the teeth on the disc being of different pitch, as specihed.
4. In a governing mechanism, the combination of a valve for controlling the passage of fluid, a toothed disc for opening and closing the valve, a member which is constantly vibrating, dogs carried by said member and arranged to engage the teeth on the disc, a pivoted shield plate responsive to changes in load for controlling the action of the dogs on the toothed disc, a support therefor, and means movable with th.. disc for resetting the pivoted plate after movable with the valve is mod. as specifled.
5. In a governing mechanism, the combination of a valve for controlling the passage of flutd, a toothed disc for opening and closing the valve, a member which is constantly vibrating, oppositely acting dogs carried by the said mem-
ber, one being arranged to move the disc in one direction step-by-step and the other to move it in the opposite direction step-by-step, a device responsive to speed changes for controlling the action of both dogs, and a toothed means that engages with and restores both dogs to a normal position after the valve has been moved, as specified.
6. In a governing mechanism, the combination of a valve for controlling the passage of fluid, a toothed disc for opening and closing the valve, a vibrating member, oppositely acting dogs carried by said member, a shield plate controlling the action of the dogs which is adapted to be moved a predetermined number of degrees for a predetermIned change in speed, and a means provided with teeth that restores the shield plate to its normal position after the valve is moved, the teeth on said means being separated by a greater angular distance than the teeth on the disc to compensate for the movement of the shicld plate due to a change in speed, as specified.
7. In a governing mechanism, the combination of valves arranged to control the passage of fluid, a toothed means for opening and closing the valves successively, a vibrating member, oppositely actirts dogs carried by said member and arranged to engage the teeth of the said member and move it step-by-step, a pivotally supported shield plate for controlling the action of the dogs, a shaft governor, and a connection between the shaft governor and the shield plate which rocks the shield plate about its pivot, as specified.
8. In a governing mechanism, the combination of a plurality of valves for controlling the passage of motive fluid. an actuator for each valve, a shaft common to said actuators, the actuators being arranged to open and close the valves in predetermined order, a toothed means mounted on the shaft for moving it step-by-step in one direction or the other to meet the load conditions, a source of power, means for transmitting motion from said source to the toothed means, and a device responsive to changes in speed for controlling the action of the dogs, as specifled.
9. In a guverning machine, the combination of a plurality of valves controlling the passage of motive fluid, an actuator for each of the valves, a shaft common to the actuators, a toothed disc mounted rigidly on a shaft for moving all of the actuators, a vibrating lever ireely moving about the axis of the shaft, dogs carried by the lever which \(a r e\) arranged to engage the teeth on the disc and move it in one direction or the other as the load changes, a second lever also movable about the axis of the shaft, a shield plate carried by the second lever for controlling the action of the dogs in response to changes in speed, and a means for restoring the shield plate to its normal position after one or more of the valves have moved. as specified.
10. In a governing mechanism the combination of a valve controlling the passage of motive fluid, a vibrating member, means for connecting the vibrating member to the valve under the control of a speed governor, a shut-off valve. a means for releasing the shut-off valve which is moved by the vibrating member, and a speed responsive device, as specifled.
11. In a governing mechanism the combination of a plurality of admission valves, a means for operating each of the valves, a toothed dise common to said means, a vibrating member, dogs carried by the vibrating member adapted to engage with and actuate the disc, a shut-off valve, a device for actuating it, a means controlling said device which is actuated by the toothed disc and a speed responsive device which is common to the admission and the shut-off valves, as specified.
12. In a governing mechanism the combination of an admission valve, a toother disc for opening and closing the valve, a member which has a constant to-and-fro motion for moving the disc. a shield plate for controlling the action of said means on the valve, a speed responsive device for controlling the action of the shield plate, and a second toothed disc which is smaller in diameter than the first for restoring the shield plate to a neutral position after the valve has been moved in response to a change in speed, as specified.
13. 'In a governing mechanism the combination of a plurality of valves regulating the passage of fluid through a turbine, a device which has a constant to-and-fro movement, a toothed means acted upon by the said device which is common to and actuates the valve, and mechanism responding to load changes for connecting the device and the toothed means in a manner to actuate the latter step-by-step, as: specified.
14. In a governing mechanism the combination of a valve, a device which has a constant to-and-fro movement. dogs carried thereby, a toothed means for opening and closing the valve. a pivoted shield plate controlling the dogs, a speed responslve device, and a connection between the speed responsive device and the shield plate that positively tllts the plate on its pivot to permit the dogs to operate, as speclified.
\$0. 100,938. Governor for Turbines.
Gouicrneur de turbincs.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of William L. R. Emmet, Schenectady, New York, U.S.A., 11th September, 1906 ; 6 years. Filed 22nd May, 1906. Recelpt No. 136,143.
Claim.-1. In a governing mechanism the combination of a valve, a crosshead which is constantly reciprocated in a given path for opening and closing the valve, a means movIng in a plane at an angle to the direction of motion of the crosshead for controlling the action thereof on the valve, and a device responsive to load changes for shifting sald means.
2. In a governing mechanism the combination of a valve, a crosshead which is reciprosated in a given path, a dog carrled by the crosshead for opening and closing the valve, a means moving in a plane at right angles to the direction of motion of the crosshead for moving the dog in a manner to cause it to operate the valve, and a load responsive device for shifting the said means, as and for the purpose specified.
3. In a governing mechanism the combnation of a valve, a means which is reciprocated in a given path, a double acting pivoted dog, carried by the means for operating the valve, a device for snapping the dog first into one of its positions and then the other, and a means responsive to load variations for controlling the action of the dog, as and for the purpose specified.
4. In a governing mechanism the combination of a valve, a means which is reciprocated in a given path, a doubleacting pivoted dog carried by the means for operating the valve, a spring working over a dead center for snapping the dog, first into one of its positions and then the other, and a speed responsive device for tilting the dog in one direction or the other as the load conditions change, as and for the purpose specified.
5. In a governing mechanism the combination of a valve, as actuator, a double ended pivoted dog carried by the actuator adapted to engage the valve stem and move it, a slide for causing one end or the other of the dog to engage the stem, and a speed responsive device for moving the sllde, as and for the purpose specified.
6. In a governing mechanism the combination of a valve having a stem, a crosshead through which the stem freely passes, a means for reciprocating the crossheads without moving the valve, a dog carried by the crosshead which is adapted to engage with and move the valve, and pins moving in response to speed changes for causing the dog to actuate the valve, as and for the purpose specifed.
7. In a governing mechanism the combination of a valve having a stem, a crosshead, a guide therefor, a rock shaft, a connection between the rock shaft and the crosshead for transmitting motion, a valve stem, and a means carried by the crosshead and acting in response to load changes for ofening and closing the valve, as and for the purpose specified.
8. In a governing mechanism the combination of a valve having a stem, a crosshead, a guide therefor, a means for transmitting motion from the crosshead to the valve, a slide uoving at an angle to the path of movement of the crossbead, a gulde therefor, a device carried by the slide for controlling the said means, and a speed responsive device connected to and moving the slide, as and for the purpose, specified.
9. In a governing mechanism the combination of a valve, means for opening and closing the valve, a device for controlling the action of the sald means in response to load
changes and a support for the said device which is normally In motion to prevent the friction of repose, as and for the purpose specified.
10. In a governing mechanism the combination of a valve, a means for opening and closing the valve, a device for controlling the action of the sald means in response to load changes. a guide for said devices having parallel surfaces and means for keeping the guide in action to prevent the friction of repose, as and for the purpose specified
11. In a governing mechanism the combination of a valve, a means for controlling the action of the said means in response to load changes, a pair of connected rock shafts which form a guide for the said device and a driving means for rocking the shafts, as and for the purpose specified.
12. In a governing mechanism the combination of a valve, a means for opening and closing it, a device governing the action of said means, a speed governor connected to the device and a means for taking up the play of the parts, as and for the purpose specifled.
13. In a governing mechanism the combination of a valve, means for opening and closing it, a device governing the action of said means, a speed governor connected to the device and a spring for taking up the play in the connection between the governor and said device, as and for the purpose specified.
14. In a governing mechanism the combination of a plurality of valves, a crosshead which is common thereto, means carried by the crosshead for actuating the valves, a slide arranged to move to and fro at right angles to the plane of movement of the crosshead in response to load changes and pins or projections on the slide for controlling the action of said means, as and for the purpose specified.
15. In a governing mechanism the combination of a plurality of valves, a crosshead which is common thereto, means carried by the crosshead for actuating the valves, a slide arranged to move to and fro at right angles to the plane of movement of the crosshead in response to load changes and pins or projections on the slide arranged in sets to cause the said means to open and close the valves successively, as and for the purpose specifled.
16. In a governing mechanism the combination of a plurality of valves, a crosshead, a rock shaft, cranks and rods driven by the shaft and connected to opposite ends of the crosshead for actuating the valves and a speed responsive device for controlling the action of the dogs, as and for the purpose specifled.
17. In a governing mechanism the combination of a plurality of valves, a crosshead, a rock shaft, cranks or rods driven by the shaft and connected to opposite ends of the crosshead for reciprocating it, dogs carried by the crosshead for actuating the valves. a slide arranged to move at right angles to the plane of movement of the crosshead, means on the slide for controlling the dogs and a speed res ponsive device connected to and moving the slide, as and for the purpose specified.
18. In a governing mechanism the combination of a valve, a two part stem therefor, a coupling between the parts of the stem, a reciprocating crosshead, a means carried by the crosshead which acts through one part of the stem to open and close the valve and a speed responsive device controling the action of said means, as and for the purpose specified.
19. In a governing mechanism the combination of a casing, a plurality of valves, a removable crosshead located in the casing, and dogs mounted on and removable with the crosshead for actuating the valves, as and for the purpose specined,
20. In a governing mechanism the combination of a casing, a plurality of valves, a double acting dog for actuating each of the valves, a spring for causing each dog to snap from one postion to another and a removable crosshead located in the casing to which the dogs and springs are attached and removable therewith.
21. In a governing mechanism the combination of a casing. a plurality of valves, actuators therefor, a crosshead for moving the actuators, a receptacle or tray in the crosshead for supplying lubricant to the actuators, as and for the purpose specfied.
22. In a governing mechanism the combination of a crosshead, a plurality of valves, actuators therefor carried by the crosshead, a sllde arranged to move to and fro, and a four point support for the slide, as and for the purpose specified.
23. In a governing mechanism the combination of weights moving in response to speed changes, an opposing spring, an exclosing barrel to which one end of the spring is attached. a shaft recessed to receive barrel, and means for confining the barrel in place, as and for the purpose specified.
24. In a governing mechanism the combination of weights moving in response to speed changes, knife edge pivots therefor, an opposing spring, an enclosing barrel for the spring and means for securing the barrel in place that also acts as a support for the pivots, as and for the purpose specifled.

No. 100,939. Governor for Turbines. Gouverneur de turbines.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Oscar Junggren, Schenectady, New York, U.S.A., 11th September, 1906; 6 years. Filed 27th February, 1906. Receipt No. 133,366
Claim.-1. In a governing mechanism the combination of a valve which serves both as a regulating and a shut-off valve, a mechanism for moving the valve in a manner to regulate the passage of fluid, a device to load changes for controlling the action of sald mechanism , and means for suddealy actuating the valve under predetermined conditions, as specified.
2. In a governing mechanism the combination of a valve which serves both as a regulating and a shut-off valve, a source of relay power for moving the valve for regulating purposes, a speed responsive device controlling the action of said course on the valve, and a means for suddenly actuating the valve under predetermined conditions, as specified.
3. In a governing mechanism the combination of a valve, a motor for automatically adjusting it to vary the passage of fluid to the apparatus being governed, and a second motor which under predetermined conditions suddenly closes the valve, as specified.
4. In a governing mechanism the combination of a valve, a motor for automatically moving the valve in a manner to vary the passage of fluid to the apparatus under control, a lock for connecting the motor and valve, and a second motor which releases the lock and closes the valve under predetermined conditions, as specified.
5. In a governing mechanism the combination of a valve capable of assuming intermediate positions, a motor for actuating it that is also capable of assuming intermediate fositions, a source of power for the motor, a second motor for operating the valve under predetermined conditions which has two positions only corresponding to the open and closed positions of the valve, and means connecting the second motor and the valve in such manner that the motor moves a full stroke each time it is operated irrespective of the position of the valve, as specified.
6. In a governing mechanism the combination of a valve capable of assuming intermediate positions, a motor directly connected thereto for varying the passage of fluid, a second motor acting on the valve through a lost motion connection, and means responding to the speed changes for disconnecting the first motor from the valve and allowing the second motor to close it, as specified.
7. In a governing mechanism the combination of a valve, a motor for adjusting it to vary the passage of fluid to the apparatus being governed, a load responsive device for moving the valve in a step-by-step manner both in opening and closing, and a second motor acting independently of the first for suddenly closing the valve, as specified.
8. In a governing mechanism the combination of a valve, a motor for adjusting it to vary the passage of fluid to the apparatus being governed, a load responsive device for movtog the valve in a step-by-step manner both in opening and closing, a second motor acting independently of the first for suddenly closing the valve and a speed responsive devise which controls the second motor, as specifed.
9. In a governing mechanism the combination of a valve, 8 motor for adjusting the valve to vary the passage of fluid to the apparatus being governed, a speed responsive device for regulating the motor, a follow-up device to prevent over travel of the motor, a second motor acting independently of the first for suddenly closing the valve, and a means for disconnecting the first motor from the valve and permitting the second motor to act thereon, as specified.
10. In a governing mechanism the combination of a pivotally supported valve, a reciprocating motor, a means for transforming the rectilinear movement of the motor into an oscillating movement of the valve, a second motor for auddenly closing the valve irrespective of the position of the first motor and a speed responsive device for controlling the action of the second motor, as specified.
11. In a governing mechanism the combination of a valve. a fluid actuated motor capable of assuming intermediate positions for moving the valve, a pilot valve responding to load changes for controlling the motor and a weight for suddenly closing the valve in response to predetermined con, ditions, as specified.
12. In a governing mechanism the combination of a valve, a fluid actuated motor capable of assuming intermediate positions for moving the valve, a pilot valve responding to load changes for controlling the motor, a follow-up device for preventing over travel of the motor, a weight for suddenly closing the valve, and means responiding to abnormal conditions for releasing the weight and permitting it to fall and close the valve, as specified.
13. In a governing mechanism the combination of a valve, a motor, a source of relay power therefor, an actuator for the valve connected to and moved by the motor, a means normally connecting the actuator and the valve, a second motor acting independently of the first through a lost motion for closing the valve, the said motor being arranged to first preak the connection between the actuator and the valve, and a device for releasing the second motor and permitting it to break the connection and close the valve, as specified.
14. In a governing mechanism the combination of a valve, a spindle therefor, an actuator loosely mounted on the valve spindle, a device rigidly connected to the valve spinide. a lock carried by the device for rigidly connecting the actuator and the valve spindle, a motor for moving the actuator and through it the valve and a means for controlling the movement of the valve, as specified.
15. In a governing mechanism the combination of a valve, a spindle therefor, an actuator loosely mounted on the valve spindle, a device rigidly connected to the valve spindle, a lock carried by the device for rigidly connecting the actuator and the valve spindle, a motor for moving the actuator and through it the valve, a means for controlling the movement of the valve and a second motor which releases the lock and actuates the valve, as specified.
16. In a governing mechanism the combination of a valve, a motor, a locking device for connecting the movable element of the motor and the valve, a weight, a pivotally supported arm therefor, a latch for holding the arm in a raiged position, and a means for releasing the arm and permitting the weight to fall and release the lock and move the valve, as specified.
17. In a governing mechanism the combination of a valve. a motor capable of assuming intermediate positions for moving the valve, a follow-up device for preventing overtravel of the motor, a second motor having two positions, a latch for restraining the second motor, a speed responsive device for starting and stopping the first motor and asecond speed responsive device for tripping the latch and permitting the second motor to operate and disconnect the first motor from and shut the valve, as spectited.
18. In a governing mechanism the combination of a throttle valve supported by a spindle, a motor for moving the valve to and fro to throttle the admission of fluid to the apparatus being governed 28 the load changes, an actuator loosely mounted on the valve spindle, a clevis secured to the valve spindle, a lock carried by the clevis which normaliy connects the motor and the actuator, an arm loosely mounted on the spindle and acting to release the lock and close the valve by a hammer blow, a weight for moving the arm. and a speed responsive device for releasing the weight and permitting it to suddenly close the valve, as spectfed.
19. In a governing mechanism for turbines the combination of a throttle valve, a motor for automatically adjumting the position of the valve in response to changes in load, a second motor for closing the valve under abnormal conditions, and one or more valves for varying the number of fluid discharging devices in service, as specifted.
20. In a governing mechanism the combination of a throttle valve, a motor for shutting it suddenly in response th abnormal conditions, a fluid actuated motor for moving the valve to throttle the admission of fluid to the apparatus being governed, a pilot valve responding to speed changes for starting and stopping the motor, a crosshead connected
to the movable element of the motor. a speed responsive device, a lever connected to the said device and the pilot valve, and a lever and connecting rod between the firstmentioned lever and the crosshead for restoring the pilot valve to its neutral position when the movable element of the motor has moved an amount corresponding to the movement of the speed responsive device and stopping the motor, as specified.
21. In a governing mechanism the combination of a valve a motor for automatically moving it to and fro to regu'ate the admission of fluid to the apparatus being governed, a second motor for suddenly closing the valve, a device for restraining the second motor, and a manually actuated means for releasing the said device and permitting the second motor to operate, as specified.

\section*{No. 100,940. Governor for Turbines.}

Gouvernetur de turbines.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Oscar Junggren, Schenectady. New York, U.S.A., 11th September. \(1906 ; 6\) years. Filed 15 th June, 1906. Receipt No. 136.920.
Claim.-1. A turbine through which the flow of motive fluid is from the high to the low pressure end, in combination with a valve for regulating the admission of motive fluid and a governor controlled member whose orbit varies with load changes and also moves the valve too and fro to regulate the passage of motive fluid, as and for the purpose specified.
2. An elastic fluld turbine comprising a casing and relatively rotatable elements in combination with a valve for regulating the passage of motive fluld through said elements, a speed responsive device, a member rotating with said device for moving the valve too and fro whose orbit varies in size with load changes to vary the travel of the valve, as and for the purpose specifled.
3. An elastic fluld turbine having wheel buckets and a fluid idmitting device in combination with a valve that regulates the passage of motive fluid to the device and is interposed between it and the source of supply, a speed governor, a member carried by and rotating with the governor whose orbit changes in size with the load and a connection that transmits the rotary motion of said member into too and fro movement of the valve, as and for the purpose specified.
4. An elastic fluid turbine having a wheel bucket and intermediate fluid admitting devices in combination with a valve having a constant too and fro movement varying in amplitude with the load, that is common to the devices to regulate the passage of motive fluid to the devices and is interposed between them and the source of fluid supply, a governor responding to changes in load on the turbine, a member carried by and rotating with the governor weight whose orbit enlarges and diminishes as the load changes and a connection for transmitting the rotary motion of said member into a too and fro motion of the valve and also changes the amplitude of its movement with changes in size of the orbit of the said member, as and for the purpose specified.
5. An elastic fluid turbine having wheel buckets and a fluid admitting device in combination with a valve for regulating the passage of fluid to the device that has a too and fro movement, a fiy wheel driven by the turbine, a weight pivotally mounted on the fly wheel, the wheel and weight changing their relative positions with changes in speed. a member mounted on and moving with the weight whose orbit enlarges and diminishes as the relative positions of the weight and fly wheel change, and a mechanical connection uniting the valve and said member so that the rotary movement of the latter is transformed into a too and fro movement of the valve whose amplitude of stroke varies with changes in the orbit of the said member, as and for the purpose specified.
6. A turbine through which the flow of elastic fluid is constantly from the high to low pressure end, comprising wheel buckets and fluid discharging devices in combination with a valve which moves too and fro to expose a port connected to one of said devices under load conditions and to expose another port under different load conditions, a governor carrying a member which rotates therewith and whose orbit varies with changes in load, and a connection between the member and the valve for moving the latter, as and for the purpose specified.
7. A turbine through which the flow of motive fluid is constantaly from the high to low pressure end, comprising wheel buckets and a fluid discharging device in combination with ports which admit fluid to the device, a valve that opens first one port and then another, a governor responsive to speed changes, a member carried by the governor which rolates therewith and has its orbit changed with changes in load and a connection uniting the said member and valve so that the latter will be moved too and fro to open and close the ports, the extent of said movement being determined by the variations in the size of the orbit of said member, as and for the purpose speclficd.
8. A turbine through which the flow of motive fluid is constantly from the high to the low pressure end, comprising wheel buckets and a fluid discharging device in combination with ports arranged in sets that admit motive fluid to the different devices, one set recelving fluld for light load conditions and another for heavier load conditions, a speed responsive device, a member moving with said device whose orbit varies with the load for moving the valve in a manner to cover and uncover one set of ports for light load conditions and cover and uncover all the ports for heavier load conditions, as and for the purose specifled.
9. A turbine through which the flow of motive fluid is constantly from the high to the low pressure end, comprising wheel buckets, devices discharging motive fluid against the buckets and passages conveying fluid to the devices in combination with a valve arranged to cover and uncover ports communicating with passages. a rotary means for imparting a too and fro movement to the valve. a weight for varying the orbit of said means in accordance "ith load changes and a spring opposing the movements of th? veight, as and for the purpose specified.
10. A turbine comprising wheel bickots, a casing therefor and fluid discharging devices in combination with a valve which is constantly moved too and fro with a given travel for a given load to admit motive fluid to one or more of said devices and is moved in a similar manner but with a greater travel for an increased load, a speed responsive device, a member mounted thereon and rotating therewith whose orbit changes with changes in speed and a mechanical connection for directly transforming and transmitting the orbltal movement of the said member into a too and fro movement of the valve, as and for the purpose specifled.
11. A turbine comprising wheel buckets, a casing therefor and fluid discharging devices, a plurality of ports connecting vith the devices. a valve arranged to move too and fro over the ports, the parts of the valve and the ports having a progressive overlap to successively cut the said devices into and out of service, a speed responsive device, a member carried thereby whose orbit changes in size with changes in load on the turbine and a mechanical connection secured to said member that vibrates the valve and changes its travel in accordance with changes in size of the orbit of said member, as and for the purpose specified.
12. In combination a turbine with a governing mechanism therefor comprising a speed responsive device, a member carried thereby whose orbit enlarges and diminishes with changes in load. a valve for controlling the admission of fluid to the turbine which is driectly vibrated by the said member, the extent of said vibrations varying with variations in size of the orbit of said member, and a reservoir interposed between the valve and the turbine to decrease the pulsatory effects of the motive fluid, as and for the purpose specified.
13. In combination a turbine with a governing mechanism therefor comprising a speed responsive device, a secondary shaft for the governor, gearing between the main and secondary shaft to reduce the speed of the latter, a member carried by the speed responsive device whose orblt enlarges with an increase in load and diminishes with a decrease in load, a controlling valve and a connection between the said member and the valve for moving the latter tuo and fro and changing its travel in accordance with changes in size of the orbit of said member, as and for the purpose specifled.
14. A turblne in combination with ports through which the motive fluid passes, independent fluid discharging devices communicating with the ports. a valve balanced as to fluid pressures having portions of varying widths arranged to cover and uncover the ports to successively cut the discharging devices into and out of service and a governor controlled member whose orbit changes in size with load
changes for moving the valve too and fro and also change the extent of its travel, as and for the purpose specifled.
15. A turbine in combination with means for regulating the passage of motive fluld therethrough, a governor acting by centrifugal force and inertia, a member rotating with the governor whose orbit changes in size with the changes in load and a device connecting the said means and the member for transforming the rotary movement of the latter into the too and fro movement of the former.

No. 100,941. Bmergency Governor. Gouverncur.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Frederick Samuelson, 11th Septem: ber, 1906 ; 6 years. Filed 29th June, 1906. Receipt No. 137,390.
Claim.-1. In an emergency governor of the character described the combination of a rotating shaft, a single centrifugally acting weight positively driven by the shaft and arranged to move bodily, and a regulating mechanism operated by said weight, as and for the purpose specified.
2. In an emergency governor of the character described the combination of a rotating shaft, a centrifugally acting welght which surrounds the shaft and is positively driven thereby, means for opposing the action of the weight, and a mechanIsm normally out of engagement with the weight and operated by it for shutting off the supply power to or from the machine, as and for the purpose specified.
3. In a governor the combination of a rotating shaft, a centrlifugally acting weight, means carried by the shaft on which the weight is slidably mounted to move in a plane transverse to the axis of rotation, means for opposing the action of the weight, and a mechanlsm operated by the weight, as and for the purpose specified.
4. In a governor the combination of a rotating shaft, a centrifugally acting weight which surrounds the shaft, means for supporting the weight on the shaft and permitting it to move in a direction at right angles to he latter, means for orposing the action of the weight, and a mechanism operated by the weight, as and for the purpose specifled.
5. In a governor the combination of a rotating shaft, a centrifugally acting weight which surrounds the shaft, radially extending supporting means on the shaft for the element and on which the latter is free to move, means for opposing the action of the welght, and a mechanism operated by the weight, as and for the purpose specified.
6. In a governor the combination of a rotating shaft, an annular centrifugally acting member surrounding the shaft, radially extending and diametrically opposite projections on the shaft which support the said member, means for op: posing the action of the member, and a regulating mechanism operated by the member, as and for the purpose speciried.
7. In a governor the combination of a rotating shaft, a centrifugally acting member on the shaft, diametrically disposed projections on the shaft for supporting the member, means arranged on one of the projections and disposed within the periphery of the member for opposing the centrifugal action of the latter, and means actuated by the sald member, as and for the purpose specified.
8. In a governor the combination of a rotating shaft, an unequally weighted ring, projections on the shaft which movably support the ring, an abutment arranged on one of the projections which is disposed within the periphery of the ring, a spring on the said projection between the abutment and the ring which opposes the centrifugal action of the latter, and a means adapted to be actuated by the ring which engages the periphery thereof, as and for the purpose specified.
9. In an governing mechanism of the character described the combination of a shaft, a radially moving weight driven
by the shaft, a guide which directs the radial movement of the weight, a means opposing the movements of the weight, and a controller actuated by the weight, as and for the purpose specified.

No. 100,942. Ribbon Device for Typewriters. Appareil de ruban pour clavigraphes.

The Underwood Typewriter Company, New York City, New York, assignee of Carl August Joeressen, Washington, Distriot of Columbia, both in U.S.A., 11th September, 1906; 6 years. Filed 2nd May, 1906. Recelpt No. 135.472.
Claim.-1. In a sight typewriting machine, a ribbon guide, means to interpose the ribbon between the type and the platen, actuating means for the interposing means, sald actuating means being movable to engage the interposing means at different points to vary the throw thereof and means independent of the operation of the machine, determining the position of the actuating means, and causing the ribbon to be moved to a different printing position relatively to the platen.
2. The combination with a ribbon vibrating lever having upon its opposite sides studs at unequal distances from the fulcrum of the lever, of an actuator mounted on a pivot and having slots to engage sald studs, and shiftable upon said pivot to bring either stud into use at will.
3. In combination with a ribbon guide, a suitably fulcrumed lever having connection with said ribbon guide, an arm engaging said lever to oscillate it, and a reciprocating part of the machine carrying said arm, said lever having pins at different distances from its fulcrum and said arm being movably transversely to the plane of the lever's movement and having slots through which it is engaged with the respective pins at will.
4. In a sight writing typewriter having a platen shifting to bring it into printing relation with upper case characters and having a ribbon interposing means which shifts with the platen to maintain its relation and normal operation during upper case printing, means actuating the ribbon interposing means, and means changing the throw imparted by such actuating means independently of other functions of the machine and without changing the normal position to which the ribbon is returned and maintaining the same control of said actuating means over the ribbon interposing means for both positions of the platen.
5. In a sight writing typewriter having a shifting platen and a ribbon interposing means shifting with the platen, and actuating means having a plurality of engagements with the interposing means adapted to be brought into effect at will and each permitting movement of the interposing means relatively to the actuating means during the platen shift.
6. In a sight writing typewriter the combination of a platen shifting from its normal position to receive characters on a different portion of the type bar, a ribbon interposing means movable to and from the printing point and shifting with the platen in order to maintain its normal relation thereto and comprising a suitably fulcrumed lever and an actuating arm movable into engagement with the lever at different distances from its fulcrum whereby it changes the throw imparted to the lever, but permitting independent movement of the lever during the platen shift.
7. In a sight writing typewriter the combination of a shifting platen, a ribbon interposing means shifting with the platen and maintaining its normal relation thereto at different positions of the platen, and comprising a lever through which varying throws may be imparted to the ribbon and an arm through which movement is imparted to the Interposing lever, adapted to engage either of the pins on the lever at will, such engagement being through the medium of a slot extending in the direction in which the lever moves in the shifting of the platen, so as to maintain the throw
varying relation of the parts during either position of the platen.
8. In a sight writing typewriter the combination of a ribbon guide, a pivoted lever by which the ribbon gutde is moved, a means for imparting movement to said lever having a changeable point of connection therewith, and means for changing said point of connection consisting of a longitudinally movable rod engageing the lever moving means.
9. In a sight writing typewriter the combination of a ribbon guide, means through which the ribbon guide is moved, an arm actuating said means carried by a part having in the operation of the machine a tall plece or extension on said arm, and a longitudinally movable rod engaging said extension.
10. In a sight writing typewriter the combination of a ribbon guide, a means for imparting a throw thereto to bring the ribbon over the prfiting point, a means for varying said throw to change the portion of the ribbon brought over the printing point, means for shifting the direction of the ribbon feed, and a connection between the ribbon feed shifting means and the throw varying means whereby one of said parts may be set through the other.
11. In a sight writing typewriter the combination of a ribbon guide, an arm having connection with the ribbon gu!de for moving it mounted on a moving part of the machine and having a movable bearing thereon whereby the amplitude of the movement imparted to the ribbon guide is changed, a ribbon shifting means by which the feed of the ribbon is changed and a connection between the ribbon shifting means and sald arm, whereby the throw of the ribbon is changed through the act of shifting the ribbon feed.
12. In a sight writing typewriter the combination of a ribbon guide, a means for imparting a throw thereto to bring the ribbon over the printing point. a means for varying said throw to change the portion of the ribbon brought over the printing point, means for shifting the direction of the ribbon feed and releasable connection between the ribbon feed, shifting means and the throw varying means, whereby one of said parts may be set through the other.
13. In a sight writing typewriter the combination of a ribbon guide, a pivotally mounted arm having connection with the ribbon guide for imparting a throw thereto and movable on its pivot to vary said connection and amplify or diminish the throw of the ribbon, a longitudinally movable rod engaging said arm. a ribbon feed shifting means and an arm extending from the ribbon feed shifting means and engaging the longitudinally movable rod. for the purposes set forth.
14. In a sight writing typewriter the combination of a ribbon guide, a means imparting a throw to said ribbon guide shiftable 10 vary its connection therewith and to amp ify or diminish the throw thereof, a longitudinally movable rod having a flange by which it engages said means to shift it and a ribbon feed changing mechanism having an arm extunding therefrom into engagement with said flange whereby the rod is moved simultaneously with the shifting of the ribbon feed.
15. In a sight writing typewriter the combination of a rlbbon guide, a pivotally mounted arm having connection with the ribbon guide for imparting a throw thereto and movable on its pivot to vary said connection and amplify or diminish the throw of the ribbon, a longitudinally movable rod engaging said arm, a ribbon feed shifting means and an arm extending from the ribbon feed shifting means and engaging the longitudinally movable rod for the purposes set forth. said rod being rotatable and disengaging its connection with the ribbon feed shifting means by said rotation.
16. In a sight writing typewriter the combination of a ribbon guide, a means imparting a throw to said rlbbon guide shiftable to vary its connection therewith and to amplify or diminish the throw thereof, a longitudinally movable rod having a flange by which it engages said means to shift it, and a ribbon feed changing mechanism having an arm extending therefrom into engagement with said flange whereby the rod is moved simultaneously with the shifting of the ribbon ferd. sald flange having recess therein adapted to be brought into registry with the arm of the ribbon feed changing mechanism to render said arm ineffective as to the longitudinally shiftable rod.
17. In a typewriting machine the combination of key levers, a ribbon vibrator, means operable by the key levers and normally connected with said vibrator for operating it, and means also operable by the key levers but normally disconnected from said vibrator. said last-mentioned means being also adapted to operate the vibrator when connected therewith.
18. In a typewriting machine the combination of key levars, a ribbon vibrator, actuating means operable by the key levers and normally in operative engagement with said vibrator, other actuating meatus also operable by the key
levers and normally out of engagement with said vibrator and switch mechanism for connecting the last-mentioned means with the ribbon vibrator and for disconnecting the first-mentioned means therefrom.
19. In a typewriting machine the combination of a ribbon vibrator. printing keys, means operable thereby to throw said vibrator a given distance from a normal position, and other means also operable by the printing keys and adapted to be connected to said vibrator for throwing it a different dislance from sald position.
20. In a typewriting machine the combination of a ribbon vibrator, a lever having a fixed fulcrum for actuating the same, a vibrating means operative upon sald lever at a predetermined distance from its fixed fulcrum, a second vibrative means operative upon said lever at a different predetermined distance from its fixed fulcrum, and means for shifting said operative means alternately to and out of engagement with said lever.
21. In a visible writing machine the combination of a ribbon, a ribbon winding mechanism, means for reversing th, ribbon winding mechanism, means for holding the rlbbov normally from the printing point, means for moving the ribbon automatically to cover the printing point, and means for altering the extent of said automatic movement. said last-named means being operated by the ribbon reversing means.
22. In a visible writing machine the combination of a pair of ribbon spools arranged one at either side of the printing point, winding means for said spools, means for reversing sald winding means, a ribbon carrier arranged between the spools and normally away from the printing point, means for throwing the carrier upward, one or another of a plurality of predetermined distances to cover the printing point during printing operation, and means for changing automatically from one to another of sald predetermined distances the throw of said carrier.
23. In a visible writing machine the combination of a series of printing keys, a ribbon, a ribbon winding mechanism, means for reversing said ribbon winding mechanism, means operated by the printing keys for moving the ribbon to and from the printing point, and means operatively controlled by said reversing means for altering the to and fro movement of the ribbon.
24. In a visible writing machine the combination of a ribbon carrier, means for moving sald carrier to and from the printing point, a ribbon winding mechanism, means for reversing said ribbon winding mechanism and a switching member operable by sald reversing means to alter the movement of said carrier moving means.
25. In a visible writing machine the combination of a rib bon carrier, a lever adapted to move said carrier to and fro.n the printing point, ribbon winding mechanism. means for reversing said ribbon winding mechanism, and means for simultaneously altering the throw of said lever only when said reversing means is operated.
26. In a visible writing machine the combination of a ribbon, a ribbon winding mechanism, means for reversing the ribbon winding mechanism, means for holding the \(r\),woon normally away from the printing point. means for moving the ribbon automatically to cover the printing point, means cperated by the ribbon reversing means for altering the extent of said automatic movement, and means for rondering said altering means inoperative.
27. In a visible writing machine the combination of a series of printing keys, a universal bar operated by sald printing keys, a ribbon, a ribbon winding mechanism, means for reversing said ribbon winding mechanism, means actuated by said universal bar for moving the ribbon to and from the printing point, means connected with said ribbon winding mechanlsm, and with said reversing means and operable by the latter for altering said to and fro movement of the ribbon, and means for rendering said altering means inoperative.
28. In a typewriting machine the combination of a ribbon vibrator, a single lever for operating said vibrator, a single means operative upon said lever at ode or another of a plurality of predetermined distances from its fulcrum, means for automatically causing said single means to operate on said lever at one or another of said predetermined distances. and means for rendering said automatic means inoperative.
29. In a typewriting machine the combination of printing instrumentalities, a ribbon, means for feeding said ribbon longitudinally a ribbon vibrator, means for throwing said vibrator one or another of a plurality of predetermined distances so as to cause the types to follow one or another of a number of predetermined parallel paths longitudinally of said ribbon, means for automatically changing the throw of said vibrator directly from one to another of said predetermined distances, and means for rendering sald automatic mrans inoperative.

\section*{No. 100,943. Core Drill. forêt d noyau.}

The Keystone Driller Company, Beaver Falls, assignee of John Morris Smith. Reynoldsville, and R. M. Downie and F. W. Ranson. of Beaver Falls, all in Pennsylvania U.S.A., 11th September, \(1906 ; 6\) years. Filed 20th August, 1906. Receipt No. 138,871.
Claim.-1. The combination with a tubular reciprocatory drill stem having a percussion cutter at its lower end, of a tubular core holder located within the stem and having a free longitudinal movement in the same, the lower portion of said tubular core holder being movable freely through the percussion cutter, and a spring engaging the holder and urging the same through said percussion cutter.
2. The combination with a tubular reciprocatory drill stem having a completely closed upper end and an open lower end, of a percussion cutter head surrounding said lower end, a tubular core holder located within the stem and having a free longitudinal movement therein, and a spring engaging the holder and urging the same through the said cutter head.
3. The combination with an imperforate stem tube, of an attaching head completely closing the upper end thereof, a percussion drill head sleeve secured to the lower end of the tube a freely movable core barrel longitudinally slidable in the stem tube and movable through the sleeve, and a colled spring interposed between and bearing against the attaching head and barrel to urge the latter outwardly through the drill head sleeve.
4. The combination with a tubular drill stem, of a longitudinally movable swivel therein, said swivel comprising relatively rotatable members, a core holder carried by one member, and a spring associated with the other member to urge the holder over a core.
5. The combination with a tubular drill stem, of a longitudinally movable core barrel located therein, and a spring having a swivelled bearing upon the core barrel.
6. The combination with a tubular drill stem, of a longi tudinally movable swivel therein comprising relatively rotatable upper and lower members, a tubular core barrel de pending from the lower member, and a coiled spring extending above the swivel and bearing downwardly thereupon.
7. The combination with a tubular drill stem, of a longitudinally movable core barrel located thereln, a cap. carried by the upper end of the barrel and constituting a swivel member, another member including a spindle journalled in the cap, and a coiled spring bearing upon said other member.
8. The combination with a tubular drill stem, of a core holder movable therein, a weight having a swivel connection with the core holder, and a spring associated with the welght.
9. The combination with a tubular reciprocatory drill stem carrying a percussion cutter at its lower end, of a core barrel longitudinally slidable in the stem, a weight having a swivel connection with the upper end of the barrel. and a spring surrounding the weight and bearing against the swivel connection.
10. The combination with a drill stem, of a core barrel longitudinally movable therein and having a can at its upper end, a weight located above the barrel and having a stem journalled in the cap, and a spring coiled about the weight and urging the core barrel downwardly.
11. The combination with a tubular drill stem, of an attaching head secured to the upper end thereof and closing the same, a percussion drill head secured to the lower end of the stem and having an opening therethrough, a tubular core barrel slidably mounted in the stem and movable through the opening. a cap secured to the upper end of the barrel, a weight swivelled on the cap and located between the barrel and attaching head, said weight being adapted to engage with said attaching head, and a spring surrounding the weight and bearing against the attaching head, said spring urging the core barrel downwardly.
12. The combination with a stem, of a core holder movably associated therewith, means for effecting the downward movement of the holder, said means having a swivel connection with the holder, and anti-friction rollers located contiguous to said swivel connection.
13. The combination with a tubular stem, of a core holder longitudinally movable therein, a weight for moving the holder downwardly in the stem, said weight having a swivel conection with the holder and anti-friction rollers carried by said swivel connection.
14. The combination with a stem, of a core nolder movably assoclated therewith, a welght having a swivel connection with the upper end of the core holder, a carrier mounted on the swivel connection and rollers journalled on the carrier and operating against the stem.
15. The combination with a stem, of a core holder movably associated therewith, a weight having a swivel connection with the upper end of the core holder, a carrier mounted on the swivel connection, rollers journalled on the carrier and operating against the stem and a ball bearing interposed between the carrier and holder.
16. The combination with a tubular drill stem, of an at taching head secured to the upper end thereof, a percussion cutter head sleeve secured to the lower end of the stem, a tubular core barrel slidably mounted in the stem and arlanged to move through the cutter head. a cap carried by the upper end of the barrel, a weight located within the barrel and having a spindle journalled in the cap, a carriage collar mounted on the spindle and having recessed seats, rollers journalled in the seats and bearing against the drill stem and a spring surrounding the weight and bearing against the carrier collar.
17. The combination with a drill stem and core holder, of a cutter carried by the lower end of the stem and including a series of rollers having sharpened peripheral edges.
18. The combination with a drill stem and a core holder, of a sleeve carried by the lower and of the stem and having a series of slots, cutting rollers located in the slots, journal means for said rollers mounted on the sleeve and a keeper secured to the sleeve and having ears that extend between the rollers and over the journal means.
19. The combination with a drill stem and a core holder of a sleeve carried by the lower end of the stem and having a series of slots, cutting rollers located in the slots, a ring axle for said rollers located at the end of the sleeve and a keeper secured to the sleeve and having ears that extend between the rollers and over the axle to retain the latter in place.
20. The combination with a drill stem and core holder, of a cutter comprising a sleeve secured to the lower end of the stem, said sleeve having an annular seat and slots intersectIng the same, rollers located in the slots, a ring axle for the rollers located in the seat and a keeper extending over the axle.
21. The combination with a tubular stem, of a core barrel longitudinally movable therein, means detachably associated with the core barrel for effecting the feeding movement thereof over a core and a device for holding the moving means against rotation during the detachment of the barrel therefrom, said device being carried by the stem and said means being movable into and out of engagement therewith.
22. The combination with a tubular stem, of a cutter head carried by the lower end thereof, a lug disposed inside the stem adjacent to the cutter head, a core barrel slidably mounted within the stem, a cap screwed upon the upper end of said barrel, said cap having a socket that receives the lug. and means for urging the barnel outwardly to bring the seat of the cap to a position to receive the lug.

\section*{No. 100,944. Machine for Forming Metallic Stays for Garments.}

Machine pour faire des renforts métalliques pour rêtements.
The Spirella Company, assignee of Francis William Mal:et, both of Meadowville, Pennsylvania, U.S.A., 11th September, 1906 ; 6 years. Filed 20th June, 1906. Receipt No. 137,075.
Claim.-1. In combination with the alterately oscillating wire carrying bars, vertical shafts at opposite sides of said bars and adjustable in their distances from the same, wire bending fingers attached to said shafts and mechanisms 1 m parting alternate oscillatory motion to the shafts, as set forth.
2. In combination with the alternately oscillating wiro carrying bars, pivotally supported eccentrics at opposite sides of said bars, means for locking said eccentrics adjustably in position, shafts pivoted in the eccentrics, wire bending fingers attached to said shafts and mechanism imparting alternate oscillatory motion to the shafts, as set forth.
3. In combination with the pivotally supported wire carrying bars, wire bending fingers disposed at opposite sides of
sald bars, and means imparting alternate oscillatory motion to sald fingers, a rotary horizontal shaft disposed at right

angles to the wire carrying bars, grooved cams attached to said shafts and reversed in their contours, arms pivoted to the said bars and engaging said cams to impart alternate oscillating motion to said bars, as set forth.
4. In combination with the alternately osclllating wire carrying bars, vertical shafts at opposite sides of said bars, wire bending fingers attached to said shafts, a rotary horizontal shaft disposed at right angles to the aforesaid bars, reversely disposed grooved cams attached to said horizontal shafts, arms attached to the vertical shafts and rods connected to said arms and receiving reciprocating motion from the grooved cams, as set forth.
5. In combination with the pivotally supported wire carrying bars, vertical shafts at opposite sides of said bars, wire bending fingers attached to said shafts, a rotary horizontal shaft disposed at right angles to the wire carrying bars, two sets of grooved cams attached to sald horizontal shafts, the contours of the cams of each set being reverse to each other, arms connected to the wire carrying bars and receiving reciprocating motion from one set of sald cams, arms attached to the vertical shafts, and rods connected to said arms and receiving reciprocating motion from the other set of dams, as set forth and shown.
6. In combination with the alternately oscillating wire carrying bars, vertical shafts at opposite sides of sald bars and provided with laterally projecting arms and wire bending fingers attached to said shafts, a rotary horizontal shaft disposed at right angles to the aforesaid bars, grooved cams of reversed contours attached to said horizontal shafts and rods transmitting motion from said cams to the arms of the vertical shafts, and each of said rods composed of two end sections provided with sockets and intermediate sections having right and left threaded ends screwed adjustably into the aforesaid sockets to adjust the length of the rod, as set forth.
7. The combination with the wire carrying bars and alternately oscillating wire bending fingers, of a wire guide leading to said bars and pivoted to swing laterally within limits of the sweeps of said fingers, as set forth.
8. In combination with the wire carrying bars and alternately oscillating wire bending fingers, a wire guide leading to said bars and supported yicldingly to the thrust of the wire, tonsioning plates disposed at opposite sides of the path of the wire to said guide, and means for adjustably wressing sald plates into contact with the wire, as set forth.
9. The combination with the wire carrying bars and wire bending fingers, of an anvil located beyond said bars and in line therewith to recelve the bent wirc. a hammer over sald anvil, and mechanisms actuating said hammer to successlvely strike the said bent wire in transit on the anvil.
10. The combination with the wire carrying bars and wire bending fingers, of an anvil located beyond said bars and in range therewith to receive the bent wire, a guide leading said wire to the anvil, a hammer over said anvil, and mechanisms actuating said hammer to successively strike the wire in transit on the anvil.
11. The combination with the wire carrying bars and wire bending fingers of an anvil located beyond said bars and provided with a longitudinal wire receiving groove in its top and with a depression in said groove, a hammer over said depression and mechanismz actuating said hammer to successively strike the wire in transit, as set forth.
12. The combination with the wire carrying bars and wire bending fingers of an anvil located beyond said bars and provided with a longitudinal groove in its top, push bars corcing the bent wire into said groove, mechanisms actuating sald push bars, a hammer over the groove of the anvil and mechanisms actuating said hammer.
13. The combination with the wire carrying bars and wire bending fingers of an anvil located beyond said bars and provided with a longitudinal groove in its top, a block formed with a guide groove leading the bent wire to the groove of the anvil, levers pivoted to said block, wire pushing dogs pivoted to said levers and riding in the guide groove of the block, springs depressing said dogs, mechanisms imparting osciliatory motion to said levers, a hammer over the groove of the anvil and mechanisms actuating said hammer.
14. The combination with the wire carrying bars and wire bending fingers of an anvil located beyond the said bars and in range therewith, a hammer over said anvil, a spring depressing the hammer and a rotary cam lifting the hammer, as set forth.
15. The combination with the wire carrying bars and wire bending fingers, of an anvil located beyond said bars and in range therewith, a hammer over the anvil and pivoted beyond the same, a post between the anvil and the pivot of the hammer and provided with a vertical guide slot receiving the hammer through it, a horizontal shaft extending through said slot under the hammer and journalled in the post, a hammer lifting cam wheel attached to said shaft within the slot of the post. a spring supported in the post and bearing on the top of the hammer, a screw connected to the post and depressing on the top of the spring, and mechanisms transmitting rotary motion to the aforesaid shafts, as set forth.
16. The combination with the pivoted wire carrying bars and wire bending fingers of an anvil located beyond said bars and in range therewith, a hammer over said anvil and attached to successively strike the bent wire in transit, a block interposed between the anvil and aforesaid bars provided with a guide groove leading to the anvil, wire pushing levers pivoted to the interposed block, a rotary horizontal shaft disposed at right angles to the wire carrying bars. cams of reverse contours mounted on said shafts and imparting oscillatory motion to said bars and to the wire pushing levers.
17. The combination with the pivoted wire carrying bars and wire bending fingers, of an anvil located beyond said bars and in range therewith, a hammer over said anvil and pivoted beyond the same, a post between the anvil and the pivot of the hammer and provided with a vertical guide slot receiving hammer through it, a horizontal shaft extending through the sald slot and journalled in the post, a hammer lifting cam wheel attached to said shaft, a block interposed between the anvil and the wire carrying bars and provided with a guide groove leading to the anvil, wire pushing levers pivoted to the interposed block, a rotary horizontal shaft disposed at right angles to the wire carrying bars, cams of reverse contour mounted on said shaft and imparting oscillatory motion to said bars and to the wire pushing levers, and a train of gears transmitting motion from said shaft to the shaft of the hammer lifting cam wheel, as set forth and shown.
18. In combination with the wire carrying bars, wire bending fingers, wire band straightening hammer, the driving shaft, mechanisms transmitting motion from sald shaft to the aforesald parts, a reel mounted on mandrels, a wheol fastened to one of said mandrels, and provided with means for imparting rotary motion to the reel, a ratchet wheel mounted loosely on said mandrel, a friction disc interposed between said wheels and a lever actuated by the oscillations of the hammer and imparting rotary motion to the aforesaid to the path transversed by said fingers.
19. In combination with the alternately oscillating wirs carrying bars provided with upwardly projecting pins on their front end, the wire bending fingers movable across the ends of said bars and provided with wire engaging notches lower than the top of the bar in ralsed position to bend the wire partly down on the top edge if the bar, as and for the purpose set forth
20. In combination with the wire carrying bars and oscil!. atory wire bending fingers, a laterally yielding wire feed
gulde leading the wire to the path traversed by the aforesaid fingers.
21. In combination with the wire carrying bars and oscillatory wire bending fingers, a laterally ylelding wire feed gulde supported adjustably in elevation and leading the wire to the path transversed by said flugers.
22. In combination with the wire carrying bars and oscillatory wire bending fingers, a post supported adjustably in elevation and a wire feed guide pivotally supported on said post.
23. In combination with the wire carrying bars and wire bending fingers, a post supported adjustably in elevation, a wire feeding guide pivotally supported on said post, a sleeve embracing the post and provided with a screwthreaded perforation in its side, an arm screwed into said perforation and engaging the post, a post secured to the free end of the arm and wire tensioning plates attached to the latter post, as set forth.
24. In comblnation with the reel, a roller parallel with the said reel and provided with right and left grooves in its periphery, a ring surrounding sald roller and movable toward and from the same, tongues in opposite side of the interior of the ring and inclined corresponding to the aforesaid grooved, means for shifting the ring toward and from the roller at opposite end thereof, a guide on the aforesaid ring carrying the wire band toward the reel, and means for transmitting motion to the aforesaid roller.
25. In combination with the reel, a roller parallel with said reel and provided with right and left grooves in its periphery, a ring surrounding said roller and movable toward and from the same, tongues in opposite sides of the interior of said ring and inclined corresponding to the aforesaid grooves, a lug in each of the grooves and disposed a! opposite ends of the roller to throw the ring alternately toward and from the roller, a track parallel with the roller, a stem extending from the ring and disposed to engage the: track alternately at opposite sides, a gulde on the ring carrying the wire band toward the reel, and means for transmitting motion from the reel to the roller, as set. forth.

No. 100,945. Governor for Pumping Engines. Gouverneur pour machines d'épuisement.

Charles Palmer McMullen and William Elmel Nye, both of Wareham, Massachusetts, assignee of Charles Palmer McMullen, Brooklyn, New York, all in the U.S.As, 11th September, 1906; 6 years. Filed 4th April, 1906. Receipts No. 133,682 and 134,614.
Note-This patent is a re-issue of No. 97,032 , bearing date the sixteenth day of January, 1906.

Claim.-1. A governor for pumping engings comprising a cylinder, a trap connected with one end thereof and in operative connection with the water pipe leading from the pump, and means for connecting sald piston with the throttle valve of the engine, said piston being operated in one direction by the water in said pipe, and means for operating said piston if. the opposite direction and for holding the throttle valve normally open, substantially as shown and described.
2. A governor for pumping engines comprising a cylinder, a trap connected with one end thereof and with the water fipe leading from the pumping engine, a piston mounted Within said cylinder and operated in one direction by the water in the pipe leading from the pump, means for connecting said piston with the throttle valve of the pumping engine, devices for moving said piston in the opposite direction and to normally hold the throttle valve open, and means for supplying oll to said trap. substantially as shown and described.

No. 100,946. Apparatus for Purifying Liquids. Appareil pour purifter les liquides.

Emile Gobll, Paris, France, 11th September, 1906; 6 years. Filed 16th January, 1906. Recelpt No. 131,926.
Claim.-Ce que je revendique comme mon invention et desire prot ger par la présente demande de brevet, c'est, un appareil d'epuration de tous liquides ou fluides, caractérisé par des éléments epurateurs constitués par des coquilles, disques, rondelles ou autres, empiles et serres l'un contre i'autre, de facon que le liquide ou le fluide traité s'épure par son passage entre eux, soit de l'exterieur a l'interieur, soit, au contraire, de l'interieur a l'exterieur, ces elements laissant, en outre, repasser le llquide ou le fluide epure en sens inverse pour le nettoyage de l'apparell, après qu'ils ont éte desserrés, ou en les faisant écarter automatiquement, apres desserrage au moyen de ressorts interposes entre eux, les piles d'éléments assemblés sur tubes, tiges ou fonds perfores étant placées dans des réservoirs munis de dispositifs variables suivant leur destination et avec lesquels fls sont combines.

No. 100,947. Feed Mechanism for Magasinen, Etc. Appareil d'alimentation pour magasins.

D. P. Montagne and Charles Owens, assignees of Alexander Lyle, all of Chattanooga, Tennessee, U.S.A., 11th September, 1906 ; 6 years. Flled 13th July, 1906. Receipt No. 137,786.
Claim.-1. In an apparatus of the class described, means for holding the magazines or other articles set up on edge and means for engaging the two opposite lateral edges of the said magazines or other articles and feeding the same from the holding means, substantially as described.
2. In combination in a machine of the class described, means for holding the magazines or other articles set up on

Datrued by
edge and means for entering between the leaves at the opposite side edges of the said magazine or other article to remove it from the holding means, substantially as described.
3. In combination a holder for the magazines or other articles to hold them set up on edge, and feed means for the said articles comprising feed fingers, rotary carrying means therefor and means for automatically advancing and retracting the said feed fingers in relation to the carrying means, and substantially transverse to the paths travelled by them, substantially as described.
4. In combination a holder for the magazines or other articles and feed means for the said articles consisting of carrying means, feed fingers carried thereby and means for advancing the feed fingers substantlally at right angles to the paths they travel to enter between the folds or leaves of the article and from opposite ends thercol when the said feed fingers arrive at a certain point in relation to the said article. substantially as described.
5. In combination holding means, carrying means having turning movement and feed fingers carried thereby and having advancing and retracting movement in relation to the said carrying means to grasp the articles to be fed, substantially as described.
' oombination in apparatus of the class described, a holder for the articles to be fed, carrying means having: turning movement and provided with guide flanges for the articles, feed fingers on the said carrying means having movement in a direction transversely of the flanges to engage the articles at opposite ends, substantially as described.
7. In combination in apparatus of the class described, means for holding the articles set up on edge, carrying means. and feed fingers carried thereby to engage the articles, said feed fingers having advancing and retracting movement in relation to the carrying means to engage the articles, substantially as described.
8. In combination in an apparatus of the class described, means for holding the articles set up on edge, feed fingers to engage the said articles and carrying means for the said feed fingers having turning movement and on which the sald feed fingers have movement, substantially as described.
9. In combination in apparatus of the class described, means for holding the articles set up on edge, feed fingers, turning carrying means for the sald feed fingers adapted to lift the articles from the holding means, said feed fingers having movement in relation to the said carrying means. substantially as described.
10. In comblnation in apparatus of the class described, means for holding the articles set up on edge, feed fingers, carrying means therefor rotating in one direction and means comprising a cam for controlling the position of the feed ficgers on the said carrying means, substantially as described.
11. In combination in apparatus of the class described means for holding the articles, feed fingers, carriers rotating constantly in one direction on which the said feed fingers are supported and means for advancing and retracting the feed fingers, substantially as described.
12. In combination holding means for the articles, feed fingers, carriers therefor rotating only in one direction and adjustable cam means for controlling the position of the feed fingers on the carriers in relation to the article to be fcd, substantially as described.
13. In combination holding means for the articles, carrier means having turning movement. feed fingers on the carrier means, arms carrying said feed fingers adjustable radially of the carrying means, and car means for operating the arms stbstantlally as described.
14. In combination, holding means for the articles, feed fingers, carrier means therefor, means for advancing and retracting the feed fingers and means for adjusting them radially of the carrier means, substantially as described.
15. In combination the holding means having the ledge or stop against which the articles are held set up on edge, feed fingers for engaging the two opposite lateral edges of the article to be fed and carrying means for the feed fingers, said feed fingers being adapted to lift the articles over, the sald ledge or stop, substantially as described.
16. In combination in apparatus of the class described, holding means for the articles, a ledge or stop against which the articles bear when set up on edge, automatic follower means for pressing the upper parts of the artcles forwardly and feed fingers with carrier means for engaging the opposite lateral edges of the articles, substantially as desscribed.
17. In combination the ledge or stop, endless bands or rhains for prossing the articles against the stop, follower merans for pressing forwardly the upper parts of the article, and means engaging the opposite ends of the article for lifting them over the ledge or stop and feeding the same freward. substantially as described.
18. In combination the ledge or stop, endless bands or chains for pressing the articles against the stop. follower muans for pressing forwardly the upper parts of the articles, and means engaging the opposite ends of the articles for lifting them over the ledge or stop and feeding the same forward, said follower means consisting of the rolls having gears associated therewith and rack bars with which the gears engage, substantially as described.
19. In combination holding means for the articles, fecd fingers to engage the opposite side edges of the articles, carrying means therefor arranged to turn, said carrying means being associated with a cylindrical or partly cylindrical surface or surfaces upon which the articles rest when drawn from the holding means. substantially as described.
20. In combination means for supporting the magazines or articles set up on edge, rotary means associated with a cylindrical or partly cylindrical surface or surfaces to receive the articles, feed fingers carried by the rotary means, and means for advancing and retracting the feed fingers in line parallel with the axis of rotation, said feed fingers withdrawing the articles from the holder onto the cylindrical surface, substantially as described.

No. 100,948. Match Making Machinery.
Machine d faire des allumetles.

Ferral Carlton Dininny, New York City, New York, assignee of Almon Beeman Calkins, Franklin, New Jersey, both in the U.S.A., 11th September. 1906; 6 years. Filed 6th September, 1901. Recelpt No. 90.104.
Claim.-1. In matchmaking machinery the combination with veneer card cutting mechanism, of a feed trough for the feed trough to said cutting mechanism, a feed plate rototably mounted upon a a \(h\) of the sald feed racks, but secured against relative endwise movement thereon and operating we.ans for the said feed racks.
2. In matchmaking machinery the combination with veneer card cutting mechanism, of a feed trough ror the vencer cards, two feed racks for feeding the cards in said feed toough to said cutting mechanism, a feed plate rotatably mounted upon each of the sald feed racks but secured against relative endwise movement thereon, and means for independently operating either of the said feed racks.
3. In matchmaking machinery the combination with veneer card cutting mechanism, of a feed trough for the veneer cards, a stationary gulde rod on either side of the feed trough, two feed racks each having a lug which surrounds and loosely engages one each of the sald guide ords, two pusher or feed plates, each rotatably mounted on the lug of cne each of the said feed racks, feed pawls on the said racks. and means for disengaging either or both of the said feed pawls irom their respective feed racks.
4. In matchmaking machinery the combination with veneer card cutting mechanism, of a feed trough for the veneer cards, a stationary guide rod 30 on elther side of the feed trough, two feed racks 32 , each having a lug 33 in loose engagement with sald guide rods. two pusher or feed plates 34 rotatably mounted upon the lugs 33, a transverse rock shaft 38, feed pawls 36 carried thereby and tripper shafts for disengaging cither or both of the said feed pawls 36 from thelr respective racks.
5. In matchmaking machinery the combination with veneer card cutting mechanism, of a feed trough for the veneer cards, two feed racks arranged one each on elther side of the feed trough, a transverse rock shaft having feed pawls adapted to engage the said fced racks, tripper shafts having a connection with the said feed pawls whereby upon the operation of the said shafts either or both of the said pawls may be disengaged from their respective racks.
6. In matchmaking machinery the combination with veneer card cutting mechanism, of a feed trough for the vencer cards, two fced racks arranged one each on elther side of the
feed trough, a rock shaft having feed pawls adapted to engage the said feed racks, two rotatably mounted tripper shafts 44, each having an operating handle and each having a pin 46 in engagement with staples 48 upon the feed pawls.
i. In matchmaking machinery the combination with veneer card cutting mechanism, of a feed trough for the vencer cards, duplicate feeding means for feeding the cards in said feed trough to said cutting mechanism, a leed plate rotatably mounted with respect to each of said feeding means, but secured against relatively endwise movement thereon and independent operating means for each of the said duplicate feeding means.
8. In matchmaking machinery the combination with rotary cutters, of receivers for receiving the splints thereform, adapted to convey the same to carrier frames for the splints, plungers for expelling the splints from the receivers and forcing them into the frames after the recelvers have been moved in the direction, and means for giving a step by step feeding means for feeding veneer cards to the cutting mechanism, comprising a feed trough and two independently operated feed plates, each rotatably mounted to swing out of the path of the cards in the trough, substantially as specifled.
9. In matchmaking machinery the combination with rotary cutters, a feed plunger for feeding veneer cards thereto, and means for reciprocating the feed plunger, of receivers for receiving the splints into which the veneer cards are separated by the cutters and for conveying the same to carrier frames, and means for intermittently reciprocating the receivers once for every reciprocation of the said feed plunger, together with duplicate feeding means for feeding veneer cards to said feed plunger, comprising a feed trough and two independently operated feed plates, each rotatably mounted to swing out of the path of the cards in the trough, substantially as specified.
10. In matchmaking machinery the combination with rotary cutters, a feed plunger for feeding veneer cards thereto, and means for reciprocating the feed plunger, of receivers for receiving the splints into which the veneer cards are separated by the cutters and for conveying the same to carrier frames, and a cam for intermittently reciprocating the receivers once for every reciprocation of the said feed plunger, together with duplicate feeding means for feeding veneer cards to said feed plunger, comprising a feed trough and two independently operated feed plates each rotatably mounted to swing out of the path of the cards in the trough, substantially as specified.

No. 100,949. Machine for Making Wire Fences. Machine d faire des clôtures de al de fer.

Maud H. Smart, assignee of Jonathan Harris, both of Cleveland, Ohio, U.S.A., 11th September, 1906; 6 years. Filed 12th May, 1905. Receipt No. 125,128.
Claim.-1. In a machine for making wire fence, the combination with yielding and statlonary upper dies, and vertically reciprocating lower dies, of a staple feeding trough
adjacent to the lower dies, a staple carrying blade pivoted to the outer end of the said trough, staples thereon, a spring detent in the trough at the upper end and means for lowering said blade, and for threafter releasing said detent to permit one staple to fall into the lower die, substantially as described.
2. The combination with lower dies, and a rigid inclined trough adjacent thereto, of a staple storage blade pivoted to the upper end of the trough, a spring detent arranged to resist the passage of staples in the trough, and means for controlling the movements of the detent to intercept the staples and to release the remaining staple when the blade is lowered, substantially as described.
3. In a device for the purpose described, in combination, a vertically reciprocating lower die, comprising a longitudinally and doubly grooved portion and adjacent vertical wedge-shaped portion, and upper dies comprising a vertically ylelding primary recessed portion, and a stationary bending die provided with a transversely and doubly grooved portion, substantially as and for the purpose described.
4. In a device for the purpose described, in combination, an upper die comprising a vertically yielding portion provided with a single recess in its lower face and a fixed portion provided with a transversely and doubly grooved lower face, of a lower vertically reciprocating die provided with a doubly grooved upper surface underneath the yielding upper die, and with a wedge-shaped portion underneath the fixed upper die, an inclined trough leading to the lower grooved die, wires intersecting over the grooved portion of the lower die, a staple feeding and storing device, a releasable detent for the staples, and means for lowering the staple storing device, previous to releasing the said detent, substantially as described.
5. In means for attaching staples to intersecting fence wires, the combination with the intersecting wires, of upper and lower dies, adjacent to the intersecting points thereof, and a device for feeding staples, one at a time, to said dies, comprising an inclined trough, a staple storage blade pivoted to the outer end of said trough, a spring detent in the upper end of the trough adapted to retain the lower staple, means for releasing said detent, and means for lowering the storage blade with the staples thereon, previous to releasing said detent whereby one staple only will be delivered at a time to the dies, substantially as described.
6. The combination with the lower dies of a staple attaching device for wire fencing, of a trough leading to said dies. a staple storage blade pivoted to the upper end thereof, a spring detent at the upper end of said trough, adapted to retain a staple discharged into said trough from said blade, means for operating said detent, consisting of a rotatable cam adjacent thereto, and means for lowering said blade to prevent the staples thereon from passing into said trough when the detent is released, and for elevating the blade to provide another staple for the trough, substantially as described.
7. In a machine for the purpose described, an upper die, one portion of which is yielding and the other portion fixed, a vertically reciprocating lower die, a transverse bar in which said lower bar is fixed, a main shaft and cam thereon engaging said transverse bar, and a staple feed device comprising a trough communicating with the lower die, at its lower end, a staple storage blade pivoted to said trough, and discharging therein, a detent in the upper end of the trough adapted to retain a staple from the said blade, means for withdrawing said detent to release sald staple and for replacing the same, means for lowering said blade to prevent the discharge of the staples thereon until said detent is replaced, and cams upon said main shaft, and mechanism controlled thereby for operating said blade and detent, substantially as described.
8. In a device for the purpose described, the combination with a vertically reciprocating lower die, and operating main shaft, and cam therefor, of a staple feed device. consisting of an inclined trough and staple storage blade pivotted thereto, a rock bar adapted to raise and lower said trough, a shaft and cam thereon adapted to control the movement of said detent, and cams upon said main shaft, and intermediate mechanism adapted to control the movements of said rock bar, and detent controlling cam, substantially as described.

\section*{No. 100,950. Pipe Joint. Joint de tuyau.}

Arthur L. Greenlaw, Malden and Wesley W. Blair, Boston, both in Massachusetts, U.S.A., 11th September, 1906: 6 years. Filed 4th May, 1906. Receipt No. 135,550.
Claim.-1. In a flexible pipe joint the combination of a casing, pipe members each provided with a flaring end extending within sald casing, a head secured to either end of said casing provided with a seat for one of said flaring ends, and means located within said ends for forcing each of sald flaring ends to 1 ts seat.
2. In a flexible pipe joint the combination of a casing, pipe members each provided with a flaring end extending within

said casing, a head secured to either end of sald casing provided with a seat for one of said flaring ends, a tubular connector interposed between said flaring ends, and means for forcing each of sald flaring ends to its seat.
3. In a flexible pipe joint the combination of a casing. pipe members each provided with a flaring end extending within sald casing, a head secured to either end of sald casing provided with a seat for each of said flaring ends, a tubular connector interposed between sald flaring ends, means for forcing each of said flaring ends to its seat, and means for adjusting said heads longitudinally of said casing.
4. In a flexible pipe joint the combination of a casing, plpe members each provided with a flaring end extending within said casing, a head secured to either end of sald casing provided with a seat for one of said flaring ends, a tubular connector interposed between said flaring ends, means for forcing each of said flaring ends to its seat, means for adjusting said heads longitudinally of said casing, and means for locking said heads in adjusted position.
5. In a flexible plpe joint the combination of a casing, pipe members each provided with a ball-shaped end located partially within said casing, a head secured to elther end of sald casing provided with a seat for a ball-shaped end. a divided tubular connector interposed between said bal'shaped ends, and means for forcing the outer enis of said divided connector against the Interior face of said ballshaped ends.
6. In a flexible pipe foint the combination of a casing. pipe members each provided with a ball-shaped end located partlally within said casing, a head secured to either end of said casing provided with a seat for a ball-shaped end, a divided tubular connector interposed between said ballshaped ends, means for forcing the outer ends of said divided connector against the interior face of said bell-shaped ends, and means for adjusting the heads longitudinaily of said casing.
7. In a flexible pipe joint the combination of a casing, plpe members each provided with ball-shaped end located partlally within said casing, a head secured to elther end of sald casing provided with a seat for a ball-shaped end, a telescopic connector interposed between sald bell-shaped ends, and means for forcing the ends of said telescopic connector against the interlor surface of sald ends.
8. In a flexlble plpe joint the combination of a casing, pipe members each provided with a ball-shaped end located partially within said casing, a head secured to either end of sald casing provided with a seat for a ball-shaped end, a telescopic connector end of which is provided with a flaring mouth and an annular seat fitting the interior face of sald ball-shaped ends, and means for forcing the ends of said telescopic against the interior surface of said ends.
9. In a flexible pipe joint the combination of a casing. pipe members each provided with a ball-shaped end located partially within said casing, a head secured to either end of said casing provided with a seat for a ball-shaped end, two tubular members telescopically connected together each provided with a flaring end having a seat against the interior face of said ball-shaped ends, and means for forcing said members apart to insure the proper seating of said ends.
10. In a flexible pipe joint the combination of a casing. pipe members each provided with ball-shaped end located partlally within said casing, a head secured to either end of said casing provided with a seat for a ball-shaped end, two tubular members telescopically connected together each provided with an annular flange and a spring interposed between said flanges.
11. In a flexible plpe joint the combination of a casing. pipe members each provided with a ball-shaped end located partlally within sald casing, a head secured to elther end of said casing provided with a seat for a ball-shaped end. and a packing ring held by said head to protect sald seat.
12. In a flexible pipe foint the combination of a casing, a pipe member provided with a ball-shaped end located partlally within said casing, a head secured to an end of said casing provided with a seat for said ball-shaped end, and a packing ring held by said head contacting with said ballshaped end outside of sald seat.

No. 100,951. Water Cleaning Device.

\section*{Apparetl de nettoyage d'eau.}

The United Injector Company, New York City, New York, assignee of William R. Park, of Taunton, Massachusetts. both in the U.S.A., 11th September, 1906; 6 years. Filed 22nd May, 1906. Receipt No. 136,158.
Claim.-1. In a device of the character described a vessel having a perforated top and central annulus with a dependink skirt thereon, a re-entrant outlet with its mouth under the skirt, a valve sliding in the annulus to control the outlet, and means extending from the valve to operate the same.
2. The combination of a trap vessel having an apertured top and re-entrant outlet, of a valve for the outlet sliding in a bearing in the vessel top and adapted to be inserted in the said bearing from the outside of the vessel.
3. The combination with a trap vessel having an apertured top and re-entrant outlet, of a valve for the outlet sliding in a bearing in the vessel top and adapted to be inserted in the said bearing from the outside of the vessel, a strainer dome over the valve having space therein to accommodate the valve when lifted, and valve operating means extending through the strainer-dome.

\section*{No. 100,952. Feed Water Filter.}

\section*{Filtre d'eau d'alimentation.}

Henry E. Ferchen and Alexander Easler, assignee of onehalf of the interest, both of Vancouver, British Columbla, Canada, 11th September. 1906 ; 6 years. Flled 4th June, 1906. Reccipt No. 136,539.
Claim.-1. As a filter for the removal of grease and ofl from feed water, an elongated open trough having at the end in which the water is delivered a receiving compartment with a borizontal removable perforated distributing plate and at the outer end an overflow wall that will retain the trough practically full of water, a passage from the receiving compartment to the trough in the level of the bottom, a partition adjacent over which the water may flow, a partition at the other end adjacent to the overfiow having an under passage, and a series of removable gauze screens throughout the length of the trough.
2. As a filter for the removal of oil or grease from feed water, an open trough surrounding a rectangular downward aperture, one of the end walls of which aperture is lower than the other walls of the trough to form an overflow into the central aperture, a partition produced from one of the sides of the aserture terminating the trough beyond the overflow, a receiving compartment across the end of the trough adjacent to such termination, a passage in the level of the bottom from the receiving compartment to the beginning of the trough, an overflow partition across the trough adjacent to such entering passage, an underfiow partition across the box adjacent to the outlet overflow and a series of removable gauze screens across the trough.
3. As a fllter for the removal of oll or grease from feed water, the receiving recentacle 7 having the perforated screen 4, the passage 13 communicating with the open trough 7 surrounding the downward aperture 10 , the overflow parti-
tion 16 adjacent to the inlet passage, the overflow partition 11 adjacent to the outlet 10 , the underflow partition 8 ad-

jacent to the overflow 11 and the removable gauze screens 17.

No. 100,953. System of Ventilating Railway Cars. Système de centilation de chars de chemins de fer.

George Henry Layng, Toronto, Ontario, Canada, 11th September, 1906 ; 6 years. Filed 13th March, 1906. Receipt No. 133.862.
Claim.-1. In a car the combination with the roof thereof, false ceiling within said car provided with apertures or holes to permit air from the body of the car to pass into the space between said false ceiling and said roof, and means whereby a current of fresh air is passed from the outside of the car into and out of said space, of a conduit or pipe longitudinally placed within the body of the car and below said false ceiling and in proximity to the apertures or holes therein, whereby fresh air passes from the outside of the car through a plurality of apertures or holes formed in the upper side of said conduit or pipe so as to direct said fresh air upward towards said apertures or holes in said false ceiling, so as to carry the foul air from the car body into said space and thereout through the means before mentioned for permitting the passage of air into and out of said space.
2. In a car the combination with the roof thereof, a false ceiling within said car provided with apertures or holes to permit air from the body of the car to pass into the space between said false ceiling and said roof, and means whereby a current of fresh air is passed from the outside of the car into and out of said space, of a conduit or pipe longitudinally placed within the body of the car and below said false celling and in proximity to the apertures or holes therein, whereby fresh air passes from the outside of the car through a plurality of apertures or holes formed in the upper side of said conduit or pipe so as to direct said fresh air upward towards said apertures or holes in said false ceiling, so as tc carry the foul air from the car body into said space and thereout through the means before mentioned for permitting the passage of air into and out of said space, and means for controlling the passage of air through said conduit or pipe
3. In a car the combination with the roof thereof, a false ceiling within said car provided with apertures or holes to permit air from the body of the car to pass into the space between said false ceiling and said roof, means for control ling the opening and closing of said apertures or holes, and means whereby a current of fresh air is passed from the outside of the car into and out of said space, of a conduit or pipe longitudinally placed within the body of the car and below said false ceiling and in proximity to the apertures or holes therein, whereby fresh air passes from the outside of the car through a plurality of apertures or holes formed in the upperside of said conduit or pipe so as to direct said fresh air upward towards said apertures or holes in said false ceiling, so as to carry the foul air from the car body into said spase and thereout through the means before mentioned for permitting the passage of air into and out of said space, and means for controlling the passage of air through said conduit or pipe.
4. In a car the combination with the roof thereof, a false ceiling within said car provided with apertures or holes to permit air from the body of the car to pass into the space between said false ceiling and said roof, a plurality of slats positioned so as to open and close said apertures or holes apertures or holes therein, whereby fresh air passes from the outside of the car into and out of said space, of a conduit or pipe longitudinally placed within the body of the car and below said false ceiling and in proximity to the apertures or holes therein, whereby fresh air passs from the outside of the car through a plurality of apertures or holes formed in the upper side of said conduit or pipe so as to direct said fresh air upward towards said apertures or holes in said false ceiling, so as to carry the foul air from the car body into said space and thereout through the means before-mentioned for permitting the passage of air into and out of said space, and means for controlling the passage of air through said conduit or pipe.

No. 100,954. Clothes Pin. Epingle à linge.

Joseph Gideon Cartier, Winnipeg, Manitoba, Canada, 11th September, 1906; 6 years. Filed 28th March, 1906. Receipt No. 134,370.
Claim.-1. A clothes pin comprising a single loop through which the clothes line is designed to extend and one resilient short arm terminating in a suitable grip to straddle the wire and one long arm terminating in a suitable grip designed tf straddle the wire, as and for the purpose specified.
2. A clothes pin comprising a single wire loop througb which the clothes line is designed to extend and one resilent short arm terminating in a coil designed to straddle the wire and one long arm designed to straddle the wire, as and for the purpose specified.

No. 100,955. Cigarette Making Machine. Machine d faire des cigarettes.

Napoleon Du Brul, Cincinnati, Ohio, U.S.A., 11th September, 1906; 6 years. Filed 26th April, 1905. Rece!pt No 124,618.
Claim.-1. In a tobacco feeding mechanism for cigarette machines, an apron upon which the tobacco is dellvered and a compresing roller beneath which the tobacco is fed by the belt, said compressing roller having its periphery spirally grooved.
2. In a tobacco feeding mechanism for cigarette machines the combination of the apron upon which the tobacco is delivered, an auxillary compression roll, a main compression roller and a swinging frame pivoted upon the axis of the main compression roller, the outer end of which supports the auxiliary compresison roller in aljustable relation to the feeding apron.
3. In a tobacco feeding mechanism for cigarette machines the combination of the apron upon which the tobacco is delivered, the main compressing roller beneath which the tobacco is passed, and the auxiliary compressing roller adjustably mounted by a frame swinging about the axis of the main compressing roller, said rolls being both spirally grooved.
4. In a tobacco feeding mechanism for cigarette machines the combination of the apron upon which the tobacco is delivered, the main compression roll, the swinging frome pivotolly mounted upon the axis thereof, the auxiliary compression roll mounted in the outer swinging end of the said frame and a screw for regulating the height of the auxiliary compression roll above the feeding apron.
5. In a cigarette machine the combination with means for feeding and compressing the tobacco, of tobacco carding means, comprising the short toothed picker roll and the relatively long toothed stripper roll slightly meshing therewith, means for forming the tobacco into a rope, means for wrapping the tobacco rope in a paper wrapper, and means for cutting into lengths the cigarette rod thus formed.
6. In a cigarette machine the combination with means for fceding and compressing the tobacco, of the short tooth picker roll, the guiding roller co-operating therewith, the ielatively long toothed stripper roll slightly intermeshing with the picker roll. means for forming the tobacco into a continuous rod, means for feeding the wrapper to the continuous cigarette rod, means for pasting sald wrapper, means for encasing the cigarette rod therein, and means for cutting into lengths the cigarette rod thus formed.
7. In a cigarette machine the combination with the tobacco feeding means, the compressing means, the carding means, the rope forming means, the wrapping means, and the means for cutting into lengths of the continuous cigarette rod thus formed, of exhaust mechanism for drawing off dust from the tobaceo.
8. In a cigarette machine the combination with the tobacco feeding means, the compressing moans, the carding means, the rope forming means, the wrapping means and the means for cutting into lengths of the continuous cigarette rod thus formed, of a stripper roll by means of which the tobacco

Is discharged from the carding mechanism and an exhaust for drawing off dust from the tobacco.
9. In a cigarette machine the combination with the tobacco fecding means, the compressing means, the carding means, the rope forming means, the wrapping means and the means for cutting into lengths of the continuous cigarette rod thus formed, a a stripper roll lying parallel to the rope forming mechanism and a dust exhausting means drawing transversely to the rope and axis of the stripper roll.
10. In a clgarette machine a rope forming mechanism comprising an endless belt, the pulley between which the belt is stretched, the supporting rollers over which the belt runs at intermediate points, and the pairs of lateral rollera located at intervals and shaping the belt into the desired fcrm.
11. In a rope forming mechanism for cigarette machines the combination of the endless belt, the adjustable side members, the paired shaping rollers mounted on the side members, and an adjustable connection between the side members by which their distance apart may be determined at will.
12. In a rope former for cigarette machines, the combination of the belt, the adjustable side members, the seriea of pairs of belt forming rollers mounted upon the side members, each side member carrying one roller of each pair, means for determining the distance between the side members, and the supporting rollers, each mounted on a side member.
13. A rope former for cigarette machines comprising an endless belt, the paired forming rollers, and the relatively adjustable side members supporting the forming rollers.
14. A rope former for cigarette machines comprising the pivoted side members, the adjusting screw connecting them, the paired forming rollers, and the endless belt.
15. The combination of the relatively adjustable side members, the paired forming rollers mounted thereon, the endless belt running between the forming rollers, the condensing wheel, and the adjusting screw drawing the side inembers together and pressing the belt, through means of the forming rollers, against the condensing wheel.
16. In a wrapper attachment for clgarette machines, the tape or paper guide comprising the deflecting part and the guide swinging therefrom and supported by the tape or paper passing therethrough.
17. In a paper attachment for cigarette machines, the deflecting part carrying the hinging guide, and having adjusting screws for shifting it laterally.
18. In a wrapper mechanism, having a paper feed and a tape, an adjustable guide for the paper having a curved portion over which the paper is deflected before passing upon the tape.
19. In a wrapper applying mechanism for cigarette machines the combination of the paper supply, the tape, and independently adjustable deflecting and guiding means for said paper and tape respectively.
20. In a wrapper attachment for cigarette machines, the combination of the tape deflecting roller, the guide hinging therefrom, the guide through which the paper passes having a curved part over which the paper is deflected before reaching the tape and the set screws for adjusting the guide laterally.
21. In a cigarette machine, the combination with an endless tape, a driving wheel to propel the same, forming devices to form the cigarette rod upon the tape, adjustable flanged guides fitted to the edges of tape and wrapper, the one guiding the tape to a deflecting roller, the other guiding the paper over a stationary ironing and smoothing deflecting end, pins on which the guldes are adapted to swing and set screws to vary the relation of the guides to each other and the forming tube.
22. In a cigarette machine, the combination of a main drive shaft, a tape, a tape driven wheel driven from the main drive shaft, and a pair of independent paper drive rolls having driving connections imparting to them the same surface speed as that imparted to the tape drive wheel.
23. In a paper cigarette machine, having a main drive shaft and a tape drive wheel connected directly therewith, independent paper drive rolls also geared directly to the main shaft and driven thereby at the same peripheral speed as the tape drive wheel.
24. In a paper cigarette machine, the combination of the main shaft, the tape having its driving means directly connected with the main shaft, a pair of independent paper Urive rolls also directly connected with the main shaft, and driven thereby at the same surface speed as the tape driving means, a cutter also driven from the main drive shaft and interchangeable gearing between the main drive shaft and the cutter whereby the length of the cigarettes to be produced may be changed at will.
25 . In a cigarette machine, a pair of crimping or knurling rolls located in position to knurl or crimp the pasting edge of the wrapper.
26. In a cigarette machine in which the wrapper is pasted, means crimping or knurling the pasted edge of the paper before it reaches the paster.
2i. In a cigarette machine in which a paper wrapper is pasted to secure it around the fller, a pair of paper drive rolls having crimping or knurling surfaces in line with the pasting edge of the paper as it passes between the rolls. 28. In combination with a paper cigarette machine, a printing roll and its platen, and independent paper drive rolls for the wrapper paper, driven from the same source of power as the printing roll and having the same surface speed as the printing roll.
29. In combination with a paper cigarette machine, drive rolls for the wrapper paper, the printing roll with its platen, and a gear connecting said gear and drive rolls and causing them to travel with the same surface speed, and in definite relation to the operation of the cigarette machine.
30. In combination with a paper cigarette machine, a plurality of printing rolls, a pair of paper drive rolls for the wrapper paper rotating in definite relation to the operation of the cigarette machine and a gear connecting all of said printing and drive roll and causing them to rotate with the same surface speed.
31. In combination with a paper cigarette machine. print Ing rolls, Inking rolls for said printing rolls, a bronzing roll driven from said inking rolls, paper drive rolls for the wrapper paper and a gear connecting the paper drive rolls and printing rolls and causing them to run with equal surface speed.
32. In combination with a paper cigarette machine, first and second printing rolls, inking rolls for said printing rolls, a pair of paper driving rolls for the wrapper paper and a gear common to all of said rolls and driving the printing and paper drive rolls at equal surface speed.
33. In combination with a paper cigarette machine, the feed rolls for the wrapper paper, the printing roll, a gear causing said rolls to travel at equal surface speed, the cigarette cutter, the shaft rotating in definite relation to the cutting operation and a gear connecting sald shaft to the printing roll.
34. In combination with the wrapping mechanism of a paper cigarette machine, a printing attachment co-operating with the same, additional printing mechanism constructed to be aplied to the machine, an Idler gear to connect one printing means with the other, a drive shaft and a gear connecting said drive shaft to the printing roll.
35. In combination with the wrapping mechanism of a paper cigarette machine having a printing attachment, an additional removable printing means, constructed to be brougth into driving relation to the printing mechanism, a drive shaft, and a drive gear for connecting said shaft to the printing attachment, said gear having an adjustable connection with the shaft, permitting the driven parts to be adjusted relatively to the shaft.
36. In a cigarette machine the combination of the cutter, wrapper driving mechanism, a printing attachment, a shaft connecting the cutter operating parts with the mechanism of the printing attachment, a sleeve turning on said shaft, a gear for driving the printing and wraper driving mechanisms, supported on said sleeve, a hand grip also on said sleeve, and means carried by the hand grip whereby the sleeve may be rigidly secured to the shaft.
37. In a cigarette machine the combination of the cutter, a shaft in operating connection therewith, a gear detachably secured to said shaft, a compound gear supported in turning relation with the said shaft detachably secured gear, an idler intermeshing with said compound gear, by means of which the wrapper driving and printing mechanisms are simultaneously and co-relatively driven and a second gear on the supporting shaft of said compound gear, by means of which additional printing attachments may be driven.
38. In a continuous cigarette machine having a printer to print upon the wrapper before it is delivered to the wrapping mechanism, the combination with the tape and driving wheel to propel the same, of a printing roll with type to print the impressions and a pair of driving rolls for the wrapper paper adapted to crimp and feed the paper between their opposed faces, and means connecting the tape driving wheel, the printing roll and the driving rolls, so as to feed the paper in unison with the tape.
39. In a continuous cigarette machine the combination with tape and means for driving same, of a pair of driving rolls for the wrapper, provided with intermeshing grooves and ridges adapted to crimp the wrapper between their opposed faces.
40. In a continuous cigarette machine having a printer to print upon the wrapper before it is delivered to the tape, the combination with the tape and a driving wheel to propel the same, of a printing roll with type to print the impressions and a palr of crimping rolls provided with intermeshing grooves and ridges adapted to press and stretch the paper betwen their opposed faces, and means connecting the tape
driving wheel, the printing roll and the crimping rolls, so as to feed the wrapper in unison with the tape.
41. In a continuous cigarette machine the combination with the tape and means for driving the same, means for supplying the wrapper and feeding the tobacco thereto, means for forming the cigarette rod and a cutter for cutting of the cigarettes, of a printer having a printing roll to print upon the wrapper, a pair of non-inking drive rolls for paper, and a master gear connecting the printing roll and feed roll to rotate them at the same surface speed.
42. In a continuous cigarette machine the combination with the tape and means for propelling the same means for supplying the wrapper paper and feeding the tobacco thereto, means for forming the cigarette rod and a cutter for cutting off the cigarettes, of a printer having a printing roll to print upon the wrapper, a pair of crimping, drive rolls for paper and mechanism connecting the cutter to the printing and drive rolls to rotate them in unison.
43. In a continuous cigarette machine the combination with the tape and means for propelling the same, means for supplying the wrapper paper and feeding the tobacco thereto, means for forming the cigarette rod and cutter for cutting off the cigarettes, of a printer having a printing roll to print upon the wrapper, a pair of driving rolls for paper mechanism lonnecting the cutter to the printing and drive rolls to rotate them in unison, gearing connecting the cut-off knife with the tape driving wheel, and a change wheel in such gearing to vary the lengths of the cigarettes.
44. In a continuous clgarette machine the combination with the tape and means for propelling the same, means for supplying the wrapper paper and feeding the tobacco thereto, means for forming the cigarette rod and a cutter for cutting off the cigarettes, of a printer having a printing roll to print upon the wrapper, a pair of driving rolls for paper, mechanism connecting the cutter to the grinting and drive rolls to rotate them in unison, gearing connecting the cut-off knife with the tape driving wheel, a change wheel in such gearing to vary the length of cigarettes, a drive shaft in such mechanism, a printer drive gear releasably secured to said shaft by a set screw, permitting a rotary adjustment of such printing rolls and drive rolls, to vary the relation of the printer to the cutter, or to wholly detach the printer from the cutter, when required.
45. In a cutter for cigarette machines the combination of the knives mounted to oscillate across the path of the cigarette rod, the slide upon which the knives are mounted and a cam having connections for simultaneously oscillating the knives and reciprocating the sllde.
46. In a cutter for cigarette machines the combination of the sllde, the pivoted irame, the knives mounted in the frame, and the cam for oscillating the frame and reciprocating the slide, said frame being formed of two parts relatively adjustable about the center of oscillation in order to adjnst the knives tof ward the path of the cigarette rod.
47. In a cigarette machine the combination of the reciprocating slide, the oscillating frame formed in two parts, each having a bearing at the center of oscillation and a slot and screw connection between said parts whereby they may be adjusted relatively to bring the cutting edge of the knives into proper relation to the path of the cigarette rod.
48. In a cutter for cigarette machines the combination of the oscillating frame carrying the knives, the slide upon which the frame is mounted to oscillate, shoes secured to the ends of the slide and having sliding bearings upon the machine and the caps secured to the machine over the shoes and holding the latter in place.
49. In a cutter for cigarette machines the combination of the slide shoe formed with a turned body, the oscillating knife frame having a bearing on the turned body of the slide, a shoe secured to the end of the turned body and conflining the oscillating frame, the caps fitted over the shoes and holding them upon their bearings, the cam lever depending from the oscillating frame, the roller stud depending from he slide, and a cam engaging the cam lever and roller stud for oscillating the knife frame and reciprocating the slide.
60. In a cutter for cigarette machines the combination with the oscillating knife lever, the rotary knives mounted thereon and having a pulley for rotating them, a pulley journalled on the center of oscillation of the knife frame, and a bolt passing from an external source of driving power over said pulleys and rotating the knives.
51. In a cigarette machine the combination with the feedIng and carding means, the rope forming means, the mechanism for wrapping the continuous rope fller and the cigarette cutting means, of a means for crimping, corrugating, ribbing or otherwise roughening one of the overlapped pasting edges of the wrapper paper, prior to applying paste thereto.
52. In a cigarette machine the combination with the feeding and carding means, the rope forming means, the mechanism for wrapping the continuous rope fller and the cigarette cutting means, of means for roughening the paste recelving portion near but not extending to one edge of the wrapper paper, means for applying paste to said roughened edge, and
means for pressing the pasted roughened edge into position io adhere to the opposite edge of the paper.
53. In a cigarette machine the combination with the feeding and carding means. the rope forming means, the mechanism for wrapping the continuous rope filler and the cigarette cutting means, of means for roughening the paste receiving portion near but not extending to one edge of the wrapper paper so as to leave a flat smooth pasting portion, means for applying paste to said roughened edge, and means for pressing the pasted roughened edge into position to adhere to the opposite edge of the paper.
54. In a cigarette machine the combination with the feeding and carding means, the rope forming means, the mechanism for wrapping the continuous rope fller and the cigarette cutting means, of means for feeding the paper by a pair of rolls having corresponding portion of their peripheries formed to crimp, corrugate, rib or otherwise roughen the edge of the paper, means for passing the paper in position to receive paste upon said edge, and means for pressing said edge in overlapped relation to the opposite edge of the paper.
55. In a cigarette machine, a dryer movable on the machine to and from the folding tube and adapted to dry the pasted seam of the clgarette rod passing therethrough.
56. In a cigarette machine, a heater trunnioned on the machine and removable therefrom and adapted to be moved into or out of the heating relation with the pasted seam of the continuous cigarette.
57. In a cigarette machine, a heater movable on the machine to or from heating relation with the folding tube, the said heater embodying an overhanging portion formed with a chamber through which the products of combustion pass to increase the drying effect as the continuous rod passed through the cigarette tube.
58. A dryer for cigarette machines, comprising a hollow body adapted to conform to the folding tube of a clgarette machine and constructed with a base chamber for fuel having an upwardly discharging burner opening, a combustion chamber into which said burner opening discharges, having inlets for air to support combustion, a baffle plate extending transversely of said combuston chamber to deflect the burning gases toward the wall which contacts with the folding tube, and an extension to the combustion chamber extending a part of the length of the dryer and overhanging the fold ing tube.

\section*{No. 100,956. Controller for Distributing Meohanism for Fluids in Cities.}

Mécanisme de distribution des ruides dans les villes.

Frank J. Foveaux, Alameda, Callfornla, U.S.A., 11th September, 1906 ; 6 years. Filed 27th June, 1906. Receipt No. 137,337 .
Claim.-1 In an apparatus of the character described the combination of a cylindrical valve casing having ways, a stem arranged axially of the casing, arms secured upon said stem, a yoke-shaped valve gate having sector-shaped holes in the arms of said yoke, said holes surrounding the valve stem and the arms secured thereto, the middle portion of the yoke being cylindrical in form to move in contact with the cylindrical wall of the casing, the face of the gate having an opening therein, a relief valve in said opening. means operated by the movement of the stem for withdrawing sald relief valve, the arms on the stem in their further movement being adapted to come into contact with the arms of the yoke-shaped gate to actuate the same, substantlally as described.
2. In an apparatus of the character described the combination of a cylindrical casing having ways for connecting with main pipes, a stem arranged axially in said casing, arms secured to said stem to rock therewith, a yoke-shaped valve gate the arms of which have holes surrounding the
valve stem, the arms on the stem moving loosely in sald holes, the face of the gate having an opening, a rellef valve in said opening having a flange and guide stem, said guide stem being sultably guided in the gate, a lever to which said stem is loosely pivoted. an arm extending from the stem from a link connecting sald lever and arm, a coiled spring around the relief valve stem pressing it outward and a coiled spring for pressing the gate outward, substantially as described.
No. 100,957. Eat. Chapear.

Charles Johnstone-Hall, 92 Bexley Road, Northumberland Heath, Belvedere, England, 11th September, 1906; 6 years. Filed 19th March, 1906. Recelpt No. 134,007.
Claim.-1. In combination with a hat, a hook pivotally connected thereto and adapted to project outward and to lie within the hat.
2. In a hat suspending device, a plate, a hook pivotally connected to the plate, and means for attaching the plate to a hat.
3. In a hat suspending device, a plate, a hook pivotally connected to the plate, means for attaching the plate to a hat, and means for limiting the movement of the hook.
4. In a hat suspending device, a plate provided with a plurality of slots, a hook pivotally connected to the plate, and means for attaching the plate to a hat.
5. In a hat suspending device, a plate, a hook pivotally connected to the plate and provided with a stamped strengthening rib.
6. In a hat suspending device, a plate, a hook pivotally connected to the plate and attaching members disposed through the plate.
7. In a hat suspending device, a plate, a hook plvotally connected to the plate and provided with an arched portion, and attaching screws disposed through the plate over one of which sald arched portion of the hook is adapted to pass.
8. In a hat suspending device, a plate, an eyelet disposed through the plate and a hook carried by the eyelet.
9. In a hat suspending device an attaching member, a hook pivoted to the attaching member, means for securing the attaching member, and means for limiting the movement of the hook.
10. In a hat suspending device an attaching member, a hook pivoted to the attaching member, means for securing the attaching member to a hat and a projecting member carried by the attaching member in the path of movement of the hook.

\section*{No. 100,958. Money Paying Machine.}

Machine a payer l'argont.
Edward Ludvigsen, Copenhagen, Denmark, 11th September, 1906; 6 years. Flled 30th October, 1905. Recelpt No. 129,657.
Claim.-An apparatus for paying in an out by the use of which contagion by money can be prevented in such a manner that the shop assistant or cashier is not obliged to touch the coins or notes comprising combination the transporting device for the bank notes consisting of a band moved below an opening of the casing of the till, two rollers revolubly mounted in the casing having each one end of the band fixed to it, means for revolving the one roller in one direction and the other roller in opposite direction to wind up the band with the band notes upon the one roller and to unwind the same in opposite direction in such a manner that the notes fall out from the band. a push engageing with an inclsion of one of the rollers for locking the same in position, tubes for the reception of coins of assorted value, slides closing the bottom of said tubes, a bottom plate of the tube having an opening for the coln and a guide plate for the slide having an opening through which the
coin falls out, a counter plate for the reception of the coin to be paid out, a locking device consisting of a bar securing

Fig. 1.

Fig.2.

the stopper of the note rollers in locking position and the slides of the coin tubes, an angular lever hinged with one end to said bar, a support plate hinged to the frame, a spring for swinging round said support plate and cams connected with the pivots of the support plate and engaging with the other end of the angular lever, a hook of the support gripping behind a fixed noose of the casing, a sllding carriage mounted in said support plate adapted to be moved forward in said support, a feeding device for a paper strip mounted in said carriage, a toothed disc at the end of the main roller of said feeding device and a rack fixed on the support plates outside said carriage for automatically revolving the roller when the carriage is moved forward in its support, substantially as described and shown and for the purpose set forth.

No. 100,959. Coiled Wire Fabric Making Machine. Machine ì faire les tissus de tll roulé.

Wilber J. Pine, Oshkosh, Wisconsin, U.S.A., 11th September 1906; 6 years. Filed 11th December, 1905. Receipt No. 130,912.
Claim.-1. In a coiled wire fabric machine, the combination with the coiling devices, of a pair of feed rolls for feeding the wire thereto, one of said rolls comprising a shaft and a removable collar or ring mounted thereon and rotatable iberewith.
2. In a coiled wire fab:ic machine, the combination with the coilling devices, of a pair of feed rolls for feeding the wire thereto. one of said rolls comprising a shaft and a plurality of collars or rings mounted thereon parallel to each other and rotatable therewith.
3. In a colled wire fabric machine, the combination with the coiling devices, of a pair of feed rolls for feeding the wire thereto, one of said rolls comprising a shaft, a disc mounted on and driven by the shaft. and a ring or collar surrounding the disc and constituting the wire feeding surface of such roll.
4. In a coiled wire fabric machine, the combination with the coiling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls having a ylelding connection with its driving shaft and the wire \(f \in e d i n g\) surface of the other roll comprising a removable ring or collar positively driven by its shaft.
5. In a coiled wire fabric machine, the combination with the colling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls being in the form of a ring or collar having a yielding operating connection with its shaft, and a ring or collar removably mounted on the other feed roll.
6. In a coiled wire fabric machine, the combination with colling devices, of a pair of feed rolls for feeding the wire thercto, and means for intermittently moving the wire feeding surface of one roll towards that of the other with a yielding pressurc.
7. In a coiled wire fabric machine. the combination with coiling devices, of a pair of feed rolls for feeding the wire thereto, and means for intermittently moving the wire feeding surface of one roll towards that of the other with a yielding pressure, adjustable in degree.
8. In a coiled wire fabric machine. the combination with colling devices, of a pair of continuously operating feed rolls ficr feeding the wire thereto, and having shafts having a fixed working relation, and means for moving the wire feeding surfaces of one roll towards that of the other with a yielding pressure.
9. In a coiled wire fabric machine. the combination with coiling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls being arranged to be moved eccentric of its shaft to a feeding position. and intermittently operated means for so moving the pressure surface.
10. In a coiled wire fabric machine. the combination with coiling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface nf one of the rolls belng arranged to be moved eccentric of its shaft to a feeding position, and intermittently actuated means for so moving the pressure surface for an intermittent feed of the wirc, sald fued rolls being continuously running.
11. In a colled wire rabric machine. the combination with coiling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls being arranged to be moved eccentric of its shaft to a leeding position, and spring pressed mechanism for intermittently exerting pressure on such surface and moving the same eccentric of its shaft for feeding the wire.
12. In a coiled wire fabric machine, the comblnation with coiling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls being arranged to be moved eccentric of its shaft to a feeding position, and comprising a ring or collar encircling its shaft and baving a spring driving connection therewith, and an intermittently operated roller arranged to bear against the ring or collar and move it in its eccentric feeding position.
13. In a coiled wire fabric machine. the combination with coiling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls being arranged to be moved eccentric of its shaft to a feeding position. and comprising a ring or collar encircling its shaft and having a spring driving connection therewith and an intermittently operated spring pressed roller arranged to bear against the ring or collar and move it in its eccentric feeding position.
14. In a coiled wire fabric machine, the combination with coiling devices, of a pair of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls being arranged to be moved eccentric of its shaft to a feeding position, and comprising a ring or collar encircling its shaft and having a spring driving connection therewlth, a pair of rollers arranged to bear against the ring or collar, a movable spring pressed frame or cradle for such rollers, and means for intermittently reciprocating the frame to cause its rollers to intermittently move the ring to eccentric feeding position.
15. In a coiled wire fabric machine, the combination with a plurality of coiling devices, of a pair of continually running feed rolls for feeding the wire thereto, one of the rolls having a plurality of pressure surfaces with a ylelding driving connection with the shaft of their roll, a corresponding plurality of pressure rollers co-operating with the pressure surfaces to move the latter eccentric of their shaft for wire fceding, means for so moving the rollers, and means for regulating the pressure capable of being exerted by such rollers independently.
16. In a colled wire fabric machine, the combination with a plurallty of coiling devices, of a pair of contlnually running feed rolls for feeding the wire thereto, one of the rolls having a plurality of pressure surfaces with a yielding driving connection with the shaft of their roll, a corresponding plurality of pressure rollers co-operating with the pressure
surfaces to move the latter eccentric of their shaft for wire fceding, means for so moving the rollers, and means for rendering any one of the rollers inactive at the will of the operator.
17. In a coiled wire fabric machine, the combination with a plurality of colling devices, of a pair of continually runriing feed rolls for feeding the wire thereto, one of the rolls having a plurality of pressure surfaces with a pielding driving connection with the shaft of their roll, a corresponding plurality of pressure rollers co-operating with the pressure surfaces to move the latter eccentric of their shaft for wire feeding, an operating connection, springs interposed between said connection and the rollers for transmitting motion, and means interrupting such transmitting connection at the will of the operator.
18. In a coiled wire fabric machine, the combination with a plurality of coiling devices, of a pair of continually running feed rolls for feeding the wire thereto, one of the rolls having a plurality of pressure surfaces with a yielding driving connection with the shaft of their roll, a corresponding plurality of pressure rollers co-operating with the pressure surfaces to move the latter eccentric of their shaft for wire feeding, an operating connection, springs intcrposed between said connection and the rollers for transmitting motion, and a series of independently operated keys for taking the thrust on said springs and relleving the rollers of pressure.
19. In a coiled wire fabric machine, the combination with the colling devices, of a pair of feed rolls for feeding the wire thereto, means for intermittently exerting a yielding pressure against one of the rolls, said rolls having a plurality of wire feeding surfaces to accomodate a plurality of coiling devices, and a series of independently operable keys for preventing the action of such yielding pressure in respect to any one or all of the sets of colling devices.
20. In a coiled wire fabric machine, the combination with the coiling devices, of a pair of feed rolls for feeding the wire thereto, one of the rolls having a ylelding pressure surface movable to a position eccentric of its shaft, a pressure roller arranged to bear against such surface, to move it to said position, a movable frame for said roller, a reciprocating bar having a bore partway of its length, a spring arranged within said bore, and a plunger or pin sliding in the bore and outwardly pressed by said spring, said plunger exerting pressure against said frame when the bar is operated.
21. In a coiled wire fabric machine, the combination with the coiling devices, of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls consisting of a pair of rings or collars yieldingly connected with their driving shaft, pressure applying rollers for the pressure rings a corresponding pair of frames or cradles in which the rollers are mounted, a fulcrum bar on which the frames are pivoted, a reciprocating bar, and a spring connnection between the latter bar and the fulcrum bar.
22. In a coiled wire fabric machine, the combination with the coilling devices, of feed folls for feeding the wire thereto, the pressure surface of one of the rolls consisting of a pair of rings or collars yieldingly connected with their driving shaft, pressure applying rollers for the pressure rings, a corresponding pair of frames or cradles in which the rollers are mounted, means for moving the frames with a yielding pressure adjustable with respect to the individual frames.
23. In a colled wire fabric machine, the combination with the coiling devices, of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls consisting of a pair of rings or collars yieldingly connected with their driving shaft, pressure applying rollers for the pressure rings, a corresponding pair of irames or cradles in which the rollers are mounted, a sliding bar having a cam roller, yielding operating connections between such bar and the frames or cradles, and an operating bar having a cam ar ranged to co-operate with the cam roller and thereby actuate its sliding bar.
24. In a coiled wire fabric machine, the combination with the coiling devices, of feed rolls for feeding the wire thereto, the pressure surface of one of the rolls consisting of a pair of rings or collars yieldingly connected with their driving shaft, pressure applying rollers for the pressure rings, a corresponding pair of frames or cradles in which the rolters are mounted, a sliding bar, ylelding operating connections retween such bar and the frames or cradles, an operating bar, and a cam mounted thereon to operate the sliding bar and adjustable to time the movement of the latter.
25. In a colled wire fabric machine, the combination of an oscillating head, the colling devices and cut-off mechanism mounted thereon, and cut-off mechanism adjustable in respect to the colling device.

2f. In a rolled wire fabric machine, the combination with the coiling device, of an oscillating head on which said coll-
ing device is mounted and a knife also mounted in said
head for cutting off the wire, sald knife being adjustable in position relatively to the coiling device.
27. In a colled wire fabric machine, the combination with the coiling device, of a movable trigger or arm arranged to engage and position the coll during the cording operation, and means for adjusting the position of such arm.
28. In a coiled wire gabrio machine, the combination with the coiling device, of a movable trigger or arm arranged to engage and position the coil during the cording operation, cut-off mechanism for cutting the wires after being coiled, and means for adjusting the arm to operate closer to or further away from the cut-oc mechanism.
29. In a coiled wire fabric machine, the combination with the colling device, of a movable trigger or arm arranged to engage and position the coil during the cording operation, and cut-off mechanism for cutting the wires after being coiled and adjusted in respect to the coiling device, said arm being also adjustable in respect thereto.
30. In a colled wire fabric machine, the combination with the colled device, of a movable trigger or arm arranged to engage and position the coll during the cording operation, and cut-off mechanism for cutting the wires after being coiled, said cut-oc mechanism and said arm being indepently adjustable with respect to the colled device and in respect to each other.
31. In a coiled wire fabric machine, the combination with the coiled device, of a movable positioning or retaining finger arranged to hold the coll after belng colled and to also move the rearward end thereof slightly away from the colling device.
32. In a coiled wire fabric machine, the combination with the coiling device and cut-off mechanism, of a movable retaining finger arranged to engage the coll in the cording operation, and a trigger or arm arranged to engage and move an end of the coll towards the cut-off mechanism in the cording operation, said cut-off mechanism, finger and arm being independently adjustably adjustable in respect to each other and to the colling device.
33. In a coiled wire fabric machine, the combination with the coller, of a tensioner therefor comprising a cylinder mounted in advance of the coller and having a spiral to cooperate with that of said coller, and means for rotarily adjusting the cylinder comprising a gear operatively connected with the cylinder, and a pinion engaging said gear.
34. In a colled wire fabrid machine, the combination with the wire colling and weaving devices, of electrical means for holding the wire or coil last run while the weaving device is acting upon preceding colls.
35. In a coiled wire fabric machine, the combination with the wire colling and weaving devices, of an electro-magnet for attracting and clamping the wire or coll last run while the weaving device is acting upon preceding colls.
36. In a coiled wire fabric machine, the combination with the wire coiling and weaving devices, of an electro-magne for attracing and clamping the wire or coll last run while the weaving device is acting upon the preceding colls, and automatic means for alternately energizing and de-energizing the electro-magnet.
37. In a coiled wire fabric machine, the combination with a wire coilling device, of a weaving device comprising a channel in which the wires as colled are run, and electrical means for retaining the wire last run in the channel.
38. In a coiled wire fabric machine, the combination with a wire coiling device, of a weaving device comprising a channel in which the wires as coiled are run, and an electromagnet arranged in the channel to attract and thereby clamp the wire last run in the channel.
39. In a colled wire fabric machine, the combination with a wire coiling device, of a weaving device comprising a channel in which the wires as colled are run, and an electromagnet forming the bottom of the channel and adapted, when energized, to attract and retain the wire last run in the channel.
40. In a colled wire fabric machine. the combination with a wire coiling device, of a weaving device comprising a channel in which the wires as colled are run, and which consists of parallel strips in allgnment with the colling device, and an electro-magnet arranged between such strips and extending substantlally throughout thelr length to attract and thereby clamp the coll or wire last run in the channel.
41. In a coiled wire fabric machine, the combination with a wire coiling device, of a weaving device comprising a channel in which the wires as colled are run, an electromagnet arranged in the channel to attract and thereby clamp the last wire run in the channel, and automatic means for energizing and de-energizing said magnet.
42. In a colled wire fabric machine, the combination with a wire coillng device, of a weaving device comprising a channel in which the wires as colled are run, parrallel plates of non-magnetic material lining the opposite longitudinal walls of the channel, and an electro-magnet arranged in the channel between said plates to attractoand clamp the wire last run in the channel.
43. In a coiled wire fabric machine, the combination with a wire colling device, of a weaving device comprising a channel in which the wires as colled are run, means for holding the last wire run in the ohannel, and shutters alternately movable partially across the channel from opposite sides thereof to engage the wire fabric in the weaving operation.
44. In a colled wire fabric machine the combination with a wire colling device, of a weaving device comprising a channel in which the wires as coiled are run, one side of sald channel being movable vertically, means for holding the last wire run in the channel, and shutters mounted on both sides of the channel and movable partially across the channel from opposite sides thereof to engage and feed the wire fabric.
45. In a coiled wire fabric machine, the combination with a wire colling device, of a weaving device comprising a channel in which the wires as colled are run, one slde of said channel being fixed and the other movable verticaliy, means carried by both sides of said channel for co-operating with the fabric in the weaving operation, and mechanism for actuating said means.
46. In a coiled wire fabric machine, the combination with a wire coiling device, of a weaving device comprising a channel in which the wires as colled are run, one side of sald channel being fixed and the other movable vertically, an electro-magnet secured to the fixed side of the channel and adapted, when energized, to clamp the wire last run in the channel.
47. In a coiled wire fabric machine, the combination with a wire colling device, of a weaving device comprising a channel in which the wires as colled are run, one side of said channel being fixed and the other movable vertically, an electro-magnet secured to the fixed side of the channel with a pole forming the bottom of such channel, and shutters movable on the walls or sides of the channel to co-operate with the fabric in the weaving operation.
48. In a coiled wire fabric machine, the combination with a wire collng device, of a weaving device comprising a channel in which the wires as colled are run, and shutters mounted on both sides of the channel and movable partially across the channel, one side of sald channel being fixed and the other movable bodily vertically together with its shutter.
49. In a colled wire fabric machine, the combination with a wire coiling device, of a weaving device comprising a channel in which the wires as colled are run, and shutters alternately movable partially across the channel to engage the wire fabric and comprising plates or strips arranged to slide upon the opposite walls of said channel and extending substantlally throughout the length thereof.
50. In a colled wire fabric machine, the combination with a wire colling device, of a weaving device comprising a channel in which the wlres as colled are run, shutters alternately movable partially across the channel to engage the wire fabric, bars arranged to slide in the walls of the channel and operatively connected with the shutters, and means for actuating said bars.
51. In a colled wire fabric machine, the combination with a wire colling device, of a weaving device comprising a channel in which the wires as colled are run, shutters alternately movable partially across the channel to engage the wire fabric, bars arranged to slide in the walls of the channel and having a slot and pin connection with the shutters, and means for actuating said bars.
52. In a colled wire fabric machine, the combination with a wire colling device, of a weaving device comprising a channel in which the wires as coiled are run, shutters alternately movable partially across the channel to engage the wire fabric, bars arranged to slide in the walls of the channel and operatively connected with the shutters, means for actuating sald bars, and an abutment plate arranged above one of the shutters
53. In a colled wire fabric machine, the combination with a wire colling device, of a weaving device comprising a channel in which the wires as colled are run, said channel being formed of one fixed member and a parallel but movable member, and means for moving said last-named member in the weaving operation.
54. In a colled wire fabric machine, the combination with a wire coiling device, of a weaving device comprising a channel in which the wires as colled are run, said channel being formed of one fixed side and a parallel but movable side, and means arranged near the opposite ends of the movable side for operating the same.
55. In a colled wire fabric machine, the combination with a wire colling device, of a weaving device comprising parallel side members forming a weaving channel between them, and means for adjusting the width of such channel for different diameters of coils.
56. In a coiled wire fabric machine, the combination with a wire colling device, of a weaving device comprising parallel side members forming a weaving channel between them, one of the members being adjustable to adjust the width of such channel for different diameters of colls.
57. In a colled wire fabric machine, the combination with a wire colling device, of a weaving device comprising parallel side members forming a weaving channel betwen them, both of the members being adjustable to adjust the width of such channel for different diameters of colls.
58. In a colled wire fabric machine, the combination with a wire colling device, of a weaving device comprising two parallel bars or strips, forming a channel between them, one of which is movable and the other stationary, a series of yokes arranged at intervals along the length of the strips to receive both of them but secured to the stationary strip only, means for adjusting the relative position of the movable strip in the yoke, and means for adjusting the yokes and stationary strip, whereby the width of the channel may be adjusted for different diameters of coils.
59. In a colled wire fabric machine, the combination with the coiling device, of a weaving device comprising two parallel longitudinal strips forming a weaving channel between them, one of the strips being stationary and the other movable in the weaving operation, a laterally adjustable frame supporting the stationary strip.
60. In a coiled wire fabric machine, the combination with the coiling device, of a weaving device comprising two parallel longitudinal strips forming a weaving channel between them, one of the strips being stationary and the other movable in the weaving operation, and a laterally adjustable frame supporting the stationary strip, and means for correspondingly adjusting the movable strip.
61. In a colled wire fabric machine, the combination with the coilling device, of a weaving device comprising two parallel longitudinal strips forming a weaving channel between them, one of the strips being stationary, and the other movable in the weaving operation, and a serles of yokes arranged along the length of the strips and secured to the stationary strip but only receiving the movable strip, a laterally adjustable frame supporting the stationary strip, and removable fllets arranged between an inner side of the yokes and the outer side of the movable strip.
62. In a coiled wire fabric machine, the combination with the colling device, of a weaving device comprising two parallel longitudinal strips forming a weaving channel between them, one of the strips being stationary, and the other movable in the weaving operation, and a serles of yokes arranged along the length of the strips and secured to the stationary strip but only receiving the movable strip, laterally adjustable frames or plates supporting opposite ends of the stationary strips, and removable fillets arranged in the yokes for adjusting the relative position of the movable strips thereon.
63. In a coiled wire fabric machine, the combination with the coiling device, of a weaving device comprising a channel in which the wires as colled are run, shutters movable partially across the channel to co-operate with the fabric, and yielding operating connections co-operating with the shutters and arranged to yield when the cords are presented to the shutters.
64. In a coiled wire fabric machine, the combination with the colling device, of a weaving device comprising a channel in which the wires as coiled are run, shutters movable partially across the channel to co-operate with the fabric. operating connections for said shutters to move them in respect to the channel and automatic means for determining the degree of such movement accordingly as the regular weave or cords are presented to the shutters.
65. In a coiled wire fabric machine, the combination with the coiling device, of a weaving device comprising a channel in which the wires as colled are run, shutters movable partally across the channel to co-operate with the fabric, a driving shaft. and operating connections between such shaft and the shutters and adapted to yield after a predetermined thrust is imparted to the shutters.
66. In a coiled wire fabric machine, the combination with the colling device, of a weaving device comprising a channel in which the wires as coiled are run, shutters movable partially across the channel to co-operate with the fabric, a driving shaft, and operating connections between such shaft and the shutters and having interposed springs adapted to yield after a predetermined thrust is imparted to the shutters.
67. In a coiled wire fabric machine, the combination with a wire coilling device, of a weaving device comprising two parallel bars or strips, forming a channel between them, one of which is movable and the other stationary, a series of yokes arranged at intervals along the length of the strips to receive both of them but secured to the stationary strip only, a plate arranged upon the inner side of the stationary strip to form thereat a removable wear plate, said plate being of non-magnetic material, blocks connected with the そokes, and an electro-magnet supported by such blocks.
68. In a colled wire fabric machine, the combination with colling and weaving devices, of a pattern device comprising a movable member having a step-by-step movement, and
means co-operating therewith and controlling the movements of the weaving device.
69. In a colled wire fabric machine, the combination with colling and weaving devices, of a pattern device comprising a movable member having a step-by-step movement, and having a series of depressions spaced according to the particular plan or pattern of fabric as regards the place of insertion of the cords, and means co-operating with said dopressinne .... arranged to control the movements of the weaving device.
70. In a coiled wire fabric machine, the combination with coiling and weaving devices, of mechanism for operating the weaving device, and a pattern device determining the pattern or place of insertion of cords in the fabric and cooperating with the weaving device
71. In a coiled wire fabric machine. the combination with colling and weaving devices, of mechanism for operating the weaving device, and a pattern devire determining the pattern or place of insertion of cords in the fabric and arranged to stop the weaving device at intervals.
72. In a colled wire fabric machine, the combination with coiling and weaving devices, of mechanism for oprating the weaving device, and a pattern device comprising a mo able member provided with a series of projections and depres. sions, and means co-operating therewith and controlling the movements of the weaving device
73. In a colled wire fabric machine, the combination w th coiling and weaving devices. of mechanis'n for oncrating the weaving device, and a pattern device comprising a longitudinally movable member provided on one edge with a series of projections and depressions and means co-operating therewith and controlling the movements of the weaving device.
74. In a colled wire fabric morhinn the rombination with colling and weaving devices, of a pattern device determining the pattern or place of insertion of cords in the fabric. such pattern device comprising an endless hand continuously operated in the operation of the machine and having means for causing the stopping of the weaving devices for the insertion of cords.
75. In a colled wire fabric machine, the combination with coiling and weaving devices, of a pattern device dotermining the nattern or place of insertion of cords in the fabric. and mechanism for operating the weaving devices. such pattern device comprisiug an endless band continuously onerated in the operation ofthe machine, and an arm controlled by the band and. when permitted by the latter, arranged to stop said onerating mechanism.
76. In a colled wire fabric machinc, the combination with coiling and weaving devices, of a nattern device determining the pattern or place of insertion of cords in the fabric. and mechanism for onerating the weaving deviers, such nattorn device comprising an endless band continuously onerated in the operation of the machine, and an arm normally hold with a yielding pressure towards a position to interfore with and ston the weaving devices, but restrained thercby until the time for the insertion of a cord.
77. In a colled wire fabric machine, the combination with coiling and weaving devices, of a pattern device dotermining the nattern or place of Insertion of cords in the fabric. and mechanism for operating the weaving devices. such pattern device comprising an, endleas band continuously onerated in the operation of the machine, and provided with a series of notches soaced at predotermined distances anart accordine to the desired type of fabric to be produced. and an arm cognerating with such notches and arraneed to stop the wearing device when a notch is presented thereto.
78. In a colled wire fabric machine. the combination with coiling and weaving devices, of a pattern device determining the nattern or place of insertion of cords in the pabric. and mechanism for onerating the weaving devices. such pattern device comprising an endless band continuouslv operated in the oneration of the machine, and nrovided on one edge with a series of notches spaced according to the dealred type of pabric in he nroduced. said band having a step-bv-step movement and an arm co-onerating with such notches and controlling the oneration of the weaving device. sald arm being arranoed to dron into any notch presented and thereby stop the weaving device.
79. In a colled wire fabric machine. the combination with coilling and weaving devices, of a pattern device determining ......t+arn or place of insertion of cords in the fabrlc. and mechanism for onerating the weaving devices such nattern device comprising an endiesg band continuously operated in the oneration of the machine and nrovided on one edge with a scries of notches smaced acrordine to the desired trpe of Pabric to he prondiced and provided or the other eden with panth corresnonding to the number of weaves in the fahric. a ninion onerated hy the machine and encagine said tenth to tonen the hand with a sten-bv-sten movement. and an arm controlling the operatinn of the weaving device and itself rontrolled by the notches of the band.
80. In a colled wire fabric machine, the combination with coiling and weaving devices, of a pattern device determining the pattern or place of insertion of cords in the fabric, and mechanism for operating the weaving devices, such pattern device comprising an endless band continuously operated in the operation of the machine, and provided on one edge with a series of notches spaced according to the desired type of fabric to be produced and provided on the other edge with teeth corresponding to the number of weaves in the fabric, a pinion engaging said teeth, a pin wheel operated by the machine, and an arm controlling the operation of the weaving device and itself controlled by the notches of the band.
81. In a coiled wire fabric machinc, the combination with coiling and weaving devices, of a pattern device determining the pattern or place of insertion of cords in the fabric, such pattern device comprising an endless band continuously operated in the operation of the machine, a train of mechanism for operating the weaving device and including a ratchet and pawl, and means under the control of the band for swinging the pawl to an inactive position when a cord is being run.
82. In a colled wire fabric machine, the combination with oiling and weaving devices, of a pattern device determining the pattern or place of insertion of cords in the fabric, such pattern device comprising an endless band continuously operated in the operation of the machine, a train of mechanism for operating the weaving device and including a ratchet and pawl, and means under the control of the band for swing ing the pawl to an inactive position when a cord is being run. sich means comprising a slide having an arm which when the slide is stopped interferes with and swings the pawl to inactive position, and an arm governed by the band and arranged to stop sald slide when a cord is to be run, as determined by the band.
83. In a colled wire fabric machine, the combination with coiling and weaving devices, of a pattern device determining the pattern or place of insertion of cords in the fabric, such pattern device comprising an endless band continuously operated in the operation of the machine, a train of mechanism for operating the weaving device and including a ratchet and pawl, and means under the control of the band for swinging the pawl to an inactive position when a cord is being run, such means comprising a slide spring pressed downwardly and having an arm which when the slide is held suspended interferes with and swings the pawl to inactive position, a cam for raising the slide against its spring presstire, said band having on one edge a series of notches spaced according to a predetermined pattern as regards cords in the fabric, and a spring pressed arm having a tooth pressed against said edge of the band and adapted to drop into any one of the notches presented to thereby cause such arm to nove to a position to interfere with the sllde and hold it suspended.
84. In a coiled wire fabric machine, the combination with coiling and weaving devices, of a pattern device determining the pattern or place of insertion of cords in the fabric, such pattern device comprising an endless band continuously operated in the operation of the machine, a train of mechanism for operating the weaving device and including a ratchet and pawl, and means under the control of the band for swinging the pawl to an inactive position when a cord is being ran. such means comprising a slide having an arm which when the slide is stopped and held suspended interferes with and swings the pawl to inactive position, and a device under the control of the band for holiling the slide suspended when a cord is to be run, as determined by the band, a second slide, a trigger or arm operatively connected therewith to co-operate with the wire after leaving the coiling device, and a connection between sald slides whereby the second sllde may be held suspended, together with the first slide.
85. In a coiled wire fabric machine, the combination with coiling and weaving devices, of a reciprocating head on which the coiling device is supported.
86. In a colled wire fabric machine, the combination with colling and weaving devices, of a head supporting the coiling device and arranged to reciprocate toward and away from the weaving device.
87. In a colled wire fabric machine, the combination with coiling and weaving devices, of a head supporting the coiling device and arranged to be moved intermittently and to be reciprocated toward and away from the weaving device.
ss. In a colled wire fabric machine. the combluation with coiled and weaving devices, and with wire feeding mechanism for feeding the wire to the colling device, of a head carrying said coiling device and wire feeding mechanism and arranged to reciprocate toward and away from the weaving device.
89. In a coiled wire fabric machine the combination with coiling and weaving devices, and with feed rolls for feeding the wire to the colling device, of a head carrying sald feed rolls and colling device and arranged to be intermittently reciprocated toward and away from the weaving device.
90. In a colled wire fabric machine, the combination of a colling device, a weaving device, cut-off mechanism, and a reciprocating head on which the colling device and cut-off mechanism are mounted.
91. In a coiled wire fabric machine, the combination of a colling device, a weaving device, cut-off mechanism, feed rolls for feeding the wire to the colling device, and a reciprocating head on which the coiling device, cut-off mechanism and feed rolls are mounted.
92. In a coiled wire fabric machine, the combination with coiling and weaving devices, of a reciprocating head on which the coiling device is supported and actuating mechanism for such head comprising a driving shaft, a rolling key operatively connected with the head and co-operating with the shaft, and means for controlling the position of such key.
93. In a coiled wire fabric machine, the combination with colling and weaving devices, of a reciprocating head on which the colling device is supported and actuating mechanism for such head comprising a driving shaft, a disc arranged on such shaft and operatively connected with the head, a rolling key co-operating with the shaft, and means for intermittently rolling said key to establish engagement between the disc and shaft to reciprocate the head, comprising an intermittently operated tripper adapted to be interposed in the path of the key to so rock or roll the same.
94. In a coiled wire fabric machine, the combination with the main frame. of an oscillating head therein, a coiling device, feed rolls for feeding the wire to the colling device, and cut-off mechanism, sald colling device, feed rolls and cut-off mechanism being mounted on the oscillating head, and such mechanism being adjustable with respect to the coiling device.
95. In a coiled wire fabric machine, the combination with the main frame, of an oscillating head therein, a colling device, feed rolls for feeding the wire to the colling device, and cut-off mechanism, said colling device, feed rolls and cut-off mechanism being mounted on the oscillating head, a movable trigger or arm arranged to co-operate with the forward portion of the coll in the cording operation and also mounted on the oscillating head, said trigger being adjustable towards and awry from the coiling device.
96. In a coiled wire fabric machine, the combination with the main frame. of an oscillating head therein, coiling device, feed rolls for feeding the wire to the coiling device, and cut-ofir mechanism, safd coiling device, feed rolls and cut-off mechanism being mounted on the oscillating head, a movable trigger or arm arranged to co-operate with the forward portion of the coil in the cording operation and also mounted on the osclllating head, a movable finger arranged rearwardly of the trigger to stretch the coil and position the cords and likewise mounted on the oscillating head, said finger being adjustable towards and away from the colling device.
97. In a coiled wire fabric machine, the combination with the main frame, of an oscillating head carrying the colling device, a housing on such head, a trigger frame mounted in the housing and having an independent movement, a trigger mounted in the trigger frame and arranged to co-operate with the forward end of the coil, and means for oscillating the head and moving the trigger irame.
18. In a colled wire fabric machine, the combination with the main frame, of an osclllating head carrying the coiling device, a housing on such head, a trigger frame mounted in the housing and having an independent movement, a trigger frame, operating connections between the sllde and operate with the forwand end of the coil, a slide in the trigger frame, operatin connections between the slide and the trigger, and means for oscillating the head.
99. In a coiled wire fabric machine the combination with the coiling device, and the weaving channel, of a rotatable roll arranged above the channel and adapted to elevate the completed fabric therefrom, and a friction device connection for the roll.
100. In a colled wire fabric machine, the combination with the coiling device, and the weaving channel, of a rotatable roll arranged above the channel and adapted to elevate the completed fabric therefrom, and a friction drive connection for the roll, such iriction being adjustable in degree.
101. In a colled wire fabric machinc. the combination with the colled device, and the weaving channel, of a rotatable roll arranged above the channel and adapted to elevate the completed fabric therefrom, sald roll having a spiral prorided with a flange, a drive wheel fitting over the spindle. and a spring for pressing the drive wheel against the flange with a yielding pressure.
102. In a colled wire fabric machine, the combination with 2 plurality of colling devices. of weaving mechanism comprising channels in which the wires as coiled are run. separate sets of shutters movable partially across the channels tu co-operate with the colls, and operating connections for the shutters. the connections for one set of shutters of the different channels being seperately yielding.
103. In a colled wire fabric machine the combination with a plurality of colled devices, of weaving mechanism comprising channels in which the wires as coiled are run, separate sets of shutters movable partially across the channels to co-operate with the colls, and separate operating arms for the different sets of shutters, actuating or driving me- hanism for said arms, separable vielding connections betweeen the shutters of one set and their operating arm, and a yielding connection between the other arm and said driving niechanism.
104. In a colled wire fabric machine, the combination with the colling and weaving devices, and with the feed rolls, of mechanism for actuating said devices and rolls, a clutch device co-operating with such mechanism, and electrically controlled mechanism actuated by the running wires when entangled and arranged to co-operate with the clutch.
105. In a colled wire fabric machine, the combination with the coilling and weaving devices, and with the feed rolls, of mechanism for actuating sald devices and rolls, a clutch device co-operating with such mechanism, and electrically controlled mechanism actuated by the running wires when enlangled and arranged to co-operate with the clutch and comprising electrodes arranged adjacent the running wires and in an electrical circuit, and an electro-magnet in said circuit and controlling the clutch device.
106. In a coiled wire fabric machine, the combination with the colling and weaving devices, and with the feed rolls, of mechanism for actuating said devices and rolls, a clutch device co-operating with such mechanism, and electrically controlled mechanism actuated by the running wires when entangled and arranged to co-operate with the clutch and comprising flexible electrodes arranged adjacent the running wires and in an electrical circuit, and an electro-magnet in said circuit co-operating with the clutch device.
107. In a coiled wire fabric machine, the combination with the colling and weaving devices, and with the feed rolls, of mechanism for actuating said devices and rolls, a clutch device co-operating with such mechanism. and electrically controlled mechanism actuated by the running wires when en langled and arranged to co-operate with the clutch and comprising electrodes arranged adjacent the running wires and in an electrical circult, a shafting lever connected with the clutch, a notched rod on said lever, an armature adapted to engage said notch, an electro-magnet interposed in said circuit and adapted to co-operate with the armature, and a :ircuit breaker operated by said rod.
108. A coiled wire fabric machine, comprising a plurality of gangs of coiling and weaving devices for producing a plurality of fabrics, and feed rolls adapted to leed the wires into the machine, one of which rolls has a series of pressure surfaces subjected to independent tension.
109. A coiled wire fabric machine, comprlsing a plurality of gangs of coiling and weaving devices for producing a plurality of fabrics, and feed rolls adapted to feed the wires into the machine, one of which rolls has a series of pressure rings for the wires subjected to independent tension.
110. n a colled wire fabric machine the cambination with coiling and weaving devices, and with power or driving mechanism for the machine, or means co-operating with the wire before its entrance to the machine for automatically stopping said mechanism when the strain on the wire exceeds a predetermined amount.
111. In a coiled wire fabric machine, the combination with coiling and weaving devices, and with power or driving mechanism for the machine, of electrically controlled means co-operating with said mechanism, and a circuit closer controlling the electrical circuit of said means and arranged to co-operate with the wire before its entrance to the machine.
112. In a coiled wire fabric machine, the combination therewith of the wire reels, and means interposed between the machine and the reels for catching a knot or the like in the wire and automatically stopping the machine when a wire thus becomes caught and for supplying sufficient wire to complete the coll of the particular wire caught or knotted.
113. In a coiled wire fabrlc machine the combination therewith of the wire reels, a pulley or sheave over which the wire runs from the reel to the machine and which is suspended with a yielding pressure, said pressure being overcome when a wire is caught or knotted, and an electrical device actuated by the falling sheave for stopping the machine.
114. In a colled wire fabric machine, the combination therewith of the wire reels, a pulley or sheave over which the wire runs from the reel to the machine and which is suspended with a yiclding pressure, said pressure being overcome when . wire is caught or knotted, means for predetermining the amount of such pressure, and an electrical device actuatoi by the falling sheave for stopping the machine
115. In a colled wire fabric machine, the combination therewith of the wire reels, a pulley or sheave over which the wire runs from the reel to the machine and which is suspended with a yielding pressure, said pressure being overcome when a wire is caught or knotted, an upright arm
near whose upper end the sheave is so held and on which it is arranged to slide when falling, and an electrical device actuated by the falling sheave for stopping the machine.
116. In a coiled wire fabric machine, the combination therewith of the wire recls, a pulley or sheave over which the wire runs from the reel to the machine and which is stispended with a yielding pressure, said pressure being overcome when a wire is caught or knotted, an upright arm having a longitudinal slot arranged to receive the spindle of the sheave, a spring pressed arm having an inclined portion engaging said spindle to hold the sheave in elevated position in the slot with a yielding pressure, and an electreal device actuated by the falling sheave for stopping the machine.
117. In a coiled wire fabric machine, the combination therewith of the wire reels, a pulley or sheave over which the wire runs from the reel to the machine and which is suspended with a yielding pressure, said pressure being overcome when a wire is caught or knotted, an upright arm having a longitudinal slot arranged to receive the sp'ndle of the sheave, a spring pressed arm arranged to engage the spindle to hold the sheave in elevated position in the slot with a yielding pressure, an electrical device actuated by the falling sheave for stopping the machine, a support having a bracket on which the slotted arm is mounted. and another sheave mounted on said bracket and over which the wire passes on its way to the machine.
118. In a colled wire fabric machine, the combination with the coiling and weaving devices, of a trimmer arranged in the path of the rearward edge of the fabric as delivered from the machine and adapted to trim said edges.
119. In a coiled wire fabric machine, the combination with the coiling and weaving devices, of a reciprocating knife arranged in the path of the rearward edge of the fabric as delivered from the machine and adapted to trim sald edges.
120. In a coiled wire fabric machine, the combination with the colling and weaving devices, of a fixed plate having a slot receiving the rearward edge of the fabric as dellvered from the machine, and a reciprocating knife movable across such slot to trim such edge of the fabric.
121. In a coiled wire fabric machine, the combination with gangs of coiling and weaving devices adapted to simultaneously produce a plurality of fabrics, of a trimmer arranged in the path of the rearward edge of all the fabrics and adapted to simultaneously trim the same.
122. In a coiled wire fabric machine, the combination with the coiling and weaving devices, of means for crushing one end of the fabric to prevent displacement of the coils.
123. In a coiled wire fabric machine, the combination with the colling and weaving devices, of a trimming device for trimming one edge of the fabric, and means for crushing such edge of the fabric.
124. In a coiled wire fabric machine, the combination with the coiling and weaving devices, of a channel or guide in which the fabric passes, and a movable member adapted to crush an edge of the fabric against such guide.
125. In a colled wire fabric machine, the combination with the coiling and weaving devices, of a channel or guide in which the fabric passes, a reciprocating knife for trimming an edge of the fabric, and a movable member operatively connected with the knife and arranged to crush the fabric against such guide.
126. A colled wire fabric machine, comprising a plurality of coiling devices for producing the coils, of a plurality of separate and complete fabrics, each coiling device being separate and independent and arranged to produce all of the coils of its particular fabric, a corresponding plurality of weaving devices separate and independent of each other and co-operating with said colling devices, and mechanism common to all of said colling and weaving devices for operating them.
127. A colled wire fabric machine, comprising a plurality of gangs of coiling and weaving devices for producing a plurality of fabrics, and feed rolls adapted to feed the wires into the machine, one of which rolls has a series of independent pressure surfaces.
128. A coiled wire fabric machine, comprising a plurality of gangs, of coiling and weaving devices for producing a plurality of fabrics, and feed rolls adapted to feed the wires into the machine, one of which rolls has a series of independently adjustable pressure surfaces.
129. A coiled wire fabric machine, comprising a plurality of gangs of coiling and weaving devices for producing a plurality of fabrics, and feed rolls adapted to feed the wires into the machine, one of which rolis has a series of separate pressure rings for the wires.

1:30. A coiled wire fabric machine comprising a plurality of gangs of coiling and weaving devices for groducng a plurality of fabrics, and feed rolls adapted to feed the wires into the machine, one of which rolls has a series of independently adjustable rings forming pressure surfaces for the wir's.
131. A colled wile fabric machine, comprising a plurality of colling devices for producing the colls. of a plurality of separate and ocn plete fabrics, each coiling device being separate and independent and arranged to produce all of the coils of it; particular fabric, a corresponding plurality of weaving devices comprising separate and independent channels arranzed in :.dvance of and co-operating with the coiling devices and a so comprising shutters working from opposite sides of the channels, and mechanism common to said coiling and weavirg devices for operating them.

\section*{No. 100,960. Hose and Pipe Couplins. Joint de boyave et tuyaue.}

Jonas Pehrson, Willow Brook. Saskatchewan, Canada, 11th September, 1903; 6 years. Filed 18th May, 1906. Receipt No. 136.041.
Claim.-A hose and pipe coupling comprising two members provided with ends adapted to abut on one another, one on said members having a series of arms provided with cam surfaces, the other member being provided with webs spaced from one another and one of them having apertures through which said arms are inserted, a locking ring loosely mounted between said webs and into which said arms are thrust, said ring being provided with a series of lugs at intervals provided with cam surfaces to engage the corresponding surfaces on said arms and draw said members together, and a eetaining collar on one of sald webs, substantially as described.

No. 100,961. Filter. Filtre.

John Mills, Toronto, Ontario, Canada, 11th September, 1906 ; 6 years. Filed 5th May, 1906. Recelpt No. 135,606.
Claim.-1. A filtering machine comprising a rotary filter, squeezing rolls opposed thereto, and means for causing the revolution of the rotary fllter.
2. A filtering machine comprising a rotary filter, squeezing rolls opposed thereto, means for causing the revolution of the rotary filter, and means for causing the revolution of the squeezing rolls.
3. A filtering machine comprising a rotary filter, squeezing rolls opposed thereto, means for causing the revolution of the rotary filter and means for adjusting the squeezing rolls ielatively to the rotary filter.
4. A filtering machine comprising a rotary filter, squeezing rolls opposed thercto, means for adjusting the squeezing iolls relatively to the rotary filter, means for causing the revolution of the rotary filter, and means for causing the revolution of the squeezing rolls.
5. A filtering machine comprising a rotary filter composea of a number of removable filter sections, means for securely
holding the filter sections in their fixed positions, squeezing rolls opposed to the rotary filter and means for causing the revolution of the rotary filter.
6. A filtering machine comprising a rotary filter composed of a number of removable filter sections, means for securely holding the filter sections in their fixed positions, squeezing rolls opposed to the rotary fller, means for adjusting the squeezing rolls relatively thereto, means for causing the revolution of the rotary filter and means for causing the revolution of the squeezing rolls.
7. A filtering machine comprising a shaft, a rotary plate revoluble around said shaft, an annular spur wheel concentric with the rotary plate and separated therefrom by an intervening space, a perforated filter bed connected to the rotary plate and to the annular spur wheel to bridge the intervening space between them, squeezing rolls opposed to the filter bed and means for causing the revolution of the spur wheel, filter bed and rotary plate
8. A filtering machine comprising a vertical shaft, an horizontally disposed plate revoluble around said shaft a filter bed supported by said plate, squeezing rolls opposed to the filter bed. means for causing the revolution of the filter bed. and means for causing the revolution of the squeezing rolls.
9. A filtering machine comprising a vertical shaft, an horizontally disposed plate revoluble around said shaft a filter bed supported by said plate, squeezing rolls opposed to the alter bed, means for causing the revolution of the filter bed, means for causing the revolution of the squeezing rolls, and means for adjusting the squeezing rolls to the filter bed.
10. A filtering machine comprising a rotary filter, squeezing rolls opposed thereto. means for causing the revolution of the filter, sides enclosing the squeczing rolls and means for adjusting the sides to the filter.
11. A filtering machine comprising a stationary shaft, a rotary plate revoluble around said shaft, means on said shaft for maintaining the rotary plate in a fixed horizontal plane, an annular spur wheel encircling the rotary plate and separated therefrom by an intervening space, a perforated fiter bed connected to the annular spur wheel and rotary plate and bridging said space, a filter plate supported upon the filter bed, idlers supporting the annular spur wheel, means for causing the revolution of the spur wheel, filter bed and rotary plate, squeezing rolls opposed to the filter bed and means for causing the revolution of the squeezing rolls.
12. A filtering machine comprising a stationary shaft a rotary plate revoluble around said shaft, means on said shaft for maintalning the rotary plate in a fixed horizontal plane an annular spur wheel encircling said rotary plate and separated therefrom by an intervening space, a perforated filter bed connected to the annular spur wheel and rotary plate and bridging said space, a filter plate supported upon the filter bed composed of a number of removable filter plate sections, means for removably holding the filter plate sections in their fixed positions upon the filter bed, idlers supporting the annular spur wheel, means for causing the rorolution of the spur wheel, filter bed and rotary plate, squeezing rolls opposed to the filter bed and means for causing the revolution of the squeezing rolls.
13. A flltering machine comprising a stationary shaft, a rotary plate revoluble around said shaft, means on said shaft for maintaining the rotary plate in a fixed horizontal plane. an annular spur wheel encircling said rotary plate and separ ated therefrom by an intervening space, a perforated filter bed connected to the annular spur wheel and rotary plate and bridging said space, a filter plate supported upon the filter bed, idlers supporting the annular spur wheel, means for causing the revolution of the spur wheel, filter bed and rotary plate, squeezing rolls opposed to the filter bed, means for causing the revolution of the squeezing rolls, and means for adjusting the squeezing rolls to the filter bed.
14. A fltering machine comprising a stationary shaft, a rotary plate revoluble around said shaft, means on said shaft for maintaining the rotary plate in a fixed horizontal plane an annular spur wheel encircling said rotary plate and separated therefrom by an intervening syace, a perforated filter bed connected to the annular spur wheel and rotary plate and bridging said space, a filter plate supported upon the filter bed, composed of a number of removable filter plate sections, means for removably holding the filter plate sections in their fixed positions upon the filter bed, idlers supporting the annular spur wheel, means for causing the revolution of the spur wheel, filter bed and rotary plate squeezing rolls opposed to the filter bed, means for causing the revolution of the squeezing rolls, and means for adjusting the squeezing rolls to the filter bed.
15. A filtering machine comprising a stationary shaft, a collar vertically adjustable upon the shaft, a rotary plate \(r \in\) voluble around said shaft and supported by sald collar, an annular spur wheel encircling the rotary plate and separated therefrom by an intervening space, idlers to support the annular spur wheel, an annular drain connected to the rotary plate and to the spur wheel and protruding through the space intervening between them, a flter bed bridging the Interven-

Ing space above the drain, a filter plate supported by the filter bed composed of a number of removable filter plato sections, a clamping means for each filter plate section to removably hold it in its fixed position, squeezing rolls opposed to the filter surface of the filter plate, adjustable bearings for the shafts of the squeezing rolls whereby they can be adjusted to the filter surface, tension springs engaging the bearings of the squeezing rolls to hold them in their adjusted position, a crown wheel carried by the rotary plate, bevel wheels mounted upon the shafts of the squeezing rolls meshing with the crown wheel, and tub sides enclosing the squeezing rolls adjustable to the fllter bed.
16. A filtering machine comprising a stationary shaft, a collar vertically adjustable upon the shaft, a rotary plate revoluble around said shaft and supported by said collar, an annular spur wheel encircling the rotary plate and separated therefrom by an intervening space, Idlers to support the anbular spur wheel, an annular drain connected to the rotary Flate and to the spur wheel and protruding through the space intervening between them, a filter bed bridging the intervening space above the drain, a filter plate supported by the filter bed composed of a number of removable filter plate sections, a clamping means for each fllter plate section to \(r \in m o v a b l y\) hold it in its fixed position, squeezing rolls opposed to the filter surface of the filter plate. adjustable bearings for the shafts of the squeezing rolls whereby they can be adjusted to the filter surface, tension springs engaging the bearings of the squeezing rolls to hold them in their adjusted position, a crown wheel carried by the rotary plate. \(b \in v e l\) wheels mounted upon the shafts of the squeezing rolls meshing with the crown wheel. tub sides enclosing the squeezing rolls adjustable to the filter bed. and a trough located below the drain.

\section*{No. 100,962. Filter Wash Trough.} Auge d laver pour nitres.

FIG. 2

Frederick Bernard Leopold, Evanston, Illinois, U.S.A., 11th September, 1906; 6-ears. Filed 29th June, 1906. Receipt No. 137,418.
Claim.-1. A wash trough for fllters having bulging or protruding walls forming inclined faces and a contracted mouth. 2. A wash trough for filters having a projecting top portion extending outwardly from the mouth of said trough whereby the water before entering said trough travels in a horizontal or substantially horizontal course.
3. A wash trough for filters having an inclined top portion extending from the mouth of said trough whereby the water before entering said trough travels in a horizontal or substantially horizontal course.
4. A wash trough for filters having outwardly projecting top portions extending from the mouth of sald trough at both s!des thereof whereby the water before entering said trough travels in a horizontal or substantially horizontal course.
5. A wash trough for filters having inclined top portions oxtending from the mouth of said trough at both sides thereof, whereby the water before entering said trough travels in a horizontal or substantlally horizontal course.
6. A wash trough for flters having upwardly and outwardly inclined faces extending from the bottom of gaid trough to a
point and inwardly and upwardly inclined faces extending from said point to the mouth of said trough.
7. A wash trough for filters having an opening in the botiom thereof leading back into the filter.
8. A wash trough for filters comprising metal plates connected together with a slight intervening space between their lower edges.
No. 100.963. Electrically Operated Safety Valve. Soupape de suireté actionnéz par l'électricité.

Adolph W. Jenczewsky, Chicago. Illinols, U.S.A.. 11th September. 1906 ; 6 years. Filed 25 th May, 1906. Receipt No. 136,216 .
Claim.-1. The combination with a supply pipe which enters a building through the outer wall thereof. of a safety valve aiplied to the supply pipe inside of the said wall of the puilding. said valve embracing a valve closure which has a tenflency to assume its closed position, means for holding the chosure in its open position, and electrically actuated means for relnasing the closure embracing an electric circuit and a switeh in said circuit located outside of the building.
2. The combination with a supply pipe which enters a building through one of the walls thereof, of a safety valve applied to the supply pipe inside of the said wall of the tuilding. said valve embracing a valve closure which has a tendency to assume its closed position, means for holding the closure in its open position, electrically operated means for releasing the closure, and a valve casing which surrounds and forms a permanently closed enclosure for the said electrically operated releasing means.
3. A safety valve for supply pipes comprising a valve casing. a valve closure in said casing which has a tendency to assume its closed position. means for holding the valve closure in its open position embracing a supporting member which is destructible by heat, and an electric clrcuit adapted to generate heat for effecting the destruction of said supporting member, and the release of the closure.
4. A safety valve for supply pipes comprising a valve casing, a movable valve closure in said casing which has a tendency to assume its closed position, and means for holding caid valve closure in its open position including a wire within the casing which is insulated from the casing and forms part of an electric circuit.

\section*{No. 100,964. Valve. Soирири}

Henry Rustad, Lindsay, Ontario. Canada, 11th September. 1906 ; 6 years. Filed 13 th June, 1906. Receipt No. 136. S37.
Claim.-1. In a valve in combination a body portion having a suitable seat. a bonnet covering in said body portion and having a recess from its lower end and a central cylindrical orifice into sald recess, a spindle having a threaded portion intermediate of its length and extending through said orlfice into proximity with said seat, a spring held non-rotating nut slidably arranged in said recess correspondingly threaded and co-acting with said spindle, and a valve at the lower cad of said spindle and engaging said seat, as and for the purpose specifled.
2. In a valve in combination a body portion having a suitable seat, a bonnet covering said body portion and having a recess from its lower end and a central cylindrical orifice into said recess, a spindle having a threaded portion intermediate of its length and extending through said orifice into proximity with said seat, a non-rotating nut slidably arranged in said recess correspondingly threaded and co-acting with said spindle, a helical spring esconsed in the central cyllndrical orifice in said bonnet and resting against said nut, and a valve at the lower end of said spindle and engaging said seat, as and for the purpose specifled.
3. In a valve in combination, a body portion having a suitable seat, a bonnet covering in said body portion and having

a recess from its lower end and a central cylindrical orifice itito said recess and projections from the wall of said recess, a spindle having a threaded portion intermediate of its length and extending through said orifice into proximity with said seat, a non-rotating nut slidably arranged in sald recess and correspondingly threaded and co-acting with said spindle and having slots in the periphery thereof registering with the projections from the walls of said recess, a heilical spring esconsed in said cylindrical orifice and resting against said nut, and a valve at the lower end of said spindle and engage ing said seat, as and for the purpose specified.
4. In a valve in comblnation, a body portion having a suitable seat, a bonnet covering in said body nortion and having 3 recess from its lower end and a central cylindrical orifice into said recess and projections from the wall of said recess. a spindle having a threaded portion intermediate of it:s length and an enlarged lower end and extending through said orifice into proximity with said seat, a non-rotating nut slidably arranged in said recess correspondingly threaded and co-acting with said spindle and having slots in the periphery thereof registering with the projections from the walls of said recess, a valve surorunding the enlarged lower end of said recess, a valve surrounding the enlarged lower end of ing said valve on sald spindle, as and for the purpose specified.
5. In a valve in combination a body portion having a sultable seat, a bonnet coyering in said body portion and having a recess from its lower end and a central cylindrical orifice into said recess and projections from the wall of sald recess. a spindle having a threaded portion intermediate its length and an enlarged lower end and lateral projections therefrom and extending through said orifice into proximity with said seat, a non-rotating nut slidably arranged in said recess correspondingly threaded and co-acting with said spindle and having slots in the periphery thereof registering with the projections from the walls of said recess, a valve at the lower end of said spindle and engaging sald seat having a recess from its upper side and threaded on the interior and a central cylindrical recess below said threaded recess to receive the enlarged end of sald spindle and recess from said central recess to recelve the projections from sald spindle. and nut surrounding said spindle having a threaded portion of said valve and securing it to said spindle, as and for the purpose specified.
6. In a valve in combination a body portion having a suitable seat, a bonnet covering in said body portion and having a cylindrical recess from its lower end reduced for a portion of its length and forming a shoulder and projectlons from the walls thereof below said shoulder and a central cylindrical orifice into said recess and the outer periphery threaded at the upper end, a spindle having a threaded portion intermediate of its length and an enlarged lower end and lateral projections therefrom and extending through said orifice into proximity with said seat, a cylindrical nut slidably arranged in said recess correspondingly threaded and co-acting with said spindle and having slots in the periphery thereof registering with the projections from the walls of said recess, a valve at the lower end of said spindle and engaging said seat having a recess from its upper side and threaded on the interior and a central cylindrical recess below sald threaded recess to receive the enlarged end of said spindle and forming a shoulder and recesses from said central recess to receive the projections from sald spindle, and a nut surrounding said spindle having a threaded portion to engage the threaded portion of sald valve and abutting sald shoulder. as and for the purpose specified.

No. 100,865. Tobacco Pipe. Pipe d tabac.

Charles Lindberg, Duluth, Minnesota, U.S.A., 11th September, 1906; 6 years. Filed 30th April, 1906. Receipt No. \(135,406\).
Claim.-The herein described tobacco plpe having the bowl provided with the short stem having the draft bore and the enlarged counterbore, the draft tube, of reduced diameter connected with the draft bore and extending through the counterbore, the hollow drain cap or plug communicating with the inner end of the counterbore and depending from the short stem, the main stem fitted in the counterbore and into which the draft tube extends, and the mouthpiece fitted and having the reduced inner portion in the outer end of the main stem, the mouthplece being spaced from the draft tube. substantiaily as specified.

No. 100,966. Tobacco Pipe. Pipe d tabao.

Bertram Odegard, Chicago, Illinois, U.S.A., 11th September, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,648.
claim.-1. A pipe comprising a bowl and a removable stem, said stem comprising a sleeve and a core removably arranged in said sleeve, said core having a spiral groove in its surface and provided at its outer end with an extension having a diminished diameter and surrounded by an annular chamber communicating with said spiral groove, said extension having on its outer end a portion fitting the opening in the outer end of the sleeve, said portion having therein a perforation communicating with the annular chamber.
2. A pipe consisting of a bowl and a stem removably fitting said bowl, said stem comprising a core having spiral grooves in its surface, a cord arranged in one or more of said grooves, a sleeve surrounding said core and holding said cord in its grooves, sald sleeve being removable from said core.
3. A pipe comprising a bowl. a stem consisting of a core and a sleeve and a wiper arranged on said core, substantially as shown and described.

\section*{No. 100,967. Tobacco Pipe. Pipe d tabac.}

Muscoe L. Spotswood and Turner Ashby Weller, Birmingham, Virginia, U.S.A., 11th September. 1906 ; 6 years. Filed 10th May, 1906. Recelpt No. 135,762.
Claim.-1. A tobacco plpe attachment consisting of a perforated plate and a spring cllp formed from sheet metal, the inner clip member being flat and the outer member having oppositely inclined portions, as and for the purpose described.
2. A new article of manufacture, a tobacco plpe attachment, the same comprising a perforated plate and a spring clip formed of a sheet metal blank, the clip members being flat and adapted to lie close against the inner and outer walls of the pipe bowl, the outer member being longer than the inger member and composed of oppositely inclined parts, substantially as speciffed.
\(9-17\)
3. An attachment for the bowl of tobacco plpes, the same comprising a plate, a deflector arranged below the plate and

spaced therefrom, and connecting means between the plate and deflector
4. An attachment for the bowl of tobacco pipes, the same comprising a plate, a deflector of approximately concavor cenvex form arranged below the plate and spaced therefrom, the hollow side facing away from the plate, and connecting means between the plate and deflector.
5. In a tobacco pipe, the combination of a trap in the lower portion of the bowl, a tube leading through said trap and extended upward therefrom, and a deflector located above the trap and recelving the upper end of said tube.
6. In a tobacco pipe, the combination of a perforated plate aranged within the lower portion of the bowl, a deflector 10cated below said perforated plate, a trap arranged below said deflector, and a tube opening through the trap and having its upper end projected into the deflector.
7. An attachment to be fitted in the longitudinal portion of the bowl of a tobacco plpe, the same comprising a plate, and a deflector of concavo-convex form spaced from the plate and baving central connection therewith, the hollow side of the deflector facing away from the sald plate.
8. An atachment to be fitted in the longltudinal portion of the bowl of a tobacco plpe, the same comprising a plate, a trap spaced from the plate, a deflector of approximately con-cavo-convex form arranged in the space formed between the said plate and trap, and having its hollow side facing the trap and its lower edge spaced therefrom, and connecting. means between the several parts forming a support to admit of manipulating the attachment.
9. An attachment for tobacco pipes comprising a bar adapted to form a scraper, and a perforated plate, deflector and trap supported by said bar and adapted to be placed in position or removed from the bowl of the plipe thereby.
10. An attachment for tobacco pipes comprising a cap, a bar projected therefrom, and a perforated plate, deflector and trap supported by means of said bar.
11. An attachment for tobacco pipes comprising a cap adapted to be fitted to the upper end of the bowl of a pipe and adapted to be turned thereon, a bar connected with said cap and adapted to form a scraper for cleaning the inner s!de of the bowl, and a perforated plate, deflector and trap supported by means of said bar.
12. An attachment for tobacco plpes comprising a support, and a trap connected with said support and movable therewith to be placed within or to be removed from the bowl, said trap being movable with reference to the support to admit of its being readily cleaned.
13. An attachment for tobacco pipes comprising a support, and a trap having hinged or pivotal connection with the support and provided with a catch to normally hold the same in a given position.
14. An attachment for tobacco pipes comprising a cap rotatable upon the end of the bowl, a support connected with said cap and comprising a spring arm and a bar, the latter coming close to the inner side of the bowl to form a scraper and the spring arm being deflected between its ends to span the bulge of the bowl and grip the side thereof at a point between the bulge and base, and a perforated plate, deflector and trap attached to said support.
15. An attacbment for tobacco pipes comprising an annular cap, bars and spring arms connected therewith, and a perforated plate, deflector and trap connecting the lower ends of the bars, the trap being provided with a centrally disposed tube having its lower end in communication with the passage of the stem of the pipe and having its upper end extended Into the space of the deflector.

No. 100,988. Gyroscope. Gyrophore.

Hermann Aschutz-Kaemfe, Kiel, Prussla, Germany, 11th September, 1906; 6 years. Filed 9th June, 1906. Receipt No. 136,737.
Claim.-1. In a gyroscope the provision of means to bring about a precession thereof corresponding at any point of the surface of the earth to the velocity and direction of the rotation of the earth, consisting in providing on one side of the axis of rotation a weight which has the tendency to turn the gyroscope about the horizontal axis perpendicular to the axis of rotation-the axis of elevation-the action of the sald weight being brought in accordance with the desired latitude by suitable choosing its size and position, substantially as described.
2. A gyroscope characterized by the arrangement of a weight acting on its axis of rotation the said weight being movable transversely of the axis of elevation along a scale the divisions of which correspond to the different degrees of latitude and indicate the positions into which the welght has to be moved for producing a precession corresponding to the desired latitude, substantially as described.
3. A gyroscope characterized by the arrangement of the weight in such manner, that the leverage with which it acts on the axis of rotation is automatically modified in accordance with the elevation of the axis of rotation, in such manner that the speed of precession always remalins the same, substantially as described.
4. In a gyroscope the provision of means to automatically return its axis of rotation to normal position, when the position of said axis has been varied to a given extent.
5. In a gyroscope the provision of means whereby when the position of the axis of rotation has been altered to a given extent, the circuit of an electro-magnetic device is inlluenced in such manner that a torque or turning movement is exerted on the gyroscope with reference to the axis perpendicular both to the axis of rotation and to the axis about which the incorrect turning has taken place, axis of elevation, in such manner that owing to the reaction the axis of rotation is moved in accordance with the laws of gyroscopic action in the opposite direction to that in which it was wrongly moved, substantially as described.
6. In a gyroscope the provision of two electric circuit closing devices secured to the frame carrying the axle of rotation of the gyroscope, one of the said circuit closing devices. when the axis of rotation \(s\) wings out in one of two directions to a glven extent closing the circuit of an electro-magnetic device in such manner that the latter exerts a torque on the third axis perpendicular to the axis of rotation and to the axis of elevation, the said torque producing a movement of the axis of rotation to return the same to normal position, substantially as described.
i. In a gyroscope the combination with an electro-magnetic dtvice, of circuit closing devices secured to the frame of the axle of rotation so that after an incorrect movement of the said axle to a given amount has taken place, the circult is maintained closed until movement of the axis of rotation, produced by the electro-magnetic device, has reached the same amount as that of the previous incorrect movement, whereupon the circuit is broken.
8. In a gyroscope having electro-magnetic means to automatically control the position of its axis of rotation the provision of contacts to close an electric ciruit, one contact being movable by the movement of the axis to close the circuit, and the other being moved after the circuit is closed, substantially as and for the purpose described.
9. In a gyroscope having circuit closing devices to control the apparatus for correcting the position of its axis of rotation, the provision of a contact. in the form of a mercury cup arranged on the armature of an electro-magnetic device which. whin the circuit is closed by the contact of the mercury surfacr with a second contact in the form of a metal pili. is raised to such an extent that the contact pin dips into the mercury to the same extent to which the axis of rotation
disscended in order to bring about the contact, substantially as described.
10. In a gyroscope a device for automatically returning its axis of rotation to normal position comprising an electromagnet armature provided with a pawl, which when the circuit is closed, is first brought into engagement with a ratchet wheel mounted on the third axle perpendicular to the axis of rotation and to the axis of elevation, and afterwards operated to turn the ratchet wheel to give a desired torque to said axle, substantially as described.
11. In a gyroscope a device to automatically return its axis of rotation to normal position the provision of a pawl rotatably mounted on a slide block movable in guides, which slide block forms the armature for an electro-magnet which is switched in when the circuit is closed by a change of position of the said axis from normal and is raised when the said electro-magnet is excited, whereby on the one hand the pawl is brought into engagement with the ratchet wheel, and on the other hand, the circuit of another electro-magnet is excited, which exercises a lateral pull in one or in the other direction on the pawl, substantially as and for the purpose described.

No. 100,969. Air Gun. Fusil d vent.

Axel Linus Blomëu, Sundbyberg, Sweden, 11th September. 1906; 6 years. Filed 9th June, 1906. Receipt No. 136.732. claim.-1. The combination with an air gun having an air reservoir, an air pump and a valve acted upon by a trigger device and adapted to close and open a passage between the reservoir and the barrel, of a body yieldingly connected to the valve and adapted to engage the pawl which as usual is released by the trigger, so that a tension is established between the valve and said body, when the latter engages the pawl, said tension being adapted to press the valve against its seat, for the purpose set forth.
2. The combination with an alr gun having an air reservoir, an air pump, and a valve acted upon by a trigger device and adapted to close and open a passage between the reservoir and the barrel, of a sleeve passed on the rear end of the valve stem, a spring inserted between the valve stem and the bottom of the sleeve, and a screw fastened in the stem and passing through a hole in the bottom of the sleeve, so that the backward movement of the sleeve relatively to the stem is stopped by the head of the screw. substantially as get forth.
3. The combination with an air gun, having an air reservoir, an air pump, and a valve controlling the communication between the reservoir and the barrel, of a sleeve passed on the valve stem, a spring adapted to move the sleeve rearwards on the stem, a stop connected to the stem and adapted to limit the backward movement of the sleeve on the stem. another spring adapted to open the valve by pressing on the front edge of the sleeve, a shoulder on the sleeve, adapted to engage a pawl engaged by the trigger, and a cap screwed on the rear end of the sleeve and leaving a space between its bottom and the sald stop so as not to interfere with the movement of the sleeve relatively to the stem, substantially as set forth.

No. 100,87O. Animal Trap. Piçc.

John Jefferson Crowson, Pecan Cap, Texas, U.S.A., 11th September, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,718.
Claim.-1. A trap of the character described having means to suspend the same above the ground, and means simulcaneously operated with the springing of the trap to elevate the latter, substantially as described.
2. A trap of the character described, comprising a supportng frame, spring actuated gripping jaws pivoted to said frame, a trigger to hold sald jaw in an open or set position, a slidably mounted supporting rod connected to said trap, means to pull said rod upwardly and thereby elevate said trap, and means adapted to be released by the spring of the trap jaws, to hold said rod and trap in a lowered position, substantially as described.
3. A trap of the character described comprising a supporting frame, spring actuated gripping jaws pivotally mounted on said frame, a trigger to hold said jaws in an open or set postion, a supporting post, a gulde arm projecting from said post, a supporting rod slidably mounted in said arm, said rod being connected at its lower end to said trap, an elevating connection to the upper end of sald rod, a lever pivotally mounted on said arm, means formed on said lever to hold said rod and the trap in a lowered position, and means connected to the jaws of the trap whereby when the same are sprung said lever is actuated to release said rod and permit said spring to elevate the trap.
4. A trap of the character feecribed comprising a supporting frame, spring actuated gripping jaws pivotally mounted on said frame, a trigger to hold said jaws in an open or set position, a supporting rost, a guide arm projecting from said rod being connected at its lower end to said strap, an elevating spring connected to the upper end of said rod, a lever pivotally mounted on said arm, a laterally projecting roller pivotally mounted on said rod, a hook formed on said rod and strap in a lower position, a rod or cord connected to the upper end of said lever, and to one of the jaws of said strap whereby when the latter is sprung, said lever will be actuated to disengage the hook thereon from the roller on sald rod, thereby permitting said spring to elevate the trap, substantially as described.

No. 100,97 1. Trap. Piede.

James P. Sandefur, Stamford, Texas, U.S.A., 11th September, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,780. Claim.-1. The combination with the uprights and the top bar, of the base bar provided with upwardly projecting
spikes, the central spike bar, the springs on the uprights adapted to depress the latter spike bar, the hinge jointed bait bar, and operative means between the bait bar and central spike bar to latch the latter in raised position when its joint is straightened, but to release the said spike bar when the hinge joint of the bait bar is broken.
2. The combination with the uprights and the top bar, of the base bar provided with upwardly projecting spikes, the central spike bar, the springs on the uprights adapted to depress the latter spike bar, the hinged jointed bait bar, the latch pins pivoted in said bifurcations, the trip standards having latch engaging fingers, to which standards the ends of the bait bars is pivoted, the said flingers engaging the latches on one side of their plvot and the central spike bar resting upon them on the other side of their pivots, the said standards being each provided with a hinge joint, and the angular guiding standard.

No. 100,972. Firearm. Arned feu.

Juhn D. Russ, F. F. McIntosh and A. J. Lyons, each an assignee of a third interest, all of Spencer, West Virginia, U.S.A., 11th September, 1906; 6 years. Filed 29th May, 1906. Receipt No. 136,359.
Claim.-1. In a single trigger mechanism the combination with the hammer sears, of a receptacle member having two operative positions for sear release, and an automatic detent distinct from the sears and arranged to retain sald reciprocable member in first operative position and to be moved out of engagement therewith by the sear releasing movement thereof.
2. In a single trigger mechanism the combination with the hammer sears, of a reciprocable member having two operative positions for sear release, an automatic detent distinct from the sears for rotating said member in first operative position, and means for actuating said member to simutaneously disengage said detent and to bring about first sear release.
3. In, a single trigger mechanism, the combination with the hammer sears, of a reciprocable member having two operative positions for sear release, an automatic dotent distinct from the sears and arranged to retain sald member in first operative position and to be moved out of engagement with said member by the sear releasing movement thereof, setting means for moving the member in one direction into first operative position, and means for moving the member in the opposite direction upon disengagement of the detent.
4. In a single trigger mechanism, mechanism vertically movable to bring about release of the sears successively, comprising a horizontally reciprocable slide and a horizontally pivoted detent overlying the slide, said detent having an engaging tip arranged to engage detainingly with the slide and said slide being constructed on vertical movement to engage liftingly with the detent between pivot and tip.
5. In a single trigger mechanism the combination of a longitudinally movable member having two operative positions for sear release, means for moving the member from first to second operative position, a detent for retaining the member in first operative position, means for disengaging the detent and actuating the member to bring about release of the sears succcessively, and means for timing such disengagement of the detent.
6. In a single trigger mechanism, mechanism vertically movable to bring about sear release successively, comprising a horizontally reciprocable slide and a horizontally pivoted dent overlying sald slide, said detent having an engaging tip arranged to engage detainingly with the slide and a depending adjustable nin disposed intermedlate the pivot and tip, and said slide having a detent disengaging reglon arranged on vertical movement of the slide to contact liftingly with the pin.
7. In a single trigger mechanism the combination of a longitudinally movable slide capable of pivotal movement about a horizontal axis, a horizonta'ly pivoted detent overlying the slide and having an engaging tip and actuating means for elevating the slide to bring about sear-release, the slide being provided with a shoulder engaged by the tip of the detent and with a detent disengaging region located farther from the horizontal axis than sald shoulder and arranged on vertical movement of the slide to contact liftingly with the detent between pivot and tip.
8. In a single trigger mechanism a longitudinally movable member having two operative positions for sear release. an automatic detent arranged to retain said member In firsi operative position, and means carried by the detent for detaining the slide between operative positions.
3. In a single trigger mechanism a longitudinally and vertically movable member having two operative positions for sear release, means for urging the members from first to second operative positions, means for elevating the member to bring about sear release, and an automatic detent for retaining the member In first operative position and also for preventing the member assuming second operative posi tion while elevated for first sear release.
10. In a single trigger mechanism the combination of a longitudinally and vertically movable slide having two operative positions for sear release, a horizontally pivoted detent overlying said slide and having an engaging tip arranged automatically to engage and detain the slide at first operative positions, actuating means arranged to elevate the sllde to bring about sear release, and slide being provided with a detent disengaging region arranged to contact liftingly with the detent between pivot and tip during elevation at first operative positions, and a stop depending from the detent and arranged to arrest the slide in advance of second releasing operative position during such elevation.
11. In a single trigger mechanism the combination of a longitudinally movable slide raisable for sear release, means for urging the slide longitudinally from one operative position to another, and an automatic horizontally pivoted detent overlying and co-operating with the sllde and having a depending adjustable pin and a depending stop in rear of said pin, sald pin being engaged by the slide during elevation to release the slide and said stop being arranged to temporarily arrest the slide between operative positions.
12. In a single trigger mechanism the comblnation of a reciprocable member movable in one direction into first operative position and in the opposite direction into second operative position, actuating means for moving said member at operative positions to bring about sear release. and an adjustable stop arranged to temporarily arrest the member between first and second operative positions.
13. In a single trigger mechanism the combination with the hammer sears, of a sear releasing member normally in ruleasing positions with reference to one of sald sears, a releasing member for the other sear unconnected with the other releasing member, setting means for positioning the latter member in advance of releasing position with reference to the corresponding sear, and single means for successively actuating the members to release the sears.
14. In a single trigger mechanism, the combination with second sear releasing member unconnected with said initial nomber setting means for moving sald second releasing memver to a point in advance of releasing positinn, and single means for actuating said releasing members successively to effect sear release.
16. In a single trigger mechanism, the combination with the hammer sears, of an Initial sear releasing member arranged to occupy releasing position with reference to one of the sears, a second sear releasing member unconnected with said inltial member, and setting means for disposing said second member In advance of releasing position, said second member being arranged, after release of the first sear by the inttial member, to occupy releasing position with reference tr, the second sear.
16. In a single trigger mechanism. the combination with the hammer sears, of an initial releasing member arranged to occupy releasing position with reference to one of the sears, a second releasing member constructed and arranged to actuate said initial member in firing action, and setting means for disposing said second member in advance of releasing position where operable to actuate the initial releasing member to effect release of the first sear, the second releasing member then moving to assume releasing position with reference to the second sear.
17. In a single trigger mechanism, the combination with the hammer sears, of an initial releasing member for the first sear, and a second releasing member for the second sear arranged to actuate sald inltial member in firing action.
18. In a single trigger mechanism the combination with the hammer sears, of an initial releasing member for the first sear, a second releasing member for the second sear arranged to engage operatively said initial releasing mem-
ber in firing action, and a single finger trigger plece arranged to, actuate said second releasing member.
19. In a single trigger mechanism the combination with the hammer sears. of an initial releasing member for thr first sear. and a second releasing member but arranged to actuate said member in firing action.
20. In a single trigger mechanism the combination with the hammer sears, an initial releasing member for the first sear and a second releasing member for the second sear arranged to actuate the initial releasing member, of setting means for positioning said second releasing member in advance of releasing position, and manual actuating means whereby said second releasing member is released to move toward releasing position and simultaneously actuates the initial releasing member to effect release of the first sear, said means being then operable to actuate said second releasing member to effect release of the second sear
21. In a single trigger mechanism the combination with the hammer sears, of an initial releasing member for the first sear, a releasing member for the second sear, and setting means for positioning sald second releasing member in advance of releasing position, sald initial member being arranged to serve as a detent to retain temporarily the second releasing member in such advanced position. and of means for actuating said releasing members to effect sear release successively.
22. In a single trigger mechanism the combination with the hammer sears, of an initial releasing member for the first sear, a slide movable to effect release of the second sear, setting means for moving said slide longitudinally in advance of releasing position, said initial releasing member being arranged to serve as a detent to temporarily retain sald slide in such advance position, and of actuating means for causing said member and slide to effect sear release successively.
23. In a single trigger mechanism the comblnation with the hammer sears ralsable to release the hammers, of a vertically movable initial releasing member arranged to underlic one of said sears. a second longitudinally slidable releasing member underlying said initlal member, setting means for moving said second member longitudinally in advance of releasing position beneath the other sear though still beneath the initial releasing member, and manual actuating means arranged to bring about sear releasing elevation of sald second releasing member, rlevation of sald second member while advanced operating to raise the initial member into releasing engagement with its sear, the second releasing member then moving to take up releasing position with reference to its sear.
24. In a single trigger mechanism the combination with the hammer sears ralsable to release the hammers, of a horizontally pivoted initial releasing member arranged to underlfe one of said sears. a second longitudinally slldable releasing member underlying said initial member at one alde of its pivot, setting means for moving sald second member longitudinally in advance of releasing position beneath the other sear though still beneath the initial releasing member. and manual actuating means arranged to bring about sear releasing elevation of sald second releasing member, elevation of sald member while advanced operating to raise the initial member into releasing engagement with its sear, the second releasing member then moving to take up releasing position with reference to its sear.
25. In a single trigger mechanism the combination with the hanmer sears, of an initial releasing member for the first sear, and a releasing member for the sicond sear. said inttial member being arranged to serve as a detent to retain the other releasing member in advance of releasing position prior to the release of the first sear.
26. In a single trigger mechanism the combination with the hammer sears, of an inltial relcasing momber for the first sear, a releasing member for the second sear, setting means for positioning said second member in advarce of releasing position, sald initial member being arranged to serve as a detent for temporarlly retaining said second member in such advanced position, and of actuating means for simultancously removing said initial releasing member from retaning engagement and causing it to effect sear release. said means being afterwards operable to actuate the reinaining releasing momber to effect sear release.
27. In a single trigger mechanism, the combination with the hammer sears, of an initial releasing member for the first sear, a member for releasing the second sear, setting means for positioning said second member in advance of releasing position, said inltial releasing member being arranged to be actuated by the second member and to serve as a detent for temporarily retaining sald member in advanced position. and of means arranged to actuate sald second releasing member to disengage the initial relcasing member and simultaneously to cause said initial member to effect sear release, sald means being afterwards operable tc calise the second releasing member being afterwards
uperable to cause the second releasing member to effect release of the second sear.
28. In a single trigger mechanism in combination with the hammer sears of an initial releasing member for the first sear, a releasing member for the second sear, and setting meang for positioning said second releasing member in advance of releasing positon. said init!al releasing member heing arranged to serve as a detent to reiain temporarily the second releasing member in such aúvanced position and again to arrest said member before reaching releasing positinn.
29. In a single trigger mechanism the combination with the bammer sears, of an initial releasing member arranged to occupy releasing position with reference to the first sear and a longitudinally movable releasing member for the second sear arranged to have a setting movement in one langitudinal direction to a point in advance of releasing position and a return movement to releasing position, both of sald members being raisable to effect initial sear release, ard said initial releasing member serving as a detent to retain temporarily the second releasing member in such advanced position and again, during elevation of the second releasing member for initial sear release, to arrest such member before reaching release position.
30. In a single trigger mechanism, the combination with the hammer sears, of a longitudinally reciprocable slide for releasing one of the sears having a setting movement in one longitudinal direction to a point in advance of releasng position and a return movement into releasing position, and being provided on its upper surface wth a recess, of an Initial releasing member arranged, while sald slide is advanced to occupy releasing position with reference to the other sear. and overlying said slide and serving as a detent to retain the same in advanced position, of means for elevating the releasing members at releasing positions to bring about sear release, elevation at initial releasing position freeing the slide to take up movement toward second releasing position. and of a stop depending from the initial releasing member and arranged, during elevation of the slide for initial release, to arrest the slide before reaching releasing position, said stop during elevation of the slide at second releasing position being received in the recess in said slide.
31. In a single trigger mechanism, the combination with the hammer sears, of a selective releasing member movable to effect release of either of the sears as desired, and a second indenendently mounted releasing member arranged to actuate the selective member in firing action and movable to release the other sear after the operation of the selective member.
32. In a single trigger mechanism, the combination with the bammer sears, of a selective releasing member movable at will to occupy releasing position with reference to either of the sears, and a second independently mounted releasing member arranged to actuate said selective member in firing action and movable, after release of the first sear by the selective member, to nccupy releasing position with reference to the other sear
33. In a single trigger mechanism. the combination with the hammer sears. of a seloctive releasing member movable at will to occuny releasing position with reference to either of the sears, a second releasing member movable after release of the first sear by said selective member to occupy releasing position beneath both of the sears, and of means for preventing said second member assuming releasing position in event of failure of the selective member to release ejther sear.
34. In a single trigger mechanism. the combination with the hammer sears, of a selective releasing member located between the sears and transversely shiftable at will to occupy releasing position with reference to either sear, but incapable in mid-position of occupying releasing position with reference to ether sear, and a second releasing member overable only after the release of the first sear to release the remaining sear.
35. In a single trigger mechanism, the combination with the hammer sears, of a selective releasing member movable \(t 0\) effect release of elther of the sears as desired, and a second releasing member movable to release the other scar after the operation of the selective mmber, said selective member serving as a detent for retaining the second releas ing member in advance of releasing position until after the release of the first sear by said selective member.
36. In a single trigger mechanism, the combination with the hammer sears, of a transversely shiftable selective releasing member movable to effect release of either of the sears as desired. and a longitudinally movable independently mounted member arranged to actuate said selective member in firing action and having releasing means for effecting release of the other sear after the operation of the selective nember.
37. In a single trigger mechanism, the combination with the hammer series, of a transversely shiftable selective re-
leasing member movable to effect release of either of the sears as desired, and a longitudinally movable member arranged to actuate said selective member in firing action and having means for effecting release of the other scar after the operation of the selective member, said selective member being movable transversely without partaking of the longitudinal travel of said longitudinally movable member.
38. In a single trigger mechanism, the combination with the hammer sears, of a transversely swinging selective member movable to effect release of either of the sears as desired, and a longitudinally movable member arranged to actuate said selective member in firing action and movable to effect release of the other sear after the operation of the selective member.
39. In a single trigger mechanism, the combination with the hammer sears located at either side of the lock chamber and raisable to release the hammers, of a selective releasing member mounted intermediate the sears on vertical and horizontal axes so as to be capable of raising either of the sears as desired, and a second releasing member arranged to actuate said selective member in firing action and capable of raising the other sear after the operation of the selective member
40. In a single trigger mechanism, the combination with the hammer sears located at either side of the lock chamber and raisable to release the hammers, of a trigger plate, a post intermediate the sears mounted on said plate on \(n\) vertical axls, a selective releasing member carried by said post to swing laterally therewith beneath either sear a desired and mounted on a horizontal axis to bring about the elevation of the sears, and a second releasing member capable of raising the other sear after the operation of the selective member.
41. In a single trigger mechanism the combination with the hammer sears located at either side of the lock chamber and raisable to release the hammers, of a selective releasing member mounted intermediate the sears and laterally shiftable to occupy releasing position beneath either of the sears. and a sllde positioned below sald selective member and having a transverse releasing region arranged to underlio both of the sears at once, said slide being longitudinally movable, after release of one of the sears by the selective memher, to carry said releasing region to such point beneath the both of the sears as to be in position to raise either of the sears not raised by the selective member.
42. In a single trigger mechanism the combination of a releasing slide movable longitudinally between two operative positions and having a detaining shoulder, means for urging the side from the first to second operatlve position and detent overlying the slide and arranged to engage with said shoulder at first position, the region of the slide in advance of said shoulder being downward inclined or curved to prevent the detent when released from opposing the movement rif the slide to second position.
43. In a single trigger mechanism the combination of a longitudinally moved releasing slide having a detaining shoulder and a downwardly inclined or curved region in advance of said shoulder, means for urging the sllde longitudi nally and a pivoted detent overlying the slide and arranged to engage said shoulder to retain the slide in opposition to said urging means, the engaging tip of the detent being extended downward to co-operate with the downward inclined or curved region of the slide.
44. In a single trigger mechanism the combination of a longitudinally movable releasing slide and an intermediately pivoted setting lever connected at one end with sald slide and adapted to be engaged at the other end by a moving part.
45. In a single trigger mechanism the combination with the hammer sears disposed longitudinally and raisable to release the hammers, of a releasing member longitudinally movable in one direction to a point in advance of releasing position and having a return movement into releasing position and being provided on its upper surface with a transverse releasing region of such length as to underile both of the sears at once and with a transverse shoulder in rear of said region having its walls extended upward at the center of a selective releasing member mounted intermediate the sears and laterably shiftable to occupy releasing position beneath either of them but incapable in mid position of underlying either of them, said selective member serving as a detent to engage with the shoulder on the longitudinally movable member to hold the latter in advanced position and of means for elevating said longitudinally movable member at such advanced position to cause the selective member to release one of the sears, such elevation also removing the selective member from engagement with said shoulder but being Incapable of raising the selective member free of the shoulder when said member occupies mid position in rear o the extension of the shoulder.
46. In a single trigger mechanism the combination with the hammers and the hammer sears pivoted above the hammers and raisable to release the hammers, with a selective releasing member movable to release either of the hammers
as desired, a second releasing member movable to release the other hammer after the operation of the selective member and manual means for actuating said members, of bevelled lugs disposed upon the sears to engage with the backs of the hammers during firing whereby each hammer when down maintains its sear sufficiently elevated to escape further engagement with the corresponding releasing member.

No. 100,973. Pile Fabric Loom. Métior.

Nazar Costikyan, assignee of James Karmi Delkranian, all of New York City, New York, U.S.A., 11th September, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,823.
Claim.-1. A loom for interweaving a pile thread with a pair of ground warp threads, comprising means for passing the pile thread twice between the ground warp threads of a pair, and means for crossing and uncrossing the ground warp threads alternately relative to the movement of the pile thread.
2. A loom for interweaving a pile thread with a pair of ground warp threads, comprising means for alternatively crossing and uncrossing the ground warp threads, means for passing the pile thread twice between the ground warp threads, that is once while the ground warp threads are in crossed condition, and a second time while the ground warp threads are in an uncrossed condition.
3. A loom for interweaving a plle thread with a pair of ground warp threads, comprising means for alternately crossing and uncrossing a pair of ground warp threads, and means for passing a pile thread between the ground warp threads after the crossing is made and passing one end of the pile thread between the ground warp threads after they are uncrossed.
4. A loom for interweaving a pile thread with a pair of ground warp threads, comprising means for alternately crossing and uncrossing a pair of ground warp threads, means for passing a pile thread between the ground warp threads after the crossing is made and passing one end of the pile thread between the ground warp threads after they are uncrossed, means for shlfting the ground warp threads to form an open shed, and means for passing a weft thread through the open shed.
5. A loom for interweaving a pile thread with a pair of ground warp threads, comprising means for alternately crossing and uncrossing a pair of ground warp threads, and a pile thread carrier for passing a pile thread between the ground warp threads after the \(y\) are crossed and for passing one end of the pile thread between the ground warp thread after they are uncrossed.
6. A loom for interweaving a pile thread with a pair of ground warp threads, comprising means for alternately crossing and uncrossing a pair of ground warp threads, a pile thread carrier for passing a pile thread between the ground warp threads after they are crossed and for passing che end of the pile thread between the ground warp threads after they are uncrossed, heddles for operating the ground warp threads to form open sheds, and a shuttle mechanism for passing weft threads through the open sheds.
7. A loom for interweaving a pile thread with a pair of ground warp threads, comprising means for alternately crossing and uncrossing a pair of ground warp threads, a pile thread carrier for passing a plle thread between the ground warp threads after they are crossed and for passing one end of the plle thread between the ground warp threads after they are uncrossed, and a knife for cutting the piletbread adjacent to the said carrier.
8. A loom for interweaving a pile thread with a pair of ground warp threads comprising a lay and heddles, a shogging device for alternately crossing and uncrossing the said ground warp threads, and a tuft yarn tube carrying the pile thread and adapted to pass between the ground warp threads when the ground warp threads are crossed and again when the ground warp threads are uncrossed.
9. A loom for producing an oriental weave having Persian knots comprising heddles for operating the ground warp threads in pairs, an intermittently reciprocating lay having dents adapted to pass between the ground warp threads of a pair of ground warp threads, a set of tuft yarn tubes for carrying the plle threads and adapted to pass between the ground warp threads of the pairs of ground warp threads. a shogging device for alternately crossing and uncrossing the ground warp threads during the formation of each row of knots, and means for actuating the tuft yarn tubes twice for the formation of each row of knots.
10. A loom for producing an oriental weave having Persian knots comprising heddles for operating the ground warp threads in pairs, an intermittently reciprocating lay having dents adapted to pass between the ground warp threads of a pair of ground warp threads, a set of tuft yarn tubes for carrying the pile threads and adapted to pass between the ground warp threads of the pairs of ground warp threads. a shogging device for alternately crossing and uncrossing the ground warp threads during the formation of each row of knots, and means for actuating the tuft yarn tubes twice for the formation of each row of knots and alternately with the said shogging device.
11. A loom for producing an orlental weave having Persian knots comprising heddles for operating the ground warp threads in pairs, an intermittently reciprocating lay having dents adapted to pass betwoen the ground warp threads of a pair of ground warp threads, a set of tuft yarn tubes for carrying the pile threads and adapted to pass between the ground warp threads of the pairs of ground warp threads. a shogging device for alternately crossing and uncrossine the ground warp threads during the formation of each row nf knots, means for actuating the tuft yarn tubes twice for the formation of each row of knots and alternately with the said shogging device, and a cutting device for cutting the pile threads adjacent to the tuft yarn tubes and while the latter are at rest at the end of the last half stroke.
12. A loom for producing an orlental weave having Persian knots cumprising a tuft varn tube, means for imparting two full strokes to the tuft yarn tube to move the latter twice between the ground warp threads of a pair of gronnd warp threads during the formation of the knots. a shogginlevice for intermittently crossing and uncrossing the ground warp threads of a pair of ground warp threads and alternately relative to the movement of the tuft varn tube and curing the formation of the knot, and a cutting device for cutting the pile thread adjacent to the tuft yarn tube and at the time the tuft yarn tube is at the end of its last half stroke.
13. A loom for producing an oriental weave having Persian knots comprising a tuft yarn tube, means for imparting two full strokes to the tuft yarn tube to move the latter twice between the ground warp threads of a pair of ground warp threads during the formation of the knots, a shogging device for intermittently crossing and uncrossing the ground warp threads of a pair of ground warp threads and alternately relative to the movement of the tuft varn tube and during the formation of the knot. a cutting device for cutting the plle thread adjacent to the tuft yarn tube and at the time the tuft yarn tube is at the ond of its last half stroke, heddles for operating the pair of ground warp threads, a shuttle mechanism for passing the weft through the open shed and a lav for beating in thr weft and knots.
14. A loom for producing an oriental weave having Persian knots comprising a tuft yarn tube. means for imparting two full strokes to the tuft yarn tube to move the latter twice between the ground warp threads of a pair of ground warp threads during the formation of the knots, a shogg!ng device for intermittently crossing and uncrossing the ground warn threads of a palr of ground warp threads and alternately relative to the movement of the tuft yarn tube and during the formation of the knot, a cutting device for cutting the pile thread adjacent to the tuft varn tube and at th. time the tuft yarn tube is at the end of its last half strokn. heddles for operating the pair of ground warp threads. a shuttle mechanism for passing the weft through the open shed and a lay for beating in the weft and knots, the lay
having a detent adapted to pass between the ground warp threads.
15. A loom for producing an oriental weave having Persian knots comprising a tuft yarn tube, means for imparting two full strokes to the tuft yarn tube to move the latter twice between the ground warp threads of a pair of ground warp threads during the formation of the knots, a shogging device for intermittently crossing and uncrossing the ground warp threads of a pair of ground warp threads and alternately relative to the movement of the tuft yarn tube and during the formation of the knot, a cutting devlce for cutling the pile thread adjacent to the tuft yarn tube and at the time the tuft yarn tube is at the end of its last half stroke, heddles for operating the pair of ground warp threads, a shuttle mechanism for passing the weft through the open a dent adapted to pass between the ground warp threads, and means for intermittently reciprocating the said lay.

No. 100,974. Stop Motion for Looms.
Mouvement d'arret pour motiors.

The Coldwell-Gildard Company, Fall River, Massachusetts, U.S.A., 11th September, 1906 ; 6 years. Filed 11th June, 1906. Receipts Nos. 136,419 and 136,762 .

Note.-This patent is a re-issue of Patent No. 95,964 bearing date the 7th day of November, 1905.
Claim,-1. The combination with a loom and a stop motion therefor comprising a series of drop bars supported upon the warp threads of the loom, of an elastic guard strip supported above and out of contact with the drop bars and the warp threads of the loom and designed to prevent an accidental throwing off of said drop bars from said warp threads and capable of being stretched to one side to give access to the drop bars.
2. The combination with a loom and a stop motion therefor comprising a series of drop bars supported on the warp threads of the loom, of an elastic guard strip removably supported above and out of contact with the drop bars and designed to prevent an accidental throwing off of sald drop tars from the warp threads.
3. The combination with a loom comprising brackets arranged for the support of its lease rods and above and between the latter provided with lugs, of a stop motion for the loom comprising a series of drop bars supported by the warp ihreads thereof between the lease rods and a guard strip arranged above and out of contact with the drop bars and terminating in eyes engaging said lugs of the brackets.
4. In an electrically operated stop motion for looms and in combination with an electrical circuit rod or bar and drop bars loosely embracing the same, a contact bar, also in circuit and having an inclined contact surface free at its lower edges arranged in the path of and adapted to deflect said drop bars.
5. In an electrically operated stop motion for looms and in combination with a pair of electrical circuit bars and drop bars loosely embracing the same, a hollow triangular contact bar having its oppositely inclined contact surfaces arranged in the path of and adapted to deflect the drop bars, and also in circult.
6. The combination with a loom frame the main brackets supported thereby and provided with the lugs forming the broken triangular sockets, one of which the latter has a perforation, a wire conducting tube leading to the same and to the bottom of the loom, triangular insulating plugs one of which is hollow, seated in the sockets, a triangular contact bar receiving the inner ends of the plugs, a source of electrlcal supply located at the foot of the loom or below the same, a circuit wire leading from the same up through the tube and terminating in the triangular contact bar in an electrical contact, of a pair if leased rod brackets, circuit bars below the same and supported by the main brackets, lease rods
carried by the lease rod brackets, a series of drop bars embracing the circuit bars and adapted to be supported out of conitact with the contact bar by the warp threads passing about the lease rods, a knock-off mechanism, a magnet for operating the same and an electrical connection between the source of electrical supply and the said magnet.
7. The combination in a loom, a stop motion therefor, comprising a series of drop bars supported upon the warp threads if the loom and an elastic guard strip supported above the drop bars and adapted to limit the upward movement of the drop bars.
8. The combination in a loom, of means for disposing the warp threads thereof into opposite declining intersecting banks. a stop motion embodied in the loom and comprising epposite series of drop bars supported by the several threads composing gaid banks. and a yielding means located between the intersecting banks of warp threads and the thread disposing means for limiting the upward movement of sald bars and capable of being drawn aside to expose said bars.
9. The combination in a loom, of means for disposing the warp threads thereof into opposite declining intersecting banks, a stop motion embodied in the loom and comprising opposite series of drop bars supported by the several threads cemprising sald banks, and a yielding means common to both series of drop bars located between the intersecting banks of threads and the thread disposing means for limiting the vertical movement of said drop bars and capable of being drawn aside to expose said drop bars.
10. The combination in a loom, means for disposing the warp threads thereof into opposite intersecting banks, a stop motion embodied in the loom and comprising opposite series of drop bars supported by the several threads composing the said banks and an elastic strip located between sald dividing means and above the said drop bars whereby the drop bars of both series are limited in their upward movement.
11. The combination in a loom, of means for supporting the warp threads thereof, a stop motion embodied in the loom and comprising a series of drop bars supported by the several warp threads and a flexible strip secured at lts opposite ends located above and adapted to limit the upward movement of the drop bars and adapted to be drawn aside in order to give address to sald drop bars and permit of their removal from and replacement on the threads.
12. The combinationin a loom, of means for disposing the warp threads thereof into opposite declining intersecting banks, a stop motion embodied in the loom and comprising opposite series of drop bars supported by the several threads composing said banks and a flexible guard common to both series of drop bars secured at its opposite ends and located between the intersecting banks of threads and adapted to be drawn aside from sald drop bars to give access to sald drop bars and permit of their removal from and replacement on the threads.
13. In warp stop mechanism for looms the combination of a series of drop bars supported upon the warp threads and a guard strip attached at each end to the loom rrame and located above the series of drop bars and across their line of movement transversely of the warp threads, which guard strid strip is adapted normally to prevent the drop bars from being thrown from the warp threads and aiso to be readily moved to one side of the line of drop bars without detaching the end connections of the guard strip from the frame.
14. In warp stop mechanism for looms the combination of a series of drop bars supported upon the warp threads and a guard strip attached at each end to the loom frame in a position to normally cover the upper ends of the series of drop bars and prevent their accidental displacement from the warp threads, which guard strip is adapted to be readily moved from its normal position without disturbing its attachment to the loom frame and to be automatically returned to such position.
15. In warp stop mechanism for looms the combination of one or more seres of drop bars supported upon the warp threads and a cover for the upper ends of the drop bars nornually located above and in proximity to them and attached at each end to the loom frame, which cover is adapted to be thrown to one side to give access to the drop bars and to be returned. to its normal position without removal from its connections with the loom frame.

No. 100,975. Condenser and Purifier for Water. Condenseur et épurateur pour l'eau.
William McIntryre, and Odus Graham Young, assignee of a half interest, both of Kansas City. Missouri, U.S.A., 11 th September, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,846 and 138,798.
Claim.-1. The combination with a plurality of condensing chambers disposed one above the other and connected by pipes for the passage of steam, the upper chamber having an inlet to receive the exhaust steam and the lower chamber
having an outlet for water and air, of a plurality of settling basins mounted one upon each of said chambers and en-

circiing said steam pipes, the upper basins having overflow pipes discharging respectively into the next lower basins, the lowest basin having an overflow pipe discharging into the outlet of the lower chamber.
2. In a combined condenser and water purifier. the combination with a plurality of condensing chambers disposed one above the other and connected respectively by stcam pipes, the upper chamber having an inlet to receive the exhaust steam and the lower chamber having an outlet for ail and water, of a series of settling basins mounted one on each chamber. a series of overflow pipes connected one to each basin, the lowest overflow pipe discharging into the outlet \(0^{\circ}\) the lower chamber and the other overflow pipes discharging aach into the next lower basin. and means for diffusing the steam entering the upper chamber.
3. In a combined condenser and water purifier, the combination with a plurality of condensing chambers disposed one above the other, adjacent chambers being connected by steam pipes, the upper chamber having an inlet for the steam to be condensed, and the lower chamber having an outlet for air and water, of a screen disposed transversely in the upper chamber, a plurality of settling basins mounted one on each chamber, and a series of overflow pipes connected respectively with said basins and the upper overflow pipes discharging respectively into the basins next below, the lowest overfiow discharging into the outlet of the lower chamber.
4. In a combined condenser and water purifier, the comblation with a plurality of condensing chambers disposed one above the other, the upper chamber having an inlet for receiving the exhaust steam, and the lower chamber having an outlet for water and air, of a plurality of sets of vertical radially disposed pipes connecting respectively the different chambers, a plurality of settling basins mounted one on each chamber, and a plurality of overflow pipes connected respectively one to each basin, the upper overflow pipes discharging each into the next lower basin, and the lowest overHow pipe discharging into the outlet of the lower chamber
5. A combined condenser and water purifier comprising a series of condensing chambers disposed one above the other. steam pipes connecting said chambers, the upper chamber having an inlet for receiving the exhaust steam, the low chamber having an ontlet for air and water, one or more upwardly extending draft pipes connected at their lower ends to the lower chamber, a plurality of basins mounte! one on each chamber, means in the upper chamber for diffusing the steam, overflow pipes connected one to each basin, the upper overflow pipes discharging each into the next lower basin, the lower overflow pipe discharging into the outlet for the lower chamber, means for supplying water to the upper basin, and means by which the basins may be drained respectively of water contained therein.
6. A combined condenser and water purifier comprising a series of condensing chambers connected in series one above the other by steam pipes, the upper chamber having an inlet for steam, the lower chamber having an outlet for air and water, one or more screens disposed transversely and horizontally in the upper chamber, a plurality of settling basins mounted one on each chamber, overflow pipes connected one to each basin, the upper overflow pipes discharging each into the next lower basin, the lower overflow pipe discharging into the outlet of the lower chamber, means for supplying water to the upper basin, means respectively for draining the several basins, and upwardly extending draft pipes connected at their lower ends to the lower chamber.
7. A combined condenser and water purifier comprising a plurality of condensing chambers disposed one above the other, the upper chamber having an inlet for exhaust steam, the lower chamber having an outlet for water and air,
steam pipen connecting respectively the different chambers, a plurallty of settling basins mounted one on each chamber, means by which water may be supplied to the upper basin, overfiow pipes connected to said basins respectively, the upper overflow pipes discharging into the next lower basins respectively, the lower overfiow pipe discharging into the outlet of the lower chamber, and a flaring steam pipe connected at its larger end to the inlet of the upper chamber.
8. A combined condenser and water purifier comprising a plurality of condensing chambers disposed one above the other, the upper chamber having an inlet for exhaust steam. the lower chamber having an outlet, an outlet pipe connected to said outlet and having two outlets one disposed above the other for the passage of water and air respectively, a plurality of steam pipes connecting respectively the said chambers, a plurality of basins mounted one on each chamber, a plurality of overflow pipes connected one to cach basin, the upper overflow pipes discharging each into the next lower basin, the lower overflow plpe discharsing into said outlet pipe, means for supplying water to the upper basin, and an upwardly extending air draft pipe connected at its lower end to the lower chamber.
9. A combired condenser and water purifier comprising a plurality of condenser chambers disposed one above the other and upper chamber having an inlet for exhauststeam, the lower chamber having an outlet for water and air, a plurality of steam pipes connecting respectively the chambers, a horizontal transverse screen in the upper chamber an air draft pipe connected at its lower end to the lower chamber and extending upwardly therefrom, a plurality of settling basins mounted one on each chambers, a plurality of overflow pipes connected one to each basin, the upper overflow pipes discharging into the basins next below respectively, the lower overflow pipe discharging into the outlet of the lower chamber, means for supplying water to the upper basin, means by which the basins may be respectively dralned, and a flaring pipe connected at its larger end to the inlet of the upprr chamber and adapted to receive in it. smaller end the exhaust steam.

No. 100,976. Window. Fenétre.

Oliver Murray Edwards, Syracuse, New York, assignee of Edward Frank Chaffee, Brooklyn, New York, both in U. S.A., 11th September, \(1906 ; 6\) years. Filed 7th June, 1906. Receipt No. 136,622.
claim.-1. In a window the combination substantially as sct forth. of a trame adapted to receive and hold a sash, a sash movable in the frame holding means, a support for the sash and means connecting such support with the holding means whereby the sash is supported through the holding means and its weight aids in moving it transversely in the frame to hold the sash therein.
2. In a window the combination substantially as set forth, of a frame adapted to recelve and hold a sash, a sash motable in the frame, holding means a portion of which is movable relatively to the sash, a support for the sash and means connecting such support with the movable portion of the holding means.
3. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means, a support for the gash, means connecting the support with the holding means, and releasing means connecting with the holding means whereby the sash is supported and held stationary in its frame and is released to permit it to move therein to open and close the window.
4. In a window the combination substantially as set forth, of a irame adapted to receive and support a sash, a sash, movable in the frame, a support for the sash, and means arranged between the support and sash and provided with a movable part adapted to move the sash transversely in the frame to bold it therein.
5. In a window the combination substantialy as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, a support for the sash, a sash movable in the frame, a support for the sash, and holding means, a portion of which is movable relatively to another portion, connecting with both the support and the sash, whereby the sash is supported in the frame and its weight aids in holding it therein.
6. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, a support for the sash consisting of sash balancing means supported on the frame, and means arranged between the sash and support and provided with a movable part adapted to move the sash transversely in the frame to hold it therein.
7. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, a support for the sash consisting of a spring roller mounted on the frame, and means arranged between the sash and roller and provided with a movable part adapted to move the sash transversely in the frame to hold it therein.
8. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, a support for the sash consisting of sash balancing means supported on the frame, and sash holding means, a portion of which is movable relatively to another portion, one of which portions is attached to the balancing means and the other is upon the sash, whereby the sash is supported in the frame and its welght aids in holding it therein.
9. In a window the combination substantially as set forth, of a frame adapted to recelve and support a sash, a sash movable in the frame, a support for the sash supported on the frame, and sash holding means, a portion of which is movable and in the form of a wedge, which portion is attached to the support for the sash and is engageable with the sash, whereby the sash is supported in the frame and its weight aids in holding it therein.
10. In a window the combination substantially as set forth, of a frame adapted to receive, hold and support a sash, a sash movable in the frame, holding means arranged in coacting relations with the sash and frame and adapted to move one relatively to the other, a support for the sash, and means connected with the support and holding means and normally acting thereon to support and hold the sash is the frame.
11. In a window the combination substantially as set forth, of a frame adapted to recelve, hold and support a sash, a sash movable in the frame, holding means, a portion of which is movable and is adapted to move the sash and frame, one relatively to the other, a support for the sash, and means connected to such movable portion and the support and normally acting thereon to support and hold the sash in the frame.
12. In a window, the combination substantially as set lorth, of a frame adpated to receive and support a sash, a sash movable in the frame, holding means, a portion of Which is movable and is arranged in co-acting relations with the sash and trame, and sash supporting means connected with the sash through such movable portion and normally acting thereon to support the sash and hold it in the frame.
13. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means, a portion of which is movable and engageable with the sash and frame, the sash holding means connected with the sash only through such movable portion to balance and hold it in the frame.
14. In a window the combination substantialiy as set forth, of a frame adapted to roceive and support a sash, a sash movable in the frame, holding means arranged at each edge portion of the sash, a portion of which is movable relatively to another portion, and sash balancing means connected with such movable portion at each edge portion of the sash and thereby adapted to balance and hold it in the frame.
15. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, holding means, a portion of which is movable relatively to another portion, a spring roller, and connecting means arranged between the roller and such movable portion, normally holding the sash in the frame.
16. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, holding means arranged at each edge portion of the sash, a portion of which is movable relatively to another portion, and sash balancing means connected with such portions and acting thereon to support the sash in the frame.
17. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash
movable in the frame, a plurality of holding means arranged at one edge portion of the sash, each of which has a por tion movable relatively to the sash, and sash balancing means connecting with such portions and acting thereon to support the sash in the frame.
18. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, holding means provided with co-acting wedge faces, one of which is formed on a part movable relatively to the other, and sash supporting means connected with such movable part and normally acting there cn to support and hold the sash in the frame.
19. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, a plurallty of wedging members arrangec at each edge portion of the sash, co-acting members engageable with the other members, sash balancing means connectable with such members, and means connecting each plurality of members together and with the balancing means, whereby the sash is supported and held in the frame by such balancing means.
20. In a window the combination substantially as set forth. of a frame adapted to recelve and hold a sash, a sash movable in the frame, a piurality of wedging members attached to the sash at each edge portion thereof, a bar provided with similar members which are arranged in co-acting relations thereto, and sash balancing means connected with such bars, whereby the sash is supported and held in the frame by the balancing means.
21. In a window the combination substantially as set forth, of a irame adapted to receive and support a sash, a sash movable in the frame, holding means, a portion of which is movable relatively to another portion, a spring roller, fiexitle material connecting with the ro'ler and adapted to wind thereon, and means connecting such flexible material with the movable portion of the holding means whereby the sash is held in the frame.
22. In a window the combination substantially as set forth. of a frame adapted to receive and support a sash, a sash movable in the frame, holding means, a portion of which is movable relatively to another portion, a spring roller, flexible material connecting with the roller and a bar, a bar connecting with such movable portion whereby the spring roller is connected with the holding means and the sash is held in the frame.
23. In a window the combination substantailly as set forth. of a frame adapted to receive and support a sash, a sash movable in the frame, holding means arranged at each edge portion of the sash, a portion of which is movable relatively to another portion, means connecting such movable porti-ns together, a bar centrally connected to such means, a spring roller and means connecting such bar with the roller whereby the movable portions of the holding means are moved relatively to the sash to hold it in the frame.
24. In a window the combination substantially as set forth. of a frame adapted to receive and support a sash, a sash movable in the frame, holding means, a portion of which is movable, sash balancing means connected with such movable portion and normally acting thereon to hold the sash in the frame, and operating means engageable with such movable portion to move it relatively to another portion whereby the action of the balancing means on the holding means is overcome and the sash is released and movable in the frame.
25. In a window the combination substantially as set forth, of a frame adapted to receive and support a sash, a sash movable in the frame, holding means, a support for the sash, means connecting such support with the holding means and operating means adapted to engage with a portion of the holding means to move such portion re'atively to the sash to release and permit it to move in the frame.
26. In a window the combination substantially as set forth, of a frame adapted to recelve and hold a sash, a sash movable in the frame, holding means arranged at each edge portion of the sash with a portion thereof movable relatively to another portion, sash balancing means connecting with and normally acting on such movable portions, and operatIng means at each edge portion of the sash and adapted to operate each of such movable portions separateiy one from the other whereby the sash is permitted to move in the frame.
27. In a window the combination substantially as set forth, of a frame adapted to recelve and hold a sash, a sash movable in the frame, holding means arranged at one edge portions of the sash, a portion of which is movable relatively to another portion and is adapted to engage with a locking detent, a locking detent and operating means adapted to engage with and operate both the movable portion of the holding means and locking detent. whereby the sash is released from the holding means and is unlocked by the movement of the operating means.
28. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means arranged at one edge portion of the sash, a portion of which is movable relatively to another portion and is adapted to engage with and operate a locking detent, a locking detent movably mounted on the frame and engageable with the sash, and operating means mounted on the sash whereby the movable portion if the holding means and locking detent are operated by the movement of the operating means.
29. In a window the combinaton substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the framp, holding means a portion of which is connected with the sash and is adapted to engage with a portion of the frame, a support for the sash and means for connecting such support with the portion of the holding means connected with the sash.
30. In a window the combination substantially as set forth. of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means having a lever pivotally connected to the sash and movable therewith, and a support for the sash connected to such lever. of the holding means and adapted to move a portion thereof into engagement with the window frame.
31. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means having a wedge surface arranged on an elbow lever pivotally connected to the sash near one of its ends, and a support for the sash connected to the lever of the holding means between its pivotal connection to the sash and such wedge surface.
32. In a window the combination substantlally as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means a portion of which is connected with the sash and is adapted to engage with a portion of the frame, another portion connected with the firstmentioned portion and adapted to he moved thereby, a support for the sash and means whereby the sash is supported and held in the frame.
33. In a window the combination substantially as set forth, of a frame adapted to recelve and hold a sash, a sash movable in the frame, holding means having a portion pivotally connected to the sash and engageable with the window frame, a support for the sash connected to such pivoted portion, and wedging surfaces arranged between the sash and frame, one of which is moved into wedging position by the movement of such pivoted portion.
34. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the irame, holding means a portion of which is engageable with the sash and is adapted to move relative thereto a support for the sash, and means for connecting such support with the part of the holding means engageable with the sash, whereby the support is connected to the holding means to both support and tightly hold it in the window.
35. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means having a portion arranged near each edge portion of the sash engageable with it, and the frame and another portion pivotally connected to the sash and adapted to move the first-mentioned portions relatively to the sash a support for the sash, and means connecting such support with the portion of the holding means pivotally connected to the sash.
36. In a window the combination substantially as set forth, of a frame adapted to receive and hold a sash, a sash movable in the frame, holding means having a portion arranged hear each edge portion of the sash engageable with it, and the frame and other portions pivotally connected to the sash adjacent to the first-mentioned portions and adapted to move them relatively to the sash, a support for the sash, and means connecting such support with those portions of the holding means pivotally connected to the sash.
37. In a window the combination substantially as set forth, of a sash having at its vertical portions wedge surfaces, holding means at such portions having movable wedge surface's and sash supporting means connecting with the holding means connecting with the holding means and adapted to to the sash to hold it in the window.
38. In a window the combination substantially as set forth, of a sash having at its vertical portions wedge surfaces holding means at such portions having a plurality of movable wedge surfaces connected together and sash supporting means connecting with the holding means and adapted to move such connected surfaces relatively to the sash to hold it in the window.
39. In a window the combination substantially as set forth, of a sash having at one end of its vertical portions a wedge surface, holding means at such porton having a wedge surtace, sash supporting means connecting with the holding means and adapted to move the wedge surface of the holding means relatively to the sash in one direction, and means
adapted to engage with the holding means and move such wedge surface in the opposite direction.
40. In a window the combination substantially as set forth. of a sash having at its vertical portions wedge surfaces. holding means at such portions having wedge surfaces and yielding sash supporting means connecting with the holding means and adapted to move thelr wedge surfaces relatively to the sash to hold it in the window.
41. In a window the combination substantially as set forth. of a sash having at its vertical portions wedge surfaces. holding means at such portions having wedge surfaces, sash supporting means connecting with the holding means and adapted to move their wedge surfaces relatively to the sash 10 hold it in the window, a locking detent automatically movable into locking position, and operating means adapted to operate a portion of the holding means and thereby move the detent out of locking position to permit of the sash being moved to open the window.
42. In a window the combination substantially as set forth. of a sash having its vertical portions wedge surfaces. cooperating wedge surfaces at such portions, equalizing means. portions of which connect with such co-operating wedge surfaces and other portions connect with the sash supporting means and sash supporting means connected wth the equalizing means and adapted to move such co-operating wedge surfaces relatively to the sash to hold it in the window.
43. In a window the combination substantially as set forth, of a sash having at its vertical portions wedge surfaces, cooperating wedge surfaces at such portions connectable to one of a pair of equalizing bars, a pair of equalizing bars connected together midway of their length and connecting with such co-operating means and sash supporting means, and sash supporting means connected to one pair of equalizing bars and adapted to move such co-operating wedge surfaces relatively to the sash to hold it in the window.

No. 100,977. Method of Lining Converters. Méthode de garnir les convertisseurs.

Henry Lewis Charles and Fritz Augustus Helnze, assignee of a half interest, both of Butte, Montana, U.S.A., 11 th
September, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137,689.
Claim.-1. The within described method of drying and hardening basic or sillcious lining of converters or refining furnaces prior to their use in oxidation by using the heat derived from the introduction of molten material within the converter or refining furnace while the basic or silicious linings is still in a damp and unhardened condition.
2. The within described method of drying and hardening the basic or silicious lining of converters or refining furnaces prior to their use in oxidation by using the heat derived from the introduction of molten material within the converter or refining furnace while the basic or sllicious lining is still in a damp and unhardened condition to form a shell over the inner surfaces of the lining.
3. The within described method of drying and hardening the basic or silicious lining of converters or refining furnaces by introducing molten slog or matte within the converter or refining furnace while the basic or sillcious lining is still in a damp and unhardened condition.
4. The within described method of drying and hardening the basic or silicious lining of converters or refining furnaces by introducing molten slag or matte within the converter or refining furnace while the basic or silicious lining is still in a damp and unhardened condition to form a slag or matte shell over the inner surface of the lining material.
5. The within described method of lining converters or refining furnaces consisting if first tamping the lining material around the inner core, then removing the core, and while the lining material is still damp and unhardened introducing molten material within the converter or refining furnace in suffieient quantitles to completely dry and harden the lining material.
6. The within described method of lining converters or refining furnaces consisting of first tamping the lining material around an inner core, then removing the core, and while the lining material is still damp and unhardened introducing molten slag or matte within the converter or refining furrace in sufflicient quantitles to completely ary and harden the lining material.
7. The within described method of lining converters or refining furnaces, consisting of first tamping the lining material around an inner core then removing the core and forming a slag or matte shell over the inner surface of the lining by the introduction of molten slag or matte.
8. The within described method of lining converters or refining furnaces, consisting of first, tamping the lining material around an inner core, then removing the core and par tially drying the lining by forming a shell over the inner surface of the lining by the introduction of molten material, then removing the molten material and completing the drying of the lining by the introduction of one or more additional ladles of molten material.

No. 100,978. Steam Pump. Pompe a vapeur.

The Canadian Westinghouse Company, Hamilton, Ontario Canada, assignee of Alexander England, Wilkinsburg. Pennsylvanla, U.S.A., 11th September, 1906; 6 years. Filed 19th April, 1906. Receipt No. 135,055.
Claim.-1. In a compound pumping engine, the combination with a high pressure engine cylinder and piston, and a low, pressure engine cylinder and piston, of an initial compression pump cylinder and a final com ression pump cylinder, the piston of the initial compression pump cylinder being directly connected to the high pressure engine piston.
2. In a compound pumping engine, the combination with high and low pressure engine cylinders having pistons therein, of an initial compression pump cylinder having a piston directly connected to the high pressure steam diston, a smaller final compression pump cylinder having a piston connected to the low pressure steam piston, and a valve mechanism operated by the movement of the high pressure steam piston for effecting the admission and exhaust of steam to and from the engine cylinders.
3. In a compound pumping engine, the combination with a high pressure engine cylinder and low pressure pump cylinder in line therewith, and a low pressure engine cylinder and a high pressure pump cylinder, of a cylinder head having a valve seat with ports leading to the opposite ends of
said engine cylinders, a steam actuated slide valve for controlling said ports, and means governed by the movement of the high pressure steam piston for controlling the movement of said slide valve.
4. In a compound engine, the combination with vertical high and low pressure engine cylinders, of an integral head for said cylinders having a valve seat with ports leading to the opposite ends of said cylinders, a steam actuated slide valve controlling said ports, and means in line with and governed by the movement of the high pressure steam piston for controlling the movement of the slide valve.
5. In a compound pumping engine, the combination with a high pressure engine cylinder, and a low pressure engine cylinder, of a cylinder head having a valve seat with ports leading to the opposite ends of said cylinders, a steam actuated slide valve for controlling said ports, an auxiliary reversing valve for controlling the movement of the distribution slide valve, and a reversing valve rod extending through the cylinder head in line with the engine piston rod.
6. In a compound pumping engine, the combination with high and low pressure engine cylinders of initial and final compression pump cylinders, the high pressure steam piston being directly connected to the piston of the initial compression pump cylinder, a steam actuated distribution valve for the engine cylinders, and means governed by the movement of the high pressure steam piston for controlling the movement of the said distribution valve.
7. In a compound pumping engine, the combination with high and low pressure engine cylinders of initial and final compression pump cylinders, the high pressure steam piston being directly connected to the piston of the initial compression pump cylinder, a steam actuated distribution valve for the engine cylinders, and an auxiliary reversing valve actuated by the movement of the high pressure steam piston for controlling the movement of the main distribution valve.

No. 100,979. Scafiold Support. Support d'échafaud.

Moulton and Evans, Minneapolis, Minnesota, assignee of Marquis F. Seeley. Chicago. Illinois U.S.A., 11 th September, 1906; 6 years. Filed 8th January, 1906. Re ceipt No. 131,693.
Claim.-1. A metal hanger for scaffolds consisting of a shank provided at its opposite ends with integral lateral arms, said arms extending from the body of the hanger in right angled relation to each other, and the lower arm being provided at its end with means for securing the hanger to one of the members of the scaffold.
2. A metal hanger for scaffolds consisting of a shank provided at its opposite ends with integral lateral arms, said arms extending from the body of the hanger in right angled relation to each other and the upper arm being provided with a downwardly extending prong.
3. A metal hanger for scaffolds consisting of a shank provided at its opposite ends with integral lateral arms, said arms extending from the body of the hanger in right angled relation to each other, and the hanger being provided at its upper part with a handle.
4. A metal hanger for scaffolds consisting of a shank provided at its opposite ends with integral lateral arms, said arms extending from the body of the hanger in right angled relation to each other, and the hanger being provided at its upper part with a loosely connected ring forming a handle.
5. The combination with a scaffold member provided with a hole extending therethrough parallel with the wall on which the scaffold is hung, of a metal hanger embracing a shank having at its uper and lower ends lateral rigid arms, said arms extending from the body or shank at right angles to each other and the lower arm being adapted to engage the hole in the scaffold member. and the upper arm to engage a hole in the said wall.

No. 100,880. Steam Turbine. T'urbive d vapeur.

The Allis-Chalmers Company, assignee of Charles Frederick Barth, all of Milwaukee, Wisconsin, U.S.A., 11th September. 1906; 6 years. Flled 1st March, 1906. Receipt No. 133,427.
Claim.-1. A securing strip having an edge at an intermediate flow portion.
2. A metallic securing strip having a force applying face. and a metal flow edge near the force applying face.
3. A metaliic securing strip having a bevelled side and a pair of parallel engaging sides.
4. A turbine blade ring securing strip having a bevelled side and a palr of parallel engaging sides.
5. A member having a groove, a strip entering said groove and leaving a parallel side space in the groove, and a securing strip having a bevelled side in the parallel side space.
6. A member having a groove provided with a recess, a rigid strip entering the groove and leaving a parallel sided space, and a close slip fit securing strip in said parallel sided space and adjacent said recess.
7. A member having a groove with a perpendicular side, a strip entering said groove leaving a parallel sided space, and a securing strip non-rectangular in cross section in said space.
8. A member having a groove with a perpendicular side, a strip entering said groove and leaving a parallel sided space, whereby the strip may be readily forced into locking portions whereby the strip may be readily forced into locking position in said space.
9. A member having a groove provided with a locking recess, a strip having a perpendicular side entering said groove and leaving a parallel sided space adjacent said recess, and a malleable securing strip in sald space.
10. A member having an endless groove, a rigid strip entering said groove and leaving a parallel sided space, and a securing strip having a bevelled portion whereby the strip may be readily forced Into locking position in sald space.
11. A rotary member having a peripherial groove provided with a recess, a strip entering said groove and leaving a parallel sided space, and a malleable securing strip having a bevel terminating near the recess whereby the strip may be forced more readily into locking position in said space.
12. A rotor having a groove provided with a recess, a blade holding ring entering said groove and leaving a parallel sided space, and a securing strip having a bevel terminating near the recess, said strip having a close slip fit in said space.
13. A rotor having a peripherial groove provided with a rontinuous recess in a side wall, a blade holding ring entering sald groove and leaving a parallel sided space, and a malleable securing strip having four obtuses angles whereby the strip may be forced more readily into locking position in said space.
14. A rotor having a peripherial groove formed with \(\Omega\) tapering side and a perpindicular side, there being a recess in the perpendicular side, a blade holding ring fitting agalnst the tapering side, and a soft metal securing strip having an edge at the recess in the perpendicular side of the groove.
15. A rotor having a groove with a radial side and a recess, a blade holding ring in said groove, and securing means adjacent said recess for sald ring.
16. A rotor having a groove with a radial side and a lockIng recess, blades mounted in said groove. and means adjacent said recess to rigidly secure the blades.

No. 100,981. Locomotive Engine.
Machine de locomotive.

F. A. Pierce, J. E. Oswald and J. Y. Travers, each an assignce of a fourth interest, all of Wheelling, West Virgina, U.S.A., 11th September, 1906; 6 years. Flled 3rd May, 1906. Receipt No. 135,492.

Claim.-1. As an improvement in englnes the combination with a pair of cylinders, a distributing valve for each cylinder, and an exhaust lead that is common to both distribhting valves, of an auxiliary valve having an exhaust port that communicates with the stack and is adapted under one adjustment to connect the exhaust lead from the two cylinders with the stack, an air reservoir having a lead that connects with the supplemental exhaust valve, the said exhaust valve having a port adapted under a predetermined adjustment to connect the cylinder exhaust with the reservoir, and relief valves connected with the feed lead to the distributing valves for charging the cylinders with air when the exhaust through the supplemental valve to the stack is cut off and the exhaust from the said valve to the air reservoir is open, for the purfose specified.
2. In a locomotive engine the combination with high and low pressure cylinders, of a distributing valve therefor on one side of the locomotive. and corresponding parts on the opposite side of the locomotive, of a receiver space common to both sets of cylinders and their distributing valves, and an air reservoir, of an auxiliary exhausting valve that communicates and co-operates with the two distributing valves at the opposite sides and with the recelver space, said supplemental exhausting valve including a port adapted to be brought into communication with the air reservoir, means operable from the engine cab for shifting said auxillary valve with relation to the distrlbuting valves, sald valves having provisions in virtue of which the several cylinders may be operated under compound action or under high pressure in all the cylinders, or as air compressors, as set forth.
3. In a locomotive engine the combination with a pair of cylinders, and a separate distributing valve co-operatively toined with each cylinder, of an exhaust receiver in communication with the distributing valves and an air reservoir, of an auxliary valve mechanism having inlet and exhaust ports that communicate with the reservoir and with the distributing valve, and having a port that communicates with the air reservoir. said valve having provisions in virtue of which when under one adjustment, the feeds and the exhausts ar. controlled to feed a working agent pressure into the cylinder and under another adjustment to convert both cylinders into air compressors, and means for shifting the auxlliary valves.
4. The combination with high and low pressure cylinders, a distributing valve co-operatively joined with each set of high and low pressure cylinders, a receiver in communication with the distributing valves, of an auxiliary valve mechanism having inlet and outlet ports that communirate with said distributing valves, and having provisions in virtue of which when the auxiliary valve is under one adjustment, it controls the feeds and exhausts to effect \(a\) compound action of the two sets of cylinders, under another adjustment to work all the cylinders under high pressure and under a third adjusiment to convert the several cylinders
into air compressors, and means for shifting the auxiliary valve.
5. In a locomotive engine, the combination with an air reservolr, a pair of pressure cylinders, a separate distributing valve for each of the pressure cylinders, an exhaust receiver common to both cylinders and their co-operative distributing valves, of a supplemental exhausting valve in communication with the stack and with the exhaust receiver, the said supplemental valve including a supplemental exhaust port adapted when the valve is adjusted to cut off the stack exhaust from the recelver to connect the said receiver with the air reservoir, as set forth.
6. In a locomotive engine, the combination with a pair of high pressure cylinders and a pair of low pressure cylinders one for each high pressure cylinder, a distributing valve for each set of high and low pressure cylinders, a receiver common to both sets of cylinders, and their co-operating distributing valves, of a supplemental valve exhausting mechanism incommunication with the stack and with the two distributing valves, the said supplemental valve mechanism including a supplemental exhaust port adapted when the valve is adjusted to cut off the stack exhaust to exhaust to the air reservoir, as set forth.
7. The combination with two sets of high and low pressure cylinders and their controlling valves, and a receiver common to both the distributing valves and having connection with the stack, and an air receiver, of a supplemental exhaust valve located in the said stack connection, and having ports and feeds that connect with the high pressure cylinder distributing valves, and provided with a supplemental port adapted to connect with the air reservoir for the brake and signal mechanism, said supplemental valve having provisions in virtue of which when under one adjustment. a high pressure action is effected in all the cylinders, and under another adjustment of the valves the cylinders are worked compound, automatically actuated rellef valves in the several feeds of the distributing valves, and means operable from the engine cab for simultaneously shifting the relief valves and the supplemental exhaust valve, as set forth.
8. The combination with the high and low pressure cylinders, a distributing valve therefor at one side of the locomotive, corresponding parts on the other side of the locomotive, a receiver common to both sets of cylinders and valves, an air reservoir, of a supplemental valve mechanism having provisions in virtue of which when the supplemental valve is under one adjustment the fluid will be conducted from the receiver against the low pressure side from the distributing valve, and under another adjustment, the pressure of the receiver will be conducted to the air reservoir, said supplemental valve having ports adapted to communicate with ports in the distributing valves, relief valves connected with the live steam feeds to the distributing valves and other relief valves in the leads that join the supplemental valve with the distributing valves, as set forth.
9. The combination with two sets of high and low pressure cylinders and their pistons, of a distributing valve for each pair of cylinders, an exhaust receiver betwenn the distributing valves and in communication therewith, an air reservoir, said distributing valves having similar arrangement of ports at diametrically opposite sides, connections between said distributing valves and their respective cylinder at their respective sides, a supplemental exhaust valve in communication with each distributing valve and with the reservoir and with the air reservoir, and in communication with the stack, said supplemental valve also having a live steam inlet and having provisions in virtue of which under one adjustment of the supplemental valve, the pressure is led from the receiver to the low pressure side of the distri. buting valves, and under adjustment of the supplemental valve into the low pressure side of the distributing valves, and under a third adjustment to cut off the stack and lead the fluid pressure from the receiver into the air reservoir, and means for shifting the supplemental valve as set forth.
10. The combination with the high and low pressure cylinders, and a distributing valve therefor at one side of the locomotive, corresponding parts on the other side of the locomotive, the said distributing valve having a like arrangement of high and low pressure ports at diametrically opposite sides thereof, the shiftable member of said distributing valve having grooves for connecting adjacent ports of the valve, and a receiver into which the said distributing valves discharge, of a supplemental exhausting valve in communication with the recelver, the stack. and with the distributing valves at the opposite sides of the locomotive. the rald supplemental valve having its ports which include a live steam inlet arranged, when under one adjustment to admit live steam through the said supplemental valves to the low pressure side of the two distributing valves, and under another adjustment to feed the fluid nressure from the recoiver against the low pressure side of the valves, as set forth.
11. The combination with the high and low pressure cylinders, and a distributing valve therefor mounted on one side oi the locomotive, and similar cylinders and a valve therefor on the opposite side of the locomotive, a rellef valve in ferch feed pipe for the distributing valve, a receiver space common to both of the aforesaid distributing valves, and air reservoir, of a supplemental exhausting valve for connecting said reservoir with the receiver, the said supplemental valv. having passages through the receiver exhausts to the stack and passages for connecting the receiver with the reservoir and another passage for connecting the low pressure side of the distributing valve, a relief valve in each lead from the sipplemental valve to the distributing valve, and means for shifting the said supplemental valve from the engine cab While the train is in motion, as set forth.
12. The combination with two sets of high and low pressure cylinders, a distributing valve co-operatively jo!ned with each set of high and low pressure cylinders, of a recelver in communication with the distributing valves, an auxiliary exheust valve mechanism, also in communication with the reservoir and baving inlet and exhaust ports in communication with the several distributing valves, sald auxiliary mechanism having provisions in virtue of which when under one adjustment the working agent is fed to the cylinders to operate the engine compound, under another adjustment to feed the working pressure and under a third adjustment to convert the several cylinders into air compressors, and means for shifting sald auxiliary valve.
13. The combination with two pairs of cylinders, a distributing valve for each pair of cylinders, each distributing valve being co-operatively joined with each cyllnder of its respective pair, an exhaust receiver in communication with cach distributing valve, an auxiliary and said distributing valves having provisions in virtue of which when the auxiliary valve is under one adjustment the working agent is fed into the cylinders to operate the same compound, and when the auxiliary valve is under another adjustment to convert the cylinder into air compressors, and when the auxiliary valve is under a third adjustment to feed working agent to the cylinders to operate them under high pressure. and means for shifting said auxlliary valve.

No. 100,982. Dlectric Clock. Horloge électrique.

The Kutnow Brothers, assignees of Timothy Bernard Powers, all of New York City, New York, U.S.A., 11th September, 1:06; 6 years. Filed 22nd June, 1906. Receipt No. 137,183.
Claim.-1. In an electric clock, the combination of a clock train, a balance wheel to the clock train, an electro-magnet mounted with the balance wheel, a stationary armature and circult connections and contacts whereby the magnet is momentarily energized as its pole approaches the armature.
2. In an electric clock, the combination of a clock train, a balance wheel, means for transmitting motion from the balarce wheel to the clock train, an electro-magnet mounted with the balance wheel, a stationary armature, a contact pin carried by the balance wheel, a contact spring located in the path of movement of the pin and circuit connections.
3. In an electric clock, the combination of a clock train, a balance wheel, means for transmitting motion from the balance wheel to the clock train, an electro-magnet mounted with the balance wheel, a stationary armature, a contact pin carried by the balance wheel and insulated on one side, a contact spring having a broad L-shaped head located in proximity in the path of movement of the pin whereby the pin passes on one side of said head in one direction and on the other side of said head in the other direction, and circuit connections.
4. In an electric clock, the combination of a clock train, a split compensating balance wheel, an electro-magnet mounted with the balance wheel. a stationary armature, a contact pin carried by the balance wheel, a contact spring located in proximity to the path of the pin, transmission devices having a portion located in proximity to the spring to be actuated thereby and circult connections.
b. In an electric clock, the combination of a clock train, a balance wheel, an electro-magnet mounted with the balance wheel, a stationary armature, a contact pin carried by the balance wheel, a contact spring located in proximity to the path of the pin, a lever mounted in proximity to the contact spring to be actuated thereby, means whereby the movement of the lever is made to actuate the clock train, and circuit connections.
6. In an electric clock, the combination of a clock train, a balance wheel mounted upon a horizontal axis, means for transmitting motion from the balance wheel to the clock train, an electro-magnet mounted with the balance wheel, a stationary armature beneath the balance wheel and circuit connections, and circuits whereby the magnet is momentarily energized as its pole approaches the armature.
T. In an electric clock, the combination of a clock train, a spilt compensating balance wheel mounted upon a horizontal axis and having roller journal bearings and end thrust bearings, means for transmitting motion from the balance wheel to the clock train, an electro-magnet mounted with the balance wheel, a stationary armature and circuit connections.
8. In an electric clock, the combination of a clock train, a balance wheel mounted upon a horizontal axis, roller journal bearings for the balance wheel, glass sheets closing the cuter ends of said bearings, the shaft of the balance wheel having pivot bearings against said glass sheets through which the roller bearings are visible, means for transmitting motion from the balance wheel to the clock train, an electromagnet mounted with the balance wheel, a stationary armature and circuit connections.

No. 100,983. Winding Indicator for Clock. Indicateur de montage d'horloge.

Theodore J. Arneson, Westbrook, Minnesota, U.S.A., 11th September, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,394.
Claim.-1. The combination with a clock having an actuating spring arranged for expansion as the clock runs down, of an alarm mechanism, and means for holding said mechanism against operation, said holding means consisting of a revoluble shaft, an arm carried by the shaft and lying in position for engagement and movement by the spring when the latter expands to move the shaft, a notched disc mounted upon the shaft, a pivoted arm having a finger resting upon the periphery of the disc, said shaft being arranged for movement by the spring to bring the notch of the disc into position for passage of the finger therethrough, means for holding the shaft yleldingly against movement by the spring, and connections betue \(n\) the second arm and the alarm mechanism, said connections being arranged to hold the alarm mechanism against movement when the finger is engaged with the periphery of the disc.
2. The combination with a clock, of an alarm mechanism therefor, an arm pivoted for vertical movement, means for holding the arm against movement in one direction, said means being arranged for movement into and out of operative position, means arranged for actuation by the clock for moving the arm holding means out of operative position when the clock has run down, and means connected with the arm and with the alarm mechanism to hold said mechanism against operation when the arm holding means is in operatlue postion.

No. 100,984. Bottle. Bouteille.

De Witt Clinton Breed, Lockport, New York, U.S.A., 11th September, 1906; 6 years. Filed 13th December, 1905. Receipt No. 130,968.
Claim.-1. A bottle provided with means for separating the liquid from the foam when discharging the contents of the bottle.
2. A bottle provided with a valvular means for separating liquid from foam when discharging the liquid from the bottle. 3. A bottle provided with a loam separating means.
4. A bottle provided with a plurality of neck portions, and a foam separating means in each of the neck portions.
5. A bottle provided with a plurality of neck portions, and a valvular member mounted in each of sald neck portions and constituting a means for separating the liquid from the foam when the liquid is discharged from the bottle.
6. A bottle comprising a neck portion and a valvular mewber mounted therein and constituting a means for separating liquid from foam when discharging liquid from the bottle.
7. A bottle comprising a neck portion, a valvular member mounted therein and constituting a means for separating liquid from foam when discharging the liquid from the bottle, and a resilient member extending in said neck portion for retaining the valvular member in position.
8. A bottle comprising a neck portion, a valvular member mounted therein and constituting a means for separating liquid from foam when discharging the liquid from the bottle. a resilient member extending in said neck portion for retaining the valvular member in position, and a packing surrounding said valvular member near the top thercol.
9. A bottle provided with a plurality of neck portions, and a valvular member of less diameter than the neck portion suitably suspended therein and constituting a means for separating liquid from foam when discharging liquid from the bottle
10. A bottle comprising a plurality of neck portions, a valvular member mounted in each of sald neck portions and constituting a means for separating foam from liquid when discharging liquid from the bottle, and resilient members for suspending said valvular members within the neck portions.
11. A bottle comprising a plurality of neck portions, a valular member mounted in each of said neck portions and constituting a means for separating foam from liquid when discharging liquid from the bottle, resilient members for suspending said valvular members within the neck portions, and a packing suitably surrounding each of sald valvular members.
12. In a bottle the combination with a neck portion, of a valvular member mounted therein and constituting means for separating foam from liquid, said member consisting of a tube closed at its bottom and provided with liquid inlets. and a valve for closing that portion of the tube below the outlet.
13. A bottle comprising a plurality of neck portions, a valvular member mounted in each of said neck portions and constituting a means for separating foam from liquid, and a closure for each of sald valvular members.
14. A bottle comprising a plurality of neck portions, a valvular member arranged in each of said neck portions and constituting a means for separating foam from liquid, resilient devices for suspending the valvular members in said neck portions, and a closure for each of the valvular members.
15. A bottle comprising a plurality of neck portions, a valvular member arranged in each of said neek portions and constituting a means for separating foam from liquid, resilient devices for suspending the valvular members in said neck portions, a closure for each of the valvular members and a packing interposed between the valvular members and the inner face of the neck portions.
16. A bottle provided with a plurality of neck portions and means for connecting the neck portions together at the top thereof. thereby forming a handle for the bottle.
17. A bottle provided with a plurality of neck portions. means for connecting the neck portions logether, thereby
forming a handle for the bottle, and a foam separating means in each of the neck portions.
18. A bottle provided with a plurality of neck portions and means for connecting them together, thereby forming a handle for the bottle.
19. A bottle provided with a foam separating means, a neck portion in which is mounted said means, and a handle for the bottle.

No. 100,985. Coment Block Making Machine. Machine à faire des blocs de ciment.

Thomas D. Brock and Clarence W. P. Brock, co-inventors, Waterford. Ontario, Canada, 11th September, 1906; 6 years. Filed 10th April, 1905. Receipt No. 124,124.
Claim.-1. In a cement block machine the combination with a bed provided with crossbars, of set screws extending through screw-threaded sockets in said crossbars, a vertically adjustable frame supported on said set screws, rollers mounted on said frame, and a pallet resting on said rollers.
2. In a cement block machine a bed provided with crossbars, set screws extending through screw-threaded sockets in said crossbars, a vertically adjustable frame supported on said set screws, rollers mounted on said frame, and a pallet resting on sald rollers, in combination with a stationary upright, and a base secured to said bed, a swinging frame pivotally secured to said base and a mould box the sides of which are secured one to said upright and the other to said swinging frame, and the ends of which rest on said pallet, and means clamping said ends between said sides.
3. In a cement block machine, a bed, a pallet supported by and a base and stationary upright secured to said bed and a swinging frame pivotally secured to said base, in combination with a mould box to the sides of which straps are secured in which a geries of bolt holes are formed, to adapt said sides to be adjustably secured one to said stationary upright and the other to said swinging frame, and the ends of which mould box rest on said pallet, and means for clamping said ends between said sides.
4. In a cement block machine, a bed, a base and stationary upright secured thereto, a pallet supported by said bed end a swinging frame pivotally secured to said base, in combination with a mould box, the sides of which are secured, one to said stationary upright aud the other to said swinging frame, and the ends of sald mould box formed with a plurality of openings, and resting on said pallet, a plurality of cores supported in said openings in the en is of said mould box, and means for operating said swinging frame to clamp sald ends in position between the sides of sald mould box.
5. In a cement block machine the combination with a bed a base secured thereto. a pallet supported by sald bed, and a stationary upright secured to said bed adjacent to said pallet, of a swinging frame pivotally secured to said base, a mould box the sides of which are secured one to said upright and the other to said swinging frame and the ends of which rest on said pallet, and are clamped and rigidly held in position between the sides of the mould box secured to sald upright and to said swinging frame, and means for operating said swinging irame.
6. In a cement block machine the combination with a bed, a pallet supported by and a stationary upright secured to said bed, of a base secured to said bed in two opposite sides of which a series of bolt holes are formed, a swinging frame adapted to be pivotally secured to sald base by a bolt extending through any of sald series of holes in said base, a mould box the sides of which are secured one to said stationary upright and the other to said swinging frame, and the ends of which rest on said pallet, and are clamped and rigidis beld in position between the side secured to said station-
ary upright and said swinging frame, and means for operating said swinging frame.
7. In a cement block machine, a bed, a base secured thereto, a pallet supported by sald bed, a stationary upright secured to said bed. a swinging frame pivotally secured to said base, and a mould box the sides of which are secured one to said stationary upright and the other to said swinging frame, and the ends of which rest on said pallet, in combination with hand levers secured to said swnging frame, inclined stationary uprights provided with elongated slots and secured to said bed, and bolts secured to said hand levers, and restitig in said elongated slots in sa!d stationary uprights.
8. In a cement block machine. a bed. a base secured thereto, a pallet supported by sald bed. a stationary upright secured to said bed, a swinging frame pivotally secured to said base, a mould box the sides of which are secured one to said stationary upright and the other to said swinging frame, and the ends of which rest on said pallet, hand levers secured to said swinging frame, and inclined stationary uprights provided with elongated slots secured to said bed, with which slotted uprights said bolts secured to sald hand levers engage, in combination with a platiorm the sides of which are pivotally secured to the aforesaid base, and connecting bars provided with elongated slots with which the pivot bolts secured to sald hand levers engage, to raise and lower said platform alternately as the swinging frame is adjusted backwards and forwards.
9. In a cement block machine, a bed, a base and stationary upright secured to said bed, guide bars secured at one end to said bed and at the other end to said base, a core head held in place by and vertically adjustable in said guide bars, cores secured to said core head, in combination with a hanger pivotally secured to said bed, a platform pivotally secured to said base. and a lever fulcrumed on said hanger, and conrected at one end to said core head and at the other end to said platform.

No. 100,986. Ore Concentrator.
Concentrateur de minerats.

Christoffer A. Christensen, Oretown, Oregon, U.S.A., 11th September, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,242 .
Claim.-1. In an ore concentrator, the combination with a supporting frame, of a table pivotally and slidably mounted thereon, riffles arranged on said table, and means whereby said riffles may be elevated at one end of the table, substantially as described.
2. In an ore concentrator, the combination with the supporting frame, of a table pivotally and slidably mounted thereon, longitudinally disposed riffles arranged on said table, means whereby the riffles may be elevated at one end of said table to form a gradual rise from one side to the other of the table, and means whereby said table is operated, substantially as described.
3. In an ore concentrator, the combination with a supporting frame, of a table pivotally and slidably mounted thereou, longitudinally disposed riffes arranged on said table, pivotally mounted elevating bars arranged beneath said riffles at one end of the table, adjusting screws adapted to elevate one end of said bars and the riffles thereon, and means to operate said table, substantially as described.
4. In an ore concentrator, the combination with a supporting frame, of a table pivotally and slidably mounted thereon, riffles arranged on sald table and extending longitudinally from one end to the other thereof, a transversely disposed pivot rod arranged near one end of the table frame, elevating bars pivotally mounted on their inner ends on sald bars, a bearing plate arranged across the under side of said end of the table, bands arranged on the ends of said elevated bars,
said bands having in their lower sides threaded apertures, and adjusting screws swivelled in said bearing plate and adapted to engage the threaded apertures in said bands, whereby when sald screws are turned in the proper direction, said bars and the riffles above the same will be elevated, substantially as described.
5. In a concentrator, the combination with a supporting frame, of a table slidably and plvotally mounted thereon, riffles arranged on said table, means to elevate one end of said riffles, a bumper arranged on said table to engage a bumper on said supporting frame, a table operating mechanism arranged on one end of sald supporting frame, and means connected to one side of the table whereby the latter is tilted, substantially as described.
6. In a concentrator, the combination with a supporting frame, of a table pivotally mounted thereon, riffles arranged on said table, means arranged in the framework of one end of the latter to elevate one end of said riffles. bumpers arranged on said supporting frame and table, means to operate said table and bring said bumpers into violent engagement, threaded elevating rods connected to one side of said table and a turnbuckle arranged on said rods whereby the same may be lengthened or shortened to tilt said table, substanthally as described.
7. In an ore separator the combination with a supporting frame having a centrally disposed supporting bar or beam, of open bearings arranged thereon, supporting shafts or bars arranged in said bearings, supporting lugs pivotally mounted on sald rods or shafts, a table arranged on said lug, riffles arranged on and extending longitudinally from one end to the other of sald table, means to elevate one end of said riffies in a gradual rise from one side of the table to the other, a yoke arranged on the outer end of one of said supporting bars or shafts, a drive shaft mounted on the forward end of said supporting frame, a cam arranged on said shaft to engage said yoke and move sald supporting rod and table in one direction, and a spring adapted to throw said table back in the opposite direction, substantially as described.
8. In an ore concentrator the combination with a supporting frame having open bearings arranged thereon, of supporting rods slidably mounted in said bearings, a table pivotally mounted on said rods, a yoke arranged on the outer end of said rod, a bearing roller journalled in said yoke, a guide rod slidably mounted in the outer end of said supporting frame, a coll spring arranged on said guide rod, means to adjust the tension of sald spring, a drive shaft journalled on the supporting frame, a cam arranged on sald shaft to cngage the bearing roller in sald yoke, whereby the table is moved in one direction against the tension of said spring, and means to regulate the stroke of said operating mechanism, substantially as described.
9. In an ore concentrator the combination with a supporting frame having open bearings arranged at each end thereof, supporting rods or shafts slidably mounted in sald bearings, a table pivotally mounted on said shaft, a yoke secured to the outer end of one of said operating shafts, a bearing roller journalled in sald yoke, a guide rod connected to the outer end of the latter, a drive shaft journalled on said supporting frame, a cam arranged on said shaft to engage the bearing roller in said yoke to move the table in one direction, a spring arranged on sald guide rod to throw said table back in the opposite direction, an adjusting nut to regulate the tension of said spring. an adjusting nut arranged on said supporting rod to limit the stroke of said shaft. bumpers arranged on said table and its supporting frame, threaded tilting rods arranged on one side of said table, and a turnbuckle arranged on said rods whereby said table may be tilted, substantially as described.
10. A concentrator table, riffles arranged on said table and extending longitudinally from one end thereof to the other. and means whereby said riffles are elevated at one end of the table to provide a gradual rise from one side of the latter to the other, substantially as described.

\section*{No. 100,987. Electric Drill. Foret électrique}

William O. Duntley, Chicago, Illinols, U.S.A., 11th September, 1906; 6 years. Filed 1st May, 1905. Receipt No. 124,746.
Claim.-1. An electric drill comprising a casing, an electric motor therein having an armature shaft, a tool spindle journalled in said casisg and arranged in axial alignment with the armature shaft, grasping handles on said casing, and means for operatively connecting the spindle and armature shaft.
2. An electric drill comprising a casing, an electric motor therein having an armature shaft, a tool spindle journalled in said casing and arranged in axial alignment with the armature shait, grasping handles on said casing, and a planetary gearing connection between the spindle and armature whaft.
3. An electric drill comprising a casing forming the feld frame of an electric machine, a rotatable armature within

said casing, a tool spindle journalled in such casing and arranged in axial alignment with the armature shaft, grasp ing handles on said casing, and means for operatively connecting the spindle and armature shaft.
4. An electric drill comprising a casing forming the field frame of an electric machine, a rotatable armature within said casing, end heads for the casing in which the armature shaft is journalled, a tool spindle journalled in such casing and arranged in axial alignment with the armature shaft, grasping handles on said casing, and means for operatiwely connecting the spindle and armature shaft.
5. An electric drill comprising a casing forming the field frame of an electric machine, a rotatable armature within said casing, end heads connected to the ends of the casing and having ball bearing journals to receive the armature shaft, a tool spindle journalled in such casing and arranged in axial alignment with the armature shaft, grasping handles on said casing. and means for operatively connecting the spindle and armature shaft.
6. An electric drill comprising a casing forming the fleld frame of an electric machine, a rotatable armature within said casing, end heads connected to the ends of the casing, the lower one of which has a thrust bearing to receive the lower end of the armature shaft, and the upper one of which has an adjustable bearing for the upper end of armature shaft, a tool spindle journalled in such casing and arranged in axial alignment with the armature shaft, a breast plate connected with the upper head, and means for operatively connecting the spindle and armature shaft.
i. An electric drill comprising a casing forming the field frame of an electric machine, a rotatable armature within said casing, end heads connected to the ends of the casing. the lower one of which has a thrust bearing to receive the lower end of the armature shaft and the upper one of which has a flanged opening, a bearing adjustable up and down in said flanged opening and adapted to recelve the upper end of such shaft, a breast plate fitting over such opening, and a tool spindle journalled in such casing and operatively connected with the armature shaft.
8. An electric drill comprising a casing forming the field frame of an electric machine. a rotatable armature within said casing, end heads connected to the ends of the casing. and having bearings for the armature shaft, a gear case secured to the lower end head and having an internal circular rock, a driving pinion on the lower end of the armature shaft, a gear case secured to the lower end head and having an internal circular rack, a driving pinion on the lower end of the armature shaft, a tool spindle, and the two pinions 14 carried thereby and meshing with the driving pinion and with the rack.
3. An electric drill comprising a casing, an electric motor therein having an armature shaft, a tool spindle journalled in said casing and operatively connected with the armature shaft, handles connected with the casing, and an electric switch governing the current to the motor and operatively connected with one of the handles.
10. An electric drill comprising a casing. an electric motor therein having an armature shaft, a tool spindle journalled is. sald casing and operatively connected with the armature shaft, handles connected with the casing and one of them being movable, and an electric switch governing the current to the motor and controlled by the movements of said movable handle.
11. An electric drill comprising a casing, an electric motor therein having an armature shaft, a tool spindle journalled in said casing and operatively connected with the armature shaft, handles 20,21 connected with the casing, a switch box 22 secured to the casing and to which the handle 21 is connected so as to have a rotary movement, and a switch arranged within said box to govern current to the motor and operatively connected with the handle 21.
12. An electric drill comprising a casing, an eleitric motor therein, a tool spindle driven by the motor, and an air cool-
ing device contaned within the casing and comprising a fan arranged at one end of and driven by such motor.
13. An electric drill comprising a casing, an electric motor therein, a tool spindle driven by the motor, and an air cooling device contained within the casing and comprising a fan arranged on the armature shaft and driven thereby.
14. An electric drill comprising a casing having openings for the entrance and exit of air, an electric motor in such casing, a tool spindle driven by the motor, and a fan comprising a collar 19 secured to the armature shaft of the motor and having blades \(19 a\) to cause a circulation of air through the said openings and casing.
15. An electric drill comprising a cylindrical casing having openings arranged at the ends for the entrance and exit of air, an electric motor in such casing. id tool spindle driven by the motor, and a fan operatively cuinecting with the motor and adapted to cause a circu'aticn of air through the said openings and casing.

No. 100,988. Flastic Fluid Turbine. Turbine à fluides élastiques.

James W. Ferguson, Sandusky, Ohio, U.S.A., 11th September, 1906; 6 years. Filed 2nd August, 1906. Receipt No. 138,363.
Claim.-1. In an elastic fluid turbine, the combination of radially and axially extending buckets open at their circumferential and side ends and arranged to receive fluid tangentially at their circumferential end and to discharge the fluid equally from the side ends in an axial direction, with buckets arranged to receive the fluid from the side ends of the first bucket to further abstract energy from the fluid.
2. In an elastic fluld turbine, the combination of buckets which recelve the motive fluid delivered in a tangential direction and are open at their circumferentlal and side ends, with successive rows of buckets constructed to form passages of uniform cross section and arranged to receive the motive lludaxially from the first-mentioned buckets, the cross section of the bucket of alternate rows being different from the cross section of the intermediate rows.
3. In an elastic fluid turbine, the combination of radial and axially extending buckets adapted to receive fluid discharged tangentially against them, intermediate buckets arranged at an angle to the first for receiving fluid flowing from the latter in axial directions, and rotary buckets aranged adjacent and at an angle to the intermediate buckets to receive the fluid discharged thereby, the cross section of the fluid passages of the intermediate buckets being uniform and less than the cross section of the passage between the said rotary buckets.
4. In an elastic fluid turbine, the combination of radially and axially extending buckets adapted to receive fluid discharged tangentially, rows of intermediate buckets forming passages of unlform cross section disposed at an angle to the pasages between the first buckets, and rotary buckets arranged in co-operative relation to the intermediate buckets which form passages of different uniform cross section and disposed at an angle to the first buckets different from the angle of the intermediate buckets.
5. In an elastic fluid turbine, the combination of radially and axially extending buckets rotatably mounted and adapted to receive fluid tangentially and deliver it axially, rows of Intermediate buckets forming passages of uniform cross section and disposed at an angle to the axis of rotation, and rows of rotating buckets forming passages of greater cross section than the aforesaid passages and disposed at a less angle to the axis of rotation.
6. In an elastic fluid turbine. the combination of a rotatable element, radially and axially extending buckets arranged thereon which are uncovered at their circumferential and side ends to deliver fluid axially therefrom, tangentially discherging nozzles angularly displaced around the element, and alternately arranged statlonary and rotary buckets forming

\section*{9-19}
axially extending passages, the passages between the stationary bucket being of less cross section than those of the rotary buckets and disposed at a greater angle to the axis of rotation than the passages of the rotary buckets.
7. In an elastic fluid turbine, the combination of a casing having annular grooves in its internal surface, rows of rotating buckets mounted thereon, rows of intermediate buckets, externally grooved arc-shaped members supporting the intermediate buckets and engaging the interior wall of the casing. and a key fitted in the grooves of said members and the casing for preventing relative axial displacement between the intermediate buckets and the casing.
8. In an elastic fluid turbine, the combination of a casing. rows of rotating buckets mounted therein, rows of intermediate buckets, annular members for supporting the intermediate buckets which are held circumferentially in engagement with the interior wall of the casing, registering keyways in the said members and casing, and keys in said ways for preventing relative axial displacement of the members and casing.
9. In an elastic fluid turbine, the combination of buckets having flat fluid impinging faces and arranged to receive the motive flulds dellivered in a tangential direction, the passages between the buckets being of substantially uniform cross section and open at their circumferential and side ends, with buckets having flat fluid impinging faces and arranged to receive the fluid delivered from the side ends of the first buckets.

\section*{No. 100,989. Track Laying Machine.}

Machine à poser les rails.

Taylor Milton Garver, Champaign, Illinois, U.S.A., 11th September, 1906; 6 years. Filed 16th August, 1906. Receipt No. 138,735 .
Claim.-1. A track laying apparatus comprising a car having a compressed air tank mounted upon it, truck adapted to run on the track forward of the car, means on the car for conducting rails and ties along the car and forward thereof past said truck, pneumatically operated track gauging appliances mounted on the truck, and a flexible pipe connection to said appliances from the compressed alr tank on the car.
2. A track laying apparatus comprising a car adapted to run on the track to be laid, a compressed air tank mounted on such car, a truck adapted to run on the track in advance of the car, pneumatically operated track gauging appliances ou the truck and a flexible pipe connection from the compressed air tank on the car to said pneumatic appliances, -neumatic operated tie lifters on the truck and flexible pinc connections thereto from the compressed air tank.
3. A track laying apparatus comprising a car adapted 10 run on the track laid, a compressed air tank mounted on such car, tie lifters suspended from the car in position for engaging the ties underlying the ralls on which the car stands, pneumatically operated means for actuating sait? tie lifters to uphold the ties against the under side of the rails, and pipe connections from the compressed air tank to said devices.
4. A track laying apparatus comprising a car adapted to run on the track to be lald, means mounted on the car extending longitudinally thereof and forward therefrom for conducting rails and ties to the road bed forward of the car. and a track gauging apparatus adapted to run on the track between the car and the delivery end of the rail and tie conductors.
5. A track laying apparatus comprising a car adapted to run on the track to be laid, rail and tle conductors extending alongside the car and projecting forward therefrom for delivery of rails and ties to the road bed in advance of the car. a truck adapted to run on the track between the forward end of the car and the delivery point of the rail and tie conductors, a compressed air tank mounted on the car, pneumatically operated track gauging devices mounted on the truck and flexible pipe conenctions from the tank to said devices.
6. A track laying apparatus comprising a car adapted to run on the track to be laid, rail and tie conductors extending alongside the car and projecting forward therefrom for delivery of rails and ties to the road bed in advance of the car, a truck adapted to run on the track between the fcrward end of the car and the delivery point of said rail and tie conductors, a compressed air tank mounted on the car, pneumatically operated track gauging devices and pneumatically operated tie lifters both mounted on the truck, and flexible pipe connections from the compressed air tank on the car to said devices on the truck.
7. A track laying apparatus comprising a car adapted to run on the track to be laid, rail and tie conductors extending alongside the car and projecting forward therefrom along the road bed for delivery rails and ties to the latter at a point in advance of the car, a truck adapted to run on the track between the forward end of the car and sald rail and tie delivery point, a compressed air tank mounted on the car, pneumatically operated tie lifters mounted on the car and connections for supplying them with compressed air from the tank, pneumatically operated track gauging devices and tle lifters mounted on the truck and flexible pipe connections to said devices from the compressed air tank.
8. A track laying apparatus comprising a truck adapted to run on the track to be laid, a gauging device having its frame carried by the truck and comprising two parallel inner gauge bars extending transversely with respect to the track between the front and rear wheels of the truck at the level of the heads of the rails for spacing the latter, two pairs of transversely reciprocating bars extending out over the ralls, between the truck wheels, one pair at each side, and having their ends hooked for engaging outside the rails, and pneumatically operated connections for actuating said ciamping bars to draw them inwardly for clamping the rails against the interior spacing bars.
9. A track laying apparatus comprising a truck adapted to be run on the track to be laid, a gauging device having its frame carried by the truck and comprising two parallel inner gauge bars extending transversely with respect to the track between the front and rear wheels of the truck at the level of the heads of the rails for spacing the latter, two pairs of transversely reciprocating bars extending out over the rails, one pair at each side, and having their ends hooked for engaging outside the rails between the truck wheels, a cylinder mounted on the truck having connection with a source of compressed air for operating the piston or pistons, such piston or pistons having connections therefrom for actuating the reciprocating bars.
10. A track laying apparatus comprising a truck adapted to run on the track to be laid, a frame suspended from such truck between the rails, interior spacing bars mounted on such frame at the level of the heads of the rails between the tread points of the front and rear wheels, exterior clamping bars mounted for reciprocation on such frame extending out over the rails between the front and rear wheels and hooked for engagement outside the rails, pneumatic tie lifters mounted on the truck having their means for engaging the tles extending down between the interior gauging bars, and pneumatically operated devices for actuating the clamping bars.
11. A track laying apparatus comprising a truck adapted to run on the track to be laid, a frame flexibly suspended from the truck between the wheels and below their axles, track gauging devices mounted on such frame and tie lifters mounted on the truck.
12. A track laying apparatus comprising a truck adapted to run on the track to be laid, having the axle bearings all rigidly framed together, such frame comprising an elevated transverse bar located in a vertical plane between the front and rear wheels of the truck and extending laterally beyond the track at both sides to overhang the road bed, tie lifters curried by the overhanging ends of such bar, and track fauging devices carried by the truck in position for operating on the track rails before and behind the transverse vertical plane of the tie lifters.
13. A track laying apparatus comprising a car having a compressed air tank mounted upon it, means adapted to run
on the track in advance of the car for gauging the rails, a plurality of pneumatically operated tie lifters mounted on the car, trolley hangers for the same, and trolley tracks upon which they are mounted to run longitudinally of the track. and flexible connections from the tie lifters to the compressed air tank.

\section*{No. 100,990. Machine for Bending Metal Tubes.}

Machine d plicr les tubes en métal.

Wlliam Kennedy, West Drayton, Middlesex England, 11th September, 1906; 6 years. Filed 3rd October, 1905. Recelpt No. 128,922.
Claim.-1. In apparatus for bending metal tubes, rods or the like, the combination of a central screw-threaded plug having a fixed flange and a flange screwed thereon, a stop ou the fixed flange, a bracket mounted to revolve round the central plug, a stop on said bracket, and a screw lever consisting of a toothed wheel revolving with the bracket and a worm journalled in a fixed bracket and gearing with the sald toothed wheel, substantially as described.
2. In apparatus for bending metal tubes, rods or the like, the combination of a central screw-threaded plug having a flange screwed thereon, a bracket mounted to revolve round the central plug. a stop on said bracket, means for revolving said bracket upon the central plug, and means for temporarily coupling sald bracket with the screwed flange, substantially as and for the purpose set forth.

No. 100,991. Method of Treating Tin Ecrap.
Méthode de traitement des déchets de ferblanc.

Meredith Leitch, Elizabeth, New Jersey, U.S.A., 11th September, 1906: 6 years. Filed 5th July, 1906. Receipt No. 137,570.
Claim.-1. In the treatment of tin scrap for the recovery of tin by a de-tinning bath the improvement which consists in converting the filth adhering to sald scrap into a form not detrimental to the bath without removing the coating of tin and keeping the medium surrounding the scrap while beling thus treated inert relatively to the tin thereon.
2. In the treatment of tin scrap for the recovery of tin by a de-tinning bath the improvement which consists in volatizing the volatile portions of the filth and carbonizing the carhonaceous matter of the filth and meanwhile keeping the
medium through which the scrap is then passing de-oxidized and at an even temperature sufficiently high to carbonize the carbonaceous matters but not high enough to remove the coating of tin from the scrap.
3. In the treatment of tin scrap for the recovery of tin by a de-tinning bath the improvement which consists in volatilizing the volatile portions of the filth and carbonizing the carbonaceous matters of the filth in a de-oxidized atmosphere heated sufficiently to carbonize the carbonaceous matters but not to remove the tin coating from the scrap and Jarring said scrap so as to remove the carbonized matter therefrom.
4. In the process of treating tin scrap comprising old cans for the recovery of tin by a de-tinning bath the improvement which consists in volatilizing the volatile portions of the filth and carbonizing the carbonaceous matter of the filth in a heated de-oxidized atmosphere without removing the tin coating and subjecting the cans while in said heated atmosphere to mechanical blows and thereby disintegrating them.
5 . In the process of treating tin scrap consisting of old tin cans, the improvement which consists in subjecting the same to heat in a de-oxidized atmosphere and subjecting the cans thus heated to mechanical blows.
6. In the process of treating tin scrap consisting of old cans, the improvement which consists in subjecting the same te heat in a de-oxidized atmosphere and periodically striking the cans thus heated and thereby disintegrating them and impelling them in an onward direction.
7. In the process of treating tin-scrap consisting of old cans, the improvement which consists in subjecting the same to heat in a de-oxidized atmosphere and striking the cans thus heated with blows in an obliquely onward direction and impelling them onward by such blows.
8. In the process of treating tin scrap consisting of old cans, the Improvement which consists in subjecting the same to heat in a de-oxidized atmosphere and simultaneously subjecting them to centrifugal force and striking them with blows in an obliquely onward direction thereby causing them to-move onward and to become disintegrated.

No. 100,892. Cement Block. Bloc de ciment.

John Fretts Madden, London, Ontario, Canada, 11th September, 1906 ; 6 years. Filed 28th October, 1905. Receipt No. 129,639.
Claim.-1. A building block comprising iront and rear walls of concrete or the like connected by wooden blocks which extend into the front wall and through the rear wall.
2. A building block comprising front and rear wall of concrete or the like connected by wooden blocks about which the concrete is moulded, said blocks extending into the front wall and through the rear wall, and means to prevent the separation of sald blocks and walls.

\section*{No. 100,983. Vaponriser for Firnaces.}

\section*{Appareil d vaporiser pour fournaises.}

David L. O'Connor, Waynesboro, Virginia, U.S.A., 11th September, 1906; 6 years. Filed 24th July, 1906. Receipt No. 138,114 .
Claim.-1. A vapourizer for furnaces comprising a receptacle having ports therein, an apertured ring mounted upon the receptacle and adapted to simultaneously open or close the ports, a supply pipe opening into the receptacle, a float and means operated by the float for controlling the passage of liquid through the pipe.
2. A vapourizer for furnaces comprising a receptacle having ports therein, an apertured ring upon the receptacle
adapted to simultancously open or close the ports, a float within the receptacle, a guide therefor, a supply pipe

opening into the receptacle, and means operated by the float for controlling the passage of liquid through the pipe.
3. A vapourizer for furnaces comprising a receptacle having ports therein, means for simultaneously opening or closing the ports, a cover, a float within the receptacle, a stem thereon guided within the cover, a supply pipe, and means operated by the fioat for controlling the passage of liquid through the pipe.
4. A vapourizer for furnaces comprising a receptacle having a groove therein, sald groove provided with ports, an apertured ring movably mounted within the groove and adapted to open or close the ports, a cover upon the receptacle, a guide tube therein, a float and a stem extending from the float and slidably mounted within the tube.
5. A vapourizer for furnaces comprising a receptacle having a groove therein, said groove provided with ports, an apertured ring movably mounted within the groove and adapted to open or close the ports, a cover upon the receptacle, a guide tube therein, a float and a stem projecting from the float and slidably mounted within the tube, a supply pipe extending into the receptacle, and means operated by the stem and float for controlling the passage of liquid through the pipe.

No. 100,994. Building Block. Bloc de construction.

Nels J. Peterson, Omaha, Nebraska, U.S.A., 11th September. 1906; 6 years. Filed 21st April, 1906. Recelpt No. 135,128.
Claim.-1. A fller block for wall construction comprising a body portion having four converging sides which meet in two lines opposite each other and the center thereof, and said body portion belng provided with an aperture, substantially as set forth.
2. A fller block for wall construction composed of four inclined sides 5 which meen in points 6 and 8 opposite the enter of the block, the ends 7, the top and bottom faces b and the diamond shaped aperture, substantially as get forth.
3. A wall composed of building blocks A having converging sides 2 which meet in a line 3 , the filler blocks \(B\) having
a diamond shaped aperture \(f\). and the four inclined sides 5 which meet in lines 6 and 8 opposite each other and the center of said block, said last-mentioned blocks belng laid so that each block of a course above the lowermost course will seat upon the blocks next below.
4. A masonry wall consisting of a plurality of wall sections, one section at an angle to the other section, sald wall being composed of a plurality of angular blocks lald in courses and having three contiguous rows in each course. such rows belng separated to provide an air space on each side of the center row or flller blocks, the alr space of one course on each slde of the center row or fller blocks being arranged to cross the air space of the adjoining courses above and below to provide vertical communicating passages between the air spaces of the several courses and the center row of blocks having substantially quadrangular shaped apertures to provide vertical air passages which communicate with the aforesaid contiguous air spaces upon each side of the center row of blocks.

No. 100,995. Power Fammóor. Marteau mécanique.

Frank P. Polaski, Granite, Oklahoma, U.S.A., 11th September, 1906: 6 Jears. Filed 27th June, 1906. Receipt No. 137,341.
Olaim.-A power hammer comprising a framework having an anvil thereon, a hammer to co-operate therewith and carried by a fulcrumed beam, a flexible joint carried by one end of said beam, a screw-threaded shank projecting from said joint, a U-shaped member adjustably connected to said shank and an elliptical spring resting under or secured to a stationary part of the framework and passing between the sides of said U-shaped member, the lower portion of said spring being connected to the sides of the sald U-shaped member and adapted to restore the hammer to its normal position.

\section*{No. 100,996. Explosive. Explosif.}

Berthold Gustav Reschke. Hamburg, Germany. 11th September. 1906; 6 years. Filed 19th June, 1906. Receipt No. 137,058.
Claim.-In the manufacture of ammonium nitrate safety explosives the introduction of fennel with or without the addition of wood pulp, substantially in the proportions and for the purpose specified.

\section*{No. 100,997. Typewriter Mechanism.} Ḿcanisme de clavigraphe.
John Stephen Southerden. Brisbane, Queensland, Australla, 11th September, 1906; 6 years. Filed 20th April, 1906. Recelpt No. 135,100.
Claim.-1. In improvements in line spacers for typewriting machines the combination of a platen, a disc having a central boss attached to the end of aplaten. a grip ended clutch with tail pieces fitting over boss of disc and the grip ends adapted to engage with the periphery of the disc, substantially as described.
2. In improvements in line spacers for typewriting machines the combination of a platen, a disc having a central boss attached to the end of said platen, a iriction clutch member having a tail piece, a lever with eccentric end pivotally connected to said tall picce and adapted to engage with the periphery of the disc, substantially as described.
3. In improvements in line spacers for typewriting machines the combination of a platen, a disc having a central boss attached to the end of said platon, a friction clutch memer having a tall pere. a lever with ecoentric and pivotally connected to said tail pioce, a spring connected to said tail piece keepine the ecerntric end of lever in engagement with the disc, substantlally as described.
4. In improvements in line spacers for typewriting machines the combination of a platen, a disc having a central

boss attached to the end of said platen, a friction clutch member having a tail piece, a stop on type machine against which said tail piece abuts, an eccentric ended lever plvotally connected by an arm to the operating epacing lever of the machine, substantially as described.

No. 100,998. Typewriter Mechanism.
Lécanisme de clavigraphe.

John Stephen Southerden, Brisbane, Queensland, Australia, 11th September, 1906; 6 years. Filed 20th April, 1906. Recelpt No. 135,102.
Claim,-1. In improvements in line spacers for typewriting machines the combination of a platen, a circular plate necessed on face having a concentric groove for recelving gripping dogs and a central boss fitting round platen spindle, sald plate attached to end of platen, substantially as described.
2. In improvements in line spacers of typewriting machines the combination of a platen, a plate having a recessed face and a concrete groove, dogs adapted to grip said groove, a lever having a boss provided with notches for engaging said dogs and spiral springs attached to sald lever and dogs, substantially as described.
3. In improvements in line spacers for typewriting machines the combination of a platen, a plate having a recessed face and a concentric groove, dogs adapted to grip sald groove, a lever having a boss provided with notches for engaging said dogs, springs attached to said lever and dogs, a plate connected to said lever by helical spring and provided with radial arms having pins on ends of same for engaging with said dogs and a radial arm engaging with a stop on the machine, substantially as described.

No. 100,898. Typewriter Mechanism. Mécanisme de clavigraphe.

John Stephen Southerden, Brisbane, Queensland, Australia, 11th September, 1906;6 years. Filed 20th April, 1906. Receipt No. 135,101.
Claim.-1. In improvements in line spacers for typewriting machines the combination of a platen, a recess formed in the end of platen lined with a flanged ring, a disc having a boss formed integrally therewith fitting into the end of the platen. said boss having a tapered recess, a ball or roller travelling along the path of said recess and a spiral spring forcing the said ball or roller into grip with the flanged ring and the sald boss, substantially as described.
2. In improvements in line spacers for typewriting machines the combination of a platen, a recess formed in end of platen lined with a flanged ring, a disc having a boss formed integrally therewith, said boss having a tapered recess, a ball or roller, a spiral spring flxed in end of said recess. a stop on frame of machine, a releasing member working in a straight line or concentrically against the face of the disc, provided at one end with a pin set at right angles adapted to engage with the ball or roller and the free end engaging with the sald stop releasing ball or roller from gripping the platen, substantially as described.
3. In improvements in line spacers for typewriting machines the graduated dial \(M\) provided with a stop \(Q\) and pointer \(P\) in combination with lock nut \(N\) and handle NI adapted to lock the dial to frame of machine, substantially as described.
4. In improvements in line epacers for typewriting machines the combination of a graduated dial \(M\), lock nut \(N\) and operating lever \(L\) in combination with the toothed gearing K and KI , springs V and S , substantially as described.

\section*{No. 101,000. Rural Route Mail Deliverer. \\ Appareil de distribution de la malle rurale.}

Valentine F. Springer. Milford, Nebraska, U.S.A., 11th Septtember, 1906 ; 6 years. Filed 19th June, 1906. Receipt No. 137,069.
Claim.-In a device of the character described the combination with two superposed suspended wires, of a carriage, seid carriage being provided with brackets, a sheave supported within each bracket working upon the uppermost suspending wire, a gear secured to one of said sheaves, a drive gear secured to said carriage meshing with said first-
mentioned gear, a suitable motor actuating said gears, a sheave secured to said driving shaft adapted to come in en-

gagement from below with said lowermost suspended wire and a mail receptacle secured to sald carriage.

No. 101,001. Turbine Enginc. Machive turbine.

Alfred Tschinkel, New York City, New York, U.S.A. 2 11th September, \(1906 ; 6\) years. Flled 10th August, 1906. Recelpt No. 138,584.
Claim.-1. In a turbine engine, a stationary enclosing casing having inlets in one side and outlets in the other side and a line of transversely extending pockets in its interior circumference open at each end, and a rotatable wheel in said casing having a line of transversely extending pockets in its outer circumference open at each end and adapted to intersect the pockets in said casing, whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes therein when the pockets register and then exhausts from sald pockets on the other side of said casing. substantially as described.
2. In a turbine engine, a stationary enclosing casing having a line of transversely extending pockets in its interior circumference open at each end, a rotatable wheel having a line of transversely extending pockets in its outer circumference open at each end and adapted to Intersect the pockets in said casing, inlets in one side of the casing each having a passage communicating with the pockets in said casing, and a passage communicating with the passage in the wheel and outlets in the other side of the casing, whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes therein when the pockets register and then exhaust from said pockets on the other side of said casing, substantially as described.
3. In a turbine engine, a stationary enclosing casing having inlets in one side and outlets \(n\) the other side and a line of transversely extending curved pockets in its interior circumference open at each end and a rotatable wheel in said casing having a line of transversely extending curved pockets in its outer circumference open at both ends and adapted to intersect the pockets in said casing. whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes therein when the pockets register and then exhausts from said pockets on the other side of said casing, substantially as described.
4. In a turbine engine, a stationary enclosing casing having a line of curved pockets in its interior circumference, a rotatable wheel having a line of curved pockets in its outer circumference adapted to intersect the pockets in said casing, inlets in one side of the casing each having a passage communicating with the pockets in said casing and a passage communicating with the pockets in the wheel and outlets in
the other side of the casing. whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes therein when the pockets register and then exhausts from said pockets on the other side of said casing, substantially as described.
5. In a turbine engine, a stationary enclosing casing having Inlets in one side and outlets in the other side and a llne of transversely extending curved pockets open at each end and a rotatable wheel having a line transversely extending pockets in its outer circumference curved in the reverse direction to the pockets in the casing and adapted to intersect the pockets in said casng, whereby the motive fiuld simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes therein when the pockets register and then exausts from said pockets on the other side of the casing, substantially as described.
6. In a turbine engine, a stationary enclosing casing having a line of transversely extending pockets in its interior circumference open at each end, a rotatable wheel having a line of transversely extending pockets in its outer circumference open at each end and adapted to intersect the pockets in said casing. inlets in one side of said casing, outlets in the other side of said casing, and a chamber in said casing to receive the exhaust from the pockets therein and the pockets in the wheel, whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes therein when the pockets register and then exhausts from said pockets on the other side of said casing, substantially as described
7. In a turbine engine, a stationary enclosing casing having a line of pockets in its interior circumference, a rotatable wheel having a line of pockets in its outer circumference adapted to intersect the pockets in said casing. inlets in one side of said casing, each havng a passage communicating with the pockets in said casing and a passage communicating with the pockets in the wheel, outlets in the other side of the casing and a chamber in said casing to receive the exhaust from the pockets therein and the pockets in the wheel. whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes thercin when the pockets register and then exhausts from said pockets on the other side of said casing, substantially as described.
8. In a turbine engine. a stationary enclosing casing having inlets in one side and outlets in the other side, a line of transversely extending graduated pockets in its interior circumference open at each end and a rotatable wheel having a line of transversely extending graduated pockets in its outer circumference open at each end and adapted to intersect the pockets in said casing, whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodics mixes therein when the pockets register and then exhausta from said pockets on the other side of said casing, substantially as described.
9. In a turbine engine. a stationary enclosing casing having a graduated line of transversely extending pockets in its interior circumference onen at both ends, a rotatable wheel having a graduated transversely extending line of pockets in its outer circumference open at both onds and adapted to intersect the pockets in said casing. inlets in one side of said casing each having a passage communcating with the pockets in said casing and a passage communicating with the pockets in the wheel and outlets in the other side of the casing, whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes thereln when the pockets register and then exhausts from said pockets on the other side of said casing. substantially as described.
10. In a turbine engine, a stationary enclosing casing having inlets in one side and outlets in the other side and interior circumferential ribs forming a line of transversely extending graduated pockets open at each end and a rotatable wheel having exterior circumferential ribs forming a line of transversely extending graduated pockets open at cach end and adapted to intersect the pockets in said casing. whereby the motive fluid simultaneously enters the i. \(\cdot\) clists in the cas: \(n s\) auci the pockets in the wheel from irclats in the
\(r i d e\) in separate brics, mixes therein when the pockets rigister and ther e latst: from sald pockets on the other sid. of said casirg substantially as described.
11. In a turbine engine. a stationary casing having inlets in one side and outlets in the other side and interior circumferential ribs forming a lne of transversely extending pockets open at each end, a rotatable wheel having exterior circumferential ribs forming a line of transversely extendIng pockets open at each end adapted to intersect the pockets in sald casing, inlets in one side of the casing each having a passage communicatng wth the pockets in said casing and a passage communicating with the pockets in the
wheel and outlets in the other side of the casing, whereby the motive fluid simultaneously enters the pockets in the casing and the pockets in the wheel from one side in separate bodies, mixes therein when the pockets register and then exhausis from said pockets on the other side of said casing. substantialiv as described.

No. 101,002. Pegging Machine. Machine d cheviller.
Pegging Muchinc.

The United Shoe Machinery Company of Canada, Boston, Massachusetts, assignee of The Davey Pegging Machine Company, assignee of William Winslow Kelly, both of Portland. Maine, U.S.A., 11th September, 1906; 18 years. Filed 9th January, 1900. Receipt Nos. 76,042 and 78,057
Note.-This patent is a re-issue of Patents No. 54,643 , bearing date the 18th day of January, 1897.
Claim.-1. The combination of a awl and peg driving mechanism of pegging machine with a rotatable horn presenting an effective support for the material between the point penetrated by the awl and the axis of rotation of the horn, the axis of rotation of the horn being offset with relation to the line of feed of the awl, which awl operates outside the exterior surface of said support, substantially as described.
1a. The combination of the awl and peg driving mechanism of a pegging machine with a rotatable horn, the axis of which is offset with relation to the line of feed of the awl, and means for presenting an effective support for the material close to the point penetrated by the awl between the axis of rotation of the horn and the point of penetration of the awl, and an additional support beyond said point of penetration forming a bottomless working space for the awl between sald supports.
2. The combination of the peg driving mechanism of a pegging machine with a rotatable horn, the axis of rotation of which is offset with relation to the line of feed of the peg driving mechanism, and an anvil plece pivotally supported in the top of sald horn to support the material between the point penetrated by the awl and the axis of rotation of the horn, the awl operating on a tangent outside the periphery of said anvil plece, substantially as described.
3. The combination of the peg driving mechanism of a pegging machine with a rotatable horn, the axis of rotation of which is offset with relation to the line of feed of the peg driving mechanism, and an anvil piece pivotally supported In the tip of said horn to support the material between the point penetrated by the awl and the axis of rotation of the horn, the awl operating on a tangent outside the periphery of said anvil piece, and means for holding said anvil piece against rotation with the horn, substantially as described.
4. The combination of the rotatable horn with an anvil plece supported in the tip thereof and projecting laterally beyond said horn tip to afford a support for the material. and means for holding said anvil against rotation with the horn, substantially as described.
5. The combination of the peg driving mechanism comprising an awl and peg driver with a rotatable horn, the axis
of rotation of which is offset with relation to the sald awl and triver which operate outside the periphery of the tip of said horn, and an anvil plece supported in said horn tip and projecting over the periphery thereof toward the awl and driver, and means for holding said anvil plece against rotation with the horn, substantially as described.
6. The herein described anvil piece for the horn of a peg ging machine comprising a pivotal shank and an overhanging head or supporting portion having a lateral projection at one end thereof, substantially as described.
7. The combination of the rotatable horn with a sprocket wheel held against ratation in the axis of the horn, a second sprocket wheel having its bearing in the rotating horn, and a chain connecting said sprocket wheels, an anvil plece pivotally supported in the horn tip and connection between the same and said sprocket wheel and horn, substantially as and for the purpose described.
8. The combination with the rotatabde horn and means for yleldingly pressing it upward, of a treadle and means for yieldingly pressing it upward, and a loose or slotted connection between said treadle and horn, said horn being movable downward independently of said treadle, substantially as described.
9. The combination of a rotatable horn with an anvil plece supported in the tip thereof, gearing in said horn to prevent rotation of said anvil plece therewith and a shaft in the shank of said horn connected with said gearing, a fixed post below and in line with the said horn engaged with said shaft as described whereby the latter can move longitudinally but without rotary movement in said post, substantially as and for the purpose set forth.
10. The combination of a rotatable horn with a spring to press it upward and an anti-friction bearing for the end of said spring comprising a collar, a series of balls contained therein and bearing surfaces for said balls at each side of said collar, substantially as and for the purpose described.
11. The combination of the horn having a hollow or tubular shank and an anvil plece supported in the tip thereof, and gearing in said horn to prevent rotation of said anvil piece therewith, a post fixed below and entering the tubular shank of said horn, a shaft in said horn connected with the gearing therein and engaged with said post as described, a spring to elevate said horn and a treadle connected to a shaft in said horn and provided with a stop to limit the upward movement thereof, substantially as described.

No. 101,003. Letter Chute and Conveyer. Transport et chute de lettre.

Martin C. Schwab, Baltimore, Maryland, U.S.A., 18th September. 1906; 18 years. Filed 23rd April, 1906. Receipt No. 135,177
Claim.-1. The combination of a letter chute and a gravity conveyer.
2. The combination of a letter chute and a spiral gravity conveyer.
3. The combination of a vertical letter chute and a fravity conveyer adjacent thereto.
4. The combination of a letter chute and a multiple spiral gravity conveger.
5. The combination with an outer casing of an inner core, a spiral blade interposed between said casing and core, and a letter chute extending through said inner core.
6. The combination with an outer casing of an inner core and a spiral blade interposed between said casing and core, said casing having an observation opening and an intake oppning.
i. The combination of a gravity conveyer having an observation opening and an intake opening, and a letter chute extending through the interior of said conveyer.
8. The combination of a gravity conveyer and a letter chute of rectangular cross section extending longitudinally through the interior of said conveyer.
9. The combination of a multiple spiral gravity conveyer and a plurality of letter chutes extending longitudinally through the interior of said conveyer.
10. The combination with a gravity conveyer, of a letter chute and receiving boxes for sald conveyer and chute.
11. The combination with a multiple spiral gravity conveyer, of receiving means for each spiral, a letter chute and additional receiving means for said chute.
12. The combination with a multiple spiral gravity conveyor or a plurality of letter chutes extending longitudinally through the interior of said conveyer, and a box at the lower end of the conveyer and chutes provided with separate compartments for each of the spirals and chutes.
13. The combination with a conveyer of an inner letter chute, and means affording communication between the outer portion of the conveyer and said inner chute.
14. The combination with a conveyer of an inner chute, means affording communication between the outer portion of said conveyer and sald inner chute and observation openings adjacent said means.
15. The combination with a gravity conveyer of an inner chute having one of its walls composed of transparent material. and an auxiliary chute extending from the exterior of said conveyer to sald inner chute, said conveyer being provided with observation openings in alignment with the transparent wall of said inner chute.
16. The combination with a conveyer of an inner chute and an auxiliary chute extending from the exterior of said conveyer to said inner chute, sald conveyer and inner chute being provided with observation openings.
17. The combination with an outer casing of an inner chute. an interposed spiral blade and an inner chute, said casing and core being provided with openings in substantial alignment with each other.
18. The combination with an outer casing of an inner chute an interposed spiral blade, an inner chute and an auxiliary chute connecting an opening in said outer casing with an opening in said inner chute, said casing, core and inner chuto being provided with openings in substantial alignment with each other.
19. The combination with an outer casing of an inner core, an. interposed spiral blade, an inner letter chute and an auxiliary letter chute below said blade and connecting an opeaing in the outer casing with an opening in the inner chute through an opening in the inner core, said casing core and inner chute being privided with observation openings between said blade and sald auxillary chute.
20. The combination with a gravity conveyer of an inner chute and a plurality of auxiliary, chutes extending between the exterior of said conveyer and said inner chute, said conveyer and inner chute being provided with observation openings adjacent each of said auxiliary chutes.
21. The combination with a gravity conveyer of landing floors therefor, an inner chute auxiliary conveying means adjacent a landing and extending between, the exterior of said conveyer and said inner chute.
22. The combination with a gravity conveyer of landing floors therefor, a plurality of inner chutes and auxiliary conveying means extending from the exterior of said conveyer adjacent a floor landing to the said inner chutes, sai. conveyer and chutes being provided with observation openings.
23. The combination with a multiple spiral gravity conveyer, of landing floors therefor, an inner chute, and means affording communication between the exterior of said conveyer and said inner chute at a point adjacent a floor landing. said conveyer and chute being provided with openings in substantial alignment with each other.
24. The combination with an outer casing of an inner core, a plurality of spiral blades interposed between said casing and core to form conveying surfaces for packages, a plurality of letter chutes extending longitudinally through said inner core, means affording commurication between said outer casing at points adjacent a floor landing and the said letter chutes, said outer casing having intake openings and observation openings adjacent the spirais of the conveyer, and the letter chute being provided with additional observation openings for the letter chute and individual receiving means for the letter chutes and for the package convey ing spirals.

\section*{No. 101,004. Plate Printing Machine.}

\section*{Machine is imprimer des plaques.}

The Long-Arm System Company, assignee of Robert H. Kirk, both of Cleveland, Ohio. U.S.A.. 18th September, 1906 ; 6 years. Filed 28th May, 1906. Receipt No. 136,301.
Claim.-1. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an im-
pression roller in the form of a cylinder mounted above said bied roller, of a plate carriage mounted to vibrate on said

frame between said rollers, and a card carrier also mounted to vibrate on sald frame, means for automatically moving said card carrier towards and coupling it with sald plate carirage and for uncoupling same and holding the card carrier in the initial position, and a friction drive independent of the pressure between said rollers for moving the plate carriage, and with it the card carrier, between sald rollers, substantially as described.
2. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an impression roller in the form of a segment, of a cylinder mounted above sa!d bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, and a card carrier also mounted to vibrate on said frame, means for automatically moving said card carrier towards and coupling it with said Fhate carriage and for uncoupling it with said plate carriage and for uncoupling same and holding the card carrier in the ir:tial position, and a friction drive independent of the pressure between said rollers for moving the plate carriage, and with it the card carrier between said rollers, and means for bolding the card normally at an angle on said card carrier and causing it to project above and clear of the plate, except when pressed between the rollers, substantially as described.
3. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an impression roller in the form of a segment, of a cylinder mounted to vibrate on said frame between said rollers, and a card carrier also mounted to vibrate on sald frame, means for automatically moving said card carrier towards and coupling it with said plate carriage, and for uncoupling same and holding the card carrier in the initial position, and a eriction crive independent of the pressure between said rollers, for moving the plate carriage, and with it the card carrler between said rollers, and an inking roller automatically operaled by the motion of said plate carriage for inking the plate, 3ubstantlally as described.
4. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an impression roller in the form of a segment of a cylinder mounted above said bed roller, of a plate carriage mounted to vibrate on said frame between said rollers," a card carrier with means for automatically moving same towards and coupling same t' said plate carriage, means for automatlally uncoupling said card carrier when it returns to the initlal position. automatic means for holding the card carrier in the inltial position untll released, a strap connected to the plate carriage, with a weight suspended therefrom, a stiff strip contected to said strap, and Intermittently acting friction roll'rs acting upon said strap and strip for imparting a frictional feed to said plate carriage independent of the pressure between the printing rollers, substantially as described.
i. In a plate printing machine the combination with a frame, a bed roller journalled therein and an impression roller in the form of a segment, of a cylinder mounted above
sald bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, a card carrier with means for automatically moving same towards and coupling same to said plate carriage, means for automatically uncoupling said card carrier when it returns to the initial position. automatic means for holding the card carrier in the initial position until released, a strap connected to the plate carr:age with a weight suspended therefrom, a stiff strip con nected to said strap, and intermittently acting friction rollers acting upon said strap and strip for imparting a frictional feed to said plate carriage independent of the pressure between the printing rollers, and an ink roller automatically operated by the motion of said plate carriage for inking the plate, substantially as described.
6. In a plate printing machine the combination with a frame, a bed roller journalled therein and an impression roller in the form of a segment, of a cylinder mounted above said bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, a card carrier with means for automatically uncoupling said card carrier when it returns to the initial position, automatic means for holding the card carrier in the initial position untll released, a strap connected to the plate carriage with a weight suspended therefrom, a stiff strip connected to said strap, and intermittently acting friction rollers acting upon said strap and strip for imparting a frictional feed to said plate carriage independent of the pressure between the printing rollers, and an ink roller automatically operated by the motion of said plate carriage for inking the plate, with means for holding the card normally at an angle on sald card carrier and causing it to project above and clear of the plate, except when pressed between the rollers, substantially as described.
7. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an impression roller mounted above said bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, a plate holder mounted on said garriage, a card carrier with means for holding the card at an angle above said carrier, means for coupling the plate carriage and card carrier together and a friction drive for moving said plate carriage independently of the pressure between the printing rollers, substantially as described.
8. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an impression roller mounted above said bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, a plate for holding the card at an angle above said carrier, means, for holding the card at an angle above said carirer, means, for coupling the plate carriage and card carrier together and a friction drive for moving said plate carriage independently of the pressure between the printing rollers, with an ink roller automatically operated by the motion of said plate carriage for inking the plate, substantially as described.
9. In a plate printing machine the combination wth a frame and printing rollers journalled in said frame, of a plate carriage mounted to vibrate on said frame between said printing rollers, and a card carrier provided with a series of resilient fingers for gripping the card and holding it at an angle in the card carrier, a rod journalled in said card carrier and having a flat face normally resting beneath said gripping fingers and allowing the same to grip the card but lifting said gripping fingers when said rod is rocked, substantially as described.
10. In a plate printing machine the combination with a frame and printing rollers journalled in said frame, of a plate carriage mounted to vibrate on said frame between said printing rollers and a card carrier provided with a of resilient fingers for gripping the card and holding it at an angle in the card carrier, a rod journalled in said card carrier and having a flat face normally resting beneath said gripping fingers and allowing the same to grip the card but lifting said gripping fingers when said rod is rocked, with a wrist lug secured to said rod for rocking the same, substantially as described.
11. A card holding and releasing device for use in machines of the character described, comprising a bar having an inclined face, a rod mounted to rock in said bar and flattened along one side thereof, a serics of resilient gripping fingers secured to said bar and engaging said flattened face of said red and normally tending to restore the same to the initial position and to grip the card beyond the edge of said rod. with means for rocking said rod and thereby releasing all of said fingers from engagement with the card, substantially as described.
12. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carrage mounted to vibrate on said frame between sald printing raller's and a card carrier also mounted to vibrate on said frame, with means for coupling said plate carriage and said card carrier together, a shaft for driving said printing rollers a drive wheel loosely mounted on said shaft, clutch mechan-

Ism for connecting said drive wheel and said shaft together when desired and automatic means for disconnecting said clutch mechanism before said shaft has performed a complete revolution, substantially as described.
13. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said printing rollers and a card carrier also mounted to vibrate on sald frame, with means for coupling said plate carriage and said card carrier together, a shaft for driving sald printing rollers, a drive wheel loosely mounted on said shaft, clutch mechanism for connecting said drive wheel and said shaft together when desired, a treadle and mechanism operated thereby for throwing said clutch mechanism into engagement when desired, and means independent of sald treadle for automatically throwing said clutch mechanism out of engagement, irrespective of the position of said treadle, before the said shaft completes a single revoluton, substantally as des crbed.
14. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said printing rollers and a card carrier also mounted to vibrate on said frame, with means for coupling sald plate carriage and said card carrier together, a shaft for driving said printing rollers, a friction drive operated by said shaft for moving sald plate carriage, a drive wheel loosely mounted on sald shaft, clutch mechanism for connecting said drive wheel and said shaft together when desired and automatic means for disconnecting said clutch mechanism before said shaft has performed a complete revolution, substantially as described.
15. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said printing rollers, and a card carrier also mounted to vibrate on said frame, with means for coupling together, a shaft for driving said printing rollers, a friction drive operated by said shaft for moving on said shaft, clutch mechanism for connecting said drive wheel and said shaft together when desired, a treadle and mechanism operated thereby for throwing said clutch mechanism into engagement when desired, and means independent of said treadle for automatically throwing said clutch mechanism out of engagement, irrespective of the position of said treadle, before said shaft completes a single revolution, substantially as described.
16. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said printing rollers and said plate carriage, a drive wheel loosely mounted on said shaft, clutch mechanism for connecting said drive wheel and said shaft together when desired, and automatic means for disconnecting sald clutch mechanism before said shaft has performed a complete revolution, substantially as described.
17. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said printing rollers, means for holding the card above said plate carriage, a shaft for driving said printing rollers and said plate carriage, a drive wheel loosely mounted on said shaft. clutch mechanism for connecting said drive wheel and said shaft together when desired, a treadle and mechanism operated thereby for throwing said clutch mechanism into engagement when desired, and means independent of said treadle for automatically throwing said clutch mechanism out of engagement, irrespective of the position of said treadle, before the said shaft completes a single revolution, substantlally as described.
18. In a plate printing machine the combination with a frame and printing rollers, means for holding the card above sald plate carriage, a shalt for driving said printing rollers, a friction drive operated by said shaft, for moving sajd' plate carriage, a drive wheel loosely mounted on said shaft, and clutch mechanism for connecting said drive wheel and said shaft together when desired, with automatic means for cisconnecting said clutch mechanism before said shaft has performed a complete revolution, substantially as described.
19. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between sald printing rollers, means for holding the card at an angle above said plate carriage, a shaft for driving said printing rollers, a friction drive operated by said shaft for moving said plate carrlage, a drive wheel loosely mounted on said shaft, clutch mechanism for connecting said drive wheel and said shaft together when desired, a treadle and mechanism operated thereby for throwing said clutch mechanism into engagement when desired, and means independent of said treadle for automatically throwing said clutch mechanism out of engagement, irrespective of the position of said readle before said shaft completes a single revolution, subtantially as described.
20. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said printing rollers, and a card carrier with means for causing same to move towards said plate carriage when released, and means for coupling said plate carriage and said card carrier together, a shaft for driving said printing rollers, a drive wheel loosely mounted on said shaft, clutch mechanism for connecting said drive wheel and said shaft together when desired, a treadle and mechanism operated thereby for releasing said card carriage, and independent mechanlsm, also operated by said treadle, for throwing said clutch mechanism into engagement when desired, and means independent of said treadle for automatically throwing sald clutch mechanism out of engagement, irrespective of the position of said treadle before the said shaft completes a single revolution, substantially as described.
21. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on sald frame between said printing rollers, means for holding the card above said plate carriage, a shaft for driving said printing rollers and said plate carriage, a drlve wheel loosely mounted on said shaft, clutch mechanism normally tending to couple said drive wheel and said shaft together, comprising a member fast to said wheel, and a shifting member splined to said shaft, and automatic means for moving said sliding clutch member out of engagement with the opposite member before said shaft has performed a complete revolution, substantially as described.
22. In a plate printing machine the combination with a frame and printing rollers fournalled therein, of a plata carriage mounted to vibrate on said frame between said p:inting rollers. means for holding the card above said plate carriage, a shaft for driving said printing rollers and said plate carriage, a drive wheel loosely mounted on said shaft c!utch mechanism normally tending to couple sald drive wheel and said shaft together comprising a member fast to said wheel, and a sliding member splined to said shaft, a treadle and mechanism controlled thereby for throwing said cliding clutch member into engagement when desired, and means independent of said treadle for automatically throwing said sliding clutch member out of engagement, irrespective of the position of said treadle, before the said shaft completes a single revolution, substantially as des cribed.
23. In a plate printing machine, the combination with a frame and printing rollers journalled therein, of a plate mounted to vibrate on said frame between said printing rollers, means for holding the card above said plate carriage, a shaft for driving said printing rollers, spring supported bearings for said shaft, a friction drive operated by said shaft for moving said plate carriage, a drive wheel loosely mounted on said shaft, and clutch mechanism for connecting said drive wheel and said shaft together when desired, with automatic means for disconnecting said clutch mechanism before said shaft has performed a complete revolution, substantially as described.
24. In a plate printing machine the comblnation with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said printing rollers, means for holding the card above said plate carriage, a shaft for driving said printing rollers, a friction drive operated by sald shaft for moving said plate carriage a drive wheel loosely mounted on said shaft, clutch mechanism normally tending to couple said drive wheel and said shaft together, comprising a member fast to said wheel, and a sliding member splined to said shaft, a treadle and mechanism controlled thereby for throwing sald sliding clutch into engagement when desired, and means independent of said treadle for automatically throwing said sliding clutch member out of engagement irrespective of the position of said treadle, before said shaft completes a single revolution, substantially as described.
25. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on sald frame between sald printing rollers, means for holding the card above said plate carriage, a shaft for driving said printing rollers, spring supported bearings for said shaft, a friction drive operated by said shaft for moving said plate carriage, and an inkng roller automatically operated by the motion of the plate carriage, a drive wheel loosely mounted on said shaft and clutch mechanism for connecting sald drive wheel and sald shaft together when desired, with automatic means for disconnecting said clutch mechanism before said shaft has performed a complete revolution, substantially as described.
26. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between sald rollers, means for holding the card sbove the plate carriage, a strap under tension connected to the plate carriage, with a stiff
strip connected to said strap and intermittently acting friction rollers acting upon said strap and strip for imparting : frictional feed to said plate carriage independent of the pressure between the printing rollers, substantially as desribed.
27. In a plate printing machine the combination with a frame and printing rollers journalled therein, of a plate carriage mounted to vibrate on said frame between said rollers. motas for holding the card above the plate carriage, a 6trap umder tension comerted to the plate carriage with a stiff strip conneeted to said strap and intermittently acting fricion rollw s acting upon said strap and strip for imparting a irictional fird to said plate carriage independent or the pressure between the printing rollers, with an ink roller automatically operated by the motion of said plate carriage tor inking the plate, substantially as described.
\(2 s\). In a plate printing machine the combination with a frame, a bed roller journalled therein and an impression rolled in the form of a segment, of a cylinder mounted above sald bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, means for holding the card above said plate carriage. a strap connected to the plate carriage with a weight suspended therefrom. a stiff strap connectod to said strap and intermittently acting friction :ollers acting upon said strap and strip for imparting a frictional feed to said plate carriage independent of the pressure bitween the printing rollers, substantially as described.
29. In a plate printing machine the combination with a frame, a brd roller journalled therein and an impression roller in the form of a segment, of a cylinder mounted above said bed roller, of a plate carriage mounted to vibrate on said frame betwern said rollers, a strap connected to the plate carriage with a weight suspended therefrom, a stiff stip connected to said strap and intermittently acting friction rollers acting upon said strap and strip for imparting a frictional feed to said plate carriage independent of the f:ressure between the printing rollers, with means for holdme the card normally at an angle above and clear of the pate rexent when pressed between the rollers, substantially as described.
30. In a plate printing machine the combination with a frame, a bed roller journalled therein and an impression roller mounted above said bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, a plate holdrer mounted on said carriage, a card carrier, with means for holding the card at an angle above said carrier, muans for coupling the plate carriage and card carrier togother, and means for moving said plate carriage independontly of the pressure betwen the printing rollers with the same lincar sperd as. has the periphery of the impression roller. substantially as deseribed.
31. In a plate printing machins the combination with a frame, a bed roller journalled therein and an impression roller mounted above said bed roller, of a plate carriage mounted to vibrate on said frame between said rollers, a plate holder mounted on said carriage, with means for holding the card at an angle above said carrier, means for coupiing the plate carriage and card carrier together, and means for moving said plate carriage independently of the pressure between the printing rollers with the same linear speed as has the periphery of the impression roller, with an ink roller atutomatically operated by the motion of said plate carriage tor inking the plate, substantially as described.
32. A card holding and releasing device for use in machines of the character described comprising a bar having an inclined face, a rod mounted to rock in said bar and flattened along one side theroof, a suries of resilient gripping fingers serured to said bar and engaging said flattened face of said rod and normally tending to restore the same to the initial position and to grip the card beyond the edge of said rod, with means for rocking said rod and thereby releasing all of said fingers from engagement with the card, and a sliding stop mounted on the card carrier and normally held by one or more of said gripping fingers, substantially as described.

3:. In a plate printing machine the comblnation with a frame and printing rollers fournalled in said frame, of a piate carriage mounted to vibrate on said frame between said printing rollers, and a card carrier provided with a bar :and a series of resilient fingers on said bar for gripping the rard and holding it on the card carrier, means for adjusting said bar, and means for simultaneously releasing all of said linzers when dosired, substantially as described.
:31. In a plate printing machine the combination with a irame and printing roller journalled in sald frame, of a Hite rarriage mounted to vibrate on said frame between aid printing rollers and a card carrier provided with a bar athd a suries of resilient fingers on said bar for gripping lhe card and holding it on the card carrier, means for adjusting said har. a rod journalled in sald card carrier and liaving a Hat face normally resting beneath said gripping fineres and allowing the same to grip the card but lifting sad gripping tingers when said od is rocked, substantlally as described.
35. In a plate printing machine the combination with a frame and printing rollers journalled in said frame, of a plate carriage mounted to vibrate on said frame between said printing rollers, and a card carrier provided with a bar and a series of resilient fingers mounted on said bar for gripping the card and holding it on the card carrier, a rod journalled in said carrier and having a flat face normally resting between said gripping fingers and allowing the same to grip the card but lifting said gripping fingers when said rod is rocked with a wrist lug secured to sald rod for rocklig the same, and a sliding stop mounted on said bar and diormally held in place by one or more of said gripping tingers, substantially as described.
36. A card holding and releasing device for use in machines of the character described comprising a bar having an inclined face, a rox mounted to rock in said bar and flattened along one side thereof, a series of resilient gripping fingers secured to said bar and engaging said flattened face of said rod and normally tending to restore the same to the initial position and to grip the card beyond the edge of said rod, with means for rocking said rod and thereby releasing all of said fingers from engagement with the card, a sliding stop mounted on said bar and normally held in places by one or more of said gripping fingers, substantially as described.
37. A card holding and releasing device for use in machines of the character described comprising a bar having an inclined face, a rod mounted to rock in said bar and flattened along one side thereof, a series of resilient gripping fingers secured to said bar and engaging said flattened face of said rod and normally tending to restore the same to the initial position and to grip the card beyond the edge of said rod, a wrist lug connected to said rod for rocking the same when desired and a sliding stop mounted on said bar and normally held in place by one or more of said gripping fingers, substantially as described.
38. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an impression roller mounted above sald bed roller, of a plate carriage mounted to vibrate on said frame between sald rollers, and a card carrier also mounted to vibrate on sald frame, means for moving said card carrier towards and coupling it with said plate carriage and for uncoupling same, a detent for holding the card carried in the initial position, and mechanism for temporarily withdrawing said detent from engagement when desired, and for automatically restoring said detent to the initial position, substantially as described.
39. In a plate printing machine the combination with a frame, a bed roller journalled therein. and an impression roller also mounted in said frame, of a plate carriage mounted to vibrate on said frame between said rollers, and a card carrier also mounted to vibrate on said frame, means for moving said card carrier towards and coupling it with said plate carriage and for uncoupling same, means for holding the card carrier in the initial position, comprising a spring constrained detent. a rod controlled by the operation, and mechanism actuated by sald rod for first withdrawing said detent and then automatically restoring the same to the initial position during a single movement of said rod, substantially as described.
40. In a plate printing machine the combination with a frame, a bed roller journalled therein, and an impression roller also mounted in said frame, of a plate carriage mounted to vibrate on said frame between said rollers, and a card carrier also mounted to vibrate on said frame, means for moving said card carrier towards and coupling it with said plate carriage and for uncoupling same, means for holding the card carriers in the initial position, comprising a constrained detent, a treadle controlled by the operator, a rod pivoted to said treadle, and mechanism actuated by said mechanism actuated by said rod for first withdrawing said detent, and then automatically restoring the same to the initial position during a single downward movement of said treadle, substantially as described.
41. In an apparatus of the character described the combination with a card carrler, and automatic means for moving the same, of a detent normally holding said carrier in the initial position, a treadle controlled by the operator, a rod pivoted to said treadle, and mechanism actuated by said rod for first withdrawing said detent, and then automatically restoring the same to the initial position during a single downward movement of said treadle, substantially as described.

\section*{No. 101,005. Ironing Board. Planche ì repasser.}

Max Anthony Baetz and Philipp Kessler, assignee of a third interest, both of Ashbury Park, New Jersey, U.S.A., 18th September, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138.828.
Claim.--1. In a folding ironing board the combination with the top, of attaching devices secured to one end thereof, a
prop, bail-shaped hinges connected to one end of said prop and provided with spurs, means to slidably connect sald

hinges with said top, and clamping nuts to insert said spurs and adjustably connect said hinges to said top, substantially as described.
2. In a folding ironing board the combination with the top having inner and outer pairs of transversely disposed cleats secured to its underside, of inner and outer pairs of longitudinally disposed bars secured to sald cleats, attaching hooks secured to said inner bars, a prop, ball-shaped hinges slidably mounted on caid outer pair of bars, and means Whereby said hinges are rigidly connected to said bars to hold the same and the prop in their adjusted positions, substantially as described.
3. In a folding ironing board the combination with the top having inner and outer pairs of transversely disposed cleats secured to its underside, of inner and outer pairs of longitudinally disposed bars secured to said cleats, attaching hooks secure to said inner pair of bars, a prop, ballshaped hinges slidably mounted on said outer pair of bars to hingedly and slidably connect said prop with said bars, harbs or spurs formed on the inner sides of said bail-shaped hinges a thumb nut arranged on the pivot bolts of said hinges whoreby the sides of the latter may be clamped into eugagement with sald outer bars and said spurs forced into the same, substantially as described.

No. 101,006. Turning Lathe. Tour.

The Memphis Column Company, Memphis, Tennessee, assignce of Frederick Neudorff, Sheffield, Alabama, U.S.A., 18th September, 1906; 6 years. Filed 23rd August, 1906. Receipt No. 138,943.
Claim.-1. In a turning lathe, a base, a carriage mounted to travel thereon, a work holder upon said carriage, means for rotating the work by said holder during the trayel of
the carriage, a back frame extended upward from sald base and provlded with a laterally extending bracket, a rotating cutter head disposed in said bracket above said holder, means for automatically feeding said carriage toward and from said back frame, means for automatically reversing the direction of travel of said carriage.
2. In a turning lathe, a work holder, means for rotating the work therein, a rotating cutter head disposed in a hori zontal plane above the holder, means for automatically feeding the work holder transversely to its axis of rotation and bencath said head, means for reversing the direction of travel of said work holder, means for vertically adjusting said cutter head, a frame carrying a back knife and mounted to travel in a vertical plane parallel to said cutter head, and cut-off saws mounted upon the frame of the back knife at the opposite ends thereof.
3. In a turning lathe, a back knife frame mounted for reciprocation, supporting arms carried by said frame, a shaft rotatably mounted in said arms and provided with saws at the opposite ends thercof, and means for rotating said shaft.
4. In a turning lathe, a back knife frame mounted for reciprocation, supporting bearings carried by said frame, a shaft rotatably mounted in said arms and provided with saws at the opposite ends thereof, a driving pulley upon said shaft, idlers at opposite ends of sald pulley and carried by said frame, and a driving bolt carried by the machine frame and disposed between said idlers and driving pulley.
5. In a turning lathe. vertical standards, a back knife mounted to reciprocate therein, driving screws connected to said knife, a laterally disposed shaft extending between the screws, opposite cones carried by said shaft, an intermediate driving conc. means for shifting said driving cone. cut-off saws supported upon the knife frame, a driving belt for rotating said saws during the travel of said frame.
6. In a turning lathe, vertical standards, a back knife mounted to reciprocate therein, driving screws connected to said knife, a laterally disposed shaft extending between the screws, opposite cones carried by said shaft, an interinediate driving cone, a geared shaft extending from said driving cone, means for plvotally mounting said shaft. a pivoted lever connected at its upper end to said pivoted shaft, a crank pin connected to the lower end of said lever, a gear carried by the shaft of said crank pin, and means for operating said gear.
7. In a turning lathe, vertical standards, a back knife mounted to reciprocate therein, driving screws connected to said knife, a laterally disposed shaft extending between the screws, opposite cones carried by said shaft, an intermediate driving cone, a geared shaft extending from said driving cone, means for pivotally mounting said shaft. a pivoted lever connected at its upper end to said plyoted shaft. a crank pin connected to the lower end of said lever. a grar carried by the shaft of said crank pin, a reciprocating rack meshing with said gear, a controlling lever pivotally mounted upon the base of the machine, and connections extending from said controlling lever and rack to reciprocate the latter.
8. In a turning lathe, a base, a carriage mounted to travel thereon, a rotatable work holder mounted upon said carriage, a driving shaft extending from and movable with said carriage, oppositely disposed cones splined upon said shaft and supported against longitudinal movement therewith, an intermediate driving cone, a pivoted lever carrying said driving cone at one end, tappets carried by said driving shaft, and means extending from said lever and disposed in the path of said tappets to be actuated thereby.
9. In a turning lathe, a base, a carriage mounted to travel thereon, a work holder mounted upon said carriage, means for rotating said work holder, a standard carried by the base and provided with a nut mounted therein. a driving screw carried by said carriage, a driving shaft extending from said screw and provided with opposite cones thereon, an intermediate driving cone mounted upon a pivoted lever. a controlling lever mounted upon the base and provided with a rack bar connected therewith, a gear mounted upon the base and meshing with said bar and a crank pin carred by said gear to engage a slotted end of sald lever.
10. In a turning lathe, a base, a carriage mounted to travel thercon, a work holder mounted upon said carriage, means for rotating said work holder, a standard carried by the base and provided with a nut mountod therein. a driving screw carried by said carriage, a driving shaft extending from sald screw and provided with opposite cones thercon, an intermediate driving cone mounted upon a pivoted lever. a controlling lever mounted upon the base and provided with a rack bar connected therewith, a gear mounted upon the base and meshing with said rack bar, a crank pin carried by said gear to engage a slottod end of said lever, finger: carried by said driving shaft, a countershaft provided with co-operating fingers, a lever extending from said countershaft. and a bell crank lever pivotally connected to said countershaft lever and having its opposite end disposed in the path of tappets carried by said rack bar.
11. In a turning lathe, a stock provided with a driving gear thereon, a chuck spindle carried by said stock and longitudinally adjusted by said gear, a driving shaft having a pinion co-operating with sald gear, means for producing a travel of sa!d stock laterally of the spindle, opposite cones splined upon said shaft, and an intermediate driving cone.
12. In a turning lathe, a stock provided with a driving gear thereon, a chuck spindle carried by said stock and longitudinally adjusted by said gear, a driving shaft having a pinion co-operating with said gear, means for producing a travel ot sald stock laterally of the spindle. opposite cones splined upon said shaft, an intermediate driving cone, a plvoted lever carrying said driving cone at one end, a controlling lever mounted upon the base, and connections extending from said controlling lever to said pivoted lever for shifting the same.
13. In a turning lathe, a carriage, means for driving the same, a work holder mounted upon said carriage, means for adjusting the chuck of sald work holder, controlling levers mounted upon a common pivot and provided with connectlons to the carriage, driving and work holder chuck adjusting shafts respectively and means controlled by the carriage driving shaft for automatically reversing the travel thereof and shifting its controlling lever.
14. In a turning lathe, a carriage, means for driving the same, a work holder mounted upon said carriage, means for adjusting the chuck of sald work holder, controlling levers mounted upon a common pivot and provided with connections to the carriage driving and work holder chuck adjusting shafts respectively, means controlled by the carriage driving shaft for automatically reversing the travel thereof and shifting its controlling lever, a back knife, driving means for reciprocating the same, and a controlling lever for said driving means upon a common pivot with the beforementioned controlling levers.
15. In a turning lathe, a carriage, means for driving the same, a work holder mounted upon the carriage, means for adjusting the chuck for sald work holder, controlling levers mounted upon a common pivot and provided with connection to the carriage driving and work holder chuck adjusting shafts respectively, means controlled by the carriage driving shaft for automatically reversing the travel thereof and shifting its controlling lever, a back knlfe, driving means for reciprocating the same, a controlling lever for said drivIng means mounted upon a common pivot with the before mentioned controlling levers, cut-off saws supported upon the frame of said knife and means for continuously driving sald saws during the movement of the knife frame.
16. In a turning lathe, a carriage. means for driving the same, a work holder mounted upon said carriage, means for adjusting the chuck of said work holder, controlling levers mounted upon a common frame and provided with connections to the carriage driving and work holder chuck adjusting shafts respectively, means controlled by the carrlage driving shaft for automatically reversing the travel thereof and shifting its controlling lever, a back knife, driving means for reciprocating the same. a controlling lever for sald driving means mounted upon a common pivot with the before-mentioned controlling levers, cut-off saws supported upon the frame of the knife, means for continuously driving said saws during the movement of the knife frame, a rotatable cutter head, means for continuously driving the same, and means for vertically adjusting sald head while belng driven.
17. In a turning lathe, a carriage feed comprising a base, a carriage mounted to travel thereon, a feed nut mounted upon sald base, a driving screw carried by sald carriage, a driving shaft extended from and movable with said screw. driving devices mounted upon the base through which said shaft travels, and an intermediate driving member disposed between sald devices.
18. In a turning lathe, a carriage feed mechanism comprising a base, a carriage mounted to travel thereon, a feed nut mounted upon said base, a driving screw carried by said carriage, a driving shaft extended from and movable with said screw, driving devices mounted upon the base and through which sald shaft travels, an intermediate driving nember disposed between sald devices, means for shifting said driving member, and means carried by the driving shaft for actuating the shifting means.
19. In a turning lathe, a carriage feed mechanism comprising a base, a carrlage mounted to travel thercon, a feed nut mounted upon said base, a driving screw carried by sald carriage, a driving shaft extended from and movable with said screw. driving devices mounted upon the base and through which sald shaft travels, an intermediate driving member disposed betwern sald devices. means for shifting said driving member. fingers carried by the driving shaft and means extended from the driving members into the bath of said fingers to be actuated thereby.
20. In a turning lathe. a carriage feed mechanism comrerising a base, a carriage mounted to travel thereon, a feed
rut mounted upon said base, a driving screw carried by sald carriage, a driving shaft extended from and movable with said screw, driving devices mounted upon the base and through which said shaft travels, an intermediate driving member disposed between said device, a work holder mounted upon sald carriage and provided with means for adjusting its chuck, a driving shaft for sald work chuck morable with the carriage, and relatively fixed driving devices througt which the driving shaft of the work chuck travels in the movement of the carriage.
21. In a turning lathe, a carriage feed mechanism gompriaing a base, a carriage mounted to travel thereon, a feed nut mounted upon said base, a driving screw carried by said carriage, a driving shaft extended from and movable with sald screw. driving devices mounted upon the base and through which said shaft travels. an intermedate driving member disposed between said devices, a work holder mounted upon sald carriage and provided with means for adjusting its chuck. a driving shaft for said work chuck movable With the carriage. relatively fixed driving devices through which the shaft of the work chuck travels in the movement of the carriage, an operating lever disposed at one side of the carriage to control the driving means for the work chuck, and an operating lever disposed adjacent the work chuck lever for controlling the driving devices for the carriage.
22. In a turning lathe, a carriage feed mechanism comprising a base, a carriage mounted to travel thereon, a feed nut mounted upon said base, a driving screw carried by said carriage and having an extended shaft, opposite driven cones mounted upon the base and having a sliding connection upor said shaft.an intermediate driving cone. and means for automatically shifting said cone in the travel of said carriage.
23. In a turning lathe, a carriage foed mechanism comprisIng a base, a carriage mounted to travel thereon. a feed nut mounted upon said base, a driving screw carried by sald carriage and having an extended shaft, opposite driven cones mounted upon the base and having a sliding connection upon said shaft. an intermediate driving cone, a pivoted lever upon which said driving cone is mounted, a gear mounted upon the base. a crank pin carried by sald gear to engage the slotted end of said plvoted lever, and means for rotating said gear.
24. In a turning lathe, a carriage feed mechanism comprising a base, a carriage mounted to travel thereon, a feed nut mounted upon sald base, a driving screw carried by sald carriage and having an extonded shaft. opposite driven cones mounted upon the base and having a sliding connection with sald shaft. an intermedate driving cone. a pivoted lever upon which said driving cone is mounted. a gear mounted unon the hase, a crank pin carried by sald gear to engage the slotted end of sald plvoted lever, a controlling lever mounted unon the base, and a reciprocating rack bar carrifd by said lever and engaging said gear.
25. In a turning lathe. a carriage feed mechanism comprising a hase, \(\boldsymbol{r}\) carriage mounter to travel thereon, a feed nut nounted upon sald bise. a driving screw carried by sald carriage and having an extended shaft, opposite driven cones mounted upon the base and having a sliding connection upon sald shaft, an intermediate driving cone, a plvoted lever upon which said driving cone is mounted. a gear mounted upon the base. a crank pin carried by sald gear to engage the slotted end of said pivoted lever, a controlling lever mounted upon the base. a reciprocating crank bar carried by sald lever and engaging said gear, trappets carried by said rack bar. a bell crank lever co-operating with said tappets, and means carried by the shaft of the driving screw for oberating said bell crank lever.
26. In a turning lathe, a carriage feed mechanism comprising a base, a carriage mounted to travel thercon, a feed rut mounted upon sald base, a driving screw carried by said carrlage and having an extended shaft. onposite driven cones mounted upon the base and having a sliding connection upon said shaft. an intermediate driving cone. a pivoted lever upon which said driving cone is mounted, a gear mounted upon the base, a crank pin carried by sald gear to engage the slotted end of said shaft pivoted lever. a controlling lever mounted upon the base, a reciprocating rack bar carried by said lever and engaging sald gear, tappets carried ty sald rack bar, a bell crank lever co-operating with said tappets, fingers carried by sald driving shaft, co-operating fingers provided upon a counter shaft, and a lever connection from sald countershaft to the bell crank lever.
27. In a turning lathe, a carriage feed mechanism comprising a base provided with a feed nut, a carrlage mounted to travel upon said base, a driving screw mounted upon the carriage to co-operate with sald nut and provided with an extended shaft therefrom, shifting means mounted upon said shaft, driving devices slidably mounted upon sald shaft. controlling means for said devices, fingers carrled by the driving shaft, a countershaft provided with co-operating
fingers, a bell crank lever connected to said countershaft, and means carried by said lever to operate sald shifting means.
28. In a turning lathe, a carrlage feed mechanism comprisIng a base provided with a feed nut, a carriage mounted to travel on said base, a driving screw movable with sald carriage and provided with an extended shaft, fingers mounted upon said shaft at the opposite ends thereof, a relatively fixed countershaft provided with means at its opposite ends to engage the fingers of the screw shaft in the travel of the carriage, a driving mechanism for the screw shaft, and means controlled from the countershaft for shifting said driving mechanism.
29. In a turning lathe, a carriage feed mechanism comprising a base provided with a swivelled feed nut thereon, a carriage adapted to travel upon sald base, driving screw pivotally mounted in said carriage, a shaft carried by sald screw at the rear of the carriage, driving devices for sald shaft mounted upon the said base and having a sliding connection with said shaft, and means carried by said shaft for automatically shifting the driving devices to reverse the direction of rotaton of the shaft.
30. In a turning lathe, a carriage feed mechanism comprising a base provided with parallel ways, a carriage mounted upon said base and provided with ways upon its under face, roller bearings disposed between said base and carriage, cooperating rack bars carried by the base and carriage at cach side and an intermediate pinion disposed between said rack bars.
31. In a turning lathe, a carriage feed mechanism comprising a base, a carrlage mounted to travel thereon, a work chuck supported from sald carriage and provided with adjusing gear, a driving shaft having a pinion co-operating with said gear and movable with said carriage, opposite cones carried by the base and splined upon said shaft and an intermediate driven shaft.
32. In a turning lathe, a carriage feed mechanism compris ing a base, a carriage mounted to travel thereon, a work chuck supported from said carriage and provided with adjusting gear, a driving shaft having a pinion co-operating with said gear and movable with sald carriage, opposite cones carried by the base and splined upon sald shaft, an intermediate driven shaft. a pivoted lever carrying said driving cone at one end, a controlling lever mounted upon the base and connections from sald controlling lever to said pivoted lever for shifting the same.
33. In a turning lathe, a carriage ieed mechanism comprising a carriage, a driving shaft therefor, a work chuck movable with said carriage, an adjusting shaft for said work chuck, controlling levers mounted upon a common pivot and connections from the carriage and work chuck adjusting shafts, respectively to said levers.

No. 101,007. Rallway Tie. Dormant de chemin de fer.

John E. Walling Salt Lake City, Utah, and Clarence E. Rathbun, assignee of a half interest, Helena, Montana, U.S.A., 18th September, 1906 ; 6 years. Filed 22nd August. 1906. Receipt No. 138,912.
Claim.-1. In a rallroad tio comprising a body portion, a plate disposed upon the body portion, said plate having vertical openings therein, members engaged in the openings and members lying in pairs at opposite sides of the body portion and at opposite sides thereof, said members extending downwardly below the plate and having rail engaging lips at their upper ends adapted for engagement with a rail disposed between the members, said members having registering horizoatal passages in their downwardly extending portions and co-operating wedge members engaged in the passages, said members being disposed for operation to move the first-named members downwardly.
2. A railroad tie comprising a plate, a support for the plate, members engaged in the plate for vertcal movement and having co-operating lips adapted for engagement with a rail. said members having registering passages therein below the plate, upper and lower wedge members on
gaged in the passages, the lower wedge members having downwardly directed portions extending over the surfaces of the first-named members below their passages, the upper wedge members resting upon the lower and against the under face of the plate and being movable inwardly to move the first-named members downwardly and means for holding the upper wedge members at different points of their movement.
3. The combination with a rallroad tie, of a plate disposed thereupon and extending laterally beyond the sides thereof, said plate having vertical openings in the laterally extending portions, members slidably disposed in the openings and lying in pairs at opposite sides of the tie, the members of each pair having rail engaging lips directed toward each other, a rail disposed upon the plate between the members of each pair and with its base flange beneath the lips means for moving the members downwardly to hold the rail in position and a spike engaged in the plate and in the tic beneath the rall.
4. In a railroad tie the combination with a body portion of a plate disposed thereupon, a spike engaged in the plate and in the body portion, a rall disposed upon the plate above the spike, said plate, having vertical openings therein at opposite sides of the rail, rail engaging members slidably engaged in the openings for vertical movement, said members having allgning passages therein below the plate upper and lower wedge members disposed in the aligning passages therein below the plate, the upper and lower wedge members disposed in the aligning passages, the lower member having downwardly extending portions lying outwardly of the first-named members to hold the lower wedge member against longitudinal movement, the upper wedge member being operable to move the rail engaging members downwardly to clamp the rail in position.

No. 101,008. Railway. Chemin de fer.

Lewis Ginger, Colorado Springs, Colorado, U.S. A., 18th September, 1906 ; 6 years. Filed 27th August, 1906. Receipt No. 139,002.
Claim.-1. The combination of an inclined track, an elevator travelling thereon, a drum carried by the elevator, a cable wound upon the drum with one end anchored at the top of the track and the other end anchored at the bottom of the track, and means actuated by a motor car upon the truck for rotating the drum to raise and lower the track.
2. The combination of an inclined track, a truck running thereon, a drum mounted upon the truck, a cable wound upon the drum with its free end anchored at the top of the truck and its lower end anchored at the bottom of the track, a gear connected to the drum, a drive shaft mounted upon the truck, a gear upon the drive shaft and in mesh with the first-mentioned gear, and a drive wheel mounted upon the shaft and projecting above the top of the truck.
3. The combination of an inclined track, a truck running thereon, a track upon the top of the truck at substantially right angles to the first-mentioned track, and truck elevat ing means carried by the truck and including a drive wheel raising above the top of the track between the track rails thereon
4. The combination of an inclined track. a truck running thereon, a drum mounted upon an upright axis upon the truck. a cable wound upon the drum with one end anchored at the top of the track and the other end anchored at the bottom of the track, a substantially horizontal drivo shaft mounted upon the truck and operatively connected to the drum, and a drive whecl carried by the drive shaft and rising above the top of the truck.

\section*{No. 101,009. Machine for Making Barrels. Machine pour faire des barils.}

Charles John Alley, Farndon, New Zealand, 1Sth September 1906; 6 years. Filed 22nd August, 1906. Receipt No 138,929.
Claim.-1. In means for chiming, crozing and howelling barrels, a barrel supporting frame comprising a pair of heads supported upon parallel horizontal bars and capable of adjustment thereon and each having a roller mounted on a horizontal axis at the back end thereof, a pair of sliding blocks mounted on the bars, one on the outslde of each head and each having a roller mounted thereon and adapted to lie in the same horizontal plane as the roller upon the respective head, means whereby the sliding blocks may be moved outwards or inwards along the bars, and means for rotating a barrel supported upon the rollers, substantially as specified.
2. In means for chiming, crozing and howelling barrels, a barrel supporting frame comprising a pair of heads supported upon parallel horizontal bars and capable of adjust ment thercon and each having a roller mounted on a horizontal axis at the back end thereof, a pair of sliding blocks mounted on the bars, one on the outside of cach head and each having a roller mounted thereon and adapted to lie in the same horizontal plane as the roller upon the respective head. cutter carriers mounted on the morizontal bars, one on the out side of each sliding block and connected to the respective block, so as to be capable of movement therewith, means whereby the sliding blocks may be moved outwards or inwards along the bars. and means for rotating a barrel supported upon the rollers , substantially as herein specified.
3. In means for use in chiming, crozing and howelling barrels, a barrel supporting and rotating irame slidably mounted upon a pair of parallel bars, in combination with cutter carricrs mounted upon the bars, one upon each end of the frame, cach of which is formed with an upwardly extending meinber adapted to form a bearing for the cutter spindle and with a forwardly extending portion formed with a slot therein and eccentric sleeves mounted upon the front parallel bar and ntting within the slots in the respective cutter carriers, and means whereby such bar and the sleeves may be rotated, substantially as specified.
4. In means for use in chiming. crozing and howelling barrels, a barrel supporting and rotating frame, slidably mounted upon a palr of horizontal parallel bars and cutter carricrs mounted upon the bars, one at each end of the frame, and each formed with bearings for carrying the cutter spindle arranged to allow of longtudinal movement thereof. in combination with a bar secured to one end of the cutter spindle and formed with a backwardly extending member, a bar slldably mounted upon the barrel supporting frame, a cork secured thercon adapted to engage with the truss hoop upon the barrel in the machine and a fork upon the end of this bar adapted to engage with the backwardly extending member of the bar secured to the cutter spindle, substantially as specined.

\section*{No. 101,010. Barrel Making Machine.}

Machine it laire des barils.
Rinaldo L. Cummings. Paris, Mainr. I'S.A. 1Sth September, 1906: 6 ywars. Filed 21st August, 1!06. Recelpt No. 138.900.
('laim.-1. In a barrel making machine, a supporting frame. a stationary flexbble ring pisitioned at one end thereof, a nowable carriage, flexible divided assembling rings mounted on sadd carriage and adapted to be positioned relative to
said stationary ring so that the middle assembling ring is substantially concentric therewith, means for contracting the

stationary ring, means for contracting the assembling rings and means for reciprocating said carriage and assembling rings to and away from said stationary ring.
2. In a barrel making machine, a suitable frame, a staicnary flexible ring positioned at one end thereof, means for contracting and expanding said ring, a movable carriage. flexible divided assembling rings mounted on said carriage and provided with lugs at their adjacent ends. means for reciprocating said carriage and assembling rings to and away from said stationary ring, means for contracting the contral assembling ring independent of the outside rings and means for contracting the outside assembling rings.
3. In a barrel making machine, a suitable supporting frame. a statlonary flexible ring positioned at one end thereof, rotable cutter heads for finishing the ends of the shook positioned at the other end of the frame, a reciprocating carriage mounted in said frame, assembling rings mounted upon zaid carriage and means for reciprocating said carriage and rings from one end of said frame to the other, whereby the assembling rings and a barrel shook contained therein may be transferred from a position in which the central assembling ring is concentric with said stationary rings to a position wherein the ends of the shook are adjacent said cutter heads and means for trussing the ends of the shook.
4. In a barrel making machine, a supporting frame, a statlonary flexible ring positioned at one end thereof, a movable carriage, flexible divided assembling rings mounted on sald carriage, cutter heads positioned at the opposite end of the frame adapted to finish the ends of the shook and means for trussing the ends of the shook, sald trussing device being pivotally and slidably mounted upon said frame.
5. In a barrel making machine, a supporting frame, a stationary flexible ring positioned at one end thereof. a movable carriage, flexible divided assembling rings having lugs on the cnds thereof mounted on said carriage. cutter heads posi tioned at the opposite ends of the frame adapted to finish the ends of the shook and means for trussing the ends of the shook consisting of oppositely moving arms adapted to engage said lugs and a lever for operating sald arms, said. trussing device being pivotally and slidably mounted upon said frame.
6. In a barrel making machine, a supporting frame, a stationary flexible ring positioned at one end thereof, and provided with a toggle jointed section, a movable carriage flexible divided assembling rings mounted on said carriage. said carriage being adapted to be positioned relative to said stationary ring so that the middle assembling ring shall be concentric therewith and spaced apart therefrom a distance about equal to the thickness of the shook, whereby the shook can be inserted between said stationary ring and said cenlual assumbling ring.
7. In a barrel making machine, a suitable frame having positioning board at one end, a curved slot in said board, a contractile statlonary ring positioned near said board, a toggle section in said ring, a lever for operating said toggle projecting through said board, a reciprocating carriage mounted in said frame, assembling rings mounted on said carriage, the stationary ring and divided assembling rings boing positioned so as to give entrance to the staves between the said stationary ring and the middle assembling ring, means for locking the middle assembling ring upon the shook and means for contracting the stationary ring whereby the assembling rings and shook may be moved away from the stationary ring
8. In a barrel making machine, a suitable supporting frame means for assembling the shook, cutter bands mounted upon the end of the shaft for finishing the ends of the shook, means for transferring the assembled shook to said cutter head, and means for drawing the end of the shook into contact with said heads.
No. 101,011. Valve for Heating Systems.
Soupape pour systèmc de chauffage.

Albert Preston Broomell. York, Pennsylvania, U. S. A. 18th September. 1906; 6 years. Filed 21st August, 1906. Receipt No. 138.903.
Claim.-1. A valve comprising a casing provided with locking recesses, a rotary valve controlling the passage of fluid through the casing, a stem for the valve, a handle on the st'm having a portion to engage any one of said recesses, and a spiral spring between the handle and a part of the casing to hold the valve to its seat and also hold the handle in its locked posittons.
2. A valve comprising a casing provided with locking recesses and a horizontal valve seat or partition a rotary valve geating upwardly against the lqwer side of the said seat or partition, a stem extending upwardly through the casing from the valve, a handle pivoted to the upper end of the stem and having a depending lug to engage anyone of the sald recesses, and a spiral expansion spring on the stem between the inner end of the handle and a portion of the casing, and holding the handle locked and the valve seated.
3. A valve comprising a casing provided with a horizontal scat or partition beneath its inlet and outlet openings. a tube connecting the said seat or partition with the closed apper end of the casing, a shoulder being formed at the lower end of the tube, a rotary disc valve seating upwardly against the under side of the partition or seat, a stem extending down through the tube and secured to the valve, a lonse collar on the stem in the upper end of the tube, an expansion spring on the stem between the collar and shoulder. a horizontal handle pivoted to the upper end of the stem and engaged at its under side of its inner end by a spring pressed collar, the handle having a depending lug to engage the upper side of the valve casing and hold the handle ir its adjusted position.
4. A valve comprising a casing provided with a horizontal seat or partition between its inlet and outlet openings, said sfat having a curved slot. a tube connecting the partition with the closed upper end of the casing, a shoulder at the lower end of the tube, a valve stem extending down through the tube, a valve disc on the lower end of the stem, having a scries of apertures to register with said opening, a horizental handle having a slotted inner end in which the upper con of the stem is pivoted. a spiral spring on the stem within the tube, a collar on the stem in the upper end of the tube ard forced upward by sald spring against the handle. the int.er end of the handle having a projection engaging the collar and the handle having at the opposite side of its pivot a depending locking lug to engage the top of the casing and hold the handle in its adjusted position.
5. A vaive comprising a casing a rotary valve controlling the passage through the casing, a stem for the valve, a hatedle on the stem, means for locking the handle to the ca:ing, a spiral spring on the stem between the handle and a shoulder on the casing to hold the handle in its adjusted porition, and a packing around the stem between the shou!d \(r\) and siring and instantly compressed against the stem by sall spring.
6. A valve comprising a casing. a rotary upwardly seating valve controlling the passage through the casing, a stem for the valve, a pivoted handle on the upper end of the stem and adapted to engage the casing at its outer portion, an annular shoulder in the valve casing above the valvo seat, packing on the shoulder around the stem. a washer on the stem over the packing, and a spring expansion spring on the valve stem between the inner end of the handle and the said washer and acting to hold the outer end of the handle down to the casing, press the valve upwardly to its seat and compress said packing around the valve stem.
7. A valve comprising a casing, a rotary upwardly seating valve controlling the passage therethrough, said valve consisting of a metallic disc having an annular recess in its upper face and a non-metallic ring therein and profecting above the walls of the recess to prevent engagement of the metal valve disc with the seat. a stem extending up through the casing from the valve, a packing for the stem over the valve seat, a locking handle for the stem and a spring on the stem between the handle and packing, and serving to hold the valve to the soat, hold the packing around the stem and hold the handle in locking engagement with the casing.
8. A valve comprising a casing, an upwardly seating rotary valve therein having a semi-circular series of apertures to control the passage through the valve, a central opening in the valve having a flattened or guiding portion. a valve stem extending down through the casing and valve seat and shaped at its lower end to correspond with the central valve opening so that it may be placed properly thereon with resbect to the valve apertures, a spring holding the valve to its seat and a locking handle for the valve acted on by the spring to hold it in its adjusted position.
9. A valve comprising a casing, a rotary valve controlling the passage through the casing. a locking handle on the valve stem and a spiral spring on the stem seating the valve and throwing the handle into locking engagement with the casing.
10. A valve comprising a casing, a valve seat therein having a slot therethrough. a rotary valve seating upwardly against the seat and having a plurality of openings to suc cessively register with said slot. a stem extending down through the casing, means for predetermining the correct position of the valve on the stem with respect to the openings. a locking handle on the upper end of the stem and a spiral spring, holding the valve to its seat and the outer end of the handle in locking engagement with the casing.
11. A valve comprising a casing having a valive seat, and a series of interchangeable valve discs rach having a series of different sized apertures to enable a single size valve to be used with different sized radiators.

\section*{No. 101,012. Engineer's Brake Valve.}

Soupape de frein.
James Amers Hicks. Atlanta, Georgia, U.S.A.. 18th September. 1!106; 6 years. Filed 16th July, 1906. Receipt No. 137.853.

Claim.-1. An engineer's valve for fluid pressure brake systems comprising in combination ports and passages for effecting train brake service. ports and passages for effecting engine brake service, and means for securing engine brake application in advance and independently of train brake application.
2. An engineer's brake valve for fluid pressure brake system comprising in combination ports and passages for effecting train brake service, ports and passages for effecting engine brake service, normally movable means for securing engine brake application in advance and independently of train brake application, and means for automatically effecting engine brake application upon destruction of train line.
3. An engineer's valve for fluid pressure brake systems comprising in combination ports and passages for effecting train brake service, ports and passages for effecting engine brake service. manually movable means for securing engine brake application. and means normally held inactive by train line pressure for automatically effecting engine brake application upon destruction of train line.
4. An engineer's brake valve for fluid pressure braks systems, comprising in combination ports and passages for effecting train brake service, ports and passages for effect. ing engine brake service, a single manually movable element
to control pressure for both train and engine brakes, means wherely the engine brake application may be manually ef-

fected In advance and Independently of train brake application, and automatically means for securing engine brake application upon destruction of train line.
5. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for effecting train brake service, ports and passages for effecting engine brake service and a single manually movable element to control pressure for both train and engine brake operable to effect engine brake application in advance and independently of train brake application.
6. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for effecting train brake service; ports and passages for effecting engine brake service and a single manually movable ele. ment to control pressure for both train and engine brakes operable to effect engine brake application and effect engine brake release after train brake release.
T. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for effecting train brake service, ports and passages for effecting engine brake service, a single manually movable element to control pressure for both train and engine brakes, means whereby the engine brake application may be manually effected in advance and Independently of train brake application, and means normally held inactive by train line pressure for automatically effecting engine application upon destruction of train line.
8. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for eflecting train brake service, means for feeding main reservoir pressure to the engine brakes, a single manually movable element to control the engine feed and the train brake ports and passages and automatic means for securing engine trake application upon destruction of train line.
9. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for effecting train brake service, means for feeding main reservoir pressure to the engine brakes, a single manually movable element to control the engine feed and the train brake ports and passages, and means normally held inactive by train line pressure for automatically effecting engine brake application upon destruction of train line.
10. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for -ffecting train brake service, means for feeding main reservoir pressure to the engine brakes, a single manually movable element to control the engine feed and the train brake ports and passages, and means normally closing said second main reservoir feed.
11. An engineer's brake valve for fluld pressure brake systems, comprising in combination ports and passages for effecting train brake service, means for feeding main reservoir pressure to the engine brakes, a single manually movalle clement to control the engine feed and the train brake ports and passages, a second normally closed main resirvoir feed to the angine brakes, and means operable upon distrucfion of train line to open said second main reservoir.
12. An engineer's brake valve for tluid pressure brake systems, comprising in combination ports and passages for - flecting train brake service, means for feeding main reserwoir pressure to the engine brakes, a single mamually movaibe clement to control the engine feed and the train brake burts and passages, a second normally closed main reservoir fral to the rngine brakes, and means normally closed by train line pressure but operable upon destruction of train liue controlling said second feed.
13. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for "ifecting train brake service, means for feeding main reservoir pressure to the engine brakes, a single manually movable element to control the engine feed and the train brake ports and passages, a second main reservoir feed to the engine brakes, and a pressure operated check brake normally under train line pressure closing said second feed.
14. An engineer's brake valve for tluid pressure brake systems, comprising in combination ports and passages for elfecting train brake service, means for feeding main reservoir pressure to the engine brakes, a single manually movable element to control the engine feed and the train brake ports and passages, a second main reservoir feed to the ensine brakes and a double check valve controlling both engine feeds.
15. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for effecting train brake service, means for feeding main reservoir pressure to the engine brakes, a single manually movable element to control the engine feed and the train brake ports and passages, a second main reservolr engine feed and a double check valve normally closing said second engine feed, but releasable upon destruction of train line to open said second feed.
16. An engineer's brake valve for fluid pressure brake systems, comprising in combination ports and passages for :ifecting train brake service, means for leeding main reservoir pressure to the engine brakes, a single manually movitble element to control the engine feed and the train brake ports and passages, a second main reservoir engine feed and is double check valve controlling both feeds and normally closed by train line pressure against said second engine feed. releasable upon destruction of train line to open said second reed.
17. An engineer's brake valve for fluid pressure brake systems having a manually controlled main reservoir supply fur the engine brakes, an independent constant main reservoir supply for the engine brakes, and means releasable upon destruction of train lines normally closing said constant supply.
18. An engineer's brake valve for thaid pressure brake systems having a manually controlled main reservoir supply for the engine brakes, and an independent constant main reservolr supply for the engine brakes.
19. An engineer's brake valve for fluid pressure braks: systems having a manually controlled main reservoir supply tor the engine brakes, an independent constant main reservoir supply for the engine brakes, and automatic means for controlitig said constant supply.
20. An engineer's brake valve for fluid pressure brake systems, having two main reservoir supply feeds for engine brake service, means for manually controlling one feed, and means automatically operable by train line pressure controlling the other feed.
21. An engineer's brake valve for fluid pressure brake systems, having two main reservoir supply feeds for engine trake service, a manually operable controlling device for one of said feeds, and a train line pressure operated check valve controlling the other feed.
22. An engincer's brake valve for fluid pressure brake systems comprising in combination ports and passages for effecting train brake service, an engine brake supply port in constant communication with main reservoir pressure, and an engine brake feed passage in the path of said supply port. said engine brake supply port and feed passage being so disposed relative to the train brake ports and passages as to fermit engine brake application in advance and indepenuently of train brake application.
23. An engineer's brake valve for fluid pressure brake system, comprising in combination ports and passages for etfecting train brake service, an engine brake supply port in constant communication with main reservoir pressure and an engine brake feed passage in the path of said supply port, said engine brake supply port and passage being disposed relative to each train brake ports and passages as to permir engine brake application in advance and independently of train brake application and without interrupting train line feed.
24. An engineer's brake valve for fluid pressure brake systems, comprising in comblnation ports and passages for effecting train brake service, ports and passages for effecting engine brake service in advance and independently of train Lrake application, an engine exhaust ports and passages so disposed as to effect release of the engine brake after release of the train brakes.
25. An engineer's brake valve for fluid pressure brake systems comprising in combination ports and passages for cfiecting train brake application and release, and ports and passages for efferting engine brake application and release. said engine brake ports and passages being so disposed as
tc permit application and release of engine brakes independently of train brake application and release.
26. In a fluid pressure brake system and in combination, an engineer's brake valve having ports and passages for effecting brake application and release, a single connection bekween said valve and the brake cylinders, a feed valve in said connection through which the brake cylinders are fed. and a by-pass around said feed valve through which the brake cylinders are exhausted.
27. In a fluid pressure brake system and in combination, an engineer's brake valve having ports and passages for effecting brake application and release, a single connection beiween said valve and the brake cylinders, a feed valve in said connection through which the brake cylinders are fed, and a by-pass around said feed valve having a check valve closed in feed and open to exbaust through which the brake cylinders are exhausted.

No. 101,013. Car Brake. Frein de chars.

Edward G. Tillman, Thayer, West Virginia, U.S.A., 18th September, 1906; 6 years. Filed 21st August, 1906. Receipt No. 138.890
Claim,-1. In a car brake the combination with the car frame, an axle mounted in said frame, and the supporting wheels of the axle, of the swinging bar pivotally connected 10 the bottom of the car and having cam slots therein. of sprag bars arranged transversely of the car and having their outer ends adapted to engage with said car wheels and the slide blocks secured to the inner ends of sald sprag bars fitted into said cam slots in said swinging bar und adapted to be actuated by the walls of said slots to effect a longitudinal movement of said sprag bars, substantlally as set forth.
2. In a brake of the class described the combination with the car frame, the car axle and the wheels thereon, of the swinging bar pivotally mounted on the car bottom and having a slot therein, the sprag bar arranged transversely of the cam frame and the slide block carried by said sprag and adapted to be engaged by the walls of said slot to move the sprag longitudinally. substantially as set forth.
3. In a brake of the class described the combination with a car frame, the axle mounted in the frame and the wheels thereon, of the sprag bars arranged transversely of the car frame and adapted to have their outer ends engage with the said wheels and having slide blocks carried by their inner ends and a swinging bar pivotally mounted on the car bottom and having cam slots therein, the slots of which are adapted to engage with the slide blocks on the sprag bars to move the bars longitudinally, substantially as set forth.
f. In a brake of the class described the combination with the car frame, an axle mounted on the frame and the supporting wheels of the axle, of the swinging bar pivotally connected to the bottom of the car and having a cam slot therein. the sprag bar mountd transwersely of the car and having its outer end adapted to engage with one of said car wheels, the guides for said bar adapted to hold it in parallelism with the said axle and the slide block carried by the inger end of said sprag bar and fitted into said cam slot in the swinging bar and adapted to be actuated by the walls :hereof. substantially as set forth.
5. In a car brake the combination of the car frame an axle mounted thereon and the supporting wheels of the axie, of the swinging bar pivotally connected to the bottom of the car on an axis in the vertical plane of the axis of sald axle and having cam slots arranged at either side of said pivotal connection, the sprag bars arranged transversely of the car at either side thereof and on opposite sides of said axle and adapted to have their outer ends engage with the adjacent supporting wheel and the slide blocks secured to the inner cnds of sald sprag bars and each fitted into one of said slots in said swinging bar an adapted to be actuated by the walls thereof, substantially as set forth.
6. In a car brake the combination with a truck frame, an axle therefor and supporting wheels for the axle, of the sprag bars arranged transversely of the truck frame, a swinging bar. and cam-like connections between said sprag bars and said swinging bar, each adapted to reciprocate one of the sprag bars in a straight line into and out of engagement with one of said supporting wheels, as said swinging bar is oscillated.
7. In a car brake the combination with a car frame, an axle thereon and supporting wheels on the axle, of the longitudinally reciprocatable sprag bars, each adapted to be thrown into and out of engagement with one of said supporting wheels, a swinging bar, and cam connections between said swinging bar and said sprag bars adapted to impart straight line motion to the sprag bars as the swinging bar is oscillated.

No. 101,014. Sawbuck. Chevalet pour le bois.

Ashley Dwight Thomas, Arena, Wisconsin, U.S.A., 18th September, 1906 ; 6 years. Filed 22nd August, 1906. Recelpt No. 138,910 .
Claim.-1. In a sawbuck the combination with a frame including crossed braces, of levers pivoted in the frame, log regaging devices carried by the levers, said levers being movable to hold a log engaged by the devices in an angle of the crossed braces and means for holding the levers with a log in such a position.
2. A sawbuck comprising a frame including legs and crossed braces, of levers pivoted between the legs, log engaging devices connected with the levers, said levers being movable to permit of the engagement of the devices with a \(\log\) and to bring a \(\log\) thus engaged into an angle of the crossed braces and means for holding the levers at different points of their movement.
3. In a sawbuck the combination with a collapsable frame including spaced pairs of legs and crossed braces pivotally connected with the legs at one end and removably connected therewith at their opposite ends, of a lever pivoted between the legs of each pair, log engaging tongs connected with the levers at one end, said levers being movable to bring the tongs into position for engagement with a log disposed between the pairs of legs and to raise a log thus engaged to bring it into an angle of the crossed braces, rack bars connected with the pairs of legs and retaining devices carried by the lever and adapted tor engagement of the rack bars to hold the levers at different points of their movement.

\section*{No. 101,015. Saw. Scic.}

Calvin Dilks, Alloway, New Jersey, U.S.A., 18th September, 1906; 6 years. Filed 22nd August, 1906. Recelpt No. 138,909.
Claim.-1. The combination substantially as herein described of the saw blade having a throat whose rea" wall forms a seat for a bit, and provided in advance of said wall with a tongue projecting outwardly into the gullet and spaced apart from sald seat wall and having its wall adjacent to said seat undercut. the bit fitted between said seat wall and tongue and having its front edge opposite the tongue recessed and the key made larger at its butt end und tapering thence toward its point end and fitted in the space between the bit and the tongue whereby to secure
the bit and having its point end bent or returned along the front edge of the tongue whereby to lock the bit in

place and to form a protecting cover for the front edge of the tongue, as and for the purpose set forth.
2. The improvement in saws comprising the blade having a throat whose rear wall forms a seat for the bit, an abutment projecting into the throat in advance of said wall, a bit fitting between the wall and abutment and a key operating between the bit and abutment and bent into locking engagement with the abutment; substantially as set forth.
3. The combination of the saw blade having a seat wall for a bit, an abutment in advance of said seat wall, a bit fitting against said seat wall and a key operating between the bit and abutment and having its point end bent along the front wall of the abutment whereby to protect the same from wear, substantially as set forth.
4. The combination of the saw blade having a seat wall for the bit and an abutment in advance thereof, the bit fitting sald seat wall and the key initially of greater thickHus than the saw blade and applied between the bit and abutment and swaged laterally into engagement therewith and bent longitudinally over the outer end of said abutment, substantially as set forth.
5. The combination of the saw blade having a throat whose rear wall forms a seat for the bit, and said blade being provided with an integral tongue projecting into the throat in advance of the said seat wall, the bit fitting against the seat wall and having opposite the said tongue a recess for the locking key, and the locking key operating between the tongue and bit and bent at its point end along the front edge of the tongue, substantially as set forth.
6. The combination of the saw blade having a seat wall for a blt an abutment tongue in advance thereof and having its edges chamfered, the bit fitting against said seat wall and recessed in its edge opposite the abutment tongue and the key operating between the bit and abutment tongue and initially of greater thickness than the sald tongue and swaged laterally into locking engagement with the chamfered edges thereof and bent longitudinally over the outer end of said abutment tongue, substantially as set forth.
7. A saw blade having a throat whose rear wall forms a seat for the bit and having an integral tongue projecting into the throat in advance o ih said seat wall, the blt fitting against said seat wall and the key operating between the bit and the integral tongue in advance thercof and bent Into engagement with the outer end of said tongue substantially as set forth.

\section*{No. 101,016. Mouthpiece for Pneumatic Teat Oups.} Embouchure dc godet pneumatique pour les dents.
Alexander Gillies, Gulong, Victoria, Australia, 18th September, 1906: 6 years. Filed 20th April, 1906. Recelpt No. 135,094.
Claim.-1. An improved mouthpiece for pneumatic teat cups made of a substantially rigid substance such as metal, and having a hollow chamber the underside of which is in communication with the suction in the cup, and the inner perirhery of which is formed with openings, substantially as and for the purpose set forth.
2. An improved mouthplece for pneumatic teat cups made of metal having a flange to fit substantially round the top of the teat cup, and a raiscd hollow chamber which substantially encircles the root of the teat. sald chamber having openliges on its under side and internal periphery, substantially a) and for the purpose set forth.
3. An improved mouthplece for pneumatic trat cups made of a subsiantially rigid substance such as metal, having a flange to fit substantially round the top of the teat cup, and a raised hollow chamber which substantially encircles the
rcot of the teat. said chamber having openings on its underside and internal periphery and a pin hole air inlet in its

external circumference, substantially as and for the purpose set forth.
4. In a metallic mouthpiece for pneumatic teat cups, a raised annular hollow chambered portion with openings in the underside and a slot around the internal periphery thereof, substantially as and for the purpose set forth and as illustrated in figure 5 of the drawings.
5. In a metallic mouthplece for pneumatic teat cups, a raised annular hollow chambered portion completely open on its underside and having a series of holes on its internal periphery. substantially as and for the purpose set forth and as illustrated in figure 2 of the drawings.

No. 101,017. Track Eander. Appareil d sabler la coic.

John Henry Hanlon, Somerville, Massachusetts, U.S.A., 18th September, 1906; 6 years. Filed 14th August, 1906. Recelpt No. 138.699.
Claim.-1. The improved air nozzle for track sanders, hav!ng a tapering end for engagement with a socket wrench.
2. The improved air nozzle for track sanders, having one end tapering for engagement with a socket wrench and the other end screw-threaded for engagement with the body of the sander.
3. In a track sander, the combination of a sand collector. an air discharge nozzle and a scale collector within the said air discharge nozzle.
4. In a track sander, the combination of a sand collector an air nozzle screwed into the interior of the said sand colifctor, and a scale collector within the said.air nozzle screw\(\in d\) to the interior thereof.
5. The improved air nozzle for sand collectors, comprising a nozzle body, having an air aperture and an enlarged bore and a scale collector within the said enlarged bore having an exterior diameter less than the interior diameter of the said nnlarged bore.
6. The Improved air nozzle for sand collectors comprising a nozzle body having an air aperture, an enlarged bore and a scale collector within the said enlarged bore provided with air apertures in the form of slits.
7. The improved air nozzle for sand collectors comprising a nozzle body having an air aperture, an enlarged bore and a scale collector within the said enlarged bore provided with air apertures in the form of slits and circular holes.
8. The improved clean-out device for track sanders, which ccmprises a tube enclosing the air nozzle and reaching from the exterior of the clean-out to a point back of the air inlet holes.
9. The improved air discharge nozzle for track sanders having its air discharge aperture counterbored to prevent the admission of sand to the interior of the air discharge nozzle.
10. The improved means for preventing the wear of sand discharge pipes comprising a cushion or buffer of sand collected in a suitable pocket.
11. The improved means for preventing the wear of sand discharge pipes which consists in a pocket opposite the point of discharge in which sand may collect and form a cushion or buffer.
12. The improved means for preventing the wear of sand discharge pipes which consists of a T-connection, one branch of which serves as a pocket opposite the point of discharge in which the sand collects to form a cushion or buffer, and the other branch of which is connected to the sand discharge p!pe.
13. The improved means for preventing the wear of sand discharge pipes which consists of a Y-connection, one branch of which serves as a pocket opposite the point of discharge it which the sand collects to form a cushion or buffer, and the other branch of which is connected to the sand discharge plpe, the angle between the said branches of the Y-connection being relatively small.
14. In a track sanding device, the combination with a sand dome, of a sand collector, an ingress hole through the said sand dome, and a hood above the said ingress hole and shielding the said ingress hole from a flow of sand from within the said sand dome.
15. In a track sanding device, the combination with a sand dcme, of a sand collector, an ingress hole through the said sand dome, whereby access may be had to the sand inlet holes in the sand collector, and a hood above the said ingress hole and shielding the said ingress hole from a flow of sand from within the sald sand dome.

No. 101,018. Grain Treating Apparatus. Apparell power traiter le grain.

John Liviagstone Hathaway, West Hill, Turtle Mountain, Manitoba, Canada, 18th September, 1906; 6 years. Filed 23rd August, 1906. Recelpt No. 138,934.
Claim.-1. A grain treating device comprising the combination of a receptacle, a second receptacle pivoted to the first receptacle and provided with a round wall, and a perforated wall.
2. A grain treating device comprising the comblnation of a receptacle, a second receptacle pivoted to the first receptacle, provided with a perforated end wall and a rounded bottom and side, and a guard lip secured to said perforated wall.
3. In a grain treating device the combination comprising a receptacle, provided with openings therein, a grain receptacle disposed within the first-named receptacle, pintles disposed through said openings and secured to the grain receplacle, a guard lip secured on the grain receptacle, and a handle secured to said grain receptacle, all of said parts being constructed of a non-corrodible material.
4. A grain treating device comprising the combination of a solution receiving receptacle provided with a slot in one or its walls, a grain receiving receptacle pivotally supported within the solution receptacle, a handle on the grain receiving receptacle adapted to lie within said slot, and a guard lip secured to the grain receiving receptacle, the latter of which is provided with perforations.

No. 101,019. Shirt. Chomise.

Mato Fitmaurice MaLoney, Norfolk, Nebraska, U.S.A., 18th September, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,837.
Claim.-The herein described shirt provided with shoulder straps 5 providing a series of loops, slits formed at opposite sides of the front and in the center of the back for the suspender ends, and flaps 8 for covering said slits, in combination with suspenders having the ends passed through the slits, and fastening devices 7 for holding the suspender ends within the slits, substantially as described.

No. 101,020. Track Lajing Machino. Machine d poser les voies de chemins de for.

Charles Oscar Wescott, Puyallup, Washington, U.S.A., 18th September, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,827.
Claim.-1. In a track laying machbne the combination of a car platform, a supporting structure secured thereto and extending forward therefrom, a track secured to one side of said structure, a carriage sliding on said track, a cable secured to the rear end of said carriage, means for pulling said cable rearward, two sheaves mounted at the ends of said carriage, a double ended cable passing over said sheaves and extending forward along said track, rail gripping means secured to the ends of sald double ended cable, and means for pulling said double ended cable forward.
2. In a track laying machine the combination of a car platform, a supporting structure secured thereto, an extension of said supporting structure hinged to the forward end
thercof and adapted to extend forward thereof and to be fclded back therebeside, and means supported by said struc ture whereby ralls may be raised, transported, or lowered.
3. In a track laying machine the combination of a car platform, a supporting structure secured thereto and extending forward therefrom, a track secured to one side of said structure, a carriage sliding on said track, two sheaves mounted at the ends of sald carriage, a cable secured to said carriage, a double ended cable passing over said sheaves and supporting the rail, means actuating said cables in opposite directions, and means controlling said actuating means whereby their re-actions one on the other will raise, transport or lower sald rall.
4. In a track laying machine the combination of a supportIng structure having a longitudinal track thereon, a carriage sllding on said track, a cable secured to said carriage, a cable engaging said carriage and depending therefrom to support a rail, means actuating said cables in opposite directions, and means controlling said actuating means whereby their re-actions one on the other will control the vertical position of the suspended rall and the horizontal position of the sliding carriage.

No. 101,021. Cold Draft Etop.
Arrett pour le tirage de l'air froid.

William Andrew Brewster, Edmonton, Alberta, Canada, 18th September, 1906; 6 years. Filed 23rd November, 1905. Receipt No. 130,347.
Claim.-1. In an automatic draft stop the combination with the casing and the door, of a flexible strip secured at its upper side in proximity to the bottom of the door, and extending thereacross, said strip having an enlarged lower edge, a reinforcing crossbar secured to the free portion of the fiexible strip, and on its upper face, and of such dimensions that the enlarged portion of the flexible strip extends below the lower edge of the crossbar, a plurality of spiral compression springs extending from the door and behind the said crossbar, and a stop rigidly secured to one of the case uprights, and designed to receive the said crossbar, and press it downwardly and inwardly, until the enlarged portion of the flexible strip comes into surface contact with the base of the casilig. when the door is passing to its closed position, las and for the purpose specified.
2. In an automatic draft stop the combination with the casing and the door, of a crossbar extending parallel with and along the inner lower edge of the door, a flexible strip secured to and passing longitudinally along the said crossbar, and extending upwardly and laterally away from the same, a cross strip above and substantially parallel the herebefore mentioned crossbar, means for securing the said cross strip through the laterally extending portion of the flexible strip to the door, a cushioning portion extending along the lower face of the crossbar, and secured thereto, a plurality of sprial compression springs extending from the door and behind the said crossbar, and a stop rigidly secured to one of the case uprights, and designed to receive the said crossbar, and press it downwardly and inwardly till the cushioning member comes into surface contact with the base of the casing. when the door is passing to its closed position, as and for the purpose specified.

\section*{No. 101,022. Mothod of Cutting Rails and Chatr Soats in Railway gleepers.}

\section*{Méthode de couper les rails, efc.}

Albert Collet. Paris, France, 18th September, 1906; 6 years.
Filed 27th March, 1906. Receipt No. 134,326.
Claim.-1. A cutting apparatus for forming rail and chair seats in rallway slcepers, comprising the combination of a vertical shaft, arms fixed to the shaft, axles on the arms, culting discs movably disposed on the axles and provided
with inclined faces, and vertical knives arranged to cut the vertical walls of the seat.

2. A machine for forming rail and chair seats in railway sleepers, comprising a frame held upon a rail by means of keys passed beneath the latter and upon which runs a rack carriage supporting the rotary cutter, substantially as hereinbefore described.
3. In a machine of the character described maintaining the sleeper beneath adjustable stops connected to the carriage by pivoting arms, by means of a shoe on the end of a lever adapted to be operated by a screw, substantially as hereinbefore described.
4. In a machine of the character described, the pinion operating the carriage rack and the screw for ralsing the sleeper to be recessed, by means of a hand wheel the sleeve of which may be disengaged in order to act either upon one part or the other, substantially as hereinbefore de-cribed.
o. In a machine of the character described the combination and arrangement of parts for automatically effecting the angular movement of the cutter relatively to the movable carriage each time the said carriage has completed its forward or backward movement, which allows of forming by a movement in each direction above the sleeper a seat or recess the width of which is double the diameter of the cutting tools, substantially as hereinbefore described.
6. In a machine of the character described, the means for effecting the angular automatic movement of the cutter shaft comprising two superposed plates the lower one fixed and the upper movable, supporting the cutter shaft, the said plates being connected during the working stroke of the carriage by catches combined with levers in connection with a rod having adjustable stops determining the disengagement of the plates at the_end of the stroke, substantialy as hereinbefore described.
7. In a machine of the character described. mounting the catches between the fixed plate and the movable pivoting plate in slots, the relative position of the two catches determining in combination with the disengaging levers the variable extent of the angular movement of the cutter shaft. the said catches being adapted to be placed in such a position as not to effect any angular movement when the recessing operation is to be performed in a single stroke, substantially as hereinbefore described.

No. 101,023. Golf Ball Marker.
Marqueur de boule de golfe.

ohn Campbell Cory, New York City, New York, U.S.A., 18th September, 1908; 6 yeras. Filed 29th June, 1906. Recelpt No. \(137,407\).
Claim.-1. A golf ball marker comprising a frame having a circular ball seat, a movable die holder, a die secured
to said holder and a power member adapted to operate sald die holder and ie, substantially as described.
2. A golf ball marker comprising a frame having circular ball seat, a die holder pivoted to said frame and provided with a die having a spherical contour, and a power member likewise pivoted to the frame and engaging said die holder for operating the same, substantialy as described.
3. A golf ball marker comprising a truncated spherical seat, a movable die holder pivotally mounted adjacent thereto, a die mounted on said holder having raised characters thereon. and a pivoted power member engaging with said die holder and adapted to operate the same, substantially as described.
4. A goli ball marker comprising a frame having a truncated spherical seat. a movable die holder pivotally mounted on said frame adjacent thereto, and having a die with raised characters mounted thereon, and a power member also pivoted to sald frame and a ball and socket connection between the die holder, and power member, and a spring for maintaining the die in its normal position, substantially as described.

No. 101,024. Building Block. Bloc de construction.

William Edward Henderson, Toronto, Ontario, Canada, 18th September, 1906; 6 years. Filed 7th February, 1906. Receipt No. 132,676.
Claim.-1. A composite building block comprising fibre and plaster of paris suitably mixed and moulded into block form and having apertures extending therethrough and tongues on two of the adjacent sides and grooves on the two adjacent sides opposite, as and for the purpose specified.
2. A wall comprising a plurality of blocks formed uf Abre and plaster of paris, each block having two tongues on adjacent sides and two grooves on the opposite adjacent sides, and an aperture or apertures extending therethrough as and for the purpose specifled.

\section*{No. 101,025. Mannfacture of Ozygen Briquettey. Fabrication de briquettes d'oxygine.}

George François Jaubert, Paris, France, 18th September, 1906: 6 years. Filed 20th April, 1906. Receipt No. 135,085.
Claim.-Briquettes with a base of oxygenated salt such as a perchlorate of potash or other perchlorates or nitrates liberating practically pure oxygen by their combustion and prepared by kneading, in the presence of water or of another solvent. the said oxygenated salt with a small proportion of puiverulent combustible such as carbon and inert material. this kneading being followed by the moulding into cakes or briquettes of the paste obtained apd by the drying of these briquettes.

\section*{20. 101,026. Oxysen Generator.} GÉnérateur d'oxygìne.
George Francois Jaubert, Paris France. 18th September, 1906; 6 years. Filed 20th April, 1906. Receipt No. 135,086.
Claim.-1. In an apparatus for the production of oxygen by the combustion of briquettes with a base of oxygenated aalts, the combination of a receiver. of independent generators, of pipe connections between the generator or generalors and the receiver, and a puriffer between said parts.
2. In an apparatus for the production of oxygen by the combustion of briquettes with a base of oxygenated salts, the combinatiou of a receiver, independent generators con-
taining briquettes placed in baskets supported within the generators, said generators having as small a capacity as

possible additional to the space occupied by the briquettes, cut-off cocks for said generators, and means for cooling the same.
3. In an apparatus for the production of oxygen by the combustion of briquettes in the manner referred to, the combination of a gas receiver, of one or more independent generators containing briquettes, pipe connections between said generators and a purifier placed In front of the gas receiver, cut-off cocks on the plpe connections and means for cooling the generators, consisting of a water tank in which deep the generators and means for ensuring a water circulation through the tank.

No. 101,027. Vacuum Device. Apparcil dc vacuиm.

Sylvester Smith Leonard, Chicago, Illinois, U.S.A., 18th September. 1906; 6 years. Filed 10th May, 1906. Receipt No. 135,767
Claim.-1. In a device of the class described, the combination with a pump cylinder, a piston movable therein, a piston rod secured to the piston and profecting from the rear of the cylinder, and a handle at the rear end of the piston rod, of a frame slidably mounted on the cylinder, a perforation in the rear end of the frame through which the handle can pass and means for locking the frame in its rear position.
2. In a device of the class described, the combination with a pump cylinder, a piston movable therein, a piston rod secured to the piston and projecting from the rear of the cylinder, and a handle at the rear end of the piston rod of a frame slidably mounted on the cylinder, a perforation in the rear end of the frame through which the handle can pass, an abutment upon the rear end of the cylinder, and a pin upon the frame adapted to be brought into engagement with the rear thereof whereby the frame can be locked in its rear nosition.
3. In a device of the class described, the combination with a pump cylinder, a piston movable thereln. a piston rod secured to the pston and projecting from the rear of the cylinder, and a handle at the rear of the piston rod, of a frame slidably mounted upon the cylinder, a perforation in the rear end of the frame through which the handle can
pass, means for locking the frame in its rear position on the cylinder, and a spring adapted to hold the piston normally forward.
4. In a device of the class described. the combination with a cylinder, a piston movable therein, a piston rod secured to the piston and extending rearwardly from the cylinder and a handle at the rear of the piston rod, of a ring slidably mounted on the cylinder, rods extending rearwardly from the ring on opposite sides of the cylinder, a brace connecting the rear ends of the rods, said brace perforated for the passage of the handle, an abutment upon the rear end of the cylinder having a notch in its periphery, and a pin upon one of the rods adapted to pass through the notch and engage the rear of the abutment, whereby the frame can be locked in its rear position.
5. In a device of the class described, the combination with a cylinder, a piston movable therein, a piston rod secured to the piston and extending rearwardly from the cylinder and a handle at the rear of the piston rod, of a ring slidably mounted on the cylinder, rods extending rearwardly from the ring on opposite sides of the cylinder, a brace connecting the rear ends of the rod, said brace veing perforated for the passage of the handle, an abutment upon the rear end of the cylinder having a notch in Its periphery, a pin unon onc of the rods adapted to pass through the notch and engage the rear of the abutment whereby the frame can be locked in its rear position, and a spring exerting a forward pressure on the piston.

No. 101,028. Carbureter. Carburateur.

William F. Rothe, East Saint Louis, Illinois, U.S.A., 18th September, 1906; 6 years. Filed 10th February, 1906. Receipt No. 132,783.
Claim.-1. A carbureter, comprising a cylindrical member adapted to be secured to the engine casing, there being an integral flange helically arranged on the interior of said member, means whereby oil is discharged into the cylindrical member at the front thereof, and an adjustable member arranged in the cylindrical member opposite the oll inlet and provided in its upper end with a recess, substantally as specified.
2. A carbureter, comprising a cylindrical member adapted to be secured to the engine casing, an integral flange helically arranged on the interior of said cylindrical member, an inlet valve located in the top of the outer end of the cylindrical member in front of the flange therein, an oil inlet tube leading to said valve, a screw bolt passing through the outer end of the cylindrical member opposite the inlet valve, there being a recess in the upper end of said screw bolt, and a lock nut arranged on the screw bolt outside the cylindrical member, substantially as specifled.

\section*{No. 101,029. Mower Cutter Bar.}

\section*{Barre de lames de faucheuses.}

Welden C. Rarig, Ogden, Utah, U.S.A., 18th September, 1906; 6 years. Filed 8th January, 1906. Receipt No. 131,636.
Claim.-1. The combination with a mower cutter bar, of a reciprocating knife mounted thereon, a lubricating conduit extending longitudinally of the cutter bar and having passages leading therefrom for delivering a lubricant, and means for reciprocating said condult relatively to the cutter bar thereby distributing the lubricant between the relatively movable parts of the reclprocating knife and the cutter bar.
2. The combination with a mower cutter bar, of a reciprocating knife mounted thercon. clips ongaging said knife for guiding the same, a lubricating conduit extending longltudinally of the cutter bar, and having passages leading
therefrom for supplying a lubricant between the several clips and the knife, means for automatically supplying a lubricant to said conduit.

3. The combination with a mower cutter bar, of a recipro cating knife comprising cutting sections, gulde clips located at predetermined points on said cutter bar and engaging sections of said knife, a lubricating condult extending longitudinally of the cutter bar and having passages leading therefrom for supplying a lubricant between the several clips and the corresponding knife sections, and means for automatically supplying a lubricant to said condult.
4. The combination with a mower cutter bar, of a reciprocating knife comprising cutting sections, guide clips. located at predetermined points on said cutter bar and engaging sections of said knife, a lubricating conduit beneath the knife sections extending longtudinally of the cutter bar and having passages leading therefrom at points below said clips, the knife sections beneath said clips having holes therethrough with which said passages register, whereby the lubricant is supplied between sald clips and the knife sections engaged thereby.
5. In a mower knife, the combination with a knife bar. of cutting sections secured to said bar, a longitudinal lubricating conduit in said bar extending beneath said sections. predetermined sections having holes therethrough, communicating with said condult, whereby the lubricant is supplied from said conduit to the upper surface of said sections.
6. In a mower knife, the combination with a knife bar, of cutting sections secured to said bar. a longitudinal conduit iccated within said bar and extending beneath said sections, predetermined sections having holes therethrough communicating with holes through said conduit. whereby the lubricant is supplied from said conduit to the upper surface of said sections.
7. In a mower knife, the combination with a knife bar. of a head secured to the inner head of said bar, a hollow ball on sald head to which a pitman rod is adapted to be connected. a lubricating conduit communicating with said hollow bail and extending longitudinally within said bar beneath said sections, predetermined sections having holes therethrough. ocmmunicating with said conduit, and a supply of lubricant communicating with said ball.
8. In a mower kinfe, the combination with a knife bar, o, a head secured to the inner end of said bar, and a hollow ball on said head to which a pitman rod is adapted to be connected, said ball having holes leading from the interior to the exterlor thereof, a lubricating conduit communicating with said hollow ball and extending longitudinally within said bar beneath said sections, and a supply of lubricant communicating with said hollow ball.

\section*{No. 101,030. Motal Brasing Composition. Composition à braser le métal.}

Electus Backus Ward. New York City. New York, U.S.A.. 18th September. 1906; 6 years. Filed 8th May. 1906. Receipt No. 135,700.
Claim.-The herein described composition of matter or brazing flux, consisting of sodium carbonate and boracic acid, substantially as specified.

\section*{No. 101,031. Paint. Peinturc.}

Jolin Francis Villard and and S. L. Tilley Harrison, assignee of a half interest, both of Rexton, New Brunswick, Canada, 18th September, 1906; 6 years. Filed 12th May, 1906. Receipt No. 135,833.
C'laim.-1. The herein described composition of matter which consists of whiting, flour, water and glue cooked into
a paste, rossin and Bergundy pitch, white lead and linseed oil, colouring mattes, and a drier.
2. The herein described composition of matter which consistsof whiting, flour, water and glue cooked into a paste, rosin and Burgundy pitch, beeswax and turpentine, white lead and linseed oll, colouring matter, and a drier.

No. 101,032. Feating and Illuminating Device. Apparefl d chauffer et ćclairer.

Samuel Shelton St. Hoor, Mary H. Clagett, and William S. Clagett, each an assignee of a fourth interest, all of Kansas City, Missouri, U.S.A., 18th September, 1906; 6 years. Filed 1st May, 1906. Receipt No. 135,414.
Claim.-1. A device of the character described, comprising a casing provided with perforations in its lower portion, a suitable drum having its lower portion perforated, a condult or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with said drum, means for adjustably supporting the drum upon sald pipeway or conduit, and means for heating the air in said drum.
2. A device of the character described, comprising a caslag provided with perforations in its lower portion, a sultable drum having its lower portion perforated, a conduit or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with said drum, and a heater within the casing.
3. A device of the character described comprising a casing provided with perforations in its lower portion and with a door controlled opening, a suitable drum having its lower portion perforated, a conduit or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with said drum, and means for heating the air in said drum.
4. In a device of the character described, a suitable casing having its lower portion perforated, a drum suitably supported and having its lower portion perforated, a condult or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with the drum, a lamp sultably supported and having its chimney arranged to discharge into the drum, and an adjustable tube arranged within the drum and having its lower end externally embracing the upper end of the lamp chimney.
5. In a device of the character described, a suitable casing having its lower portion perforated, a drum suitably supported and having its lower portion perforated, a condult or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with the drum, a lamp suitably supported and having its chimney arranged to discharge into the drum, a tube arranged within the arum and having its lower end externally embracing the upper end of the lamp chimney, and a deflecting bell suspended from the top of the drum and overhanging the upper end of said tube.
6. In a device of the character described, a casing baving its lower portion perforated, a drum having its lower portion perforated, a plurality of conduits or pipeways communcating with the upper portion of the casing, and projecting upward into the drum, collars on the conduits or pipeways below the drum to support the latter, a lamp having its chimney arranged to discharge into the drum, and a support for the lamp above the casing and supported by said conduit or pipeways.
7. A device of the character described comprising a casing baving a perforated bottom, a drum having a perforated bottom, pipes leading from the casing into the drum, a lamp
supported by said pipes, and a tube adjustably secured in the bottom of the drum and passing up into the same and having its lower end encircling the top of the chimney of the lamp.

No. 101,033. Oxygon Gas Gonerating Composition. Composition d générer le gaz d'oxygène.

The Roessler and Hasslacher Chemical Company, New York City, assignee of George Fred. Brindley, Niagara Falls, Ontario, Canada, 18th September, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,659.
Claim.-1. A composition of matter contalning an alkall peroxide and a metallic oxide.
2. A composition of matter containing a fused alkali peroxide and a substance causing a catalytic reaction in the presence of molsture.
3. A composition of matter containing a fused alkall peroxide and a metallic oxide.
4. A composition of matter contalning sodium peroxide and a metallic oxide.
5. A composition of matter containing fused sodium peroxide and a substance causing a catalytic reaction in the presence of molsture.
6. A composition of matter containing fused sodium peroxide and a metallic oxide.
7. A composition of matter containing sodium peroxide and cupric oxide.
8. A composition of matter containing fused sodium peroxide and cupric oxide.

\section*{No. 101,034. Apparatug for Generating Oxygen Gas.}

Appareil d générer le gaz d'oxygìne.

The Roessler and Hasslacher Chemical Company, assignee of Rlchard von Foregger, New York City, New York, U,S.A. 18th September, 1906 ; 6 years. Filed 7th May, 1906. Receipt No. 135,661.
Claim.-1. A generator for oxyegn gas comprising a container, gas producing means suspended therein, means for controlling the generation of gas by said gas producing means and means for controlling the pressure in said container.
2. A generator for oxygen gas comprising a container, gas producing means suspended therein, means for controlling the generation of gas by said gas producing means and means for varying the pressure in said container.
3. A generator for oxygen gas comprising a container, gas producing means suspended therein and means for instantaneously starting the generation of gas.
4. A generator for oxygen gas comprising a container, gas producing means suspended therein and means for instantaneously stopping the generation of gas.
5. A generator for oxygen gas comprising a container, gas producing means suspended therein and means for instantaneously starting and stopping the generation of gas.
6. A generator for oxygen gas comprising a container, gas producing means suspended therein and means for generating said gas under low pressure in sald container.
7. A generator for oxygen gas comprising a container, gas producing means suspended therein and means for preserving said gas producing means against decomposition when said generator has been closed.
8. A generator for oxygen gas comprising a portable apparatus including a container, gas producing means suspended
therein, means for controlling the generation of gas by said gas producing means and means for controlling the pressure on said container.
9. A generator for oxygen gas comprising a container, gas producing means suspended therein, means for controlling the generation of gas by said gas producing means. means for varying the pressure in sald contalner and means for drawing off said gas.

No. 101,035. Proceng of Purifying Air. Procédé pour purificr l'uir.

The Roessler and Hasslacher Chemical Company, assignee of Richard von Foregger, both of New York City, and of George Fred. Brindley, Niagara Falls, Ontario, Canada, 18th September. 1906; 6 years. Filed 7th May, 1906. Recelpt No. 135.662.
Claim.-1. A process for the regeneration and purification of air comprising the passing of a continuous stream of alr over a substance adapted to re-act with the humidity of the air to free oxygen and absorb carbon dioxid.
2. A procyss for the regeneration and purification of air comprising the passing of a continuous stream of air over an alkaline peroxid.
3. A process for the regeneration and purification of air comprising the passing of a continuous stream of air over fused sodium peroxid.
4. A process for the regeneration and purification of air comprising the passing of the air over an alkaline peroxid and the removing of the carbonates or bi-carbonates formed during the re-action.
5. A process for the regeneration and purification of air comprising the passing of the air over an alkaline peroxid whereby the humidity of the alr decomposes the peroxid generating oxygen and absorbing carbon dioxid and the removing of the carbonates or bl-carbonates formed on the peroxid by the re-action.
6. A process for the regeneration and purification of air comprising the generating of oxygen gas and the absorbing of carbon dloxid by the reaction of the humidity contained in the air on sodium peroxid and continuously removing the coating of carbonate of bi-carbonate formed by the re-action.
7. A process for the regeneration and purification of air - omprising the continuous generation of oxygen gas and absorption of carbon dioxid by the re-action of the humidity contained in the air on an alkaline peroxid.
8. A process for the regeneration and purification of air comprising the generating of oxygen and absorbing of carbon dioxid from the air by decomposing fused sodium peroxid or peroxid in any other form, by the humidity contained in the air and continuously removing the coating of carbonates or bi-carbonates formed by the re-action with sodium peroxid.
9. A process for the regeneration and purification of air comprising the passing of the air over an alkaline peroxid whereby the humidity of the air decomposes the peroxid generating oxygen and absorbing carbon dioxid, removing the carbonates of bi-carbonates formed on the peroxid by the the re-action and the regulating of the degree of humidity to which the peroxid is exposed.
10. A process for the regeneration and purification of alr comprising the passing of the air over an alkaline peroxid whereby the humidity of the alr decomposes the peroxid generating oxygen and absorbing carbon dioxid, removing the carbonates of bi-carbonates formed on the peroxid by the re-action and the regulating of the generation of oxygen.
11. A process for the regeneration and purification of air comprising the passing of the air over an alkaline peroxid whereby the huminity of the air recomposes the peroxid gen--raling oxygen and absorbing carbon dioxid and removing the carbonates or bl-carbonates formed on the peroxid by the re-action, sufficient oxygen being generated to restore the air to normal conditions and to destroy the toxic elements of the vitiated air.

\section*{No. 101,036. Mothod of Obtaining a Bolvble Glutinous Bubstance.}

Méthode dobtenir unc aubstance soluble et gluante.
La Compagnie Internationale La Norgine, assignee of Ernest Hermann, both of Paris. France, 18th September, 1906; 6 years. Filed 8th May, 1906. Receipt No. 135,671.
' 'laim.-Method of producing a glutinous substance which shall be dry. neutral and perfectly soluble, by pressing tangacid while in a heated state, reducing the resulting product to a powder and subjecting it to the action of ammonia vapour or treating it with ammonia gas, drying and at the same time freeing said product from any excess of ammonia which it may contain, substantially in the manner described.

\section*{No. 101,037. Window shade Fizture.}

Garniture d'abat-jour de fenêtre.

John Franklin Cannon, Mattie Newton Cannon and Frederick Ernest Beaty, assignee of a half interest, all of Erick, Oklahoma. U.S.A., 18th September, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,019.
Claim.-1. A window shade fixture comprising brackets arranged for attachment to the stiles of a window frame, arms pivotally connected at one end to sald brackets to swing in a vertical plane, a plate connecting the free ends of said arms, said arms being provided with sockets for the reception of the gudgeons of a shade roller, and one of said arms being provided on its inner face with a stud and on its outer face with a pin or lug, an actuating rod secured to the stud whereby the arms may be raised and lowered, a spring catch projecting out from the face of one stlle and provided with an orifice in which the lug on the outer face of said arm is designed to snap and an actuating cord secured to said catch ard designed to draw the same outwardly from engagement with said lug.
2. A window shade fixture comprising brackets designed for attachment to the stiles of a window frame, arms pivoted in said brackets to swing in a vertical plane and provided at their free ends with sockets designed to receive the gudgeons of a shade roller, an L -shaped plate permanently connected at one end to one of said arms and having a detachable conficction to the outer end of the other arm whereby said arm may be sprung outwardly with relation to the plate to secure the shade roller in place and remove it also, an actuating rod secured to one of said arms, said latter arm being provided on its outer face with a lug, an angular spring catch projecting out from one stile and provided with an orifice in which the lug is designed to snap whereby to hold the arms in raised position, and an actuating cord or cable secured to the free end of sald catch, an eye or loop being provided on the stile adjacent to and in horizontal alignment with said catch and through which the cord or cable passes.

No. 101,038. Window Eereen. Eicran de fenêtre.
Joseph W. Adams, Pasadena, California, U.S.A., 18th September. 1906; 6 years. Filed 7th June, 1906. Recelpt No. 136,635.
(laim.-1. The combination with a window having a vertical groove. of a screen frame having a furrow along its vertical edge, a rigid strip mounted in the furrow and engaging within the groove of the window, a spring within the screen trame arranged to hold the strip normally in engagement with the groove, a link engaging the strip and extending transversely through the screen frame, a cam engaging the l!nk and the face of the screen frame and means whereby the cam may be manipulated to draw the strip out of the groove and retain it wholly within the furrow of the screen.
2. A window screen comprising a frame having furrows formed along its opposite vertical edges, a rigid strip mount-

ed and laterally movable within each furrow and with a longitudinal edge protruding normally beyond the lines of the frame, a spring mounted in the frame and exerting pressure against the inner edge of the strip. a link connected with the strip and extending transversely through the frame and ar eccentric connected with the link and extending opposite the strip and arranged upon manipulation to draw and hold the strip wholly within the furrow and against the tension of the spring.

No. 100,039. Hanger for Curtain Poles and shade Rollers.
Console opur batons de rideaus et rouleau d'abat-jour.

Milo A. Elliott, Waterville, Maine, U.S.A., 18 th September, 1906; 6 years. Filed 28th June, 1906. Receipt No. 137,366. Claim.-A reversible and adjustable hanger for curtain pcles and shade rollers comprising two brackets disposed at right angles to each other, the brackets having bearings or supports for the shade roller upon upper and lower edges thereof respectively, one of sald brackets having a support for the shade roller at the end of said bracket and lengthwise therewith, substantially as and for the purpose set forth.

No. 101,040. Curtain Pole. Baton de rideau.
Edson B. French, Helena, Montana, U.S.A., 18th September, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,629.
Claim.-1. The herein described device comprising a plate having means for attachment to a window and with one end bent laterally for bearing beneath the window casing and with a curtain shade roller bracket extending laterally from the other end and with a vertical socket between the bracket and plate, and a standard supported in said socket and having means at its free end for supporting a curtain pole.
2. The herein described device comprising a plate having means for attachment to a window and with one end bent laterally for bearing beneath the window casing and with a
curtain roller bracket extending laterally from the other end and a vertical socket between the plate and bracket, and a

standard supported in said socket and having means at its free end for supporting a curtain pole.
3. The herein described device comprising a plate having means for attachment to a window and with one end bent laterally for bearing beneath the window casing and with a curtain roller bracket extending laterally from the other end and a vertical socket between the plate and bracket and with one side open, a standard supported in said socket and provided with means at the free ends for supporting a curtain pole, and a tongue extending from said plate transversely of said socket and bearing upon the standard supported therein.

No. 101,041. Cathode Plate. Plaque de cathode.

Harry Cross Hubbell, East Orange, New Jersey, U.S.A., 18th September, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,264
Claim.-1. A storage battery cathode composed of hairlike fibers of nickel interwined and embedded in a mass of nickel oxid, forming a plastic mat or cake.
2. A cathode comprising hair-like fibers of nickel and a mass of plastic nickel oxid formed into a mat-like body.
3. A battery plate composed of nickel filaments interlocked in a mass of nickel oxid in a pasty or dough-like condition and forming a mat or cake.
4. A cathode consisting of hair-llke nickel fibers mixed and interwined with a mass of nickel and inserted in a wire gauze pocket or sack.

\section*{No. 101,048. Trap for Bewer Pipes.} Trappe de tuyau d'égout.

Leon Jodoin, Montreal, Quebec, Canada, 18th September, 1906; 6 years. Filed 3rd May, 1906. Receipt No. 135,500.
Claim.-1. The combination with a sewer pipe and a valve for closing the same, of an auxiliary duct communicating with such sewer pipe and containing a float, and means operatively connecting such fioat to the valve, substantially as described and for the purpose set forth.
2. The combination with a street sewer, a house branch pipe connected thereto, and a downwardly projecting circular seat within the upper end of such branch, of an auxiliary duct cast in one with the house branch pipe and containing a ball float, a valve hinged adjacent to the seat, and a curved rod pivotally connected to such float and valve, substantially as described and for the purpose set forth.'
3. The combination of street sewer \(b\), house branch \(c\), duct d. port \(d^{\prime}\), partition \(f\), slit \(f^{\prime}\) valve \(g\), lugs \(g^{1}\), lugs \(h\), bracket \(i\),

ball float \(k\), curved rod \(m\), valve seat \(q\), rubber gasket \(r\), and icmovable side portion \(t\), substantially as described and for the purpose set forth.

No. 101,043. Chair. Fautewil.

Jacob Stadelbauer Encchtel. Hanover. Ontario, Canada, 18th September. 1906; 6 years. Filed ist June, 1906. Receipt No. 136,473.
Claim.-1. In a chair the combination with a frame having a hinged back and a recess from the rear end in each of the side pieces thereof, of a pair of racks pivotally secured to the chair back at one end and adapted to recede into said recesses. and a pin extending across each of the said receases at the open end thereof and engaging sald racks, as and for the purpose specified.
2 . In a chair the combination with a frame having a hinged back and a recess from the rear end in each of the side pieces thereof, of a pair of racks pivotally secured to the chair back at one end and adapted to recede into said recesses having a longitudinal slot therein and teeth projecting downwardly from the upper edge of said slot. and a pin extending across each of the said recesses at the open end thereof and passing through the slot in said racks, as and for the purpose specified.
3. In a chair the combination with a frame having a hinged biack and a vertical longitudinal recess from the rear end in fach of the side pleces thereof, of a pair of racks pivotally secured to the chair back at one end and adapted to recede into sald recesses having a longitudinal slot therein and teeth projecting downwardly from the upper edge of said slot and a rearwardly projecting portion beyond sald slot, and a piu extending across each of said recesses at the open "nd thercof and passing through the slot in said racks and - ngaging the teeth therion. as and for the purpose specified.
4. In a chair in combination with a frame having recesses In each of the side picces thereof and a back hingedly secured thereto. a pair of pivotal members secured to said back and alapted to rected into sad recessis and presenting an unliroken outer adg and having a longitudinal slot therein and ...th projecting into said slot from the upper edge, and moans socurid 10 said frame to ongage the slot in the sald whotal members for securing the back of the chair, as and lor the purpose specilled.
5. In a chair the combination with a frame and a back hingedly secured thereto, of a pair of pivotal members secured to said chair having a longitudinal slot therein and teeth projecting into said slot, and means for engaging the teeth in said slot and securing the back of the chair, as and for the purpose specified.

No. 101,044. Fly Frightener. Chasse-mouche.

Thomas J. Merryman, Lincoln, Nebraska, U.S.A., 18th September, 1906; 6 years. Filed 27th March, 1906. Receipt No. 134,331.
Claim.-1. In a device of the class described, the combination with a door frame and door, of movable insect frightening devices, one mounted upon the vertical side of the door frame and outside thereof, and the other mounted upon the top of said door frame and outside thereof, and a continuous cable wound around both said devices and attached to said door.
2. In a device of the class described, the combination with a door frame and door, of movable insect frightening devices, one mounted upon the vertical side of the door frame and outside thereof, and the other mounted upon the top of said dcor frame and outside thereof, a continuous cable wound around both said devices and attached to said door, and a spring secured to one end of sald cable.
3. In a device of the class described. the combination with a door frame and door, of a plurality of rotatable insect frightening devices mounted one upon the door and the other upon the door frame, and common means for simultaneously rotating said devices.
4. In a device of the class described, the combination with a door frame and door, of an insect frightening device movably mounted on the door frame, a separate fly frightening device mounted to rotate upon the door, and means for simultaneously moving both devices upon the opening of the said duor.
5. In a device of the class described, the combination with a door frame and door, of an insect frightening device mounted on the door frame, an Insect frightening device mounted on the door, one of said devices consisting of a shaft, spiral wings arranged longitudinally of and secured to the shaft. said wings having looped portions projecting on opposite s!des of the shaft, and means for simultaneously operating the frightening devices upon the opening of the door, said means having an engagement with the shaft for actuating the same.
6. In a device of the class described, the combination with a door frame and door, of a movable insect frightening device separately mounted on each, each of said devices including a rotary shaft having a pulley, and a single cable passing about the pulleys of both shafts and having a movuble resistance at one end.
7. In a device of the class described, the combination with a door frame and door, of an insect frightening device mount ed on the door frame and including a vibratory shaft having a drum, another insect frightening device mounted on the dcor and including a shaft having a pulley, a cable having one end wrapped upon the drum, sald cable passing about the pulley, and a weight attached to the other end of the pulley.
8. In a device of the class described, the combination with a door frame and door, of a shaft journalled along the top of the frame and having wings secured thereto, an upright shaft journalled along one side of the frame and having wings, a shaft journalled upon the door and having wings. and a cable having a movable end, said cable passing about the various shafts to simultancously operate the same when the door is moved.

No. 101,045. Sewer Cleaning Devico.
Appareil à nettoyer les égouts.

Robert Shannon, Jersey Clty, New Jersey, U.S.A., 18th September, 1906 ; 6 years. Filed 8th May, 1906. Receipt No. 135.701.

Claim.-1. A sewer cleaning device comprising an opentopped and trough-shaped body portion having a sharp charging or cutting end formed by a pair of segmental edges of the body meeting in a sharp point, said point lying in the plane of the base of said body, and a swinging gate or door back of sald charging or cutting end in one end of said trough-shaped body portion adapted to open inwardly into said trough-shaped body portion, the said gate or door and charging end forming an auxiliary scoop, substantially as and for the purposes set forth.
2. A sewer cleaning device comprising an open-topped and trough-shaped body portion having forwardly and rearwardly projecting and sharp scoop-shaped charging or cuttling ends farmed by segmental marginal edges meeting in sharp points at the opposite ends of the body, said points lying in tha plane of the base of said body, and a swinging gate or door back of said rear charging or cutting end in one end of said trough-shaped body portion adapted to open inwardly into said trough-shaped body portion adapted to open inwardly irto said trough-shaped body portion, said gate or door and rear charging or cutting end forming an auxiliary scoop, ouhstantially as and for the purposes set forth.
3. A sewer cleaning device comprising an open-topped and trough-shaped body portion having a sharp scoop-shaped body charging or cutting end formed by a pair of segmental marginal edges of the body meeting in a sharp point, said point lying in the plane of the base of said body, a swinging gate or door back of said charging or cutting end in one end of sald trough-shaped body portion adapted to open inwardly into said trough-shaped body portion, the said gate or door and charging end forming an auxiliary scoop, and means to prevent sald gate or door from swinging in an outward direction, substantially as and for the purposes set forth.
4. A sewer cleaning device comprising an open-topped and trough-shaped body portion having forwardly and rearwardly projecting and sharp scoop-shaped charging or cutting ends formed by segmental marginal edges meeting in sharp points at the opposite ends of the body, said points lying in the plane of the base of said body, a swinging gate or door back of the said rear charging or cutting end on one end of said trough-shaped body portion adapted to open inwardly into sald trough-shaped body portion, sald gate or door and rear charging or cutting end forming an auxiliary scoop, and means to prevent said gate or door from swinging in an outward direction, substantlally as and for the purposes set forth.
5. A screw cleaning device comprising an open-topped and trough-shaped body portion having a sharp charging or cutting end formed by a pair of segmental edges of the body meeting in a sharp point, said point lying in the plane of the base of said body, a swinging gate or door back of said charging or cutting end in one end of said trough-shaped body portion, the said gate or door and charging end forming an auxiliary scoop, means to prevent said gate or door from swinging in an outward direction, and shoes secured upon the bottom of said trough-shaped body portion, substantially as and for the purpose set forth.
6. A sewer cleaning device comprising a trough-shaped body baving a forwartly projecting and sharp scoop-shaped charging or cutting end pointed at its lowest portion, a
closure near one end of the said device, and a detachable cover, and means for securing said detachable cover to said trough-shaped body, substantially as and for the purpose set forth.
7. A sewer cleaning device comprising a trough-shaped body having forwardly and outwardly projecting and sharp scoop-shaped charging or cutting ends pointed at their lowest portions, a closure near one end of the said device, a detachable cover, and means for securing said detachable cover to said trough-shaped body, substantially as and for the purpose set forth.
8. A screw cleaning device comprising a trough-shaped body having a forwardly projecting and sharp charging or cutting end pointed at its lowest portion, a swinging gate or door in one end of said trough-shaped body portion adapted to open inwardly into said trough-shaped body portion, a detachable cover, and means for securing said detachable cover to said trough-shaped body portion, substantially as and for the purposes set forth.
9. A sewer cleaning device comprising a trough-sbaped body portion having forwardly and outwardly projecting and sharp scoop-shaped charging or cutting ends pointed at their lowest portions, a swinging gate or door in one end of said trough-shaped body portion adapted to open inwardly into said trough-shaped body portion, a detachable cover, and means for securing said detachable cover to said trough-shaped body portion, substantlally as and for the purposes set forth.
10. A sewer cleaning device comprising a trough-shaped body having a forwardly projecting and sharp scoop-shaped charging or cutting end pointed at its lowest portion, a detachable cover, and means for securing said detachable cover to said trough-shaped body, consisting essentially of fixed bolts secured upon one end of said detachable cover. and movable bolts slidably arranged at the opposite end of said detachable cover, said trough-shaped body portion being provided with holes for the reception of sald bolts, substantially as and for the purposes set forth.
11. A sewer cleaning device comprising a trough-shaped body having forwardly and outwardly projecting and sharp scoop-shaped charging or cutting ends pointed at their lowest portions, a detachable cover, and means for securing said detachable cover to said trough-shaped body, consisting essentially of fixed bolts secured upon one end of said detachable cover, and movable bolts slidably arranged at the opposite end of said detachable cover, said trough-shaped body portion being provided with holes for the reception of said bolts, substantially as and for the purposes set forth.
12. A sewer cleaning device comprising a trough-shaped body portion having a forwardly projecting and sharp charging or cutting end pointed at its lowest portion, a swinging gate or door in one end of said trough-shaped body portion adapted \(t\) open inpardly into said trough-shaped body portion, a etachable cover, and means for securing said detachable cover to said trough-shaped body portion, consisting essentially of flxed bolts secured upon one end of said detachable cover, and movable bolts slidably arranged at the opposite end of said detachable cover, said trough-shaped body portion being provided with holes for the reception of said bolts, substantially as and for the purposes set forth.
13. A sewer cleaning device comprising a trough-shaped body portion having forwardly and outwardly projecting and sharp scoop-shaped charging or cutting ends pointed at their lowest portions, a swinging gate or door in one end of said trough-shaped body portion adapted to open inwardly into sald trough-shaped body portion, a detachable cover, and means for securing said detachable cover to said troughshaped body portion, consisting essentially, of fixed bolts secured upon one end of said detachable cover, and movable bolts slidably arranged at the opposite end of said detachable cover, said trough-shaped body portion being provided with holes for the reception of sald bolts, substantially as and for the purposes set forth.
14. A sewer cleaning device comprising a scoop-shaped body adapted to be drawn through a sewer to collect obstructions, a closure near one end of said device, and a cover detachably connected with said scoop-shaped body to produce a bucket, substantially as and for the purposes set forth.
15. A sewer cleaning device comprising a scoop-shaped body, draft links pivotally connected with each end of said body for drawing said body through a sewer to collect obstructions, a closure near one end of said device. and a cover detachably connected with said scoop-shaped body to produce a bucket, substantially as and for the purposes set forth.
16. A sewer cleaning device comprising a scoop-shaped body adapted to be drawn through a sewer to ccllect ob structions, a closure near one end of sald device, a cover tletachably connected with sald scoop-shaped body to produce a bucket, and means for securing said cover in position, consisting essentially of fixed bolts secured upon one
cnd of said detachable cover, and movable bolts slidably arranged at the opposite end of said detachable cover, sald scoop-shaped body being provided with holes for the reception of said bolts, substantially as and for the purposes set forth.
17. A sewer cleaning device comprising a scoop-shaped body, draft links pivotally connected with each end of said body for drawing said body through a sewer to collect obstructions, a closure near one end of the sald device, a cover detachably connected with said scoop-shaped body to produce a bucket, and means for securing said cover in position, consisting essentially of fixed bolts secured upon one end of said detachable cover, and movable bolts slidably arranged at the opposite end of said detachable cover. sald scoop-shaped body being provided with holes for the reception of said bolts, substantially as and for the purposes set forth.
18. A sewer cleaning device comprising a scoop-shaped body adapted to be drawn through a sewer, to collect obstructions, a hinged gate near one end of the sald device, and a projection extending from said gate to prevent the gate sticking by suction, substantially as and for the purposes set forth.

No. 101,046. Fioctric Bmelting Furnace. Hout fourneas éleotrique.

E. A. A. Gronwall, A. R. Lindbald, and O. Stalhane, co-inventors, all of Ludirika, Sweden, 18th September, 1906 ; 6 jears. Filed 5th May, 1906. Receipt No. 135,591.
Claim.-1. An electric furnace comprising a static electric transformer, an endlese groove arranged so as to enclose one or two legs of the said transformer and intended for the reception of the material to be heated or smelted which material itself or eventually other conductors placed in said groove, forms the secandary coil of the transformer, sald groove being thus arranged, that parts of the same are placed substantially parallel to and near each other so as to form arms or projections etxending from those parts of the groove that are bent round the leg or legs of the transformer and for inducing alternate current in the material forming the secondary coll.
2. In an electric furnace of the class described the arrangement of two or more electric transformers combined with each other by a common secondary coll formed by an endless groove onclosing a leg of the iron cores of each of the transformers and charged with the material to be heated, said groove being thus arranged that parts of the same are placed substantially parallel to and near each other so as to form a projection or arm, connecting said parts of the groove with each other that are bent around the said legs of the cores of the transformer.
3. In an electric smelting furnace of the class described, the combination of the groove intended for the reception of the material to be treated with a blast furnace or other smelting furnace in such a way that parts of the sald groove extend into or pass through the hearth of said blast furnace or smelting furaace.
4. In an electric furnace of the class described the combination of two grooves intended for reception of material to be treated and each provided with parts arranged parallel to and near each other so that sald parts form relatively long arms or projections, sald grooves being located the one higher than the other and connected with each other by suitable means for tapping off smelted mass from the one into the other, the higher one of said grooves eventually extends into or passes through the hearth of a blast furnace or other amelting furnace. onc or more transformers elther rommon to both the sald grooves or one or more transformers arranged separately for each of the grooves for inducing alternate electric current in the conducting material placed in said grooves.
5. In an electric furnace of the class described the arrangement that the groove intended for reception of the material to be treated and which extends into the blast furnace or smelting furnace be covered with a vault or plates of fireproof materials, so that canals or passages be formed extending into the blast furnace, said canals or passages being connected with a pipe for introducing suitable gases, as for instance gases containing carbon monoxide, into the blast furnace or the smelting furnace
6. In an electric furnace of the class described two or more grooves each of which being arranged to partly enclose a leg of the iron core belonging to one and the same transformer or a leg of each of several separate electric transformers, sald grooves being connected with each other by means of other grooves arranged parallel to and near each other in such a way that the first-mentioned grooves together with the last-mentioned one form an endless groove, a blast iurnace or other similar furnace located above the parts of sald groove that are placed parallel to and near each other through the hearth of which furnace the last-mentioned parts of the groove pass.
7. In an electric furnace of the class described the arrangement of a basin for collecting the smelted material, said basin being connected with the groove or grooves intended for reception of the material to be smelted and located about at the middle of the parts of said groove or grooves that are arranged parallel to and near each other, sald basin being further so arranged as to form a neutral point.
8. In an electric furnace of the class described the arrangement that the primary coil of the transformer is placed on the lower part of those parts of the core of the transformer that connect its vertical legs with each other or eventually that a primary coll be placed at the same time on both the said lower part and on the adjacent part of the leg not enclosed by the smelting groove or secondary coil.

No. 101,047. Concentrator. Concentrateur.

E. Peters and G. F. Bander, Seattle, Washington, and Alexander D. Campbell, Van Asselt, Washington, U. S.A., co-inventors, 18th September, 1906; 6 years. Filed 24th July, 1906. Receipt No. 138,117.
Olaim.-1. In apparatus of the class described, the comblnation with the chute, and of a frame adapted to be placed within said chute, said frame being formed with sides and a top with alternately disposed rimes and defector bars which are arranged in different planes.
2. In apparatus of the class described the combination with the chute, of a irame adapted to be placed within said chute, said frame being formed with sides and a top with alternately disposed riffes and deflector bars which are arranged in different planes, and a layer of fabric intermediate the frame and the bottom of the chute.
3. In apparatus of the class described the combination with the chute having a cleat at its delivery end, of a frame adapted to be placed within said chute, said frame being formed with sides and a top with alternately disposed riffies and deffector bars which are arranged in different planes, and a layer of fabric intermediate the frame and the bottom of the chute.
4. In apparatus of the class described the combination with the chute having a cleat at its delivery end, and a hopper provided with a discharge opening communicating with the chute, of a frame adapted to be placed within sald chute. said frame being formed with sides and a top with alternately disposed riffies and deficctor bars which are arranged in differcnt planes, and a layer of fabric intermediate the frame and the bottom of the chute.
5. In apparatus of the class described the combination with the chute having a cleat at its delivery end, and a hopper provided with a discharge opening communicating with the chute, of a frame adspted to be placed within said chute, said frame belng formed with side and a top with alternately disposed riffes and deflector bars which are arranged in different planes, a layer of fabric intermediate the frames and the bottom of the chute, and a gate for said discharge opening.
6. In an apparatus of the class described, the combination with the chute having a cleat at its delivery end, and a hopper provided with a discharge opening communicating with the chute, of a frame adapted to be placed within said chute and extend into said discharge opening, said frame being formed with sides and a top with alternately disposed riffles and deflector bars which are arranged in different planes, a layer of fabric intermediate the frame and the bottom of the chute, and a grate for said discharge opening.
7. In apparatus of the class described the combination with the chute having a cleat at its delivery end, and a hopper provided with a discharge opening communicating with the chute, of a frame adapted to be placed within sald chute and extend into said discharge opening, said frame being formed with sides and a top with alternately disposed riffles and deflector bars which are arranged in different planes, a layer of fabric intermediate the frame and the bottom of the chute, a grate for said discharge opening, and a gate for the delivery end of the frame.
8. In apparatus of the class described, the combination with the chute having a cleat at its delivery end, and a hopper provided with a discharge opening communicating with the chute, of a frame adapted to be placed within said chute and extend into said discharge obening, said frame being formed with sides and a top with alternately disposed riffles and deflector bars which are arranged in different planes, a packing piece for making a non-leakable joint between the hopper and the frame, a layer of fabric intermediate the frame and the bottom of the chute, a gate for said discharge opening, and a gate for the delivery end of the frame.

No. 101,048. Railway Gate. Barritre de chembn de fer.

Albert M. Dyer, Baxter, Tennessee, U.S.A., 18th September, 1906 ; 6 years. Filed 25th June, 1906. Recelpt No. 137,251. Claim.-1. The combination with the track ralls, of guides depending therefrom, and a gate movable upon said guides. 2. The combination with the track rails, of guides depending therefrom, and an automatically operated gate slidable upon said guides.
3. The combination with the track rails, of guides depending therefrom, a gate vertically slidable upon said guides, a spring for elevating sald gate, and a tread bar for lowering said gate.
4. The combination with the track ralls, of guide rods depending therefrom and connected at their lower ends, a vertically sliding gate upon said rods having slots or openings to receive said track rails, springs upon said rod for clevating said gate, and tread bars for lowering said gate.
5. The combination with the track rails, of guide rods de pending therefrom and connected at their lower ends, a vertically sliding gate upon said rods having slots or openings to receive said track rails, springs upon said rod for
elevating said gate, and pairs of tread bars arranged upon opposite sides of said gates and having their outer ends pivotally connected to the track rails and their inner ends loosely pivoted to said gate, substantially as described.

No. 101,049. Tobacco Pipe Stem Cleaner. Nettoyeur de pipe de tabac.

Benjamin Franklin Eshelman, Tacoma, Washington, U.S.A.
18th September, 1906; 6 years. Filed 26th June, 1906. Receipt No. 137,313 .
Claim.-1. In a pipe the combination of a bowl, a stem having two smoke passages therein, a mouthpiece having a single passage therein adapted to connect with either one of said smoke passages, and a cleaner secured to said mouthplece and adapted to enter and to dry out the smoke passage with which said mouthplece passage is not connected.
2. In a plpe the combination of a stem having smoke passages therein arranged symmetrically of the center, and a rotatable mouthpiece having an eccentric passage therein adapted to connect with different passages in sald stem in different positions thereof.
3. A pipe having a bowl, a stem with a plurality or symmetrical passages therein, a mouthpiece adapted to connect with any of said passages, a cleaner secured to said mouthpiece and lying within the unused passage in said stem.

No. 101,050. Machine for Clamping Pieces of Wood, Etc.
Machine pour unir des pieces do bois, etc.

William Jamieson, Grays, Essex, England, 18th September, 1906; 6 years. Filed 20th April, 1906. Receipt No. \(135,120\).
Claim.-1. In a machine for clamping wood or other material the employment of a presser bar worked by a crank and connecting rod through a lever having no flxed or immovable fulcrums, and the work of which is measured by the strength of a spring to which it is attached, substantially as described with reference to the accompanying drawings.
2. In a machine for clamping wood or other material, the device for preventing the work rising from the table when pressure is applied, consisting of a bar hinged to the presser and having its lower end extended through a slot in the table against the end of which slot it engages and is tilted up to allow work to be placed on the table.
3. In a machine for clamping wood or other material having a bar hinged to the presser for the purpose of holding the work down on to the table, the arrangement of a piece fixed to the end of the table and having a hole in it through which the said bar can pass (as the presser moves forward) for the purpose of further strengthening and securing \(i t\), substantially as described.
4. In a machine for clamping woorl or other material, the arrangement of a clutch so disposed as will allow the machine to perform one revolution and then stop, such device consisting of a shoe resting on the edge of a disc and controlling the rise and fall of a catch and working conjunction with a projecting ring on the side of a driving wheel, substantially as described and set forth with reference to the accompanying drawings.
No. 101,051. Protector for Tool Handles. Protecteur pour manches d'outils.

John H. Lyons, Oregon, U.S.A., 18th Scptember, 1906 ; \(\mathbf{~}\) years. Filed 29th June, 1906. Receipt No. 137,400.
Claim.-The combination with a tool and its handles, of a detachable shield embracing the handle and comprising a soft iron body portion having its parallel longitudinal edges tampered and spaced apart to conform to the shape of the tool handles and gradually increasing in thickness from said edges to the center of the body portion and inclined towards one end of the latter, said body portion being provided at its opposite end with an annular shoulder for engagement with the base of the tool and having a reduced extension of approximately one half the width of the body portion and forming a socket adapted to receive the adjacent longitudinal edge of the handle, the end of the extension being bent to form a central laterally projecting lug for engagement with the head of the tool and provided with the longitudinal key receiving recess extending laterally through the walls of said extension and communicating with the eye of the tool, and a key seated in said recess and adapted to pierce the handle.

\section*{No. 101,052. Overseaming Device for Sewing Ma-} chines.

\section*{}

Jehu C. Moore, Brooklyn, New York. U.S.A., 18th September, 1906 ; 6 years. Filed 11th June, 1906. Recelpt No. 136,774. Claim.-1. In a device for the purpose specified the combination with the intermittently rotating pillar provided with a radial cam at its lower end, the base plate and the casing of the plllar provided with a recessed base, of a pusher \(\mathbf{G}\) slidably mounted and provided with a semi-circular yoke \(h\) ombracing the said cam on the pillar, said yoke having a projection \(i\) disposed in the path of the cam for withdrawing the pusher.
2. In a device for the purpose specified the combination with the base plate A, the upright casing B mounted on the base plate and provided with a recessed base \(c\). and the intermittently rotating pillar \(C\) in the casing and provided with a radial cam \(g\) at its lower end of the slidably mounted pusher provided with means so disposed as to be engaged by said cam \(g\) for imparting positive reciprocating movement to the pusher.
3. In a device for the purpose specifled the combination with the base plate, the reciprocating pusher and the spring

plate mounted adjustably on the base plate, of a presser device and guide I, carried by the spring plate and having au upper lip 1, an upper guide 2, a lower lip 3, and a lower guide 4, substantially as set forth.
4. In a device for the purpose specified the combination with the base plate A, having an edge \(n\) set obliquely to the path of the feed, the reciprocating pusher and a spring plate mounted adjustably on said base plate of a presser device and guide \(I\), mounted on and carried by the spring plate and having an upper lip 1, an upper guide 2, a lower lip 3, and a lower guide 4. said guide being parallel with the adjacent margin or edge \(n\) of the base plate.
5. A guide \(J\) for an overseaming attachment having an upright guide plate 4, a loop-like portion, a spring finger \(p\) attached to said loop-like portion at one end and bearing with spring pressure on the outer face of the guide plate 4, said finger being directed forward at its free end and a pin \(q\) carried by the guide and aligned with the guide plate 4 and in front of same.
6. In a device for the purpose specified the combination with the base plate, a pusher for displacing the goods, means for operating the pusher and a guide for the goods, said guide having an attaching portion whereby it is secured to the base plate, a loop-like portion, an upright guide plate 4, a spring finger \(q\) attached to the free end of the loop-like portion and its frec end adapted to bear with spring pressure up to the plate 4, and an upright pin \(q\) carrled by the guide and disposed in front of an adjacent to the pusher.

No. 101,053. Incubator Nest. Couveuse.

John U. Moore, Morrow, Iowa, U.S.A., 18th September, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,300. Claim.-1. In an incubator, a casing opon at the lower side in combination with a nest for the eggs detachably connected into said casing and inserted into and removable downwardly and swinging laterally from sald casing.
2. In an incubator, a casing open at the lower side, a nest for the eggs detachably fitting into said oden side, a supporting means having said nest mounted for rotation thereon, vertically, and means for swinging said supporting means and the nest carried thereby laterally.
3. In an incubator, a casing open at the lower side, a nest for the eggs detachably fitting into said open side, a supporting means having said nest mounted or rotation thereon, means for moving said supporting means and the nest carried thereby vertically, and means for swinging sald supporting means laterally
4. In an incubator, a casing open at the lower side, a bracket connected to said casing, a standard mounted for rotative and longitudinal movement in said bracket, an arm extending laterally from said standard, a nest for the eggs mounted for rotation upon said arm, and means for moving sald standard and the arm and nest carried thereby vertically to insert said nest into and remove it from said casing.
5. In an incubator, a casing open at the lower side, a bracket conected to said casing, a standard mounted for rotative and longitudinal mevement in said bracket, an arm extending laterally from said standard, a nest for the eggs mounted for rotation upon said arm, a collar mounted loosely upon said standard and bearing upon said bracket, spaced rods movably connected by one end to said collar, a wheel rotatively connected to the other ends of said rods and provided with an operating handle, and means for movably coupling said wheel to said standard.

No. 101,054. Crosscut Saw Fandle.
Manche de scie.

Heman E. Owens, Black Creek, New York, U.S.A., 18th September, \(1906 ; 6\) years. Filed 25th June, 1906. Receipt No. 137,261.
Cilam.-1. A saw handle comprising in combination a grip, a ferrule to which said grip is attached and provided with a contracted upper portion and an enlarged lower portion, an internally threaded core projecting upwardly from the bottom of said ferrule, a looped rod having a threaded portion adapted to be retained in place in said core, and means carried by said core adapted to expend the lower end of the grip.
2. In a saw handle, a ferrule formed of a single pitce of metal and having an enlarged lower portion and a contracted upper portion, an internally threaded core projecting upwardly from the bottom of said ferrule, a looped rod adapted to recelve one end of said saw blade and held in place in said threaded core, and wedge-shaped projections provided on opposite sides of said core.
3. A saw handle comprising in combination a grip, a ferrule to which sald grip is connected and provided with an upper contracted portion, a lower enlarged portion and an internally threaded core projecting upwardly from the bottom of said ferrule and provided at diametrically opposite points with wedge-shaped projections, said grip being provided with an upwardly extending opening adapted to receive said core when in place in said ferrule and a looped rod to embrace one end of the saw blade and held in place in the threaded portion of the core.

No. 101,055. Naphin Holder. Porte-serviette.
Sarah VanDuzer, New York City, New York, U.S.A., 18th September, 1906 ; 6 years. Filed 21st June, 1906. Recelpt No. 137.136.
Claim.-A napkin holder comprising a body portion embodying a spring coil, each of the loops of the coil having the curvature thereof continuous in the same plane, sald
body portion having one end thereof extending rearwardly at an inclination and the other end vertically, rearwardly

and downwardly at an inclination, said rearwardly extending portions arranged at the back of the body portion, one of said rearwardly extending portions provided with an enlargement.

No. 101,056. Box Filling Machine.
Machine d remplir les boîtes.

The Diamond Match Company, Chicago, Illinois, assignee of Jacob P. Wright and Charles F. Wright, both of Baberton, Ohio, U.S.A., 18th September, 1906 ; 18 years. Filed 2nd June, 1906. Recelpt No. 136,484.
Claim.-1. In a box filling machine the combination of a series of travelling holders movable in a horizontal plane or substantially so, a fiexible carrier extending toward, longitudinally of, and away from the path of said holders, a series of plungers supported by said carrier and progressively impelled thereby to and in a path alongside of, and in slibstantially the same horizontal plane with, the holders, means for concertedly impelling the holders and the longltudinally adjacent portion of the carrier in the same direction and at the same rate of speed, and means for reciprocating horizontally, or substantially so, the plungers of such portion of the carrier transversely of the path of travel of the holders and of the carrier, substantially as described.
2. In a box filling machine the combination of a series of travelling bolders movable in a horizintal plane, or substantially so, an endless flexible carrier extending toward, longitudinally of, and away from the path of said holders, a series of plungers supported at intervals by and throughout the length of said carrier and progressively impelled thereby to and in a path alongside of, and in substantially the same horizontal plane with, the holders, means for concert cdly impelling the holders and the longitudinally adjacent portion of the carrier in the same direction and at the same rate of speed, and means for reciprocating horizontally, or substantially so, the plungers of such portion of the carrier transversely of the path of travel of the holders and of the carrier, substantially as described.
3. In a box flling machine the combination of a series of \(t \in m p o r a r y\) match holders movable in a horizontal plane, or substantially so, an endless chain of links extending toward, longitudinally of. and away from the path of said holders, Hlungers supported by the respective links of said chain and progressively impelled thereby to and in a path alongside of, and in substantially the same horizontal plane with, the
holders, means for concertedly impelling the holders and the longitudinal portion of the chain in the same direction and at the same rate of speed, and means for reciprocating horlzontally, or substantially so, the plungers of such portion of the chain transversely of the path of travel of the holders and of the chain, substantially as described.
4. In a box filling machine the combination of an endless chain of holders movable in a horizontal plane or substant!ally so, an endless chain of links extending toward, longitudinally of, and away from the path of said holders, plungers supported by the links of said chain and progressively impelled thereby to and in a path alongside of, and in substantially the same horizontal plane with, the chain of holders, means for concertedly impelling the adjacent longitudinal portions of said chains in the same direction and at the same rate of speed, and means for reciprocating horizontally or substantlally so, the plungers transversely of the path of travel of the holders and of the carrier, substantially as described.
5. In a box flling machine the combination of an endless chain of holders movable in a horizontal plane, or substantially so, an endless chain of links extending toward, longitudinally of, and away from the path of sald holders, plungers supported by the links of said chain and progressivels mpelled thereby to and in a path alongside of, and in substantially the same horizontal plane with, the chain of holders, means for concertedly impelling the adjacent longitudinal portions of sald chains in the same direction and at the same rate of speed, and a stationary cam with which the plungers co-act during their traverse, whereby the said plungers are reciprocated horizontally, or substantially so, across the path of travel of the holders as they move onward therewith, substantially as described.
6. In a box flling machine the comblnation of a series of tcmporary match holders movable in a horizontal path, or substantially so, an endless flexible carrier extending toward, longitudinally of, and away from, the path of said match holders, plungers supported by and throughout the length of said carrier, and progressively impelled thereby to and i: a path alongside of, and in substantially the same horizontal plane with, the match holders, means for continuously moving said holders and the adjacent longitudinal portion of the carrier in the same direction and at the same rate of speed, and means for reciprocating the plunger in such portion of the carrier horizontally, or substantially so, into and across the path of travel of the match holders as they travel along therewith, whereby the matches are progressively exalong therewith, whereby the said match holders, substantially as described.
7. In a box filling machine the combination of a series of horizontally travelling holders for tray-and-shuck boxes, an erdless fiexible carrier extending toward, longitudinally of, and away from the path of said holders, plungers supported by and throughout the length of said carrier, and progressively impelled thereby to and in a path alongside of, and in substantially the same horizontal plane with, the holders, means for continuously moving said holders and the adjacent longitudinal portion of the carrier in the same direction and at the same rate of speed, and means for reciprocating the plungers in such portion of the carrier horizontally, or substantially so, into and across the path of travel, of said holders to impinge against and effect the opening of the trays of the boxes carried by the hoiders, substantially as described.
8. In a box flling machine the combination of a serles of horizontally travelling holders for sustaining tray-and-shuck boxes with their trays in open position, an endless flexible carrier extending toward, longitudinally of, and away from, the path of sald holders, plungers supported by and throughout the length of said carrier, and progressively impelled thereby to and in a path alongside of, and in substantially the same horizontal plane with, the holders, means for continuously moving said holders and the adjacent longitudinal portion of the carrier in the same direction and at the same rate of speed, and means for reciprocating the plungers in such portion of the carrier horizontally, or substantially so, in respect to the path of travel of said holders to push into their shucks the open trays of the boxes carried by gaid holders, substantially as described.
9. In a box filling machine the combination with a series oi box holders, and means for impelling the same, of two of positely disposed sets of plungers, whereof one set is adapted to open and the other set to close the trays of boxes in said holders, carriers for the respective sets of plungers, uch of said carriers extending towards, longitudinally of, and away from the path of the box holders, means for imwlling in concert with the box holders the longitudinal portions of the respective carriers adjacent thereto, and means for reciprocating the respective sets of plungers in opposite directions across the path of travel of the box holders, substantially as described.
10. In a box filling machine the combination with a series of temporary holders a series of box holders adjacent thereto, and means for concertedly actuating said match and box holders, of two oppositely disposed sets of plungers whereof one set is adapted to open the trays of the boxes in the box holders and the other set to transfer the contents of the temporary holders to said trays, carriers for the respective sets of plungers, each of sald carrlers extending towards, longitudinally of and away from the path of the box holders, means for impelling in concert with the sald match and box holders the longitudinal portions of the respective carriers adjacent thereto, and means for reciprocating the said sets of plungers across the paths of travel of the match and box holders respectively, substantially as described.
11. In a box filling machine the combination with a series of temporary match holders a series of box holders adjacent thereto, and means concertedly actuating said match and box holders of two oppositely disposed sets of plungers, whereof cne set is adapted to open the trays of the boxes in the box holders and the other set to transfer the contents of the temporary holders to sald trays, carriers for the respective sets of plungers \({ }_{2}\) each of said carriers extending towards, longitudinal of and away from the path of the box holders, means for impelling in concert with the sald match and box holders the longitudinal portions of the respective carriers adjacent thereto, means for receiprocating the said sets of plungers across the paths of travel of the match and box holders respectively and means for closing the filled boxes, substantially as described.
12. In a box filling machine the combination with a series of temporary match holders, a series of box holders adjacent thereto, and means for concertedly actuating sald match and box holders, of two oppositely disposed sets of plungers, whereof one set is adapted to open the trays of the boxes in the box holders and the other set to transfer the contents or the temporary holders to said trays, carriers for the respective sets of plungers, each of said carriers extending towards, longitudinally of and away from the path of the box holders, means for impelling in concert with the said match and box holders the longitudinal portions of the respective carriers adjacent thereto, means for reciprocating the said sets of plungers across the paths of travel of the match and box holders respectively, a third set of plungers adapted to close the filled boxes, a carrier for the last-named plungers, means for actuating this carrier and means for reciprocating its plungers across the path of travel of the box holders, substantially as described.
13. In a box filling machine the combination with a series of temporary match holders, means for ejecting the matches therefrom comprising a series of plungers, a carrier for said plungers, and means for reciprocating said plungers with a vibratory or jarring action across the path of travel of the match holders, substantially as described.
14. In a box filling machine the combination with a series of temporary holders for matches, of a plunger for ejecting the matches endwise from said holders, and means for reciprocating said plungers with a rapid vibratory or jarring action transversely of the match holders, whereby a tremulous impact is exerted upon the ends of the matches while they are being ejected, substantially as described.
15. In a box filling machine the combination with means for impelling open trays in a horizontal position, of means in the horizontal path of said trays for engaging and raising one end of said trays during their trasverse so as to Incline or tilt the same, and means for introducing matches to the inclined trays, substantialiy as described.
16. In a box flling machine the combination with means for impelling open trays in a horizontal position, of means in the horizontal path of said trays for engagng and ralsing one end of said trays during their traverse so as to incline or tilt the same, means for introducing matches to the inclined trays, and means for returning the trays to their normal plane, substantially as described.
17. In a box fllling machine the combination with means for impelling open trays in a horizontal position, of means in the horizontal path of said trays for engaging and raising one end of said trays during their traverse so as to incline or tilt the same, means for introducing matches to the inclined trays, means for returning the trays to their normal plane and yielding means bearing upon the matches while they are being introduced to the trays, substantially as described.
18. In a box flling machine the combination with means for impelling open trays in a horizontal position, of means for raising one end of said trays to incline or tilt the same. means for introducing matches to the inclined trays and yielding means extending longitudinally of the path of travel of the trays and bearing upon the matches during and after their introduction of the trays, substantially as described.
19. In a box filling machine the combination with means for impelling open trays in a horizontal position, of means for raising one end of said trays to incline or tilt the same,
means for introducing matches to the inclined trays and a thin flexible rod extending longitudinally of the path of travel of the trays and bearing upon the matches during and after their introduction to the trays, substantially as described.
20. In a box fllling machine the combination with means for impelling open trays in a horizontal position, of means for raising one end of said trays to incline or tilt the same, means for introducing matches to the inclined trays. a thin flexible member extending longitudinally of the path of travel of the boxes and bearing upon the matches during and after their introduction to the trays, and means for acting against the ends of the matches while they are passing under said member, substantially as described.
21. In a box filling machine the combination with means for impelling slide boxes having their trays in open position, of means extending into and longitudinally of the path of travel of the boxes for raising the engaged ends of the box shucks and trays and thereby inclining the same, and means for introducing matches to the Inclined open trays, substantially as described.
22. In a box filling machine the combination with a travelling carrier on which slide boxes with trays in open position are carried, of a cam extending into and longitudinally of the path of travel of the boxes with which cam said boxes ccntact and by which the engaged ends of the box shucks and trays are raised to incline the shucks and trays and means for introducing the matches to the inclined open trays, substantially as described.
23. In a box flling machine the combination with means for impelling slide boxes having their trays in open position, of means extending into and longitudinally of the path of travel of the boxes for raising the engaged ends of the box shucks and trays and thereby inclining the same, means for irtroducing matches to the inclined open trays, and means for returning the boxes to their normal plane, substantially a. described.
24. In a box flling machine the combination with a travelling carrier on which slide boxes having their trays in open position are carried, of a cam extending into and longitudinally of the path of travel of the boxes with which cam said boxes contact and by which the engaged ends of the box shucks and trays are raised to incline the same, means for introducing matches to the inclined open trays, and means for returning the boxes to their normal plane, substantially as described.
25. In a box fllling machine the combination with means ior impelling slide boxes having their trays in open position, of means for supplying matches to said boxes, means for bodily jarring the filled boxes, and means for thereafter closing the boxes, said latter means comprising a series of plungers, a carrier for moving them along with the boxes and devices for progressively reciprocating them into and from the path of travel of the boxes during their langitudinal traverse therewith, substantially as described.
26. In a box flling machine the combination with means for impelling slide boxes having their trays in open position, of means for supplying matches to said boxes, means for bodily jarring the filled boxes, means for partially closing the boxes while they are being jarred, and means for thereafter completing the closing of the boxes, said latter means comprising a series of plungers, a carrier for moving them along with the boxes and devices for progressively reciprocating them into and from the path of travel of the boxes during their longitudinal traverse therewith, substantially as described.
27. In a box fllling machine the combination with an endless chain of holders in which the boxes are held with their trays in open position, of means for supplying matches to said boxes, means for bodily jarring the flled boxes, and means for partially closing the boxes while they are being jarred, said latter means comprising an inclined rib or cam which extends into the longitudinal path of travel of the open ends of the trays, substantially as described.
28. In a box fllling machine the combination with an end. lags chain of holders in which the boxes are held with their trays in open position, of means for supplying matches to sald boxes. means for bodily jarring the filled boxes, means for partially closing the boxes while they are being jarred, and means for thereafter completing the closing of the boxes, said latter means comprising a series of plungers, a carrier for moving them along with the boxes and devices for progressively reciprocating them into and from the path of travel of the boxes during their longitudinal traverse therewith, substantially as described.
29. In a box flling machine the combination with an endless chatn of holders in which the boxes are held with their trays in open position, of means for supplying matches to sald trays, means for jarring the filled boxes. and means for thereafter closing the boxes, said latter means comprising
a series of plungers, a carrier for moving them along with the boxes and devices for progressively reciprocating them into and from the path of travel of the boxes during their longitudinal traverse therewith, substantially as described.
30. In a box fllling machine the comblnation with an endless chain of box holders in which the boxes are held with their trays in open position, of means for supplying matches to said boxes, means for bodily jarring the holders with the filled boxes, and means for thereafter closing the boxes, said latter means comprising a series of plungers, a carrier for moving them along with the boxes and devices for progressively reciprocating them into and from the path of travel of the boxes during their longitudinal traverse therewith, substantially as described.
31. In a box filling machine the comblnation with box holders comprising jointed links having parallel walls to receive and hold closed boxes, of means for opening the said boxes during the travel of the holders, means for supplying matches to the open boxes, and means for thereafter closing said boxes, said latter means comprising a series of plunsers, a carrier for moving them along with the boxes and devces for progressively reciprocating them into and from the path of travel of the boxes during their longitudinal traverse therewith, substantially as described.
32. In a box flling machine the combination with an endless chain, of box holders comprising jointed links having parallel walls to recelve and hold boxes, of means for supplying closed boxes to said chain, means for opening the said boxes during the travel of the chaln, means for supplying matches to the open boxes, and means for thereafter closing said boxes, said latter means comprising a series of Ilungers, a carrier for moving them along with the boxes and devices for progressively reciprocatingthem into and from the path of travel of the boxes during their longitudinal traverse therewith, substantially as described.
33. In a box filling machine, an endless chain of box holders comprising jointed links each having a horizontal body portion with surfaces for the support of the shucks and trays respectively of the boxes, one of said surfaces being providedwith plane parallel walls to embrace the shucks and the other with recessed or off-set walls to embrace the trays cxtending from said shucks and to overhang the upper edges of the side walls of the trays, substantially as described.
34. In a box filling machine, an endless chain of box holders comprising jointed links each having two flat horizontal surfaces on different planes, the lower surface being provided with plane vertical walls and the upper surface with recessed or offset walls, substantially as described.
35. In a box filling machine the combination of an endless chain of box holders, two endless chains of plungers between which travels the chain of box holders, each of said chains of plungers for a portion of its length extending adjacent to and in parallelism with the chain of box holders, means for impelling the adjacent parallel portions of the respective chains in the same direction and at the same rate of speed, and means for progressively reciprocating the respective sets of plungers toward and from the box holders as they travel along therewith, substantially as described.
36. In a box filling machine the combination with a series of travelling holders and actuating mechanism therefor, of a trough or way for said holders comprising severai sections frinted together and pivotally supported at their outer extremities, and means for vertically jarring sald trough or way, substantially as described.
37. In a box flling machine the combination with the match carrier of a match machine, and means for discharging the matches from said carrier, of a series of travelling holders moving across the path of the matches discharged from said carrier, and a trough or way for said holders comprising several sections jointed together, one section extending throughout the width of carrier, or substantially so, and the other sections of the trough being plvotally supported at their extremities, as described, together wth means for vertically jarring said trough or way, substantially as described.

\section*{No. 101,057. Plate Lifter.}

Appareil à soulever les assiettes.
Oscar Goodwin and William H. Sanborn, assignee of a half interest, both of Berlin, New Hampshire, U.S.A., 18th September, 1906; 6 years. Flled 25th June, 1906. Receipt No. 137,277 .
Claim.-A plate lifter and carrier comprising a handle of the character described, two pairs of arms composed of wire depending from the handle. a pair of jaws formed from the central portions of sald wires and each jaw constructed on cach side with a straight portion, a triangular bend, an inward return bend forming a long finger, and a stretch of wire the outer margin of the central part of the jaws, each jaw
being a counterpart of the other, excepting when closed the finger bends of one jaw will extend parallel with and out-

side of the finger bend of the other \(j a w\), and into the trlangular bend of the opposite jaw.

No. 101,058. Embraidery Device for Bewing Man chine.
- Apparcil de broderics pour machines a coudre.

B!llie Johnson and David R. Pendleton, assignee of a half interest, both of Temple, Texas, U.S.A., 18th September, 1906; 6 years. Filed 4th July, 1906. Receipts Nos. 137,513 and 138,151 .
Claim.-1. A yieldable presser foot attachment formed of a single piece of metal having at its lower end a coiled eye for the passage of the sewing needle, the upper portion of said plece of metal being bent to form a plurality of spaced arms arranged to bear against the bottom of the needle bar, and open at one end to permit the lateral introduction of the shank or body portion of the needle, an intermediate portion of the piece of metal being bent to form a spring loop.
2. A yieldable pressure foot attachment formed of a single piece of wire colled at one end to form an eye, the coils verlapping and the end of the wire being bent upward, the wire being thence bent to form a spring coil and being bent above the coll to form a plurality of arms disposed in paralle! relation, thereby to form an extended bearing for contact with the lower end of the needle bar, the upper port:on of the wire being bent at a right angle to said parallel bars to form a loop for engaging a boss or projection on said needle bar and the extreme end of the wire projecting to form a finger plece.

\section*{No. 101,059. Cement Post and Fastener.}

Poteau et attache de ciment.
Homer S. Quick, Indianapolis, Indiana, U.S.A., 18th September, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,474.
Claim.-1. A cement post provided with recesses in the surface and fence wire holding means insertible in any of said recesses and adapted to spread at its inner end to prevent its escape.
2. A cement post provided with recesses in the surface Wereof enlarged within the post, and fence wire holding means insertible in any of said recesses and adapted to spread at its inner end to prevent its escape.
3. A cement post provided with thimbles embedded therein and enlarged within the post, and compressible spring fasteners inscrtible in sald thimbles for holding the wires o: the fence.
4. A cement post with thimbles embedded in the surface thereof and enlarged at their inner ends, and spring wire

looped fasteners with their ends bent away from each other and when compressed insertible in the thimbles and expansible in the enlarged portions of the thimbles.
5. A cement post provided with metallic thimbles embedded therein, each thimble consisting of a body portion extending from the outer surface of the post into the post and a cap covering the inner end of the body portion of the thimble sc as to form an enlarged chamber therein, and a compressible spring fastener insertible in said thimble and with its inner ends expansible in said chamber.
6. A cement post with metallic thimbles embedded therein, each thimble formed of a body portion extending into the post and with an annular outwardly extending flange on its inner end and a cap for covering the inner end of said body portion of the thimble that surrounds sald fiange and has a stop to hold the back of the cap at a distance from the inner end of the body portion so as to form an enlarged chamber, and a compressible spring fastener insertible in said thimble with its inner ends expansible in sald chamber.
7. A cement post with metallic thimbles embedded therein, and compressible fasteners insertible in said thimbles for holding the wires of a fence, the diameter of the thimbles being greater than the width of the fastoners so that a tool may be inserted in the thimbles to compress the fasteners for the removal thereof.
8. A cement post provided with thimbles embedded thereIn, the outer ends of the thimbles being flush with the surface of the post and the inner ends enlarged, and compressible spring fasteners insertible in said thimbles for holding the wires of a fence.
9. A cement post provided with a recess in the surface thereof, and externally extending holding means insertible in said recess and adapted to spread at its inner end to prevent its escape.

\section*{No. 101,060. Process of Producing Fac-similes of 011 Paintinga.}

Procide pour la production de fac-simile de peinture d lhuile.
Herbert Frederick Gribble and Frank Augustus Rolph, assignee of a half interest, both of Toronto, Ontario Canada, 18th September, 1906; 6 years. Filed 20th July, 1906. Receipt No. 137,995.
Claim.-1. A process for the production of fac-similles of oil paintings consisting in first forming a solvent surface on a flexible holding, then printing the various colours upon said solvent surface and allowing the same to dry, then applying to the complete surface a solid colour and allowing the same to dry, then applying to said surface an adhesive, then applying said adhesive surface in a tacky condition to a primed sheet of textile material and finally removing said flexible holding, as described.
2. A process for the production of facsimiles of oll paintings consisting in first forming a solvent surface of a preparation of gum arabic on an absorbent flexible holding, then printing the various colours upon said solvent surface and allowing the same to dry, then applying to the complete surface a solid colour and allowing the same to dry, then applying to said surface an adhesive, then applying said adhesive surface in a tacky condition to a primed sheet of textile material and finally removing sald flexible holding, as described.
3. A process for the production of fac-similes of oll paintings consisting in first forming a solvent surface of a pre paration of gum arabic on an absorbent flexible holding. then printing the various colours upon sald solvent surface and allowing the same to dry, then applying to the complete surface an adherent coating and allowing the same to dry and form a solid backing to the colours, then applying to said surface an adhesive, then applying said adhesive surface in a tacky condition to a primed sheet of textile material and finally removing said flexible holding, as described.
4. A process for the production of fac-simlles of oll paintings consisting in first forming a solvent surface of a preparation of gum arabic on an absorbent flexible holding, then printing the various colours upon said solvent surface and allowing the same to dry, then applying to the complete surface an adherent coating and allowing the same to dry and form a solid backing to the colours, then applying to said surface an adhesive coating of a mixture of Canada balsam and lithograph varnish, then applying said adhesive surface in a tacky condition to a primed sheet of textile material and finally removing said flexible holding.
5. A process for the production of fac-similes of oil paint ings consisting in first forming a solvent surface of a preparation of gum arabic on an absorbent flexible holding, then printing the various colours upon the solvent surface and allowing the same to dry, then applying to the complete surface an adherent coating and allowing the same to dry , aud form a solid backing to the colours, then applying to said surface and adhesive coating of a mixture of Canada balsam and lithograph varnish, then applying said adhesive surface in a tacky condition to a primed sheet of textile material, then partly dissolving the solvent surface and finally removing the flexible holding, as described.
6. A process for the production of fac-similes of oil paintlags consisting in first forming a solvent surface of a preparation of gum arabic on a flexible holding, then printing the various colours upon sald solvent surface and allowing the same to dry, then applying to the complete surface an adherent coating and allowing the same to dry and form a solid backing to the colours, then applying to said surface an adhesive coating of a mixture of Canada balsam anil lithograph varnish, then applying said adhesive surface in a tacky condition to a primed sheet of textile material, then dampening the back of the flexible holding, then subjecting the whole to pressure and finally removing the said flexible holding, as described.

No. 101,061. Talking Machine. Gramophone.

The Victor Talking Machine Company, assignee of Wllburn N. Dennison, Camden, New Jersey, U.S.A., 18th September, 1906 ; 6 years. Filed 25th March, 1906. Recelpt No. 123.698

Claim.-1. A multi-speed regulator for talking machines comprising a governor, an adjusting screw for regulating the speed of the governor, connections between said screw and goveroor, a slidable rotatable sleeve within which said screw is mounted, an inclined guide for said rotatable sleeve and for limiting the movement of said slecve to give different speeds having definite relations to each other.
2. A multi-speed regulator for talking machines comprising a governor, an adjusting screw for regulating the speed of the governor, connections between sald screw and governor, a slidable rotatable sleeve within which sald screw is mounted, a fixed sleeve for holding said slidable sleeve, said sleeves being provided with a projection and corresponding recess for limiting the movement of said movable sleeve in relation to said fixed sleeve to give different speeds having defnite relations to each other.
3. A multi-speed regulator for talking machines comprisIng a governor, an adjusting screw for regulating the specd of the governor, connections between said screw and governor, a slidable sleeve within which said screw is mounted, a fixed sleeve for holding said slldable sleeve, means for movIng said slidable sleeve, a projection carried by sald slidable sleeve, said fixed sleeve having an inclined portion, said inclined portion being provided with stops for limiting the movement of said projection to definite distances thereover to give different speeds having definite relations to each other.
4. A multi-speed regulator for talking machines comprisIng a governor, an adjusting screw for regulating the speed of the governor, connections between said screw and the governor, a slidable sleeve within which said screw is mounted, a fixed sleeve for holding said slidable sleeve, a lever for moving said slidable sleeve radially, a projection carried by sald slidable sleeve, said fixed sleeve having a recess with an inclined rear wall within which is a socket for limiting the movement of said projection to definite distances on sald incline to give different speeds having definite relatlons to each other
5. A multi-speed regulator for talking machines comprising a governor, an adjusting screw for regulating the speed of the governor, connections between said screw and gover nor, a slidable sleeve within which said screw is mounted a fixed sleeve for holding said slidable sleeve. said fixed sleeve having a spring portion adapted to hold said slidable sleeve frictionally in position, and means for limiting the movement of said slidable sleeve within said fixed sleeve to give different speeds having definite relations to each other.

No. 101,062. Sole Presaing Machine.
Machine d presser les semelles.

The United Shoe Machinery Company. Montreal, Quebec, Canada, assignee of Erastus Edwin Winkley, Lynn, Massachusetts, U.S.A., 18th September, 1906 ; 6 years. Flled 22nd September, 1904. Receipt No. 118,602.
Claim.-1. A sole pressing machine having in combination a shoe supporting jack, a sole pressing form and mechanism operating automatically and continuously to impart a rela tive vertical movement to the jack and form to bring the jack and form into a position of pressure, to hold the jack and form in said position during the time required to press the sole of a shoe placed upon the jack and thereafter to separate the jack and form to bring the jack into a position of clearance, substantially as described.
2. A sole pressing machine baving in combination a shoe supporting jack, a sole pressing form and mechanism operat ing automatically and continuously to impart a relative vertical movement to the jack and form to bring the jack and form into a position of pressure, to hold the jack and form in said position during the time required to press the sole of a shoe placed upon the jack, and thereafter to return the jack to its position of presentation, substantially as described.
3. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of pressing forms co-operating respectively therewith, mechanism for rela lively actuating the jacks and forms to cause each jack and its co-operating form to press the sole of a shoe placed on the jack, comprising means for imparting relative vertical movements to each jack and form to produce pressure and clearance, means controlled by the operator for connerting each jack with said actuating mechanism and automatic means for disconnecting each jack therefrom, substantially 25 described.
4. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of pressing forms co-operating respectively therewith, mechanism for relatively actuating the jacks and forms to eause each jack and
its co-operating form to press the sole of a shoe placed on the jack comprising means for imparting relative vertical movements to each jack and form to produce pressure and clearance, and means for connecting each jack with said actuating mechanism having provision for throwing sald mechanism into operation, substantially as described.
5. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of pressing forms co-operating respectively therewith, mechanism operating automatically and continuously to impart a relative vertical movement to each jack and form when connected therewith to bring the jack and form into a position of pressure, to hold the jack and form in said position during the time required to press the sole of a shoe placed upon the jack and thereafter to return the jack into its position of presentation, and means for connecting and disconnecting each jack and said actuating mechanism, substantially as described.
6. A sole pressing machine having in combination a plurallty of shoe supporting jacks, a plurallty of pressing forms co-operating respectively therewith, mechanism for imparting to the jacks rectilinear reciprocating movements to bring them from a position of presentation to a position of clearance and to return them to a position of presentation, means for connecting and disconnecting each jack and said mechanism and mechanism for imparting to each jack and form relative vertical movements to bring the jack and form into a position of pressure and to separate the jack and form to bring the jack into a position of clearance, substantially as described.
7. A sole pressing machine having in combination a plurality of shoe supporting Jacks, a plurality of forms co-operating respectively therewith, mechanism acting to bring each jack and form when connected therewith into a position of pressure, to separate the jack and form to bring them into a position of clearance and to return the jack to a position of presentation, means for throwing each jack and its cooperating form into and out of operative connection with said actuating mechanism, and means acting automatically to throw said actuating mechanism out of operation when the Jack is in its position of presentation and its co-operating form is in its position of clearance, substantially as described.
8. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of forms cooperating respectively therewith, mechanism acting to bring each jack and form into a position of pressure, to separate the jacks and forms to bring them into a position of clearance and to return the jacks to a position of presentation, and means acting automatically to throw said actuating mechanism out of operation when one of the jacks is in its position of presentation and all the forms are in thelr position of clearance, substantially as described.
9. A sole presing machine, having in combination, a plurality of sole pressing forms, a plurality of shoe supporting jacks co-operating respectively therewith, a vertically reciprocating supporting table common to all the jacks and along which each jack is independently movable from a position of presentation to a position of clearance, and means for actuating the table and jacks, substantially as described.
10. A sole pressing machine having in combination a plurality of shoe supporting jack, a plurality of sole pressing forms co-operating respectively therewith, swinging levers for imparting to said jacks a rectilinear movement from a position of clearance, links and latches connecting the levers and jacks, and means for automatically actuating the latches to disconnect the jacks when the jacks are returned to a position of presentation, substantially as described.
11. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of sole pressing forms co-operating respectively therewith, and mechanism for relatively actuating the jacks and forms to press the soles of shoes supported upon the jacks and to return the jacks to a position of presentation having provision for actuating each jack separately or all the jacks simultaneously at the will of the operator, substantially as described.
12. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of sole pressing forms co-operating respectively therewith, mechanism acting to impart to each jack and its co-operating form relative vertical movements to produce pressure and clearance and to return the jack to its position of presentation, while the other jacks remain in a position of presentation, and means acting automatically to throw said mechanism out of operation when all the jacks are in a position of presentation, substantially as described.
13. A sole pressing machine having in combination a shoe supporting jack, a sole pressing form, mechanism acting automatically to bring the jack and form in such position of fressure to hold the jack and form in such position and thereafter separate the jack and form, and means for varying the time during which the jack and form are held in a pusition of pressure, substantially as described.
14. A sole pressing machine having in combination, a shoe supporting jack, a sole pressing form, mechanism for relatively actuating the jack and form to press the sole of a shoe, means acting automatically to stop sald mechanism with the jack and form in a position of pressure, and means acting, automatically to thereafter start said mechanism into operation, substantially as described.
15. A sole pressing machine having in combination, a shoe supporting jack. a sole pressing form, mechanism for relatively actuating the jack and form to press the sole of a shoe, means acting automatically to stop said mechanism with the jack and form in a position of pressure, and means acting automatically to thereafter start said mechanism into operation having provision for adjustment to vary the time during which the jack and form are held in a position of pressure, substantially as described.
16. A sole pressing machine having in combination a shoe supporting jack, a sole pressing form, mechanism for relatively actuating the jack and form to press the sole of a shoe, means acting automatically to stop said actuating mechanism with the jack and form in a position of pressure, normally inoperative mechanism actlng automatically when thrown into operation to start said actuating mechanism, and means acting automatically to throw said normally inoperative mechanism into operation, substantially as described.
17. A sole pressing machine having in combination a shoe supporting jack, a sole pressing form, mechanism acting automatically to bring the jack and form into a position of lressure to hold the jack and form in such position, and thereafter return the jack to a position of presentation, and means for varying the time during which the jack and form are held in a position of pressure, substantially as described.
18. A sole pressing machine having in combination a shoe supporting jack, a sole pressing form, mechanism for relatively actuating the jack and form to bring them into a position of pressure, to hold them in such position and thereafter return the jack to a position of presentation, means acting automatically to stop said mechanism with the jack and form in a position of pressure, and means acting automatically to thereafter start said mechanism into operation, substantially as described.
19. A sole pressing machine having in combination a shoe supporting jack, a sole pressing form, mechanism for relatively actuating the jack and form to bring them into a position of pressure, to hold them in such position and thereafter return the jack to a position of presentation, means acting automatically to stop said mechanism with the jack and form in a position of pressure, and means acting automatically to thereafter start said mechanism into operation having provision for adjustment to vary the time during which the jack and form are held in a position of pressure, substantially as described.
20. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of co-operating sole pressing forms, mechanism acting automatically to bring each jack and form into a position of pressure to hold the jack and form in such position and thereafter separate the jack and form, means for throwing each jack and its co-operating form into and out of operative connection with said mechanism and means for varying the time during which the jack and form are held in a position of pressure, substantially as described.
21. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of co-operating sole pressing forms, mechanism acting automatically to bring each jack and form into a position of pressure to hold the jack and form in such position and thereafter return the jack to position of presentation, means for throwing each jack and its co-operating form into and out of operative connection with said mechanism and means for varying the time during which the jack and form are held in a position of pressure, substantially as described.
22. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of co-operating sole pressing forms, mechanism for relatively actuating each jack and its co-operating form to press the sole of the shoe, means for throwing each jack and its co-operating form into and out of operative connection with said mechanism, means acting automatically to stop said mechanism with a jack and form in a position of pressure, and means acting automatically to thereafter start said mechanism into operation, substantially as described.
23. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of co-operating sole pressing forms, mechanism for relatively actuating each jack-and its co-operating form to press the sole of the shoe, means for throwing each jack and its co-operating form into and out of operative connection with said mechanism, means acting automatically to stop said mechanism with a jack and form in a position of pressure, and means acting automatic-
ally to thereafter start said mechanism into operation havlng provision for adjustment to vary the time during which the jack and form are in a position of pressure, substantially as described.
24. A sole pressing machine having in combination a plurality of shoe supporting jacks, a plurality of co-operating sole pressing forms, mechanism for relatively actuating each jack and form to press the sole of the shoe and to return the jack to its position of presentation, means for connecting and disconnecting each jack in its actuating mechanism, and means for locking each jack in its position of presentation. substantially as described.
25. A sole pressing machine having In combination a plurallty of shoe supporting jacks, a plurality of co-operating sole pressing forms, mechanism for relatively actuating each jack and form to press the sole of a shoe and to return the jack to its position of presentation, means for locking eac! jack in its position of presentation, and a treadle and suitable connections for unlocking a jack, for connecting the jack to the mechanism. for relatively actuating said jack and its co-operating form and for throwing said mechanism into operation, substantially as described.
26. A sole pressing machine having in combination a shoe supporting jack, a co-operating sole pressing form, mechanism for relatively actuating the jack and form to press the sole of the shoe and to return the jack to its position of presentation, means for locking the jack in its position of presentation and a treadle and suitable connections for unlocking the jack and for throwing the mechanism for relatively actuating the jack and form into operation, substantiaily as described.
27. A sole pressing machine having in combination a shoe supporting jack and a sole pressing form co-operating to level the sole of a shoe placed on the jack, mechanism for relatively actuating the jack and form comprising an intermittently rotating cam shaft, a constantly rotating driving shaft, and connections between the driving shaft and cam shaft acting automatically to stop the cam shaft with the jack and form in a position of pressure and thereafter start the cam shaft, substantially as described.
28. A sole pressing machine having in combination a shoe supporting jack and a pressing form co-operating to press the sole of a shoe placed on the jack. means for actuating the Jack, a latch for holding the jack in a position of presentation, a latch for connecting the jack with its actuating mechanism, and mechanism connected with both latches for actuating the same to release the jack and connect it with its actuating mechanism. substantially as described.
29. A sole pressing machine having in combination a jack and a pressing form co-operating to press the sole of a shoe placed on the jack, a spring pressed latch for holding the jack in a position of presentation, mechanism controlled by the operator for disengaging the latch from the tack. and means for preventing a re-engagement of the latch with the jack until the machine has completed its cycle of operations, substantially as described.
30. A sole pressing machine having in combination a shoe supporting jack and a pressing form co-operating to press the sole of a shoe placed on the jack, means for holding the jack in a position of presentation, means for connecting the jack with its actuating mechanism, and mechanism connected with both of said means whereby one is rendered inoperative when the other is rendered operative, substantially as described.
31. A sole pressing machine having in combination a shoe supportlng jack and pressing form co-operating to press the sole of a shoe placed on the jack, means for holding the jack in position of presentation, mechanism controlled by the operator for rendering said means inoperative and a device for maintaining said means inoperative until the machine has completed its cycle of operations, substantially as described.
32. A sole pressing machine having in combination a shoe supporting jack and a pressing form co-operating to press the sole of a shoe placed on the jack, means for holding the jack in a position of presentation. mechanism controlled by the operator for rendering said means inoperative, a device acting to maintain said means inoperative until the machine has completed its cycle of operations and then allow said means to become operative, and means acting automatically to actuate said device, substantially as described.

\section*{No. 101,063. Machine for Forming Stoppers from Pulp Fibre.}

\section*{Machine pour faire des bouchons de flbre de pulpe.}

The United States Fibre Stopper Company, assignee of Rudolph William Goeb, both of St. Louis, Missouri, U.S.A., 18th Sepatember. \(1906 ; 6\) years. Filed 17th May, 1906. Recelpt No. 135,991.
('Vaim.-1. In a machine of the class described, a perforated receptacle for receiving a quantity of pulp water, a movable
carrier upon which said receptacle is mounted, a hollow member which receives the water that drains away from

the pulp fibre, means for turning said receptacle over to deposit the wet pulp fibre at a certain point, dies which mould the pulp flbre into the orm of a stopper, and means for extracting all of the water from sald pulp fibre, substantially as described.
2. In a machine of the class described, a movable member carrying a plurality of oscillating perforated receptacles for receiving a quantity of pulp water, means for collecting the water which drains away from the pulp fibre, means for oscillating said receptacles to discharge the pulp fibre therefrom, dies which mould the pulp fibre into predetermined form, and means for extracting all of the water from said pulp fibre. substantially as described.
3. In a machine of the class described, a turntable carrying a plurality of pivotally mounted perforated receptacles, means for moving said table intermittently, means for actuating said receptacles to discharge the contents thereof, dies for moulding the pulp fibre into predetermined form, and means for extracting the water from said pulp flbre while it is being acted upon by sald dies, substantially as described.
4. In a machine of the class described, a movable member provided with a plurality of pivotally mounted perforated receptacles. means for actuating said receptacles to discharge the contents thereof, and dies for moulding the material discharged from said receptacles into predetermined form, substantially as described.
5. In a machine of the class described, a movable member provided with a plurality of pivotally mounted preforated receptacles, a rack bar for actuating sald receptacles to discharge the contents thereof and dies for moulding the material discharged from sald receptacles into predetermine form, substantially as described.
6. In a machine of the class described, a trough, a plunger leciprocatingly mounted in said trough, means for depositing a mass of wet pulp fibre in said trough, dies co-operating with said plunger to mould the pulp fibre into predetermined form, dies for thereafter acting on gaid pulp fibre to mould it into cylindrical form and a movable member provided with dies into which the pulp fibre is forced to mould it into the form of a stopper, substantially as described.
. In a machine of the class descrbed, a trough for receiving a quantity of wet pulp flbre, a movable member having a solid face which closes the end of said trough and provided with a die adjacent said solid face, a plunger reciprocatingly mounted in said trough for pressing the pulp fibre dies which thereafter act upon the fibre to mould it into cylindrical form, means for actuating said movable member to bring its die into alignment with the trough, and means for forcing the pulp fibre into the die in said member, substantially as described.
8. In a machine of the class described, a trough for receiving a quantity of pulp fibre, a plunger reciprocatingly mounted in said trough for acting upon said pulp fibre, moulding dies co-operating with said plunger to mould the the pulp fibre into predetermined form, a member provided with a recess acting as a die, a hollow die mounted in the plunger, means for causing the water from the wet pulp fibre to be drawn through said hollow die by means of air pressure. and means for moving said hollow die relatively to said plunger to force the pulp flbre into the recess of said member, substantially as described.
9. In a machine of the class described, a hollow support, a turntable rotatably mounted on said support and provded with a plurality of openings and a plurality of buckets pivotally mounted on the turntable over said openings and provided with perforated bottoms, substantially as described.
10. In a machine of the class described, dles for moulding a mass of wet pulp fibre into predetermined shape, a movable member provided with dies, means for forcing the pulp fibre into the dies of said member to mould It into predetermined form, and means for subjecting the pulp fibre to an air vacuum while it remains in the die of said member for extracting the water therefrom, substantially as described.
11. In a machine of the class described, dies or moulding a mass of wet pulp into a predetermined shape, a member provided with dies, means for forcing the pulp fibre into the dies of said member, means for subjecting the pulp fibre to an air vacuum while it remains in said member, means for imparting an intermittent movement to said member, and means for ejecting the moulded fibre from said member, substantlally as described.
12. In a machine of the class described, dies for moulding a mass of wet pulp fibre into a predetermined shape, means for supplying pulp fibre to sald dies, a movable member provided with a plurality of dies, means for forcing the pulp fibre into one of the dles of said member after it has been shaped by the dies first referred to, means for actuating said movable member, and means for extracting the water from the pulp fibre before it leaves the die of said member, ubstantially as described.
13. In a machine of the class described, dies provided with oncave faces for moulding a mass of wet pulp fibre into the form of a cylindrical block, an air vacuum for acting upon the pulp fibre while it is being moulded by said dies, a movable member provided with plurality of tapered openings acting as said dies, means for forcing the cylindrical block of pulp fibre into one of the dies of said member, plungers mounted in said movable member in alignment with the tapered openings therein and provided with perforated ends. means for creating a vacuum in sald plungers, and means for actuating said plungers to eject the moulded pulp fibre from the dies of said movable member, substantially as described.
14. In a machine of the class described a movable member provided with a plurality of openings acting as dies, means for forcing pulp fibre into said openings, devices mounted in said movable member in alignment with said openings and i, rovided with perforated ends which form the bottom of said dies, each of said devices being provided with a bore or passageway, a valve which moves with said movable member, said valve being provided with ports which communicate with the bores of sald devices, a stationary valve seat provided on its inner face with a recess that registers with a number of the ports of said valve and an air vacuum pipe communicating with the recess of said valve, substantially as described.
15. In a machine of the class described a turret provided with a plurality of openings actlng as dies, plungers mounted in the turret in alignment with said openings and having perforated ends which form the bottom of said dies, each of said plungers being provided with a bore, a valve moving with the turret and provided with a plurality of ports, tubes communicating with said ports and connected to the outer ends of said plungers, a stationary valve seat provided on its inner face with a recess with which a number of the ports of said valve register simultaneously, an air vacuum pipe communicating with said recess, a second recess formed in the valve seat and registering with but a single port of the valve seat at the same time and an air pressure pips communicating with said last-named recess, substantially as described.
16. In a machine of the class described, a die for acting on a mass of wet pulp fibre, an air vacuum for extracting the water from said pulp flbre through said die, a trap into which the water drains, said trap being provided with an opening, a slide provided with an opening, and means for actuating said slide to move the opening therein into alignment with the opening of the trap, substantially as described.
17. In a machine of the class described a die for acting on a mass of wet pulp fibre, an air vacuum for extracting the water from said pulp fibre through said die, a trap into which the water drains, said trap being provided with an opening, a slide provided with an opening. means for actuating said slide to move the opening therein into alignment with the opening of the trap, and ylelding means for holding the slide in intimate engagement with the trap, substantially as described.
18. In a machine of the class described a die for acting on a mass of wet pulp fibre, an air vacuum for extracting the wateh from said pulp fibre through said die, a trap into which the water drains, sald trap belug provided with an opening, a slide provided with an opeuing, a guideway in which the slide moves, a drain pipe communicating with said guideway, and means for actuating said slide to cause its opening to allgn with the opening in the trap and thereafter allgn with the draln pipe in the guldeway, substantially as described.
19. In a machine of the class described a die for acting on a mass of wet pulp abre, an alr vacuum for extracting the
water from sald pulp fibre through said die, a trap into which the water drains, said trap being provided with an opening in its bottom, a guideway carried by the trap, a slide mounted in said guideway and provided with an opening, a spring pressed plate forming the bottom of said guideway and having a drain pipe connected thereto and means for reciprocat ing the slide, substantially as described.
20. In a machine of the class described a turret provided with a plurality of recesses acting as dies, means for rotating the turret intermittently, a locking device for said tur ret plungers mounted in said turret in alignment with said dies, and a stationary cam with which projections on sald plungers engage during the movement of the turret, substantially as described.
21. In a machine of the class described, a turret having notches formed in its periphery and provided with a plurallaty of dies, an actuated lever provided with pawl which co-operates with the notches in said turret to impart movement thereto, a locking dog for sald turret and means carried by said lever for moving the locking dog into an inoperative position as said lever moves into position preparatory to feeding the turret forwardly, substantially as described.
22. In a machine of the class described. a trough for recelving a quantity of liquid pulp fibre, a plunger mounted in said trough, means co-operating with said plunger for compressing the pulp fibre, and means for causing the face of tho pulp fibre which is acted upon by said plunger to be subjected to air pressure which causes the liquild to be forced out of the fibre, substantially as described.
23. In a machine of the class described. a trough for recelving liquid pulp fibre, a plunger mounted in said trough. dies co-operating with said plunger to compress the pulp fibre, a movable member normally closing one end of the irough and provided with a die and a reciprocating member mounted in the plunger for forcing the pulp fibre into said din substantially as described.

\section*{No. 101,064. Punching and Shearing Machine.}

Machine a poingonnage et ragnage

Leslle David Jannell, Sylver J. Gonya, Aretas E. Stearns and Philo B. Clark, each an assignee of a sixth interest all of Rumford, Maine, U.S.A., 18th September, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,095
Claim.-1. In a combined punching and cutting machine the operating shaft arranged transversely to the line of the cutting blades and a punch operated from the same shaft being in substantially the same plane, and said punch and cutting mechanisms having feed openings facing in the same direction.
2. A punching and shearing machine comprising a supporting frame having a fixed punch member at its upper portion, and a fixed shear blade located below the flxed punch member, a carrier movable vertically in the frame and having a punch member and a shear blade arranged to co-operate respectively with the fixed punch member and fixed shear blade, and an operating shaft located below the shear blades and having oppositely and alternately acting cams engaging the carrier at points at opposite sides of the shaft and substantially in alignment with the punch members and with the central portions of the shear blades, one of the cams being formed to depress the carrier with a relatively slow motion. while the other is formed to raise the carrier with a relatively quick motion.
3. A punching and shearing machine comprising a supporting frame, a movable carrier guided thereby in a substantially vertical path, said frame and carrier having complemental cutting members which are caused to co-operate by
movements of the carrier, and an operating shaft provided with two oppositely acting cams, one cam acting to project the carrier and cause the action of the cutting members, and the other cam acting to retract the carrier.
4. A punching and shearing machine comprising a supporting frame, a movable carrier guided thereby in a substantially vertical path, said frame and carrier having complemental cutting members which are caused to co-operate by movements of the carrier, and oppositely facing abutments at its lower portion, located substantially in alignment with the said cutting members, and an operating shaft provided with two oppositely acting cams co-operating with said abutments, one cam acting to project the carrier and the other to retract the carrier.
8. A punching machine comprising a supporting frame having a substantially horizontal seat provided with guides, a die holding and guiding yoke having a base movable on said seat between the guides, complemental punching dies, one attached to the yoke and the other movable therein, the movable die having coupling members, and a reciprocating carrier having a head overhanging the seat, sald head and niovable die having complemental coupling members adapted to be interlocked by a movement of the yoke to its operative position on the seat.
6. A punching machine comprising a supporting frame having a punch member, a guide above such punrh member, a reciprocating carrier having a head overhanging the guide and the punch member, and a punch member movable in said guide and engaged with the overhanging head, the said head being relatively small cross sectional area, so that it nay be surrounded by an annular body presented to the flinching dles, and the said guide and the two punch members being removable as a unit from the supporting irame.
7. A punching and shearing machine comprising a supporting frame having a substantially horizontal seat at its upper forward portion. and a fixed shear blade located below said seat, a die holding and guiding yoke movable horizontally to and from said seat, complemental punching dies, one attached to the yoke and the other movable therein, and a reciprocating carrier movable vertically in the frame and having an upper end projecting above the frame and overhanging the seat, sald overhanging end being provided with means for detachably engaging the movable die when the yoke is in its operative position upon the seat, the carrier having also a shear blade arranged to co-operate with the fixed shear blade, the sald yoke occupying a space directly above the shear blades, and between the seat and the overhanging end of the carrier, so that the removal of the yoke permits the utilization of said space for the reception of the upper portion of an annular body subjected to the shear tlades.
8. A punching and shearing machine comprising a supporting frame, a carrier movable thereon, said frame and carrier having complemental cutting members caused to act by movements of the carrier, a rotary operating shaft having means for engaging and reciprocating the carrier, a power mechanism for rotating said shaft, said mechanism having an automatic stop motion for rendering it inoperative and a hand operated shaft rotating mechanism adapted to be used interchangeably with the said power mechanism.
9. In a machine of the character stated, a shear blade holder having a three-sided recess, one of the end walls of which overhangs the bottom of the recess, a shear blade adapted to enter said recess and having shouldered ends, the blade being shorter than the recess, so that a space exists between one of its ends and the corresponding end of the recess when the blade is in place, and an attaching bolt engaged with the holder and having a head occupying said space, one side of the head being formed to overhang the adjacent end of the shear blade.
10. In a machine of the character stated, a male punch of cylindrical form, having a stepped acting end and a centering projection on the axial line of the punch, each stepped portion having a flat outer face arranged substantially at a right angle with the axial line of the punch, and adapted tc independently detach a portion of the material removed by the action of the punch, the hole being formed by successively detaching parts or sections of the material, one stepped portion acting to detach a part of the material before the next stepped portion commences to act.

No. 101,065. Compensating Direct Acting Engine. Machine d action directe.

Henry R. Worthington, New York City, New York, U.S.A. assignee of Franz F. Nickel, East iange, New Jersey. U.S.A., 18th September. 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,831.

Claim.-1. In a compensating direct acting engine having one or more compensating cylinders and pistons, a valve conone or more compensating pressure and means controlled
by the length of the engine stroke for varying the pressure on said valve to control its movement.

2. In a compensating direct acting engine having one or more compensating cylinders and pistons, and means for applying fiuid in opposition to the working pressure to adjust the compensating pressure, a valve opened by the opposing pressure to permit the escape of opposing fluid, and means controlled by the length of the engine stroke for varying the resistance to the opening of said valve to vary the compensating pressure.
3. In a compensating direct acting engine having one or more compensating cylinders and pistons and an accumulator though which the compensating pressure is derived, a valve actuated by presure in the compensating system to control the accumulator pressure, and means controlled by the length of the engine stroke for varying the resistance to movement of sald valve to vary the compensating pressure.
4. A compensating direct acting engine having devices for controlling the compensating pressure including a valve, a pressure device acting on said valve, means actuated by the engine piston for actuating the pressure device to vary the pressure when the length of the engine stroke is increased, and means for returning the pressure device to normal position.
5. In a compensating direct acting engine having one or more compensating cylinders and pistons, a weighted valve controlling the compensating pressure and means actuated by the engine piston for shifting the weight to vary the pressure on the valve.
6. In a compensating direct acting engine having one or more compensating cylinders and pistons, a weighted valve actuated by the pressure in the compensating system to control the compensating pressure, means actuated by the engine piston for shifting the weight to vary the pressure on the valve, and means for slowly returning the weight when shifted by the engine.
7. A compensating direct acting engine having devices for controlling the compensating pressure including an escape valve opened by pressure in the system, a weight lever and shiftable weight controlling the valve, a rod and connections for shifting the weight, a tappet moved by the engine plston for shlfting the rod, a spring for returning the rod and a cataract cylinder having a piston connected to the rod and arranged to retard the return movement of the rod.
8. The means for varying the compensating pressure to control the stroke of a compensating direct acting engine. substantially as shown in the accompanying drawings.

\section*{No. 101.068. Brooder. Coureuse.}

Marion W. Savage, assignee of Newton C. Sprague, Minneapolis, Minnesota, U.S.A., 18th September, 1906; 6 years.
Filed 19th February, 1906. Receipt No. 133,044.
Claim.-1. In a brooder the combination with a floor havling an opening therein, of a perforated drum removably mounted on said floor, a hover plate supported above said drum having depending curtains inclosing the same, and imperforate drum removably mounted within said first-named dirum and spaced therefrom, intake and discharge fiues communicating with said drums respectively and a source of heat communicating with said imperforate drum, substantially as described.
2. The combination with a brooder floor having an opening therein of a perforate drum arranged on sald floor, a hover plate having discharge ports supported above said drum and having a depending curtain inclosing said drum, an imperforate drum provided within said first-named drum and spaced therefrom, intake and discharge flues communicating with said drums respectively. a pipe provided in said second imperforate drum and having open ends, the lower end com-
municating with a source of heat, substantially as described. 3. The combination with a brooder floor of a plate arrang-

ed beneath the same and spaced therefrom, a perforate drum mounted on said floor, cold air intake flues provided in the siace between said plate and floor and communicating with said drum, a hover inclosing said drum, an imperforate drum provided within said first-named drum and spaced therefrom amsl having a discharge flue leading to the open air and a pipe provided within said imperforate drum and communicaling with a source of heat, substantially as described.

No. 101,067. Milling Machine. Machinc ì trairc.

The Canadian General Electric Company, Limited, Toronto, Ontario. Canada, assignee of John Riddle. Schenertady. New York, U.S.A., 18th September, 1906; 6 years. lilles Tth June, 1905. Receipt No. 125,799.
Claim.-1. In a machine of the character described ihe combination of a column supported above the work, an 2 rm attached to the column which is unsupported at its out'r cnd, a work holder having its axis coincident with the ax:m of the column, the arm and work holder being capabion n! relative angular adjustment, a tool holder carried by the fre: end of the arm, means for adjusting the position of the tool holder with respect to the work, and a motor supported by the column which drives the tool, as specfied.
2. In a machine of the character described the combinaof a supporting column, a radial cutter carrying arm revolvably mounted thereon, and means for adjusting the ar:a elther side of a radial position and in a plane at right angles to the axis of the column, as specified.
3. In a machine of the character described the combination of a supporting column having a base which is adap:cd io rest on the work, a radial tool carrying arm revolvably supported solely by the arm, a tool carriage arranged to reciprocate on the arm, and means for angularly adjusting the arm on its axis, as specified.
4. In a machine of the character described the combination of a supporting column. means for supporting the work with respect to the axis of the column to permit of a relalive turning movement, an arm carried by the column, moans for shifting the arm laterally in a plane at right augles to the axis of the column, means for angularly adjustIng the arm on its axis and a cool carriage operatively mounted on the arm, as specifled.
J. In a machine of the character described the combinat!on of a hollow column which is adapted to be mounted on interchangeable supporting columns for work of different sizes, a radial arm arranged on the hollow column, means between the column and the arm which permits the latter to be adjusted laterally of and also around its axis and a tool carriage operatively mounted on the arm, as specified.
6. In a machine of the character described the combination of a supporting column suitable for work of a definite size, a hollow column adapted to fit the supporting column, a ball bearing between the columns, an arm secured to the hollow column to rotate therewith, means between the arm and hollow column for adjusting the former in a lateral direction, means for adjusting the arm on its axis and a tool carriage on the arm which is adjustable and is adapted to be reciprocated axially of the arm, as specified.
7. In a machine of the character described the combination of a supporting column, a shoulder on the column which rests on the work for supporting the column, a hollow column assembled on the supporting column, a ball bearing between the lower end of the hollow column and the said shoulder and a cutter carrying arm on the hollow column, as specified.
8. The combination of a supporting column, a hollow column assembled thereon, an anti-friction bearing between them, an arm carried by the hollow column which extends parallel to the plane of the work, a tool carriage operatively mounted on the arm, a tool carried by the carriage, and means for adjusting the arm to cause the tool to be moved radially with respect to the work, as specified.
9. In a machine of the character described the combination of a supporting column, a cutter carrying arm, a support between the arm and the column, a carrier between the arm and the support, means for adjusting the carrier laterally on the support, and means for adjusting the arm around ats axis on the carrier, as speciffed.
10. In a machine of the character described the combination of supporting column, a hollow column assembled thereon, a dovetail way provided on the hollow column, a carrier movably supported in said way, means for adjusting the carrier laterally in the way, an arm rigidly secured to the carrier to move therewith, means for adjusting the arm about its axis on the carrier and a tool carriage operatively mounted on the arm, as specified.
11. In a machine of the character described, the combination of a column adapted to be arranged centrally on the work to be finished, a radial arm supported thereon, a carrier between the column and the arm, a dovetall connection between the carrier and the column, an adjusting screw supported by the column for moving the carrier and the arm laterally on the column, means for permitting the arm to be adjusted axially on the carrier, and a tool carriage operatively mounted on the arm, as specifled.
12. In a machine of the character described, the combination of a central supporting column, a radial arm mounted thereon, a tool carriage arranged on the arm which is movable longitudinally thereof, a cutter carrying spindle mounted in the carriage which extends transversely to the axia of the arm, a cutter on the spindle, means for adjusting the spindle longitudinally in the carriage, and means for adjusting the arm angularly about its axis and also laterally in a plane at right angles to the column to cause the cutter to move in a radial direction with respect to the supporting column, as specified.
13. In a machine of the character described, the combina. tion of a central supporting column pivotally supported to move on its axis, a radial arm arranged thereon, a cutter carriage mounted on the arm and adapted to move there with about the axis of the column which is movable longltudinally thereof, a means carried by the arm for reciprocating the carriage, a cutter carrying spindle mounted in the carriage, a cutter on the spindle, a source of power arranged on the column and movable therewith and means for transmitting power from said source to the spindle, as specified.
14. In a machine of the character described, the combina tion of a supporting column, a radial arm mounted thereon and composed of two sections which are independently adjustable about the same axis, a yoke formed on the outer section the axis of which extends parallel to that of the arm, a carriage mounted in the yoke, means for reciprocating the carriage, a spindle mounted in the carriage with its axis extending transversely to that of the arm, a cutter on the spindle, and means for rotating the cutter, as specifled.
15. In a machine of the character described, the combination of a column, a radial arm adjustably mounted thereon. a yoke formed at the outer end of the arm, a carriage mov: ably mounted in the yoke, a rotating cutter carrying spindle in the carriage, a manually actuated lever carried by tho arm, and a connection between the lever and the carriage. as specifled.
16. In a machine of the character described, the combination of a column, a radial arm adjustably mounted thereon

Which is provided with a yoke, a carriage which is movable in the yoke in the direction of the axis of the arm, a sleeve in the carriage which extends transversely to the axis of the arm, a spindle rotatably mounted in the sleeve, a cutter on the spindle, means for adjusting the spindle and sleeve together in the carriage, and a manually operated device carried by the arm for reciprocating the carriage and cutter during the cutting strokes, as and for the purpose specifed.
17. A milling machine adapted to be bodlly supported and movably mounted on the work, an adjustable cutter carrying spindle in the carriage, a motor supported on the column, and a power transmitting device between the motor and the spindle for rotating the latter, said device including means for permitting the arm and spindle to be adjusted, as and for the purpose specified.
18. In a machine of the character described, the combination of a stationary support, a laterally and angularly adjustable arm revolvably mounted thereon, a carriage longitudinally movable on the arm, a rotating cutter carrying spindle adjustably mounted on the carriage, a driving wheel on the spindle, a motor supported to revolve with the arm, a belt driving connection between the wheel and motod, and means for maintaining said connection in operative relation to the wheei for all positions of adjustment of the cutter carying spindle, as and for the purpose specified.
19. In a machine of the character described. the combination of a supporting column, a radial arm which is revolvably mounted thereon, and is capable of lateral and axial adjustment, a carriage on the arm which is adjustable therewith, means for reciprocating the carriage longitudinally of the arm, a cutter carrying spindle on the carriage which extends transversely of the arm and is longitudinally adjustable, a motor secured in fixed position on the supporting column, a shaft pulley for the motor, a distance pulley adjustably supported on the arm, a driving wheel on the spindle which is movable therewith, an idler arranged in a common plane with the wheel and distance pulley and movable with the former, and a driving belt extending from the motor pulley to the distance pulley and operatively engaging with the driving wheel and idler, as and for the purpose specified.

No. 101,068. Means of Attaching Turbine Buckets. Moyen d'attacher des godets de turbines.

Ihe Canadian General Electric Company, Toronto, Ontario, Canada, assignee of John G. Callan, Lynn, Massachusetts U.S.A., 18th September, 1906 ; 6 years. Filed 2nd May, 1906. Receipt No. 135,462.

Claim.-1. In an elastic fluid turblne the combination of a support having one or more channels, a bucket carrying base mounted in the channel, and staking pieces situated between the bucket base and the walls of the channel, said staking p!eces being held by the walls of the groove and turned over at their outer ends to secure the buckets.
2. In an elastic fluid turbine the combination of a support provided with one or more channels having overhanging shoulders on opposite sides. a bucket carrying segmental base mounted in the channel and provided with shoulders on opposite sides, and staking pieces located between the sides of the channel and the bucket base, the inner ends of the staking pleces being held in place by the support and the outer ends turned over to engage the said shoulders.
3. In an elastic fluid turbine the combination of a support having a channel formed therein with an overhanging wall, a bucket carrying base mounted therein and provided with a shoulder on one side, and a staking piece located between the wall of the channel and the bucket base and secured at its inner end by the overhanging wall of the channel. the outer end being bent over to engage the shoulder on the bucket base and secure it in place.

2-24

No. 101,069. Bucket for Elastic Finid Turbines. Godet pour turbines id fluides clastiques.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of George E. Stevens, Lynn, Massachusetts, U.S.A., 18th September, 1906 ; 6 years. Filed 8th May, 1906. Receipt No. 135.670.
Claim.-1. In an elastic fluid turbine the combination of a support, a sheet metal bucket having a base formed integral therewith, and a device which extends across the base for securing the bucket to the support.
2. In an elastic fluid turbine the combination of a support, sheet metal buckets having a base that is common to and integral therewith, a device which extends across the base and acts as a means common to the buckets for securing them to the support.
3. In an elastic fluid turbine the combination of a support, sheet metal buckets arranged between the separate rows, a base plece which is common to and integral with the buckets, and a retainer which crosses the base piece for securing the buckets and is located between the rows.
4. In an elastic fluid turbine the combination of a suppcrt, a sheet metal bucket having an integral base piece projecting each side thereof and retainers which overlle the base piece and secure the bucket to the support.
5. In an elastic fluid turbine the combination of a support, having projections thereon, sheet metal buckets which are supported by the projections, a base plece formed integral with two or more buckets which is located in the groove between the projections, and retainers that occupy the grooves and hold the buckets in place.
6. In an elastic fluid turbine the combination of a support, sheet metal buckets arranged in rows thereon, a base plece formed integral with and connecting buckets of different rows, and retainers which secure the buckets at a point between the rows.
7. In an elastic fluid turbine the combination of a sup port, sheet metal buckets arranged in rows thereon, a base piece formed integral with and connecting buckets of different rows, retainers which secure the buckets at a point between the rows, and means for securing the base piece at the ends.
8. In an elastic fluid turbine the combination of a support buckets carried thereby and arranged in rows, a base com mon to and integral with the buckets in different rows, re tainers for the buckets which extend across the base and are common to adjacent rows.
9. In an elastic fluid turbine the combination of a support a plurality of buckets carried thereby and arranged in rows said buckets being formed by sheet metal and each provided with an integral tenon, a base piece common to and connecting buckets of different rows, and a cover that is secured tc the ends of the buckets by the tenons thereon.
10. In an elastic fluid turbine the combination of a support having a deformed edge portion, with buckets having bases mounted on the support which are secured in place by securing the support of its deformity by forcing the metal of which it is composed over the ends of the bucket bases.
11. In an elastic fluid turbine the combination of a support having parallel projections thereon, with grooves between buckets mounted on the projections having bases which extend acriss the grooves and segmental locking pieces located in the grooves which extend across the bases
12. In an elastic fluid turbin the combination of a support having parallel projections thereon with grooves between buckets mounted on the projections having bases which extend across the grooves, and segmental locking pleces locat ed in the grooves which extend across the bases, and retain ing devices which are common to adjacent segmental lock ing pleces.
13. As an article of manufacture a bucket element which is punched out of sheet metal and has a base plece common to two or more buckets, the said buckets being arranged to form an angle with the base piece.

No. 101,070. Bucket for Elastic Fluid Turbines. Godet pour turbines ì thides élastiques.

The Canadian General Electric Company, Toronto, Ontar;o, Canada, assignee of Edmund H. Farquhar, Schenectady, New York, U.S.A., 18th September, 1906 ; 6 years. Filed 4th June, 1906. Receipt No. 136,514.
Claim.-1. In an elastic fluid turbine the combination of a plurality of buckets made of a hot rolling alloy, a cast metal support to which the buckets are fused and a carrier for the support, as and for the purpose specified.
2. In an elastic fluid turbine the combination of a plurality of buckets each saving a concave and a convex wall and made of hot rolling alloy, a cast metal base to which the buckets are fused at one end, a means for connecting the opposite ends of the buckets to hold them in alignment and preserve the pitch distance and a carrier for the support, as and for the purpose specifled.
3. In an elastic fluid turbine the combination of a plurality of buckets each being separately formed and provided with concave and convex walls, a base to which the buckets are secured by fusing, tenons on the buckets, a cover or shroud that is secured to the buckets by the tensons which forms one wall of the fluid passages, preserves the pitch relation between the buckets and assists in securing the buckets against centrifugal strains and a carrier for the base, as and for the purpose specifled.
4. In an elastic fluid turbine the combination of a plurality of buckets each being made of extruded metal and provided with a recess at one end, tenons formed integral with the buckets, a cast metal base to which the buckets are fused, the metal of the base fllling the recesses and forming an additional mechanical support, a cover for the buckets which is secured thereto by riveting over the ends of the tenons, the said cover acting as a mechanical support to resist centrifugal strains and also to preserve the pitch distance between the buckets and hold them in allgnment against lateral displacement and a carrier for the base, as and for the purposo specified.

No. 101,071. Bucket for Elastic Fluid Turbines. Godet pour turbines à Aluides élastiques.

The Canadian General Electric Company, Coronto, On arin. Canada, assignee of Edmund H. Farquhar, Schencctady, New York, U.S.A., 18th September, 1906 ; 6 years. Filed 27th August, 1906. Receipt No. 138,991.
elaim.-1. The combination with a base having a dovetall \(\sigma^{\text {r }}\) undercut groove, of a plurality of separately formed buckets having shanks fitting said groove and spacing blocks in said groove between sald bucket shanks. the material of the base at the pads of the groove being upset to secure the parts together.
2. The combination with a base having a dovetail or undercut groove, of a plurality of separately formed buckets of uniform cross section and cut away at one end to form shanks fitting said groove, spacing blocks in sald groove flush with the surface of the base and having curved ends fitting against the bucket shanks, and lips upset at the ends of the groove to hold the parts together.
3. The combination with a base having a dovetail or undercut groove, of a plurality of separately formed buckets of uniform cross section land cut away at one end to form shanks fitting said groove, spacing blocks of the same material as the buckets fitted into said groove and fitting the curves of said bucket shanks, a filling block at the end of the groove of substantially the same material as the base, the incisions in the ends of the base forming upset lips to hold the parts together.
4. In an elastic fluid turbine the combination of a bucket support having a groove formed therein which is narrower at the throat than at the bottom buckets, having projections thereon which enter the groove and are retained in place by the walls thereof and devices for spacing the buckets apart to preserve the proper pitch, the ends of the support being riveted over to force the buckets and spacing devices into engagement with each other and also to secure them rigidly in said support.
No. 101,072. Bucket Fastening for Flastic Fluid Turbines.
Attache de golet pour turbines aluides élastiques.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Oscar Junggren, Schnectady. New York, U.S.A., 18th September, 1906; 6 years. Filed 2sth August, 1906. Receipt No. 139,037 .
Claim.-1. In an elastic fluid turbine the combination with a wheel, of bucket carrying base segments fitted thercto. shoulders on each side of said wheel and segments, flangeil rings engaging with said shoulders and rivets passing through sald rings and wheel.
2. In an elastic fluid turbine the combination with a wheel having a concentric shoulder on each side and transverse passages, of a base segments fitted to the rim of said wheel and provided with shoulders concentric therewith, separately formed buckets secured in said segment, flanged clamping rings engaging said shoulders and rivets passing through said rings and the passages in said wheel.
3. In an elastic fluid turbine the combination with a wheel having a smooth periphery and concentric shoulders on its sides, of the base segments fitted to sa!d periphery provided with a longitudinal undercut groove and having concentric shoulders on each sides, separately formed buckets having shanks engaging in said groove, spacing blocks between them, segmental clamping rings having flanges engaging with said shoulders on the base segments and wheel and rivets passing through said rings and wheel.

\section*{No. 101,073. Bucket for Elastic Fluid Turbines.} Godet pour turbines ì fuides élastiques.
The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Walter Field Rice, Quincey, Massachusetts. U.S.A., 18th September, 1906; 6 years. Filed 31st August, 1906. Receipt No. 139,133.
Claim.-1. In an elastic fluid turbine the combination with separately formed buckets. of a connector passing through the same, and a mass of metal cast on said buckets, as anl for the purpose specified.
2. In an elastic fluid turbine the combination with sepa:ately formed buckets, of a connector passing through the same and a mass of metal cast on said buckets and fusc.l thereto, as and for the purpose specifled.
3. In an elastic fluid turbine the combination with separately formed buckats, of a connector passing through the
same, and a mass of metal cast on said buckets and fused thereto and to said connector, as and for the purpose specified.

4. In an elastic fluid turbine the combination with separately formed buckets. of a connector passing through their "nds, and a mass of metal cast thereon and extending be yond said connector, as and for the purpose spesifed.
5. In an elastic fluid turbie the combination with separately formed buckets, or a cable passing through their ends and a support cast thereon and enveloping said ends and said cable, as and for the purpose specified.
6. In an elastic fluid turbine the combination with sepacately formed buckets, of a base and cover both cast on said buckets, as and for the purpose specified.
i. In an elastic fluid turbine the combination with separately formed buckets, of a base and a cover both cast thereon and a connector passing through said buckets, as and for the purpose specified.
8. In an elastic fluid turbine the combination with separately formed buckets, of a base and cover both cast thereon and a connector passing through said buckets and enveloped by the cast metal, as and for the purpose specitied.
9. In an elastic fluid turbine the combination with separately formed buckets, of a cover nast thereon and mechanically interlocked therewith, as and for the purpose specified.
10. In an elastic fluid turbine the combination with separately formed buckets, of a cover cast thereon and mechanically interlocked therewith and a base cast on and fused to said buckets, as and for the purpose spociffed.
11. In an elastic fluid turbine the combination with separately formed buckets having shouldered ends, of a cover cast thereon and interlocking with said shoulders, as and for the purpose specified.
12. In an elastic fluid turbine the combination with separately formed buckets, of a connector passing through them near one end, a base cast on and fused to sald buckets and enveloping sald connector and a cover cast on and mechanically interlocked with said buckets, as and for the purpose specified.

\section*{No. 101,074. Packing Device for Shafts of Steam Turbines.}

\section*{Garniture pour essieus de turbines d vapeur.}

The Honourable Charles Algernon Parsons, Heaton Works, Newcastle-on-Tyne, assignee of John Turnbull and Howitson Hall, both of Turbina Works, Walsend-on-Tyne, England, 18th September, 1906; 18 years. Filed 7th February, 1906. Receipt No. 132,663.
Claim.-1. A packing gland for rotating shaft, having in combination a semi-cylindrical extension in the pressure casing, a removable top cover, split bushing carrying the packing collars, packing collars on the shafts and registering with the packing bushings, substantially as described.
2. A packing gland for rotating shafts having in combination, a fixed semi-cylindrical extension on the pressure casing, a removable top cover, a split bushing having groups of packing rings or collars. packing rings or collars fixed to the shaft and registering with the packing rings or collars on the bushing, substantially as described.
3. A packing gland for rotating shafts having in combination, conically arranged collars on the shaft, a split bushing carrying packing collars adapted to sald conically arranged collars, an enclosing box having a removable top thereto, substantially as and for the purpose described.
4. A packing for rotating shafts having in combination groups of collars arranged in steps on the shapt, a split bushing carrying packing collars, an enclosing box having a removable top thereto.
5. A packing gland for rotating shafts having in combination packing collars arranged in groups partly cylindrical in form and partly conical, a split bushing adapted to the collars on the shaft, a box enclosing the bushing and having a removable cover thereto, substantially as described.
6. A packing gland for rotating shafts having in combination a packing gland box with a removable top cover, a split bushing within the box, said split bushing having packing collars thereon, packing collars on the shaft, and means for longitudinally adjusting the position of the split bushing, substantially as described
7. A packing gland for rotating shafts having in combination a packing gland box with a removable cover, a split bushing within said box. groups of packing collars arranged in steps. collars on the shaft adapted to the collars in said bushing, means for longitudinally adJusting the position of the bushing, substantially as described.
8. A packing gland for rotating shafts having in combination a packing gland box with a removable cover, a split bushing carrying groups of packing collars, groups of packing collars on the shaft adapted to the packing collars on the bushing, spaces between said groups, lantern spaces \(g\) in the packing gland box, holes in the split bushing at the spaces between the groups of packing said holes communicating with the latern spaces.
9. A packing gland for rotating shafts having in combination, a packing gland box with removable cover, a split bushing, packing collars on said bushing, packing collars on the shafts, lantern spaces \(g\) in the packing gland box, a packing gland \(q\) adapted to prevent leakage from said lantern spaces, substantially as described.
10. A packing gland for rotating shafts having in combination a packing gland box with removable cover, a split bushing, packing collars on sald bushing, packing collars on the shafts, lantern spaces \(g\) in the packing gland box, a packing gland \(q\) adapted to prevent leakage from said lantern spaces, means for longitudinally adjusting the split bushing.
11. A packing gland for rotating shafts having in combination a packing gland box with removable cover, a split bushing, packing collars on said bushing, packing collars on the shafts, lantern spaces \(g\) in the packing gland box, a packing gland \(q\) adapted to prevent leakage from said lantern spaces, a ring externally fixed to the gland box, a screwed ring engaging with a screw on the split bushing and working in a recess in the externally fixed ring.
12. A packing gland for rotating shafts having in combination a packing gland box with removable cover, a split bushing, packing collars on sald bushing, packing collars on the shafts, lantern spaces \(g\) in the packing gland box, a packing gland \(q\) adapted to prevent leakage from said lantern spaces, a ring externally flxed to the gland box, a screwed ring engaging with a screw on the split bushing and working in a recess in the externally fixed ring, screws in the screwed ring adapted to exert an end pressure on the packing gland \(q\).

No. 101,075. Liquid Filter. Filtrc à liquidc.

Wilfred Reeves and Balfour Bramwell, co-inventors, both of Wellington Place, Belfast, Ireland, 18th September, 1906;
6 years. Filed 29th August. 1906. Recelpt No. 128,020.
Claim.-1. Apparatus for filtering liquids comprising a filter chamber revolvably mounted on hollow trunnions, a permanently fixed inlet pipe passing through one of the said trunnions in and extending upwardly within the said chamber, a filter bed having spherical walls is the lower part of the chamber. a passage connecting the lower side of the filter
bed with the second trunnion, and a fixed outlet pipe leading from the said second trunnion, substantially as described.
2. In apparatus for filtering liquids such as herein described, a filter chamber revolvably mounted on hollow trunnious, a filter bed in the lower part of the sald chamber, and a fixed inlet pipe passing through one of the said trunnions and extending upwardly over the filter bed and terminating ir an upwardly turned open bell-mouth, substantially as described.
3. In apparatus for flltering liquids such as herein described. a spherical ended filter chamber revolvably mounted on hollow trunnions and constructed in two sections divided en a plane normal to the axis of said trunnions, a permanently flxed inlet pipe passing through one of the said trunnions into the filter chamber, an upwardly inclined extension of said inlet pipe terminating in an upwardly directed open bell-mouth, a fixed outlet plpe leading from the second hollow trunnion, and means for revolving the filter chamber, substantially as described.
4. Apparatus for filtering liquids comprising a spherical ended fiter chamber revolvably mounted on hollow trunnions, a filter bed in the lower part of the said chamber, a fixed pipe passing through one of the said trunnions and terminating in an upwardly turned open bell-mouth adapted to distribute the liquid to be filtered over the upper side of the f.ter bed, a perforated supporting floor for the filter bed.

\section*{Na 101,076. Vacrum Filter. Filtre d vacuиm.}

Charles Butters. Berkeley. California. U.S.A., 18th September. 1906: 6 years. Filed 12th February, 1906. Receipt .- 0 . 132,842.
Cluim.-1. A vacuum filter frame having a porous material interposed between two sheets of filtering fabric and a perforated tube for removing fluid from and supplying fluid to the interior of said filter frame.
2. The combination in a vacuum filter frame of a porous material interposed between two sheets of iltering fabric, the fibrous material and filtering fabric being sewed or fastened together at intervals and a perforated pipe for withdrawing and admitting fluid to and from the filter.
3. A vacuum filter frame having a porous material interfosed between two sheets of filtering fabric and a perforated cube for removing fluid from and supplying fluid to the interior of said filter frame, and means for producing a vacuum in the interior of said frame.
4. A vacuum filter frame having a top member or rall. grooves therein, retaining strips having the under outer edge lower than the portion next to the frame adapted in combination with said grooves to hold filtering fabric, and means for producing a vacuum in the interior of said frame.
5. A vacuum filter frame provided with a filtering fabric portions of which are rendered impervious to fluid.
6. A vacuum filter frame provided with a filtering fabric a narrow rim around the sides of which is rendered impervious to fluid.
7. A vacuum filter frame having a porous material interposed between two sheets of flltering fabric and means for removing fluid from and supplying fluid to the interior of said filter frame, and means for producing a vacuum in the interior of said frame.
8. A vacuum filter frame having a top member or rall, grooves therein, retaining strips adapted in combination with said grooves to hold flltering fabric and grooves in said retaining strips adapted to deflect fluid from the surface of said filter frame.
9. A vacuum filtering apparatus having a receptacle, a filtering frame, a drum, connections between said drum and filter frame, an outlet pipe from said drum, and means for exhausting the air from said drum.
10. A vacuum filtering apparatus having a receptacle, a Altering frame, a drum, connections between sald drum and filter frame, an outlet pipe from said drum, a supply and discharge pipe, means for connecting and disconnecting said supply and discharge pipe from said vacuum drum, and m"ans for exhausting the air from said drum.
11. A vacuum filter aparatus having a filter frame, a vacuum drum, connections between sald frame and drum. means for exhausting the air from sald drum, a discharge pipe from said drum and a water seal at the lower end of said discharge pipe.
12. A vacuum filter having a tubular frame and porous material interposed between two sheets of filtering fabric.
13. A vacuum filter frame having a porous material interposed between two sheets of filtering fabric and a perforated tube enclosed within said filtering fabric.
14. The combination in a vacuum filter of a porous material interposed between two sheets of filtering fabric, the material and fabric being sewed together or fastened at intervals and a perforated pipe within said filtering fabric.
15. A vacuum filter frame having a porous material interposed between two sheets of filtering fabric. a perforated tube within said filter fabric for supplying fuid to and removing fluid from the interior of said filter. and means for producing a vacuum in the interior of said irame.
16. A vacuum filter frame having a foraminous materia! interposed between two sheets of filtering fabric, and means for removing fluid from and suplying fluid to the interior of said frame.
17. A vacuum filter frame provided with a filtering fabric, portions of which are coated with waterproofing material.
18. A vacuum filter frame provided with filtering fabric, a narrow rim of which is coated with a waterproofing material.
19. A vacuum filter having its surface divided into panels by vertical strips.
20. A vacuum filter having projections upon the surface thereof to aid in holding material to be filtered upon said surface.

No. 101,077. Power ELammer. Marteau mécanique.

Austin Bragg, Waterville, Maine, U. S. A., 18th September.
1906; 6 years. Filed 23rd July. 1906. Receipt No. 138.019 . Claim.-1. In a power hammer, the combination with a ram or hammer, of an elliptic spring helve having both of its members connected at one end to said ram or hammer and the other ends of said members pivotally supported an means connected to the two members of said spring helve intermediate the ends thereof for actuating it, substantially as set forth.
2. In a power hammer. the combination with a ram or hammer and a movable support, of an elliptic spring helve having its two members connected at one end to said ram or hammer and at the other end pivotally connected to the movable support, and means connected to the members o: the spring helve intermediate the ends thereof for operating the same.
3. In a power hammer, the combination with a ram or hammer and a lengthwise adjustable support, of an elliptic spring helve having both of its members connected at one end to said ram or hammer and at the other end pivotall: connected to the adjustable support and means connectid to the helve intermediate its ends for operating same.
4. In a power hammer the combination with a ram or hammer and a swinging fulcrum, the latter being constructed whereby it may be lengthened or shortened, of an elliptic spring helve having both of its members connected at one end to the ram or hammer and at the other end pivotally connected to the free end of the fulcrum, and means engaging the two members of the helve intermediate the ends thereof for operating the same.
5. In a power hammer the combination with a rain or hammer, of a movable fulcrum, an elliptic spring helve connecting said ram and fulcrum. bars on opposite sid.s of said spring helve, clamping bolts connecting said birs and adanted to adjust the tension and flexibility of the spring helve. and onerating means connected with said helve between its ends.
6. In a power hammer, the combination with a frame, of an elongated ram or hammer guide in said frame, a ram or hammer in said guide having an opening therein. a fulcrum rod, an elliptic spring helve having eyes in the ends of its two members, one of said eyes pivotally mounted on the fulcrum rod, an eccentric, and a pitman connecting said eccentric with the helve between the ends of the latter.
7. In a power hammer, the combination with a frame, of a head having ram guides therein and pivoted at its lower end to said frame, a shaft carried by the head, pinions on said shaft, racks on the frame in mesh with said pinions, a hand wheel to turn the shaft, and a lock nut to secure the parts at any adjustment.
S. In a power hammer, the combination with a ram or hammer, of an elliptic spring connected at one end to tha ram or hammer and at the other end to a fulcrum, a bar connecting the two ends of the spring helve and means intermediate the ends of the helve for operating the same.
9. In a power hammer, the combination with a ram or hammer, of an elliptic spring helve connected at one end to said hammer and at its other end to a fulcrum, means connecting the semi-elliptic sections of the spring for regulating their tension and means connected to the helve intermediate its ends for operating same.

No. 101,078. Station Indicator. Indicatcur de station.

Arthur James Clark, Seattle, Washington, U.S.A., 18th September. 1906 ; 6 years. Filed 25th July, 1906. Receipt No. \(138,155\).
Claim.-1. The combination with a car, a track contact and the circuit wires connected with a source of energy of two spools, a screen provided with apertures adjacent of its ends and wound about the spools, spaced attachments upon the screen, a contact on the car and connected with the track contact by two-fold primary circuit. said circuit, a duplex switch including said primary circuit, a two-fold supplementary circuit connected with the electro-magnets of said switch and terminating in two palrs of contacts arranged upon opposite sides of the screen and adapted to complete the respective circuits thereof through the said screen apertures, devices for detachably retaining the switch in its closed condition with either fold of said primary circult. electro-magnets included in said supplementary circuit for disengaging said retaining means to divert the current from one-fold to the other of said primary circuit when the respective pairs of contacts close the supplementary circuit, a iwo-fold primary circuit including a motor and a circuit closer in each of its folds, said motors, sald circuit closers which are respectively actuated by the first-named electromagnets. devices for individually retaining said circuit closers in operative condition. means co-acting with said attachments for disengaging said retaining devices from said circuit closers, and driving connections between said motors and spools.
\(\therefore\) The combination with a car, a track contact and the circuit wires connected with a source of energy of two spools. a screen provided with apertures adjacent of its ends and wound about the spools, spaced attachments upon the screen, a contact on the car and connected with the track
contact by a two-fold primary circuit, sald circuit, a duplex switch including said primary circult, devices for detachably retaining the switch in its closed condition with either fold of said primary circuit, mechanical means for diverting the current form one fold of the primary circult to the other, a two-fold primary circuit including a motor and a circuit closer in each of its folds, said motors, said circul! closers which are respectively actuated by the first-named electro-magnets, devices for individually retaining said circuit closers in operative condition, means co-acting with said attachments for disengaging said retaining devices from said circult closers and driving connections between said motors and spools.
3. The combination with a car, a track contact and the rircuit wires connected with a source of energy of two spools, a screen provided with apertures adjacent of its ends and wound about the spools, spaced attachments upon the screen, a contact on the car and connected with the track contact by a two-fold primary circuit. said circuit, a duplex switch including said primary circuit, a two-fold supplementary clrcuit connected with the electro-magnets of said switch and terminating in two pairs of contacts arranged upon opposite sides of the screen and adapted to complete the respective circuits thereof through the sald screen apertures, devices for detachably retaining the switch in its closed condition with either fold of said primary circuit, electro-magnets included in said supplementary circuit for disengaging said retaining means to divert the current from one fold to the other of said primary circult when the respective pairs of contacts close the supplementary circuit, mechanical means for diverting the current from one fold of the primary circuit to the other, a two-fold primary circuit including a motor and a circuit closer in each of its folds, said motors, said circuit closers which are respectively actuated by the first-named electro-magnets, devices for individually retaining said circuit closers in operative condition, means co-acting with said attachments for disengaging said retaining devices from said circuit closers, and driving connections between said motors and spools.
4. The combination with a car, a track contact, and the circuit wires connected with a source of energy, of two spools, a screen provided with apertures adjacent of its ends and wound about the spools, spaced attachments upon the screen, a contact on the car and connected with the track contact by a two-fold primary circuit, said circuit, a duplex switch including said primary circuit, a two-fold supplementary circuit connected with the electrro-magnets of sald switch and terminating in two pairs of contacts arranged upon opposite sides of the screen and adapted to complete the respective circuits thereof through -the sald screen apertures, devices for detachably retaining the switch in its closed condition with either fold of sald primary circuit, electro-magnets included in said supplementary circuit for disengaging said retaining means to divert the current from one fold to the other of sald primary circuit when the respective pairs of contacts close the supplementary circuit, a slidable bar, devices actuated by the movement of the bar for reversing the switch, a two-fold primary circuit including a motor and a circuit closer in each of its folds, said motors, said circuit closers which are respectively actuated by the first-named electro-magnets, devices for individually retaining said circuit closers in operative condition, means co-acting with said attachments for disengaging said retaining devices from said circuit closers, and driving connections between sald motors and spools.

\section*{No. 101,079. Railway Track. Voie de ohemin de for.}

Reuben D. Culver, Veederburg, Indiana, U.S.A., 18th September, 1906; 6 years. Filed 12th April, 1906. Recelpt No. L3i, 973
Claim.-1. Iי, a railw 2 s tiack consirvilion, a concrete base £xtending lorgitudinally beneath each track rail, and rail cushiuns arranged at intervals in the tops of said bases, substatially as spenified.
2. It ab railway track raistriatin, a coucrete base extandlick lons;tudinally heleeitly cach track rail, there being cavirites !ormerl at intervals '"1 the tops of the bases, and rail cushlons arranged in said cavities, substantially as zreciflel
3. An improved track construction for street and other railways comprising independent cement concrete bases having spaces formed at intervals in their length, cushions nounted in said spaces, and ralls supported by said cushfous, substantially as specified.
4. An improved track construction for street and other rallways, comprising independent cement concrete bases, bearing boxes formed at intervals in the length of said bases, cushions mounted in said boxes, rails supported by said cushions, and bolts engaging said ralls and having their lower ends anchored to said bases, substantially as specified.
5. An improved track construction for street and other railways. comprising independent cement concrete bases.

\section*{No. 101,080. Production of Nickel.}

\section*{Production de nickel.}

Ellen G. Elworthy, Battlefleld Road, Herts, England, administrix of the estate of Herbert Samuel Elworthy, 18th September, 1906; 6 years. Filed 30th May, 1905. Receipt No. 125,609.
Claim.-1. Method or process for the manufacture of nickel. comprising the reduction of a nickel compound by means of a reducing gas and heating the resulting metallic nickel to a temperature at which the metal becomes pasty and coherent.
2. Method or process for the manufacture of nickel, comprising the reduction of a nickel compound by means of a reducing gas, and heating the resulting metallic nickel in an atmosphere of gas inert thereto. to a temperature at which the metal becomes pasty and coherent.
3. Method or process for the manufacture of nickel, comprising the reduction of a nickel compound, as commercial nickel oxide, by a reducing gas, as hydrogen, and heating the resulting metallic nickel to approximately 1,200 to \(1,400^{\circ} \mathrm{C}\).
4. Method or process for the manufacture of nickel, comprising the reduction of a nickel compound, as commercial nickel oxide, by a reducing gas, as hydrogen, and heating the resulting metallic nickel in an atmosphere of gas inert thercto approximately \(1,200^{\circ}\) to \(1,400^{\circ} \mathrm{C}\).

\section*{No. 101,081. Tag. Etiquette.}

Axel E. Ellis, Boston. Massachusetts. U.S.A.. 18 th September.
1906; 6 years. Filed 25th June. 1906. Receipt No. 137,281.
Claim.-1. A tag comprising a body portion, a string and a fastening device, said fastening device belng located near one end of the tag and provided with a plurality of prongs and said string being looped about one prong and passing between two other prongs, substantially as described.
2. A tag comprising a body portion, a string and a fastening device provided with three or more prongs, said string being looped about one of said prongs and passing between two other prongs, sald prongs extending through the body portion of the tag and being clinched on the reverse side, substantially as described.
3. A tag comprising a body portion, a pronged fastening device located adjacent to one end of the tag and a string looped about one of the prongs of said fastening and placed with both strands arranged between other prongs, said prongs extending through the body portion and being clinched upon the reverse side, substantially as described.

\section*{No. 101,082. Tag. Etiquettc.}

Lavid Essex, Kearney, New Jersey. U.S.A., 18th September, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138.083.
Claim.-1. A tag comprising a body, a turned-over lap at each end of said body, and a string or cord connected with each end and the turned-over lap of the said body, and each string or cord having a pair of free end portions extending from each end of the tag. whereby the tag can be arranged and secured in a flat condition upon a package, substantially as and for the purposes set forth.
2. A tag comprising a body. a turned-over lap at each end of said body, both the said body and said laps being provided with a plurality of perforations at the ends of the tag, and a string or cord at each end of said body, each string or cord beling inserted in the perforations at the respective ends ci the tag, and having their free end portions extending from the ends of the tag. whereby the tag can be arranged and secured in a flat condition upon a package, substantially as and for the purpose set forth.
3. A tag comprising a body, sald body being provided at each end with two pairs of perforations, said perforations being staggered. and a string or cord at each end of sald body, each string being inserted in the said staggered perforations
and having their free end portions extending from the ends of the tag. whereby the tag can be arranged and secured in

a fiat condition upon a package, substantially as and for the purposes set forth.
4. A tag comprising a body, a turned-over lap at each end of said body, both the said body and said laps being provided with two pairs of perforations, said perforations being staggered, and a string or cord at each end of said body, each string being inserted in said staggered perforations and having their free end portions extending from the ends of the tag, whereby the tag can be arranged and secured in a flat condition upon a package, substantially as and for the purposes set forth.

No. 101,083. Steam Engine. Machine à vapeur.

Thomas Row Fowler, Formby, Lancaster, England, 18th September, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,870.
Claim.-1. In a high pressure, superheated steam engine of the single acting type, the combination of a closed crank chamber \(j\), a cylinder \(a\) open at its inner end, and in iree communication with the chamber \(j\). two pistons \(c\), \(d\), directly connected together and working in said cylinder, a space \(f\) between the said pistons, and a port \(g\) through the walls of the cylinder in constant communication with the saidespace, substantially as described.
2. In a high pressure, superheated steam engine of the single acting type, the combination of a closed crank chamber \(j\), a cylinder \(a\) open at its inner end, and in free communication with the chamber \(j\), two pistons \(c, d\), directly connected together and working in said cylinder, a space \(f\) between the said pistons, a port \(g\) through the walls of the cylinder in constant communication with said space, a jacket \(b\) around the cylinder \(a\), a passage \(r\) communicating at one part with the cylinder \(a\) and at another with the jacket \(b\), an exhaust lift valve \(k\) adapted to opan and close the said communication, and an exhaust port \(n\) on said jacket \(b\), as herein set forth.

\section*{No. 101,084. Finger Bar of Mowery.}

\section*{Barre de fauchouses.}

William Gaterman, Manitowoc, Wisconsin, U.S.A., 18th September, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,222.
Claim.-1. In combination with the finger bar and guards of a mower or harvester, a series of castings, shoes pivotally attached to the forward ends of sald castings, sald shoes having pointed front ends and lifting arms extending backward therefrom, adjustable and vertically reversible end socketed engaging bodies to receive and hold the points or forward ends of said guards and bolts for securing the said bodies in adjusted position.
2. In combination with the finger bar and guards of a mower or harvester, a series of castings having openings
therein, adjustable and vertically reversible end socketed engaging bodies for the reception of the points or forward

ends of said guards, and bolts for uniting the castings and bodies in adjusted position.
3. In combination with the finger bar and guards of a mower or harvester, a series of castings, and a series of adjustable and vertically reversible end socketed bodies attached to said casting for the reception of the points or lorward ends of said guards.
4. In combination with the finger bar and guards of a mower or harvester, a series of castings with openings therethrough, adjustable and vertically reversible end socketed engaging bodies for the guard points, and bolts for securing the castings and bodies together, sald bolts being adjustably movable in said openings, and adapted to stay in place after adjustment.
5. In combination with the finger bar and guards of a mower or harvester, a series of castings, shoes pivotally attached to the forward ends of said castings and having pointed cront ends, and a serles of engaging bodies having end sockets at one side of the centers thereof, and adjustably secured to said castings for the reception of the forward ends of the guards, said bodies being reversible so as to receive sald guard ends at a different elevation, whereby the eievation of the shoe points may be changed.
5. In combination with the finger bar and guards of a mower or harvester, a series of castings, shoes pivotally atbached ito the forward ends of said castings, said shoes having pointed front ends, and lifting arms extending backward therefrom, longitudinally and reversible blocks having end sockets at one side of the centers thereof for the reception of the points of forward ends of said guards, and bolts for securing the said blocks in adjusted position.
6. In combination with the finger bar and guards of a mower or harvester, a series of castings recessed to form troughs with divergent side walls, and having longitudinal openings with serrated opposed edges through their bottom walls, hexagonal longitudinally adjustable and reversible blocks formed with end sockets at one side of their centers for the reception of the points or forward ends of sald guards and vertical bores beyond the end sockets, and bolts for uniting the castings and blocks, the bolt shank having squared or lozenge-shaped portions for adjustable engagement with the serrated edges of the trough openings.
8. In combination with the finger bar and guards of a mower or harvester, a series of castings, and a series of reversible blocks resting on and attached to said castings, and having end sockets at one side of the centers thereof for the reception of the points or forward ends of said guards.
9. In combination with the finger bar and guards of a mower or harvester, a reversible socketed member for each guard adapted to engage the point thereof at one side of the central horizontal plane of the block, a supporting member adjustably connected therewith and also secured to the finger bar, and lifting shoe pivotally connected with said supporting member in advance of the socketed member.

\section*{No. 101,085. Ice Cream Freezer.} Appareil réfvigérant pour crème a la glace.
Henry Jacob Gerner, Niagara Falls, New York, U.S.A., 18th September, 1906; 6 years. Filed 15th May, 1906. Receipt No. 135,934 .
Claim.-1. In an ice cream freezer, a freezer can, a cream feeding pipe leading into said can adjacent the bottom thereof, an air supply plpe communicating with the feed pipe, agitating means within said freezer can, and means for rotating same.
ereezer can, a cream feed pipe 2. In an ice cream freezer, a freeze bottom thereof, an air leading into said can adjacent the bottom

supply pipe communicating with the feed pipe, oppositely rotating agitating means operating within said freezer can, and means for operating said oppositely rotating agitating means.
3. In an ice cream freezer, a tub, a freezer can stationary within said tub, a frame mounted within said freezer can and provided with wings or arms held at a suitable angle, a shaft also within said freezer tub and provided with wings or arms held at a suitable angle, and means for rotating said frame and said shaft in opposite directions.
4. In an ice cream freezer, a tub, a freezer can stationary within said tub and provided with a pyramidal or frustro-conical-shaped top, a discharge tube opening into said top, a frame mounted within said freezer and provided with wings or arms held at a suitable angle, a shaft also within said freezer tub and provided with wings or arms held at a suitable angle, a spiral discharge screw controlled by said frame and operating within said freezer can top and designed to feed the finished product out of said freezer through said discharge tube, and means for rotating said frame and said spiral discharge screw in a direction opposite to that in which said shaft is rotated by said means.
5. In an ice cream freezer, the freezer tub hung to swing in uprights or standards, freezer can mounted in the tub, a reservoir, a feed pipe in communication with the reservoir and the freezer can adjacent the bottom of the latter, means for agitating the cream within the freezer can, and means for moving the tub and freezer can from a vertical to a horizontal position to permit of the discharge of the finished product.
6. In an ice cream freezer, a vertically disposed freezer tub trunnioned to swing in uprights or standards, a can mounted stationary within said tub, means for supplying a freezing agent to the tub through one of the trunnions, means for supplying cream to the can through the other trunnions, means for moving the tub and can from a vertical to an inclined and horizontal position, and agitating means within the freezer can.
7. In an ice cream freezer, a vertically disposed fre zer tub, a freezer can mounted stationary therein, means for supplying cream to said freezer can adjacent the bottom thereof, a frame mounted to turn within said freezer can and provided with wings or arms placed at a suitable angle, a shaft mounted within said freezer can and provided with wings or arms placed at a suitable angle, the said shaft and its wings or arms rotated in a direction opposite to the direction of rotation of said frame and its wings or arms, and means for rotating said frame and said shaft.
8. In an ice cream freezer, a freezer tub trunnioned in uprights or standards, a freezer can mounted within said tub and stationary therein, means for supplying brine to the tub through one of the trunnions, a cream supply pipe leading through the opposite trunnion and into the freezer can adjacent the bottom, agitating means within the freezer can, and means for moving the tub on its trunnions to incline the same.
9. In an ice cream freezer, a freezer can provided at its upper edge with a series of lugs, threaded bolts pivoted or hinged to said lugs, a can top resting on the top of said can and provided with a horizoníal flange having notches which receive said threaded bolts, and nuts in said bolts for securing said top to said freezer can.
10. In an ice cream freezer, a ireezer tub, a freezer can mounted within said tub and provided with a substantially pyramidal or frusto-conical fop, a lid for the freezer tub embodying two hinged sections or members adapted to con-
form to said top and means for holding said sections or members in the closed gosition.
11. In an ice cream freezer, a stationary freezer can, a frame mounted within said can and provided with a seriso of wings or arms placed at a suitable angle, a shaft also mounted within said can and provided with a series of wing mounted wid at a suitable angle, said sliaft and its wings or arms held at a suictate in a direction opposite to the or arms designed to rotate frame and its arms or wings direction of rotation of sald rotating these members.
and means for oppositely rotating stationary freezer can, a
12. In an ice cream freezer, and provided with a series frame mounted within said can and provide, a sleeve held of wings or arms placed at a said freezer can and provided to rotate within the botholes or notches, pins secured to or in its top portion with holase and designed to rest in the formed a part of said frame and shaft also mounted within holes or notches in said sleeve. aries of wings or arms held said can and provided with a member mounted within said at a suitable angle, a couplate therewithin and provided with sleeve and designed to rotate head in which is designed to a square-shaped socket in its end of said shaft and means fit the square shaped other said shaft in shaft, and means for rotating said frame and sald shaft in opposite directions.

No. 101,086. Circulating Advertising Card. Carte d'annonce.

George Weatherall Hemmans. Winnipeg. Manitoba, Canada. 18 th September, 1906; 6 years. Filed 27 th July, 1906. Receipt No. 138,216 .
Claim.-1. Improved advertising means, comprising a monthly circulating card, having a centrally disposed limitrd space thereon, a vertical index column at the outer edge thereof, vertically and horizontally aligned block sections. to receive the text of the individual advertisements, sur rounding said open space. vertical columns adjoining said index column, and means within said adjoining columns. co-operative with said index column, for giving immediate reference to the aforesaid individual block sections, as anti for the purpose specifled
2. An improved advertising device comprising a card divided at one portion into columns and lines by squares an 1 having a complementary index portion to designate the contents and positions of each square on the card, as and for the purpose specified.

\section*{No. 101,087. Sterilizing Cabinet.}

\section*{Cabinet de stérilisation.}

James A. Henning, Beardstown, Illinois, U.S.A., 18th September, 1906 ; 6 years. Filed 26th June, 1906. Receipt No. 137,304.
Claim.-1. In a sterilizing cabinet, a plurality of perforated shelves arranged within the cabinet one above the other to form compartments, whereby a sterilizing agent may pass throughout the entire cabinet, a door for one of the faces of the cabinet whereby access may be had to the entire cabinet, and means carried by the door communicating with each of the compartments in such a way that access may be had to une of the shelves independent of the other compartments.
2. In a sterilizing cabinet, a plurality of perforated shelves arranged within the cabinct one above the other and forming compartments through which a sterilizing agent is free to pass, a door for one of the faces of the cabinet, said door being provided with a series of openings communicating with a compartment within the cabinet, the lower edge of each
opening being flush with the corresponding shelf or floor and means for closing each of the openings within the door.

3. In a sterilizing cabinet, a plurality of perforated sleeves aranged within the cabinet one above the other and forming compartments, each of said compartments being of such size as to receive a tray, a hinged door for one of the faces of the cabinet, sald door permitting access to all of the compartments, said door having a series of openings of such size as to allow the passage of a tray therethrough, each of sald. openings communicating with a compartment within the cabinet, the lower edge of each opening being flush with the corresponding shelf or floor, guides on the sides of the openings and drop doors mounted in the guides.

No. 101,088. Tension Regulator for Belte, Ftc. Régulateur de tension de courroies, etc.

Frederick Duncan Mercer, London, Ontario, Canada, 18th September, 1906; 6 years. Filed 16th March, 1906. Receipt No. 133,965 .
Claim.-1. A tension regulating means comprising a belt, a tension regulator, means connected with the tension regulator and connecting one part of the belt to another part, means for attaching the connecting means at one place to the belt, and other means for slidably attaching the connecting means at another place disposed with regard to the firstmentloned place lengthwise of the belt, and located between the tension regulator and the first-mentioned means of attachment.
2. A tension regulating means comprising a belt, a tension regulator. means connected with the tension regulator and connecting one part of the belt to another part, said connecting means being attached at one place to the belt, and slidably attached to the belt at another place disposed with regard to the first-mentioned place lengthwise of the belt, said last-mentioned place being intermediate the tension regulator and the first-mentioned place of attachment.
3. A tension regulating means comprising a belt, a tension regulator, means connected with the tension regulator and connecting one part of the belt to another part, means for attaching the connecting means at one place to the belt and aranged to adjust the length of the connecting means, other means for slidably attaching the connecting means to the belt at another place disposed with regard to the first-ment;oned place lengthwise of the belt. said last-mentioned means being located between the tension regulator and the arst-mentioned means of attachment.
4. A tension regulating means comprising a belt, an extenalle and contractile member, means connected with the extensile and contractile member and connecting one part of the belt to another part, means for attaching the connecting neans at one place to the belt, other means for slidably at-
taching the connecting means to the belt at another place disposed with regard to the first-mentioned place lengthwise ot the belt, said last-mentioned means being located between the extensile and contractile member and the first-mentioned means of attachment, and means for adjusting the connecting means.
5. A tension regulating means comprising a belt, a tension regulator, means connected with the tension regulator, and connecting one part of the belt to another part, means for attaching the connecting means at one place to the belt, and other means for slidably attaching the connecting means to the belt at another place disposed with regard to the firstmentioned place lengthwise of the belt, and located between the tension regulator and the first-mentioned means of attachment, and means for limiting the extending movements of the tension regulator.
6. A tension regulating means comprising a belt, a .tension regulator, means connected with the tension regulator and connecting one part of the belt to another part, means for attaching the connecting means at one place to the belt, and arranged to adjust the length of the connecting means, other means for slidably attaching the connecting means to the \(b \in l t\) at another place disposed with regard to the first-mentioned place lengthwise of the belt, said last-mentioned means being located between the tension regulator and the first-mentioned means of attachment and means for limiting the extending movements of the tension regulator.
7. A tension regulating means comprising a belt, a tension regulator disposed transversely to the length of the belt and intermediate its side edges, connecting means connected with the tension regulator, fastening means for adjustably attaching the connecting means at one place to the belt, and other means for slidably attaching the connecting means to the belt, said last-mentioned means of attachment being located intermediate the tension regulator and first-mentioned means of attachment.
8. A tension regulating means comprising a belt, a tension regulator disposed transversely to the length of the belt, connecting means connected with the ends of the tension regulator, fastening means for attaching the connecting means at one place to the belt, and other means for slidably attaching the connecting means to the belt intermediate the tension regulator and the first-mentioned means of attachment, said last-mentioned means of attachment belng arranged to limit the extending movement of the tension regulator.
9. A tension regulating means comprising a belt, a tension regulator disposed transversely to the length of the belt, connecting means connected with the ends of the tension regulator, fastening means for attaching the connecting means at one place to the belt, and other means for slidably attaching the connecting means to the belt intermediate the tension regulator and the first-mentioned means of attachment, said last-mentioned means of attachment being arranged to limit the extending movement of the tension regulator, and means for adjusting the length of the connecting means.

No. 101,089. Lock. Scrrure.

Sorren Juul Nielson, Copenhagen, Denmark, 18th September, 1906; 6 years. Flled 9th December, 1905. Receipt No. 130,833.
Claim.-Keyless lock comprising in combination a frame at the front end of the drawer to be locked, a ledge in the bottom end of the frame, a slab with a horizontal slot for covering the front surface of the frame, and upper guide board of the drawer having a groove in the lower surface and the bottom plate of the drawer having a groove in the upper surface, a number of vertical rods shorter than the helght
of the frame standing on said ledge of the frame and provided with an aperture, an equal number of longer rods close behind said short rods, having longitudinal slots and adapted to engage with the groove of the bottom plate or with the groove of the upper gulde board according to their position with regard to the front rods, and flat headed screw bolts located in the apertures of the front rods and projecting with their heads through the slot of the slab and plate flxed in the drawer behind the longer rods, screw nuts for the reception of the ends of the flat headed screw bolts in said plate, substantially as described and shown and for the purpose set forth.

No. 101,090. Surface Carbureters. Carburatewr.

William Oliphant, mronto, Ontario, Canada, 18th September 1906; 6 years. Filed 4th May, 1906. Receipt No. 135,530.
Claim.-1. In a carbureter a tank, a feed rescrvoir therefor having its outlet extending down below the fluld level in the tank, a diphragm in the reservoir close to its outlet having an opening therein and a needle valve adapted to control the said opening and having its stem extending out through the reservoir, substantially as described.
2. In a carbureter a tank, a feed reservoir therefor having its outlet extending down below the fluid level in the tank, a cup supported about the lower end of the outlet to form a scal perforated to permit of a flow of liquid, substantially as described.
3. In a carbureter a tank, a tapped air inlet therefor, an air outlet therefor, a supply pipe for an engine connected with the air outlet, a check valve in said pipe, and a valve controlled air inlet in the pipe between the check valve and the engine end of the pipe, substantially as described.

\section*{No. 101.091. Driving Belt and Covering for Friction Wheels.}

Courroic If commande et courercle pour roue» de friction.

Parascheva Seehiari, Paris, France, 18th September, 1906; 6 years. Filed 1st May, 1906. Recelpt No. 135,429.
Claim.-1. A frictional transmission element having a covering or envelope of cork.
2. A transmission element having a working surface of denaturized cork.
3. A transmission element having a covering of denaturized cork applied in sheets.
4. A transmission element having a body of textlle fabric and a covering composed of sheets of denaturized cork.
5. A driving belt comprising a body of textile fabric and a covering of denaturized cork applied in sheets.
6. A driving belt comprising superposed plies of textile fabric and a covering of cork sheets applied thereto by rubber containing cement.
7. A driving belt embodying a plurality of plies of textile liabric applied to each other by means of india rubber rement, and a covering of cork sheets, likewise applied by mans of india rubber cement to the outer piles.
8. A driving belt embodying a plurality of plies of textile fabric applied at an angle to each other by means of india rubber cement, and a covering of cork sheets, likewise applied by matas of india rubber cement to the outer plles.

No. 101,092. Steam Enginc. Machine d rapfur.

Leon Serpollet, Paris, France, 18th September, 1906; 6 years. Filed 11th June, 1906. Receipt No. 137,700.
Claim.-1. A double steam acting motor with distribution by means of valves, comprising in combination a motor cylinder \(a\) with two bottoms, a cylindrical sleeve \(j\) rigid. connected to the motor cylinder and in a line therewith. a tight casing \(p\) filled with oil and secured in a line with the sleeve \(j\), a piston \(c\) moving in the motor cylinder, a slide block \(k\) fixed to the pree end of the piston rod and moving tigthly in the sleeve \(j\), a connecting rod \(l\) jointed to the block \(k\) and a cross driving shaft o journalled on bearings through the casing \(p\) and to which is jointed the connecting rod, substantially as described and for the purpose set forth.
2. A double steam acting motor with distribution by means of valves, comprising in combination a motor cylinder \(a\) with two bottoms, a cylindrical sleeve \(;\) rigidly connected to the motor cylinder and in a line therewith, a tight casing \(p\) flled with oll and secured in a line with the sleeve \(j\), a piston \(c\) moving in the motor cylinder, a slide block \(k\) fixed to the free end of the piston rod and moving tightly in the sleeve \(j\), a connecting rod \(l\) fointed to the block \(k\), a cross driving shaft \(o\) journalled on bearings through the casing \(p\) and to which is jointed the connecting rod, a guide \(d\) for the piston rod comprising parallel grooves, a passage \(g\) by which oll is supplied to said grooves, a passage \(h\) leading on one hand to the sleeve \(;\) between the guide \(d\) and the slide block \(k\) and on the other hand to the exterior, substantially as described and for the purpose set forth.
3. A double steam acting motor with distribution by means of valves, comprising in combination a motor cylinder \(a\) with two bottoms. a cylindrical sleeve \(j\) rigidly connected to the motor cylinder and in a line therewith. a tight casing \(p\) filled with oil and and secured in a line with the sleeve \(j\), a piston \(r\) moving in the motor cylinder. a slide block \(k\) fixed to the free end of the piston rod and moving tightly in the sleeve \(f\), a connecting rod \(l\) jointed to the block \(k\), a cross driving shaft o journalled on bearings through the casing \(p\) and to which is jointed connecting rod, two admission valves 1 and 2 , two exhaust valves 3 and 4, a distributing shaft \(q\) parallel with the motor shaft and journalled on bearings through the casing \(p\), two cams r and " mounted on the distributing shaft within the casing p, two rollers \(s\) carried by the rod of one the admlssion valves and by the rod of one of the exhaust valves, and bearing respectively on the cams \(r\) and \(u\), and two transmission levers \(t\) bearing on one side respectively upon the cams \(r\) and \(u\) and on the other side upon the ends of the rods of the other admission valve and of the other exhaust valve. substantially as described and for the purpose set forth.

No. 101093. Can Opener. Appareil d ouvrier les boîtcs.

Archibald Grant Snowdown, Westmount, Quebec, Canada, 18th September. 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,330.
Claim.-1. A can opener comprising a case having an opening at one end thereof and a knife blade projecting from its under side at sald open end and a bar slidably arranged in said case and extending beyond the open end thereof having at the outer end thereof a downwardly and outwardly turned and pointed end, and means for stopping the further movement of the bar on the said bar reaching its extreme outer position, as and for the purpose specifled.
2. A can opener comprising a case having an open end and formed in the interior thereof with suitable guide ways, a knife blade projecting from its under side and in a parallel direction therewith , bar sliding in sald guide ways and having a pointed end suitably formed to engage one of the walls of the can, said pointed end extending byond said open end of the case, and means for stopping the slipping out of the bar from the case, as and for the purpose specifled.
3. A can opener comprising a handle having a central recess and a knife blade projecting from its under surface in a parallel direction therewith and a bar longitudinally slotted having a suitably formed point to engage the top of the can and a rivet extending through the said handle and said slot in the bar, as and for the purpose specified.
4. A can opener comprising a handle internally recessed forming a case and having a knlfe blade projecting from the ur der side thereof and in a parallel direction therewith, a bar longitudinally slotted and correspondingly formed to slide in said recess, and a rivet extending across the open end of said recess through said slot in the sliding bar, as and for the purpose specified.
5. A can opener comprising a handle formed of upper and lower pieces internally grooved to form a case having a gulde way therein and an open end, a knife blade projecting from the under side of said under piece and extending in a parallel irection therewith, a bar sliding in sald handle and extending through said open end and having a longitudinal slot for a portion of its length and a downwardly and outwardly turned point adapted to engage the can, and a rivet securing said pleces together at the open end thereof and extending through the slot in the said bar and forming the stop for the further outwardly movement of said bar, as and for the purpose specifled.

\section*{No. 101,094. Bed. Lit.}

John Henry Sticht, Montreal, Quebec, Canada, 18th September, 1906; 6 years. Filed 11th January, 1906. Receipt No. 131,760.
Claim.-1. The combination with a bed post and a slide frame piece, of a member secured rigidly to the post and presenting a pair of vertical ribs having corresponding transverse recesses extending downwardly from their tops, the forwand walls of such recesses being downwardly inwardly inclined to present vertical wedges, a second member secured rigidly to the side frame and presenting a pair of abutment shoulders and a vertical tongue adapted to be received between the said pair of ribs, and a transverse pin projecting through the middle of the said tongue and having its ends adapted to be inserted into the recesses in the pair of pibs and jam the said wedges between them and the abutment shoulders, substantlally as described and for the purpose set forth
2. The combination with a bed post and a side frame piece, of a member secured rigidly to the post and presenting a

pair of vertical ribs having the outer corners of their adjacent sides rounded and such sides being formed with corresponding longitudinal recesses extending downwardly from their tops to within a short distance of their lower ends, the forward walls of such recesses being downwardly inwardly inclined to present vertical wedges, a second member secured rigidly to the side frame piece and presenting a pair of abutment shoulders and a vertical tongue adapted to be received between the said pair of ribs, and a steel pin project ing through the middle of the tongue with its ends adapted to be inserted into the slots in the pair of ribs and jam the wedges between them and the abutment shoulders, substantially as described and for the purpose set forth.

\section*{No. 101,095. Tag for Clothing.}

Etiquettc pour vêtements.

John Cornelius St. John, Boston, Massachusetts, U.S.A., 18th September, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,860 .
Claim.-1. The combination with a ticket or tag made of cardboard or other such like material, and a fabric of any suitable kind lying in part within the thickness of the tag, of a pin inserted through and lying in the thickness of the tag and passing through the goods lying within the thickness of the tag, substantially as described for the purpose specifled.
2. The combination with a ticket or tag made of cardboard or other such like material and having a hole through its thickness, and a fabric of any suitable kind lying in part within said hole of the tag, of a pin inserted through and lying in the thickness of the tag and passing through the goods lying within said hole of the tag, substantially as described for the purpose specified.
3. A pin tag comprising a main label having a seat formed in the body therefor, and having cavities in the body thereof aligned with each other on the opposite sides of said seat. and a removable fastener inserted in said cavities and across fald seat, substantially as described.

No. 101,096. Milling Machine. Machine d mouler.

Percy Leonard Weston, University of Sidney, New South Wales, Australla, 18th September, 1906; 6 years. Filed 16th December, 1906. Receipt No. 131,062.
Olaim.-1. A bevel gear milling machine comprising a stationary standard having a head whose center constitutes a fixed axis for the co-acting parts, a sleeve having a socket articulating mounted on the head of the stationary standard, an arm supported by the sleeve, a tool supporting means connected with the arm, a work supporting standard adjustable relatively to the stationary standard and radially on an arc concentric with the fixed center, and means for actuating the arm to determine the obliquity of the tool on the work.
2. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constistutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center, a work supporting standard carried by the oscillatory plate, adjustable relatively to the stationary standard and radially to the fixed center, a sleeve supported by the stationary standard, and arm carried by the sleeve, a tool supporting means adjustable connected with the arm, and means for automatically positioning the arm to determine the obliquity of the tool on the work.
3. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and morable in a curvilinear plane concentric with the center of the fixed standard, a work supporting standard carried by the oscillatory plate adjustable relatively to the stantionary standard, an arm shpported by the stationary standard, a tool supporting means adjustably connected with the arm and and so arranged that the longitudinal axis of the cutting tool supported by its will when projected intersect the fixed center, and means for automatically positioning the arm to determine the obliquity of the tool on the work.
4. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a cnrvilinear plane concentric with the fixed center, a work supporting standard carried by the oscillatory plate, means for adjusting the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm supported by the stationary standard, a tool supporting means adjustably connected with the arm and arranged so that the longitudinal axis of the work cutting tool will constantly Intersect the fixed center, and means for automatically positioning the arm to determine the obliquity of the tool on the work.
5. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the conter of which constitutes a fixed center for the co-acting parts, an ocillatory plate mounted upon the base and mor-
able in a curvilinear plane concentric with the fixed center. a work supporting standard carried by the oscillatory plate, means for adjusting the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm suported by the stationary standarr a tool supporting means adjustably connected with the arm and arranged so that the longitudinal axis of the work cutting tool will constantly intersect the fixed center, and means for automatically positioning the arm to determine the obliquity of the tool on the work, comprising a sector plate on the free end of the arm, a guide cone engaging the working face of the sector plate, a travelling clutch engaging the sector plate and the guide cone, and means for actuating the travelling clutch.
6. A bevel gear inlling machine comprising a base, a stationary standard supported thereon having a head, the center of .which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center, a work supporting standard carried by the oscillatory plate, means for adjusting the work suppnrting standard relatively to the stationary standard, an arm supported by the stationary standard, a tool supporting means adjustably connected with the arm and arranged so that the longitudinal axis of the work cutting tool will constantly intersect the fixed center, and means for automatically positioning the arm to determine the obliquity of the tool on the work, comprising a sector plate on the free end of the arm, a gulde cone engaging the working face of the sector plate, a travelling clutch engaing the sector plate and the guide cone, and means for actuating the travelling clutch, comprising a pair of clutch arms, a spur wheel to oscillate the clutch arms in a fixed path. a pinion meshing with the spur wheel, a stub shaft for the pinion, a worm wheel mounted on the stub shaft and arranged to revolve un!tedly with it in one direction and to permit the stub shaft to revolve independently of it in the opposite direction, a worm meshing with the worm wheel, and means for causing the revolution of the worm.
7. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head the center of which constitutes a fixed center for the co-acting parts. an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center, a work supporting standard carried by the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm supported by the stationary standard, a tool supporting means adjustably connected with the arm and arranged so that the longitudinal axis of the work cutting tool will constantly intersect the fixed center, means for automatically positioning the arm to determine the obliquity of the tool on the work, comprising a sector plate on the free end of the arm, a guide cone engaging the working face of the sector plate, a travelling clutch engaging the sector plate and the guide cone, and means for actuating the travelling clutch, comprising a pair of clutch arms, a spur wheel to oscillate the clutch arms in a fixed path, a pinion meshing with the spur wheel, a stub shaft for the pinion, a worm wheel mounted on the stub shaft and arranged to revolve unitedly with it in one direction and to permit the stub shaft to revolve independently of it in the opposite direction, a worm meshing with the worm wheel, means for causing the revolution of the worm, and means for automatically stopping the motion of the worm when the travelling clutch has completed its movement in a forward direction.
8. A bevel gear miling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center, a work supporting standard carried by the osclllatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm supported by the stationary standard, a tool supporting means adjustably connected with the arm and arranged so that the longitudinal axis of the work cutting tool will constantly intersect the fixed center, means for automatically positioning the arm to determine the obliquity of the tool on the work, comprising a sector plate on the free end of the arm, a guide cone engaging the working face of the sector plate, a travelling clutch engaging the sector plate and the guide cone, and means for actuating the travelling clutch, comprising a pair of clutch arms, a spur wheel actuating the clutch arms and adapted to oscillate the clutch arms in a fixed path, a pinion meshing with the spur wheel, a stub shaft for the pinion, a worm wheel mounted on the stub shaft and arranged to revolve unitedly with it in one direction and to permit the stub shaft to revolve independently of it in the opposite direction, a worm meshing with the worm wheel, means for causing the revolution of the worm, and two bands, the ends of one of which are connected to the upper extremity of the gulde cone and to the lower extremity of the sector plate, and the other to
the upper extremity of the sector plate and to the lower extremity of the guide cone.
9. A bevel gear milling machine comprising a stationary standard having a head whose center constitutes a fixed axis for the co-acting parts, a sleeve having a socket articulatirgly mounted on the head of the stationary standard, an arm supported by the sleeve, a movable head adjustable on the arm, a plate swivelled to the movable head, a tool supporting means connected with the swivel plate, a work supporting standard adjustable relatively to the stationary standard and radially on an arc concentric with the fixed center, and means for actuating the arm to produce a geometrically correct involute conical surface on the work.
10. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center, a work supporting standard carried by the oscillatory plate adjustable relatively to the stationary standard and radially to the fixed center, a sleeve supported by the stationary standard, ar arm carried by the sleeve, a movable head adjustable on the arm, a plate swivelled to the movable head, a tool supporting means connected with the swivel plate, and means for actuating the arm to produce a geometrically correct involute conical surface on the work.
11. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plans concentric with the center of the fixed standard, a work supporting standard carried by the osclllatory plate adjustable relatively to the stationary standard, an arm supported by the stationary standard, a movable head adjustable on the arm, a plate swivelled to the movable head, a tool supporting means connected with the swivel plate and means for actuating the arm to enable the tool to produce a geometrically correct involute conical surface on the work.
12. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center a work supporting standard carried by the oscillatory plate, means for adjusting the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm supported by the stationary standard, a movable head adjustable on said arm, a plate swivelled to the movable head, a tool supporting means connected with the swivel plate, and means for actuating the arm to enable the tool to produce a geometrically correct involute conical surface on the work.
13. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center a work supporting standard carried by the oscillatory plate, means for adjusting the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard. an arm supported by the stationary standard, a movable head adjustable on said arm. a plate swivelled to the movable head, a tool supporting means connected with the swivel plate, means for actuating the arm to enable the tool to produce a geometrically correct involute conical surface on the work, comprising a sector plate on the free end of the arm, a guide cone engaging the working face of the sector plate, a travelling clutch engaging the sect.or plate and the guide cone, and means for actuating the travelling clutch.
14. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head. the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base and movable in a curvilinear plane concentric with the fixed center, a work supporting standard carried by the oscillatory plate, means for adfusting the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm supported by the stationary standard. a movable head adjustable on said arm, a plate swivelled to the movable head, a tool supporting means connected with the swivel plate, means for actuating the arm to enable the tool to produce a geometrically correct involute conical surface on the work, comprising a sector plate on the free end of the arm, a guide cone engaging the working face of the sector plate, a travelling clutch engaging the sector plate and the guide cone, means for actuating the travelling clutch, comprising a pair of clutch arms, a spur wheel to oscillate the clutch arms in a fixed path, a pinion meshing with the spur wheel, a stub shaft for the pinion, a worm Wheel mounted on the stub shaft and arranged to revolve unitedly with it in one direction and to permit the stub
shaft to revolve independently of it in the opposite direction, and a worm meshing with the worm wheel and means for causing the revolution of the worm.
15. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base, and movable in a curvilinear plane concentric with the fixed center, a work supporting scandard carrled by the oscillatory plate, means for adjusting the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm supported by the stationary standard, a movable head adjustable on said arm, a plate swivelled to the movable head, a tool supporting means connected with the swivel plate, means for actuating the arm to enable the tool to produce a geometrically correct involute conical surface on the work, comprising a sector plate on the free end of the arm, a guide cone engaging the working face of the sector plate, a travelling clutch engaging the sector plate and the guide cone, means for actuating the travelling clutch, comprising a pair of clutch arms, a spur wheel to oscillate the clutch arms in a fixed path, a pinion meshing with the spur wheel, a stub shaft for the pinion, a worm wheel mounted on the stub shaft and arranged to revolve unitedly with it in one direction and to permit the stub shaft to revolve independently of it in the opposite direction, and a worm meshing with the worm wheel, means for causing the revolution of the worm, and means for automatically stopping the motion of the worm when the travelling clutch has completed its movement in a forward direction.
16. A bevel gear milling machine comprising a base, a stationary standard supported thereon having a head, the center of which constitutes a fixed center for the co-acting parts, an oscillatory plate mounted upon the base, and movable in a curvilinear plane concentric with the fixed center. a work supporting standard carried by the oscillatory plate, means for adjusting the oscillatory plate, means for adjusting the work supporting standard relatively to the stationary standard, an arm supported by the stationary standard a movable head adjustable on said arm, a plate swivelled to the movable head, a tool supporting means connected with the swivel plate, means for actuating the arm to enable the tool to produce a geometrically correct involute conical surface on the work, comprising a sector plate on the free end of the arm. a guide cone engaging the working face of the sector plate. a travelling clutch engaging the sector plate and the guide cone, means for actuating the travelling clutch. comprising a pair of clutch arms, a spur wheel to oscillate the clutch arms in a fixed path, a pinion meshing with the spur wheel, a stub shaft for the pinion, a worm wheel mounted on the stub shaft and engaged to revolve unitedly with it in one direction and to permit the stub shaft to revolve independently of it in the opposite direction and a worm meshing with the worm wheel, means for causing the revolution of the worm, means for automatically stopping the motion of the worm when the travelling clutch has completed its movement in a forward direction, and two bands, the ends of one of which are connected to the upper extremity of the guide cone and to the lower extremity of the sector plate, and the other to the upper extremity of the sector plate and to the lower extremity of the guide cone.

\section*{No. 101,097. Turbine Bucket Wheel. Turbine d roues d godets.}

James Wilkinson, Providence, Rhode Island, U.S.A., 18th September, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,100 .
Claim.-1. A turbine bucket wheel or drum, a bucket supporting rim thereon, buckets mounted on said rim and having integral elongated shank portions which straddle said rim and hug the sldes thereof. inwardly disposed hooked
extensions carried by said shanks and adapted to engage with said rim to hold the buckets against radial displacement, and means to secure said buckets positively to said rim.
2. The combination with a bucket supporting element provided with shouldered portions on each side. a plurality of individual buckets adapted to be mounted thereon and provided each with a pair of integral spacing shank portions adapted to straddle said element, and projections on said shanks which catch under said shouldered portions.
3. A turbine bucket element having a rim portion on which the buckets are mounted. in combination with buckets having shanks which straddle said rim portion, shoulders on said shanks adapted to engage a portion of said rim, and projections on sald rim adapted to be caulked against said shanks to hold them in engagement with said rim.
4. A bucket wheel having a rim portion for supporting buckets and an annular flange on each side, in combination with buckets adapted to be mounted on sald wheel and to be held in position by having said flanges bent into engagement with them.
5. A turbine bucket wheel comprising an under cut rim and two caulking flanges. In combination with buckets having portions which interiock with said rim, said flanges being so disposed relatively to said bucket portions that they may be bent into engagement with them, for the purposes described.
6. A turbine bucket wheel provided near its perlphery with an annular flanged portion, and a narrow annular web connecting said portion with a rim which is wider than said web but of less width than said flanged portion, in combination with buckets which straddle and interlock with said rim, the sides of said flanged portion being adapted to be bent into engagement with said buckets, for the purposes described.
7. The combination with an element having an undercut bucket sypporting portion, of individual buckets having integral spacer base blocks carrying two shanks which are adapted to straddle said portion with a close fit, sald shanks being enlarged for a considerable portion of their length to form intermediate shoulders which are adapted to enterlock with the overhanging parts of said portion, caulking flanges en said element, and tapered faces at the ends of sald shanks against which said flanges are adapted to be caulked.
8. As an article of manufacture, a bucket or vane having integral ductible shanks oppositely disposed and provided with inwardly projecting shoulders. the top faces of which are disposed substantially at right angles to sald shanks.
9. A turbine bucket wheel having a rim. in combination with bucket elements, each of which is provided with arms adapted to be spread apant and passed over said rim so as to straddle it, hooked projections on said arms so disposed that when the bucket is seated upon the rim and said arms have been brought together Against the sides of the rim. the sald projections will catch under said rim, and means to hold said projections in engagement with the rim.
10. A turbine bucket wheel having a shouldered rim of considerable radial thickness. an annular groove in said rim to lighten ft , buckets adapted to seat against said rim and having elongated hooked shanks which straddle said rim, flting closely against its sides and catching under the shouldcred portions thereof, and means to hold sald shanks in engagement with said rim.
11. The combination with a bucket supporting element, of a row of buckets mounted thereon and provided each with a spacing flange at its outer end, which is spread until it abuts against an adjacent bucket.
12. \(\Lambda\) bucket wheel comprising a row of buckets spaced at their inner and outer ends and placed under an initial tension at their outer ends by spreading or caulking their abutting portions.

No. 101,098. Illuminated Sign. Enseignc illuminée.
Charles L. Williams, Parkersburg. West Virginia. U.S.A., 18th September. 1906; 6 years. Filed 21st July, 1906. Recelpt No. 138,015.
Claim.-1. A symbol for flluminated signs comprising an opaque body, and translucent edge plates set at an angle to the body, the body and the plates being in contrasting colors to produce a shaded effect.
2. A symbol for illuminated signs comprising a back having an opening therein, an opaque symbol body disposed opposite the opening at one side of the back, and translucent edge plates extending between the edge of the body and the edges of the opening, the symbol body and plates being in contrasting colors to give a shaded effect to the symbol.
3. A symbol for llluminated signs comprising a back having an opening therein in the: shape of a symbol. a seat. exlonding around the odge of the opening, an opaque symbol body dixposed opposite. the opening at one side of the back and provided with a peripheral seat. and translucent plates get at an angle to the body with their edges recelved within
the seat of the body and the seat of the back, the body and plates being in contrasting colours.

4. In an illuminated sign the combination of a fleld having an opening therein in the shape of a symbol, an opaque symbol body disposed opposite the opening at one side of the field and smaller than the opening, and translucent edge plates extending between the edges of the symbol and the edges of the opening and inclined across the opening, the symbol body and the plates being in contrasting colours.
5. A symbol for illuminated signs comprising a back having an opening therein in the shape of a symbol, and provided with seats around the edges of the opening, an oqaque symbol body disposed opposite the opening at one side of the back and provided with peripheral edge seats, translucent plates set at an angle to the body with their edges received within the seats of the body and the back, and angle bars connecting the abutted ends of adjacent translucent plates, the symbol body and the plates being in contracting colours.
6. A symbol for illuminated signs comprising an opaque back plate having edge portions bent across the back of the plate to form atlaching flanges and there being an opening formed in the plate and having the shape of the symbol to be exhibited, an opaque symbol body of the same shape and of less size than the opening and translucent pdge plates extending between the edges of the opening and the edges of the symbol and inclined across the opening, the symbol body and the plates being in contrasting colours and the plates forming a connection betwern the symbol body and the back glate.

\section*{No. 101,099. Metal Turning Lathe.}

\section*{Tour pour le métal.}

Henry Pattman Trueman and Edward Duncan Cleghorn, co-inventors, both of Worcester. England, 18th September, 1906; 6 years. Filed 22nd May, 1903. Receipt No. 105.764.

Claim.-1. In screw making and metal turning lathes, the means for enabling various thicknesses of work to be operated upon, consisting in the combination of a work spindle. a feed tube carried within said work spindle, and having an interior screw thread at one end, a feed shell having an exterior screw thread at its inner end, and a reducing socket having one end screw threaded internally and adapted to receive the externally screw threaded end of the feed shell and having its other end screw threaded externally and adapted to screw into the feed tube, substantially as specified.
2. In screw making and metal turning lathes, in which a supplemental tool carried.is employed, means for imparting a sliding movement to said tool carrier, said means comprising a shaft having a worm wheel and crank for actuating said tool carrier, a worm shaft to actuate said worm wheel, a bearing bracket upon the main tool slide for supporting said shaft, an arm for supporting said tool carrier. and an extension on said arm the bearing bracket for which said extension slides, in combination with stops and springs fcr automatically operating said tool carrier, said stops being rigidly carried upon sald worm shaft, one on each side of said bearing bracket. and said spring being interposed between said stops and said bearing bracket, substantially as specifiod.
3. In screw making and metal turning lathes, the cutting of slideways held upon the main frame and capable of angular adjustment, the actuating lever of said cutting off slideways, the telescoping ball joints of said actuating lever, and the grooved guides along which the ball ioints of said actuating lover nperato. said grooved guides being attached to the tool slides. substantially as specified
4. In stork fording mechanism for screw making and metal turning lathes the combination with the fending slides and the feed spools operated by said fced spools in their retracted positions, sald means consisting of balls arranged
to lie in a groove in the feed spool, recesses in the end of the feed tube, in which are located said balls, and springs

located in said recesses and arranged to exert a pressure on said balls, substantially as specifled.
5. In screw making and metal turning lathes of the multispindle type, means for enabling the tool slides to be adjusted to compensate for wear, said means comprising the rombination with side strips, capable of adjustment to compensate for the wear on the sides of the tool slide, of screw and clamp bolts for adjustment, and blocks fitted in spaces, and the spaces formed in the under side of the tool slide, said blocks being capable of vertical adjustment to compensate for wear on the bottom of the tool slide, and the set screws for adjusting vertically. substantially as specified.
6. In screw making and metal turning lathes, means for operating the feed spools, said means comprising a clamp sllde. a feed slide arranged to slide upon said clamp slide. a cam pin upon said clamp slide and a cam pin upon said feed slide, said pins being arranged to be operated by cam strips upon a cam drum, and the said cam drum and the said cam strips upon said cam drum, substantially as speciIled.

No. 101,100. Illuminated Sign. Enscignc illuminée.

Joseph Hotchner, New York City, New York, U.S.A., 18th September, 1906: 6 years. Filed 28th March, 1906. Recelpt No. 134,363.
Claim.-1. An illuminated sign comprising a light transmitting character, and an illuminating means, said illumibating means partially protruding throngh the character.
2. An illuminated sign comprising a casing. a light transmitting character carried by the casing, a reflector arranged within the casing, and an Illuminating means arranged within the casing and partially protruding through the character.
3. An illuminating sign comprising a light transmitting sign panel, and an illuminating means partially protruding through the panel.
4. An illuminated sign comprising a light transmitting sign panel, and a single illuminating means arranged on both sides of the panel.
5. An illuminated sign comprising a sign panel, and a single illuminating means arranged on both sides of the panel.

No. 101,101. Door. Porte.

Floyd W. Newman, Bradford, Pennsylvania, U.S.A., 18th September, 1906; © ycars. Filed 23 rd June, 1906. Receipt No. 137.223.
Claim.-1. In a closure of the class described, a stationary receiving pocket having spaced sldes, a plurality of leaves in \(\mathbf{C}\)-shape in transverse section and individually pivoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leap, and a stile pivoted to the free ends of sald leaves, whereby the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the door is in open position.
2. In a closure of the class described, a stationary receiving pocket having spaced sides, a plurality of leaves in \(U\) shape in transverse section and individually plvoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longltudinal edges of the adjacent leaf, a stile pivoted to the free ends of said leaves whereby the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the uoor is in open position, and locking means carried by the closure for rendering the leaves rigid at any point of thelr clevation.
3. In a closure of the class described, a stationary receiving pocket having spaced sides, a plurality of leaves in \(U\) shape in transverse section and indlvidually pivoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leaf, a stile pivoted to the free ends of said leaves whereby the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the door is in open position, a spring actuated bolt, and a member having spaced recesses to receive said bolt one at a time and connected respectively to one of said leaves and to said stile, for rendering said leaves rigid at any point of elevation.
4. In a closure of the class described, a stationary recelving pocket having spaced sides, a plurality of leaves in \(U\) shape in transverse section and individually pivoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leaf, a stile pivoted to the frecends of said leaves whereby
the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the door is in open position, a spring actuated bolt carried within one of said leaves, an arm extending from the adjacent pivot of sald leaf supported bolt and operating in a recess in sald bolt, an operating lever connected to said pivot, a plate within the stile and provided with spaced recesses for recelving said bolt when projected.
5. In a closure of the class described, a statlonary receiving pocket having spaced sides diverging toward the inner edge, a plurality of leaves in U-shape in transverse section and with the side walls converging toward the free ends and individually pivoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leaf, and a stile pivoted to the free ends of said leaves, whereby the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the door is moved into open position, and the adjacent surfaces of the individual members of the structure caused to draw away from each other and avoid -ietion bedween the parts.
6. In a closure of the class described, a stationary receiving pocket, a plurality of leaves in U-shape in transverse section and with the side walls converging toward the freo ends and individually pivoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leaf, a stile pivoted to the free ends of said leaves whereby the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the door is moved into open position, and the adjacent surfaces of the individual members of the structure caused to draw away from each other and avoid friction between the parts, a stlle pivoted to the free ends of said leaves, and bindings of yleldable material upon the overlapping edges of said leaves.
7. In a closure of the class described, a stationary side member, a plurality of leaves individually pivoted to said member with their adjacent longitudinal edges overlapping, a stile with the free ends of the leaves individually pivoted thereto, and a brace bar spaced from said leaves and pivoted at one end to the pocket end of one of the leaves and with the other end pivoted at the free end of the same leaf.
8. In a closure of the class described a door frame, a pocket within sald frame at one side and opening into the doorway opening, a plurality of leaves individually pivoted within said pocket with their adjacent longitudinal edges overlapping. a stile with the free ends of the leaves individually pivoted thereto, and a brace bar spaced from said leaves and pivoted at one end to one of the pivots at the pocket end of the leaves and with a section curved concentric to said pivot and extending through an aperture in the frame and pivoted at the free end of the same leaf.
9. In a closure of the class described, a door frame, a pocket within said frame at one side and opening into the doorway opening and a recess in the frame at the opposite side and opening into the doorway opening, a plurality of leaves individually pivoted within said pocket and with their adjacent longitudinal edges overlapping, and a stile with the frae ends of the leaves individually pivoted thereto and capable of seating within the recess in the frame when the door is in closed position.
10. In a closure of the class described, a door frame having a pocket therein at one side and opening into the doorway opening and a recess in the frame at the opposite side and opening into the doorway opening, a plurality of leaves individually pivoted within said pocket and with their adjacent longitudinal edges overlapping, a stile with the tree ends of the leaves individually pivoted thereto and capable of seating within the recess in the frame when the door is in closed position, and a yieldable packing strip attached to said stile to bear against the frame within the recess.
11. In a closure of the class described, a stationary side nuember, a plurality of leaves individually pivoted to said member with their adjacent longitudinal edges overlapping and with projections at the pree ends of two or more of the leaves, lifting bars pivoted to said projections, and a stile with the free ends of the leaves pivoted thereto.
12. In a closure of the class described, a stationary receiving pocket having spaced sides, a plurality of leaves in U-shape in transverse section and individually pivoted withit the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leaf, a stlle pivoted to the free ends of sald leaves, a socket adjacent to the pocket pivot of one of sald leaves and having extended side walls, a spring folded upon itself and seated at the fold within said socket, spaced pins carried by the leaf adjacent to sald socket and embracing both arms of said spring, and spaced pins carried by said leaf and embracing one arm of said spring.

1:. In a closure of the class described, a stationary receiving pocket having spaced sides, a plurality of leaves in Ushije in transverse section and individually pivoted within the pocket with their adjacent spaced longitudinal edges
overlapping the connected longitudinal edges of the adjacent leaf, a stile pivoted to the free ends of said leaves, whereby the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the door is in open position, and a bar coupled to the upper leaf and two or more of the intermediate leaves and operating withis said pocket, to govern the movement of the leaves.
14. In a closure of the class described, a stationary rer iving pocket having spaced sides, a plurality of leaves it. Ushape in transverse section and individually pivoted wititiv the pocket with their adjacent spaced longitudinal edg's overlapping the connected longitudinal edges of the adiacent leaf and a stile pivoted to the free ends of sald leaves whereby the leaves are capable of interfolding within the pucket and the stile foldable within the interfolded leaves when the door is in open position, one or more of sald leaves having projections at the free ends and formed with depressious for bearing yieldably against the stile and retarding the movement of the parts.
15. In a closure of the class described, a stationary recelving pocket having spaced sides, a plurality of leaves in \(U\) shape in transverse section and individually pivoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leaf, a stile pivoted to the free ends of sald leaves whereby the leaves are capable of interfolding within the pocket and the stile foldable within the interfolded leaves when the door is in open position, and filler strips upon the stlle for closing the spaces between the leaves and stile when in closed position.
16. In a closure of the class described, a stationary receiving pocket having spaced sides and opening into the doorway opening, a plurality of leaves in U-shape in transverse section and with the side walls parallel for a distance of the ends and converging toward the outer ends between the parallel portions, the parallel portions of said leaves at one end individually pivoted within the pocket with their adjacent spaced longitudinal edges overlapping the connected longitudinal edges of the adjacent leaf, and a stlle substantially In U-shape in cross section with the sides parallel for a distance at the open edge and converging toward the closed edge for the remainder of the distance, the parallel portions of said stile pivoted between the parallel portions of said leaves at the outer ends, whereby the leaves are capable of interfolding within the pocket and the stile resting within the interfolded leaves when the door is disposed in open position, and the parts caused to move without lateral strains or friction.
17. In a closure of the class described. a stationary side member, a plurality of leaves individually pivoted to said member with their adjacent longitudinally edges overlapping and with projections at the free ends of two or more of the leaves, a handle having laterally extended ends bearing against two of said projections, clamp screws operating through said projecting portions and into said extended ends, a brace member pivoted at one end at the pocket end of one of the leaves and engaging one of the extended ends of the handles which projects beyond the same and returned parallel to the body of the brace and spaced therefrom and conrected to the handle end.
18. In a closure of the class descried, a stationary side nomber, a plurality of leaves individually pivoted to sald member with their longitudinal edges overlapping and with projections at the free ends of two or more of the leaves, a handle having laterally extended ends bearing against two of said projections. lifting bars pivoted to sald projections, a brace member pivoted at one end at the pocket end of the leaves and engaging one of the extended ends of the handle and projecting beyond the same and returned parallel to the body of the brace and spaced therefrom and connected to the handle end exteriorly of the leaves.
19. In a closure of the class described, a door frame including spaced vertical tubular supporting members connected at the end to the supporting structure, horizontal tubular members within the header portion of said frame and connected at the ends to the vertical members, a pocket within said frame at one side and opening into the doorway opening and a recess in the frame at the opposite side and opening into the doorway opening, a plurality of leaves individually pivoted within said pocket and with their adfacent longitudinal edges overlapping, and a stile with the free ends of the leaves individually pivoted thereto and capable of seating within the recess in the frame when the door is in closed position.
20. In a closure of the class described, a door frame including spaced vertical tubular supporting members bearing at one end over depending pins and with spring supported pins at the other ends for entering sockets in the adjacent supporting structure, horizontal tubular members within the header portion of said frame and connected at the ends to the vertical members, a pocket within said frame at one side and opening into the doorway opening and
a recess in the frame at the opposite side and opening into the doorway opening, a plurality of leaves individually pivoted within said pocket and with their adjacent longitudinal edges overlapping, and a stile with the free ends of the leaves individually pivoted thereto and capable of seating within the recess in the frame when the door is in closed nosition.

No. 101,102. Concrete Block Making Machine. Huchine à faire des blocs de béton.

Albert A. Pauly, Youngstown, Ohio, U.S.A., 18th Septem-
ber, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,092.
Claim.-1. The combination with a frame having rollers journalled therein, of standards carried by said frame, a plate connecting said standards together, a frame slidably mounted upon sald standards, a plunger carried by said standards, a shaft journalled in said frame and having suitable crank handles, a toothed wheel mounted upon said shaft, a rack carried by sald plate and meshing with said loothed wheel, a pawl pivotally mounted upon said frame and normaily engaging said toothed wheel, substantially as described.
2. The combination with a frame having rollers journalled therein, of standards carried by said frame, a rack bar carried by said standards, a frame slldably mounted upon sald standard, a plunger carried by said frame a toothed wheel journalled in said frame and meshing with said rack bar, means to rotate said toother wheel and means to normally hold said wheel in a locked position, substantially as described.
3. The combination with a frame having rollers journalled therein, of standards carried by said frame, a frame slidably mounted upon said standards, a plunger carried by said frame, means to elevate said frame, and means to lock eaid frame in an elevated position, substantially as described.
4. Mechanism of the character described consisting of standards, a rack bar carried by sald standards, a frame slidably mounted upon said standards. a plunger carried by said frame, a toother wheel journalled in said frame, and meshing with said rack bar, means to rotate said toothed wheel and means to lock said toothed wheel in a fixed position, substantially as described.

No. 101,103. Butter Cutter. Couteau à beurre.
Patrick Mathew Scanlan, New York City, Now York, U.S.A., 18th September. 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,177.
Claim.-1. A device of the class described, comprising a casing open at one end, a tube connected with the other end thereof, a handle on said tube, cutter blades pivotally mounted on said casing one on each side thereof, a supplemental tube in said first-named tube, a rod in said supplemental tube and devices for moving said supplemental tube, said rod and said cutter blades independently of cach other, substantially as described.
2. A device of the class described, comprising a casing open at one end, a tube connected with the other end there-

of, a handle on said tube, a plunger in said casing, cutter blades on said casing, a wire carried by sald cutter blades, a supplemental tube mounted in seid first-named tube and the end of which adjacent to said handle is provided with a screw thread and an internally threaded device in operation with said supplemental tube for adjusting the same longitudinally, substantially as described.
3. A butter cutter, comprising a casing open at one end, a handle connected therewith, a blade on either side thereof, a laterally arranged block on the inner side of each of said blades, a screw in each side of said casing and provided with a slotted head in which the corresponding one of said laterally arranged members is adapted to slide, and devices connected with said handle for moving said blades, substantially as described.
4. In a butter cutter, a casing open at one end, a handle connected therewith, a plunger in said casing, a handle connected therewith, a block in said plunger, and devices for limiting the outward movement of said block in the outward movement of said plunger, substantially as described.
5. A butter cutter, comprising a casing open at one end, a tube secured to the closed end of said casing, a handle secured to said tube, plunger in said casing, a tube secured in said plunger and provided with a handle, a blade pivotally mounted on each side of said casing, a wire adjustably mounted in said blades, devices for moving said blades on their pivotal points, devices for locking said blades in their intermediate positions, a plurality of wires adjustably and detachably secured to said casing and passing over the open end thereof, a block in said plunger and devices for limiting the movement of said block in the movement of said plunger, substantially as described.
6. In a butter cutter of the class described, a casing open at one end, a handle connected therewith, a plunger movable therein, a handle connetced with said plunger, a block in said plunger, a rod connected with said block and secured in said rod and passing through a slot in sald plunger handle, said screw being also secured in a collar slidably on said plunger handle, a tube mounted on said plunger handle and provided with a screw thread at one end thereof, a screw-threaded sleeve engaging said tube, and blades pivotally mounted on each side of said casing, a wire detachably and adjustably secured on said blades and passing over the open end of said casing, and devices for moving said blades and said wire, substantially as described.
7. In a butter cutter, a casing open at one end, a hollow shank connected therewith, a handle secured to said shank, a plunger in said casing, a blade rotatably and laterally movable on each side of said casing, a plate on each side of said shank and provided with a segmental slot, a yoke lever pivoted on said shank, a link pivotally connected to said yoke-shaped lever and provided with a stub-shaft operating in said segmental slot, and a stub shaft passing through the corresponding one of said blades, a rod slidably mounted on each side of said shank and provided with a handle member, a bracket mounted on each of said slidable rods, a connecting rod pivotally connected with each of said brackets and with said yoke lever, devices for locking said blades in a predetermined position. and devices for moving said plunger longitudinally of said casing, substantially as described.
8. In a butter cutter of the class described, a casing open at one end, a blade pivoted to each side thereof, a wire secured in said blades and passing over the open end of sald casing, a plunger in said casing. devices for moving said blades, devices for moving said plunger, a plurality of wires on said casing and passing over the open end thereof, a shaft on said casing to which said wires are connected, a
lever on said shaft, a segment gear on said casing, and serving as one of the supports for said shaft, and a plate slidably mounted on said lever and adapted to engage said segment gear, substantially as described.

No. 101,104. Scaffold Bracket. Console d'échafaud.

Alfred Weir, Winnipeg, Manitoba, Canada, 18th September, 1906; 6 years. Filed 21st June, . 1906. Receipt No. 137.121.

Claim.--1. A scaffolding bracket consisting of a main arm, having one of its ends pointed, an arm pivotally bolted to the other extremity of the main arm, and a hook at the free end of the depending arm, as and for the purpose specified.
2. A scaffolding bracket consisting of a bar iron compression arm, having the liwer end pointed and turned inwardly, and the upper end turned at right angles to the body, a tension arm pivotally bolted to the compression arm and at its upper end, and means at the free end of the tension arm for securing to the uprights or studs, as and for the purpose specifled.

No. 101,105. Sea Wall. Mur de mer.

Henry Winter, Seattle, Washington, U.S.A., 18th September, 1906 ; 6 years. Flled 19th July, 1906. Receipt No. \(137,978\).
Claim.-1. A wall of the character described, comprised of a plurality of piles and blocks, said blocks being each formed or provided with apertures adapted to severally receive said piles.
2. A wall of the character described, comprised of a plurality of piles and blocks, saīd blocks being formed or provided with agertures adagted to register with said plles and thereby be interlocked for positioning the blocks during the process of construction and thereafter maintaining them in alignment.
3. A wall of the character described, consisting of parallolopiped concrete blocks arranged in courses, the blocks being arranged in the several courses to overlap those in the adjacent courses, piles passing rectangularly to and through the various said courses and so disposed as to be at rach joint of the contiguous blocks of a course.
4. A wall of the character described. consisting of parallelopiped concrete bocks arranged in courses with intervening cement flling therebetween and between the blocks of arh course, the blocks being arranged in the several courses to overlap those in the adjacent courses. piles passing rectangularly to and through the various sald courses and so disposed so ats to br at rach joint of the contiguous blocks of a rours.
5. A wall of the character described, consisting of parallelopiped concrete blocks arranged in courses, the blocks being arranged in the several courses to overlap those in the adjacent courses, piles passing rectangularly to and through the various said courses and so disposed as to be at each joint of the contiguous blocks of a course and also intermediate thereof.
6. A wall of the character described, consisting of parallelopiped concrete blocks arranged in courses with intervening cement filling there-between and between the blocks of each course, the blocks being arranged in the geveral courses to overlap those in the adjacent courses, piles passing rectangularly to and through the various said courses and so disposed as to be at each joint of the contiguous block of a course and also intermediate thereof.

No. 101,106. Fonntain Pen. Plume-fontaine.

Joseph F. Betzler, Akron, Ohio, U.S.A., 18th September, 1906;
6 years. Filed 26 th May, 1906. Receipt No. 136,288 .
Claim.-1. In a fountain pen the combination with a barrel, of a corrugated longitudinally compressible ink receptacle therein, a nozzle and pen, one end of said receptacle communicating with said nozzle, and means for compressing said receptacle, substantially as described.
2. The combination with a fountain pen having a barrel, a nozzle feeding device therein and a pen in the nozzle, of a longitudinally compressible ink receptacle enclosed within the barrel, said receptacle communicating with sald nozzle at one end, and closed at the other end, and a compressing device for the receptacle, said compressing device located within the barrel, substantially as described.
3. The combination with a fountain pen having a barrel, a nozzle therefor and a penaand ink feeding device in the nozzle, of a longitudinally compressible ink receptacle in the barrel communicating with said nozzle, a compressing device for the receptacle located in said barrel and an operating device accessible from the exterior of the barrel for sald compressing device, substantially as described.
4. The combination in a fountain pen having a barrel, a nozle therefor and a pen feeding device therein of a longitudinally compressible receptacle therein comunicating with said nozzle, a piston in the barrel behind the compressible receptacle, and means located exterior to the barrel and connected with said said piston for operating the same, substantially as described.
5. In a fountain pen the combination with the barrel and nozzle therefor having a pen and feeding means therein, of a longitudinally compressible receptacle, within the barrel, a piston behind the receptacle, an exterior longitudinally movable member and operatively connecting means for said exterior member with said piston, said barrel having an open-ir.- through which said connecting means projects, substan. itally as described.
6. In a fountain pen having a barrel, a nozzle and pen and fecding device in the nozle, a longitudinally compressible corrugated roubber tube in the barrel, a piston in the barrel. behind the tube and a stem for said pen passing longitudinally through the outer extremity of said barrel, substantially as described.
7. Ina fountain pen the combination with a barrel having a nozle and pen therein, of a longitudinally compressible ink receptacle therein. a piston in the barrel, a stem therefor projecting longitudinally though an opening in the outer end of the barrel and longitudinally extensible extremity for sald stem, substantially as described.

\section*{No. 101,107. Passenger Recorder.}

\section*{Registre pour voyagcurs.}

Emma W. Jackson, administratix of the estate of C. F. Jackson. decrased, Sherman, Texas, U.S.A., 18 th September. 1906; 6 years. Filed 7th March, 1906. Receipt No. 133,610.
Claim.-1. In a passenger recorder a plurality of yieldable steps each having independent circuit closing contacts. \(\pi\) plurality of imprinting devices, electro-magnets controlling the movement of imprinting members, said magnets being independently connected in circuits lrading to the step conlarts and elictro-magnetically controlled operating means
connected in series with certain of the electro-magnets of the imprinting members and serving to feed the record strip

only at intervals with respect to the operation of the imprinting devices.
2. In passenger recorders a series of three movable steps each having independent circuit closers, three electro-magnets connected one to each of the steps, imprinting devices operably connected to the armatures of the electro-magnets, and means for imparting feeding movement to the record strip after closing of the circuits controlled by the first and third steps.
3. In passenger recorders yleldable steps, movable doors or gates, independent contacts carried by the steps and doors and forming the terminals of electric circuits, electro-magnets connected with the circuits, imprinting devices having. operative connections with the armatures of said electromagnets, an auxiliary imprinting device, an operating magnet therefor, a circuit in which the operating magnet is connected and contacts forming the terminals of said circuit, said contacts being moved to engaging position on the closing of the doors.
4. In passenger recorders a plurality of yieldable steps, a movable door or gate, independent contacts carried by the steps and doors, circuits of which the contacts form terminals, electro-magnets connected in said circuits, imprinting devices operatively connected to the armatures of said electro-magnets and a battery circuit connected to and forming a part of the magnet circult, said battery circuit having terminals disposed adjacent to the door of the vehicle and arranged to break the circuit when the door is closed.
5. In a passenger recorder for vehicles a plurality of yieldable steps each having independent contacts, a door, ccntacts controlled thereby, circuits of which contacts form terminals, electro-magnets connected in said circuits, imprinting devices operatively connected to the armatures of said electro-magnets, means for imparting a step-by-step movement to a record strip, an auxiliary electro-magnet, a printing member carried thereby for recording on the strip the stations at which the vehicle stops, an independent circuit for the magnet, said circuit having terminals that are movable into engagement by the closing of the vehicle door, and a battery circuit having terminals disposed adjacent to the door and movable to break the circult when the door is closed.
6. In a passenger recorder a plurality of yieldable steps, contacts carried thereby and forming the terminals of inde-pendent circuits, a casing, a platen arranged in the casing, electro-magnetically actuating means for a recording strip, an inked ribbon also movable over the platen, an electromagnetically movable feeding means for the ribbon, a plurality of imprinting devices and electro-magnets for actuating the same, said electro-magnets being disposed in the circuit of which the step contacts form the terminals.

\section*{No. 101,108. Furniture. Meuble.}

William Kirkpatrick, Jamestown, New York, U.S.A., 18th September, 1906 ; 6 years. Filed 24th July, 1906. Recelpt No. 138,112.
Claim.-1. In an article of furniture of the character described the combination with vertically grooved front and rear posts and back rails, of slotted end rails having tenons slidably engaging the grooves of said posts, and front rails having slotted extension tongues engaging the slots of the end ralls and keys for securing said tongues.
2. In an article of furniture of the character described the combination with rabbetted front posts having vertical grooves offset from their rabbets, vertically grooved rear posts and back ralls, of slotted end ralls having tenons, front ralls having extension tongues passing through the slots of the end rails, and means for keying the tongues to said end ralls.
3. In an article of furniture of the character described the front post having a longitudinal corner rabbet provided with

an offset groove in combination with a slotted end rail engaging the rabbet and having a tenon engaging said groove, and a front rail having an extension tongue adapted to pass through the slot of said end rall and engage the rear surface of the front post, and means for securing said tongues to said end rail.
4. In an article of furniture of the character described the comblnation with the vertically grooved front post and slotted laterally grooved end rail having a tenon, of tha front rail having a tongue engaging the slot of the tenon, and a drawer track bar having lateral tenons engaging the groove of the end rail.

No. 101,109. Acetylene Gas Generator. Génératcur à gaz acétyline.

Aquila Lauzon, Labelle, and Liniàre Grègoire, St. Jovite, both in Quebec, Canada, co-inventors, 18 th September, 1906; 6 years. Filed 15th March, 1906. Receipt No. 133,944.
Resumé.-1. Dans un genérateur à gaz acetylene, la combinof the front post, and means for securing said tongues to aison dune cuve 12 avec une cloche a gaz fixe 11, plongeant dans l'eau de cette cuve, avec audessus un réservolr a eau indepenendant 10 surmonte d'une capacité a carbure, avec un agitateur avec une branche elliptique 22 avec une tige recourbee 23 , le tout tel que decrit en substance.
2. La combinaison dans un générateur à gaz acetylne, d'une cuve avec une cloche a gaz fixe, avec un tube de sarete 138 , avec un flotteur cylindrique plat 17 , avec une tige fletée 15 , fixee a volonte au flotteur au moyen de deux ecrous 19. avec une tête cylindrique 9 formant soupape à carbure, le teut tel que decrit en substance, pour les fins speciffees.

\section*{No. 101,110. Map Hanger. Pcndant de cartes.}

John J. O'Leary, Yreka, California, U.S.A.. 18th September. 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,862.
Claim.-An improved map hanger having in combination two parallel spaced rods or rollers. transversely extending end pleces in which the rods or rollers are journalled, said end pieces having sockets intermediate of their ends, flexible suspending devices and rods connected thereto and having their lower ends provided with journal pins adapted to engage the sockets of the end pleces whereby said end pleces and the rollers are substantially balanced, a map or other descriptive sheet having bars at opposite ends and having
a limited reciprocating movement between said rods or rollers and adapted to carry graphic representations on its ob-

verse and reverse sides, the representation on one side being upside down in relation to that on the other side.

\section*{No. 101,111. Fire Extinguisher. \\ sertinotowr d'moendla.}

Henry Simpson and Robert Tomlinson, both of Liverpool Lancaster, England, 18th September, 1906 ; 6 years. Filed 12th September, 1905. Recelpt No. 128,374.
Olaim.-1. The improved fire extinguishing apparatus consisting of an actuating device operated by changes of temperature, an alarm, a serles of jets or sprinklers, and means for producing a fire extinguishing fluid under pressure and supplying the same to the said jets, all so characterized that when the limiting temperature is reached the said device actuates means which give the alarm produces the said fluid and supplies the same to eaid jets, substantially as described. 2. Apparatus of the class described consisting of a serles of sets of jets or sprinklers, a corresponding series of actuating devices, means for producing a fire extinguishing fluid under pressure adapted to be connected to any one of the sald sets of jets and means for giving an alarm, the arrangement being such that a predetermined rise of temperature near any sets of jets operates the actuating device corresponding with that set which thereupon actuate the alarm and the means for producing the fluid under pressure and connecting it to that set of jets, substantially as described.
3. A fire extingulshing apparatus comprising an actuating device comprising a quick acting and slow acting means adapted to actuate the apparatus either when a maximum temperature is reached or when the normal temperature is exceeded by a predetermined amount, substantially as described.
4. A fire extinguishing apparatus comprising a tank containing substances which when mixed provide a fire extinguishing fluid under pressure, means for mixing the substances including a weight arranged to drop and fracture a container of one of the substances, means for connecting the tank to a particular set of sprinklers or jets, and an actuating device fixed near the said set of sprinklers and adapted to actuate an alarm and to release a weighted lever or the like device which thereupon operates the mixing and connecting means, substantially as described.
5. A fire extinguishing apparatus including actuating means comprising quick acting and slow acting devices, each carryIng two sets of contacts, one set for actuating the alarm and one set which afterwards closes the circuit, of an elec-tro-magnet which releases a loaded lever or the like which thereupon operates the fire extinguishing apparatus, substantlally as described.

No. 101,112. Display Case. Oatese d't́talage.
D. M. Ferry \& Company, assignee of Robert Turner, Jr., both of Detroit, Michigan, U.S.A., 18th September, 1906; 18 years. Filed 4th July, 1906. Receipt No. 137,502.
Claim.-1. A display casc having an inclosing body, independently constructed, folding stepped end brackets located
within the body at the extremities thereof, and a series of trays each provided at the upper ends of the extremities

thereof with supporting means to rest upon the upper edges of the corresponding steps, of said folding end brackets to suspend the trays at different elevations, whereby the trays way each be lifted vertically off from the corresponding steps of the brackets, said brackets arranged to be folded within the inclosing body in knockdown position, sald trays With their supporting means constructed to be located within the body of the case when removed from the end brackets.
2. A display case having in combination an inclosing body independently constructed, folding end brackets located within the body at the extremities thereof formed with a series of steps, and a series of trays each provided with outwardly projecting supporting clips at the extremities thereof to extend over and upon the upper edges of the corresponding steps of the brackets, to suspend the trays at different elevations, whereby the trays may be lifted vertically off from the steps of the brackets, said brackets arranged to be folded within the body in knockdown position, said trays with their supporting clips constructed to be located within the body of the case when removed from the end brackets.
3. A display case having in combination an inclosing body independently constructed, folding stepped end brackets located within the body at the extremities thereof, and a series of trays supported upon the steps of said brackets. cne rising above another, said trays each provided at its opposite extrem!ties with outwardly projecting metal suspending clips secured to the corresponding end of the tray, said clips extending outward and over the upper edge of the corresponding step of the brackets, whereby the trays may be lifted vertically off from the steps of the brackets, sald brackets arranged to be folded within the body in knockdcwn position, sald trays with their suspending clips constructed to be located within the body of the case when removed from the end brackets.
4. A display case having in combination an inclosing body independently constructed, folding end brackets located withIf the body at the extremities thereof each formed with a series of steps, and a series of trays each provided at its extremities with supporting means to suspend the tray upon the upper edges of the corresponding steps of the brackets. whereby the several trays may individually be lifted vertically off from the supporting brackets, said brackets arranged to be folded within the body in knockdown position, said trays with their supporting means constructed to be located within the body of the case when removed from the end brackets.
5. A display case having in combination an inclosing body, folding end brackets each formed with a series of steps, additional means to connect said brackets, and a series of trays each at its extremities provided with clips whereby the trays may be supported upon the upper edges of the brackets and whereby the trays may individually be lifted vertically off from the end brackets.
6. A display case having in combination an inclosing body. folding end brackets, each form with a series of steps. a back strip connecting the rear edge of said brackets, and a series of trays each provided at its extremities with clips whereby the tray may be supported upon the corresponding upper edges of the brackets, and whereby the trays may be Individually lifted vertically of from the end brackets, sail brackets and the back connecting strip being removable from the body.

No. 101,113. Advertising Apparatus. Apparell d'annonce.

Berliner Ansslellings-Gallerien, Berlin, assignee of Karl J. H. Klempau. Hamburg, both in Germany, 18th September 1906; 6 years. Filed 16th September, 1905. Recelpt No. 128,471.
Claim.-1. Advertising apparatus comprising an advertising band, two drums around which the band passes, a sliding frame in the form of a crosshead and having constant movement to and fro, an endless chain connecting the two drums, and means for connecting the sliding frame with cither the right or the left hand side of said endless chain to transmit the downward movement of said sliding frame to sald chain whereby the drums are operated to rotate either one way or the other according to whether the connection of the sliding frame is with the right hand or left hand side of the chain. substantially as described.
2. In combination in an advertising apparatus, a pair of drums, an endless band passing over the same, an endless chain connecting the drums, a reciprocating crosshead or sliding frame, means for reciprocating the said crosshead or sliding frame, pawls carried by the sliding frame and adaptcd to engage either the right or left hand side of the chain, means for automatically controlling the engagement of the pawls with the chain in order to effect the reversal of the directions of rotation of the drums, said controlling means consisting of a cam disc. a device for operating the sald cam disc, sald device being in turn operated by the reciprocating movement of the sliding frame, the said cam device having its edge formed to maintain one pawl out of engagement with the endless chain while permitting the engagement of the other pawl therewith, the said cam disc revcrsing the position of the pawl just before the completion of the transfer of the advertising band from one drum to the other, substantially as described.
3. In an advertising apparatus the combination of an advertising band, drums for holding the sald band, an endless ciain connected with the drum, a sliding frame having pawls, one of which engages one side of the chain and the other of which engages the other side of the chaln, means for automatically controlling the engagement of the pawl with the chain, a stopping lever arranged to render both pawls inoperative simultaneously and a striking pin against which the stopping lever strikes during the upward stroke of the sliding frame to release the pawls, substantially as described.
4. In an advertising apparatus the combination of the advertising band, the drums carrying the said band, an endless chain connected with the drums, a sliding frame, means for rectprocating the same, pawls carried by the sliding frame for engaging the chain to operate the same in opposite directions, means for controlling the engagement and disengagement of the pawls, two spring locking pawls for the upper drum, a pin on said upper drum to be engaged by the said spring locking pawls, a bent lever adapted to press the spring locking pawls aside. and a supporting lever engaging the bent lever, said supporting lever being controlled by the sllding frame, substantially as described.

No. 101,114. Imitation 8ilk. Imitation de sote.
La Societe Génerale de la Sole Artificielle Linkmeyer, assignee of Rudolf Linkmeyer, all of Brussels, Belgium 18th September, 1906; 6 years. Filed 22nd March, 1906. Receipt No. 134,150.
Claim.-1. In the process for the manufacture of brilliant threads resembling silk by means of solutions of cellulose in ammoniacal oxide of copper converted into threads by precipitation in solutions of fixed alkalles or salts, the treatment of the threads on leaving the precipitation bath with gases or solutions of salts adapted to absorb the ammonia and to form with the oxide of copper combinations readily soluble in acids but insoluble in water, substantially as described above.
2. In the process for the manufacture of brilliant threads resembling silk by means of solutions of cellulose in ammoniacal oxide of copper converted into threads by precipitation in solutions of fixed alkalies or salts, a method of extracting oxide of copper from the alkaline precipitation bath consisting in immersing cellulose in this bath and in withdrawing it after the salts of copper have become deposited thereon, substantially as described above.

No. 101,115. Steam Turbine. Turbine d vapeur.

The Allis-Chalmers Company, assignee of James Wilson, all of Milwaukee, Wisconsin, U.S.A.. 18th September. 1906 6 years. Filed 2nd August, 1906. Receipt No. 138,368.
Claim.-1. A grooved base, a notched strip in the groove. blades in the notches and blocks in the groove co-acting with the strip and blades.
2. A grooved base, a strip in the groove having undercut notches, blades in the notches and blocks in the groove coacting with the strip and blades.
3. A grooved base, a strip in the groove having undercut notches, blades in the notches and blocks in the groove coacting with the strip and blades and having an undercut portion.
4. A grooved base, a notched strip, in the groove, blades in the notches and blocks in the groove co-acting with the strip and blades and having an undercut portion.
5. A grooved base, a strip in the groove having notches undercut at their ends, blades in the notches co-acting along an edge with the undercut notch ends and blocks in the groove, said blocks having an undercut portion co-acting with the side of the blade.
6. A base, a blade tapered across its thickness at one portion of the blade root and across its width at a second portion of the blade root, and means for fastening the blade to the base comprising an element co-acting with the first portion of the blade root and a separate element co-acting with the second portion of the blade root.

\section*{No. 101,116. Power Transmitting Mechanism.} Mécanisme de transmission de la force.
The Canadian General Electric Company, Limited, Toronto, Ontario, Canada, assignee of Richard H. Rice. Swampscott, and Fred. R. C. Boyd, Lynn, both in Massachusetts U.S.A., 18th September, 1906 ; 6 years. Filed 15th May. 1906. Receipt No. 135,928.

Claim.-1. In an apparatus of the character described the combination of a motor, a shaft driven thereby, a driven shaft, worm gearing between the shafts, and a means for adjusting the worm longitudinally on the motor driven shaft. 2. In an apparatus of the character described the eombination of a motor, a shaft driven thereby, a bearing for the shaft, means for preventing endwise movement of the shaft,
a worm splinted on the shaft, a means for adjusting the position of the worm on the shaft, a driven shaft and a worm

wheel mounted on the driven shaft and meshing with the worm.
3. In an apparatus of the character described the combination of a motor, a shaft driven thereby, a secondary or driven shaft, gearing between the shafts, a means for adjusting the gear on the motor driven shaft, a thrust bearing lor the motor driven shaft and a conduit for introducing lubricant under the pressure to the thrust bearing and continuousiy maintaining a fluid film between its blocks.
4. In an apparatus of the character described the combination of a motor, a shaft driven thereby, a secondary or driven shaft, gearing between the shafts, a means for adjusting the gear on the motor driven shaft, a thrust bearing for the motor driven shaft, a conduit for introducing lubricant under pressure to the thrust bearings and continuously malntaining a fluid film between the blocks, one or more conduits for introducing lubricant to the gearing, and means for preventing the lubricant delivered to the gearing and the thrust bearings from mingling.
5. In an apparatus of the character described the combination of a frame or support, a driving shaft, a driven shaft, a separ splinted on the driving shaft, a gear on the driven shaft meshing therewith, a sleeve for longitudinally adjusting the gear on the driving shaft, a bearing block carried by the sleeve, an adjustable block carried by the frame or support, and a conduit for introducing fluid under pressure between the blocks and maintaining a fluid film therein.
6. In an apparatus of the character described the combination of a frame or support, a driving shaft mounted therein, a driven shaft, a gearing for transmitting motion from the driving to the driven shaft, a casing for enclosing one of the gears to keep a body of lubricant in contact therewith for lubricating and cooling purposes, and a condult for supplying lubricant to the casiag.
7. In an apparatus of the character described the combination of a frame or support, a driving shaft, a worm and worm wheel for transmitting motion from the driving to the driven shaft, a shell which surrounds the shaft.' a casing or projection carried by the shell which encloses the worm to keep lubricant in contact therewith for lubricating and cooling purposes, and a conduit for supplying lubricant to the casing projection.
8. In an apparatus of the character described the combination of a frame or support, a driving shaft mounted thereon, a driven shaft, a worm and worm wheel for transmitting motion from the driving to the driven shaft, a shell which surrounds the shaft, a casing or projection carried by the shell encloses the worm to keep lubricant in contact therewith for lubricating and cooling purposes, a condult for supplying lubricant to the casing or projection, a bearing for supporting the shell and through it the shaft. and means for adjusting the worm longitudinally of the shaft and shell. 9. In a device of the charactor described the combination of a motor having a rotating clemont, a shaft driven thereby. a bearing for the shaft, means for preventing longitudinally thrust on the shaft from being transmitter to the sald rotating eloment. a driven shaft at right angles to the drivIrig shaft, a longitudinally movable worm on the motor driven shaft, a worm wheel secured to the driven shaft, a sleeve on the shaft, a thrust block carried to the sleeve, and an adjustable thrust block engaging with the first.
10. In a device of the character described the combination of a driving shaft, a driven shaft, worm gearing between the shafts, a means for adjusting the position of the worm and worm whet with respect to each other, a means for discharging lubricant over the face of the worm, a base for supporting the shafts which contains a chamber to receive the lubricant after it is used, and a coolling coll located in the chamber..
11. In an apparatus of the character described the combination of a driving and a driven shaft, gearing between the shafts, a shell for supporting the driving shaft and containing a cylinder and a collection chamber, a longitudinally adjustable bearing block in the cylinder, a second block opposing the first, the lubricant from the blocks discharging Irto the collection chamber, a bearing carried by the shell, a second chamber formed in the shell and separated from the first to receive lubricant exhausting from the bearing.
12. In an apparatus of the character described the combination of a base or frame. a shaft mounted thereon, a motor for driving the shaft which is overhung and attached tc the frame. a driven shaft, gearing between the shafts, a means for taking up the thrust on one of the shafts.
13. In an apparatus of the character described the comtination of a base or frame, a driving shaft carried thereby. a driving shaft at right angles to the first, bearings for the driven shaft also carried by the frame and located above the driven shaft, gearing between the shafts, a fluid bearing thrust bearing between the driving shaft and a fixed abutment, and a second thrust bearing between the driven shaft and a fixed abutment.
14. In an apparatus of the character described the combination of a driving and a driven shaft, journals for the shafts, gearing between the shafts, a worm and a worm wheel, a pump driven thereby. and conduits for convering libricant from the pump to the gearing to lubricate it and dissipate heat. and also to the journals.
15. In combination a steam turbine, a hydraulic pump, a shaft driven by the turbine, a second shaft connected to and driving the movable member of the pump, the two shafts being at right angles to each other, worm gearing between the shafts. means for taking up the thrust on the worm, and a separate means for taking up the thrust on the turbine driven shaft.
16. In an apparatus of the character described the combination of a motor, a shaft driven thereby, a gearing arranged to take the thrust thereof, other bearings for supporting the motor driven shaft, a frame for supporting the bearings, a second suitably supported shaft, a gearing for transmitting motion from one shaft to the other, and means for supplying lubricant under pressure to the bearings and the gearing.
17. In an apparatus of the character described the combination of a motor, a shaft driven thereby, a frame; \(n\) bearing supporting one end of the shaft. a bearing for the other end of the shaft, a shell supporting said bearing and attached to the frame, a thrust bearing carried by the shell, a second suitably supported shaft, and gearing for transmitting motion from one shaft to the other.
18. In an apparatus of the character described the comblnation of a motor, a shaft driven thereby, a frame, bearings for the shaft supported by the frame, a second shaft, gearing for transmitting motion between the shafts, bearings for the second shaft supported by the frame, and means for taking up the thrusts on the shafts.

\section*{No. 101,117. Elastic Flnid Turbine. Turbine à fluide ćlastique.}

The Canadian General Electric Company, Toronto, Ontario. Canada, assignee of Richard H. Rice, Lynn, Massachusetts, U.S.A., 18th September, 1906; 6 years. Filed 28th August, 1906. Recelpt No. 139,036.
Claim.-1. An elastic fluid turblne comprising relatively rotating parts in combination with a main shaft, a valve mechanism a secondary shaft driven by the main shaft. gcaring between the main and secondary shafts, a means driven by the secondary shaft for actuating the valve mechanism. and a lubricating pump geared to and driven by the secondary shaft, as and for the purpose specificd.
2. An clastic fluid turbine comprising relatively rotating pirts and a main shaft in combination with a bearing therefor, a secondary shaft carried by the boaring support, gearing between the main and secondary shafts. a gear pumo also carried by the bearing support, and a gear mounted on the secondiary shaft and meshing with one of the pump gears for driving it. as and for the purpose specified.
3. An elastic fuid turbine comprising relatively rotating parts and a main shaft in rombination with a bearing therefor, a secondary shaft extending at right angles to the main shaft and carried by the bearing support, a reciprocating member driven by the secondary shaft, gearing between the
shafts, a gear pump comprising meshing gears, shafts therefor extending parallel to the secondary shaft and a gear

mounted on the secondary shaft and meshing with one of the gears of the pump to drive it, as and for the purposes specified.
4. An elastic fluid turbine comprising relatively rotating parts and a main driving shaft in combination with a bearing therefor, a secondary shaft extending at right angles to the main shaft, gearing between the two, a casing enclosing the gearing to confine the lubricant and insure proper distribution thereof, bearings for the secondary shaft, a gear pump and a support that is common to the bearings of the secondary and pump shafts, as and for the purposes specified.
5. In an elastic fluid turbine the combination of a fluid discharging device, a bucket wheel, a lip on the discharging device which projects over the periphery of the wheel, and a cylindrical projection on the wheel that extends under the discharging device, as and for the purpose specified.
6. In an elastic fluid turbine the combination of a support that is split to provide a yielding clamping member and contains a bucket receiving groove, buckets the ends of which extend into the groove, and means for causing the parts of the support to clamp the buckets, as and for the purpose specified.
7. In an elastic fluid turbine the combination of a split support having a dovetail groove, buckets with the ends mounted therein, means for clamping the parts of the support to hold the buckets, and a lining strip inserted between the support and the main body of the buckets, as and for the purpose specified.
8. In an elastlc fluid turbine the combination of wheel buckets and fluid discharging devices, a shield to reduce the rotation losses of the idle buckets, and a circumferential flange co-operating with the shield to reduce the tendency of the motive fluid to leave its normal path, as and for the purpose specified.

\section*{No. 101,118. Elastic Flnid Turbine. Turbine à fluide élastique.}

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Elihu Thompson. Swampscott, Massachusetts, U.S.A.. 18th September, 1906;6 years. Filed 9th May, 1906. Receipt No. 135,712.
Cluim.-1. In an elastic fluid turbine the combination of a casing, a bucket wheel mounted therein, a device for discharging fluid against the buckets, the axis of which is inclined towards the wheel axis to reduce the effects of centrifugal force on the fluid.
2. In an elastic fluid turbine of the parallel flow type, a wheel having peripheral buckets, with the device for discharging fluid thereto. the axis of which is inclined to the plane of of the wheel and also to its axis.
3. In an elastic fluid turbine the combination of a casing, a wheel, rows of buckets mounted thereon, intermediate

buckets between the rows of wheel buckets and a device for converting pressure of the motive fluid into velocity and discharging it against the wheel buckets, the axis of the said device being inclined to the plane of the wheel and also to the axis of the wheel to reduce the tendency for the motive fluid to pass the buckets without performing useful work.
4. In an elastic fluid turbine the combination of a casing, a wheel having a row of buckets, a cover therefor having projections extending transversely of the wheel axis and a wall carried by the casing which extends between and co-operates with said projections to reduce the leakage.
5. In an elastic fluid turbine the combination of a casing, a wheel having a row of buckets, a cover therefor, a plurality of projections and projections carried by the casing which extend between the profections on the cover to form a path of high resistance to leakage fluid.
6. In an elastic fluid turbine the combination of a casing, a wheel having rows of buckets, a cover for each row having projections extending transversely to the wheel axis, cyindrical projections carried by the casing which extend between the projections on the cover and co-operate therewith to reduce leakage, intermediate buckets, a device for discharging motive fluid against the wheel buckets.
7. In an elastic fluid turbine the comblnation of a casing, a wheel having rows of buckets, a cover for each row having projeotions thereon extending transversely of the wheel axis, projections carried by the casing which extend between the projections to reduce leakage, intermediate buckets between each two rows of wheel buckets, projections on sald intermediate buckets which co-operate with the wheel to reduce leakage and a device for discharging fluid against the buckets.
8. In an elastic fluid turbine the combination of a casing, a Huid discharging device, a wheel having buckets thereon, a cover for the buckets having projections extending transversely to the plane thereof. a projection carried by the casing which extends between those on the cover to baffle the leakage, and a means situated between the wheel axls and discharging device for further reducing the leakage.
9. In an elastic fluid turbine the combination of a support, a row of buckets mounted thereon, a cover for the buckets having a plurality of projections thereon, and means for securing the cover to the buckets which are located between the projections.
10. In an clastic fluid turbine the combination of a support, a row of buckets mounted thereon, a cover for the buckets having a plurality of rows of projections formed integral therewith and rows of tenons formed integral with the buckets which project through the cover on opposite sides of a projection and are riveted over to secure the cover in place.

No. 101,119. Governor for Elastic Fluid Turbines. Gouverneur pour turbines d fuide élastique.
The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Walter Kieser, Berlin, Germany, 18th September, 1906 ; 6 years. Filed 19th July, 1906. Receipt No. 137,954.
Claim.-1. In a governing mechanism the combination of a valve, a means for vibrating the valve, and a device responsive to lead variations for changing the region of vibration of the valve, as and for the purpose specified.
2. In a governing mechanism the combination of a valve, a means for vibrating the vaive in a manner to throttle the passage of motive fluid, a speed responsive device. and means acted upon by the speed responsive device for changing the region of vibration of the valves, as and for the pur. rose specified.
3. In a governing mechanism the combination of an elastic band valve, a means for winding and unwinding the valve. a
device for vibrating the said means and a speed responsive device for changing the region of the vibration of the said means, as and for the purpose specified.

4. In a governing mechanism the combination of a valve, a power driven means for constantly vibrating the valve and a device responsive to load conditions for varying the region of vibration of the valve, as and for the purpose specifled.
5. In a governing mechanism the combination of a valve, a spindle for the valve, a means for oscillating the spindle to vibrate the valve, a driving device for the said means, and a sneed responsive device for modifying the action of the valve vibrating means, as and for the purpose specifled.
6. In a governing mechanism the combination of a valve, a means for vibrating it, a speed responsive device and a weighted lever and connections for changing the region of vibration of the valve, as and for the purpose specified.
7. In a governing mechanism the combination of a valve, a means for vibrating It. a speed responsive device, a weighted lever and connections for changing the region of vibration of the valve, and a speed responsive device controlling the action of the welghted lever, as and for the purpose specifled.
8. In a governing mechanism the combination of a valve, a source of power, a speed responsive device, a system of levers and connecting rods connected to the source of power for moving the valve, and a means actuated by the speed responsive device for changing the relative positions of the pivots of sald system of levers and rods, as and for the purpose specifled.
9. In a governing mechanism the combimation of a valve, an actuating rocking spindle therefor, a driving connection which is directly connected to the spindle and is constantly in motion for vibrating it, and a speed responsive device for modifying the movements of the driving connection so as to change the region of vibration of the valve spindle, as and for the purpose specfied.
10. A fluid actuated motor in combination with a vibrating valve controlling the passage of motive fluid therethrough, a low speed shaft driven by the moving element of the motor, a rod which is constantly vibrated by the shaft levers, and a connecting rod for transmitting motion from the vibrating rod to the valve spindle and a speed responsive device driven by the motor for changing the position of certain of the pivots of the levers, and connecting rod to change the region of vibration of the valve, as and for the purpose specified.
11. A fluld actuated motor in combination with a vibrating valve. a speed responsive device driven by the motar, a weighted lever, the position of which is changed by the speed responsive device. a driving connection between the movable element of the motor and the valve for vibrating it and a connecting rod between the weighted lever and the driving connection for varying the position of rertain of its pivots to vary the region of the vibration of the valve, as and for the purpose specified.
12. A fluid actuated motor in combination with a speed responsive device, a vibrating valve for controlling the passage of motive fluid therethrough, a bell crank lever having a fixed pivot, a rod connecting one end of the lever with the valve to vibrate it, a second bell crank lever supported by the frst, a rod vibrated by the motor and connected to one
and of the second lever, and means for transmitting motion from the speed responsive device to the other end of the second bell crank lever to vary its position to change the region of vibration of the valve, as and for the purpose specified.
13. In a governing mechanism the combination of a valve, a means for vibrating the valve, a means changing the region of vibration of the valve and an elastlc medium which tends at all times to move the valve in one direction, as and for the purpose specified.
14. In a governing mechanism the combination of an elastic band valve, a means for winding and unwinding the valve, a means responding to speed changes for moving the valve and a spring which tends at all times to move the valve in one direction, as and for the purpose specifled.
15. In a governing mechanism the combination of a plurality of ports, a valve which opens the ports one after the other as the demand for motive fluid increases and closes them one after the other as the demand decreases, a governor for setting the valve in response to load changes, and a neans for vibrating the valve at each of its positions, as and for the purose specifled.
16. In a governing mechanism the combination of a plurality of ports, a valve which opens and clases the ports one after the other as the demand for motive fluid changes, an actuating spindle for the valve, a governor for moving the spindle too and fro in response to load changes, and a means for vibrating the valve each side of a neutral position for cach new position assumed by the actuating spindle, as and for the purose specified.
11. In a governing mechanism the combination of a plurality of ports, a valve which opens and closes the ports buccessfully, a source of power, a lever and connections between the source and the valve for vibrating the latter and a governor which adjusts the valve and determines the neutral point of vibration, as and for the purpose specified.
18. In a governing mechanism the combination of a speed responsive device, a valve, a spring tending at all times to seat the valve, a latch which holds the valve in the open position and a second latch acted upon by the speed responsive device which trips the first and allows the spring to close the valve, as and for the purpose specified.
19. In a shaft governor the combination of a support adapted to be mounted on a shaft, centrifugally acting weights mounted oa the support, a spring opposing the weights, an emergency weight mounted on the support for radial movement and a spring opposing the outward movement of the weight, as and for the purpose specifed.
20. In an elastic fluid turbine the combination of a wheel, buckets carried thereby, a blank wall situated at one side of the buckets to cut down the rotation losses and also to restrict the passage of motive fluid toward the shaft, a cylindrical wall that surrounds the idle buckets and in close proximity thereto to reduce rotation losses, and means for discharging motive fluid against the buckets, as and for the purpose specifled.
21. In an elastic fluid turbine the combination of a rotating bucket wheel, a wall, tubes which pass axially through the wall and nozzles that are detachably secured to the tubes and extend tangentially to the wheel, as and for the purpose specified.
22. In an elastic fluid turbine the combination of a wheel, Li-shaped buckets mounted on the periphery thereof, nozzles for discharging motive fluid against one side of the buckets and a wall which prevents the fluid exhausting from the wheel from interfering with that discharged by the nozzles, as and for the purpose specified.

No. 101,120. Governor for Elastic Fluid Turbines. Gouvcrncur pour turbincs d̀ Auide élastiguc.
The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of John G. Callan, Lynn, Massachus: etts, U.S.A., 18th September, 1906; 6 years. Filed 3rd March, 1906. Recelpt No. 133,492.
Clain.-1. In a governing mechanism for multi-stage turbincs, the comblnation of an admlssion valve, means for actuating the admission valve, a stage valve, means for actuating the stage valve, and a speed responsive device which causes the stage valve to open after the admission valve and close before it, as specifled.
2. In a governing mechanism for multi-stage turbines, the combination of a plurality of admission valves, means under the control of a speed governor for actuating the admission valves, a plurality of stage valves, means under the control of the speed governor for actuating the stage valves. and a syeed governor which causes the stage valves to open successively and between the periods of operation of the admission valves, as specified.
3. In a governing mechanism for multi-stage turbines, the combination of a device moved by a speed governor, an admission valve under the control of said devlce, a stage valve, a fluid actuated motor for controlling the stage valve.
the diameter of the valve being greater than that of the motor piston, and a pilot valve for controllin; the stage

valve that is connected to the device operated by the speed governor, as specified.
4. In a governing mechanism for multi-stage turbines, the combination of admission and stage valves, a mechanical means for opening and closing the admision valves, a fluid pressure means for actuating the stage valve or valves and a speed responsive device that is common to and controls the operation of the valves, as specified.
5. In a governing mechanism for multi-stage turbines, the combination of admission and stage valves, a mechanical means for opening and closing the admission valves, a fluid pressure means for actuating the stage valve or valves, one or more pilot valves for controlling the action of the stage valve or valves, a speed responsive device that is common to said mechanical means and the pilot valve or valves, as specified.
6. In a governing mechanism for multi-stage turbines, the combination of admission valves, crossheads connected to the valve stems, actuators for moving the crosshead to and fro, one or more stage valves, fluid pressure motors for actuating them, one or more crossheads for the stage valves, one or more actuators for moving the last-mentioned crossheads to and iro, one or more pilot valves for the motors actuated by the crosshead or heads, and a speed responsive device which controls the action of the admission valve actuators and the pilot valves, as specified.
7. In a governing mechanism for multi-stage turbines, the combination of a plurality of separately actuated admission valves, one or more stage valves, one or more fluid pressure motors for actuating the stage valves, a baffling device in the conduit between the source of supply and a motor, and a speed responsive device for controlling the admission of motive fluid to the turbine, as specifled.
8. In a governing mechanism for multi-stage turbines, the combination of a plurality of separately actuated admission valves, one or more stage valves, one or more fluid pressure motors for actuating the stage valves, one or more dash pots for damping the action of the stage valve or valves, and a speed responsive device for controlling the action of the valves.

\section*{No. 101,121. Governor for Turbines.} Gowverneur de turbines.
The Canadian General Electric Company, assignee of John G. Callan, Lynn, Massachusetts, U.S.A., 18th September 1906; 6 years. Filed 31st August, 1906. Receipt No. 139,131.
Claim.-1. In a governing mechanism the combination of a valve that has a tendency at a.l times to close a catch which normally prevents the valve from closing, and a means for rotating the catch after it has released the valve to reset it, as and for the purose specified.
2. In a governing mechanism an emergency valve, a catch which may engage the valve to hold it open, means for rotating the catch to engage it with the valve and means rendered operative by an increase of speed above a prescribed limit which rotates the valve from the catch, as and for the purpose specified.
3. In a governing mechanism an emergency valve, a catch which may engage the valve to hold it open, means rendered operative by an increase of speed above a prescribed limit to release the valve, and means for rotating the catch to open and reset the valve, as and for the purpose specifled.
4. In a governing mechanism an emergency valve, a catch having a plurality of members one of which engages a porcion of the valve to hold it open while another is located
adjacent another portion of the valve, means rendered operative by an increase of speed above a prescribed limit which

actuates the catch to release the valve and to impart a blow to the second portion of the valve, and means for rotating the catch to rest the valve in open position, as and for the purpose specified.
5. In a governing mechanism an emergency valve having a plurality of projections, a catch having oppositely disposed members one of which engages one of the projections while a second member is adjacent another projection, and means rendered operative by an increase of speed above a prescribed limit which actuates the catch to release the first projection and to impart a blow to the other projection to close the valve, as and for the purpose specifled.
6. In a governing mechanism an emergency valve having a plurality of projections, a catch having oppositely disposed members one of which engages one of the projections while a second member is adjacent another projection, means rendered operative by an increase of speed above a prescribed limit which actuates the catch to release the first projection and to impart a blow to the other projection to close the valve, and means for resetting the valve, as and for the purpose specified.
7. In a governing mechanism an emergency valve, a catch having oppositely disposed members one of which engages the valve to hold it open while another member is located adjacent a portion of the valve, means rendered operative by an increase of speed above a prescribed limit whicb actuates the catch to release the valve and to impart a blow to said portion to close the valve, and a means for rotating the catch to open and rest the valve, as and for the purpose specified.
8. In a governing mechanism a stud, an emergency valve loosely mounted on the stud and having a projection substantially in line with the valve and another proection at an angle to said valve, a pivoted catch having two oppositely disposed members one of which engages the first projection to hold the valve open while the other overlies the second projection, and means rendered operative by an increase of speed above a prescribed limit which actuates the catch to release the first projection and to impart a hammerlike blow to the other projection to close the valve, as and for the purpose specified.
9. In a governing mechanism an emergency valve, a catch which normally holds the valve open and is also employed to reset it after being closed, and means for operating the catch to reset the valve, as and for the purpose specified.
10. In a governing mechanism the combination of an emergency valve, a catch to hold the valve open, a device for releasing the catch when it is desired to close the valve, and means for moving the catch in a manner to reset the valve, as and for the purpose specifled.
11. In a governing mechanism an emergency valve, a catch for the valve having oppositely dispo d members including a notch and a cam-like portion, projections on the valve one of which engages the notch while the other is disposed adjacent a cam portion, means rendered operative by an increase of speed above a prescribed limit which releases the valve from the notch and brings the cam portion into forcible contact with its adjacent projection, and means for normally operating the catch to bring a cam portion into engagement with the first-mentioned projection for resetting the valve and catch, as and for the purpose specifled.
12. In a governing mechanism an emergency valve, a catch which engages the valve to hold it open, a shaft upon which the catch is mounted, an arm upon the shaft, a rod having a sliding connection with the arm, a swivel bearing for the rod, abutments on the rod for limiting the sliding movement. a spring tending to move an abutment into engagement with
the arm to actuate the catch and release the valve, a trigger for holding the rod against the action of the spring, a speed responsive device which actuates the trigger to release the rod when the speed rises to a prescribed limit, and a handle on the arm for manually resetting the catch and valve, as and for the purpose specified.
13. In a governing mechanism a valve having two discs, means for adjusting the discs with respect to each other, and means for securing the discs in adjusted position, as and for the purpose specified.
14. In combination a valve, an actuating member having a connection with the valve which permits the latter to be moved laterally into engagement with the member, a spindle extending centrally through the valve and having a conical ind, and means for bringing said end into engagement with a similar seat in said member to align the valve and the member, as and for the purpose specified.
15. In combination a valse actuating member, a hub carrying a valve dise and slidably engaging said member, a second hub carrying a valve disc and adjustably connected with the \(r\) st hub, and a spindle extending centrally through the hubs and dises and having a conical end engaging a simllar seat in said member to align the parts, as and for the purpose specifled.
16. In comblation a speed responsive device, a connection actuated thereby. a stud in one end of said connection. a hub having a connection with said stud which permits the hub to be moved laterally to connect or disconnect the hub and stud, a valve dise on the hub, a second hub in threaded engagement with the first hub, a valve disc on the second hub, a spindle passing centrally through the hubs having a threaded engagement with the second hub and a conical end engaging a corresponding seat in the head of the stud, the opposite end of the spindle extending beyond the second hub, a check nut on the extended end of the spindle for locking the hubs in adjusted position, and means for guiding the end of the spindle, as and for the purpose specified.
17. In combination, a steam chest, a speed responsive device and a forked lever connected therewith rocated outside said steam chest, a shaft extending through the wall of the chest to which one branch of the lever is secured, bearings for said shaft mounted in the walls of the steam chest and having a steam tight connection therewith, an arm mounted on the shaft within the chest adjacent one of the bearings, thrust washers between the arm and the bearing which prevent leakage along the shaft, a stud mounted in the other bearing having a steam tight connection therewith and engaging the end of the shaft to prevent longitudinal movement, said stud also affording a bearing for the other branch of the forked lever, and a valve connected with said arm, as and for the purpose specified.
18. In combination, a steam chest, a shaft mounted in the walls of the steam chest. a speed responsive device having forked lecer connected with the shaft outside the chest, an arm mounted on the shaft whithin the chest and a valve connected with the arm, as and for the purpose specified.

No. 101,122. Governor for Turbines.
Gouverncur de turbines.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of William L. R. Emmet. Schenectady, New York. U.S.A., 18 th Soptember, 1906 ; 6 years. Filed 27th August. 1906. Recelpt No. 138.992.
Claim.-1. In a governing mechanism for turbines the combination of a valve whose region of movement varies for different loads, and speed responsive device for changing the region of movement of the valve, and a means that acts to retard the movements of the valve in the opposite direction.
2. In a goveruing mechanism for turbines the combina-
tion of a regulating valve, a governor which imparts a certain number of strokes to the valve in a given unit of time, and a means which retards the movement of the valve in the opposite direction.
3. In a governing mechanism for turbine the combination o: a regulating valve, a governor which positively imparts to the valve in one direction a given number of strokes per interval of time, and a device which moves the valve in the cpposite direction and also retards it.
4. In a governing mechanism for turbines the combination of a regulating valve, a governor, a valve actuator reciprocated directly by the governor in one direction at a speed and through a distance determined by the speed of the turblne, a retract device for said actuator acting in opposition to said actuator, and means for retarding the effect of said retracting device.
5. In a governing mechanism for turbines the combination of a regulating valve, a governor responsive to speed changes, a lever actuated by said governor at a speed and through an angular distance depending upon the speed of the turbine, a valve actuator operated by said lever to open said valve, a spring for closing said valve, and a retarding device controlling the rate of the closing.
6. In governing mechanism for turbines the combination of a regulating valve, a governor comprising a weight pivoted eccentrically to its axis of revolution, a lever connceted to said weight, a valve stem operated by said lever in one direction, a spring to move said valve in the opposite direction, and a dash pot to control the rate of movement by said spring.
7. In a governing mechanism for turbines the combination with a regulating valve controlling two or more ports in succession during its travel, of a valve stem, a governar responsive to speed changes, and intermediate mechanism whereby said governor will actuate said stem by an amount inverse to the speed of the turbine.
8. In a governing mechanism for turbines the combination with a regulating valve controlling two or more ports in succession during its travel, of a valve stem, a governor comprising a revolving weight plvoted eccentrically to the axis of revolution, a wrist pin on said weight, whose orbit of revolution varies in diameter inversely with the speed of the turbine, a lever connected to the said pin and actuating said stem in one direction, and a retarded device for moving said stem in the opposite direction.

No. 101.123. Governor for Turbines.
Gouverneur de turbines.

The Canadian General Electric Company, Toronto. Ontario, Canada, assignee of Charles H. Worsey, Lynn, Massachusetts, U.S.A., 18th September, 1906 ; 6 years. Flled 28th August, 1906. Receipt No. 139,038.
Claim.-1. In a governing mechanism the combination of a plurality of regulators, a rotating actuator for sucessively moving the regulators to and fro as the load conditions change, a driving means for the actuator, a device for imparting a step-by-step action to the actuator, and a load responsive mechanism controlling the action of said device to cause successive operation of the regulators. as and for the purpose specifled.
2. In a governing mechanism the combination of a regulator, means for moving the regulator in one direction or the other, and a load responsive device for controlling the operation of said regulator including a lever having stepped ends. as and for the purpose specified.
3. In a governing mechanism the combination of a plurality of regulators, means for opening and closing said regulators, and a load responsive device for controlling the oper-
ation of said regulators including a tilting lever having stepped ends, as and for the purpose specifled.
4. In a governing mechanism the combination of a valve, means for opening and closing said valve, a device responsive to changes in the load for controlling the operation of said valve including a lever having stepped ends and a positioning device for said lever, as and for the purpose specified.
5. In a governing mechanism the combination of a valve, means for opening and closing the valve, a load responsive device controlling the operation of said valve including a lever and a positioning device for said lever comprising a spring pressed plunger and a fixed abutment having recesses with which the end of said plunger yieldingly engages, as and for the purpose specified.
6. The combination of a regulator with a constantly rotating cam for actuating said regulator. means for transmitting motion from the cam to the regulator, a means for shifting the cam to one side of a given position to move the regulator in one direction. and for shifting it further in the same direction to move the regulator in the opposite direction. as and for the purpose specified.
7. In a governing mechanism the combination of a regulator. a constantly rotating cam for actuating said regulator, means for transmitting motion from the cam to the regulator, a means for shifting the cam to one slde of a given position to move the regulator in one direction and for shifting Ii further in the same direction to move the regulator in the opposite direction, and a speed responsive device for controlling said shifting means, as and for the purpose specitied.
8. The combination of a regulator, a constantly rotating cam for actuating the regulator, means for transmitting motion from the cam to the regulator, and a means for shifting the cam to one side of a given position to move the .- M- inr in one direction and for shifting it further in the same direction to move the regulator in the opposite direction and for shifting it still turther in said direction to reliase the regulator from the cam, as and for the purpose specified.
9. In a governing mechanism the combination of a valve. a constantly rotating cam for actuating the valve, means for transmitting motion from the cam to the valve, a means for shifting the cam to the one side of a given position to move the valve in one direction and for shifting it further in the samr direction to move the valve in the opposite direction and for shiftine it still further in said direction to release the valve from the cam, and a speed responsive device contriling said shifting means, as and for the purpose specified.
10. The combination of a regulator, a yoke connected to the regulator having two oppositely disposed offset portions, a rotating cam located between said portions, and speed responsive means for shifting said cam to engage either or neither of said portions to open or close said valve or to permit it to remain open or closed, as and for the purpose specified.
11. In a governing mechanism, the combination of a plurality of valves, means for actuating said valves, a device for shifting said actuating means including a lever having stepped ends, and a speed responsive mechanism which positions said lever to shift sald actuating means, as and for the purpose specifed.
12. In a speed governing mechanism, the combination of a plurality of valves, connections spaced apart for moving said valves, a rotating shaft, a plurality of cams on the shaft so spaced apart that they can engage the connections to open or close but one valve at a time, means for shifting the cams longitudinally to actuate the valves in successive order in elther direction, and a speed responsive device to control the shifting means, as and for the purpose specified.
13. In a governing mechanism, the combination of a plurality of valves, a shaft, a series of valve actuating devices mounted on said shaft and receiving their motion therefrom, means for transmitting motion from the devices to the valves, shifting means moving with said shaft, a device adjacent said shaft which may be moved into engagement with said shifting means, a load responsive mechanism which moves sald device into or out of operative engagement with the shifting means to shift said series of devices longitudinally in either direction to engage said transmitting means and central the operation of the valves, as and for the purpose specified.
14. In a governing mechanism, the combination of a plurality of valves, a shaft, a series of actuating devices for the valves mounted on the shaft and recelving their motion therefrom, means for transmitting motion from the devices to the valves, shifting means on the shaft, a lever adjacent the shaft having means at its end to engage the shifting means, and a speed or load responsive device controlling the position of said lever and moving its end into or put
of operative engagement with the shifting means to shift the series of devices in either direction to engage the transmitting means and to onen or close the valves in successive order, as and for the purpose specified.
15. In a governing mechanism, the combination of a plurality of regulaters, a rotating shaft, a series of actuating shafts, devices for the regulators mounted on the shaft. means for transmitting motion from the devices to the valves, a shifting cam on the shaft adjacent each end of said series, a lever pivoted at a point between the cams, adjacent the shaft and having stepped ends, and a load responsive device having a connection with said lever to move its ends into or out of operative engagement with the shifting cams to move said series of devices longitudinally in either direction to engage the transmitting means and to open or close the regulators in successive order, as and for the purpose specified.
16. In a governing mechanism, the combination of a series of shiftable valve actuating devices, means for shifting the devices including a lever, a speed responsive mechanism having a connection with the lever, and a pivot for the lever which is located to receive the thrust of said shifting means to prevent load upon said mechanism, as and for the purpose syecified.
17. In a governing mechanism, the combination of a series of shifting cams, means for rotating the cams, means for shifting the cams including a lever, a speed responsive device having a connection with the lever, and a pivot for the lever which is located to receive the thrust of said shifting means to prevent load upon said device, as and for the purpose specifled.
18. In a governing mechanism, the combination of one or more regulators, means for operating sald regulators including a shaft, means for shifting the shaft in either direction comprising two discs mounted thereon and having oppositely disposed cam surfaces, a lever plvoted adjacent said shaft having stepped ends, and a load responsive device having a connection with the lever to move its ends into or out of operative engagement with the cam surfaces, as and for the purpose specified.

\section*{No. 101,124. Governor for Turbines. \\ Gouverncur dc twrbines.}

The Canadian General Electric Company, Toronto, Ontario, Canada, assignec of Oscar Junggren, Schenectady, New York, U.S.A., 18th September, 1906 ; 6 years. Flled 28th August, 1906. Receipt No. 139,039.
Claim.-1. In a governing mechanism for elastic fluid turbines the combination with the turbine of sets of nozzle valves, a cam shaft for actuating each set of valves, a liquid -pressure motor located at about the level of said valves. connections between said motor and said cam shafts and speed responsive devices controlling said motor, as and for the purpose specifled.
2. In a governing device for elastic fluid turbines the combbination with the turbine of scts of nozzle valves, a cam shaft for actuating each set of valves, a horizontal cylinder hocated at about the level of said valves, a piston in said cylinder actuated by liquid pressure, connections between said piston and said cam shafts and speed responsive devices controlling the admission of liquid to said cylinder, as and for the purpose specified.
3. In a governing mechanism for elastic fluid turbines the combination with the turbine of sets of nozzle valves, a cam shaft for actuating each set of valves, a transverse shaft geared to said cam shafts, a liquid pressure motor for rotat-
ing said transverse shaft and controlling devices for said motor responsive to speed changes of the turbine,, as and for the purpose specifed.
4. In a governing mechanism for elastic nuid turbines the combination with the turbine casing and the generator of a stool interposed between them, two valve chests on opposite sides of said stool, a cam shaft on each chest, a transverse shaft geared to said cam shafts and pressing through said stool, a hydraulic motor mounted outside of and extending into said stool and connected with said transverse shaft, and controlling devices for sald motor connected to the speed governor of the turbine, as and for the purpose specified.
5. In a governing mechanism for elastic fluid turbines the combination with mechanically operated nozzle valves, of a -liquid pressure motor for operating them and means for causing said motor to operate by an intermittent motion instead of continuously, as and for the purpose specifed.
6. In a governing mechanism for elastic fluid turbines the combination with mechanically operated nozzle valves, of a - hquid pressure motor for operating them, and means for periodically interrupting the escape of the liquid from the motor when working, as and for the purpose specified.
7. In a governing mechanism for elastlc fluid turbines the combination with mechanically operated nozzle valves, of a liquid pressure motor for operating them, means for causing said motor to operate by an intermittent motion instead of continuously comprising a valve offering a predetermined resiatance to movement and an air chamber, as and for the purpose specilled.

1T0. 101,125. Plantinc Minchine. Plastotr.

Fellx G. Green, John W. Cooper and Conway G. Norris, each an assignee of a three-fifths interest, all of Ledalia, Missouri, U. S. A., 25th September, 1906; 6 years. Filed 3rd April, 1906. Receipt No. 134,556.
Olain.-The herein described planter comprising a suitable framework and carrying wheels therefor, said carrying wheels being each formed in two parts, separated slightly from each other, furrow making discs 6 adapted to have one portion of their edges disposed between the separated wheels whereby the discs will be kept clean and in a secured condition, a pair of hoppers, grain conveying tubes extending from said hoppers to the furrows made by said discs, a slide mounted in the bottom of each hopper and an actuating disc controlling a lever connected with said slides whereby each of the slides will be operated simultaneously and at predetermined points to dispose the grain in continuous or drilled rows or hills of uniform separation all comblned, substantlally as set forth.

\section*{No. 101,126. Nut Look. \(\Delta\) rrete-ecrou.}

George Bryar, Waltham, Massachusetts, U.S.A., and John White, each an assignee of a one-sixteenth interest, all of St. John, New Brunswick, Canada, 25th September, 1908; 6 years. Filed 27th August, 1906. Receipt No. 138,998.
Olaim.-1. A nut having a free portion produced by making a longitudinal and transverse cut in the nut, the end of said free portion being pressed inwardly toward the bottom of one cut and the side of the other cut, as set forth.
2. A nut having a cut parallel with the top and base and a radial cut communicating with the arst-mentioned cut, the free portion of the nut being pressed so as to throw the threads of said portion out of alignment with the threads of the adjacent portion of the nut.
8. A nut having a free portion or tongue bent inwardly thereby throwing the threads out of alignment and also producing a shoulder adapted to engage the thread of a bolt, as set lorth.
4. A nut having a free portion or tongue, the threads of sald tree portion or tonsue being of the same pitch as the
main portion of the nut, the iree end of said tongue being Thent 80 as to throw the threads thereof out of alignment with the adjacent threads of the other portion of the nut.

5. A nut having a longitudinal cut produced therein and extending substantially half way through the nut, a radial cut extending from the top of the nut to the longitudinal cut thereby producing a free portion or tongue, the end of the said free portion being pressed inwardly toward the bottom of the longitudinal cut and side of the radial cut, as and for the purpose described.

No. 101,127. Trace Conncoter. Joint de tratt.

Robert James Lay and Benjamin E. Summers, assignee of a half interest, both of Cairo, West Virginia, U.S.A., zsth September, 1906; 6 years. Filed 3rd August, 1908. Receipt No. 138,404.
Claim.-1. A trace connector consisting of a piece of wire that is bent to provide converging membere to lle over one side of a portion of a trace, continuations of such members which span the edges of the trace, a terminal portion shaped to engage the eye of a whimetree when passed through the eye of the trace, the other terminal entering a recess in the trace, substantially as shown.
2. A trace connector made from a continuous plece of spring wire that is bent to provide diverging bars, crossportions that embrace the edges of a trace, a spring depressed member having an upward extending portion and parallel therewith a pin, a member that extends from the other cross portion, such member being bent to form a loop that limits the movement of the pin carrying member, the part beyond the loop being substantially at right angles to the bar which terminates in the pin that enters the eje of the singletree, substantially as set forth.

\section*{No. 101,128. Fireboz for Stoves and Ranges. \\ Foyer pour podles.}

The Canadian Heating and Ventilating Company, assignee of William James Christie, Robert Crane and Westley R. Wilson, all of Owen Sound, Ontario, Canada, 25th September, 1906: 6 years. Filed 29th August, 1906. Recelpt No. 139,076.
Claim.-1. In a range or stove the combination with the firebox, of bricks having hollows perforated upper edges or rims, as and for the purpose specifed.
2. In a range or stove the combination with the firebox, of the back bricks having hollow perforated rims and an arched rim extending upwardly therefrom and perforated, as and for the purpose specified.
3. In range or stove the combination with the firebor. of the back bricks having hollow perforated rims and an arched rim extending upwardly therefrom and perforated, and the end bricks having the upper hollow perforated rim communlcating at the back with the openings in the rim, as and for the purpose specified.
4. In a range or stove the combination with the firebox, of the back bricks having hollow perforated rims and an arched

rim extending upwardly therefrom and perforated, and the end bricks having the upper hollow perforated rim and having a depending front perforated portion having a front opening, the front brick having perforations or openings registering with sald openings in the depending front perforated portions of the rim of the end bricks, sald openings in the front brick communicating with openings in the front of the stove, as and for the purpose specified.
5. The combination with the back bricks having a perforated top rim, of the end bricks having a perforated top rim having end openings registering with openings in the sides of the ends of the back bricks and front openings registering with the openings in the front of the stove, as and for the purpose specified.

No. 101,129. Filling Device. Appareil d̀ remplir.

Charles A. M. Nystrom, Jacob H. Beckman, and Frank W. Beckman, co-inventors, all of Portland, Oregon, U.S.A., 25th September, 1906; 6 years. Filed 24th August, 1906. Receipt No. 138,950 .
Claim.-1. The combination with a vessel, of a closure for sald vessel, a closed tube connected with said vessel through said closure, a smaller inner tube passing through and longitudinally movable in sald outer tube and open from end to end and having outlet passages therein connecting the intcrior of the outer tube with the interior of the inner tube and being adapted to be moved into and out of communication with the inglde of said outer tube by the longitudinal motion of said inner tube.
2. The combination with a vessel of a closure for said ressel, a closed tube secured to said closure and communi-
cating therewith by passages near its ends, a smaller inner tlibo passing through and extending beyond and longitudinally movable in said outer tube and open from end to end and having outlet passages therein connecting the interior o: the outer tube with the interior of the inner tube when said inner tube is in its operative position but being removed from connection with said outer tube when not in its operative position, and a collar secured to said inner tube adjacent to said outlet passages and adapted to press against the lower end of the outer tube to prevent the leakage of liquid from said outer tube around said inner tube when sald inner tube is not in operative position.

No. 101,130. Rail Fastener. Attache de rails.

William J. Allin, Clarendon, Arkansas, U.S.A., 25th Sep tember. 1906 ; 6 years. Filed 31st August, 1906. Receipt No. 139,122.
Claim.-1. A rail fastener constructed of a single plece of metal folded upon itself and provided with an upwardly extending brace and transverse strengthening lugs upon the bottom of its lower surface and upon the outer side of its upward brace, substantially as specified.
2. A rail fastener constructed of a single piece of sheet metal forming a base plate for the rail and bent upwardly to form a brace adapted to fit against the under and outer surface of the ball of the rail to recelve its outward thrust, and transverse strengthening lugs upon the bottom surface of the fastener and upon the upper edge of the brace, sub stantially as specifled.
3. A rail fastener consisting of a tie plate and brace constructed of a single piece of metal bent and folded upon itself, the lower portion of which fastener is provided with transverse \(V\)-shaped ribs adapted to impinge against the tie when in position for use, the terminal folded end of said fastener extending up at an angle and adapted to fit underneath the head of the rail, which terminal portion is provided with transverse strengthening ribs and the bended orer portion also provided with ribs which serve as a brace for the lower end of the ribs formed on the upwardly projecting portion, substantially as specified.
4. A rail fastener comprising a single sheet of metal folded upon itself to form a seat for the rail, and a brace to proteet the ball of the rall from lateral thrust, the bottom of the fastener and the outer surface of the bracing end being provided with transverse ribs, substantially as specified.
5. A rail fastener constructed of a single plece of metal and comprising a flat base portion, integral ribs on the under side of said base portion, and an integral brace extending upwardly at an angle so as to bear against the ball of the rail, and the top side of which brace is provided with Integral ribs, substantially as specified.
6. A rail fastener constructed of a single plece of metal and comprising a flat base portion, integral ribs on the under side of sald base portion, an integral brace extending upwardly at an angle so as to bear against the ball of the rail, the top side of which brace is provided with integral ribs, and there being a tongue cut from said brace and adapted to be bent downwardly by one of the spikes which secures the fastener to the tie, substantially as specified.

\section*{No. 101,131. Rake. Ratelier.}

George W. Anderson, Ladoga, Indiana, U.S.A., 25th September, 1906 ; 6 years Filed 15th May, 1906. Receipt No. 135,944.
Claim.-1. In a rake, the combination of a crosshead having a pair of tooth recelving perforations and an allgned receptacle for an intermediate kinked portion of the tooth, and a tooth passage through said perforations and having
an intermediate portion between the perforations kinked into said receptacle.

2. In a rake, the combination of a crosshead having a pair of tooth receiving perforations, and a dimple formed in alignment therewith, and a tooth passed through said perforations and having a portion between said perforations kinked into said dimple.

No. 101,132. Lace Shoe. Laccts de chaussures.

Frank William Barron, Toronto Junction, Toronto, Ontario,
Canada, 25th September, 1906; 6 years. Filed 29 th August, 1906. Receipt No. 139,070 .
Claim.-1. In a lace shoe, an upper having a front laced portion and a back flap extending over the heel, and means for fastening such flap around at the side of the shoe, as and for the purnose specified.
2. In a lace shoe, an upper having a front laced portion and a back minor flap designed to fit inside and a major flap designed to extend around the minor flap and means for fastening such flap around at the side of the shoe, as and for the purpose specified.

No. 101,133. Bolster. Coussin.
Edward Hendry Benners, Elizabeth, New Jersey, U.S.A., 25th September, 1906; 6 years. Filed 1st September 1906. Receipt No. 139,162.

Claim-1. A bolster comprising a top plate, a narrower bottom plate and inclosed side webs connecting them, said side webs being approximately stralght from the top to the bottom plates.
2. In a bolster comprising a top plate, a narrower bottom plate and inclined open work webs connecting said plates, said webs being approximately straight from the top to the bottom plates.
3. A cast metal bolster comprising a top plate, a bottom plate of less width than the top plate, and approxi-

mately straight side webs connecting the longitudinal edges of the top and bottom plates.

No. 101,134. Crane. Grue.

Milford F. Berry, Bombay, New York, U.S.A., 25th Septem-
ber, 1906; 6 years. Flled 27th August, 1906. Receipt No. 139,001 .
Claim.-In a crane, a mast having a lower pivot, an upper socket member secured to the mast, a pivot rod extending within said socket member and provided with bifurcated arms, a support for receiving the ends of said arms, guiding sheaves mounted on the bifurcated arms, a crane arm also having guiding sheaves, a holsting cable guided by the several sheaves, a stationary operating cylinder, a piston disposed in sald cylinder, a piston rod, and means for connecting the cable to the piston rod.

\section*{No. 101,135. Heating Mechanism.}

\section*{Mécanisme de chauffage.}

Albert Preston Bromell, York. Pennsylvania, U.S.A., 25th September, 1906 ; 6 ycars. Filed 21st August, 1906. Receipt No. 138,902.
Claim.-1. In a steam heating apparatus a recoiver for the water of condensation from the radiators, a connection at the upper end of the receiver for the return water, a connection at the lower end of the receiver for returning water to the boiler, a damper actuating float in the receiver, a relief valve chamber opening into the upper end of the receiver and having a connection for the steam space of the boiler, a relief valve in the said chamber and a lever for lifting the valve extending into the receiver for operating by said float.
2. In a steam heating apparatus a receiver for the water of condensation from the radiators, a connection at the upper end of the recelver for the return water, a connection
at the lower end of the receiver for returning the water to the boiler, a damper actuating foat in the receiver, a relief

chamber opening into the upper end of the receiver and having a connection with the steam space of the boiler, a rellef valve in the chamber, a lever for lifting the valve and a rod depending from the lever into the path of the said float.
3. In a steam heating apparatus a receiver for the water of condensation from the radiators, a connection at the upper end of the receiver for the return water, a connection at the lower end of the receiver for returning the water to the boller, a float in the receiver provided with an upwardly extending damper actuating chain, a relief valve chamber opening into the upper end of the recelver and having a connection for the steam space of the boiler, a rellef valve in the chamber, a weight secured to the upper side of the valve and a lever connected to the valve and extending into the receiver for operation by the float.
4. In a steam heating apparatus a receiver for the water of condensation from the radiators, a connection at the upper end of the receiver for the return water, a connection at the lower end of the receiver for returning the water to the boller, a float in the receiver having a damper actuating chain, a relief valve having a connection for the steam space of the boiler and provided with an operating lever extending ir.to the receiver, an adjustable rod depending from the inner end of the lever, and having an abutment at its lower end in the upward path of the float.
5. In a steam heating apparatus a receiver for the water of condensation from the radiators, a connection at the upper end of the receiver for the return water, a connection at the lower end of the receiver for returning the water to the boiler, a damper actuating float in the receiver, a relief valve chamber opening into the upper end of the receiver, and open at its top and bottom, an elbow coupling to connect with the steam space of the boller and entering the lower open side of the chamber, means for securins said elbow to the chamber, a relief valve seating on the upper end of the elbow, a lever in the chamber connected to said valve and at its free end entering the receiver in operalive relation to the float.
6. In a steam heating apparatus a receiver for the water of condensation from the radiators, having a trap chamber at its upper end, a return pipe connection for said chamber, a vent pipe connection for the top of sald chamber, a conneclion from the lower end of the receiver to return the water to the boiler, a float in the receiver having a damper actuating chain and weighted at its lower end to keep the chain connection on top, a relief valve having a boiler connection and a valve operating lever entering the receiver for operation by the float.
7. The combination with the relief valve chamber having a seat at its lower end and open at its top and side, of a valve seated on the said seat and provided with a weighted extension extending up through the top opening and an actuating lever removably connected to the valve, whereby on removing the lever the valve may be rotated on its seat by means of its projecting extension.
8. In a steam heating apparatus a receiver for the water of condensation from the radiators, a connection at the upper end of the receiver for the return water, a connection at the lower end of the receiver for returning the water to the boller. a damper actuating float in the receiver, a relief valve for the steam space of the boiler, a lever extending from the valve into the receiver, a vertically adjustable rod depending from the inner end of the lever and having a lateral abutment at its lower end in the path of the float.
9. In a steam heating apparatus a receiver for the water of condensation from the radiacors, a connection at the upper end of the recelver for the return water, a connection at the lower end of the receiver for returning the water to the boller, a guide frame or spider on the upper open end of the receiver and having an interlocking connection therewith, a damper actuating float in the receiver, a relief valve connected with the steam space of the boiler, a lever for lifting the valve extending into the receiver, a vertical rod adjustably connected to said lever guided at its upper end in the guide frame or spider and having a ring-like abutment at its lower end in the path of the float.

No. 101,136. Car Conpler. Attelage de chars.

Frederick William Colley, Basswood, Manitoba, Canada, 25th September, 1906 ; 6 years. Filed 30th August, 1906. Recelpt No. 139,098.
Claim.-1. In a car coupler the combination with the drawhead provided with a substantially U-shaped end, a longitudinal recess, and the knuckle journalled on a pin extending through the apices of one of the sides, of a stem extending inwardly from the knuckle, a spring secured within the recess and co-operating with the stem, and means within the recess whereby the knuckle may be locked in a closed position, as and for the purpose specified.
2. In a car coupler the combination with the drawhead provided with a substantially U-shaped end, a longitudinal recess, and the knuckle journalled on a pin extending through the apices of one of the sides, of a stem extending inwardly from the knuckle, a spring secured within the recess and co-operating with the stem, and means within the recess whereby the knuckle may be held in an open position, as and for the purpose specified.
3. In a car coupler the combination with the drawhead provided with a substantially U-shaped end, a longitudinal recess and the knuckle journalled on a pin extending through the apices of one of the sides of a stem extending inwardly from the knuckle, a spring secured within the recess and cooperating with the stem, a spring actuated bar slidable within the recess and designed to lock the knuckle in a closed position and withhold it in an open position, as and for the purpose specified.
4. In a car coupler the combination with the drawhead provided with a substantially U-shaped end, a longitudinal recess, and the knuckle journalled on a pin extending through the apices of one of the sides, of a stem extending inwardly from the knuckle, a spring secured within the recess and co-operating with the stem, a bifurcated bar slidable within the recess, a spiral spring actuating the bar, a roller bearing within the bifurcations, the said roller being adapted to engage the stem and hold it in a locked closed position, and means whereby the bar may be thrown backwardly within the drawhead to release the stem, as and for the purpose specifled.
5. In a car coupler the combination with a hollow drawhead provided with a substantially U-shaped end and having one of the sides of the U-shaped end open mouthed, of a knuckle journalled on a pin extending through the apices of the open mouthed side, a stem extending inwardly from the knuckle and integral therewith, a spring secured to the inner face of the drawhead and behind the stem, a bifurcated bar slidable within the recess in the head, a spiral spring enveloping the inner portion of the bar and abuting forwardly a shoulder on the bar. a cross partition within the drawhead, a roller bearing within the porwardly extending ends of the slidable bar and designed to secure the knuckle In a locked closed position and to restrain the knuckle in an open position, as and for the purpose specifled
6. In a car coupler the combination with a hollow drawhead, having a substantially \(U\)-shaped end and provided with
a knuckle fournalled on a pin extending through the apices of one of the sides, of a stem extending inwardly from the knuckle and integral therewith, means whereby the knuckle is automatically locked when it is returned to a closed position, and means whereby the knuckle may be loosed from the closed position and withheld in the open position, as and for the purpose specified.
7. In a car coupler the combination with the drawhead, having a longitudinal recess and provided with a substantially U-shaped end and a knuckle journalled on a pin extending through the apices of one of the sides, of a stem extending inwardly from the knuckle and integral therewith, a spring secured within the drawhead and bearing behind the knuckle when in a locked position, a bifurcated bar slidable within the recess, a spiral spring actuating the bar forwardly, a roller bearing within the extending ends of the bar and designed to engage with the stem of a knuckle to withhold it in a closed or open position, a roller pivotally supported in the drawhead on the side opposito to the kuuckle and bearing continuously on the face of the bar, and a key extending within the drawhead and designed in its rotation to throw the bar backwardly in the recess, as and for the purpose specified.

No. 101,137. Balligg Press. Presse d'emballage.

William O. Cumming, Macon, Georgia, U.S.A., 25th September, 1906. 6 years. Filed 20th February, 1906. Receipt No. 133,103 .
Claim.-The combination in a baling press with a single plunger, of an antifriction abutment carried by and projecting at an angle to the plunger, operating arms suitably pivoted at one end of the baling press, the arms comprising a plurality of horizontal members extending transversely to each other and located in different horizontal and parallel planes the members in one horizontal plane provided with cam faces adapted to engage and wipe the anti-friction abutment preliminary to the engagement of the members in the remalning horizontal plane with the end of the plunger.

No. 101,138. Metal Tie. Dormant métallique.

Thomas A. Enloe and Joseph V. Enloe, co-inventors, both of Pinole, Californla, U.S.A., 25th September, 1906 ; 6 years. Filed 20th June, 1906. Recelpt No. 137,092.
Claim.-A permanent form of metal crosstie comprising a suitable base and top section properly united and having
upon one end an integral rail engaging device 7 and upon the opposite end an adjustable clamp 8 fitting around sald top member, a plurality of corrugations or prictional devices formed on the edges of said top section, and means carried by the adjustable member to engage said frictional devices whereby it may be locked securely against the track rall, an auxiliary securing device carried by the crosstle and adJustably secured thereon adapted to press against the inner sides of the track rails or the guard and switch ralls cooperating therewith all combined, substantially as specified and for the purpose set forth.

No. 101,139. Seat for Fiarrows. Siège de herses.

Samuel B. Hazard, Peoria, Illinols, U.S.A., 25th September, 1906; 6 years. Filed 30th July, 1906. Recejpt No. 138,234.

Claim.-1. In a device of the character described the combination of a pair of carrying wheels and their axle, \& carrying frame carried by the latter, a reach pivoted to the frame to swing in a horizontal plane, a bar carried at the forward end of the reach, and a harrow attached to the rear side of said bar, substantially as described and shown. carried by the latter, a reach plvoted to the frame to swing reach, and a harrow attached to the rear side of said bar substantially as described and shown.
2. In a device of the character described the combination of a harrow, a bar forward of the same, connections between the bar and harrow, a pair of wheels rearward of the harrow, a frame carried by the wheels, and a reach pivoted on the frame and rigidly secured to the bar forward of said harrow, draft attachments on the said bar, and a seat carried or the wheel frame, substantially as and for the purposes set forth.
3. In a combination with a harrow, a bar forward of the same and with which it has connection, a wheeled frame in the rear of the harrow, a seat carried thereon for the purposes set forth and a reach rigidly secured to the bar forward of the harrow, said reach having pivoted connection with the said wheeled Prame, and adapted to swing in a horizontal plane, as described.
4. In comblation with a harrow. a bar forward of the same to which it is connected, draft attachments on the bar, a pair of wheels rearward of the harrow, an axle therefor, a pair of hounds secured to the axle and extending forward, a reach having pivotal connection with the hounds to move in a horizontal plane, sald reach being formed in two extensions projecting forward at an angle to the right and left, said projections having rigid connection with the bar fcrward of the harrow, and a seat and seat frame carried between the wheels for the purposes explained.
5. In a combination with a harrow, a bar forward of the same with which it is connected, draft attachments on said bar, a pair of wheels rearward of the harrow, a palr of: hounds carried between the wheels, a seat carried on the hounds, a reach comprising two arms pivoted at the forward ends of the hounds and lying parallel with one another rearward of the pivot but diverging and extending forward from the pivot, the forward ends having attachment with the bar fcrward of the harrow, and means rearward of the pivot of the reach for sustaining the said reach as against vertical movement but permitting a free horizontal movement for the jurposes set forth.
b. In combination with a harrow, a bar forward thereof and to which it is connected, draft attachments for the bar, a wheeled frame in the rear of the harrow, a seat carried thereby, a bifurcated reach pivoted to the said wheeled frame, the extremities extending forward and diverging and having connection with the bar forward of the harrow
substantially as shown, means for preventing vertical movement of the reach at its rear end, and a footrest placed at the pivot of said reach, for the purposes set forth.
7. In combination with a harrow, a bar forward thereof and having connection therewith, draft attachments on the bar, a pair of reaches attached at their forward ends to the bar and extending rearward and converging near their rear ends and thence extending parallel with each other, a supporting plate to which the converging ends are secured, a second plate beneath the first, a wheeled frame to which the said second plate is secured, a guide carried by the wheeled frame between which the rear ends of the reach members are slidably held for the purposes set forth, and a pivot for the plate for permitting horizontal pivotal movement of the reaches and wheeled frame.
8. In combination with a harrow a bar forward thereof and having connection therewith, draft attachments on the bar, a pair of reaches attached at their forward ends to the bar and extending. rearward and converging near their rear ends and thence extending parallel with each other a supporting plate to which the converging ends are secured, a second plate beneath the first, a wheeled frame to which the said sccond plate is secured, a guide carried by the wheeled frame between which the rear ends of the reach members are slidably held for the purposes set forth, a plvot for the plates for permitting horizontal pivotal movement of the reaches and wheeled irame, a seat carried on the wheeled frame, and a foot rest located at the said pivot, substantially as set forth.
9. In combination with a harrow a draft bar forward thereof and with which it is connected, a wheeled frame rearward of the harrow, a pair of reach arms, of angle iron secured at their forward ends to the draft bar and extending upward and then rearward therefrom, said arms converging near their rear ends and lying parallel with each other at the rear ends, the extremities being flattened and slidably held within the said wheeled frame, and pivotal connection between the reaches and said frame, the latter preventing vertical movement of the frame and reaches at the pivot thereof.
10. The combination of a harrow having draft devices forward thereof, a wheeled seat carrying frame rearward of the harrow, a connecting frame between the said draft device and the wheeled frame, there being a pivotal connection between the two frames substantially as shown and described, and means for preventing vertical tilting movement between the two frames.
11. In combination with a harrow having draft attachments, a wheeled seat carrying frame rearward of the harrow, a connecting frame attached to sald draft attachments and pivoted on the wheeled frame and composed of two diverging ferwardly extending bars attached at their separated ends to the draft attachents, a place on the wheeled frame at the point of pivotal connection of the connecting frame and a plate on the latter, said plates forming the bearings between the said frames, and means for preventing a vertical tilting movement between the frames while permitting a horizontal movement for the purposes described.
12. In combination with a harrow having draft attachments, a wheeled frame rearward of the harrow, a reach consisting of two members pivoted to the said wheeled frame and extending both forward and rearward of the pivot, the forward ends of the reach diverging and having connection with the said draft attachments, and means for preventing vertical rocking movement between the frames while permitting horizontal movement thereof on the connecting pivot.

\section*{No. 101,140. Milking Bhield.}

Garde pour machines d̀ traire les vaches.

John W. Hughes, Rogers, Arkansas, U.S.A., 25th September. 1906; 6 years. Filed 29th August, 1906. Receipt No. 139,064.
Claim.-1. A head protector comprising a saddle block having a concaved under face for engagement upon the shoulder of the wearer, said block having a groove in its upper face, an arm depending from each end of the block, each arm having aligning slots, a waist strap secured in the lowermost aligning perforations in saidarms, a side strap secured in the uppermost slots \(0^{*}\) said arms, a neck strap secured to one of the side faces of the aforesald block, a shoulder strap secured te the other side face of the block, and a shield fitted in the aforesaid groove in the top of the block.
2. A head protector comprising a saddle block for engagement with the shoulder of the wearer, a neck strap secured

9-28
tc said block, an arm depending from each end of the block, straps connected to said arms, a shoulder strap secured to

the outer face of the block, and a shield secured to the upper face of the block.

No. 101,141. Butter Cutter. Coutear d beurre.

Arthur C. Hummer, Seattle, Washington, U.S.A., 25th September, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,252.
Claim.-1. A butter cutter comprising means for supporting a body of butter for movement, a cutting means movable into and out of the path of said body, and means engaging the body when advanced for limiting the movement thereof operated so as to be moved away from said body as the cutting means is moved for cutting.
2. A butter cutter comprising means for supporting a body of butter for movement, a cutting means movable to and from the path of said body, and means for limiting the movement of said body associated with sald cutting means for movement into said path in advance of the body as the cutter is moved from said path.
3. A butter cutter comprising means for supporting a body of butter for movement, a frame supported for movement to and from the path of said body, a cutter mounted on said frame, and means to limit the movement of said body mounted on sald frame and arranged to be moved into the path of the butter in advance of the said body as the frame is moved from the path and to move from said path as the frame is moved toward the samp.
4. A butter cutter comprising means for supporting a body of butter for movement, a frame swingingly supported for movement to and from the path of said body in a relatively angular plane, means to limit the movement of said body arranged on sald frame so as to move into said path as the frame is moved toward the same. and a cutter mounted on said frame rearwardly of said limiting means. 5. A butter cutter comprising means for supporting a body of butter for movement, a frame swingably supported for movement to and from the path of sald body in a relatively angular plane, a stop arranged to contact with said frame when the frame is in either retracted or advanced positions, means to limit the movement of said body comprising a finger arranged on said frame so as to project
into said path and to lie without the same when the frame is respectively in retracted and advanced positions, and a cutter mounted on said frame rearwardly of said limiting means.
6. A butter cutter comprising a rectangular frame having notches spaced apart in the forward outer edge of each bar thereof, a bottom plate and a side plate secured to said frame and extending rearwardly thereof, tension devices mounted on said plates adjacent their rear ends, angularly disposed cutters in the form of wires seated in opposite notches of said frame and engaged at one end each with a respective one of said tension devices, each of said cutters being secured at the opposite end to said frame rearwardly of the adjacent notches therein, a cutter frame swingingly supported in front of said first frame, and a cutter mounted on said last frame.

No. 101.14\%. Apparatus for Receiving and Delivering Mail Bags on and from Moving Traing.
Appareil pour capter et livrer les sacs posteaus des trains en mouvement.

Frank Meeker Hurley, Blissfield, Ohio, U.S.A., 25th September, \(1906 ; 6\) years. Filed 1st September, 1906. Receipt No. 139,160.
Claim.-1. In an apparatus of the character described, a supporting post, a sleeve mounted to move freely on said post both in an axial and vertical direction, the post being provided with a base and surfaces descending therefrom and the sleeve being provided with a foot designed to rest on said base and ride downwardly on said surfaces and a bag catcaing hook carried by said sleeve.
2. In an apparatus of the character described, a supporting post provided with a base and surfaces descending therefrom, a sleeve mounted to move freely both axially and in a vertical direction on said post and provided with a foot designed to rest in said base and ride on said surfaces and a bag catching hook carried by said sleeve and axially adjustable thereon.
3. In an apparatus of the character described, a supporting post provided with a base and surfaces descending therefrom, a sleeve mounted to move freely both axially and in a vertical direction on said post and provided with a foot designed to rest on sald base and ride in said surfaces and a bag catching hook carried by said sleeve and provided with an arm for supporting the bag thereon.
4. In an apparatus of the character described, a supporting post provided with a base and surfaces descending therefrom, a sleeve arranged to turn ireely on said post both axially and in a vertical direction and provided with a foot designed to rest on said base and ride on surfaces, a bag ratching hook carried by said sleeve and a stop for prevening the movement of said parts in one direction.
5. In an apparatus of the character described, a supportIng post provided with a base and surfaces descending therefrom, a sleeve arranged to turn freely on said post both axially and in a vertical direction and provided with a foot designed to rest on said base and ride on said surfaces, a bag catching hook carried by said sleeve and an adjustable stop for preventing the movement of said parts in one direction.
6. In an apparatus of the character described the combinatlon of a supporting post, a bag catching hook designed to swing axially around said post and to move vertically upon the same, and a stop mounted on the post and arranged to prevent or limit the movement of sald hook in one direction.
7. In an apparatus of the character described, a supporting post and a bag dellvering device supported thereon, the same consisting of a lower member movable both axially and vertically on sald post and an upper member mounted on said post to swing in a vertical plane.
8. In an apparatus of the character described, a support ing post, a bag delivering device mounted thereon, the same consisting of upper and lower members designed to hold the mail bag, the lowermost being mounted to turn axially and also to move in a vertical direction, and said member being provided with a foot and the post provided with inclined surfaces designed to effect a turning and lowering of said member.
9. In an apparatus of the character described comprising a bag catching hook, a spring normally tending to hold said hook within a car, means for holding said hook in a projected position from the door of the car against the action of said spring, and means whereby the impact of a bag in the hook will release the same from the means which hold it projected.
10. An apparatus of the character described comprising a bag catching hook, means for holding said hook in a profected position from a car, said means including a trigger connected to the hook, a lever connected to the trigger, a link rod connected to said lever, a cam block operatively connected to said link rod, a latch hook and a support for the bag catching hook, said support being arranged for engagement by said latch hook and a spring tending to draw said support backwardly in the car.
11. An apparatus of the character described comprising a bag catching hook, a support therefor, a latch hook adapted for engagement with said support and designed to hold the support with the bag catching hook in a projected position from the car, a cam block adapted to disengage said latch hook from the said support, a spring tending to withdraw the support and bag catching hook backwardly into the car and a trigger arranged for connection to the bag catching hook and operatively connected to said cam block, for the purpose specified.
12. An apparatus of the character described comprising a post, a bag catching hook carried by said post, a latch hook arranged for connection to a portion of the post, a cam block adapted to release said latch hook, and a trigger arranged for detachable connection to said bag catching hook and operatively connected to said cam block.
13. An apparatus of the character described, comprising a bag catching hook, a post supporting said hook, a transverse elevated rail, a carriage connected to the upper part of said post and mounted to travel on said rail, a spring pressed latch hook designed for engagement with said carriage whereby to hold the bag catching hook in a projected posithon from the car, means for automatically withdrawing said post and its bag catching hook, a cam block supported on said rail and arranged for operative engagement with said latch hook to release the same, and means whereby the impact of the bag within the hook will actuate said cam block. 14. An apparatus of the character described, comprising a post, an elevated travelling support carrying sald post, and with which the post is pivotally connected to turn in a horizontal plane, a bag catching hook carried on said post and adapted to be projected out of either doorway of the car, according as the post is turned in one direction or the reverse, a spring adapted to draw the post back into the car, and arranged to be reversed, to withdraw the post in one direction or the opposite, means for holding the post with its bar catching hook contiguous to either doorway of the car, and means whereby the impact of a bag in the hook will release the holding means.
15. An apparatus of the character described, comprising a post adapted to move transversely of a car, a bag catching hook secured by said post, a carriage provided with wheels and an elevated rall on which sald wheels are designed to run, said carriage supporting the post at its upper end, a latch hook arranged for engagement with said carriage to hold the post near the car doorway with the hook in projected position therefrom, a cam block arranged to disengage sald hook, a link rod connected to said cam block, a spring for retracting said link rod, a lever fulcrumed intermediate its ends within the car and connected at one end to said link rod, and a trigger connected to the other end of said lever and arranged for engagement with the bag catching hook.
16. An apparatus of the character described, comprising a bag catching hook provided with an aperture 11 , means for holding sald hook in a projected position from the trigger of a car, said means including a spring pressed latch hook and a travelling support for the bag catching hook with which said latch hook is designed to engage, means for disengaging said hook from the travelling support, sald means including a trigger provided at one end with a hook adapted to enter the aperture in the bag catching hook whereby the impact of a mall bag in the bag catching hook will actuate said trigger, and means for automatically withdrawing the hook into the car.
17. In an apparatus of the character described, the combination of a bag catching hook, a vertical post by which said hook is carried, a travelling support with which said post has a plvotal connection so that it may be turned in a hori-
zontal plape, whereby to rave CANADIAN
elevated rall unan
ine

 spring addapted to we car, meanok in support ruh hook, an
port back into to
 to the elevated rail at and means hok and thing sald hosition
for the purpose specitedech side or con trectravellinok ho a 18. Iu an apparatus of side of the trecting sailing supa, catching hook, a post upon wher tharacter deascring support. post belng axially movable which said hook described, a bag a rall upon which elevated travelleby to reverseried. said a spring connected at travelling support sort forse sate bag satid its other end with a pine end to support is mour said poss, end with an aperture in wither rall being provid provided run, raged whereby the tenslon of of which sraidided near nat ai the post in one the tension of the which said ped near ach the post adjacent the dioar the oppring may be exite, mean be encatching hook will the held din of the car whens for holding and means for automatically proleasied position trom the bag No. 101,143. Dispensing Can. Bidon holding means.

Rodolph F. Moore. Providence, Rhode Island, U.S.A., 25th September. 1906 ; 6 years. Filed 29th August, 1306. Receipt No. 139,068.
Clinim.-1. In a dispensing can the combination with the lody and a top secured thereto, of a pump barrel secured to sald top, a ball valve normally closing the lower or inlet passage to the pump, a manually actuated piston mounted in the pump barrel, a discharge pipe communicating with the pump above said valve and extending therefrom through the top of the can. a ball valve normally closing the outlet passage between the pump and discharging pipe, a branch pipe or nozzle in continuous open communlcation with the said discharge pipe and having an opening into the can chamber, and a manually controlled valve for automatically and normally closing the said opening when the downward pressure upon the valve is removed, substantially as here!nbefore described.
2. In a can of the character described the combination of a single acting pump, self closing inlet and discharge valves communicating with the pump barrel, an upwardly extending discharge pipe secured to the lower portion of the pump barrel having said discharge valve movably mounted therein, and a manually controlled self closing siphon valve mounted in an normally closing an opening formed in said discharge pipe, substantially as set forth.

\section*{No. 101,144. Rubber Fastener. Attache de galoches.}

Hugh D. McLachlin, Glencoe, Ontario, Canada, 25th September, 1906; 6 years. Filed 5th September, 1906. Receipt No. \(128,174\).
Claim.-1. A rubber provided with a resilient socket in combination with a shoe provided with a ball member, said ball member being secured in sald resllient socket by being inserted and sprung into said resilient socket, substantially as showa and described and for the purpose specified.
2. In a rubber fastener, a resilient socket provided with a flange in which slits are formed and a hollow body provided with an opening, radiating form which opening into said hollow body slits are formed, and a rubber to which said resilient and hollow bodies are secured in combination with a tubular section provided with a flange and a hollow ball section provided with a flange, and a shoe to which said tubular

described and for said rubber, subutanial
No. 101,145. Fan for Furnaces.
Evantail pour fournaises.

Walter Armstrong McLeod, Winnipeg, Manitoba, Canada. 25th September. 1906; 6 years. Filed 30th August, 1906. Receipt No. 139,097.
Claim.-1. In a device of the class described the combination, with the dome and the outer casing of the furnace, of a fan rotatably supported between the dome and the casing, and means for rotating the fan, as and for the purpose specified.
2. In a device of the class described the combination with the casing of the furnace, of a fan suspended within the casing and means for rotating the fan, as and for the purpose specified.
3. In a device of the class described the combination with the casing of the furnace, of a fan revolubly supported within the casing and above the dome and means for rotating the fan, as and for the purpose specified.
4. In a device of the class described the combination with the casing and the dome of the furnace, of a vertical shaft extending through the top of the casing and bearing centrally on the dome, a horizontal fan secured on the shaft and means for rotating the shaft, as and for the purpose specifled.
5. In a device of the class described the combination with the dome and the casing of the furnace, of a cup bearing centrally secured on the dome, a vertical shaft extending downwardly through the casing and bearing within the cup. a bearing for the shaft in the casing, a bevelled gear at the upper extremity of the shaft, a bevelled gear in mesh with the aforesald gear, a horizontal shaft extending from the latter gear, supports for the shaft, means for rotating the shaft and a fan secured to the vertical shaft and designed In its rotation to increase the warm alr circulation in the pipes, as and for the purpose specified.
6. In a device of the class described the combination with the dome and casing, of a fan located at the top of the dome within the casing and means outside the casing for driving the fan, as and for the purpose specified.

No. 101,146. Nut Lock Washer.
Rondelle d'arrête-éorou.

Wllliam B. Neel, Meeker, Oklahoma, U.S.A., 25th September,
1906; 6 years. Filed 30th May, 1906. Receipt No. 136,403.
Claim.-The combination with a body of a plurality of bolts extending therethrough, nuts threaded on said bolts, a flat longitudinal bar having terminal and intermediate openings formed therein for the reception of said bolts and having its opposite ends at sald openings terminating in spherical enlargements, the continuous marginal edges of which are curved laterally beyond the general plane of the bar to form :washers, sald bar having its upper and lower edges at the intermediate openings extended laterally forming spaced projections, the marginal edges of which are curved both longitudinally and laterally, there being reversely inclined incisions formed in the bar on each side of the intermediate openings and extended inwardly from the points of juncture of the longitudinally curved marginal edges of the lateral projections with said bar to thereby permit the washers to be bent inwardly into engagement with the nuts on elther side of the openings.

No. 101,147. Snatch Block for Pulleys. Chatmard pour poulics.

Gustav Nettle, Leaburg, Oregon, U. S. A., 25th September, 1906 ; 6 years Flled 4th September, 1906. Receipt No. 139,228.
Claim.-1. In a snatch block two jaws, provided each with a long opening or slot therethrough, extending from the top towards the bottom thereof, straps or plates fitting in said openings, and means for holding the jaws spaced apart.
2. In a snatch block, two jaws, provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, and means for holding the jaws spaced apart, such means also holding together the jaws and the straps.
3. In a snatch block, two jaws provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, strans or plates fitting in said openings. and means for holding the jaws spaced apart, such means also holding together the jaws and the straps and permitting pivotal movement of the jaws thereon.
4. In a snatch block, two jaws provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, and means for holding the jaws spaced apart. such means also holding together the jaws and straps and permitting pivotal movement of the straps thereon.
5. In a snatch block, two jaws, provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, and means for holding the jaws spaced apart, such means also holding together the jaws and the straps and permitting pivotal movement thereon of said jaws and straps.
6. In a snatch block, two jaws provided each with a long opening er slot hterethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, means located at the top of the jaws and the straps for spacing the jaws apart, such means also holding together the jaws and the straps, and additional means located below and independent of the first-mentioned means, for temporarily securing the jaws and the straps against independent movement.
7. In a snatch block, two jaws provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, a swinging crosshead for spacing the jaws apart, and means engaging the crosshead, the jaws and the straps for holding together the jaws and the straps relatively to the crosshead.
8. In a snatch block, two jaws provider each with a long onening or slot therethrough, extend'ne from the top toward the bottom thereof. straps or plates fitting in said openings. a swinging crosshead for spacing the jaws apart. and means engaging the crosshead, tre jaws and the straps for holding together the jaws and the straps relative to the crosshead, and constructed to permit pivotal movemint of the jaws and the strans thereon.
9. In a snatch block, two jaws provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, a swinging crosshead for spacing the jaws apart. and means engaging the crosshead, the jaws and the straps for holding together the jaws and the straps relative to the crosshead, and constructed to permit independent pivotal movement of the jaws and the straps thereon.
10. In a snatch block, two jaws provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof. straps or plates fitting in said openings, a swinging crosshead for spacing the jaws apart, and a dowel pin passing through the crosshead, the Jaws and the strans.
11. In a snatch block, two jaws provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, a swinging crosshead for spacing the jaws apart, means engaging the crosshead, the jaws and the straps for holding together the paws and the straps relative to the crosshead, and constructed to permit pivotal movement of the jaws and the straps thereon, and strips or bars disposed transversely of and secured to the jaws and constructed to permit temporary clamping of the jaws and the straps against independent movement.
12. In a snatch block. two jaws provided each with a long opening or slot therethrough, extending from the top toward the bottom thereof, straps or plates fitting in said openings, a swinging crosshead for spacing the jaws apart, means engaging the crosshead, the jaws and the straps for holding together the jaws and the straps relative to the crosshead, and constructed to permit pivotal movement of the Jaws and the strans thereon, strips or bars disposed transversely of and secured to the jaws, the straps and the transverse strips being prvoided with aligning openings, and means passing through said openings for temporarily clamping the jaws and the straps against independent movement.
13. In a snatch block, two Jaws provided each with a long opening or slot therethrough, extending from the top to ward the bottom thereof, straps or plates fitting in said openings, and provided with openings therethrough near 'heir lower ends, a swinging crosshead for spacing the jaws apart, means engaging the crosshead, the jaws and the straps for holding together the jaws and the straps rela-
tive to the crosshead, and means passing through the openings in the lower ends of the strapz for temporarily securing them against independent movement
14. In a snatch block, two jaws carrying a pulley and provided each with a long opening or slot therethrough extending from the ton towards the bottom thereof, said pulley being provided with a central opening and with counter sunk portions, in each face, adjacent to said opening.
15. In a snatch block, two jaws carrying a pulley and pro. vided each with an extended opening or slot therethrough running from the top to a point towards the bottom thereof. said pulley being provided with a central opening, with countersunk portions, in each face, adjacent to said opening, and with an internal lubricant chamber.
16. In a snatch block, two jaws carrying a pulley and provided each with a long opening or slot therethrough extend ing from the top to a point toward the bottom thereof, said pulley being provided with a central opening and with countersunk portions, in each face, adjacent to sald openIng, and a ball bearing cone disposed in the central opening of the pulley.
17. In a snatch block, two jaws carrying a pulley and provided each with a long opening or slot therethrough extending from the top to a point toward the bottom thereof, said pulley belng provided with a central opening, and a ball bearing cone disposed in the central opening of the pulley and provided with flanges adapted to fit in the countersunk portions.
18. In a snatch block, two jaws carrying a pulley and provided each with a long opening or slot therethrough extending from the top to a point toward the bottom thereof, said pulley being provided with a central opening and with countersunk portions ineach face adjacent to said openings, and a ball bearing cone disposed in the central opening of the pulley and formed in two sections, and provided with flanges adapted to it in the countersunk portions of the pulley.
19. In a snatch block. two faws carrying a pulley and provided each with a long opening or slot therethrough extending from the top to a point toward the bottom thereof, said pulley being provided with a central opening and with countersunk portions, in each face adjacent to said opening, and a ball bearing cone disposed in the central opening of the pulley and formed in two sections, and provided with flanges adapted to fit in the countersunk portions of the pulley, each section of the cone being provided with removable bushings or sleeves on which the balls run.
20. In a snatch block, two jaws carrying an automatic, self lubricating pulley and provided each with a long opening or slot therethrough extending from the top to a point toward the bottom thereof, and straps or plates fitting in said openings, said pulley being provided with a central opening and with countersunk portions, on each face, adjacent to said central opening.

No. 101,148. Infant's shirt. Chemise d'enfant.

Hattie R. Ovenshire, Minneapolis, Minnesota, U.S.A., 25th September, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,224.

Clatm.-A band or shirt comprising a body of elastic knitted fabric having shoulder pleces or straps and inelastic tapes extending downward over the front and rear if the body to a point near the bottom thereof, and tabs secured at the lower ends of said tapes, and said shoulder straps having clastic portions intermediate to said forward and rear tapes, substantlally as described.
2. A band or shirt comprising a body of elastic knitted fabric having elastic shoulder pieces or straps and inelastic strips or tapes extending diagonally downward from said shoulder pieces over the front and rear of the body to central pionts near the bottom thereof, and suitable tabs secured at the lower ends of said tapes.
3. A band or shirt comprising a body of elastic knitted fabric having shoulder pieces or straps and inelastic strips or tapes extending diagonally downward from said shoulder pieces over the front and rear of the body to central points near the bottom thereof, and suitable tabs secured at the lower ends of said tapes.
4. A band or shirt comprising a body of elastic knitted fabric having shoulder pieces or straps and inelastic tapes extending downwardly over the front and rear of the body to a point near the bottom thereof tabs secured at the lower ends of said tapes and said shoulder straps having elastic or yielding portions of double thickness at the point where they bear on the shoulder intermediate to sald forward and rear tapes, substantially as described.

No. 101,149. Washing Machine and Etand. Machine et banc à laver.

Edward M. Sinclair, Sloux City, Iowa, U.S.A., 25th September,
1906; 6 years. Filed 25th August, 1906. Receipt No. 138,979.
Claim.-1. In a washing machine the combination of primary standards, auxiliary standards, horizontal supports pivotally connected to said auxillary standards, each of said primary standards provided with an elongated groove or slot, means carried by the horizontal supports and engaging the grooved portions of said primary standards for limiting movement of the horizontal supports, swinging arms pivotally connected to the upper ends of said primary standards, means carried by said swinging arms for locking said auxiliary standards and horizontal supports in a folded position, and a wringer device connected to said swinging arms.
2. In a washing machine the combination of standards provided with longitudinally extending grooves, a tub support pivotally connected to said standards, a rod in engagement with said tub support and extending into the grooves of said standards, a tub carried by said support, a wringer positioned upon said tub, and means pivotally connecting said wringer to said standards.
3. The combination of pairs of primary and auxiliary standards, means pivotally connecting sald standards, a horizontal support connected to one pair of said standards and slidably connected to the other pair, a swinging arm, means connecting sald arm to one pair of said standards, and locking means carried by sald arm and adapted to retain said horizontal support in a folded position.
4. The combination of primary standards, auxiliary standards pivotally connected to said primary standards, a tub support plvotally connected to said auxiliary standards, and reans slidably connecting said tub support to sald auxiliary standards.
5. The combination of primary standards, each standard provided with an elongated groove, auxiliary standards
pivotally connected to said primary standards, horizontal supports pivotally connected to and near the upper ends of said auxiliary standards, a rod extending through said horizontal supports and having its ends positioned within the grooves of said primary standards, and wringer supporting means in engagement with some of said standards.
6. The combination of primary standards, each standard provided with a longitudinally extending groove. auxiliary standards pivotally connected to said primary standards, horizontal supports to said auxiliary standards near their upper end, a rod in engagement with said horizontal support and positioned within the grooves of said primary standards, swinging arms, a rod extending through sald swinging arms and in engagement with said primary standards, each of said swinging arms provided with a notch, the notched portions adapted to engage said rod positioned within said grooves when the auxiliary standards and horizontal supports are in a folded condition, and a wringer device in engagement with said arms.
7. In a washing machine the combination of a bench, a wringer device, means connecting said wringer device to said bench, said wringer device comprising a base board, a pair of detachable plates in engagement with said base board, each plate provided with a pair of elongated apertures. a pair of fastening means positioned within the elongated apertures of each plate and adjustably securing said plate to the end of said baseboard, and rollers journalled above said baseboard.
8. In a washing machine the combination of a wash bench, a wringer device, means pivotally connecting said wringer device to said wash bench, said wringer device comprising a base board. supports secured to said base board. auxiliary rollers journalled upon said supports, a primary roller journalled upon said supports. a shaft in engagement with said primary roller, hooks in engagement with said shaft and extneding through said baseboard, a bowed spring, fastening means positioned centrally of said bowed spring and base hoard, said spring provided with apertures at its ends, the hooks extending through the apertured ends of said soring. and nuts carried by said hooks and being capable of controlling the tension of said spring.
9. In a washing machine the combination of a washing bench, a wringer device, means pivotally connecting said wringer dev!ce to said wash bench, said wringer device comprising a baseboard. plates in engagement with the ends of said baseboard. each plate provided with parallel elongated asertures, bolts oositioned within the apertures of each plate and extending through said baseboard. nuts threaded upon said bolts, rollers journalled above said baseboard, a shaft in engagement with one of said rollers. hooks engaging said shaft and extending through said baseboard, a bowed spring positioned upon the lower ends of said hooks, a bolt extending through the central portion of said baseboard and spring, ond a nut threaded upon said bolt.
10. The combination of primary standards, auxiliary standards pivotally suported to said primary standards, tub supporting means pivotally conected to said auxiliary standards. means slidably connecting said supporting means to said primary standards, and means for locking said supporting means and auxiliary standard in a folded position.
11. The combination of primary standards, auxiliary standards pivotally connected to said primary standards, horizontal supports pivotally connected to said auxiliary standards, means slidably connecting said horizontal supports to said primary standards, arms pivotally connected to said primary standards, a hook carried by one of said arms, and means carried by one of said primary standards and adapted to be engaged by said hook for holding said arms in a raised pesition.
12. The combination with a wash bench, of a wringer device supporting arm pivotally connected to said bench, a hook fixedly secured near one end to said arm, and means formed upon said bench and adapted to be engaged by said book for holding said arm in an adjusted position.
13. The combination with a wash bench, of pivotally mounted wringer supporting means carried by said bench, and means for locking said wringer supporting means in a raised position.
14. The combination with a wash bench, of a pivoted arm carried by said wash bench, a hook provided with a pin, fixedly secured to said arm, and means engaging said pin and being capable of retaining said arm in an adjusted position.
15. The combination with a wash bench, a slide member provided with an enlarged portion secured to said bench, said slide member and enlarged portion provided with a groove, an arm pivotally mounted upon said bench, a hook fixed to said arm, a pin carried by said hook, the pin positioned withIn the groove of said slide member and being adapted to engige the enlarged portion for retaining said arm in an adjusted position.
16. The combination with a wash bench provided with a standard, of a slide member secured to the standard near its
upper end, said slide member provided with an enlarged portion and a longltudinally extending groove, an arm plvotally mounted upon said bench contiguous to sald standard, a hook fixedly secured to said arm, and means in engagement with said hook and the grooved portion of sald slide member, being capable of retaining said arm in a raised position.

No. 101,150. Mall Bag Catcher.
Apparell d capter les sacs postauc.

Frank Douglas Smiley, Ithaca, New York, U.S.A., 25th September, 1906: 6 years. Filed 1st September, 1906. Receipt No. 139,157.
Claim.-1. A mall bag catcher comprising a sectional hinged bar having a pair of spring actuated gripping arms mounted upon the outer end of one section, means for holding the said arms in an opened position together with means for closing and releasing said arms, as set forth.
2. A mail bag catcher comprising a bar having a pair of gripping arms pivotally connected to the outer end thereof, a spring for normally throwing said arms into closed position, a keeper adapted to be engaged by one of said arms, the other arm provided with a finger adapted to operate upon the other arm and release the same from the keeper, as set forth.
3. A mail bag catcher comprising a bar made in two sections hinged together, the coil spring attached to the said sectional bar upon the side opposite the hinge, the gripping arms pivotally connected to the outer end of the outer section, the outer arm having an upwardly projecting finger adjacent its pivotal end, a spring keeper carried by the outer section of the arm and adapted to be engaged by the inner gripping arm, and a helical spring adapted to bear upon one end of the inner arm, as and for the purpose set forth.

\section*{No. 101,151. Washboard. Planche d laver.}

Archelaus Enos Spencer, Barrie, Ontario, Canada, 25th September, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,195.
Claim.-1. The combination with the washboard, of a projecting portion extending rearwardly from near the top and designed to form a support for the board when in a slahting position, as and for the purpose specifled.
2. The combination with the washboard, of the top back board having a lower projecting portion, as and for the purpose specified.
3. The combination with a washboard, of the top back boards having blocks or projections secured to the ends of the same at the lower edge, as and for the purpose specified.
4. The combination with the washboard, of the top back boards, blocks or projections having the lower sides extending substantially at right angles to the board, and the upper sides inclined, as and for the purpose specified.

No. 101,152. Liquid Recoptacle.
Réceptacle pour liquides.

Edwin Clay Webb, Providence, Rhode Island, U.S.A., 25th September, 1906; 6 years. Filed 30th August, 1906. Receipt No. 139,092.
Claim.-1. A receptacle comprising a body portion, an inner and outer head at one end of said body forming an air space between them, each of said heads being provided with an inlet and outlet hole, each of said heads also being provided with vent holes independent of sald outlet holes.
2. In an oil can, a body portion, a bottom at one end, an outer head at its opposite end, an inner head provided with a plurality of holes, said head being located below said outer head forming a narrow space between said two heads, a partition through said space dividing the same into a plurality of compartments, one of said compartments being provided with vent holes and another compartment being provided with delivery holes.
3. An oil can comprising a body with a bottom at one end, a head at its opposite end, and an inner head or partition below said outer head forming an air space between them, and a valve placed between said heads.
4. An oil can comprising a body provided with a bottom at one end, an outer head at its opposite end, and a perforated inner head located a short distance below said outer bead forming a narrow air space between said heads, and a valve or shut-off between said heads dividing said space.
5. An oil can comprising a body provided with a bottom at one end, an outer head at its oppgite end, and a perforated inner head located a short istance below sald outer hean forming a narrow air space, between said heads, and a rotal able spindle valve extending across the can between sail heads and adapted to divide the space therein.
6. In an oil can, a body portion having a bottom at one end. an outer head at its opposite end, an inner head located below said outer head forming a narrow space between them said inner head being provided with a plurality of open spaces, and the space between said inner and outer heads being divided into a plurality of compartments, and means whereby said compartments may be subdivided.
7. In an oll can, a body portion having a bottom, at one end, an outer head at its opposite end, an inner head located below sald outer head forming a narrow space between them, said inner head being provided with a plurallty of open spaces, and the space between said inner and outer heads being divided into a plurality of compartments, and a rotatable spindle valve extending across the can between said heads and adapted to sub-divide the space between the heads In each compartment.
8. A receptacle comprising a body portion, and inner and outer head at one end of said body forming a narrow space between them, each of said heads being provided with an inlet and outlet hole, each of said heads also being provided with vent holes independent of said outlet holes, and a valve extending through said space between the heads adapted to control the communication between the hole in the inner Lead and the holes in the outer head.

No. 101,153. Press. Pressc.

Martin H. Schirmer and Josepr Lehr, co-inventors, both of Rochester, New York. 25th September, 1906; 6 years. Filed 30th August, 1906. Recelpt No. 139,103.
Claim.-1. In a pressing machine the combination with a pressing surface, of a jointed arm arranged to swing in a plane parallel to the pressing surface, a rocker arm carried by the jointed arm and mounted to swing angularly to the pressing surface, an iron catried by the rocker arm, and means operating between the jointed supporting arm and the rocker to produce pressure between the Iron and pressing surface.
2. In a pressing machine the combination with a horizontal pressing surface, of a pivoted arm arranged to swing freely In a horizontal plane, an intermediately pivoted rocker arm carried by the first arm and arranged to swing in a vertical plane, an iron carried on one end of the rocker arm and a motor operating on the other end thereof to produce pressure between the iron and pressing surface.
3. In a pressing machine the combination with a pressing surface, of a folnted arm and a rocker arm mounted thereon to swing in a plane intersecting the plane of movement of the jointed arm, an iron having a universal connection with the rocker arm and arranged to co-operate with the pressing surface, and a motor operating to produce pressure between the iron and pressing surface.
4. In a pressing machine the combination with a pressing surface, of a jointed arm arranged to swing in a plane parallel to the pressing surface, a rocker arm carried by the flrst-mentioned arm and arranged to swing angularly to the pressing surface, an iron carried by the rocker arm, and a motor arranged between the sald arms for producing pressure between the iron and the pressing surface.
5. In a pressing machine the combination with a pressing surface, of a jointed arm arranged to swing in a horizontal plane, a rocker arm carried by the first-mentioned arm and pivoted intermediately to swing in a vertical plane, an iron carried on one end of the rocker arm having an operating handle for guiding it over the pressing surface, a motor carried at the other end of the rocker arm for moving the iron toward the pressing surface, and controlling devices connected to the motor and having an operating member adjacent to the iron operating handle.
6. In a pressing machine the combination with a suitable pressing surface, of an arm mounted to swing in angular relation to the pressure surface, an iron having a supporting sbaft mounted in a universal bearing on said arm, a motor mounted separately from said shaft for operating said arm to move the iron into co-operative relation with the pressing surface, and controlling devices connected to the motor and having an operating mamber on the supporting shaft of the iron.
7. In a pressing machine the combination with a pressing surface, of an arm mounted to swing in angular relation to the pressure surface, an iron having a shaft connected by a universal bearing with the arm, a motor carried by sald for moving the iron into co-operative relation with the pressing surface, and controlling devices for the motor embodying an operating member on the said shaft, and devices for malntaining operative connection between the operating member and motor irrespective of the different angular relations of the said arm and shaft.
8. In a pressing machine the combination with a suitable pressing surface, of an arm mounted to move in angular relation to the pressing surface, an iron having a supporting shaft connected by a universal bearing to said arm, a motor mounted separately from the said shaft, and motor controlling devices embodying an operating member on the shaft, a lever on the arm having a bearing surface thereon formed
concentric with the shaft bearing and connected to the motor controlling devices, and a part actuated by the operating member and co-operating with the bearing surface on the lever while the said arm and shaft occupy different angular relations.
9. In a pressing machine the combination with a horizontal pressing surface, of an arm mounted to operate in a vertical plane, an iron having a shaft with a universal bearing on the said arm, a motor mounted separately from said shaft for moving the iron into co-operative relation with the pressing surface, and motor controlling devices embodying an operating member on said shaft, a lever on said arm having a spherical surface thereon formed concentric to the universal shaft bearing and having operative connection with the motor, and an actuating lever connected to the operating member for moving the latter into engagement with the spherical surface of the said lever.
10. In a pressing machine the combination with a horizontal pressing surface, of an arm mounted to operate in a vertical plane, an iron having a supporting shaft with a universal bearing on the sald arm and provided with a handle for manipulating the iron, a fluid pressure motor carried by the arm for moving the iron into co-operative relation with the pressing surface and having a controlling valve thereon, a bell crank lever in the said arm operatively connected to the motor controlling valve and having a bearing surface thereon formed concentric with the center of movement of the said shaft, and an operaling member located on the shaft adjacent to the handle and having a portion co-operating with the concentric bearing surface of the bell crank lever for operating the latter irrespective of the different angular relations of the said arm and shaft.
11. In a pressing machine the combination with a suitable pressing surface, of a jointed arm arranged to swing parallel to the pressing surface and having a U -shaped frame thereon, a rocker arm plvoted to the arms of the sald frame to swing in angular relation to the pressing surface, an iron carried on the rocker arm and arranged in co-operative relation with the pressing surface, and a motor operating between the said frame and rocker arm for producing pressure between the iron and pressing surface.
12. In a pressing machine the combination with a horizontal pressing surface, of a frame mounted to swing in a horizontal plane and having a pair of spaced horizontal arms, a rocker arm plvoted between the spaced arms of the frame and arranged to swing in angular relation to the pressing surface, an iron carried at one end of the rocker arm and arranged to co-operate with the pressing surface, and a motor connected to the other end of the rocker arm for tilting the latter to bring the iron into co-operative relation with the pressing surface.
13. In a pressing machine the combination with a suitable pressing surface, of a movable frame, and a rocker arm supported thereon and arranged to swing in angular vertical relation to the pressing surface, an iron carried by the rocker arm and arranged to co-operate with the pressing surface, a Huid pressure cylinder having a piston operating therein, and operating connections between the said frame and rocker arm which are operated on by the piston for producing a relative movement of the frame and rocker arm.
14. In a pressing machine the comblnation with a pressing surface, of a frame and a rocker arm pivoted thereon and arranged to swing in angular relation to the pressing surface, an iron operated on by the rocker arm, and a motor mounted on the frame for operating the arm embodying a fluid pressure cylinder having a piston operating therein, and a lever connected to the piston and forming an operative connection between the frame and rocker arm.
15. In a pressing machine, the combination with a pressing surface, of a frame, and a rocker arm pivoted thereon and arranged to swing in angular relation to the pressing surface, an iron operated on by the rocker arm, and a motor for producing relative motion between the frame and arm embodying a fluld pressure cylinder and piston carried by one of the parts, and a lever connected to the piston and having a plvotal bearing on one of the parts and a link connection with the other.
16. In a pressing machine, the combination with a pressing surface, of a supporting arm, and a rocker arm pivoted thereon and arranged to move in angular relation to the pressing surface, an iron operated on by the rocker arm, and a motor for operating the arm embodying a fluid pressure cylinder and its piston mounted on the arm, a lever pivoted on the supporting arm and having one arm thereof attached to the piston, and a link connecting the other arm of the lever and the rocker arm.
17. In a pressing machine, the combination with a pressing surface, of a supporting arm, and a rocker arm carried thereby and arranged to swing in angular relation to the pressing surface, an iron operated on by the rocker arm and arranged to co-operate with the pressing surface, a motor, connections between the said arms actuated by the
motor for operating the rocker arm, and a retracting device operating on the motor connections for restoring the motor and arm to normal position.
18. In a pressing machine, the combination with a pressing surface, of a supporting arm, and a rocker arm mounted thereon and arranged to move in angular relation to the pressing surface, an iron carrled by the rocker arm arranged to co-operate with the pressing surface and having an operating handle, a motor for operating the rocker arm, a retracting device exerting a force tending to return the rocker arm to normal position, and means for preventing the operation of the retracting device to permit manual manipulation of the iron.

No. 101,154. Gas Lamp. Lampe d gas.

Adolphus Sydney Francis, London, England, 25th September, 1906; 6 years. Filed 23rd May, 1906. Receipt No. 136,172.
Claim.-1. An inverted incandescent gas lamp comprising a gas supply pipe, a ring pipe connected thereto and a plurality of bent tube Bunsen burners connected to and arrarged to project radially inwards from said ring pipe, substantially as set forth.
2. An inverted incandescent gas lamp comprising a gas supolv pipe, a ring plpe connected thereto, a plurality of bent tube Bunsen burners connected to and arranged to project radially inwards from said ring pipe, a chimney flared at its lower end, means for supporting said chimney over said burners and apertures in said chimney to allow sald burners to pass through said chimney, substantially as set forth.
3. An inverted incandescent gas lamp comprising a gas supply pipe, a ring plpe connected thereto, a plurality of burner tubes connected to and arranged to project radialIy inwards from said ring pipe, a plurality of bent tube Bunsen burners, and a plurality of sliding foints connecting the said burners with their respective tubes, substantially as set forth.
4. An inverted incandescent gas lamp comprising a gas supply pipe, a ring pipe connected thereto, a plurality of burner tubes connected to and arranged to project radially inwards from said ring pipe, a plurality of bent tube Bunsen burners, a nlurality of sliding joints connecting the said burners with their respective tubes, a chimney flared at its lower end, means for supporting said chimney over said burners and apertures in said chimney to allow said burners to pass through said chimney, substantially as set forth.
5. An inverted incandescent gas lamp comprising a gas supply pipe, a ring pipe connected thereto, a plurality of bent tube Bunsen burners connected to and arranged to project radially inwards from said ring pipe, a chimney flared at its lower end, means for supporting said chimney over said burners, apertures in said chimney to allow said burners to pass through said chimney, an imperforate globe of larger diameter than the end of said chimney, means for supporting said globe beneath said burners and beneath sald chimney substantially as and for the purpose set forth.
6. An inverted incandescent gas lamp comprising a gas supply pipe. a ring pipe connected thereto. a plurallty of bent tube Bunsen burners connected to and arranged to project radially inwards from sald ring pipe, a chimney. means for supporting said chlmney over said burners, apercures in said chimney to allow said burners to pass through said chimney, a flare end to said chimney situated approximately in the same plane as that in which the points of said burners are situated, an imperforate globe of larger diameter than said flared end. and means for supporting sald globe in such manner that its upper edge is situated approximately in the same plane as that in which said burner points and said flared end are situated, substantially as and for the purposes set forth.
7. An inverted incandescent gas lamp comprising a gas supply pipe, a ring pipe connected thereto a plurality of bent tube Bunsen burners connected to and arranged to project radially inwards from said ring pipe, a chimney flared at its lower end, means for supporting said chimney over said burners, apertures in said chimney to allow said burners to pass through said chimney, an imperforate globe of larger diameter than the end of said chimney, means for supporting said globe beneath said burners and beneath said chimney, a cover for the upper end of said chimney, and a ring of perforations situated near to the edge of sald cover, substantially as set forth.
8. An inverted incandescent gas lamp comprising a gas supply pipe, a ring pipe connected thereto, a plurality of bent tube Bunsen burners connected to and arranged to project radially inwards from said ring pipe, a chimney flared at its lower end, means for supporting said chimney over said burners, apertures in said chimney to allow said burners to pass through said chimney, an imperforate globe of larger diameter than the end of said chimney, means for supporting said globe beneath said burners and bencath said chimney, and a domed cover supported upon said chimney for the purpose of further isolating the fresh air supply from the escaping exhaust gases, substantially as set forth.

No. 101,155. Gas Range. Poêle d gaz.

Will:am Joseph Hallarn. Toronto, Ontario, Canada, 25th September, 1906; 6 years. Filed 15th May, 1906. Receipt No. 135,930.
Claim.-1. In a gas range, a body part formed by inner and outer side and back plates, air spaces formed between the inner and outer plates, an oven bottom dividing the said body part into oven and broiler sections, an air space formed by the top and bottom faces of the said oven bottom, a hinged door for the said oven section. and a broiler pan adapted to slide in and out of the said broiler section, substantially as described.
2. In a gas range, a body part formed by inner and outer side and back plates, air spaces formed between the inner and outer plates, an oven bottom dividing the body part into oven and broiler sections, an air space formed by a flat top face and a V-shaped bottom face of said oven bottom, passages between the side edges of the said oven bottom. and the side walls of the body part, a hinged door for said oven section, a broiler pan adapted to slide in and out of said broller section. substantially as described.
3. In a gas range, a body part formed by inner and outer side and back plates, air spaces formed between said inner and outer plates, an asbestos lining on one of the inner walls of the said air spaces, an oven bottom dividing said body part into oven and broiler sections, said oven bottom comprising a flat top and a \(V\)-shaped bottom, an air space formed by said flat top and V-shaped bottom, passages between the side edges of the oven bottom and side walls of body part, current directing plates fastened to the said side walls of the body part, passages formed between the said current directing plates and the said side walls, a draft plate fastened to the inner fince of the back of the body part, a passage formed between the sald draft plate and the back wall, said passage adapted to communicate with a flue, said flue formed through the back of said body part, substantially as described.
4. In a gas range, a body part comprising inner and outer side and back plates, air spaces formed between the inner and outer plates, an oven bottom dividing the body part into oven and broller sections, said oven bottom consisting of a flat top and a \(V\)-shaped bottom, an air space formed between the said flat top and \(V\)-shaped bottom, passages between the side edges of oven bottom and side walls of body

9-29
part, current directing plates fastened to the inner side walls of the body part, passages formed by the said current directing plates and the inner side walls of the said body part, a draft plate fastened to the inner face of the safd back plate, a passage formed by said draft plate and the inner back plate, said passage communicating with the flue, said flue formed through the back plates of body part, a hinged door for the said oven section, and a sliding pan for the said broiler section, substantially as described.

\section*{No. 101,156. Treatment of Vulcanized Rubber}

Traitement des déchets de caoutchouc vulcanisés.
Whlliam Adolph Köneman, Chicago, Illinols, U.S.A., 25th September, 1906; 6 years. Filed 21st May, 1906. Receipt No. 136,114.
Claim.- - In the chemical treatment for the purpose set forth, of vulcanized rubber or rubber compounds, the process of devulcanizing the same, which consists in boiling the material in a finely divided conditon, in an aqueous compound acid solution, practically free from oxidizing ingredients, of sulphuric acid, as the base, and an acid of the halogen elements of chlorin, bromin or iodine.
2. The process of treating vulcanized rubber or rubber compounds, for the purpose set forth, which consists in boiling the material, in a finely divided condition, in an aqueous solution, practically free from oxidizing ingredients. of sulphuric acid and hydrochloric acid, and washing and drying the product.
3. The process of treating vulcanized rubber or rubber compounds, for the purpose set forth, which consists in boiling the material, in a finely divided condition, in an aqueous compound acid solution, practically free from oxidizing ingredients, of sulphuric acid, as the base, and an acid of the halogen elements of chlorin, bromin or iodine, boiling the product in an alkaline solution, and washing and drying said product.

\section*{No. 101,157. Method of Recovering Rubber. Méthode de récupérer le caoutchouc.}

William Adolph Köneman, Chicago, Illinois, U.S.A., 25th September, 1906; 6 years. Filer 21st May, 1906. Receipt No. 136,113.
Claim.-1. The process of recovering rubber from rubber waste, which consists in boiling the finely divided material in a mineral acid solution with the addition of a halogen salt of the alkaline group, such as sodium or calcium chloride, without setting free in a gaseous state the chlorine, bromine, or iodine, and removing the dissolved and decomposed fiber.
2. The process of recovering rubber from rubber waste, which consists in boiling the finely divided material in a mineral acid solution with the addition of a halogen salt of the alkaline group, such as sodium or calcium without setting free in a gaseous state the chlorine, bromine or lodine, and removing the dissolved and decomposed fiber and mineral substances.
3. The process of recovering rubber from rubber waste. which consists in bolling the finely divided material in a mineral acid solution with the addition of a halogen salt of the alkaline group, without setting free in a gaseous state the chlorine, bromine or iodine, removing the acid and dissolved matter from the rubber, then boiling the rubber in a solution of alkaline salt, and washing and drying the product.
4. The process of recovering rubber from rubber waste, which consists in first decomposing and then removing the fiber, and treating the resultant rubber product with a solution of an alkaline salt. such as soda or potash, with the addition if a chemical substance having a preservative effect on vegetable matter, such as boracic acid or sodium borate. and washing and drying the product.
5. The process of recovering rubber from rubber waste, which consists in first decomposing and then removing the fibre, and treating the resultant rubber product with a solution of an alkaline salt, such as sida or potash, with the addition of a soluble gum, and washing and drying the product.
6. The process of recovering rubber from rubber waste, which consists in first decomposing and then removing the flbre, and treating the resultant rubber product with a solution of an alkaline salt, such as soda or potash, with the addition of a chemical substance having a preservative effect on vegetable matter, such as boralc acid or sodium borate. and of a soluble gum, such as rosin or shellac, and washing and drying the product.
7. As a step in the recovery of rubber from rubber waste ty decomposing and separating the fibre from the rubber by subjecting the material to the action of a suitable chemical solution, that of removing from the rubber product soluble compounds remaining from the soluble employed in previous
treatment, which consists in rendering said soluble compounds insoluble and removing them from the rubber product by precipitation.
8. As a ste in the recovery of rubber from rubber waste by decomposing and separating the fiber from the rubber by subjecting the material to the action of a suitable chemical solution, that of removing from the rubber product soluble compounds remaining from the solution employed in previous treatment, which consists in rendering insoluble and precipltating said compounds by treating said product with a weak astringent solution of aluminum salt.
9. The process of recovering rubber from rubber waste which consists in bolling the material in a finely divided state in a mineral acid solution with the addition of a balogen salt, removing the dissolved fiber, bolling the rubber product in a solution of an alkaline salt, with the addition of a chemical substance having a preservative effect on vegetable matter and with a soluble gum, then treating the product with a weak astringent solution of an aluminum salt having the effect of rendering insoluble any remaining soluble compounds in the rubber and precipating the same, and finally washing and drying the product.

No. 101,158. Process Recovering Rabber from Wanto.
Procédé pour récupérer le caoutchouo des déchets de caoutchouc.
William A. Köneman, Chicago, Illinols, U.S.A., 25th September, 1906 ; 6 years. Filed 21st May, 1906. Receipt No. 136,115.
Claim.-1. The process of treating finely divided rubber, which consists in boiling the same in a suitable liquid and adding thereto a mixable hydro-carbon such as tar, pitch, resin or balsam, for the purpose set forth.
2. As a step in the recovery of rubber from rubber waste material by treating the material in a suitable chemical solution, adding to sald material a suitable proportion of hydrocarbon, for the purpose set forth.
3. As a step in the recovery of rubber from rubber waste material by treating the material in a suitable chemical solution, adding to said material a suitable proportion of tar, pitch or balsam, for the purpose set forth.
4. The process of recovering rubber from rubber waste material, which consists in boiling the finely divided material with the addition thereto of a suitable proportion of mixable hydro-carbon in a suitable chemical solution, and \(r \in m o v i n g ~ t h e ~ d i s s o l v e d ~ a n d ~ d e c o m p o s e d ~ f i b e r, ~ f o r ~ t h e ~ p u r-~\) pcse set forth.
5. The process of recovering rubber from rubber waste material, which consists in boiling the finely divided material with the addition thereto of a suitable proportion of mixable hydro-carbon in a mineral acid solution containing a halogen salt of the alkaline group, such as sodium or calclum chlorid, and removing the dissolved and decomposed fiber, for the purpose set forth.
6. The process of recovering rubber from rubber waste material, which consists in boiling the tinely divided material with the addition thereto of a suitable proportion of mixable hydro-carbon in a mineral acid solution containing a halogen salt of the alkaline group, removing the acid and dissolved matter from the rubber, then boiling the rubber in a solution of alkaline salt, and washing and drying the product, for the purpose set forth.

\section*{No. 101,159. Linotype Machine. Linotype.}

Gustav Kretzsehmar, Baltimore, Maryland, U.S.A., 25th September, 1906; 6 years. Filed 25th July, 1906. Recelpt No. 138,145.
Claim.-1. The combination with a linotype machine, of a holder adapted to support a plurality of magazines, and a movable magazine carrier adapted to transport magazines between the machine and holder.
2. The comblnation with a linotype machine, of a movable holder adapted to support a plurality of magazines, and a carrier movable between the machine and the holder and adapted to transport a magazine.
3. The combination with a linotype machine, of a rotatable holder adapted to support a plurality of magazines, and a carrier movable between the machine and the holder and adapted to transport a magazine.
4. The combination with a linotype machine, of a holder adapted to support a plurallty of magazines, a rail extending bitween said holder and the machine, a carrier supported on said rail, and means depending from the carrier and adapted to engage and support a magazine.
5. The combination with a linotype machine, of a holder adapted to support a plurality of magazines, a rail extendIng between sald holder and the machine, a carrier supported on said rall, and means depending from the carrier for raising and supporting a magazine.
6. The combination with a linotype machine, of a holder adapted to support a plurality of magazines, a rail extend-

ing between said holder and the machine, a carrier supported on said rail, and means depending from the carrier, comprising a lever for raising the magazine and means for retaining the lever to hold the magazine in its raised position.
7. The combination with a linotype machine, of a holder adapted to support a plurality of magazines, a rall extending between said holder and the machine, a carrier supported on said rail, and means depending from the carrier comprising a hanger, a lever pivotally connected with the hanger, a beam connected with the lever and adapted to be engaged with a magazine and means for engaging the free end of the lever with the beam.
8. The combination with a linotype machine, of a plurality of holders, each adapted to support a magazine, and a movable magazine carrier adapted to transport magazines between the machine and each of said holders.
9. The combination with a linotype machine, of a plurality of holders, each adapted to support a plurality of magazines, and a movable magazine carrier adapted to transport magazines between the machine and each of said holders.
10. The combination with a linotype machine, of a plurality of holders each adapted to support a magazine, a pivotally supported rail adapted to extend between either of said holders and the machine, and a carrier supported on said rail and provided with means for engaging and supporting a magazine.
11. The combination with a linotype machine, of a plurality of holders each adapted to support a magazine, a rail pivotally mounted on the machine and adapted to extend to either of said holders, and a carrier supported on sald rall and provided with means for engaging and supporting a magazine.

\section*{No. 101,160. Support for Electric Lamps. Support pour lampes électrigues.}

Hubert Cheppendale Smith, Erdington, near Manchester, England, 25th September, 1906; 6 years. Filed 16th May, 1906. Receipt No. 135,968.

Claim.-1. In pendants or like supports for electric lamps, the combination with a pendant of looped suspension cords, automatically adjustable connections between the cords and the pendant, and a sustaining block provided with apertures through which the said looped cords can slide on the application of a pendant adjustment movement, substantially as set forth.
2. In pendant or like supports for electric lamps, the combination comprising a pendant and looped suspension cords therefor, cord attachment arms secured to the pendant, sliding connections between the cords and the said arms permitting of a lateral movement of the lower extremities of the cords when the pendant is angularly adjuster. and a sustaining block provided with apertures through which the cords can slide on the application of a lamp adjustment modement, substantially as set forth.
3. In a pendant or like supports for electric lamps, the combination comprising a pendant and a pair of looped sus-

pension cords therefor, cord attachment arms secured to the pendant, sliding connections between the cords and the sald arms permitting of a lateral movement of the lower extremities of the cords when the pendant is angularly adjusted, a flexible lead or conductor, and a sustaining block attached to the said lead or conductor and provide with angular apertures through which the sald cords can slide, substantially as set forth.

\section*{No. 101,161. Ore Amalgamator.}

Amalgamateur de minerais.

John Robert Harrison and Hugh Victor Mackay, assignee of a half interest, both of Victoria, Australia, 25 th September, 1906 ; 6 years. Filed 11th May, 1906. Receipt No. 135,790.
Claim.-1. In an improved amalgamator or concentrator a suspended pan or table volute shape in plan having a fall helically from its feed to its discharge end partially in the form of a channel and partially provided with an inner gutter, substantially as described and shown.
2. In an improved amalgamator or concentrator, a suspended pan or table volute shape in plan having an adjustable fall helically from its feed to its discharge end and with an adjustable radial transverse fall from its inner edge to its outer edge provided with an outer rim and a partial inner rim and a discharge gutter, substantially as described and shown.
3. In an improved amalgamator or concentrator a pan or table having a volute shape surface and a radial transverse fall and a circumferential fall from its feed to its discharge end suspended by such as chains, and having a gyratory or eccentric motion imparted to the pan or table, substantially as described and shown.
4. In an improved amalgamator and concent.ator of the type herein specifled, the means for adjusting the transverse fall. circumferential fall and the height at discharge end of table, substantially as described and shown.
5. In an improved amalgamator or concentrator consisting of one or more pans or tables having a volute shaped surface with a radial and a circumferentlal fall, and a spray pipe near its discharge end, suspended by such as chains and furnished with arms having a central boss to receive a ball or other eccentric by means of which a gyratory or eccentric motion is imparted to the table substantially as described and shown.
6. An improved amalgamator or concentrator consisting of a volute shape surface having a transverse radial and a circumferential fall and a spray pipe at one side near
its discharge end, a central stool and pillar carrying bearings for the eccentric and driving gear and overhead arms by which the pan is suspended by such as adjustable chains and the pan furnished with arms having a central boss to which an eccentric or gyratory motion is imparted, a perforated feed hopper a divided collecting hopper for the saved mineral and seconds, and a tympanum elevator for returning seconds to table, all substantlally as described and shown.

\section*{No. 101,162. Method of Making Buttons from} Anstralian Ivory Nut.
Méthode de faire des boutons des noks d'ivoire.
Edward Julius Conn. Hamburg, Germany, assignee of H. G. Lelthäuser, Schmollin, Germany, 25th September, 1906 ; 6
years. Filed 19th May, 1906. Receipt No. 136,068.
Claim.-1. The method of producing buttons from Australian nuts consisting in cutting the nuts into discs, extracting the fatty matters from these discs, from which the buttons can be made.
2. The methed of producing buttons from Australian nuts, consisting in cutting the nuts into discs. extracting the fatty matters from these discs by boiling them in solutions of fat absorbing matters and in working them into buttons. 3. The method of producing buttons from Australian nuts consisting in cutting the nuts into dises. extracting the fatty matters from these discs by boiling them in a solution of soda and in working them into buttons.
4. The method of producing buttons from Australian nuts consisting in cutting the nuts into discs, extracting the fatty matters from these discs, turning these to shape and perforating them, whereupon they are ground with pumice stone and finally polished with chalk and tripoli mixed with oil.

No. 101,163. Type Setting and Distributing Machine.
Machine d distribuer les caractères.

Arthur G. Baker, Albion, J. Frank Scott and J. Frank Helmer, both of Jackson, all in Michigan, U.S.A., 25th September, 1906 ; 6 years. Filed 15th June, 1906. Receipt No. 136,950 .
Claim.-1. The combination of a movable type distributor having a rack and a detent at each end of the rack, a swinging arm, means for operating the arm. and a reversible pawl carried by the arm and co-acting with the rack and adapted to be alternately struck by the detents, for the purpose specified.
2. The combination of a movable type distributor comprising a rack and a detent at each end thereof, a swinging arm, means for opertaing the arm, and an intermediately pivoted pawl adapted to co-act at its ends with the rack and to be alternately struck by the detents automatically to reverse the pawl.
3. In a type setting and distributing machine, the combination of a base, type selecting mechanism therein, vertically extending plates rising from the base, horizontally extending bars clamping sald plates together and spaced apart from each other to form type compartments, the upper bars forming a track, a distributor mounted to move horizontally on said track, the distributor comprising vertically extending plates and means for clamping them together and spaced apart from each other to form type compariments, a rack on said distributor, a swinging arm, a reversible pawl mounted
on the arm and co-acting with the rack, a detent at each end of the rack adapted to strike the pawl to reverse the same and means for imparting regular movement to said arm.
4. In a type setting and distributing machine, the combination of a base, type selecting mechanism thercin, vertically extending plates rising from the base, horizontally extending bars clamping said plates together and spaced apart from each other to form type compartments, the upper bars forming a track, a distributor mounted to move horizontally on said track, the distributor comprising vertically extending plates and means for clamping them together spaced apart from each other to form type compartments, a rack on said distributor, a swinging arm, a reversible pawl mounted on the arm and co-acting with the rack, a detent at each end of the rack adapted to strike the pawl to reverse the same, means for imparting regular movement to sald arm, a table mounted on the base and inclining forward and downward from the lower type compartments, curved guldes extending along the upper surface of sald table to control the movement of the type delivered thereon, a galley to which said guides lead. and means for advancing the type in the galley.
5. In a type setting and distributing machine, the combination of a base, type selecting mechanism therein, vertically extending plates rising from the base, horizontally extending bars clamping said plates together and spaced apart from each other to form type compartments, the upper bars forming a track, a distributor mounted to move horizontally on said track, the distributor comprising vertically extending plates and means for clamping them together and spaced apart from each other to form type compartments, a rack on said distributor, a swinging arm, a reversible pawl mounted on the arm and co-acting with the rack, a detent at each end of the rack adapted to strike the pawl to reverse the same, means for imparting regular movement to said arm, a table on the base inclining downwardly and forwardly from the lower type compartments and adapied to receive the type from the selecting mechanism, a diagonal wall extending along said table from the upper part to the opposite lower corner thereof. curving guides on top of the table directing the type from said lower corner of the table, a galley adapted to receive the type from said lower corner, a push rod adapted to advance the type in the galley, and means for reciprocating the push rod.

No. 101,164. Process of Extracting Potassinm Chloride from Seaweed.
Procidé pour extraive le chlorure de potassium des plantes marincs.

David M. Balch, Coronado, Callfornia, and Anson P. Stephens, New York City, New York. U.S.A., assignee of a half interest, 25th September. 1906; 6 years. Filed 19th May, 1906. Receipt No. 136,072 .

Claim.-The hercin described process of obtaining potassium chloride from sea woeds, which consists in first sweatligk and drying the weeds in an enclosure and then separating the exuded salts therefrom by mechanical agitation.

No. 101,165. Machine for Making Vegetable Matter into a Solid Mass of a selective Size and Shape.
Hachine pour mettre en blocs des matirres vigitales.
Willam Howard Buker, Alliston, Ontario, Canada, 25th September, 1906; 6 years. Filed 3rd March, 1906. Receipt ㅅo. 133,502.
Claim-1. A machine for manufacturing vegetable matter Into a solid mass, comprising a machine frame, compression
rolls journalled therein, means for causing the revolution of the compression rolls, a delivery tube located at the de-

livery end of the compression rolls and located opposite the interval between them, a cutting mechanism at the delivery end of the dellivery tube, means for Imparting motion to the cutting mechanism, and means for softening the vegetable matter during its compression by the compressing rolls.
2. A machine for manufacturing vegetable matter comprising a main frame, compression rolls journalled therein having spiral grooves in their peripheral surfaces to move the material towards their delivery end, means for imparting motion to the compression rolls, a tank mounted on the main frame, steam jets to direct the steam towards the material contained between the compression rolls, and means for connecting the tank with the steam jets and the steam space of the boiler.
3. A machine for manufacturing vegetable matter comprising a main frame, compression rolls journalled therein having spiral grooves in their peripheral surfaces to move the material towards their delivery end, mans for impartIng motion to the compression rolls, a delivery tube at the delivery end of the compression rolls located opposit" the interval between them, a cutting means opposite to the lelivery end of the delivery tube, and means for actuating the cutting means.
4. A machine for manufacturing vegetable matter comprising a main frame. compression rolls journalled therein having spiral grooves in their peripheral surfaces to move he material towards their delivery end. means for imparting motion to the compression rolls. a tank mounted on the main frame, steam jets to direct the steam towards the material contained between the compression rolls, means for connecting the tank with the steam jets and the steam space of the boiler, and a delivery tube at the delivery end of the compression rolls located opposite the interval between them.
5. A machine for manufacturing vegetable matter comprising a main frame, compression rolls fournalled therein having spiral gooves in their peripheral surfaces to move the material towards their delivery end, means for imparting motion to the compression rolls, a tank mounted on the mair frame, steam jets to direct the steam towards the material ontained between the compression rolls. means for connecting the tank with the steam jets and the steam space of the boller a delivery tube at the delivery end of the compression rolls located opposite the interval between them, a utting means opposed to the delivery end of the delivery lube and means for actuating the cutting means.
6. A machine for manufacturing vegetable matter comprising a main frame, compression rolls journalled therein having spiral grooves in their peripheral surfaces tomove the material towards their delivery end. means for imparting notion to the compression rolls, a feeder for the compression rolls, a feed roll to positively deliver the vegetable matlur from the fecder to the compression rolls, a delivery lube at the delivery end of the compression rolls located opposite the interval between them. a tank mounted on the main frame. steam juts to direct the stram towards the mawrial contained between the compression rolls, and means ior connurting the tank with the stcam jets and the steam - pace of the boiler.
7. A malhine for manufacturing vegetable matter con prising a matin frame. compression rolls journalled thereln having spiral grooves in their peripheral surfaces to move the material towards their delivery end. means for imparting motion to the compression rolls. a feeder for the comprossion rolls. a feed roll to positively deliver the vegelable matter from the fioder to the compression rolls. a delivery thbe at the delivery end of the compression rolls located opposit, the interval between them, a tank mounted
on the main frame, steam jets to direct the steam towards the material contained between the compression rolls, means for connecting the tank with the steam jets and the steam space of the boiler, a cutting means opposed to the delivery end of the delivery tube and means for actuating the cutting means.
8. A machine for manufacturing vegetable matter comprising a main frame, compression rolls journalled therein having spiral grooves in their peripheral surfaces to move the material towards their delivery end. means for imparting motion to the compression rolls, a feeder for the conpression rolls, a feed roll to positively de!iver the vege table matter from the feeder to the compression rolls, a delivery tube at the dellvery end of the compression rolls lo cated opposite the interval between them. a tank mountef on the main frame, steam jets to direct the stea'n towarls the material contained between the compression rolls, means for connecting the tank with the steam jets and the steam space of the boiler, a cutting means opposed to the delivery end of the delivery tube, means for actuating the cutting means and a shaping means opposed to the end of the delivery tube.

No. 101,166. Furnace for 8melting, Eto. Fonderie, etc.

Kristian Birkeland and Samuel Eyde, Readhusgaden, Norway, 25th September, 1906; 6 years. Filed 22nd January, 1906. Receipt No. 132,103.

Claim.-1. In an electric arc furnace for smelting or metallurgical operations, the combination with a smelting hearth, of a pair of electrodes, feedways for introducing material to the hearth so disposed that no material passes under the points of the electrodes, and a magnetic field dispersing the arc to a large disc.
2. In an electric arc furnace for smelting or metallurgical operations, an annular hearth, means to create a magnetic field inside of the hearth, and a pair of electrodes placed in an axial plane in the magnetic field.
3. In an electric are furnace for smelting or metallurgical operations, a hearth in the form of an annular channel, a sloping hearth concentric with and raised above the said channel, feedways for introducing raw material to the top of the sloping hearth, electrodes placed in an axial plane above the hearth and means to create a magnetic fleld adapted to spread the arc over the hearth so that it will take the form of a more or less spherical or vault-shaped disc.
4. In an electric arc furnace for smelting or metallurgical operations a hearth in the form of an annular channel, a terraced sloping hearth concentric with and raised above the said channel, feedways for introducing raw material to the top of the terraced sloping hearth, electrodes placed in an axial plane above the hearth and means to create a magnetic field adapted to spread the arc over the hearth so that it will take the form cf a more or less sphis.cal or vault-shaped disc.
5. In an electric arc furnace for smelting or metallurgical operations, a hearth in the form of an annular channel, a sloping hearth concentric with and raised above the said channel, feedways for introducing raw materlal to the top of the sloping hearth, electrodes placed in an axial plane above the hearth and means to create a magnetic fleld adapted to spread the arc over the hearth so that it will take the form of a more or less spherical or vault-shaped disc, and to cause it to vibrate in a vertical direction.
6. In an electric furnace, a pair of electrodes, means to produce a strong magnetic field, the arc gap between the electrodes at substantially the center of said field, and a hearth situated to one side of the arc gap and magnetic field center and within the fleld and influence of the spread arc.
7. In an electric furnace, a hearth having a central aperture, a pair of electrodes projecting over the aperture, means
to produce an arc between the electrodes, and magnets of unequal intensity mounted above and below the apertures. for the purpose specifled.
8. In an electric furnace, a hearth having a central aperture and a concentricichannel in the hearth surrounding the aperture, a plurality of steps surrounding the channel, a pair of electrodes having their ends projecting over the aperture, means to produce an arc between the electrodes, means to feed raw material onto the steps of the hearth, a magnet mounted centrally of the aperture, and a magnet of greater intensity than the aforesaid magnet mounted above the latter.

No. 101,167. Die for Making Forks.
Etampe pour faire des fourches.

Cashmer Eisbrenner and Charles Arthur Dumeah, both of Tillsonburg, Ontario, Canada, 25th September, 1906; 6 years. Filed 28th August, 1906, Receipt No. 139,041.
Claim.-A die for three tine forks having a tang portion. having a central tine portion, the axis of which is coincident with the axis of the tang portion, and having outside tine portions, the axes of which are at an angle to the axis of the tang portion, said tang portions and one tine portion being pointed in one direction, and the central tine portion and the other tine portion being pointed in an opposite directiou from a central point.

No. 101,168. Wrench. Clé à écrou.

Andrew H. De Groff, Little Genesee, New York, U.S.A., 25th September, 1906; 6 years. Filed 1st September, 1906. Recelpt No. 139,161.
Claim.-A wrench comprising slmilarly formed members, each provided at one end with an off-standing jaw extending forwardly at an obtuse angle, a flattened handle at the opposite end and an intermediate flattened shank. the handles being offset from the shanks, one of said members having a stop shoulder at the juncture of the handle and shank and provided with a flattened pivot, and the other member having its shank provided with a series of pivot openings connected by means of a slot, the said pivot fastening and stop shoulder co-operating to limit the closing of the handle members.

No. 101,169. Machine for Making Turbine Wheels, Rings, Drums, Etc.
I/achine pour laire des roucs de turbines, anneaux, tambours, eto.

Sebastian Ziani de Ferranti, London, England, 25th September, 1906; 6 years. Filed 14th August, 1906. Receipt No. 138,696.
Claim.-1. In combination in apparatus for welding turbine blades to their carrying elements, means for pressing the turbine blade and carrying element together, including a slidable blade clamp adapted to carry electric current and means for automatically effecting a relative displacement of the carrying clement and welding hrad, substantlally as described.
2. A machine adapted to electrically weld turbine blades to their carrying elements comprising in combination means for causing a blade and its carrying element to approach and be pressed together, means for leading current to and from the welding point together with means for setting the blade carrying element in position for the next well, substantlally as descrlbed.
3. A machine adapted to electrically weld turbine blades to their carrying elements comprising in combination means for causing a blade and its carrying element to approach and be pressed together, means for leading current to and from the welding point, means for removing metal from said carrying clement in advance of the welding point together with means for setting the blade carrying element in position for the rext weld, substantially as described.
4. A machine adapted to electrically weld turbine blades to their carrying elements comprising in combination a rotatably mounted blade carrying element stool, a blade clamp, a slidably mounted welding head carrying said blade clamp, together with means for causing sald blade clamp to approach said stool, substantially as described.
5. A machine adapted to electrically weld turbine blades to their carrying elements comprising in combination, means for causing a blade and its carrying element to approach, a toggle device for producing pressure at the welding point, means for leading current to and from sald welding point together with means for setting the blade carrying element in position for the next weld, substantially as described.
6. A machine adapted to electrically weld turbine blades to their carrying elements comprising in combination a carrying element. a slidably mounted welding head, means for holding a blade therein, means for leading current to the welding point, means including a crank and a pitman for reciprocating said welding head together with means for causine said crank to ston automatically at the end of each half revolution. substantially as described.
7. A machine adapted to electrically weld turbine blades to their carrying eloments comprising in combination a rotatably mounted blade carrying element stool, a slidably mountrd welding head, means for causing said welding head to reciprocate together with means operated from said weldIng head for turning sald stool into a position for the next weld. substantially as described.
s. A machine adapted to electrically weld turbine blades to their carrying element. comprising in combination means for causing a blade and its carrying element to approach. a toggle device for producing pressure at the welding point. a switch together with means operated from said toggle for opening sald switch when the weld is completed, substantially as drescribed.
9. A machine adaptod to electrically weld turbine blades to thefr carrying elements comprising in combination a slidably mounted welding head carrying a blade holder slidable relative thereto, mons for reciprocating said welding head. aswith together with means operated from sald reciprorating means for closing said switch, substantially as described.
10. A machine adapted to electrically weld turbine blades to their carrying elements comprising in combination a
slidable mounted welding head, means for reciprocating said welding head including a main motion shaft, clutches adapted to drive said shaft in either direction together with means including a travelling nut and a screwed slidable extension of said shaft for stopping said shaft at each end of the travel of said welding head, substantially as described.
11. In combination in apparatus for welding turbine blades to their carrying elements, means for pressing a turbine blade and carrying element together including a slidable blade clamp adapted to carry electrical current, means for automatically setting the blade carrying element in position for the next weld, substantially as described.
12. In apparatus for welding turbine blades to their carrying elements, means for holding and clamping blade metal strip comprising a jaw holder having members movable for clamping purposes relatively to one another together with jaws supported by said jaw holder when viewed in a direction substantially parallel to that of said clamping movement.
13. In combination in apparatus for welding turbine blades to their elements, means for holding a blade including elec-tro-magnetically operated clamping jaws, means for causing a blade and its carrying element to approach and be pressed together and means for leading current to and from the welding point, substantially as described.
14. In combination in apparatus for electrically welding blades to their carrying elements. means for causing a turbine blade to make contact with its carrying element, means caused to operate by said contact producing means for pressing sald blade and carrying element together and means for automatically switching off the welding current when the weld is complete, substantially as described.
15. In combination in apparatus for electrically welding blades to their carrying elements, means for causing a turbine blade to make contact with its carrying element, means caused to operate by said contact producing means for pressing said blade and, carrying element together, a blade holder through which current is led to the welding point and means for automatically effecting a relative displacement of said carrying element and holder, substantially as described.
16. In combination in apparatus for electrically welding blades to their carrying elements, means for pressing a turblne blade and carrying element together Including a blade holder and means for setting the angle thereof, substantially as described.
17. In apparatus for welding turbine blades to their carrying elements, means for holding and clamping blade metal strip. comprising a jaw holder having members movable for clamping purposes relatively to one another and having also an aperture passing through from side to side thereof tofether with jaws supported by said jaw holder, said jaws having an operative clamping portion within said aperture.
18. In apparatus for elfetrically welding blades to their carrying elements, a blade holder having clamping elements. said holder being rotatably mounted for setting the angle of the blades in relation to their carrying elements, substantially as described.
19. In apparatus for welding turbine blades to their carrying elements, means for holding and clamping blade metal strip comprising a jaw holder having members movable for clamping purposes relatively to one another together with clamping jaws supported by said jaw holder, said jaws having each an operative clamping portion standing clear of said jaw holder when viewed in a direction substantially parallel to that of said clamping movement, and said operative clamping portions being disposed at a distance apart less than their own thickness.
20 In combination in apparatus for electrically welding blades to their carrying elements, a blade holder and means for causing said blade holder to approach such carrying element within a distance less than the length of said blades, substantially as described.
21. In apparatus for welding turbine blades to their carryIng elements, means for holding and clamping blade metal strin comprising a jaw holder having members movable for clamping purposes relatively to one another together with clamping jaws separated by said jaw holder, said jaws having each an operative clamping portion standing clear of said faw holder when vlewed in a direction substantially parallel to that of said clamping movement together with means for leading current to the welding point by way of said operative clamping portions, substantially as described.
22 . In apparatus for welding turbine blades to their carrying elements, means for holding and clamping blade metal strip comprising a jaw holder together with clamping jaws supported by said holder, one of said clamping jaws having an operative clamping convex area on the side thereof adjacent to said other jaw and a concave area on the side remote and the other of said clamping jaws having an operative concave area on the side thercof adjacent to said firstmentioned jaw and a convex area on the side remote, substantially as described.
23. In apparatus for electrically welding bent blades to their carrying elements, a blade holder having bent clamping
elements to laterally clear adjacent blades on either side thereof during the welding operation, substantially as described.
24. In combination in apparatus for electrically welding blades to their carrying elements, a blade holder, means for making good electrical contact between said holder and certain lateral portions of said blade and means for causing said blade and carrying element to approach and be pressed together, substantlally as described.
25. In apparatus for electrically welding blades to their carrying elements, a blade holder having elements between which said blade is adapted to be clamped, said element having respectively concave and convex areas on the sides adjacent to said blade the sum of sald concave and convex areas being greater than the cross sectional area of the blade, substantially as described.
26. In combination in apparatus for electrically welding turbine blades to their carrying elements, a blade holder and blade disposed therein, said blade having only a short length projecting from said holder in a direction towards the carry ing element and said holder having portions in good electrical contact with the portions of said blade which lie to one side of the plane in which are disposed the opposite edges of the blade, substantially as described.

\section*{No. 101,170. Production of Oxygen. Production d'oxygene.}

George François Jaubert, Paris, France, 25th September, 1906; 6 years. Filed 20th April, 1906. Receipt No. \(135,084\).
Claim-The improvement to the process for the preparation of oxygen or of gases rich in oxygen by kindling in an appropriate vessel a mixture formed substantially of a combustible material and of a large excess of perchlorate or nitrate and if desired of inert materials, which consists in mixing or kneading in the presence of water or of some other solvent, perchlorate of potash (or other perchlorate or nitrate) with a small proportion of pulverulent combustible such as carbon, and of an inert material, this kneading being succeeded by the moulding into blocks, cakes or briquettes of the paste obtained and by the drying of said blocks, cakes or briquettes.

No. 101,171. Pipe Grip. Grippe pour tuyaux.

David W. Stirling, Glade Mills, Pennsylvania, U.S.A., 25th September, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,153.
Claim.-1. A gripping device of the character described consisting of two substantially semi-circular straps hinged together, an eyelet carried by one of said straps, the other of said straps having a substantially hook-shaped end, and projections or teeth carried by the inner or confronting faces of said straps, substantially as described.
2. A gripping device of the character described consisting of two straps hinged together, an eyelet carried by one of said straps, a link carried by said eyelet and adapted to be attached to a rope, the other of said straps having a substantially hook-shaped end over which the rope is adapted to engage, and projections carried by the confronting or inner faces of said straps, substantially as described.
3. A grippling device consisting of two straps hinged together, an eyelet carried by the free end of one strap, a flexible connection attached to said eyelet, the other of said straps having a hook-shaped end, with which said fiexible connection is adapted to engage.

\section*{No. 101,172. Food Composition. Composé d'aliment.}

John Macfarlane Wilson, Peterborough, Ontario, Canada, 25th September, 1906; 6 years. Filed 2nd January 1906. Receipt No. 131,484.
Claim.-The herein described condiment composition consisting of cheese, olive oil, jersey cream, flour of celery seed, flour of mustard seed, and saltpetre in substantial proportions specified, or thereabouts.

No. 101,173. Machine for Making Wire Goods. Machine pour faire des objets en fll de fer.

The Clinton Wire Cloth Company, assignee of Herbert Lothrop Smith, both of Clinton, Massachusetts, U.S.A., 25th September, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,029.
Claim.-1. In combination with the co-operative elements of a wire fabric, means for feeding strand wires, means for feeding a stay wire, means for welding said wires at points of intersection, comprising a series of pairs of welding jaws, means for advancing half of said jaws, means for advancing the complemental jaws independently to grasp the work, a transformer and an independent connection from each pair of welding jaws to the secondary circuit of said transformer.
2. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stray wire, means for welding said wires at points of intersection, comprising a series of pairs of weld ing jaws, means for advancing half of said jaws, means for advancing the complemental jaws independently to grasp the work, and means whereby one of each pair of jaws has an independent and automatic upsetting movement.
3. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding said wires at points of intersection, comprising a series of pairs of welding jaws, a single transformer having a secemdary coil whose two terminals are each extended to form a buss bar, one-half of said jaws being each independently connected to one buss bar, the other half of said jaws being independently connected to the other of said buss bars.
4. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding said wires at points of Intersection, comprising a single transformer, having each terminal of its secondary coil extended to form a buss bar a series of welding jaws, a connection between each of said series and one of said buss bars, a complemental series of opposed welding jaws and an independent connection between each jaw of said series and the other of said buss bars.
\(\overline{5}\). In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for freding a stay wire, means for welding said wires at points of intersection, comprising a single transformer each secondary terminal of which is extended to form a buss bar, a scries of welding jaws, each of which is independently connected to one of said buss bars. a complemental series of welding jaws, each of which is independently connected to the other of said buss bars, means for selectively closing the primary circuit through said single transformer for each pair of welding jaws and means controlled by each pair of welding jaws for automatically breaking the circuit upon completion of the weld.
6. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for fecding a stay wire, means for welding said wires at points of intersection, comprising a series of movabie welding jaws, a series of complemental movable opposed welding jaws, means for advancing the first series to grasp the work, means for selectively and independently advancing each jaw of the second series to grasp the work and close the primary circuit, and means operated by each jaw of the first series for automatically breaking the circuit upon completion of the weld.
7. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding said wires at points of intersection, comprising a series of movable welding jaws, a complemental opposed series of movable welding jaws, means for advancing the first series to grasp the work, means for advancing each jaw of the second series independently and selectively to grasp the work, and means controlled by each pair of welding jaws for breaking the primary circuit upon completion of the weld.
8. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding sald wires at points of intersection, comprising a pair of welding jaws, each of which is movable, a break switch, means controlled by one of said jaws for setting sald switch before the welding operation and means controlled by the other of said jaws to open the \(s\) witch upon completion of the welding operation.
9. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding said wires at points of intersection, comprising a transformer, having each of its secondary terminals extended to form a buss bar, a series of welding jaws and an independent laminated connection between one of the buss bars and each jaw of said series, a complemental opposed series of welding jaws and an independent laminated copper connection between each of said jows and the other of said buss bars.
10. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding sald wires at points of intersectlon, comprising a series of pairs of welding units, means for advancing half of said welding units to grasp the work, means for selectively and independently advancing the complemental half of each welding unit to grasp the work, a source of power, means for connecting that source of power with each welding unit and means controlled by each weldIng unit for automatically cutting out or disconnecting said unit from the source of power upon completion of the welding operation of that unit.
11. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, a welding unit composed of two opposed movable members, a source of power, means for connecting said unit to the source of power, an independent power interrupter device and means controlled by sald unit for automatically actuating said device.
12. In combination with the co-operative elements of a wire cabric machine, means for feeding strand wires, means for feeding a stay wire, a series of welding units each composed of two movable members, a source of power, means for automatically and selectively connecting each unit with said source of power, an independent power interrupter device for each unit and means controlled by each unit for automatically actuating the interrupter device of that unit.
13. In confination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding sald wires at points of intersection, comprising a series of welding units, each composed of two members. or source of power, means for selectively and independently connecting each welding unit with sald source of power, an independent power interrupter device for each welding unlt, means controlled by one member of each unit for operating the interrupter device of that unit to operate the unit, and means controlled by the other nember of each unit for automatically operating said device to disconnect the power from that unit at the completion of the welding operation.
14. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for fording a stay wire, means for welding sald wires at points of intersection, comprising a pair of welding members, each of which is movable, a source of power, a power !nterrupter deviere, means controlled by one of sald members for operatI: g sitid power interrupter device to connect the power and nurans eontrolled by the other of said members for operating said power device to disconnect the power upon completion of the welding operation.
15. In combination with the co-operative elements of a wire fabric machine, means for feeding strand wires, means for feeding a stay wire, means for welding sald wires at polnts
of intersection, comprising a series of welding members, power device, an independent conncction between said power device and each of said members, a complemental opposed series of welding members, a power device and an independent connection between each of said members and said device, a source of power, means for connecting the latter with said power devices, an independent power interrupter for each pair of welding units and means controlled by said unit for automatically operating the power interrupter and disconnecting the unit from the power device upon the completion of the welding operation of that unlt.

\section*{No. 101,174. Staple Blank. Blanc de crampes.}

The Grecnfield Automatic Fastener Company, New York New York, U.S.A., 25th September, 1906; 6 years. Filed 14th August, 1906. Receipt No. 138,702.
Claim.-1. As an article of manufacture a staple blank or strip embracing a series of staples interconnected only at the lateral or side edges of the back of such blank or strip.
2. As an article of manufacture a staple blank or strip embracing a series of staples united together only at the angular portions between the legs and the backs thereof and separated from each other by oblong openings.
3. As an article of manufacture a staple blank or strip embracing completed staples integrally connected only at the angles between the legs and backs thereof.
4. As an article of manufacture a staple blank or strip embracing a series of staples separated from each other by spaces between the legs and oblong openings between the backs extending to points relatively near the lateral edges of the strip.

No. 101,175. Water Closet. Latrinc d cau.

The Duner Company, Chicago, assignce of John Charles Duner, Wheaton, Illinois, U.S.A., 25th September. 1906; 6 years. Filed 30th June, 1906. Receipt No. 137,427
Claim.-1. In a water closet the combination with a bowl and means for flushing the same, of a dumping pan embracing the outlet of said bowl and provided with a double bottom containing an insulating packing between the two layers of the bottom, substantlally as and for the purpose described
2. In a water closet. the combination of a supporting cas Ing 6, a detachable upper bowl 12 therein, a cover plate on the upper bowl, and operating means comprising means for operating the dumping pan, a flushing device and means
for operating the flushing device, all mounted upon the cover plate and removable from the supporting casing 6 with the owl 12.
3. In a water closet the combination with a bowl and a dumping pan and means for flushing said pan, of a casing and valve for admitting the flushing water having means for gradually closing the valve and continuing to inject water into the bowl after the valve has closed, substantially as described.
4. In a water closet a flushing valve consisting of a casing and a stem having a valve fixed thereon, and an auxiliary plunger mounted upon said stem and spring pressed in the casing and having a loose cup valve to admit and confine the water behind the same so that as the valve closes the plunger continues its movement to inject water from the casing into the cylinder, substantially as described.
5. In a water closet the combination with a bowl and a dumping pan, of a valve for introducing water to flush the bowl and means in the valve casing to continue the injection of water after the valve is closed, and a common handle to operate the pan and to manipulate the valve, substantially as and for the purposes set forth.
6. In a water closet a flushing valve comprising a casing having inlet and outlet passages, a poppet valve opening against the inflow of water therein, and a loose auxiliary cup plunger upon the valve stem and a spring to move it in the casing, and a bleed passage in the casing behind said plunger through which the water is caused to flow as the valve is closed, by the pressure of the plunger, substantially as described.
7. In a water closet a flushing valve comprising a cylinder having an inlet valve seat, a poppet valve opening against the incoming stream of water, an auxiliary plunger upon the stem of the valve and spring pressed to push it through the casing, a loosely fitting cup valve on the plunger and a regulable bleed passage for escape of the water behind said plunger and means for adjusting the throw of the valve plunger in operating the valve, substantially as described.
8. In a water closet the combination with a supporting casing 6, of a removable upper bowl 12 therein, a handle operating the dumping pan, a flushing valve, and means for operating the flushing valve, all carried upon a portion of the bowl and removable from the supporting cising 6 with the bowl, substantially as described.
9. In a water closet the combination with a bowl and a pumping pan, of a flushing valve, and a handle operating both the dumping pan and the flushing valve, means to return the pan and the valve to normal position, and an auxiliary plunger on the valve stem provided with means for causing the water to continue to flow as the valve is closed, to flush the pan after it is returned to normal position, substantially as described.
10. In a water closet the combination with a bowl and dumping pan, of a shaft attached to said pan for dumping the same, a lever arm and link for operating the shaft. means upon said latter shaft for reciprocating the flushing valve of the bowl, and means upon the flushing valve and spindle for regulating the flow of the valve, aud closing of the pan, and automatic means to continue the water flow after the operating means is released and the pan is closed, substantially as described.
11. In a water closet the combination with a pivoted dumping pan and a handle and connections for operating it, of a flushing valve forming an immediate inlet from the feed pipe to the pan actuated by means of the handle for dumping the pan, and an escapement hook on the handle engaging part of the dumping mechanism, whereby the link is dropped automatically at a predetermined polnt as the handle is raised, so that the valve may be held open after the pan is closed.
12. In a water closet a flushing valve therefor comprising a casing having a poppet valve opening towards the infowing stream of water, a separate chamber of the valve casing having a regulable bleed passage leading therefrom, a loose plunger mounted on the stem of the valve and provided with a spring to press it into said separate chamber, whereby the flow of water to said bleed passage is independent of the movement of the valve, substantially as described.
13. In a water closet the combination with a bowl having a circumferential groove for a stream of water and a dumping pan and flushing valve. of an injecting pipe emptying into the bowl groove at the side distant from the valve and having a squirt nozzle, and means in the flushing valve for continuing the flow of water through the squirt nozzle after the valve is closed and the pan is returned to place.
14. In a water closet the combination with a bowl and a dumping pan and means for returning the dumping pan to normal position, of a nozzle in the bowl adapted to introduce a stream in gyratory direction around sald bowl, and a flushing valve including a casing having an inlet valve therein and an auxiliary piston on the valve stem with a spring for
pressing it into the valve casing, and an escapement for liquid behind said piston to the nozzle, whereby the flow of the water through the nozzle into the bowl is continued after the valve is closed, substantially as and for the purpose described.
15. In a water closet the combination of a bowl having a circumferential groove around a top portion adapted to receive a gyratory stream of water, and an injection pipe lying therein and having a squirt nozzle at the end adapted to direct the stream of water to flow in gyratory direction in said groove and to be kept up by a centrifugal force, substantially as described.
16. In a water closet in combination, a bowl, a dumping pan, means for flushing the same, a valve, spring means to close the valve, and a fluid throttling device to retard the closing movement of the valve as it is operated by the spring.
17. In a water closet in combination, a bowl, a dumping pan and a flushing device having a valve for admitting water to flush the bowl, means for storing a portion of the water admitted, and means whereby such stored water is discharged into the bowl as the valve is closed.

No. 101,176. Water Closet. Latrines d eau.

Frederick W. Delanoy, Oakland, California, U.S.A., 25th September, 1906; 6 years. Filed 17th April, 1906. Recelpt No. 134,968.
Claim.-1. In a closet, a bowl having a trap, and a conical countersunk channel at the discharge end of the trap, a sleeve having the upper end diverged to substantially fit the countersunk channel, a gasket fitting between the upper end of the sleeve and the interior of the channel, and a screw-threaded lock nut turnable upon corresponding threads on the sleeve whereby the parts are locked and sealed.
2. In a water closet, a basin having a trap. with a terminal countersunk channel, a gasket fitting the channel, a tube or sleeve threaded upon the outer side having the upper end made divergent to fit the countersunk channel of the bowl discharge, a flanged gasket fitting the channel and enclosing the upper end of the sleeve, a threaded nut turnable upon the threads of the sleeve whereby the latter is drawn downward and the gasket compressed to form a joint.
3. In a water closet, a bowl, a trap, a discharge passage, a sleeve and means for forming a joint between the sleeve and the trap, a tube into which the lower end of the sleeve extends, said tube having a stuffing box and gland at the upper end whereby a movable joint is made around the sleeve.
4. In a closet, a bowl having a trap, a discharge, a sleeve and joint forming means between the sleeve and the trap, a tube in line with the sleeve having an annular flange through which the lower end of the sleeve extends, a stuffing box and gland forming a joint between the sleeve and the pipe screw threads formed upon the exterior of the pipe, and a threaded floor flange engaging said threads, whereby the pipe may be adjusted with relation to the floor.
5. In a closet, a basin having a trap, a metal sleeve, an interlocking disengageable joint formed between the upper end of the sleeve and the discharge end of the trap, a pipe in line with the sleeve having a stuffing box and gland through which a tight and adjustable joint of the sleeve is formed, a screw-threaded floor flange engaging corresponding threads upon the exterior of the pipe whereby the latter is adjustable with relation to the sleeve, and a soll pipe havIng a socket and joint forming devices at the junction of the two.
6. In a water closet having \(a^{\circ}\) trap and a terminal discharge, a sleeve and a detachable joint forming device between the sleeve and trap, a soll pipe in line with the sleeve, and an interposed plpe section forming a fixed joint with the soil pipe. and a slidably adjustable joint with the sleeve
7. In a water closet, a bowl and trap. a sleeve and joint forming means between the sleeve and the trap, a soll pipe connection, and a slidably adjustable joint betwren said connection and the sleeve, and an opening at the rear of the bowl and trap through which access may be had to the connecting joints.

No. 101,177. Water Closet. Latrincs à eau.

David Seaman Schureman, Rockford, Illinois, U.S.A., 25th September, 1906; 6 years. Filed 6th August, 1906. Receipt No. 138.440.
Claim.-1. In a water closet, the combination of a tank, a valve for the water inlet opening, a valve for the water discharge opening, a cam lever movable with the valve for the discharge and capable of opening the inlet valve, and a float having a connection with the cam lever
2. In a water closet the combination of a tank, a valve for the water inlet opening, a valve for the water discharge opening, means movable with the valve for the discharge opening for opening the inlet valve, sald means movable independent of the valve for the discharge opening, thereby permitting the closing of the inlet valve, and a float having a connection with said means.
3. In a water closet the combination of a tank, a valve for the water inlet opening supporting a roller at its lower end, a valve for the water discharge opening, a cam lever movoble with the valve for the discharge opening and a float having a connection with the link, sald cam lever capable of movement in engagement with the roller.

No. 101,178. Mattress Tufting Machine. Machine d garnir de toufies les matelas.

George Whitfield Bent, Hyde Park, Massachusetts, U.S.A. 25th September, 1906; 6 years. Flled 16th July, 1906. Receipt No. 137,869.
Claim.-1. In an apparatus of the character described in combination a bed or support for the mattress, a plurality of rows of needles co-operating therewith. a common carrier to which all of said needles are secured means for movlige said common needle carrier toward and from the said bed or support, and means for moving said bed or support latirally with relation to the path of movement of the ra. whstantlally as and for the purpose specified.
2. In an apparatus of the character described, a bed or support for the mattress provided on its upper surface with a plurality of compressing devices having a cavity for the reception of a tuft and provided with a slot extended substantially at right angles to the said cavity, a clamping member co-operating with the said bed to secure the mattress in operative position on said bed and provided on its lower surface with a plurality of compressing devices cooperating with the compressing device secured to the bed, means to secure said clamping member to said bed in its closed or operative position, a plurality of needles, a common carricr to which all of said needles are secured, means to move said carrier toward and from the said bed, and means to move the bed and its clamping member laterally with relation to the path of movement of the said needles, substantially as and for the purpose specifled.
3. In an apparatus of the character described in combination, a bed or support for the mattress and a needle carrier comprising side, end and intermediate bars, one of said parts being bodlly movable with relation to the other in a substantially vertical plane and the other of said parts being bodily movable laterally, and a plurality of rows of needles rigidly secured to the intermediate bars of said carrier, subsubstantially as described.
4. In an apparatus of the character described in combination, a bed or support for the mattress and a needle carrier, comprising side, end and intermediate bars, one of said parts being bodily movable with relation to the other, a plurality of rows of needles rigidly secured to the bars of said carrier, and means for effecting bodily movement of the bed laterally with relation to the needles, substantially as dnscribed.
5. In an apparatus of the character described in combination a bed or support for the mattress and a needle carrier, one of said parts being bodily movable laterally with relation to the other, and a plurality of rows of needles rigidly secured to said carrier, substantially as described.
6. In an apparatus of the character described in combination a bed or support for the mattress, a clamping device or nember bodily movable toward and from said bed or support, means to raise said clamping member away from said bed, said means comprising levers 40,41 and brace bars 44, and a handle 56 connecting the levers 40 , substantially as described.
7. In an apparatus of the character described in comblnation a bed or support for the mattress, compressing devices secured to said bed or support and each provided with a cavity for the reception of a tuft and a slot extended substantially at right angles to and beyond said cavity for the passage of a needle on opposite sides of said tuft, a clamping member co-operating with said bed, compressing devices secured to said clamping member and co-operating with the compressing devices on said bed, a common needle carrier, a plurality of needles rigidly secured thereto, means to move said carrier to cause all the needles to penetrate the mattress held between said compressing devices, and means to move said bed and clamping member laterally with relation to the path of movement of said needles, substantially as described.
8. In an apparatus of the class described in combination a bed or support for the mattress, a clamping member cooperating therewith, a substantially horizontal rock shaft. substantially vertical cranks or arms on said rock shaft in engagement with said bed, and a handle attached to said rock shaft to enable the said shaft to be rocked to effect bodily movement of said bed and clamping member, substantially as described.
9. In an apparatus of the class described in combination a bed or support for the mattress, and a common needle carrier, a plurality of rows of needles rigidly attached to sald common carrier, means to effect bodily movement of one of said parts laterally with relation to the other, and means to effect bodily movement of one of said parts in a direction substantially at right angles to said lateral movement, substantially as described.
10. The combination in a tufting machinn, of compression members for the mattress, each comprising a frame and a plurality of projuctions provided with openings, the said projections extending from opposing surfaces of said frame, one of said frames being movable toward and from the other, a plurality of rows of needles arranged to be passed through the openings in said projections. and means for producing a relative movement laterally between sald compressing members and nerdles. substantially as described.
11. In an apparatus of the class described, in combination. a bed or support for the mattress. a plurallty of ruws of recillos. one for \(\cdots\) h tuft of the completed mattress, cooperating with said support and arranged to penetrate the mattress at the points where it is to be tufted by bodily movement of one of said parts toward the other, means to effect said bodily movemenl, and means to offect movement
of one of said parts laterally with relation to the other, for the purpose specified.
12. In an apparatus of the character described, in combination, a bed or support for the mattress, a common needle carrier, one of said parts being bodily movable with relation to the other in a substantially vertical plane. and one of said parts being bodily movable laterally with relation to the other, and a plurality of of rows of needles, one for each tuft of the completed mattress, secured to said common carrier, substantially as and for the purpose specified.
13. In an apparatus of the class described, in combination, a bed or support upon which the mattress is placed; a plurality of rows of needles co-operating with said bed and arranged in penetrate the mattress at the different points over its surface where it is to be tufted, one of said parts being bodily movable laterally with relation to the other, and one of said parts being movable bodily substantially at right angles to said lateral movement, and means to clamp the mattress on its bed or support against movement thereon and to compress the same at the points where it is to be tufted, substantially as described.
14. The combination of a tufting machine, of a bed or support for the mattress, a plurality of compressing devices secured to said bed or support and arranged in rows over the surface thereof at the points where the mattress is to be tufted, a clamping member co-operating with said bed to firmly hold the mattress on said bed against movement thereon, a plurality of compressing devices secured to said clamping member and arranged in rows over the surface thereof to register with the compressing devices of the bed and thereby firmly compress the mattress on its opposite surfaces at the points where it is to be tufted, and a plurality of rows of needles one for each tuft co-operating with said bed or support and arranged to penetrate the mattress at the points under compression, substantially as described.

No. 101,179. Window Blind Fastener.
Attache de store de fenêtre.

Michael J. Coogan, Port Chester, New York, U.S.A., 25th September, 1906; 6 years. Filed 12th July, 1906. Receipt No. 137,743.
Claim.-1. In a window blind, a bar having pivotal connection with the upper and lower sets of slats, a crank shaft mounted to swing on the lower end of the blind and having a horizontal portion engaging in said bar, a handle on said crank shaft, and a spring yielding plate having channels on its outer face for recelving said handle.
2. In a window blind, a bar consisting of sections, the upper section being pivotally connected to the upper slats of the blind, while the lower section is pivoted to the lower slats of the blind, a metal plate connecting the sections and having a cut-away portion for recelving the parting strip of the blind, a plate secured to the lower end of the blind. a crank shaft mounted to swing in said plate and having pivotal connection with the lower section of said bar, a handle on said shaft, and a spring yielding plate having channels for receiving said handle.

\section*{No. 101,180. Couch. Canapé.}

John Frindale, Chicago, Illinois, U.S.A., 25th Septecber, 1906; 6 years. Filed 18 th June, 1906. Receipt No. 137.044.
olaim.-1. An article of furniture comprising a frame having
thereon a seat. a back rest mounted in said frame and adjustable to a plurality of different positions relatively of the seat, and means for clamping sald back rest in each of said positions of adjustment through pressure on said seat.
2. An article of furniture comprising a frame having thereon a seat, a back rest adjustable along said seat, and means whereby a downward pressure on the seat will secure said back rest against shifting.
3. In an article of furniture the combination of a frame, a seat on said frame, a back rest slldable in sald frame longi-
tudinally of the seat, said back rest having thereon a part opposed to said seat and adapted to be engaged thereby for

locking said back rest against movement when a downward pressure is exerted on the seat.
4. In an article of furniture the combination of a frame, a seat on said frame, a back rest slidable in said frame longitudinally of the seat, said back rest having thereon a part opnosed to said seat and adapted to be engaged thereby for locking said back rest against movement when the seat is occupied and a spring normally holding said seat out of contact with said part.
5. In an article of furniture the combination of a frame, a seat mounted in said frame, a spring supporting sald seat. a back rest adjustable along said seat and adapted to be engaged by said seat through the yielding of said spring when the seat is occupied and thereby lock said back against movement, said spring being adapted to lift the seat out of contact with said part and permit of adjusting said back. when the seat is not occupled.
6. In an article of furniture the combination of a horizontally disposed supporting frame, a seat-frame mounted on said supporting frame and adapted to be tilted at an angle thereto, a seat yleldingly suported on said seat frame, a back adjustable along said seat frame, a part secured to sald back adapted to receive the weight of said seat when occupied thereby locking said back against movement with respect to said seat and a spring normally urging said seat out of engagement with said part.
7. In an article of furniture the combination of a frame, a member mounted on said frame and adapted to be tilted at an angle thereto, a pair of racks secured at opposite sides of said member and disposed transversely thereof and in parallel relation to each other, said racks having teeth on relatively opposite edges thereof, a locking bar pivotally mounted between said racks and adapted to simultaneously engage corresponding teeth of each rack, a spring normally urging said bar into such engagement and a lever for releasing said bar to permit of angular adjustment of said member.
8. An article of furniture comprising a frame having thereon a seat and a back rest mounted in said frame and adapted to be tilted angularly of sald seat, said back rest comprising a support, having a horizontally disposed cross plece near the top, a plurality of vertically disposed springs secured to said cross plece, horizontal slats connecting said springs and a cushion mounted on said springs and being free from said support and adapted to bend to fit the back of an occupant through the yielding of said springs.
3. In an article of furniture the combination of a seat and a back rest comprising a frame adapted to be tilted angularly with respect to said seat. a horizontally disposed crosspiece rigidly secured near the top of said frame, a slat below said cross piece and connected therewith by one or more vertically disposed flat springs, a pluralty of slats below said first slat and parallel herewith, a plurality of verti(ally disposed fiat springs extending across and securing said slats together to form a yielding support said springs extending upwardly across said cross plece but being not directly connected thereto, and a cushion secured to said slats. all arranged to permit the lower end of the cushion to yield rearward and the upper end to yleld forward.

No. 101,181. Upholstery. Tapisscric

Edwin M. Hulse. Columbus, Ohio, U.S.A., 25th September, 1906; 6 years. Filed 16th July, 1906. Recelpt No. 137,859.
Claim.-1. In upholstery the combination with a spring work structure, of a top or dad therefor, a stiffening strip for the edge of said top or pad secured thereto independently of the spring work structure and metallic buttons or fastening devices constituting the means securing said strip to said edge.
2.The combination with a top or pad for application to upholster spring work, of a strip of stiff material provided with openings for the passage of fastening devices, and said fastening devices passed through said openings to secure the strip to the pad, said strip being adapted and arranged to fit next to and engage the wall of the spring work structure, substantially as described.
3. A pad for spring work upholstery comprising in combination a padded portion proper having a pliable under covering, a metallic stiffening strip provided with openings for the passage of fastening devices, fastening devices passed through said openings and securing said strip along the edge of the padded portion and a flexible fastening plece beyond the stiffening strip to secure the pad with reference to the spring work structure.
4. A pad for spring work upholstery comprising in combination a padded portion proper having a pliable under covering, a stiffening strip provided with openings secured along the edge of said padded portion in a position substantially at right angles to the plane of said padded portion and a flexible fastening piece beyond the stiffening strip to secure the pad with reference to the spring work structure.
5. The combination with a spring work structure including a frame as 7, of a pad for the spring work structure comprising a padded body proper having a pliable under covering, a stiffening strip at the edge thereof, a flexible fastening piece beyond the stiffening strip and fastening to said frame, said stiffening strip lying adjacent the corner of the wall of the spring work.
6. The combination with a spring work structure, of a pad for said structure comprising the padded body proper, a stiffening strip having holes therein along the edge of the body of the pad and staple-like fastening devices located end to end on said stiffening strip and having contiguous prongs passed through the same hole in said stiffening strip.

No. 101,182. Curtain Bracket. Console de rideau.

Willard Jones, Auburn, Maine, U.S.A., 25th September, 1906 ; 6 years. Filed 21st July, 1906. Receipt No. 138,016.
Claim.-1. The combination bracket comprising a base, prolonged supporting arms integral therewith, a roller shade
bracket struck from said base, a guide extending at right angles and integral with the base, said guide terminating at i:s outer end in a brace permanently secured to the base, said base and the parts integral therewith being formed in a single sheet of metal and a pole bracket adjustably mounted upon the guide.
2. The combination with a base having an integral guide struck thereform and terminating in a brace permanently secured to the base, of a pole and bracket adjustably mounted upon the gulde.
3. A combination bracket form in two pieces of sheet metal one of sald pieces comprising a base, angular pronged arms at one end of the base, a guide extending from between the arms and terminating in a brace and a shade roller bracket struck from the base, sald brace being permanently connected to the base adjacent the bracket and the other piece comprising a hooked slde and opositely disposed ears integral therewith and embracing the guide.

No. 101,183. Safety Deposit Receptacle.
Réceptacle de dépôt de sûreté.

Arabella A. Nees, New Orange, New Jersey, U.S.A., 25th September, 1906; 6 years. Filed 28th June, 1906. Receipt No. 137,371.
Claim.-The combination with a supporting board having keepers, of oppositely disposed latches or bolts controlling the terminals of an electric circuit and adapted to engage said keepers to lock a receptacle onto said supporting board. springs for holding sald latches in locked relation to said receptacle, a push button to release said latches from the receptacle and an electric alarm appliance and its battery conections and said terminals and controlled by said latches or bolts, substantially as set forth.

No. 101,184. Bed Spring. Sommier éalatinuc.

onas F. Dixon and Thomas J. Ridgway, both of Carthage Missouri, U.S.A., 25th September, 1906; 6 years. Filcd 7th June, 1906. Receipt No. 136,632.
Claim.-The combination with a spring element having its lower whorl provided with a terminal upstanding toe within the adjacent whorl, of a longitudinal intermediately kinked brace wire disposed above the whorl and in engagement with the toc, said wire being kinked to arch over the whorl and to bind the toed end of the element against the adjoining whorl to prevent lateral displacement and a normally straight spring brace wirc extending transversely over the
first-mentioned wire and under opposite portions of the whorl and exerting a constant upward tension upon said whorl to bind it upon the kinked wire, said lower whorl being disposed to hold in a plane parallel with the two wires.
No. 101,185. Bedistead. Bois de lit.

William A. Moore, Canton, Michigan, U.S.A., 25th September, 1906; 6 years. Filed 7th July, 1906. Receipt No. 137,603.
Claim.-1. In a bed bottom in combination, a frame having side posts at the middle thereof which stand upon the floor, a commode box and seat swingingly hung form the posts, a head section hinged to the box and adjustable to various angles.
2. A bed bottom comprising a irame, a cominode box supported therein and forming the middle section of the bottom, a head section hinged to the box and having means to support the same in an upright position and a loot section having a hinged part detachably engaged at one end to the box and hinged at its other end to the other part of the fook section and adapted to be swung down and away from the box.
3. A bed bottom comprising a frame having cleats at the head and foot and posts on each side at the middle, a commode box hung from said posts, a head section hinged to the tup of the box and adapted to rest upon the cleat at the head of the frame and a foot section formed of parts hinged together and resting upon the cleats at the foot of the frame and detachably connected to the box.

No. 101,186. Bed. Lit.

Walter B. Sterling. Wellsburg, West Virginia, U.S.A., 25th September, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,976.
Claim-1. A bed of the character described embodying tubular posts, end bars, side ralls, a revoluble shaft supported by said end bars, gear wheels loosely mounted upon said shaft, clutches carried by said shaft and adapted to engage sald gear wheels, an end frame slidably mounted in some of sald posts, a head frame slidably mounted in some of said posts, two-part hinged rails carried by said frames, depending racks carried by said frames and adapted to engage said gear wheels, means to maintain said two-part hinged rails in a horizontal position. and means to revolve sald shaft, substantially as described.
2. A bed of the character described embodying tubular posts. an end frame slidably mounted in some of sald posts, a had frame slidably mounted in the other of sald posts, twofart hinged rails connecting said frames, means to simultanrously raise said frames, and means to independently raise said frames, substantially as described.

No. 101,187. Bed Bottom. Fond de lit.

Gilbert Bezanger, Boston. Masschusetts, U.S.A., 25th September, 1906 ; 6 years. Filed 11th June, 1906. Receipt No. 136,787.
Claim.-1. A device of the class described comprising a frame having a section jointed thereto, and means for holding one end of said section in an elevated position.
2. A device of the class described comprising a trame having a section jointed thereto, and an adjustable support consisting of a double toggle adapted to hold sail section in a plurality of position.
3. A device of the class described comprising a frame havlng a jointed section, said section having a plurality op jointed members supported thereon, means for holling said scetion in a plurality of positions, and means for holding said members in a plurality of positions with reference to said section.
4. A device of the class described comprising a frame having a section jointed thereto. means for elevating the fren end of said section, a member supported upon said section and jointed thereto, a second member supported upon sald section and jointed to said first member, and means for elevating said members at the joint connecting the same.
5. A device of the class described comprising a frame hav ing a scction jointed thereto, said section comprising sldes and transverste bars, adjustable means for holding said section \(\ln\) a plurality of elevated positions, a member having flexible slate and supported upon said sides, said member further having a hinged connection with a transverse bar of said section, a second member having flexible slats sup ported upon said sides and jointed to said first member, and adjustable means for elevating the said members at the joint conncting them.
6. A device of the class described comprising a frame having a section jointed thereto at one end of the same, sais scction having sides, a longitudinal slat intermediate between said sides and transverse bars, a double toggle mounted at the free end of said section and adapted to support the same in a plurality of elevated positions, a plurality of jointed members having slats and transverse bars projecting beyond said sides and adapted to rest thereupon and upon said longitudinal slat, and means for elevating said members at the joints connecting them.
7. In a device of the class described, sections having slats and transverse bars adapted to rest upon a supporting frame. said sections having a hinged connection, a removable rod mounted upon the transverse bars near the ends thereof and near the end of one of said sections at an angle with the normal position of said member, said rod affording means for clevating said member, a block slidably mounted on the rod, said block being adapted to rest upon the supporting frame and to hold said member in a plurality of positions.
8. A device of the class described comprising a frame, a section having sides, a slat intermediate between said sides and transverse bars, one of said transverse bars being hinged to said frame, a transverse bar remote from said hinged bar having an upwardly projecting flange, a double toggle pivotally mounted upon said flange and having a bar tdapted to rest upon a support, said double toggle being adapted to hold the end of said section in a plurality of elevated positions, a plurality of hinged members having flexible slats and transverse bars adapted to rest upon said sides and said in termediate slat of sald section, one of said members having
a hinged connection with said section, a removable rod mounted upon the transverse bars of one of said members and at an angle with the normal horizontal position thereof, said rod affording means for the elevating of said member, and a slidable block upon sald rod having a curved extension adapted to rest upon the side of said section and to hold said member in a plurality of positions.

No. 101,188. Bed Bottom.
Fond de lit.

Gilbert Bezanger, assignce of John A. Stewart, both of Hallfax. Nova Scotia, Canada. 25th Srptember, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,912.
Claim.-1. A structure of the character specified comprising a frame, a plurality of flexible elastic bars assoclated therrwith, a head rest supporting the end of like portions of the bars, means for adjdsting the head rest to impart brlges to said portions, and means for adjusting fother like portions of said bars to also impart bulges thereto.
2. A structure of the character specifled comprising a frame, a plurality of flexible elastic bars associated therewith, and means for drawing the ends of the bars toward and from each other whereby to impart bulges to said bars.
3. A structure of the character specifled comprising a plurality of parallely disposed fiexible elastic bars, and means for drawing the ends of the bars toward and from each other whereby to impart bulges thereto.
4. A structure of the character specified comprising a frame, a connecting member for the sides thereof, a plurality of parallely disposed flexible elastic bars secured to sald member. and means for drawing the ends of the bars toward tach other whereby to impart bulges thereto.
5. A structure of the character speciffed comprising a frame having side strips and a member connecting the latter intermediate of their ends, a plurality of parallely disposed llexible elastir bars secured to said member. means for imparting bulges to portions of the bars at one side of said member, and means for also imparting bulges to the portions of the bars at the other sille of said member.
6. A structure of the charactor specified comprising a plurality of parallely disposed fiexible elastic bars, and means for imparting bulges thercto. said bars having a member connecting them together at rach of the ends thereof.
7. A structure of the character specified comprising a frame, a connecting memer for the sides thereof, a plurallty of parallely disposed flexible ciastic bars secured to sald member. and means for imparting bulges thereto, sald bars having a member connecting them together at each of the ends thereof.
8. \(\Lambda\) structure of the character specified comprising a frame having side strips and a member connecting the latter intermediate of their ends, a plurality of parallely disposed flexible elastic bars secured to said member, means for imparting bulg's to portions of the bars at one side of said mombor, and means for also imparting bulges to the portions of the bars at the other side of said member, said hars being connected together at each of the ends thereof.
9. A structure of the character sperified comprising a plurality of parallely disposed flexible rlastic bars. and means for imparting bulges thereto.: including a winding device.
10. A structure of the character specified comprising a plurality of parallely disposed flexible elastic bars. and mans for imparting bulg's thereto including a chain. a winding device therefor and a slidable rod having connection with the bars.
11. A structure of the character specified comprising a frame. a pluraliy of flexible elastic bars assoclated therewith,
a head rest supporting the ends of like portions of the bars. means for adjusting the head rest to impart bulges to said portions, and means for adjusting other like portions of said bars to also impart bulges thereto, said head rest embodying movably connected bars having bracket members.
12. A structure of the character specifled comprising a frame, a plurality of flexible elastic bars assoclated therewith, a head rest supporting the ends of like portions of the bars, means for acjusting the head rest to impart bulges to said portions. means for adjusting other like portions of sald bars to also impart bulges thereto. said first-named means embodying a screw, a plate movable up and down thereon and a pawl and ratchet for holding the screw in different positions.
13. A structure of the character specified comprising a plurality of parallely disposed flexible elastic bars, and means for imparting bulges thereto including a chain, a winding device therefor and a slidable rod having connection with the bars, said rod being provided with a guide pulley for said chain.
14. A structure of the character specifled comprising a frame having side strips and connecting strips therefor at the ends, one of said strips being provided with a vertical member having a bracket formed with a slot and having a branch, and the other with short strips, a plate having a pin projecting through said slot, movable arms supported by the plate and having inturned bracket members at one of their ends and formed with slots at the other ends thereof. pins extending through said slots from said vertical member, a strip connecting said bars at one end and resting uponsaid bracket members. still another strip connecting said bars at the other end and slidable on the side strips and said short strips, and means for imparting bulges to said bars.
15. A structure of the character specifled comprising a frame having side strips and connecting strips therefor at the ends, one of sald etrips being provided with a vertical member having a bracket formed with a slot and having a branch and the other with short strips, a plate having a pin projecting through said slot, movable arms supported by the nlate and having inturned bracket members at one of their ends and formed with slots at the other ends thereof, pins extending through said slots from said vertical member, a strip connecting said bars at one end and resting upon said bracket members. still another strip connecting said bars at the other end and slidable on the side strips and said short strips, and mrans for imparting bulges to said bars, embodying a slidable bar having diverging members having connection with the flexible elastic bars at one of their ends.

No. 101,189. Fence Post. Poteau de clôture.

Thomas Patterson, Henry Buckel and James Pitt Mabee, each an assignce of a third interest, all of Toronto, Ontario, Canada, 25th September, 1906; 6 years. Filed 27th July. 1906. Receipt No. 138,213.
Claim.-1. In a fence post the combination with the post, of the top and bottom encompassing brackets provided with lugs. a brace bracket and a base extending between the base bracket and one of the lugs, and a rod adjustably connected at one end to the base bracket and at the other end to one of the lugs of the lowermost bracket, as and for the purpose specified.
2. In a fence post the combination with the tubular post. of the top and bottom divided encompassing brackets provided with lugs, and bolts for clamping the brackets on the post. and supplemental lugs carrying pins for supporting or forming part of the hinges of the gate, as and for the purpose specified.
3. In a fence nost the combination with the tubular post. of the top bracket suitably supported thereon and provided with a lug, and the bottom bracket provided with a lug. a base ground plate provided with lugs, a double brace ex tending between the lug on the upper bracket and the lugs on the lower bracket and bolted thereto, and a rod having a hooked end extending into a lug in the lowermost bracket and the other end extending through the lug of the base bracket and adjustably held thereln, as and for the purpose snecified.
4. In a fence post the combination with the base and concrete ground socket, of the upper and lower brackets secured to the base, the concrete base block for the brace, the base plate located thereon, the double brace extending between the base plate and the upper bracket, and the rod connected to the lower bracket and adjustably connected to the intermediate lug of the base plate, as and for the purpose snecified.

No. 101,190. Cork Extractor. Tirc-bouchon.

Walter Frederick Goodnough, New York City, New York, assignee of Harry William Noyes, New Haven, Connecticut, U.S.A., 25th September, 1906 ; 6 years. Filed 15th June, 1906. Receipt No. 136,922.
Cluim.-1. A cork extractor comprising a loop-like handle having substantially parallel sides contracted at their outer ends, a cork screw pivoted between the said outer ends and adapted to foid into the handle, and a plate pivoted to one end betpeen the sides of the said handle within the loop. said plate corresponding in width to the width of said loop and formed on opposite sides with ears adanted to bear on opposite edges of the loop and form a fulcrum to bear upon the neck of the bottle.
2. A cork extractor comprising a loop-like handle havIng substantially parallel sides contracted at their outer ends, a cork screw pivoted between sald outer ends and adapted to fold into the handle, and a plate pivoted at one end between the sides of the said handle within the loop, said plate corresponding in width to the width of the loop and transversely bowed and formed on opposite sides with bowed ears adapted to bear upon opposite edges of the lood when in a closed position and to form a fulcrum adapted to bear upon the neck of the bottle, substantially as described.

\section*{No. 101,191. Method of Forming Woven. Pile Fabrics. \\ Méthode de faire des tissus à poils fins.}

Nazar Costikyan, assignee of James Karmi Dalkranian, both of New York City, New York, U.S.A., 25th September, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,824.
Claim.-1. The herein described method for forming woven pile fabrics having Persian knots, consisting in passing the pile thread in the same direction twice between the warp threads and shifting the warp threads laterally.
2. The herein described method for forming woven pile fabrics having Persian knots, consisting in passing the pile thread supported at one end between the warp threads, shifting the warp threads laterally and passing the supported end of the pile thread between the warp threads.
3. The herein described method for forming woven pile fabrics having Persian knots, consisting in passing the pile thread supported at one end between crossed warp threads, then uncrossing the ground warp threads and passing the supported end of the pile thread between the uncrossed warp threads.
4. The herein described method for forming woven pile fabrics having Persian knots, consisting in passing the pile

thread supported at one end between the warp threads. shifting the warp threads laterally, passing the supported end of the pile thread between the warp threads, and then cutting off the supported end of the plle thread.
5. The herein described method for forming woven pile fabrics having Persian knots, consisting in passing the pile thread supported at one end between crossed warp threads, then uncrossing the ground warp threads and passing the supported end of the pile thread between the uncrossed warp threads and then cutting off the supported end of the pile thread.
6. The herein described method for forming woven pile fabrics having Persian knots, consisting in alternately crossing and uncrossing a pair of warp threads and passing a pile thread twice in the same direction between the said warp threads, that is, once while the warp threads are in a crossed condition and a second time while the warp threads are in an uncrossed position.
7. The herein described method for forming woven pile fabrics having Persian knots, consisting in passing one end of a pile thread between a pair of warp threads, shifting the warp threads laterally and then passing that portion of the pile thread which is to form the other end between the warp threads.
8. The herein described method for forming woven pile fabrics having Persian knots, consisting in passing one end of a pile thread between a pair of crossed ground warp threads into an uncrossed position and passing the other end of the pile thread between the uncrossed ground warp threads.
9. The herein described method for forming woven pile fabrics having Persian knots. conslsting in crossing the ground warp threads of a pair of ground warp threads, inserting a pile thread between the crossed ground warp threads, uncrossing the ground warp threads. and passing one end of the pile thread between the uncrossed ground warp threads.
10. The herein described method for forming woven pile fabrics having Persian knots, consisting in extending a pile thread between a pair of crossed ground warp threads at angles thereto, uncrossing the ground warp threads, and passing one end of the plle thread between the ground warp threads to completely loop a portion of the pile thread around one of the ground warp threads.
11. The herein described method for forming woven pile fabrics having Persian knots, consisting in alternately crossing and uncrossing a pair of ground warp threads. with a pile thread between the ground warp threads to bring each end of the pile thread to the outside of the corresponding ground warp thread, and then passing one end of the pile thread between the ground warp threads.
12. The herein described method for forming woven pile fabrics having Persian knots. consisting in uncrossing a pair of crossed ground warp threads having a pile thread between them to extend the ends in onposite directions on the outside of the ground warp threads, and then passing one end of the pile thread between the uncrossed ground warp threads, and in the direction of the other end of the pile thread.
13. The herein described method for forming woven pile fabrics having Persian knots, consisting in crossing a pair of ground warp threads, passing a plle thrrad between the
ground warp threads of the said pair of ground warp threads and at angles thereto, uncrossing the said ground warp threads, and passing one end of the pile thread between the ground warp threads of the said pair of ground warp threads and in the same direction in which the pile thread was first passed between the ground warp threads.
14. The herein described method for forming woven plle fabrics having Persian knots, consisting in crossing a pair of ground warp threads, then passing a pile thread between 'he ground warp threads of the said pair of ground warp threads, one end of the pile thread being loose and the other being supported, then uncrossing the ground warp threads, and passing the supported end between the uncrossed ground warp threads.
15. The herein described method for forming woven pile fabrics having Persian knots, consisting in crossing a pair of grannd warp threads, then passing a pile thread between the ground warp threads of the said pair of ground wiarp threads, ont end of the pile thread being loose and the other being supported, then uncrossing the ground warp threads, passing the supported end between the uncrossed ground warp threads, and finally cutting the supported end of the pile thread.
16. The herein described method for forming woven pile fabrics having Persian knots, consisting in crossing a pair of ground warp threads passing a pile thread between the ground warp threads of the said pair of ground warp threads and at angles thereto, uncrossing the said ground warp threads, passing one end of the plle thread between the ground warp threads of the said pair of ground warp threads and in the same direction in which the pile thread was first passed between the ground warp threads and interweaving a plurality of weft threads with the said ground warp threads.
17. The herein described method for forming woven plle fabrics having Persian knots, consisting in crossing a pair of ground warp threads, passing a pilc thread between the ground warp threads of the sald pair of ground warp threads adjacent to the crossing and at angles to the ground warp threads, uncrossing the said ground warp threads, and passing one end of the plle thread between the ground warp. threads of the said pair of ground warp threads and in the same direction in which the pile thread was passed between the ground warp threads.

No. 101,192. Electric Smelting. Fonderic ílectrique.

La Soclété Electro-Metallurgique Francaise Froges, Isere, assignee of Paul Louls Toussaint Heroult, La Praz, Savoic, both in France, 25th September, 1306 ; 6 years. Filed sth June, 1906. Receipt No. 136,709.
Claim.-1. In the smelting of iron ore in an electric furnace having an electrode from which the current passes to the base of the furnace, the process which consists in feeding a charge of ore and carbon in such proportion that the carbon forms a magma below the electrode and the ore is fused above the column and is reduced in passing therethrough and the molten iron collects at the bottom, and adding lime to the charge in quantities sufficlent to form a scale of desired thickness at the sides of such column, diminishing the cross section of the column and thus concentrating the energy of the current through such cross section. and raising the electrode so as to increase the length of the column and to increase the rate of reduction.
2. In the smelting of iron ore in an electric furnace, the process of restricting the cross section of the zone of fusion which consists in introducing with the charge a sufficient quantity of the most refractory material thereof to form a srate of desired thickness.
3. In the smelting of ore in an clectric furnace, the procoss of restricting the cross section of the zone of fusion which consis:s in introducing with the charge a refractory matrial in sufficient quantity to form a scale of desired thichaess on the walls of the furnace.
4. The process of smelting in an electric furnace which minsits in maintaining a column of carbon between the electroles and through which the molten material passes and varying the length of sald column.
5. The process of regulating the operation of an electric furnace which consists in forming a scale on the walls of the furnace and varying the thickness of such scale.
6. The process of regulating the operation of an electric furnace which consists in varying the cross section of the zone of fusion.
7. In the smelting of iron ore in an electric furnace, the process of varying the quality of the product which consists in introducing with the charge a varying quantity of lime in excess of that required by the slag.
8. In the smelting of iron ore in an electric furnace, the process of varying the quality of the product which consists in introducing with the charge a varying quantity of refractory material to form a scale of varying thickness upon the sides of the crucible.

No. 101,193. Ground Anchor. Ancre.

William J. Gallagher, Detroit, Michigan, U.S.A., 25th September, 1906; 6 years. Filed 26th July, 1906. Receipt No. 138,180.
Claim.-1. A ground anchor consisting of blades pivoted together and a craft rod attached to sald blades at their pivot.
2. A ground anchor consisting of blades pivoted together and formed with shoulders at one side of the pivot to limit the turning of said blades, and a drait rod attached to the blades and extending from the opposite side of said pivot.
3. A ground anchor consisting of blades, ears on sald blades at the adjacent ends thereof projecting from one side of said blades and sald ends forming abutting shoulders to limit the turning of the blades, a bolt extending through said ears to pivotally connect said blades and a draft rod attached to said bolt.
4. In a ground anchor the combination of blades together forming a concave convex anchor plate having oppositely curved outer ends, ears projecting from the concave side of said blades near their adjacent ends, a pivot bolt extending through said ears, stops formed by the abutting ends of the blades and a draft rod attached to the bolt between sald ears.
5. In a ground anchor the combination of blades pivoted together at their adjacent ends, a draft rod attached to said blades at their pivot, and means attached to sald blades and engaging said rod to hold said blades and rod in a certain relation to each other.
6. In a ground anchor the combination of blades pivoted together at the adjacent ends, a draft rod attached to said blades at their pivot, and means connecting said blades to prevent one from turning independently of the other.
7. In a ground anchor the combination of blades pivoted together, the yielding means interposed between said blades to normally hold the same extended in opposite directions.
8. In a ground anchor the combination of blades pivoted together, and yielding means attached to sald blades and adapted to resist the turning of said blades toward each other.
9. In a ground anchor the combination with blades pivoted logether. of a draft rod, a spring lonp attached at its ends i) the blades and slidingly engaging the rod intermediate its ends.
10. In a ground anchor the combination of blades having ears, a pivot bolt extending through said ears to pivotally connect the blades, a draft rod attached to sald bolt, and a spring loop attached at its ends to the blades and slidingly engaging the rod intermediate its ends.
11. In a ground anchor the combination of blades having ears extending from one side thereof near one end and said ends forming shoulders, a pivot bolt extending through said ears, a draft rod having a loop at one end to engage said bolt teeth on the outer ends of said blades, and a spring loop attached to the rod intermediate its ends to slide thereon and pivotally attached at its ends to the blades.
12. In a ground anchor the combination of concavo-convex blades the inner ends of which form abutting shoulders and having outwardly curved outer ends formed with teeth, ears extending from the concave side of the blades, a pivot bolt extending through said ears, a draft rod having a loop through which said bolt extends, a spring loop pivotally attached at its ends to the blades intermediate their ends at their concave sides, and means for securing the loop intermediate its ends to said draft rod to slide longitudinally of suid rod.

No. 101,194. Pipe. Tuyau.

Ryerson D. Gates; Oak Park, Illinois. U.S.A, 25th September, 1906; 6 years. Filed 3rd July, 1906. Rece:pt No. 137,482.
Claim.-1. In a pipe the combination of a tobacco receptacle having a tubular portion, a stem leading from said receptacle and a platform slidingly mounted in the tubular portion of said receptacle for being raised and lowered therein, said receptacle being open at the bottom whereby the user may have direct access to sald platform for elevating it with his thumb or finger.
2. In a pipe the combination of a tobacco receptacle having a tubular portion, a stem leading from said receptacle and a platform slidingly mounted in the tubular portion of the receptacle for being raised and lowered therein, said receptacle teing open at the bottom for affording direct access to said piatiorm from beneath and said platform having vertically extended sides of a height approximately equal to the radius of the receptacle whereby all the necessary guiding effect is inherent in the platform itself.
3. In a pipe the combination of a tobacco receptacle having a tubular portion which is open at the bottom, a platform slidingly mounted in the tubular portion of said receptacle for being raised and lowered therein, a stem leading from the side of sald receptacle and a trap located at the foot of said stem, all substantially as shown and described.

\section*{No. 101,195. Tobacco Pipe Cleaner.} Nettoyeur de pipe \(d\) tabac.
Alexander Marr, West Norwood, near Manchester, England, 25th September, 1906; 6 years. Filed 28th July, 1906. Receipt No. 138,238.
Claim.-1. An apparatus for cleaning a tobacco pipe, comprising in combination a continuous air exhausting device and a nozzle communicating with the contlinuous air exhausting device and so formed that the bowl or other part of the pipe may make an air tight joint therein or thereon, substantially as described.
2. An apparatus for cleaning a tobacco pipe, comprising in combination a water jet ejector and a nozzle communicating therewith and so formed that the bowl or other part of the pipe may make an air tight joint therein or thereon, substantially as described.
3. An apparatus for cleaning a tobacco plpe, comprising in combination a water jet ejector. a nozzle communicating therewith and so formed that the bowl or other part of the pipe may make an air tight joint therein or thereon, and a water supply control valve, substantially as described.
4. An apparatus for cleaning a tobacco plpe, comprising in combination a water jet ejector, a nozzle communicating 2-31
therewith and so formed that the bowl or other part of the pipe may make an air tight joint therein or thereon, and

a water supply control valve operable by pressure upon the nozzle, substantially as described.
5. An apparatus for cleaning a tobacco plpe, comprising in combination a continuous air exhausting device, a nozzle communicating therewith and so formed that the bowl or other part of the pipe may make an air tight joint therein or thereon, and a receptacle for a cleansing substance into which may dip the end of the pipe which is not applied to the nozzle, substantially as hereinbefore described. 6. An apparatus for cleaning a tobacco pipe, comprising in combination a water jet ejector, a nozzle communicating therewith and so formed that the bowl or other part of the pipe may make an air tlght joint therein or thercon, and a receptacle for a cleansing substance into which may dip the end of the plpe which is not applied to the nozzle, substantially as described.

No. 101,196. Cramp Plate. Plaque.

Peter Paxton Kee, Brandon, Manitoba, Canada, 25th September, 1906; 6 years. Filed 6th July, 1906. Receipt No. 137,571
Claim.-1. A cramp plate comprising a rounded bent portion, and having a slot at a right angle to its length, and having flanges on its opposite sides.
2. A cramp plate comprising a plate having a rounded channel central portion. and having a slot at a right angle to its length, and having flanges provided with rounded corners on its opposite sides.
3. A cramp plate comprising a rounded bent portion, and having a slot at a right angle to its length, and having flanges on its opposite sides bent at an angle of 45 degrees to the plate.

\section*{No. 101,197. Gate. Barridre.}

John Marcus Millican, Brazos, Texas. U.S.A., 25th September. 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,013.
claim.-The combination with a swinging gate and a slidable latch mounted thereon, of a latch post. a latch supporting pin extending horizontally from the post, a lower pin extending horizontally from the post and in vertical alignment with the latch supporting pin, a keeper centrally fulcrumed upon the latch supporting pin and tapered toward its ends,
said keeper when the gate is closed being disposed at right angles thereto and its ends adapted to swing in a vertical
2. A thread guide having its shank turned back along itself, a clamping pate provided with a rounded projection

plane, there being a rectangular notch in the upper surface of the keeper constituting a seat adapted to snugly receive the latch, a coll pivotally mounted on the lower pin and spring loops diverging upwardly from the coil and bearing upon the keeper adjacent its ends to hold the notch normally in vertical alignment with the pins.

No. 101,198. Thread Guide. Guide-fl.

Isaac Emerson Palmer, Middleton, Connecticut, U.S.A., 25th September, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,099.
Claim.-1. A thread guide having an opening in its shank. a bearing plate or washer provided with a projection on its face extending into the opening in the shank, and means for securing the guide in position in the desired longitudinal and swinging adjustment.
2. A thread guide support, a thread guide having its shank back along itself to form a loop, a fastening device passing through the loop and leaving the guide free to be adjusted bodily thereon in a longitudinal and swinging direction. and a bearing plate or washer interposed between the thread guide and its support and provided with a projection extending between the sides of the loop.
3. A thread guide comprising a wire having a return bend in its shank, a washer froming a bearing for the shank and provided with a lug struck up from its face in position to engage the said return bend, a clamping plate and a screw for forcing the clamping plate toward the washer to lock the guide in position.

\section*{No. 101,199. Thread Guide. Gillidr-fl.}
isaac Emerson Palmer, Middleton. Connecticut. U.S.A., 25th September, 1906; 6 years. Filed 23rd July, 1906. Rereipt No. 138.100.
Claim.-1. A thread guide having its shank turned back along itsolf, a clamping plate provided with a projection -rhaging the parts of the crank, and means for fastening the clamping plate to the finger board.

adapted to engage the parts of the shank of the guide and means for fastening the clamping plate to the finger board.

No. 101,200. Greel. Panier.

Isaac E. Palmer, Middleton, Connecticut, U.S.A., 25th September, \(1906 ; 6\) years. Filed 23rd July, 1906. Recelpt No. 138,101.
Claim.-1. A creel comprising racks set at an angle to each other, spool carrying bars pivotally secured to the racks, and means for swinging a spool carrying bar from a position for holding the spools directed outwardly from the rack to a position for holding the spools directed inwardly from the rack.
2. A creel comprising racks set at an angle to each other. spool carrying bars pivotally secured to the racks, and means for simultaneously rocking the several spool carrying bars of a rack from a position to present the spools cutwardly from the rack into a position to present the spools inwardly from the rack.
3. A creel comprising racks set at an angle to each other, spindle bars provided with socket pieces at their opposite ends plvotally secured in series between the top and bottom of the rack, arms leading from the socket pleces and a bar connected with several arms for rocking the spindle bars.
4. A creel comprising racks set at an angle to each other, series of spindle carrying bars pivotally secured between the bottoms and tops of the racks, means for simultaneously rocking the spindle carrying bars of a rack and a stop for limiting the swinging movement of the bars both outwardly and inwardly.
5. A creel comprising racks set at an angle to each other, spindle carrying bars pivotally secured to the racks, arms projecting laterally from the spindle carrying bars at the top and bottom, rods connecting the sald arms to form guides for the yarn or thread, and means for swinging the said spindle carrying bars together with the guide rods and thereby maintaining the tension on the yarn or threads.

\section*{No. 101,201. Grid for Openerm, Bontchers, Etc.}

\section*{Porte pour ouvertures, tillottes, etc.}

Robert Schaellibaum, Providence, Rhode Island, U.S.A., 25th September, 1906: 6 years. Filed 9th June, 1906. Receipt No. 136.747.
Claim.-1. In an opener, scutcher and the like machine, a grid in combination with a comb, the said grid comprising bars each of which has a lateral projection \(V\)-shaped at its free end and terminating at the back in a shoulder, the said projection forming the working edge, all substantially as and for the purpose set forth.
2. In an opener, scutcher and the like machine, grid bars each of which has a lateral projecting \(V\)-shaped at its free

end and terminating at the back in a shoulder, segmental brackets engaging the ends of the said bars, projections on the said brackets between the said bars supporting them at the said shoulder and means jointly engaging the outer edges of the said bars and capable of circular adjustment, all substantially as and for the purpose set forth.
3. In an opener, scutcher and the like machine, a comb having a pin foundation with corrugations in each side and rows of pins secured into every alternate side of each corrugation to pass through two opposite sides thereof, substantially as and for the purpose set forth.

\section*{No. 101,202. Loom Machinery.}

Machine pour métiers.

William J. Stewart, Webster, Massachusetts, U.S.A., 25th September, 1906; 6 years. Flled 11th June, 1906. Receipt No. 136,775.
Claim.-1. A thin place detector for looms comprising a feeler bearing on the cloth so as to change its position in case of derangement of flling, a throw-out for stopping the loom, an electro-magnet and armature attached to control the action of the throw-out, and an electric circuit connected to the magnet and to be opened and closed by the feeler.
2. A thin place detector for looms comprising a feeler bearing on the cloth so as to change its position in case of derangement of filling, a throw-out for stopping the loom. an electro-magnet and armature attached to control the action of the throw-out, an electric circuit connected to the magnet and to be opened and closed by the feeler, and a switch in said circuit which is opened when the loom is thrown out of operation.
3. A thin place detector for looms comprising a feeler bearing on the cloth so as to change its position in case of derangement of fllling, a controlling handle for the loom, a throw-out for stopping the loom, an electro-magnet and armature attached to control the action of the throw-out, an electric circuit connected to the magnet and to be opened and closed by the feeler, and a switch controlled by the starting handle.
4. The combination of a loom, a feeler arranged thereon so as to engage the loom temple and normally held out of engagement therewith by the flling in the cloth, a throw-out for stopping the loom, an electro-magnet and armature attached to control the action of the throw-out, and an electric circuit connected to the magnet to be closed and opened by the feeler engaging and disengaging the loom temple.
5. A thin place detector for looms comprising a feeler bearing on the cloth so as to change its position in case of derangement of filling, a throw-out for stopping the loom, a dog pivoted on the throw-out, a bunter carried by the lathe, an electro-magnet, an armature connected to the pivited dog, and an electric circuit connected to the magnet to be opened and closed by the feeler.
6. A thin place detector for looms comprising a feeler bearing on the cloth so as to change its position in case of derangement of filling, a throw-out for stopping the loom, a controlling handle, an electro-magnet and armature attached to control the action of the throw-out, an electric circuit connected to the magnet and to be opened and closed by the feeler, and a switch in said circuit comprising a slotted pivoted arm which the controlling handle engages.
7. A thin place detector for looms comprising an insulated bearing carried by the looms, a feeler pivoted on the insulated bearing and bearing on the cloth so as to change its position in case of derangement of filling, a throw-out for stopping the loom, an electro-magnet and armature attached to control the action of the throw-out, and an electric circuit connected to the magnet to be opened and closed by the feeler.

\section*{No. 101,203. Apparatug for Draving Ont Blectric Ares.}

Appareil pour le tirage des arcs-électriques.

Johan J. Thoresen, Christiania, and Filip Tharaldsen, Meraker, near Trondhjeur, both in Norway, 25 th September, 1906 ; 6 years. Filed 5th June, 1906. Receipt No. 136,571.

Claim.-1. The improvement in deviating electric arcs or electric discharges as hereinbefore described which consists in producing such deviation by means of a rotary magnetic fleld, the electrodes being parallel to the axis of rotation and the fleld perpendicular thereto, for the purpose specifed.
2. The method or process of deviation of electric arcs or electric discharges, which consists in producing such deviation by means of rotary magnetic fluid, in the manner that electrodes in pairs producing the said arcs are placed parallel to the axis of rotation between two cylindric iron cores and perpendicular to the said rotating magnetic field, in order to obtain cylindric surfaces of arcs for the purpose specified.
3. The method or process of deviation of electric arcs or electric discharges, which consists in producing such deviation by means of a rotary magnetic field, the electrodes being placed parallel to the axis of rotation both the field as well as the arc being suppl!ed with alternating current or with current induced by the rotary fleld, or from a separate transformer, or from a source of direct current as hereinbefore described with reference to figures 1, 2, 3 and 4 of the annexed drawings.
4. The method or process of deviation of electric arcs or electric discharges which consists in producing such deviation by means of a rotary magnetic field in the manner that une or more pairs of electrodes producing sald arcs are placed between iron cores parallel to the axis of rotation and perpendicular to said rotary magnetic field, said electrodes connected in series with the coils producing the magnetic field. such coils being fed either with alternating or with direct current.
5. The method or process of deviation of electric arcs or electric discharges, which consists in producing such devi-
ation by means of a rotary magnetic fleld in the manner that one or more pairs of electrodes producing said arcs are placed parallel to the axis of rotation between iron cores and perpendicular to said rotary magnetic fleld, the latter being directly connected to the source of power and fed with direct current as described with reference to figure 5 of the annexed drawings, the arcs being fed from the induced current on the circular iron core.
6. Apparatus to be used in the chemical decomposition and combination of gases by means of electric arcs or discharges deviated by means of a rotary magnetic fleld in the manner that pairs of electrodes producing said ares are placed parallel to the axis of rotation between circular iron cores and perpendicular to the said magnetic fleld, said pairs of electrodes arranged at suitable intervals forming circular rows, the primary and secondary cores mounted on circular concentric walls having apertures for the inlet and outlet of the gases and being separated from the electrodes by means of partition walls of fireproof insulating material, the wall on the inlet side being perforated directly opposite the arcs, substantlally as shown and described.
No. 101,204. Acetylene Machine. Machine d acétylènc.

Arthur E. Blanchard, Toronto, Ontario. Canada, 25th September, 1906; 6 years. Filed 6th November, 1905. Receipt No. 129,834.
Claim.-1. In an acetylene generator the combination of a generating chamber, a superimposed gasometer chamber, a carbide feed chamber communicating with the generating chamber and extending up through the gasometer chamber, and a bell-shaped cover for the carbide feed chamber dipping down into the gasometer chamber, substantially as described.
2. In an acetylene generator the combination of a carbide holder having a discharge aperture in its bottom, a valve controlling said aperture, a stem extending up from said valve. a cover sultably supported over the valve and a tubular guide for the stem extending up from the cover and closed at its upper end, substantially, as described.
3. In an acetylene generator the combination of a carbide holder having a discharge aperture in its bottom, a valve controlling sald aperture, a rod adapted to operate the valve, a gasometer, a rod vertically fournalled on the gasometer, a projection on the rod adapted to engage the valve operating rod, a cap for the carbide chamber and a bent end on the gasometer rod which when the projection is in engagement with the valve operating rod lies over the cap but which may be swung to one side to free the cap and disengage the rods, substantially as described.
4. In an acetylene gas generator the combination of a generating chamber, a superimposed gasometer chamber, a surge box located in the bottom of the gasometer chamber, a pipe extending from the bottom of the surge box into the generating chamber to a point below the water level in the same, and a pipe leading from the upper part of the surge box to the atmosphere, substantially as described.
5. In an acetylenc generator the combination of a generating chamber, a superimposed gasometer chamber, a surge box located in the bottom of the gasometer chamber, a pipe extending from the bottom of the surge box into the generating chamber to a point below the water level in the same. a guard plate suitably held below the mouth of the said pipe, and a pipe leading from the upper part of the surge box to the atmosphere. substantially as described.
6. In an acetylene generator the combination of a generating chamber, a superimnosed gasometer chamber, a surge box located in the botten of the gasometer chamber. a pipe extending from the botiom of the surge box into the genvrating chamber to a point below the water level in the same, a pipe leading frum the upper part of the surge box to thi atmosphere, a gasometer in the gasometer chamber. a hlow-off pipe extending from the surge box up into the
gas space within the gasometer, a tube or cover flxed to the gasometer and extending down about the upper end of the blow-off pipe, and a trapped pipe leading from the gas space of the gasometer into the interior of the said pipe or cover, substantially as described.
7. In an acetylene gencrator the combination of a gasometer chamber, a gasometer therein, a blow-off pipe exlending from the gas space of the gasometer down and out through the gasometer chamber, a tube or cover fixed to the gasometer and extending down about the upper end of the blowoff pipe, and a trapped pipe leading from the gas space of the gasometer into the interior of the said pipe or cover, substantially as described.
\&. In an acetylene generator the combination of a generating chamber, a superimposed gasometer, a plpe connecting the two and extending up to the water level in the gasometer chamber and a trapped overflow for the generator chamber, substantially as described.
9. In an acetylene generator the combination of a generating chamber, a superimposed gasometer, a pipe connecting the two and extending up to the water level in the gasometer chamber and below the water level in the generating chamber and a trapped overflow for the generator chamber, substantially as described.
10. In an acetylene generator the combination of a generatling chamber, a superimposed gasometer, a plpe connecting the two and extending up to the water level in the gasometer chamber, a trapped overfiow for the generator chamber, a cover for the gasometer chamber and a funnel formed therein, substantially as described.
11. In an acetylene generator the combination of a generating chamber, a sludge outlet connection communicating therewith at the bottom and having a sludge outlet therein, a tube communicating with the connection and extending up therefrom, a plug closing the outlet, a rod connected to the plug and extending up through the tube, a sleeve surrounding the rod, and an agitator connected to the lower end of the sleeve, substantially as described.
12. In an acetylene generator the combination of a gasometer chamber, a gasometer therein, a blow-off plpe extending from the gas space of the gasometer down and out through the gasometer chamber, a tube or cover fixed to the gasometer and extending down about the upper end of the blow-off plpe, a trapped pipe leading from the gas space of the gasometer into the interior of the said pipe or cover, an external pipe connccting the gas space of the gasometer with the top of the cover tube and a cock in the said pipe, substantially as described.
\(1^{1} 3\). In an acetylene generator the combination of a generating chamber, a superimposed gasometer chamber, a carbide feed chamber communicating with the generating chamber and extending up through the gasometer chamber, an annular flange of greater diameter than the opening of the carbide feed chamber secured to the bottom of the gasometer chamber and extending down below the water level in the generator chamber, substantially as described.

\section*{No. 101,205. Acetylene Gas Machine.}

Machine d gaz acétylène.

Frederick P. Cave, Los Angeles, California, U.S.A., 25th September, 1906 ; 6 years. Filed 11th July, 1906. Receipt No. 137,732.
Claim.-1. In an acetylene gas machine, a water tank, a gas bell vertically movable therein, guides for said gas bell, \(a\) carbide hopper upon the top of the bell and having a delivery tube projecting into the bell, a tubular valve having an npen top, a port in the side thereof and a closed bottom vertically movable within said delivery tube, a weight connected to the bottom of said valve, levers carried by the bell and operatively connected to said valve, and weights operatively connected to the outer ends of said levers.
2. In an acetylene gas machine, a water tank, a gas bell vertically movable therein, guides for said gas bell, a carbide hopper upon the top of the bell and having a delivery tube projecting into the bell, a valve on said delivery tube comprising a tube open at the upper end and vertically movable in said delivery spout, said tube being closed at its lower end and having an opening in one side thereof, a stem secured to the lower end of said tube, supports secured to the top of the gas bell and projecting downwardly therefrom, one on each side of said delivery spout, levers having slots in the ends thereof pivotally secured to said supports, a pin passing through said slots and through the stem secured to said valve, weights secured to the outer end of said levers, a weight secured to said valve stem, and a stop to hold the inner ends of said levers against too great downward movement.

No. 101,206. Acetylene Gas Machine. Machine d gam aoétylìne.

Frederick William Moore and Albert Joseph Moore, coinventors, both of Bradford. Ontario. Canada, 25th September, 1906 ; 6 years. Filed 26th January, 1906. Receipt No. 121,964.
Claim.-1. In a machine of the class described the combingation with the generator tank. of an interior supplemental tank located in the generator tank and designed to receive the carbide, as and for the purpose specified.
2. In a machine of the class described the combination with the generator tank and bell of an interior tank located in the generator tank and extending up into the bell and extending up into the bell and designed to receive the carbide, as and for the purpose specified.
3. In a machine of the class described a tank, a blow-off pipe and service pipe extending thereinto, a connecting pipe between the blow-off pipe and service pipe and a controlling valve in the said connecting pipe, as and for the purpose specified.
4. In a machine of the class described a carbide chamber having top and bottom openings, a closing cap for the top opening of the carbide chamber, a valve provided with a lever handle and valve chamber communicating with the bottom opening of the said chamber, a stem extending from the top of the closing cap, a crossbar through which the stem loosely extends and links connecting the ends of the bar with the lever handle of the valve, as and for the purpose specified.

\section*{No. 101,207. Sliding Door. Porte glissante.}

John Sebastian Schlosser. Chicago, Illinois, U.S.A., 25th September, 1906; 6 years. Filed 25th July, 1906. Receipt No. 138,165 .
Claim.-1. In combination a door frame, a guide attached thereto and adapted to swing outwardly from said door frame, a door hung from said guide, rollers carried by said
decor, rolling on said door frame, and holding said door out of contact with said frame, said door frame having recesses

lying opposite said rollers when said door is closed, whereby said door may come against said door frame.
2. In combination a door frame, a guide consisting of a hood extending longitudinally of said door frame and attache thereto above, a track formed beneath said hood, a door having a hanger running on said track, rollers carried by said door, running on the face of said door frame and holding said door out of contact therewith, said door frame having recesses receiving said rollers to permit said door to come against said door frame.

\section*{No. 101,208. Artificial Stone, Brick, Etc.}

Pierre et brique artificiclles.
August Deidesheimer and Franz Jurschina, Wurzburg, Bavaria, Germany, 25th September, 1906; 6 years. Filled 3rd August, 1906. Receipt No. 138,383.
Claim.-1. A proces for the manufacture of burned and fire resisting blocks, bricks and like articles from materials of the kind herein specified, the distinguishing feature of said process being that the raw material is intimately mixed in suitably ground condition with about 1 to 4 per cent of clay, only so much water being used as to effect a complete coating of the individual grains by the clay whilst nevertheless obtaining a mass capable of being efficiently dry pressed in moulds or dies into bricks, blocks or the like and then immediately burnt without shrinking, substantially as disscribed.

No. 101,209. Crate. Mane.

The Milwaukee Brewers' Specialty Company, assignee of Frank Sochurek, Sr., all of Milwaukee, Wisconsin, U.S.A., 25th September, 1906; 6 years. Filed 19th January, 1906. Receipt No. 132.040 .

Claim.-1. In a bottle crate the combination with a box or receptacle consisting of an upper and a lower section, the
lower section provided with a bottom piece and the upper section turned upwardly at its lower edges and extending horizontally to form an integral horizontal partition, the said partition provided with openings for the passage of the bottles therethrough, and the upper edge of the lower secsection of the box being fitted against and secured to the upturned bend at the lower edges of the upper section, of means within the box for supporting the lower ends of the bottles.
2. In a bottle crate the combination with a box or receptacle consisting of an upper and a lower section, the lower section provided with a bottom piece and the upper section turned upwardly at its lower edges and extended horizontally to form an integral horizontal partition, the said partition provided with openings for the passage therethrough of the bottles, and the bordering edges of said openings having spring fingers depending therefrom and the upper edge of the lower section of the box being fitted against and secured to the upturned bend at the lower edge of the upper section, of means within the box for supporting the lower ends of the bottles.
3. A bottle crate consisting of a box or receptacle comprising an upper and a lower section, the lower section having its lower edges bent upwardly and extended horizontally to form an integral raised bottom piece adapted for supporting the lower ends of bottles, and the upper section turned upwardly at its lower edges, and extended horizontally to form an integral horizontal partition, the said partition provided with openings for the passage of the bottles, and the upper edge of the lower section of the box being fitted against and secured to the upturned bend at the lower edge of the upper section.

No. 101,210. Carbureting Machine. Carburateur.

Samuel S. Poole and Samuel H. Hellen, Nebrose, Massachusetts, U.S.A., assignee of half of the interest, 25 th September, 1906 ; 6 years. Filed 16th July, 1906. Receipt No. 137,838
Claim.-1. The combination of a carbureter, a series of measuring buckets for supplying hydro-carbon liquid thereto, an air supplying device provided with a reciprocating member for supplying a measured quantity of air to the carbureter, and connections between the series of buckets and reciprocating member for moving the buckets during the air supplying movement of said member.
2. In a gas machine the combination of a carbureter, an endless chain for measuring buckets for delivering hydrocarbon liquid thereto, an air supplying device having a gravitating bell, and connections between said bell and said chain for operating said chain by the dowrward movement of the bell.
3. The combination of a carbureter, a vertically moving chain of buckets for supplying hydro-carbon liquid through which the chain passes during the lower part of its travel, a recciving plate unon which the liquid is discharged, a conduit therefrom to the carbureter, an air supplying bell for delivering a measured quantity of air to the carbureter. and direct connertions between the bell and chain of buckets for moving the buckets in unison with the air supplying moverment of the bell.
4. The combination of a carbureter. a series of measuring buckits for supplying hydro-carbon liquid to the carbureter, an air bell for supplying a measured quantity of air to the carbureter. and deviees for directly connerting the bell with the series of buckets to move the buckets in unison with the air supplying movement of the bell.
5. The combination of a carbureter, a measuring device for delivering hydro-carbon liquid thereto. an air supplying device having a gravitating bell, and connections between said bell and said measuring device for directly operating said device by the downward movement of the bell.

No. 101,211. Culvert. Ponceau.

William Q. O'Neal, Edgar H. O'Neal and Frank McCalip. all of Crawfordsville, Indiana, U.S.A., 25th September, 1906; 6 years. Filed 7th October, 1904. Receipt No. 119,009.
Claim.-1. A culvert constructed of corrugated sheet metal and comprising connected cylindrical sections, the outer ends of the last sections being reinforecd with a ring having a flange entering the end of said last section and a flange approximately at right angles to said first flange extending outside of and against the end of said culvert and means for securing the inserted flange to the culvert section.
2. A culvert constructed of sheet metal and comprising connected cylindrical sections provided with circumferential corrugations extending to the extremes of the sections. and an angle iron reinforcing ring having a flange inserted within the outer end of each end section of said culvert, and means for securing it to said culvert section.
3. A culvert constructed of sheet metal and comprising connected cylindrical sections provided with circumferential corrugations extending to the extremities of the sections, each section terminating at one end in a flared and at the other end in a contracted portion of a corrugation. whereby the contracted extremity of one section is adapted to fit into the flared extremity of the adjoining section to interlock the terminal corrugation, means engaging the overlapping extremities of the corrugations for securing the sections together and an annular flange entering the end of the outside section and secured to said sections said annular flange having an outwardly extended integral flange which bears against the end of the culvert section.
4. A culvert constructed of sheet metal and comprising connected cylindrical sections provided with circumferential corrugations extending to the extremities of the sections, each section terminating at one end in a flared and at the other end in a contracted portion of a corrugation. whereby the contracted extremity of one section is adapted to fit into the flared extremity of the adjoining section to interlock the terminal corrugations, and means, as bolts, engaging the overlapping extremities of the corrugations for sacuring the sections together, and end reinforcing rings having a flange entering the end of each end section and a flange at right angles to said entering section extending outwardly and for an appreciable distance past the end of said section and means as bolts for securing the said entering flange to the section which it enters.

No. 101,212. Spirit Level. Nivau.
Thomas O. Sharp and Eugene J. Tucker, assignee of a half interest, both of Roxboro, North Carolina, U.S.A., 25th Septumber, 1906; 6 years. Filed 17th July. 1906. Recelpt No. 137.915 .
Cloim.-In a device of the character described, a stock having a longitudinal recess, the bottom thereof being on a horizontal plane. a tube within the recess, the under surface of the tube being flattened and adapted to contact with the bottom surface of the recess. the upper surface of said tube being curved, said tube being provided with gradua-
tions, a strip arranged above the recess, said strip having graduations coinciding with the graduations of the tube,

and means arranged at each end of the longitudinal recess of the stock to hold the tube within said recess.

\section*{No. 101,213. Propelling and Eteering Apparatus for Bonts.}

Appareil de propulsion et d gouverner pour bateaux.

Ethel Post, assignee of Charles Wesley Post, both of Zion City, Illinois, U.S.A., 25th September, 1906; 6 years. Filed 31st July, 1906. Receipt No. 138,29u.
Claim.-The combination of a shell provided with a passageway therethrough, a shoulder at the lower end of the passageway, said passageway being enlarged to form a chamber and said shell being provided with an aperture therethrough communicating with the chamber, a plug rotatably mounted in the shell and extending below it, said plug provided with a shoulder corresponding with and resting on the shoulder in the shell, and said plug provided with a passageway communicating with the chamber in the shell and with the water below the shell, the discharge of said passageway directing the water flowing therethrough in a substantially horizontal plane, and a steering wheel at tached to the rotatable plug, substantially as described.

\section*{No. 101,214. Wall Bracket. Console pour murs.}

Frank W. Chickering Irvine, A. Norcross and Olin M. Rowell, all of Hardwick, Vermont, U.S.A., 25th September, 1906 ; 6 years. Filed 26th June, 1906 . Receipt No. 137,303.
Claim.-1. In a wall bracket the holders each comprising a vertical plate \(c\) formed with the inwardly extending lips \(6^{112}\) and a central channel or groove \(c^{1}\), the shelf supports. each comprising the leg \(d\) formed with the raised and slotted slideway or guide \(d^{1} d^{11}\) and the horizontal portions \(g\), each provided with the downward extension \(g^{\prime}\) and means for adjustably securing said legs to the holders and said horizontal portlons of the shelf supports to the legs, substantially as described.
2. In a wall bracket the shelf supports or brackets proper, each comprising a horizontal portion and a vertical portion adjustably connected at their adjacent ends, and braces \(k\) rigidly secured at their lower ends to said vertical portions and loosely connected at their upper ends with said horizontal portions, whereby said horizontal portions and the shelf supported thereby may have their rear edges swung vertically and the angle of the shelf changed for levelling purposes with relation to said vertical portions, substantially as set forth.
3. In a wall bracket the shelf supports or brackets proper, ach comprising the horizontal portion \(g\) provided with the

hole \(g^{11}\) and the vertical portion \(d\), said horizontal and vertical portions being adjustably connected at their adjacent ends, and the braces \(k\) supported at their lower ends by said vertical portions and formed at their lower ends with the curved or rounded edges \(k^{1}\) and the projections \(k^{111}\) extending loosely into said holes \(g^{11}\) whereby a certain amount of play or relative movement is provided at that point, substantially as and for the purpose set forth.
4. In a wall bracket vertical holders adapted to be rigidly secured to the wall, shelf supports or brackets proper. each comprising a horizontal portion and a vertical portion adjustably connected at their adjacent ends, said shelf supports being adapted to be supported by slide vertically in. and adjustably secured to the holders and braces extending from the vertical to the horizontal portions of the shelf supports and connected therewith in such a manner as to allow a certain degree of adjustment as to the angle of the horizontal portion with relation to the vertical portion, substantially as described.

No. 101,215. Milking Machine. Machine pour traire.

D. H. Burrell and Company, assignee of Loomis Burrell, all of Little Falls, New York, U.S.A., 25th September, 1906; 6 years. Filed 16th February, 1906. Receipt No. 132,966. Claim.-1. In a milking machine, the combination of a milk receiving vessel, a pulsator on the same, a condult by which suction is applied to the vessel, and a separating chamber in said conduit for intercepting particles which are carried on the air which passes through the suction conduit, substantially as set forth.
2. In a milking machine, the combination of a milk receiving vessel. a pulsator on the same, a conduit by which suction is applied to the vessel, and a filter in said conduit for separating objectionable particles from the air, substantially as set forth.
3. In a milking machine, the combination of a milk recelving vessel having a suction opening in its cover, a pulsator arranged on sald cover, a separating chamber provided at opposite ends with a nipple which communicates with said opening and with a nipple to which the suction pipe is attached, and a filter arranged in sald chamber, substantially as set forth.
4. In a milking machine, the combination of a pulsator valve having an air port, and a valve cyllider having an air irlet port and a milk port, the air port in the valve being arranged to place the air inlet port of the cylinder in communication with said milk port, and the air inlet port of the cylinder having a restricted inlet which communicates directly and without the intervention of a valve with the milk port of the cylinder through the air port of the pulsator valve, substantially as set forth.
5. The combination of a milk vessel provided with a valve cylinder having a milk port and having in its side a restricted air inlet which communlcates directly and without the intervention of a valve with the outer alr, and a pulsator valve which is provided with an air port arranged to place the air inlet of the cylinder in communication with said milk port, substantially as set forth.
6. In a milking machine, the combination of a milk receivIng vessel having a removable cover, a pulsator valve and cylinder arranged upon said cover, a milk pipe connected with said valve cylinder, teat cups connected with said milk pipe, and a restricted air inlet formed on sald valve cylinder, substantially as set forth.
7. In a milking machine, the combination of a pulstaor valve, an inlet for admitting the external air to the milk passage, and a filter which covers said inlet and through which the alr is compelled to pass, substantially as set forth.
8. In a milking machine, the combination of a pulsator valve, a cylinder in which the same is arranged and which is provided with an air inlet for admitting the external air through said valve to the milk passage, and a filter which covers said inlet, substantially as set forth.
9. In a milking machine, the combination of a milk receiving vessel having a removable cover, a pulsator valve and cylinder arranged upon said cover, said cylinder being provided with an inlet for admitting the external air, and a filter which is secured to said inlet, substantially as set forth.

No. 101,216. Alarm Fuse for Telephone Exchanges.
Fusée-acertiscur pour échange téléphonique.

The Bell Telephone Company of Canada. Montreal, Quebec, Canada, assignee of Edward B. Craft, Chicago, Illinois, U.S.A., 25th September, 1906; 6 years. Flled 9th May, 1906. Recelpt Nc. 135,707.
rlaim.-1. A protective device comprising an insulating mounting strip and terminal plates therefor, a spring secured to one of said terminals, a fuse wire electrically connceted with the other terminal and united with said spring to mainlain the same under tonsion, and a target carricd by said spring, said spring when under tension holding said target in ar inconspicuous position, but being adapted upon the part-
ing of the fuse to move said target into a position of display.
2. In a protective device for electric circuits, the combination with an insulating supporting strip and terminal plates carried at the ends thereof, of a coiled spring, a support therefor mounted upon one of said plates, one end of said spring being electrically connected with the aforesaid terminal plate, an extension arm formed by the other end of said spring, a target carried by said arm, a fuse wire electrically connected with the other terminal plate and united with said arm between the target and coil to maintain said spring under tension, said arm being adapted to be moved by the spring to bring the target into a position of display when the fuse wire is parted.
3. A protective device comprising an insulating mounting strip and terminal plates therefor, a spring secured to one of said terminal plates, a fuse wire completing the electrical connection between said plates, and maintaining the spring under tension, an arm carried by said spring, and a tubular glass target carried by an angular portion of said arm, said arm when the spring is under tension maintaining the target inconspicuous, and being adapted upon the parting of the fuse to move sald target into a position of display.
4. A protective device comprising an insulating mounting strip \(e\) and terminal pieces \(e^{1} e^{2}\) therefor, a coiled spring \(t\), a support \(e^{3}\) therefor, one end of said spring being electricaily cennected with the terminal \(e^{1}\), an extension arm \(f^{1}\) formed by the other end of said spring, an opaque glass target \(g\) of distinctive colour carried by an angular portion \(f^{2}\) of sald arm, and a fuse wire \(f^{1}\) maintaining said spring under tension and electrically connected with the terminal plate \(e^{z}\), said fuse wire being united with the arm \(f^{1}\) between the target and coll, whereby when the fuse is parted the target is rioved into a position of display by the recoll of said spring.
5. A protective device comprising an insulating supporting strip, terminal plates carried at the ends thercof, a colled spring, a metallic supporting plate for said spring mounted upon one of said terminal plates at right angles thereto, one end of said spring being secured to said plate, an extension arm carled by the other end of sald spring, a leaf spring secured at one end to the other terminal plate and extending parallel to the insulating strip on the side thereof opposite said coiled spring, a fuse passing through said strip and connecting said leaf spring and extension arm to maintain the coiled spring under tension, and a target of distinctive colour carried by an angular portion of said extension arm and adapted to be moved into a position of display by said arm when the fuse is parted.
6. A protective device comprising an insulating supporting strip, terminal plates carried at the ends thereof, a colled spring supported by one of said plates, one end of said spring being connected with said plate, an extension arm carried by the other end of said spring, a leaf spring connected with the other terminal plate and extending parallel to said insulating strip on the side thereof opposite said coiled spring, a fuse passing through said strip and connecting the ends of said springs to maintain the coiled spring under tension, and a target carried by an angular portion of said extension arm independent of the current carrying portion thereof, said target being adapted to be moved into a position of display by said arm when the fuse is parted.
7. A protective device adapted to be mounted in a vertical plane, comprising an insulating supporting strip, terminal plates carried at the ends thereof, a colled spring supported by one of said plates, one end of said spring being connected with said plate, an extension arm carried by the other end of said spring, a portion of said arm being bent to lie at right angles, a fuse wire electrically connected with the other terminal plate and united with said extension arm between the angular portion thereof and the colled spring to maintain said spring under tension, and a tubular target carried by said angular portion and normally maintained in an inconspicuous position with its small end alone visible, said target being adapted to be moved by said arm to display its side suriace when the fuse is parted.

\section*{No. 101,217. Electro-Magnetic Wheel.}

\section*{Roue électro-aimante.}

Hugo Behan, Seattle, Washington, U.S.A., 25th September,
1906; 6 years. Filed 8th September, 1906. Recelpt No. 139,337.
Claim.-1. In apparatus of the class descrlbed the combination with the track rail, the wheel, and the electric conducting wires, of a plurality of electro-magnets having their cores extending through the rim of said wheel and the coils terminating in an annular piece of metal and a serics of contact segments secured to said wheel, a terminal oi the said conducting wires which makes continuous contact with said annular piece, another terminal of the conducting wires engaging with the sald contact segments, and means for adjusting said last-named terminal so as to
cause it to engage with certain predetermined of said contact segments, substantially as described.

2. In an apparatus of the class described the combination with a wheel, electro-magnets mounted radially on the wheel, an annular rotary contact, segregated contacts revoluble with the wheel, an adjustable contact adapted to engage said segregated contacts, whereby, through the movement of said adjustable contact, an electric magnet may be energized in front of or in rear of the bearing point of the wheel.

\section*{No. 101,218. Bottle. Bouteille.}

Walter D'Esmond Chappelle, Wyoming, Ontario, Canada, 25th September, 1906; 6 years. Flled 15th June, 1906. Recelpt No. 136,942.
Claim.-1. A position guard for bottles comprising a band having a movable connection with the bottle and of greater diameter and height than the portion of the cork projecting beyond the bottle.
2. A poison guard for bottles comprising a band arranged to encircle the cork and of greater height than the projecting portion thereof, the upper edge of the band being formed with a plurality of spur projections.
3. A poison guard for bottles comprising a clip to engage the bottle neck, a band arranged to encircle the cork and of greater height than the projecting portion thereof, said band having a hinge connection with the clip.
4. A polson guard for bottles comprising a clip to engage the bottle neck, a band arranged to encircle the cork and of greater height than the projecting portion thereof, said band having a hinge connection with the clip. and means for secting the band in operative relation with the cork.
5. A poiscn suard for bottles comprising a bottle engaging clip, a band having hinge connection with the clip, the upper end of the band being formed with vertically arranged spur points, and a locking strip depending from the band.

9-32

No. 101,219. Box for Blectric Mouldings.
Boite pour moulage électrique

John L. Gleason, Jamaica Plain, Massachusetts, U.S.A., 25th September, 1906; 6 years. Filed 14th May, 1906. Receipt
No. 135,880.
Olaim.-1. A reduction box for electrical mouldings comprising in its construction two end plates joined together by a curvilinear front plate, integral therewith, said front plate provided in each of its opposite edges respectively with a recess, one of said recesses being larger than the other, said recesses each having two ends connected by a longitudinal side, and a bevelled corner connecting each of said ends to said sides at opposite ends thereof respectively
2. A reduction box for electrical mouldings comprising in its construction two end plates joined together by a curvilinear front plate integral therewith, said front plate provided in each of its opposite edges respectively with a recess, one of said recesses being larger than the other, sald recesses each having two ends connected by a longitudinal side, and a bevelled corner connecting each of said ends to said sides at opposite ends thereof respectively. an a \(V\)-shaped projection extending into the larger of said recesses from said longitudinal side midway between said corners.
3. A reduction box for electrical mouldings comprising in its construction two end plates joined together by a curvilinear front plate integral therewith, said front plate provided in each of its opposite edges respectively with a recess, one of said recesses being larger than the other, and tlanges projecting from the longitudinal edges of said front plate substantially at right angles to each other.
4. A reduction box for electrical mouldings comprising in its construction two end plates joined together by a curvilinear front plate integral therewith, said front plate provided in each of its opposite edges respectively with a recess, and flanges projecting from the longitudinal edges of said front plate substantially at right angles to each other.
5. A reduction box for electrical mouldings comprising in its construction two end plates joined together by a curvilinear front plate, integral therewith, said front plate provided in each of its opposite edges respectively, with a recess, one of said recesses being larger than the other, sald recesses each having two ends connected by a longitudinal side, and a bevelled corner connecting each of said ends to sald sides at opposite ends thereof respectively, and fianges projecting from the longltudinal edges of said front plate, substantially at right angles to each other and fastened to two supporting walls at an angle to each other, in combination with mouldings projecting into said recesses and caps for each of said mouldings, said bevelled corners bearing against the edges of said caps, whereby said caps are clamped against said mouldings, and said mouldings are clamped against said supporting walls.

\section*{No. 101,220. Ewitch Receptacle.}

\section*{Réceptacle de commutatcurs.}

George H. Metheany, Lima, Ohio, U.S.A., 25th September,
1906; 6 years. Filed 18th May, 1906. Recelpt No. 136,052.
Claim.-1. A device of the character described comprising an inverted cup-shaped casing, said casing provided with an internal screw-threaded surface formed near its lower edge, an annular extension formed upon the inner face of said casing, said screw-threaded surface terminating short of said annular extension, a removable base member positioned within said casing, and contiguous to said annular extension, said base member provided with an upper concaved surface and with a central aperture, said member provided with a conical depending portion, said depending portion provided with a concaved recess, a standard formed integral upon said base

Digitized
member, ribs extending in opposite directions from said standard and formed integral with said base member, a block

formed upon the upper end of said standard, spring terminals carried by said block, and an annular locking member posithoned within said casing, for securing said base member in a fixed position, said locking member provided with an outer screw-threaded surface and with inwardly projecting extenslons.
2. A device of the character described comprising an inverted, cup-shaped casing, a removable member of the same diameter as the diameter of the interior of said casing positioned within said casing, means for securing said member within said casing, said member provided with an aperture, a ball valve positioned within said casing and normally closing said aperture, and terminal carrying means formed upon said member.
3. A device of the character described comprising a casing closed at its top and open at its bottom, a removable member positioned within and closing the bottom of said casing, said member provided with a depending guiding portion and an aperture, a ball valve closing said aperture, and terminal supporting means carried by sald member.
4. A device of the character described comprising a casing open at its bottom and closed at its top, a removable member of the same dimensions as the dimensions between the irner walls of said casing, said member positioned within said casing, said member provided with a series of apertures and with terminal carrying means, and valve means for closing one of sald apertures.
5. A device of the character described comprising a casing closed at its top and open at its bottom, a removable member closing said bottom, said member provided with an apercure, a ball valve for closing said aperture, and terminal carrying means formed upon said member.
6. A device of the character described comprising a casing, a removable member positioned within said casing, means for securing said member within said casing, guiding means carried by sald member, valve means carried by said member. and terminal carrying means carried by said member.
7. A device of the character described comprising a casing closed at its top and open at its bottom, a removable member positioned within the lower portion of said casing, means for securing said removable member within said casing, depending gulding means formed upon said member, terminal carrying means formed upon sald member within said casing, sald member provided with an aperture, and a ball valve for closing said aperture.
8. In a device of the character described, the combination of a casing closed at its top and open at its bottom, a removable bottom of substantially the same width as the interior of said casing, positioned within the same, a revoluble locking member threaded into said casing and in engagement with the said bottom, terminal carrying means supported by sald bottom, conical guiding means formed upon sald bottom, said bottom provided with an opening, and valve means for closing said opening.
9. In a device of the character described. the combination of a casing closed at its top and open at its bottom, an extension formed interiorly of said casing, a removable bottom positioned within said casing and in engagement with said extension, a removable, annular locking member threaded into said casing and in engagrment with said bottom, and terminal carrying means positioned within said casing.

\section*{No. 101,221. Outlet or Junction Boz.}

Sortie de boite de jonction.
Clarence C. Sibley and George Augustus Lutz, co-inventors, both of Ni•w York City. New York, U.S.A., 25th September, 1906; 6 years. Filed 4th May, 1:36. Receipt No. 135.524.

Claim.-1. An electrical outlet or junction box provided with holes, channel like members entering satd holes to em.
brace the end portions of correspondingly shaped conduits. means to detachably receive conduits in said members, and

means for detachably connecting said members with said box, said members being provided with prongs bent into connection with a conduit to hold the members and conduits together.
2. An outlet or junction box provided with holes. combined with members entering said holes to connect with conduits, said members having extensions passing into the loox along its bottom, and means for detachably connecting said extensions with the bottom of the box.
3. An electrical outlet or junction box provided with holes, and members entering said holes and provided with prongs bent into connection with conduits through slots in said conduits to hold the members and conduits together.
4. A bond-like member for holding a conduit to an outlet ur junction box comprising a channel-like piece having a bottom and sides provided with opposed grooves to recelve a conduit and provided with lugs adapted to be bent against the inner wall of a junction box.
5. A bond for connection with a condult comprising a channel-like plece having a bottom and sides provided with grooved portions, and a prong adapted to be bent through a slot in a conduit, substantially as described.

\section*{No. 101,222. Conduit for Electrio Wire. \\ Conduil pour flls électriques.}

Clarence C. Sibley and George Augustus Lutz, New York City, New York, U.S.A., 25th September, 1906; 6 years. Filed 4th May, 1906. Receipt No. 135,525.
Claim.-1. An elbow for condults comprising a pair of members having channels and provided with opposed arooves and movably connected together, and independent sections within said members provided with grooved port.ons entering the grooves of said members adapted to align with the grooves of corresponding conduits and to receive the covers therefrom.
2. An flbow for conduits comprising members movably connected together, means for closing the openings adjacent to the adjacent ends of said members, and sections located in satd members and having their outer ends at a distance from the chis of the members to permit the entrance of the ends of comluits into said members.
3. An clbow for conduits comprising a pair of channellike members movably connected together and adapted to receive correspondingly shaped conduits, sald members having means for flrmly connecting them with said conduits to prevent movement of the condults in a longitudinal direction.
4. An elbow for conduits comprising a pair of channellike members movably connected together and adapted to

receive correspondingly shaped conduits, sald members being provided with prongs adapted to enter slots in the conduits and to be bent to lock the conduits to the members.
No. 101,223. Speed Indicating and Alarm Device. Indicateur de vitesse et avcrtisscur.

John Ellwin Parrish and Richard Hale Smith, co-inventors, both of Springfield, Massachusetts. U.S.A., 25th September, 1906; 6 years. Filed 30th July, 1906. Receipt No. \(138,265\).
Clatm.-1. In a speed indicating device the combination With a casing, having a centrifugal governor therein provided with a hollow upwardly open spindle, and having at its top a supplemental slotied facewise indicator casing having a slot through the wall thereof, and which casing is constructed also for the reception of interchangeable cards, of a stem within the hollow spindle, subject to vertical movement on the operation of the governor and having ing its upper end located in the indicator casing and having a part movable closely to and registering on the indicator, and means connected with the governor for imparting its rotation thereto.
2. In a speed Indicating device the combination with a circular enclosed casing having upper and lower central journal bearings, and made with a socket about the upper journal bearing, and a centrifugal governor in said casing provided with a hollow upwardly open spindle and mounted for rotation in said journal bearings, of a supr plemental downwardly open indicator case having a hollow lower part fitted and detachably confined in sald socket and having an indicator scale, a stem within the hollow spindle subject to vertical movement by the operation of the governor, extended upwardly within the indicator case and having an externally visible part movable closely to and registering on the indicator scale.
3. In a speed indicating device the combination with a circular enclosed casing having upper and lower central journal bearings, and made with a socket about the upper
journal bearing and a centrifugal governor in said casing provided with a hollow upwardly open spindle and mounted for rotation in said journal bearings, of a supplemental endwise open indicator case having a hollow downwardly open boss at its bottom fitted and detachably confined in said socket, and having a vertically slotted front wall made with opposite endwise open grooves. and a vertically slotted indicator scalc card on the front wall of the indicator case, and marginally engaged in said grooves, a stem within the hollow spindle subject to vertical movement by the operation of the governor extended upwardly within the indicator case and carrying a pointer at its upper portion extended through the slots of the indicator case and scale card, and arranged closely to, and registering on, the card.
4. In a speed indicating device the combination with the main governor casing supporting at its top an indicator casing having a slotted front and a slotted scale card thereat, and a centrifugal governor in the main case provided with a hollow upwardly open spindle, of a stem within the hollow spindle connected with the governor. rotatable in unison therewith. and endwise movable independently of the governor spindle, and having at its upper end an indicator head bodily movable with the stem and relatively to which the stem is indenendently rotatable, and sald head having the lateral stud projecting through the slots of the indicator casing and scale card. and a polnter carried, adjacent the face of the scale card by the outer extremity of said stud.
5. In a speed indicating device in combination the main governor casing of circular form, and enclosed. having journal bearing holes through its top and bottom, and having about the upper journal hole an upwardly open socket \(f\), the surrounding wall of said socket depending within the top of the casing, and said main casing being constructed of the upper and lower matching sections \(b\) and \(c\), the indicator casing having a downwardly open depending boss fitting in said socket, and having a vertically. slotted front wall provided with an indicator scale detachably connected thereat. a set sernw engaging said hollow boss through the wall of the socket therefor, a centrifugal governor having the spindie thereof hollow. upwardly open and longitudinally slotted through its sides, the indicator stem vertically movable within the indicator spindle and connected with a movable member of the governor. and a head carried at the upper end of the stem within the indicator casing. provided with the lateral stud projecting through the slot in the indicator case and having the externally located nointer.
6. In a speed indicating device, the combination with an enclosed governor casing having at its top a supplemental endwise open indicator case. having a vertically slotted front wall with side wall extensions forwardly projecting beyond the slotted front wall and having within their inner sides the opposing pairs of grooves 10.10 and 12, 12, the slotted indicator card engaged in the grooves 10 and the glass forward thereof marginally engaged in the grooves 12. of the governor, having an indicator stem endwise movable relatively thereto and actuated therehy, provided at its upper end within the supplemental case with a part projecting through the front wall slot and provided with a pointer to registor on the card.
7. In a spect indicating device, a governor casing having at the top thereof an indicator scale. a governor in sald case and a stem actuated by the governor and having a pointer registering on the scale, an electric lamp supported on the case adjacent and to illuminate the scale, normally open circuit connections for the lamp including a battery, and means comprised in the lamp circuit and movably controlled by the governor for automatically closing the lamp circuit under predntormined speed conditions, and additional and non-automatic means for closing the lamp circuit at pleasure.
8. In a speed indicating device, a governor casing having at the top thereof an indicator scale, and an adjacent integrally formed aperturcd hood. a governor in sald case, and a stem actuated by the governor and having a pointer registering on the scale, an electric lamp supported by the case within said apertured hood, normally open circuit connections for the lamp, having a battery connected therein, and means for closing the lamp circuit.
9. In a speed indicating and alarm device, a governor casing having at the top thereof an indicator scale, a governor it said case and a stem actuated by the governor, a pointer carricd by the stem and registering on the scale, an electric audible alarm device carricd by the case, normally open circuit connections for the alarm device having a battery connected thereln, and automatic means actuated by the governor for closing the alarm circuit.
10. In a speed indicating device, a governor casing having at the top thereof an indicator scale, a governor in said case and a stem actuated by the governor and carrying a pointer having a reciprocatory movement and registering on the scale, an electric lamp supported on the case adjacent and to llluminate the scale, and an audible electrically operable
signaling device, normally open circult connections comprising a generator, and connecting the lamp and the signalling device, and a movable part controlled by the governor for closing the lamp and signal circuits, for simultaneously lighting the lamp and sounding the alarm under predetermined speed conditions, and additional non-automatic means for closing the lamp circuit at pleasure.
11. In a speed indicating device, a governor casing having at the top thereof a supplemental casing having an externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the scale, an electric audible alarm device, normally open circuit connections for the alarm device including the battery, the head of the indicator stem and an adjustably movable contact relatively to which the head of the governor controlled stem moves, and a screw stud projected through the slot in the casing, and having a confining nut and controlling the position of said adustable contact, for the purposes set forth.
12. In a speed indicating device. a governor casing having at the top thereof a supplemental casing having an externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the scale, an electric audible alarm device, normally open circult connections for the alarm device, including a battery, the head of the indicator stem, and an adjustably movable contact relatively to which the head of the governor controlled stem moves, a screw stud projected through the slot in the casing. and having a confining nut, and controlling the position of said adjustable contact, a numbered scale on the side of the casIng adjacent said slot. and a pointer engaged with the screw stud and movable therewith along said slot and for registry on the numbered scale, for the purposes set forth.
13. In a speed indicating device, a governor casing having at the top thereof a supplemental casing having an externally visible indicator scale, and having a vertically slot ted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the indicator scale, an electric audible alarm device, and an electric lamp adjacent the indicator, normally open circuit connections for the alarm device, and for the lamp including a battery, the head of the indicator stem, and an adjustably movable contact relatively to which the head of the governor controlled stem raoves, and means for connecting and disconnecting the circuit connectlons pertaining to the lamp from those pertaining to the alarm device.
14. In a speed indicating device, a governor casing having at the top thereof a suppemental casing having an externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the indicator scale, an electric audible alarm device, and an electric lamp adjacent the indicator, normally open circuit connections for the alarm device, and for the lamp, including a battery, the head of the indicator stem, and an adjustably movable contact relatively to which the head of the governor controlled stem moves, and means for connecting and disconnecting the circuit connections pertaining to the lamp from those pertaining to the alarm device, and additional and nonautomatic means for closing at pleasure the lamp circuit.
15. In a speed indicating device, a governor casing having at the top thereof a supplemental casing provided with externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the indicator scale, an electric audible alarm device and a battery, a metallic plate mounted on an insulating support having connection with the electric alarm device and having an upstanding member within the supplemental casing adjacent the indicator stem, a contact vertically movable on said upstanding member and having an insulated stud projecting through the slot of the supplemental casing, a wire connecting said plate and the battery, a wire connecting the battery with the metallic governor casing, and metallic connections between the governor casing and the contacting head of the ndicator stem.
16. In a speed indicating device, a governor casing having at the top thereof a supplemental casing provided with an externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and provided with a pointer registering on the indicator scale, an electric lamp and an insulating support secured within the casing having a metallic plate 42 thereon, and on which the metallic socket of the lamp is in contact, and an independent metallic plate 92 . 93 , secured to said support and with which one terminal of
the lamp is in metallic connection, the battery, wire connected to said metallic part 92, 93, and wire connected to the metallic governor casing. and a tongue adjacent and normally separated from the metallic plate 42 , and in connection with the electrically conducting governor case, and means for forcing said tongue against plate 42, for the purposes set forth.
17. In a speed indicating device, a governor casing having at the top thereof a supplemental casing provided with externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the indicator scale, an electric lamp, and an insulating support therefor secured within the casing having a metallic plate 42 thereon, and on which the metallic lamp socket is in contact, an independent metallic plate 92,93 , secured to said support and with which one terminal of the lamp is in metallic connection, the metallic part 48 having the upstanding member 50 , and the tongue 49, extending to overlap, normally separated from the plate 42, a contact supported by and adJustable on the member 50 in electrical connection with the part 48, and also connected to the metallic governor casing. metallic connections through the governor between the governor casing and the indicator stem and head, and means for placing the tongue 49 in contact against the plate 42. for the purposes set forth.
18. In a speed Indicating device, a governor casing having at the top thereof a supplemental casing provided with an externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the indicator scale an electric lamp and an insulating support secured within the casing having a metallic plate 42 thereon, and on which the metallic lamp socket is in contact, an independent metallic plate 92,93 , secured to said support and with which one terminal of the lamp is in metallic connection, the plate 48 having the tongue 49 and the member 50 provided with an adjustable contact adjacent the indicator stem head, the battery wire connected to said metallic part 92 93, and wire connected to the metallir governor casing, me tallic connections through the governo: between the gover nor casing and the indicator stem and head, and connections between the plate 48 and the battery, means for forcing said tongue 49 against said plate 42, and the tongue 60 in electrical connection with the case and arranged to be forced at pleasure against the sald plate 42, for the purposes set forth.
19. In a speed indicating device, a governor casing having at the top thereof a supplemental casing provided with an externally visible indicator scale, and having a vertically slotted wall, a governor in said case and a stem actuated by the governor and having a head in the supplemental case provided with a pointer registering on the indicator scale an electric lamp and an insulating support secured within the casing having a metallic plate 42 thereon, and on which the metallic lamp socket is in contact, an independent metallic plate 92,93 , secured to said support and with which one terminal of the lamp is in metallic connection. an elec irically operable audible alarm device, the plate 48 having the tongue 49 and the member 50 provided with an adjustable contact adjacent the indicator stem head, the battery, wire connected to said metallic governor casing, and wire connected with the audible alarm device and connections between said alarm device and the plate 48, metallic connections through the governor casing and the indlcator stem and head, and means for forcing sald tongue 49 against said plate 42.
20. In a speed indicating device, a governor casing having at the top thereof a supplemental casing provided with an externally visible indicator scale, and having a vertically slotted wall, a governor in sald case and a stem actiated by the governor and having a head in the supplemental case provided with a pointer registering on the indicator scale, an clectric lamp and an insulating support secured within the casing having a metallic plate 42 thereon, and on which the metallic lamp socket is in contact, an independent metallic plate 92, 93, secured to sald support and with which one terminal of the lamp is in metallic connection, an elec trically operable audible alarm device, the plate 48 having the tongue 49 and the member 50 provided with an adjustable contact adjacent the indicator stem head, the battery, wir connected to said metallic part 92, 93, wire connected to said metallic governor casing, and wire connected with the audible alarm device and connections between sald alarm de vice and the plate 48, metallic connections through the rovernor between the governor casing and the indicator stem and head. means for forcing said tongue 49 against said plate 42, and the tongue 60 in electrical connection with the case and arranged to be forced at pleasure against the said plate 42.
21. In a speed indicating device, a casing having a governor therein, an indicator and a pointer actuated by the governor for registering on the indicator, and an electric lamp, adjacent the indicator, and said casing made with the pockets \(d\) and \(e\) and having a battery and an audible electrically operable alarm device respectively therein, circuit connections comprising the battery and the alarm device, and automatic means controlled by the governor for closing the circuit for the alarm device.
22. For a speed indicator the combination with an indicator having a speeding governor, of a gear wheel and detachable means for its confinement on a traction wheel of the vehicle. consisting of a cllp having its intermediate portion looped to encircle a wheel poke and having its extremities adjoined and extended through the gear wheel. screw-threaded, and having a confining nut setting against the gear wheel, a pinion in mesh with the gear wheel, and a flexible shaft connecting the pinion and the governor of the indicator.
23. In transmission connections for a speed indicator device of the character described, a traction wheel-carried gear wheel, a pinion to mesh therewith and having an arbour to be flexible shaft-connected with the indicator, and a support for the pinion arbour, and relatively to which such arbour is adjustable in the line of its axis.
24. In a speed indicating apparatus in combination a casing carrying an indicator scale and having therein a governor controlled stem provided with a pointer co-acting with the scale, a traction wheel provided with a gear wheel, a pinion ir. mesh with said gear wheel having an arbour, a flexible shaft connecting said arbour and the governor and a journal support for said arbour which is adjustable bodlly in a direction transverse of the axis thereof.
25. In a speed Indicating apparatus in combination, a casing carrying an indicator scale and having therein a governor and a governor controlled stem provided with a pointer co-acting with the scale, a traction wheel provided with a gear wheel, a pinion in mesh with said gear wheel having an arbour, a flexible shaft connecting said arbour and the governor, and a journal support for said arbour which is adjustable for a swinging movement about an axis perpendicular to the axis of the arbour.
26. In transmission connections for a speed indicator device of the character described, a traction wheel-carried gear wheel, a pinion to mesh therewith and having an arbour to be flexible shaft-connected with the indicator and a support for the pinion arbour and relatively to which said arbour is adjustable on the line of its axis, adjustable bodily transversely of its axis and capable of a swinging movement on an axis perpendicular to the axis of the said arbour.
27. For a speed indicating device of the class described, the combination with a gear wheel and a pinion having an arbour, of a supporting appliance and a stem vertically adjestable relatively thereto, and provided with a journal bearing head in which the arbour of the pinion is rotatably supported and through which such arbour is endwise adjustable and a flexible shaft secured to the pinion arbour and for connection with the speeding portion of the indicating device.
28. For a speed indicating device of the class described, in combination with the indicating device and the vehicle wheel having a spur gear \(K\), the separable clip \(Q\) having the upstanding socketed portion 190, the stem 193, adjustably confined in sald socketed portion and having the journal bearing head 194, the pinion having the arbour rotatable in, and arially adjustable through said bearing head, the adjustable collars 95, 95 , and means for adjustably confining them on the arbour at opposite ends of the journal bearing head and the flexible shaft connected to the arbour and to the speeding portion of the indicating device.

No. 101,224. Electrical Gnn. Fusil éleotrique.
Martin E. Thomas, Batavia, Iowa, U.S.A., 25th September, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,956.

Claim.-1. In a gun the combination with a stock having a chamber therewithin and having a longitudinal slot in its upper portion communicating with the chamber, of contact piece disposed at opposite ends of the slot, a plate slidably mounted for movement into and out of position to contact with both of the first-named plates simultaneously, a shank secured to the slidable plate and extending outwardly through the slot, means for holding the sliding plate yleldably out of operative position, a make-and-break, electrical connections between one of the stationary plates and a member of the make-and-break, a battery, electrical connections between said battery, and the other of the stationary plates, an induction coil carried by the stock, electrical connections between said coll and the battery, electrical connections between said coll and the other member of the make-andbreak, means for operating the make-and-break, a metallic breech block for the gun, an insulating body in the breech tlock, a contact plece in the insulating body and extending
through the forward face of the breech block, electrical connections between the contact piece and the induction coll,

and electrical connections betweeen the breech block and the irduction coll.
2. In a gun the combination with a stock having a chamber therewithin and having a longitudinal slot in its upper portion communicating with the chamber, of contact plates disposed at opposite ends of the slot, a plate slidably mounted for movement into and out of position to contact with both of the first-named plates simultaneously, a shank secured to the slidable plate and extending outwardly through the slot, means for holding the sliding plate yieldably out of operative position, a make-and-break, electrical connections between one of the stationary plates and a member of the make-and-break, a battery, electrical connections between said battery and the other of the stationary plates, an induction coil carried by the stock, electrical connections between said coil and the other battery electrical connections between said coll and the other member of the make-andbreak, a metallic breech block for the gun, an insulating body in the breech block, a contact plece in the insulating body extending through the forward face of the breech block, electrical connections between the contact piece and the induction coil, electrical connections between the breech block and the induction coil, a cartridge disposed against the breech block, sald cartridge including a metallic heelplece contacting the breech block, and having a passage formed therethrough communicating with the interior of the shell, an insulating core in the passage, an electrode in the insulating core, said electrode contacting the contact piece and extending into the shell, and a second electrode disposed with one end in the shell and in spaced relation to the first-named electrode, said second electrode being electrically connected with the heel-piece.
No. 101,225. Trolley. Trollé.

William Freman Thompson, Corospolis, Pennsylvania, U.S.A., 25th September, 1906; 6 years. Filed 1st May, 1906. Receipt No. 135,420.
claim.-1. The combination with a trolley pole, and a trolley wheel, of a harp, spring arms carried by said harp and
adapted to overlie said trolley wheel, means for partially rotating said arms, means for vertically reciprocating said trolley wheel within said harp, substantially as described.
2. The combination with a trolley pole, of a harp, an adjustable spindle mounted in said harp, a wheel journalled tuon said spindle, arms carried by sald harp and adapted to overlie said wheel, means to partially rotate sald arms, and means to adjust said wheel, substantlally as described.
3. The combination with a trolley pole, of a harp, a spindle mounted in sald harp, a wheel journalled upon said spindle means carried by said harp to automatically adjust sald trolley wheel, arms carried by said harp and adapted to overlie said trolley wheel, and means to move said arms out of vertical alignment with said trolley wheel, substantially as described.
4. The combination with a trolley pole, and a trolley wire, oi a harp, a spindle adjustably mounted in said harp, a wheel journalled upon said spindle and adapted to engage said trolley wire, arms overlying said trolley wire, means to move said arms out of alignment with said trolley wire, means to return said arms to their normal position, and means to normally hold said trolley wheel in engagement with said trolley wire, substantially as described.

No. 101,226. Bow Facing Oar. Rames.

Charles Henri Wessot, Ottawa, Ontario, Canada, 25th September, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,426.
Claim.-1. An improved bow facing oar comprising two overlapping members and means for communicating the movement of one member to the other reversed in direction, as and for the purpose specifled.
2. An improved bow facing oar comprising two overlapping members, pivoting means extending between and means for communicating the motion of one member to the other reversed in direction, as and for the purpose specified.
3. An improved bow facing oar comprising two circular dises, pivoting means for extending between each, means for communicating the rotation of one disc to the other, reversed in dircction, a handle secured to one disc and an oar blade secured to the other, as and for the purpose specified.
4. An improved bow facing oar comprising two circular discs having grooved peripheries, pivoting means extending between the same, two pulleys, means for flxedly supporting the same, a cord extending partially around the periphery of each disc and over the pulleys, a handle secured to one disc and an oar blade secured to the other, as and for the purpose specified.
J. An improved bow facing oar comprising two circular dises having grooved peripheries, a spider interposed between the two discs, pivoting means extending through the dises and the spider, means for non-rotatably supporting the spider, two pulleys secured on the splder, a cord extending around the groove in each dise and around the pulleys, a handle secured to one disc and an oar blade secured to the cther, as and for the purpose sprecified.
6. In a bow facing oar the combination with the two discs, two pulleys and cords extending around the same, of
means for tightening the cord, as and for the purpose specified.
7. In a bow facing oar the comblnation with the two discs placed one above the other, of friction wheels having contact with the surface of both discs, as and for the purpose specified.
8. In a bow facing oar the combination with the two discs, pivoting means extending between the same, the oar blade and the handle of connecting brackets extending between the discs, handle, oar blade and friction rollers secured on said brackets bearing an said discs, as and for the purpose specified.
9. An improved bow facing oar comprising two overlapping members, pivoting means extending between the same, means for communicating the motion of one member to the opposite reversed in direction and means for applying foot power to rotate one member, as and for the purpose specifled.
10. In a bow facing oar the combination with the two disc and means for communicating the rotation of one disc to the other reversed in direction, of a cord extending around the periphery of one disc, a movable foot rod and connecting means extending between the foot rod and the cord, as and for the purpose specifled.
11. In a bow facing oar the combination with the two discs, pivoting means extending between and means for communicating the motion of one disc to the other, of a movable foot rod and means for communicating the motion of the foot rod to one of the discs, as and for the purpose specified.
12. In a bow facing oar the combination with two pivoted members. means for communicating the motion of one member to the other reversed in direction. of means for feathering the oar at the end of each stroke, as and for the purpose specifled.
13. In a bow facing oar the combination with means for onerating the oar blade in a reverse direction to the handle, of means for automatically feathering the oar, as and for the purpose specified.
14. In a bow facing oar the combination with the blade. handle and means for giving the blade a motion reversed in direction to that of the handle, of means for locking the oar blade in predetermined positions, means for unlocking the same at the end of each stroke and means for turning it when unlocked, as and for the purpose specifled.
15. In a bow facing oar the combination with the rotatably supported oar blade, of means for locking the same in predetermined positions and means for releasing the locking moans and rotating the oar at the end of each stroke, as and for the purpose specifled.
16. In a bow facing oar the combination with the rotatably supnorted oar blade, of lorking dogs on the end thereof. a fixed ring having a slot therein adanted to be alternately engaged by the locking dogs. means for alternately releasing the lorking dogs and moving the oar to bring them alternately in engagement with the slot in the fixed ring. as and for the purpose snecified.
17. In a bow facing oar the combination with the rotatably sunported oar blade. of means for locking the same in predetermined positions. a lug on the end thereof. stops adanted to engage said lug and turn the oar at each end of the stroke. and means for releasing the locking dogs prior to the engagement of the lug with the stop, as and for the purnose specifled.
18. In a bow facing oar the combination with a rotatably supported car blade, a pulley slidably supported in the end thercof, means for resiliently pressing the same upwardly. a fixed ring having a slot therein adapted to be engaged alternately by the pulley, cam surfaces on the bolt, fixed stops adapted to engage each of said cam surfaces alternately at each end of the stroke of the oar and operating the release sald bolt. and means for turning the oar blade after the bolt has been released until the other bolt comes in engagement with the slot, as and for the purpose specified.
19. In a bow facing oar the combination with a rotatably supported oar blade, a bolt slidably supported in the end thereof, means for resiliently pressing the same upwardly, a flxed ring having a slot therein adapted to be engaged alternately by the bolt, cam surfaces on the bolt, fixed stops adapted to engage each of said cam surfaces alternately at each end of the stroke of the oar and operating to release said bolt, a projecting lug secured to the end of the oar blade, a fixed cam surface co-operating with said lug to turn the oar at each end of the stroke after the bolts have been unlocked, as and for the purpose specificd.
20. In a bow facing oar the combination with the oar blade, and means for feathering the same, of means for adjusting the length of the stroke, as and for the purpose specifled.
21. In a bow facing oar the combination with the rotatable supported oar blade, a projecting lug secured to the end thereof, of adjustably held stops adapted to engage said
lug at the end of each stroke and co-operating therewith to turn the oar, as and for the purpose specifled.
22. An improved bow facing oar comprising a handle, an oar blade, an overlapping joint connecting the same, pivoting means extending through the joint, means for communicating the motion of the handle to the oar blade reversed in direction, means for automatically feathering the oar blade, means for adjusting the length of stroke, as and for the purpose secified.
23. An improved bow facing oar comprising a handle, an oar blade, an overlapping joint connecting the same, pivoting means extending through the joint, means for communicating the motion of the handle to the oar blade reversed in direction, means for automatically feathering the oar blade, means for adjusting the length of stroke, and means for applying foot power to the oar blade, as and for the purpose specified.
24. An improved bow facing oar comprising a handle, two circular discs having grooved peripheries, a bracket extending between the handle and one disc, a bracket rotatably supporting the handle and secured to the other disc, a spider extending between the two discs, two pulleys secured to the same, a cord extending partially around the periphery of the discs and around the pulleys, means for locking the oar blade in two predetermined positions, means for releasing the locking means at each end of the stroke, and means for turning the oar automatically after the locking means has been released, as and for the purpose specified.

No. 101,227. Discharge Pipe. Tuyau de décharge.

Frederick W. Delanoy, Alameda, California, U.S.A., 25th September, 1906 ; 6 years. Filed 14th April, 1906. Receipt No. 134.899.
Claim.-1. A stand pipe having branches for basin connecticns at intervals between top and bottom, said branches having annular interiorly screw-threaded enlargements at the outer ends, a circular disc adapted to seat upon the interior shoulder of the enlargement, and a tubular exteriorly screw-threaded gland, the inner end of which seats upon and compresses the disc between itself and the shoulder, substan tially as described.
2. In a basin and like connection, a discharge pipe or stack having branches for the connection of the basin pipe, said branches having an enlarged screw-threaded outer end and an annular seat, a disc fitting upon said seat to close the opening for testing purposes, and a screw-threaded gland having the inner end bevelled whereby the disc is forced upon its seat and a tight joint maintained.

\section*{No. 101,228. Machine for Shrinking Cold Tires. Machine à rétrécir les bandages froids.}

Henry Mayers, St. Louls, Missouri, U.S.A., 25th September, 1906 ; 6 years. Filed 29th August, 1906. Receipt No. 139,080.
Claim.-1. In a machine of the character described the combination with slidably mounted oppositely movable blocks having recesses in their surfaces with overhanging flanges, of jaws arranged in said recesses with their outer edges extending below said flanges and means to actuate said blocks.
2. In a machine of the character described the combination with slidably mounted oppositely movable blocks, of jaws arranged on the upper surfaces of said blocks, sald jaws having inwardly extending lugs. for the purpose specified, and means to actuate said blocks.
3. In a machine of the character described the combination with slidably mounted oppositely movable blocks hav-

Ing recesses in their upper surfaces with overhanging fianges, of jaws arranged in sald recesses with their outer edges ex-

tending below said flanges, inwardly extending lugs on the inner edges of said jaws and means to actuate said blocks.
No. 101,229. Bait for Fish. Apat pour poissons.

John T. Mitchell, Seattle, Washington, U.S.A., 25th September, 1906 ; 6 years. Filed 31st July, 1906. Receipt No. 138,296.
Claim.-1. In an artificial fish bait, a substantially eggshaped body adapted to represent a fish egg.
2. In an artificial fishing bait a substantially egg-shaped clastic body adapted to represent a fish egg.
3. In an artificial fishing bait a substantially egg-shaped body adapted to represent a fish egg and formed with an ear having a hook receiving aperture.
4. In an artificial fishing bait, a body having the exterior surface shaped in conformity with that of a fish egg and corresponding thereto in colour.
5. In an artificial fishing bait, a cluster of bodies each having the exterior surface shaped in conformity with that of the egg of a salmon and corresponding thereto in colour.
6. In combination with a fish hook an artificial bait comprising an egg-shaped body having the hook passed therethrough, and a plurallty of egg-shaped bodies secured to the first-named body and being entirely free of the hook.

\section*{No. 101,230. Fire Extinguisher.}

Extinctcur d'incendic.
Beauchamp Henry Montgomery, Owen Sound, Ontario, Canada, 25th September, 1906; 6 years. Filed 6th July, 1906. Recelpt No. 137,5i2.
Claim.-1. In an automatic fire extinguisher, the nozzle consisting of the tubular portion having the dish-shaped head formed with the central concave vaive geat. the disc Htting in said head and formed with a convex faced valve registering with said valve seat, said head and disc forming a chamber between the two parts, the threaded stem extending from within the tubular portion of the head and carrylng said valve disc for regulating the play of the dise
within the head, the swinging yoke provided with the adjustable centrally disposed screw having its point bearing

against the end of the screw stem on which the disc valve is adjustable for holding the valve to its seat, and a fusible member for holding the yoke in its closed position, substantially as described.
2. In an automatic fire extingulsher, the nozzle consisting of the tubular portion having the dish-shaped head formed with the central concave valve seat and having a serrated periphery, the disc fitting in said head and formed with a convex faced valve registering with said valve seat and havIng a serrated portion lying within the serrated portion of the head screw-threaded stem adjustably supporting said disc valve within the head, a yoke pivoted at one side of the head and having a centrally disposed adjustable screw for holding the valve to its seat, and a fusible member for holding the yoke to its closed position, substantially as described.
3. An automatic fire extinguisher comprising piping for the supply of a fire extinguishing agent, a nozzle connected therewith and consisting of a tubular portion provided with a dish-shaped head formed with a central concave valve scat, the disc fitting in said head and formed with a convex faced valve registering with said valve seat, a screwthreaded stem adjustably supporting said disc valve within the head, a yoke pivoted at one side of the head and having a centrally disposed adjustable screw for holding the valve to its seat, a fusible member for holding the yoke to its closed position, and an electrical alarm having a contact point located to have the free end of said yoke when thrown to one side of the head to make contact therewith to close the circult and give an alarm, substantially as described.
No. 101,231. Eignal. Signal.

John Kith Reid. Montreal, Quebec, Canada, 25th September, 1:06: 6 years. Filed 2uth November, 1905. Heceipt No. 130,246 .
Claim.-1. A signal system consisting of a semaphore arm,
a normally inanimate key signal device mounted centrally
of the path of the semaphore arm, a series of inanimate signal devices carried by sald semaphore arm, means whereby the said signal device can be animated individually in groups or collectively, and means for swinging the said arm to different angular positions relatively to the key signal device, substantially as described and for the purpose set forth.
2. A night signal system consisting of a white key signal lamp, red code signal lamps, a semaphore arm, red white and green lamps carried by the semaphore arm, means whereby the said lamps are illuminated individually, in groups, or collectively, and means for moving the semaphore arm to different angular positions relatively to the key signal lamp, substantially as described and for the purpose set forth.
3. The combination of a standard, a semaphore arm, means pivotally connecting the semaphore arm to the standard to rotate in a vertical plane, means pivotally connecting such semaphore arm to the standard to revolve around the same in a horizontal plane, a central key signal device mounted concentrically to the first-mentioned pivotal connection of the semaphore arm, a serles of signal devices carried by the arm, means for rotating the arm in a vertical plane to different angular positions, a pair of code signal devices located one above and one below the semaphore arm, and means for anlmating the signal devices individually in groups or collectively, substantially as described and for the purpose set forth.
4. The combinaton of a standard, a semaphore arm, means pivotally connecting the semaphore arm to the standard to rotate in a vertical plane. means pivotally connecting such semaphore arm to the standard to revolve around the same in a horizontal plane, a central key signal device mounted concentrically to the first-mentioned plvotal connection of the semaphore arm, two series of signal devices carrled by opposite ends of the arm, means for rotating the arm in a vertical plane to different angular positions, a pair of code signal devices located one above and one below the semaphore arm and means for anlmating the signal devices individually in groups or collectively.
5. The comblnation of a standard, a semaphore arm, means plvotally connecting the semaphore arm to the standard to rotate in a vertical plane, means pivotally connecting such semaphore arm to the standard to revolve around the same in a horizontal plane, a central key lamp mounted concentrically to the first-mentioned pivotal connection of the semaphore arm, two series of different coloured lamps carried by opposite ends of the arm, means for rotating the arm in a vertical plane to different angular positions, a pair of code signal lamps located one above and one below the semaphore arm, and means for llluminating the lamps individually in groups or collectively.
6. A night signalling apparatus somprising a standard, a frame supported thereby and adapted to swing around the same to face different points of the compass, a semaphore arm, a pair of code signal lamps, means suporting such code signal lamps one above and the other below the semaphore arm, means pivotally connecting the latter to the frame, means whereby such semaphore arm is oscillated in a vertical plane in both directions from the perpendicular, a series of signal lamps carried by the said semaphore arm, and means for illuminating the lamps individually, in groups or collectively.
7. A night signalling apparatus comprising a standard, a frame supported thereby and adapted to swing around the same to face different points of the compass, a semaphore arm, a pair of code signal lamps, movable arms supporting such code signal lamps one above and the other below the semaphore arm, a detachable device retaining the arms in a perpendicular line, means pivotally connecting the latter to the frame, means whereby such semaphore arm is oscillated in a vertical plane in both directions from the perpendicular, a series of signal lamps carried by the said semaphore arm, and means for illuminating the lamps indlvidually, in groups or collectively.
8. A night signalling apparatus for use on ship board and comprising a portable standard, a frame supported thereby and adapted to swing around the same to face different points of the compass, a semaphore arm, a palr of code signal lamps, means supporting such code signal lamps one above and the other below the semaphore arm, means pivotally connecting the latter to the frame, means whereby such semaphore arm is oscillated in a vertical plane in both directions from the perpendicular, a series of signal lamps carried by the said semaphore arm, and means for illuminating the lamps individually, in groups or collectively, substantially as described and for the purpose set forth.
9. A night signalling apparatus comprising a standard, a frame supported thereby and adapted to swing around the same to face different points of the compass, a horizontal shaft rotatably supported in the frame, a semaphore arm mounted rigidly upon one end of the shaft. a second shaft
having a hand wheel mounted rigidly thereon, a train of gears operatively connecting such shafts together, a pair of code signal lamps, means supporting such code signal lamps one above and the other below the semaphore arm, means pivotally connecting the latter to the frame, means whereby such semaphore arm is oscillated in a vertical plane in both directions from the perpendicular, a series of signal lamps carried by the said semaphore arm, and means for illuminating the lamps individually, in groups or collectively, substantially as described and for the purpose set forth.
10. A portable electric night signalling apparatus for use aloft on ship board and comprising a series of movable signal devices mounted upon a portable carrier, and means electrically connecting such signal devices to the source of electricity, substantially as described and for the purpose set forth.
11. In a marine electric night signalling apparatus substantially as described, the combination with a movable signalling member, of means operatively connected thereto and located a distance therefrom and automatically indicating the position of said signalling member, substantially as described and for the purpose set forth.
12. In an electric signalling apparatus having an oscillatory signalling member with a series of signal lamps mounted thereon, a stationary key lamp and a pair of stationary code lamps mounted adjacent to the oscillatory member, the said oscillatory member being adapted to be swung to different angular positions relatively to the key lamp, of a plurality of switches, electrical connections between each switch and a different signal lamp, substantially as described and for the purpose set forth.
13. In an electric signalling apparatus having an oscillatory signalling member with a series of signal lamps mounted thereon, a stationary key lamp and a pair of stationary code lamps mounted adjacent to the oscillatory member, the said oscillatory member being adapted to be swung to different angular positions relatively to the key lamp, of a plurality of switches, electrical connections between each switch and a different signal lamp, and a pair of switches each electrically connected to a different pair of signal lamps, substantlally as described and for the purpose set forth.
14. In an electric signalling apparatus having an oscillatory signalling member with a series of signal lamps mounted thereon, a stationary key lamp and a pair of stationary code lamps mounted adjacent to the oscillatory member the said oscillatory member being adapted to be swung to different angular positions relatively to the key lamp, of a switch board in the form of a transparency bearing a plurality of switches, electrical conncctions between each switch and a different signal lamp, and a pair of switches each electrically connected to a different pair of signal lamps, substantially as described and for the purpose set forth.
15. In an electric signalling apparatus having an oscilla tory signalling member with a series of signal lamps mount ed thereon, means for swinging such member to different vertical angular positions and means for illuminating such device individually, in groups or collectively, of an index pictorially representing the different angular positions to which the oscillatory member may be swung and also representing the different signals to be interpreted from the member when in each position with one or more lamps illuminated, an oscillatory indicator movable concentrically of and in close proximity to the index and means for moving the indicator synchronously with the oscillatory member, substantially as described and for the purpose set forth.
16. In an electric signalling apparatus having an oscillatory signalling member with a series of signal lamps mounted thereon, means for swinging such member to different vertical angular positions and means for illuminating such devices individually, in groups or collectively, of an index in the form of a transparency pictorially representing the different angular positions to which the oscillatory member may be swung and also representing the different signals to be interpreted from the member when in each position with one or more lamps illuminated, an oscillatory indicator movable concentrically of and in close proximity to the index, and means for moving the indicator synchronously with the oscillatory member, substantially as described and for the purpose set forth.
17. A night signalling apparatus comprising a standard, a frame supported thereby and adapted to swing around the same to face different points of the compass, a horizontal shaft rotatably supported in the frame, a semaphore arm mounted rigidly upon one end of the shaft, a second shaft having a hant wheel mounted rigidly thereon, a train of gears operatively connecting such shafts together to rotate in unison a pair of code signal lamps, means supporting such code signal lamps one above and the other below the semaphore arm, a series of signal lamps carried by the said semaphore arm, and a switch board bearing a plurality of switches, electrical connections between each
switch and a different signal lamp, and a palr of switches each electrically connected to a different pair of signal lamps, an index box pictorally representing the different angular positions to which the semaphore arm may be swung and also representing the different signals to be interpreted from the said semaphore arm when in each position with one or more lamps illuminated, such index box being mounted concentrically to the second shaft, and an indicator mounted rigidly upon the said second shaft in close proximity to the index, substantially as described and for the purpose set forth.

No. 101,232. Eprinkler. Arrosotr.

George Ichabod Rockwood, Worcester, Massachusetts, U.S.A., 25 th September, 1906 ; 6 years. Filed 3rd July, 1906. Receipt No. 137,495.
Cliam.-1. In an automatic sprinkler the combination with a water nozzle and a cap closing said nozzle, of a fixed boss and a cap retaining device between said cap and said boss comprising a lever arranged parallel to said cap, a post havifg one end bearing against said cap and its opposite end bearing against one end of said lever, and a strut interposed between said post and the opposite end of said lever, sald strut consisting of attached pieces detachable by heat.
2. In an automatic sprinkler the combination with a water nozzle and a cap closing said nozzle, of a cap retaining device comprising a lever arranged parallel to the cap, a post resting upon said cap and supporting one end of said lever, a strut placed at an oblique angle to said post and interposed between said post and the opposite end of said lever, said strut consisting of attached pieces detachable by heat, and means for applying pressure to said lever between its supported ends.
3. In an automatic sprinkler the combination with a water nozzle and a closing cap for said nozzle, of a fixed boss having its axis coincident with the axis of the nozzle, a lever bearing against said boss and between its ends, a post interposed between one end of said lever and said cap, and a strut interposed between said post and the opposite end of said lever, the integrity of said strut being destroyable by heat.
4. In an automatic sprinkler the combination with a water nozzle and a closing cap for said nozzle, of a fixed boss above said cap, a lever parallel with the cap and bearing against said boss, a post bearing on said cap and supporting one end of said lever and a trust resting against a shoulder on said post and supporting the opposite end of sald lever, and means for varying the distance between said boss and said cap.
5. In an automatic sprinkler the combination with a water nozzle and a cap closing said nozzle, of a fixed boss above said cap and a cap retaining device interposed between said boss and said cap and consisting of a frame comprising an upright post, an oblique strut bearing against said post, and a lever supported upon said post and strut and bearing against said-boss, one member of said retaining device being composed of pleces attached together by solder fusible at a predetermined degree of heat.

No. 101,233. Furnace for the Manufacture of

\section*{Fournaise pour la fabrication de l'acier.}

Alexandre Tropenas, Paris, France, 25th September, 1906; 6 years. Filed 26th March, 1900. Recelpt No. 78,165.
Claim.-1. A rocking open hearth furnace having attached to and extending downwardly from that part of its floor or lining which is lowermost in normal position, a crucible or converter in which the metal is adapted to be treated by a pneumatic process, the cross sectional area of the converter being less than such portion of the floor of the open hearth furnace whereby therein left at the margin or upper edge of
    9-33
the crucible a sufficient furnace floor upon which may be placed materials to be used as described and which become

heated during the pneumatic process conducted in the crucible.
2. A rocking open hearth furnace having extending downwardly from that portion of its floor or lining which is lowermost when the furnace is in its normal position, a cruction or converter of less cross sectional area than such portion of the floor of the furnace and an upward projection from the of the floor of the furnace ant the margin or upper edge of the floor of the furnace adjacent the \&c., placed upon the floor of crucible whereby scrap, lime, \&c., placed upon the fioor of the furnace at the margin of the crucible is prevented from slipping into the crucible and is highly heated during the pneumatic operation conducted in the crucible.

No. 101,234. Insulator. Isolateur

William R. Twiggs, Sandusky, Ohio. U.S.A., 25th September, 1906; 6 years. Filed 29th August, 1906. Receipt No. 139.063.

Olaim.-1. An insulator comprising a body portion having a lepression formed in the top thereof, diametrically disposed lownwardly inclined slots radiating from said depression and adapted to receive a line wire, and removable locking members disposed within said slots for engagement with said wire.
2. An insulator comprising a body portion having a depression formed in the top thereof, a plurality of diametrically disposed downwardly tapered slots radiating from said dedisposed downwardy tapered and removable locking members disposed within said slots and adapted to engage said wire.
3. An insulator comprising a body portion the top of which is An insulator with a plurality of diametrically disposed slots is provided with a pluralined downwardly from the center thereof and adapted to inclined downwardly from the center thereol and adapted to receive a line wire, and locking members
said slots and adapted to engage said wire.
4. An insulator comprising a body portion the top of which is provided with a plurality of diametrically disposed slots inclined downwardly from the center thereof and each having a groove at its lower wall adapted to recelve a line wire. and removable locking members disposed in said slots and adapted to engage said wire.
5. An insulator comprising a body portion provided with 3 depression having a plurality of diametrically disposed slots radiating therefrom, a seating groove formed in the bottom wall off each slot for the reception of a line wire, and balls disposed in the slots and adapted to engage said wire.

No. 101,235. Display Rack. Ratelier d'étalage.

Wallace D. Wllbur, Ottawa, Kansas, U.S.A., 25th September, 1906: 6 years. Filed 8th August, 1906. Receipt No 138,477.
Claim.-1. In a display rack of the character described the combination with a display bar and depending handle rigidly connected to the bar and pulleys fixedly supported above said bar, of knotted flexible supporting devices connected to the bar extending over the pulleys and means adjustably connected to said knotted flexible portions adapted to engage and support the handle.
2. The combination with a display bar having a dependrigid handle, of pulleys above the bar, cords secured to the bar and extending over the pulleys, the ends of said cords hanging together and knotted, a shank and eye at one and adapted to engage the knotted ends, and a hook on the shank adapted to engage and support the rigid handle.

No. 101,236. Gauge, or Marker and Rule. Jauge, ou marqueur et régloir.

Anthony D. Zimmer Newburg, North Dakota, U.S.A., 25th Septem 1906: 6 years, Filed 20th August, 1906. Receipt No. 138,820.
Claim.-A gauge or marker for use in fitting baseboards to the base block of a room comprising two members 1 pivot-
ally connected together at one end and provided at their pivoted ends with inwardly extending extensions 4 provided with right angles, faces or edges, two of said faces being designed to abut against each other to hold said members in parallel relation so that the device may be conveniently straddled upon the baseboard and the latter marked at the proper point.

No. 101,237. Culvert. Ponceau.

Thomas Bardon and Charles E. Wiberg, co-inventors, both of Ashland, Wisconsin, U.S.A., 25th September, 1906; 6 years. Filed 18th August, 1906 Recelpt No. 138,809.
Claim.-1. A culvert made up of a plurality of interlocking plates each of which is formed with lugs which project outwardly from the longitudinal edges of the plate, the lugs of one plate entering between the lugs of the two adjacent plates in inter locking engagement therewith, one of said longitudinal edges in each plate being continuous and thickened and formed integral with the plate itself, the thickness of said thickened longitudinal edge being greater than that of the lugs which project outwardly therefrom whereby a supporting shoulder is formed on the inner wall of each plate along said thickened longitudinal edge.
2. A culvert made up of a plurality of interlocking plates formed with lugs which project from their longitudinal edges, the lugs of one plate entering between the lugs of the two adjacent plates in interlocking engagement therewith, a plurality of said plates being formed with a continuous thickened edge, the lugs projecting from said edge being of less thickness than sald edge whereby a supporting shoulder is formed along sald edge, said lugs being formed with an inwardly projecting tooth between which and said shoulder the edge of the adjacent plate is seated, said teeth resisting pressure from within the culvert.
3. A built up culvert made up of a plurailty of interlockIng plates having thickened longitudinal edges from which project lugs of less thickness than that of said edges whereby a supporting shoulder is formed along said edges, said lugs being formed with teeth in the groove between which and said shoulder the edge of the adjacent plate is seated, said plates being provided with flanges at one end which overlap the abutting end of the corresponding plate of the next succeeding section of the culvert and a side plate of said culvert being formed with an opening having a raised collar therearound for the connection of a house pipe.

\section*{1To. 101,238. Concrete Mizer Mélangeur de béton.}

William H. Likins and William F. Cowham, assignee of a three-fourths interest, both of Jackson, Michigan, U.S.A., 25th September, 1906 ; 6 years. Filed 31st August, 1905. Recelpt No. 128,078.
Claim.-1. In a mixing machine the combination with a casing, of a vertical shaft pasing axially therethrough, agitstor arms of rounded cross section projecting from sa!a shaft within the casing, and a blade secured to said shaft at the lower end of said casing for ejecting the material therefrom.
2. In a mixing machine the combination with a casirg and movable mixing devices therein, of means for positively

0
feeding the material to be mixed to the upper end of said casing and permitting the same to be fed through said casing by gravity, an overflow connection at the upper end of said casing, and an adjustable restriction for the discharge from the lower end of the casing.
3. In a mixing machine the combination with a verticaily urranged mixing chamber, of means for feeding the materiol to be mixed into the upper end through the stirrer mechanism within said chamber, a detachable gate controlling the discharge from the lower end of said chamber, the uppen end of said chamber being provided with an overflow opening for indicating the relative volumes of the supply and discharge.
4. A mixing machine comprising a vertically arranged dry mixing chamber, a revoluble stirrer therein, and a horizontally extending wet mixing trough at the lower end of said dry mixing chamber and into which the material from the latter is discharged.
5. A mixing machine comprising a vertically arranged mixing chamber through which the material to be dry mixed is fed by gravity, stirrer mechanism within said mixing chamber, an adjustable gate at the lower end of said mixing chamber controlling the discharge of the material therefrom, a horizontally extending trough at the lower end of said chamber in which the material is discharged, stirrer mechanlsm within said trough, and a perforated nozzle extending across above sald trough, through which water is discharged into the material within the trough.

No. 101,239. Condenser. Condenscur.
The Bell Telephone Company of Canada, Montreal, Quebec, Canada, assignee of Maurice Kolb McGrath, Antwerp Belgium, 25th September, 1906 ; 6 years. Filed 30th March, 1904. Receipt No. 113,974.
Claim.-1. The herein described process of making condensers, which consists in assembling the strips of foll and insulating material in a flat roll, folding sald flat roll, treating the same with melted wax or the like, and finally subjecting the folded roll to continual pressure on all sides while allowing the wax to cool and set.
2. The herein described process of making condensers, ing the folded roll in a narrow rectangular mould and subwhich consists in assembling strips of foil and paper in a jecting the same to continued pressure while allowing the wax to cool and set.
3. An electric condenser consisting of a flat roll of alter-
 nate layers of conducting and insulating material reversely folded two times or a multiple thereof, whereby distortion of the laminae is prevented.
4. A condenser comprising a flat roll of strips of foll and paper reversely folded in a complete zigzag, parafined and pressed.
5. A condenser comprising strips of paper and tin foll, asScmbled and folded reversely into an S-shape, and inally pressed on four sides, the pressure being sufficient to produce intimate contact between the strips of foil and insulating material where the same are folded.
6. The herein described process of making condensers. which consists in rolling and folding strips of paper and tin foil reversely into an S-shape, treating the same with melted wax, and subjecting the same to pressure on all sides in a mould while allowing the wax to cool and set, the pressure being applied in such a way as to force all adjacent portions of said strips into intimate relation, whereby maxinum capacity for a given amount of material is obtained.
flat roll, reversely folding the fiat roll into an S-shape, treating the same with melted paraffin wax or the like, plac-

17389. A HIELAND LAD. (For Piano.) By. Efugen Woycke, Op. 57. No. 7. Whaley, Royce and Company, Limited, Toronto, Ont., 11th July, 1906.
17390. YE BANKS AND BRAES. (For Piano.) By Eugen Woycke, Op. 57. No. 8. Whaley, Royce and Company, Limited, Toronto, Ont. 11th July. 1906.
17391. THE CAMPBELLS ARE COMING. (For Piano.) By Eugen Woycke, Op. 57. No. 9. Whaley, Royce and Company, Limited. Toronto, Ont., 11th July, 1906.
17392. ANNIE LAURIE. (For Piano.) By Fhgen Woyake, Op. 57. No. 10. Whaley, Royce and Company, Limited, Toronto, Ont., 11th July, 1906.
17393. THE LASS O' GOWRIE. (For piano.) By Eugen Woycke, Op. 57. No. 11. Whaley, Royce and Company, Limited, Toronto, Ont., 11th July. 1906.
17394. SCOTS, WHA HAE WI' WALLACE BLED. (For Piano.) By Eugen Woycke, Op. 57. No. 12. Whaley, Royce and Company, Limited, Toronto, Ont., 11th July, 1906.
17395. I'M TRYING SO HARD TO FORGET YOU. (Song.) By Ben Jerome. Harry H. Sparks, Toronto, Ont., 12th July, 1906.
17396. FLORENTINE. Waltzes. By Josef F. Lamb. Harry H. Sparks, Toronto, Ont., 12th July, 1906.
17397. THE ENGINEERING JOURNAL OF CANADA. July, 1906. (Book.) Archd. W. Smith and Partners, Limited, Toronto, Ont., 13th July, 1906.
17398. SCHOOL ROOM PRACTICE. Arranged by J. A. Dickinson and David Young. (Book.) The Copp. Clark Company, Limited, Toronto, Ont., 13th July, 1906.
17399. THERE'S A ROOM TO RENT IN MY HEART FOR YOU. (Song.) Words by Harry L. Newton. Music by Hampton Durand Will Rossiter, Chicago, nlinois, U.8.A., 14th July, 1906.
17400. LOVE'S CONSOLATION. A Meditation for Piano. By Geo. L. Spaulding. Will Rossiter, Chicago, Illinois, U.S.A., 14th July. 1906.
17401. OFFICIAL TELEPHONE DIRECTORY, DISTRICT OF TORONTO AND SUBURBS. July, 1906. The Bell Telephone Company, of Canada Limited Montreal, Que., 14th July, 1906.
17402. THE CANADIAN LAW TIMES ANNUAL DIGEST OF CANADIAN CASES REPORTED AND NOTED DURING THE FBAR 1905. Edited by Edward B. Brown, B.A. (Book.) The Carswell Company, Limited, Toronto, Ont., 14th July, 1906.
17403. THE CANADIAN LAAW TIMES. Volume XXV. Edited by Edward B. Brown, B.A. (Book.) The Carswell Company, Limited, Toronto, Ont., 14th July, 1906.
17404. NOUHIKA. Indian Intermezzo Two-Step. Par Wilfrid Beaudry. Wilfrid Beaudry, Québec, Quué., 14 Julliet, 1906.
17405. DIXIE BLOSSOMS. Two-Step. By Percy Wenrich. Jerome H. Remick and Company, Detroit, Michigan, U.8.A., 16th July, 1906.
17406. AUTUMN. (The Woods are Ablaze.) By Nell Morèt. (Music.) Jerome H. Remick and Company, Detrolt. Michigan, U.S.A., 16th July, 1906.
17407. LE SECRET DE LA MARQUISE ; et UN HOMME D'HONNEUR. Par Adelfe Bibaud. Suivi des poésies Canadiennes de Michel Bibaud. (Livre.) Adele Bibaud, Montréal, Qué, 16 juillet, 1906.
17408. HARMSWORTH SELF-EDUCATOR MAGAZINE. 19th July, 1906. No. 16. The Amalgamated Press, Limited, London, England, 16th July, 1906.
17409. SMILY'S CANADIAN SUMMER RESORT GUIDE, 1906. By Frederick Smily. (Book.) Frederick Smily, Toronto, Ont., 16th July, 1906.
17410. I LIKE YOU, TOO. (Song.) Lyrics by Harry Williams. Music by Gertrude Hofrman. Jerome H. Remick and Company, New York, N.Y., U.S.A., 17 th July, 1906.
17411. THE CIRCUIT GUIDE. No. 28. (Book.) Archibald Young Blain, Toronto, Ont., 17th July, 1906.
17412. THE LILY MAID. A cycle of seven Songs with Piano Accompaniment. Words by Gentrude Rogers. Music by Alexander Von Fielts. Op. 84. The John Church Company, Cincinneti, Ohlo, U.8.A., 17th July, 1906.
17413. THE ONTARIO LAW REPORTS. Vol. X. 1905. Edited by James F. Smith. K.C. The Law Society of Upper Canada, Toronto, Ont., 18th July, 1906.
17414. CLEVELAND NEWS. March and Two-Step. By J. S. Zamecnik. H. N. White, Cleveland, Ohio, U.S.A., 18th July, 1906.
17415. CANADIAN ELECTRICAL ASSOCIATION QUESTION BOX. 1006. (Book.) Adolphe Alfred Dlon, Ottawa, Ont., 18th July. 1906.
17416. OTTAWA CITY DIRECTORY, 1906. Might Directories, Limited Toronto, Ont., 19th July, 1906.
17417. SELECTIONS FROM WORDSWORTH. Edited, with Notes, by Alexander Mowat, B.A. Morang \& Company, Limited, Toronto, Ont., 19th July, 1906.
17418. THE HEROES. Complete. By Charles Kingsley. Edited with Notes, by John C. Saul, M.A. Morang \& Company, Limited. Toronto, Ont., 19th July, 1906.
17419. TANGLEWOOD TALES. Complete. By Nathaniel Hawthorne. Edited with Notes, by John C. Saul, M.A. Morang \& Company, Limited, Toronto, Ont., 19th July, 1906.
17420. HITLOFI GRAFIST. By Iven Hitlof. (Book.) Iven Hitloa, Toronto, Ont., 19th July. 1906.
17421. IMPRESSIONS D'UN PASSANT (AMERIQUE-EUROPE-AFRIQUE.) Par l'Abbe V. A. Huard. (Livre.) Victor Alphonse Huand. Ptre., Québec, Que., 20 julllet 1906.
17422. HEARTS AND MASKS. For Piano. By Leo Friedman. Jerome H. Remick \& Company, Detroit, Michigan, U.8.A., 20th July. 1906.
17488. THD CARE AND REPAIR OF A WATCH. (Book.) Heary Birke \& Sons, Limited, Montreal, Que., 20th July, 1906.
17424. THE CANADIAN GIRL. (Picture.) The Canadian Rubber Company of Montreal, Limited, Montreal, Que., 21st July, 1906.
17485. DARE TO BE A DANIEL. Sermon by Rev. Frank De Witt Talmage. Los Angeles, California, U.S.A., 22nd July, 1906. Frederick Diver, Tqronto, Ont., 21st July, 1906.
17426. ORKNEY LULLABY. Words by Eugene Field. Music by Reginald de Koven. The John Church Company, Cincinnati, Ohio, U.S.A., 23rd July, 1906.
17427. FIDDLE-DEE-DEE. Words by Eugene Field. Music by Reginald de Koven. The John Church Company. Cincinnati, Ohio, U.S.A., 23rd July, 1906.
17428. SWING HIGH AND SWING LOW. Words by Eugene Field. Music by Reginald de Koven. Op. 117. No. 2. The John Church Company, Cincinnati, Ohio, U.S.A., 23rd July, 1906.
17429. LITTLE-OH-DEAR. Words by Eugene Field. Music by Reginald do Koven. The John Church Company, Cincinnati, Ohio, U.8.A., 28rd July, 1008.
17430. NIGHTFALL IN DORDRECHT. Words by Eugene Field. Music by Reginald de Koven. The John Church Company, Cincinnati, Ohio, U.S.A., 23rd July, 1906.
17431. MCALPINE'S HALIFAX CITY DIRECTORY, 1906-1907. McAIpine Publishing Company, Limited, Halifax, Nova Scotia, 23rd July, 1906.
17432. QUILTY. (Forgiven-Reclaimed.) A Canadian Story from Real Life, By Lance Bilton. Stuart Taggart, (Lance Bilton), Ottawa, Ont., 23rd July, 1906.
17433. INVESTIGATE VANCOUVER, BRITISH COLUMBIA. (Print.) The Vancouver Hundred Thousand Club, Vancouver, British Columbla, 23rd July, 1906.
17434. WHAT'S THE USE OF ANYTHING. Words by Harry Williams. Music by Egbert Van Alstyne. Jerome H. Remick \& Company, New York, N.Y., U.S.A., 24th July, 1906.
17435. WHAT'S THE MATTER WITH OUR TEAM. Words and Music by Vincent Bryan. Jerome H. Remick \& Company, New York, N.Y., U.S.A., 24th July, 1906.
17436. THE INSURANCE HOLDER., Arthur Gate, Toronto, Ont., 24th July, 1906.
17437. CAYUGA. (Two-Step.) By W. H. Hodgins. (Music.) W. H. Hodgins, Toronto, Ont., 24th July, 1906.
17438. MARRIAGE CERTIFCATE AND MARRIAGE SERVICE. By James Rollins. (Book.) James Rollins, London, Ont., 24th July, 1906.
17439. SILVER LEAVES. (Intermezzo.) For Piano. By Hampton Durand. Will Rossiter, Chicago, Illinois, U.S.A., 25th July, 1906.
17440. FLORA DORA. A Stirring March Song. Words and Music by W. R. Williams. Will Rossiter, Chicago, Illinois, U.S.A., 25th July, 1906.
17441. BANK LEGAL GUIDE, 1906-7. (Book.) McPhee Bros. \& Bayley Company, Montreal, Que., 25th July, 1906.
17442. KEEP ON PRAYING. (Hymn.) Words by F. W. Vandersloot. Music by Mabel \(F\). Gohl. Vandersloot Music Publishing Company, Williamsport, Pennsylvania, U.S.A., 25th July, 1906.
17443. SIGHT SINGING. (Theory.) By Wm. Shannon. (Book.) Wm. Shannon, Montreal, Que., 25th July, 1906.
17444. LA GRAMMAIRE. Par Eugene Labiche. Edited with Notes and Vocabulary, by John Squair, B.A. W. J. Gage \& Company, Limited, Toronto, Ont., 25th July, 1906.
17445. HISTORY OF CANADA FOR USE IN PUBLIC SCHOOLS. By Maria Lawson. Edited by A. H. Reynar, M.A., LL.D. W. J. Gage \& Company, Limited, Toronto, Ont., 25th July, 1906.
17446. ALEXANDER MUIR. (Portrait.) The Alexander Engraving Company, Toronto, Ont., 26th July, 1906.
17447. MOUNTAIN WILD FLOWERS OF CANADA. A Simple and Popular Guide to the Names and Descriptions of the Flowers that Bloom above the Clouds. By Julia W. Henshaw. (Book.) Mrs. Julia W. Henshaw, Vancouver, B.C., 26th July, 1906.
17448. THE CANADIAN MUNICIPAL JOURNAL. July, 1906. (Book.) The Canadian Municipal Journal Co., Limited, Montreal, P.Q., 26th July, 1906.
17449. AN HISTORICAL POEM : THE ST. LAWRENCE RIVER. By Judith Julia Farley. (Book.) Judith Julia Farley, Quebec, Que., 26th July, 1906.
17450. WHISPERING WAVES. (Waltzes.) By Harry J. Lincoln. Vandersloot Music Publishing Company. Williamsport, Penn., U.S.A., 27th July, 1906.
17451. THE JOKER. March Two-Step. By Abe Losch. Vandersloot Music Publishing Company, Williamsport, Penn., U.S.A., 27th July, 1906.
17452. VINGT-QUATRE JUIN. Chœur de Chant. Par Paul-Emile Prérost. (Composition musicale.) Dr. Paul-Emile Prévost, Montreal. Que., 27 juillet 1906.
17453. THE CANADIAN MAGAZINE. August, 1906. Ontario Publishing Company, Limited, Toronto, Ont., 28̣th July, 1906.
17454. ELIE'S SHORTHAND. Par Prof. William Elic. (Livre.) William Elle, Montréal, Que. 30 juillet 1906.
17455. THE HARDWARE MONTHLY OF CANADA. July, 1906. (Book.) Archd. W. Smith and Partners, Limited, Toronto, Ont., 30th July, 1906.
17456. THE ANNUAL FINANCIAL REVIEW. (Canadian) July. 1906. (Book.) William Robert Houston, Toronto, Ont., 30th July, 1906.
17457. Le VENERABLE FRANCOIS DE MONTMORENCY-LAVAL. Premier Eréque de Québec. Par l'Abbé Auguste Gosselin. (Livre.) Auguste Gosselin, (Ptre.) St-Charles, Comte de Bellechasse, Que.. 30 juillet 1906.
17458. THE CHURCH SLEEPERS. Sermon by Rev. Frank De Witt Talmage, Los Angeles, Cal., U.S.A., 29th July, 1906. F. Diver, Toronto, Ont., 30th July, 1906.
1ito 9. VICTORIA PARK, BERLIN, ONT. (Photograph.) The Panoramic Camera Company of Canada, Toronto, Ont., 31st July, 1906.
17460. HARMSWORTH SELF-EDUCATOR MAGAZINE. (No. 17.) August 2nd. 1906. The Amalgamated Press, Limited, London, England, 31st July, 1906.

Vol. XXXIV.-No. 10. OCTOBER 31st, 1906.

\section*{NOTICE.}

AU solicitors, agents or attorneys who, in circulars or advertisesents, or otherwise, refer to the Commissioner or Deputy Comsmissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

\section*{INVENTIONS PATENTED.}

SOTE.-Patenta are granted for 18 jears. The torm of years for which the foe ham been pald, is given after the date of the patent.

1To. 101,240. Bupplementary Vehicle Bpring.
Ressort supplémentaire de véhioule.

The Supplementary Spring Company, assignee of Samuel Fulmidge, both of St. Louis, Missouri, U.S.A., 2nd October. 1906; 6 years. Flled 4th September, 1906. Receipt No. 189,218.
Clatm.-1. A device of the character described, comprising a yielding connection with the vehicle body, a leaf spring having a disjoined leaf, said disjoined leaf having pivotal connection with said rigid connection, a helical spring member in pivotal connection with said leal spring, and also with sald disjoined leaf, the intermediate means for connecting said helical member to said disjoined leaf being in firm connection with one end of sald helical member.
2. A device of the character described, comprising a pendant from the vehicle body, a leaf spring having a disjoined
leaf, said disjoined leaf being connected to said pendant, a pair of vertical bolts also connected to sald pendant and to said disjoined leaf, a helical member connected at one end to the main body of the leaf spring and at the other end to said vertical bolts.
3. A device of the character described, comprising means for connecting same to the vehicle body, a lear spring having a disjoined leaf, and a pair of helical springs underneath sald leaf spring but so connected as to be resilient therewith.
4. A device of the character described, comprising a connection with the vehicle body, a leaf spring having a disjoined leaf, an eye turned at the end of said disjoined leaf and another eye turned at the end of the next adjoining leaf, bolts passing through said eyes, a helical member having an eye at one end, one of said bolts passing through said eye, and a third bolt having an eye through which the other of said first-mentioned boits passes, said third bolt being firmly connected to the end of the helical member opposite the end on which said eye is formed.
5. A device of the character described, comprising leal members and a helical member pivotally connected together and arranged so that the weight first tends to flatten one. of the leaf members, then to distend the hellcal member, and then finally to flatten the other leaf member.
6. A device of the character described, comprising a leat member having a disjoined leaf, a helical member at one end pivotally connected to said leaf member, and at the other end firmly united to an intermediate connecting means in pivotal relation to said disjoined leaf.
7. A device of the character described, comprising a fixed support and a firm but yielding point of resilient striain and a leaf spring interposed between said members and connected thereto, one leaf of said leaf spring being held disjoined from the remainder.
8. A device of the character described, comprising a leal spring having one disjoined leaf and a pair of hellcal springs connected to sald leaf spring and also to sald disjoined leaf and being located exterior to the space between sald leaf spring and said disjoined leaf.
9. A device of the character described, comprising a leaf spring having one disjoined leaf and a pair of helical springa connected to said leaf spring and also to said disjoined leaf, and being located exterior to the space between said leat spring and said disjoined leaf, and the resiliency of sald helical springs coming into play intermediate the fiattening of said disjoined leaf and the remainder of said leaf spring.
10. A device of the character described, comprising a lea spring having a disjoined leaf, said leaf spring being pivotally connected to a helical spring member, and said disjoined leaf pivotally connected with the vehicle body and being also connected with said hellcal member.
11. A device of the character described, comprising a leaf member having a disjointed leaf and a helical spring member in pivotal relation thereto, said helical spring member being located exterior to the leal member and its disjoined leaf, but its resilient action being intermediate same.

\section*{No. 101,241. Hame Fastener. Attache d'attelles.}

Eben Bryant Smith and James La Flamboy, each an assignee of a half interest, both of Buffalo, New York, U.S.A., 2nd October, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,211.
Claim.-1. In a hame fastener the combination of a supporting member, a fastener member pivotally supported on maid
supporting member, and means for retaining said fastener member in locked position.

2. In a hame fastener the combination of a supporting member having means for connection to a hame, a fastener member pivotally supported on said supporting member, meang to retain sald fastener member in locked position, and means for adjusting said fastener member on the supporting member.
3. The combination with a palr of hames, of a supporting member pivotally and adjustably connected to one of sald hames, and a fastener member having means for connecting with the other of sald hames and being pivotally supported on the supparting member.
4. The combination with a pair of hames, of a supporting member pivotally connected to one of said hames, a fastener member supported on said supporting member, means tu affect an adjustment between said members, and means to affect an adjustment between one of the hames and the supporting member.
5. A. hame fastener comprising a supporting member, a fastener member, and an intermediate member pivoted to said supporting member and having the fastener member pivotally connected thereto, the relative arrangement of the pivotal points of said members being such than when the fastener member is swung into its locked postion, the pivot thereof is beyond the center of the pivotal point of the intermediate member.
6. A hame fastener comprising a supporting member provided with a threaded aperture, an adjusting screw threaded into said aperture and having means for connection to a hame, and a fastener member carried by said supporting member and adapted for connection with a hame.
7. A hame fastener comprising a supporting member provided with a threaded aperture at or near one end, an adjusting screw having an enlarged square portion and a head and being threaded into said aperture, a V-shaped clevis provided with square apertures through which the square portion of the adjusting screw passes and which is adapted for connection with a hame, and a fastener member carried by said supporting member and adapted for connection with a hame.
8. A hame fastener comprising a supporting member consisting of side bars connected at the ends and separated by an intervening space, a fastener member movable within said intervening space, and an Intermediate member pivotally supporting said fastener member and being plvotally connected to the supporting member.
9. A hame fastener comprising a supporting member having slde bars separated by an intervening space, a lock lever pivoted near its inner end to said supporting member and a fastener member pivotally connected to the inner end of said lock lever and having at its outer end a hook for connection to a hame.
10. A hame fastener comprising a supporting member having side bars separated by an intervening space, a lock lever pivoted near its inner end to said supporting member and means for locking said fastener member and lock lever together.
11. A hane fastener comprising a supporting member havnig side bars separated by an intervening space, a lock lever pivoted near its inner end to said supporting member and a fastener member having a downwardiy and pivotally curved inner extremity connected at said extremity to the inner end of said lock lever.
12. A hame fastener comprising a supporting member, a lock lever pivotally connected near its inner end to sald supporting member and having a stud projecting laterally therefrom near its outer end, a fastener member pivoted to said lock lever, and a lock spring secured to said fastener member and having an aperture into which the stud of the lock lever its when the parts are in locked position.
13. A hame fastener comprising a supoprting member having side bars separated by an intervening space and provided with aligned longitudinal slots having a plurality of L-shaped slots branching therefrom, and a lastener member pivotally supported by said supporting memebr and having its supporting plvot movable along said L-shaped slots.
14. A hane fastener comprising a supporting member provided with a longitudinal slot, and a fastener member pivotally supported by said supporting member and having its pivot movable along said slot.
No. 101,242. Cheese Cutter. Coutear d fromage.

The Anderson Computing Scale Company, assignee of Thomas C. Braskett, both of Anderson, Indiana, U.S.A., 2nd October, 1906; 6 years. Filed 7th September, 1906. Receipt No. 139,308.
Claim.-1. In a cheese cutter the combination of a rotary cheese table an operating lever for the same having a scale, a movable fulcrum for said lever, an indicator, and means carried by said lever for changing the position of said fulcrum in accordance with the adjustment of said indicator, substantially as specified.
2. In a cheese cutter the combination of a rotary cheese table, an operating lever for the same having a cheese weight scale upon said lever, an indicator for said scale, a movable fulcrum for said lever, and means for simultaneously adjusting said indicator and movable fulcrum, substantially as specified.
3. In a cheese cutter the combination of a rotary cheese table, a horizontally working operating lever for the same, a price per unit scale bar extending transversely of said lever and an adjustable stop upon said scale bar, substantially as specified.
4. In a cheese cutter the combination of a rotary cheese table, an operating lever for the same having a longitudinal cheese weight scale, a movable fulcrum for said lever, an indicator, means for simultaneously adjusting said indicator and fulcrum, a transverse price per unit scale, and an adjustable stop therefor, substantially as specified.
5. A cheese cutter having in combination a rotary cheese table, an operating lever for the same having a cheese weight scale upon said lever, an indicator for said scale, a movable fulcrum for said lever, and a longitudinal adjusting rod engaging said fulcrum and indicator, substantially as specifled.
b. A cheese cutter having in combination a rotary cheese table, an operating lever therefor having a scale, a clutch for engagement with said table at the rear end of said lever, an indicator for said scale, a movable fulcrum intermediate of the ends of the lever, and means for simultaneously adjusting said fulcrum and indicator, substantially as specifled.
7. In a cheese cutter the combination of a rotary cheese table, an operating lever therefor having a cheese weight scale at its forward end, an indicator therefor, a price per unit scale bar at the forward end of sald lever, an adjustable stop for said price per unit scale bar, and means for varying the amount of movement imparted by said lever to the cheese table upon adjustment of said cheese weight indicator, substantially as specified.
8. In a cheese cutter the combination of a rotary cheese plate, a lever for rotating the plate, a clutch between the plate and lever, an adjustable fulcrum, and means carried by the lever for adjusting the fulcrum, substantially as specifled.
9. In a cheese cutter the combination of a base frame and a rotary table mounted thereon, a vibrating lever and means actuated thercby for rotating the table varying measured distances, and means mounted on the vibrating lever for varying the distance the table may be thrown by the lever with a stroke of a given length.
10. In a cheese cutter the comblnation of a base frame, and a rotary table mounted thereon, a vibrating lever having a fixed maximum throw, means actuated thereby for rotating the table variable distances in accordance with the amount of cheese to be measured off, a total weight scale on said lever, an indicator working in conjunction therewith, and means carried by the lever for moving the indicator simultaneously with the adjustment of the table throwing devices.
11. In a cheese cutter, the combination of a base frame and a rotary table mounted thereon, a vibrating lever, a clutch operated thereby to throw the table variable distances, and means carried by the lever for varying the throw of the clutch.
12. In a cheese cutter the combination of a base frame and a rotary table mounted thereon, a clutch adapted to rotate the table variable distances, a vibratable lever connected to the clutch and pivoted to the base and having a handle portion projecting beyond the table, a total weight scale on the projecting end of the lever, a screw rod carried by the lever, an indicator actuated by this rod and means whereby the turning of this rod varies the throw of the clutch carrying arm, the varlation in throw being indicated by the scale on the lever.
13. In a device for cutting cheese and the like into portions, a rotary cheese support, a lever for actuating the rotary cheese support, a scale on said lever, and means cooperating with said scale for regulating the movement of the cheese support so as to cut uniform pleces irom various cheeses.
14. In a device for cutting cheese and the like into portions, a rotary cheese support, a lever for actuating the rotary choese support, a scale on sald lever, and means movable with reference to the scale for regulating the influence of the throw of the Iever upon the movement of the cheese support.
15. In a device for cutting cheese and the like into portions, a rotary cheese support, a lever for actuating the rotary cheese support, a stationary welght scale on the lever. and means movable on the lever with reference to the weight scale for regulating the influence of the throw of the lever upon the movement of the cheese support.
16. In a device for cutting cheese and the like into portions, a cheese support, a lever for feeding the cheese, a variable fulcrum therefor, two scales, one a price per pound scale and the other a scale for indicating the various weights of cheeses for controlling the position of said fulcrum so that the cheeses of varying weights and prices per pound may be cut into portions of uniform value
17. In a device for cutting cheese and the like into portions, a cheese support, a lever for feeding the cheese, a variable fulcrum for said lever, and a plurality of scales for indicating the desired adjustment of said lever.
18. In a device for cutting cheese and the like into portions, a cheese support, a lever for moving one of said parts toward the other and a scale controlled means for adjusting the fulcrum of said lever to modify the feeding action thereof so as to cut portions of a certain unit of value.
19. In a computing cheese cutter, the combination of a base and a rotary cheese table thereon, a lever for operating the same, a price ualt scale bar extending transversely of eaid lever, and un adjustable stop upon said scale bar, for the purpose set forth.
20. In a computing cheese cutter, the combination of a base and a rotary cheese table, an operating lever for the same, a cheese weight scale and means co-operating therewith for varying the influence of the lever upon the cheese table. a transverse price scale, and an adjustable stop therefor, for the purpose set forth.
21. In a computing cheese cutter, the combination of a base and a rotary table thereon. a vibrating lever, a clutch operated by the lever to throw the table variable distances, and means carried by the lever for varying the throw of the clutch without varying the throw of the handle end of the lerer.
22. In a computing cheese cutter, the combination of a rctary cheese table, and means for rotating the table controlled by a price scale and a total weight scale, whereby the cheese may be cut by weight or by value.
23. In a computing cheese cutter, the combination of a rotary table, an operating lever, and means for varying the Irfluence of the lever upon the table, said means embodying a scale on the base and a scale on the lever, one of sald scales being a weight scale and the other a price scale.
24. The method substantially as herein shown and described of measuring off segments of circular cheese by weight as well as by value, consisting in governing the movements of the actuating devices by a combined total weight scale and price per pound scale, whereby segments may be meacured off either by price or by weight by the same actuating means, substantially as set forth.

No. 101,243. Eettle. Chaudron.

Herman L. Smith, assignee of John E. Longhenry, both of Gloversville, New York, U.S.A., 2nd October, 1906; 6 years. Filed 8th September, 1906. Recelpt No. 139,349.
Claim.-1. A steamer comprising an upper section adjustable in diameter, a telescoping section adapted to move vertically within the first-mentioned section, means for suspending the first-mentioned section within the kettle, and means for locking the telescoping section in its adjusted position within the first-mentioned section.
2. A steamer comprising upper and lower sections, the upper section being split longitudinally, the lower section telescoping within the split section, means for suspending the split section within a kettle, and means for locking the telescoping section in its adjusted position within the upper section.
2. A device of the kind described comprising a steamer divided into two sections, the upper section being split longitudinally, and the lower section being reticulated and movable within the upper section, perforated bars carried by the inner sides of the upper section, said bars being angled at their upper ends, an inverted bail adapted to support the lower movable section, and pins carried by the bail adapted to engage the perforations of the bars.
4. A device of the kind described comprising a steamer formed in the upper and lower sections, vertical bars carried upon the inner sides of the upper section, angled plates connected to the upper ends of the bars and projecting over and beyond the upper edges of the upper section, an inverted spring bail having its free end portions turned inwardly, said bail being adapted to move vertically within the upper section, pins carried by the bail adapted to engage the perforations of the bars, and a lower reticulated section supported within the bail, as and for the purpose set forth.

No. 101,244. Can. Bidon.

Wllliam Bohemier, Montreal, Quebec. Canada, 2nd October, 1906; 6 years. Flled 11th September, 1906. Receipt No. 139,419.
Claim.-1. A can comprising an open ended body, closures for the ends, and a bottom intermediate of the ends of the body.
2. A can comprising an open ended body, a screw-threaded closure for one end, a bottom intermediate of its ends, and a receptacle disposed in the opposite end.
3. A can comprising a body havingea crimp therein intermediate of its ends, a bottom disposed in the body and abutting against said crimp, a receptacle adapted to be inserted within one end of the body and provided with a flange adapted to abut against the lower edge of the body, and a screwthreaded closure for the opposite end of the body.

No. 101,245. Stovepipe Thimble.
Doullle de tuyau de poêle.

Thomas W. Bright, Elk, West Virginia, U.S.A., 2nd October, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,377.
Claim.-1. A stovepipe thimble having its inner surface cylindrical and face convex from end to end, said thimble being provided with an angular rebate in one end, and at its other end with an angular extension the edges of which are disposed at right angles to each other and parallel with the edges of the rebate, and a flange extending laterally from the edges of the extension.

No. 101,246. Jointer for Stubble Plougha. Oroolet pour charrucs a chaume.

Don Henry Dickinson, Parkers, Oregon, U.S.A., 2nd October, 1906; 6 years. Filed 12 th September, 1906. Recelpt No. 189,464.
Claim.-1. In a jointer for stubble ploughs, a frame mounted to turn beneath the plough beam, a revoluble disc cutter carried by the sald frame, and means for holding the cutter at an inclination in direction of the mould board side of the plough.
2. In a plough, a bracket secured to the beam, a standard carried by said bracket, a frame mounted to turn on said standard below the beam, the sald frame conslsting of a socket member and arms rearwardly extending therefrom, the land side arm being the longest, a spindle journalled in the sald arms, a dished disc cutter secured to the said spindle, and means for attaching the frame to the beam of the plough in a manner to bring the disc cutter at an inclination in direction of the mould board side of the plough.
3. In a plough, a beam, a bracket secured to the beam, a standard carried by the bracket, a frame mounted to turn on the standard, a disc cutter mounted to turn in the frame, having its mould board side dished, and means for adjustably holding the said cutter diagonally with respect to the forward edge of the plough share and inclined in dircction of the mould board side of the plough.
4. In a plough the combination with the beam thereof, a bracket secured to the beam, a standard carried by sald bracket, and a locking device for the standard also carried by the bracket, of a frame consisting of a socket section mounted to turn on the standard below the beam, and opposing arms extending rearwardly from the said frame, the land side arm being the longest, a spindle journalled in said arms, a disc cutter secured to said spindle dished at its mould board side, means for adjustably connecting the cutter to the beam, and mould board supported by the frame and acting in conjunction with the dished face of the cutter.
5. The combination with a plough, of a frame pivotally mounted below the beam therof, a cutter mounted to revolve in the said frame, means for holding the sald cutter in a diagonal position with respect to the forward edge of the plough share and at an inclination in direction of the mould board side of the plough, the mould board side of the cutter being dished, and a mould board supoprted by the said frame and held at an angle to the dished face of the sald cutter.

No. 101,247. Underouttor Eupport for Saws. Support pour scies.

Frank H. Lamb, Hoquiam, Washington, U.S.A., 2nd October, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,397.
Claim.-1. An undercutter support comprising a dog adapted for insertion in the material to be sawed, a supporting arm provided with a saw bearing thereon at one end. and means for mounting said arm upon said dog to permit the reversal of the arm to bring the saw bearing either above or below the dog.
2. An undercutter support comprising a dog adapted for insertion in the material to be sawed, a supporting arm provided at one end with a saw bearing, and means for mounting suid arm upon said dog to permit the adjustment and reversal of the arm and bearing relative to the dog.
3. An undercutter support comprising a dog adapted for insertion in the material to be sawed, a supporting arm provided at one end with a saw bearing, and clamping means for supporting said arm at one side of said dog to permit its reversal and adjustment without interference with the dog.
4. An undercutter support comprising a dog, a supporting arm mounted thereon for vertical adjustment and provided at one end with a saw bearing, a supporting bolt through which arm passes, and a clamping washer mounted upon said bolt and provided with a recessed face to engage one side of sald arm.
5. An undercutter support comprising a dog, a supporting arm mounted thereon for vertical adjustment and provided at one end with a saw bearing, a supporting bolt through which said arm passes, a clamping washer mounted upon said bolt and provided with a recessed face to engage one side of sald arm, an extended threaded shank from sald bolt, a co-operatIng washer mounted upon said shank to engage the clamping washer and provided upon one face with a recess to seat upon said dog, and a holding nut mounted upon the shank of the supporting bolt at the opposite side of the dog from said washers.
6. In an undercutter support, a dog having an aperture at its outer end, a supporting belt having a threaded shank extending through said aperture, a supporting arm adjustably carried by said bolt. means for clamping said arm and bolt to sald dog, and a supporting roller disposed upon a laterally extending lug at one end of said arm.
7. In an undercutter support. a supporting member. an arm carried thereby and provided with a saw hearing. a clamping bolt through which sald arm passes. a clamping washer mounted upon said bolt and provided upon one face with a recess to receive a portion of sald arm and upon its opposite
face with a bevelled clamping seat, a co-operating washer having a bevelled face to enter sald seat, and means for clamping said washers together.
8. In an undercutter support, a supporting member, an arm carried thereby and provided with a saw bearing, a clamping bolt through which said arm passes, a clamping member mounted upon said bolt and provided upon one face with a recess to receive a portion of said arm and upon its opposite face with a bevelled clamping seat, a co-operating washer having a bevelled face to enter said seat, a holding dog mounted upon the outer face of the co-operating washer, and a clamping nut threaded upon the shank of the holding bolt.

No. 101,248. Beot Cultivator. Cultivateur de betteraves.

Andree Larsen, Stirling, Alberta, Canada, 2nd October, 1906; 6 years. Fhled 10th September, 1906. Receipt No. 139,372.
Claim.-1. In a beet harvester, the combination of a frame, a transverse supporting bar slidably and pivotally mounted thereon, cultivator shovels carried by the bar, beams also carried by the bar, cutting and earth throwing devices carried by each beam, and each having a shank pivotally and adjustably attached to the beam, means connecting the devices to move in unison, a pressure spring acting on the shank of the earth throwing device, locking means for holding said devices in vertically adjustable position, and means for oscillating and sliding the transverse bar.
2. In a beet harvester, the combination of a frame, a transverse supporting bar slidably and pivotally mounted thereon, beams carried by the bar, cutting and earth throwing devices carried by each beam, and each having a shank pirotally and vertically adjustably attached to the beam, a link connecting the shanks of sald devices to move in unison, a pressure spring acting on the shank of the earth throwing devices, locking means for holding said devices in adjusted position, an intermediate bar adjustably connected with the beam, a link connecting said bar with the cutting device, and means for oscillating and sliding the transverse bar.
3. In a beet harvester, the combination of a frame, a transverse supporting bar slidably and pivotally mounted thereon, a sleeve non-rotatably mounted upon the bar and provided with terminal heads, a rack yoke carried by said sleeve, a gear engaging the rack, means for actuating the gear to slide the rack and bar in either direction, means for rocking the bar, and cultivating devices supported by the bar and adjustable vertically and laterally through the action thereof.
4. In a beet harvester, the combination of a frame, a transverse supporting bar slidably and pivotally mounted thereon, cultivator shovels carried by the bar, beams also carried by the bar, cutting and earth treating devices carried by each beam, each having a shank pivotally and vertically adjustably attached to the beam, a link connecting the shanks of said devices to move in unison, a pressure spring acting on the shank of the earth throwing device, an intermediate bar vertically adjustable on the beam, a link connecting said bar with the cutting device, locking means for holding sald shanks and intermediate bar in adjusted position, means for locking the supporting bar to vertically adjust the devices, and rack and pinion mechanism for sliding said bar to laterally adjust said devices.

\section*{No. 101,249. Andiliary Fuel Box for Stoves. Boite d flamme pour poéles.}

Thomas Berry Lockley. Goulburn, New South Wales, Australia, 2nd October, 1906; 6 years. Filed 12th September, 1906. Receipt No. 139,463.
Claim.-1. Improved auxiliary fuel box for stoves and the like having a removable cover and supported in front of the
firebox of a stove, substantially as herein described and explained.

2. Improved auxiliary fuel box for stoves and the like adapted to be drawn outwardly of the stove and be supported on brackets or legs or on the stove front, substantially as hereln described and explained.
3. Improved auxiliary fuel box for stoves and the like adapted to telescope with or without operating springs and being supported in front of the firebox of a stove, substantially as herein described and explained.
4. The combination with the front of a stove or the like and a fuel box or holder of a frame having horizontal such as 8 , and diagonal such as 9 , substantially as herein described and explained and as illustrated in the drawings.
5. The fuel box and its appurtenances on the front of a stove or the like substantially as herein described and explained and as illustrated in figure 1 of the drawings.
6. The fuel box and its appurtenances on the front of a stove or the like substantially as herein described and explained and as illustrated in figure 2 of the drawings.

No. 101,250. Needle Cushion for 8pools. Ouisson d'aigutlies powr bobines.

Albert C. Loomis, West Orange, New Jersey, U.S.A., 2nd October, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139.398.
Claim.-A cushion for spools comprising a disc, a sheet of fabric, the disc and the sheet of fabric enclosing a flling, and a plate having its marginal rim bent to embrace
the edges of the disc and sheet, and having a series of concentric prongs struck up from the plate, the free ends of the prongs adapted to enter the perforation of a spool.

No. 101,251. Switch. \(\Delta\) iguille.

Henry O. Marquis, Superior, Penngylvania, U.S.A., 2nd October, 1906; 6 years. Filed 23rd August, 1906. Receipt No. 138,944.
Claim.-1. In a switch throwing device, the combination With a car, a track, a switch tongue, and a spring retained hook-shaped bar carried by said car and actuated by the operator of suid car, of a casing mounted in said track and having recesses formed in its upper face, eccentrics mounted within said casing adjacent to said recesses and adapted to protrude therein, a block pivotally mounted in said casing and connected with said switch tongue, means actuated by the bar of said car to move said switch tongue, substantially as described.
2. The combination with a car, a track and a switch tongue, of a spring held hook-shaped bar carried by sald car and actuated by the operator thereof, a casing mounted in said track and having recesses formed therein, eccentrics mounted ir said casing and protruding into said recesses, a block pivotally mounted in said casing and connected to said switch tongue and links connecting the opposite ends of said block with said eccentrics, said block being actuated by said bar contacting with said eccentrics to move sald switch tongue, substantially as described.

No. 101,252. Railvas THe. Dormant de chemin defer. Arthur B. Mason, Ashland, Ohio, U.S.A., 2nd October, 1906; 6 years. Filed 10 th September, 1906. Receipt No. 139,380.
Claim.-1. In a metallic railway tie a plate, adjustable means for securing a rail thereto and means beneath the rlate for adjusting and securing said means in a plurality of positions with respect to the rall.
2. In metallic railway tie a plate, adjustable means for securing a rail thereto, and key operated means beneath the plate for adjusting the securing means to leave the rail unsecured, to partially secure the rail or to hold it tightly secured.
3. In a metallic railway tie, a top plate provided with perfcrations, the tie being adapted to be placed with the perfcrations on each side of a rail, rotatable fastening means projecting upwardly through the said plate, a means beneath the said plate for rotating the fastening means.
4. A metallic railway tie comprising a perforated plate, rotatably headed fastening means extending upwardly through said perforations, a key operatable means beneath the said plate for rotating the said fastening means.
5. A metallic tie comprising a top plate, rotatably headed fastening means projecting upwardly through sald plate, key operated means beneath the sald plate for rotating the said festening means and a channel bar secured beneath the said plate with lts web portion downward.
6. A metallic tie comprising an upper plate, rotatable lugg rrojecting upwardly through said plate, key operated means

beneath said plate for locking the lugs, a channel bar secured beneath the said plate with its web portlon downward and means on the bottom of the channel bar for holding it against longitudinal motion.
7. A metallic tie comprising a top plate, rotatable headed fastenings projecting upwardly through said plate, key operated means, and said rotating means comprising a notched bar and secured to said headed fastenings.
8. A metallic tie comprising a top plate, movable fastening means projecting upwardly through said plate, key operated means beneath the sald plate for operating the said fastening means.
9. A metallic tle comprising a top plate, rotatable lugs projecting upwardly through said plate, and adapted to hold the rail thereto, springs on the lugs beneath the said plate, cranks on the lugs beneath the springs and a notohed bar to which the ends of the cranks are pivotally connected.
10. A metallic tie comprising a top plate, means projecting from the plate to hold a rail in place thereon, means beneath the sald plate for locking the holding means in place, said means being adapted to be released by means of a key inserted through an opening in the plate.
11. A metallic tle comprising a top plate, movable rall fastening means projecting upwardly through the plate, means beneath the said plate for operating the fastening means, said means comprising a longitudinally movable bar.
12. A metallic rallway tie comprising a top plate, the said plate being provided with perforations, lugs having side wise projecting portions at their upper ends projecting through the perforations in sald plate, springs on the lower ends of the lugs. cranks beneath the springs, a bar bolted upon the lugs beneath the cranks, a bar to which the ends of the cranks are pivoted, said last-named bar being provided with notches in its side, a spring operated key releasable means for locking the last-named bar apainst longitudinal movement.
No. 101,253. Ironing Board. Planche d repasser.

Ferdinand Winthrop Moore, Montrcal, Quebec. Canada, 2nd October, 1906. 6 years. Filed 5th September, 1906. Recelpt No. 139,266.
Claim.-1. In a foldable ironing board the combination of a longltudinally slotted board, a supporting leg having a notch
or recess on its underside, near the top end thereof, an intermediate support resting on satd supporting leg intermediate its ends and engaging with a notched member to brace said ironing board.
2. In a foldable ironing board the combination of a longitudinally slotted board, a supporting leg having a notch or recess on its underside, near the top end thereof, an intermodiate support resting on said supporting leg intermediate its ends and engaging with a notched member to brace said ironing board, in combination with a leg hinged at the outer end of the board and adapted to rest on the floor.
3. In a foldable ironing board the combination with a longitudinally slotted board, an oblquely disposed notched supporting leg, a serrated casting on the upper side of said leg and a brace connected with said board at one end and resting on said casting at its opposite end.

No. 101,254. Meat Banter. Arrosor pour ofande.

John O'Connor, New York City, New York, U.S.A., 2nd October, 1906; 6 years. Filed 4th September, 1906. Receld No. 139.221.
Claim.-In a baster the combination with a pan having a substantially flat bottom and upright corner forming sides and ends, of an elongated perforated receptacle adapted to rest against the pan bottom at one side of the pan, arms extending from said receptacle and having awivelled connections with the ends of the pan, whereby by swinging the receptacle, basting mater:al may be lifted from the side of the pan and discharged over the meat.

No. 101,255. Process of Eradicatins Weeds and Insect Pests.
Procédé poutr déraciner les mauvaises herbes, etc.

FIG. 1 101236-
George Montague Bowser and Edwin Albert Bowser, co-inventors, both of Brisbane, Queensland, Australia, 2nd October, 1906; 6 years. Filed 10th September, 1906. Recelpt No. 139.415.
Cladm. -In a process for destroying vegetable growths and insect pests, exposing the same to the action of steam and hot air applled under sultable cover, from any convenient source.

\section*{No. 101,256. Carbureter. Carbureteur.}

William Brown and James Brown, co-inventors, both of Vancouver, British Columbia, Canadh, 2nd October, 1906; 6 years. Filed 16th October, 1905. Receipt No. 129,271.
Claim.-1. In a carbureter, an open-ended rectangular chamber divided by horizontal and vertical partitions into a scries of elongated passages, covers for the ends of the cham-
ber having recesses which will connect the adjacent passages to form one continuous passage from an inlet in

Fic. 3

one of the lower ones to an outlet from one of the upper ones, means for delivering atmospheric air to the inlet, and means for connecting the outlet to the lower end of an oll tank.
2. In a carbureter an open-ended rectangular chamber divided by horizontal and vertical partitions into a series of elongated passages, covers for the ends of the chamber having recesses that will connect the adjacent passages to form one continuous passage from an inlet in one of the lower ones to an outlet from one of the upper ones, said connected passages being filled with an absorbent material, means for automatically maintaining said material saturated with hydro-carbon oll from a tank adjacent, means for introducing atmospheric air to the lower end of the connected series of passages, and means for delivering into the lower end of the supply tank the hydro-carbon gas generated.
3. In a carbureter a rectangular chamber divided by horizontal and vertical partitions into a series of elongated passages which are connected by recesses in the cover to form one continuous passage which passages is charged with an absorbent material, means for introducing atmospheric air to the lower end of the series, means for delivering from the upper end of the passage the gas generated through a Hight check valve into the lower end of an oll reservoir, means for withdrawing the gas from the upper end of the oll reservoir, and a spring controlled air valve opening inward in the gas withdrawal pipe.

\section*{No. 101,257. Flashboard Holder for Dams. Ecluse pour digues.}

Wilham Lee Church, Newton, Massachusetts, U.S.A., 2nd October, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,234.
Claim.-1. A dam having at its crest a series of guides, and flashboard supporting posts movable in sald guides.
2. A dam having at its crest a series of guides, and posts movable endwise and rotatable said guides, and provided with ears or lugs adapted to engage the upper edges of flashboards.
3. A dam having in its crest a series of guides, and pockets communicating with the upper ends of the guides, ind posts movable in said guides and provided with flashboard engaging ears or lugs adapted to occupy said pockets when the posts are retracted.
4. A dam having a chamber or cavity below its crown, guides extending from said chamber through the crown, and flashboard supporting posts movable in said guides and provided with operating means located in the chamber.
5. A dam having a chamber or cavity below its crown, guides extending from said chamber through the crown, and

flashboard supporting posts movable in said guides and provided with operating handles at their lower end within the chamber.
6. A concrete dam structure hollow below its crown, tubular metal guldes extending through the crown, and flashboard supporting posts movable in sald guides.
7. A dam having a chamber or cavity below its crown, guides extending from said chamber through the crown, flashboard supporting posts movable in said guides and extending into the chamber, and stuffing boxes surrounding said posts.
No. 101,258. Dam. Digue.

.. Illam Lee Church, Newton, Massachusetts, U.S.A., 2nd October, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,235.
Claim.-1. A dam having means at the downstream side of its crest for deflecting overflow water backwardly.
2. A dam having means at the downstream side of its crest for deflecting overflow water backwardly, and a wear resisting bed arranged to sustain the impact of the deflected overflow water.
3. A dam comprising a deck, a wear resisting bed extending downstream from the heel of the deck, and a baffle wall located at the downstream side of the deck and adapted to direct overflow water backwardly toward the deck and upon the bed
4. A dam comprising a deck, a wear resisting bed extending downstream from the heel of the deck, buttresses between the bed and deck, and a baffle wall supported by the buttresses at the downstream side of the deck and adapted to direct overfiow water backwardly toward the deck and upon the bed.
5. A dam comprising a deck, a wear resisting bed extending downstream from the heel of the deck, and a bafle wall located at the downstream side of the deck and separate from the latter by an overfiow passage.
6. A dam comprising a deck, a wear resisting bed extending downstream from the heel of the deck, a bafile wall located at the downstream side of the deck and separated from the latter by an overfiow passage and a grind or grating in the upper portion of sald passage.
7. A dam comprising a deck, a wear resisting bed extending downstream from the heel of the deck, a baffle wall located at the downstream side of the deck and adapted to direct overfiow water backwardly toward the deck and upon the bed, the crest of the baffie wall being substantially fush with the crest of the deck and located over the bed.
8. A dam having an upstream crest, a downstream crest separated from the upstream crest by an overiow passage, and means for deflecting backwardly the overfow passing through said passage, the deflected water cushloning the verflow pasing over the downstream crest.
9. A dam having an upstream crest, a downstream crest separated from the upstream crest by an overiow pasaase, one side of which is formed by a bafle wall below the downstream crest and means for ma!ntaining a cushloning pool underneath the baffle wall.

No. 101,259. Dam for Wator Worize.
Digue pour machines hydrauligwes.

William Lee Church, Newton, Massachusetts, U.S.A., 2nd October, 1906; 6 years. Filed 4th September, 1906. ROceipt No. 139,236.
Claim.-1. A water works dam having a screened opening in its deck, and a clear water chamber below the deck, said chamber receiving water through said opening and communicating with a water main.
2. A water works dam having an inclined aeck provided with an elongated opening, a screen partially occupying said opening, flling pieces occupying the remainder of the opening, said screen and filling pleces being adjustable to vary the height of the screen, and a clear water chamber communicating with said opening.
3. A water works dam having an inclined deck, and a clear water chamber below the deck, the deck having an elongated opening communicating with the clear water chamber, retaining members adjacent to said opening, and a screen and flling pleces occupying said opening, and confined againgt lateral displacement by said retaining members.
4. A water works dam having a screened opening in its deck, a clear water chamber below the deck communicating with said opening, a gate house adjacent to said member, and a water main constituting the outlet of the clear water chamber and provided with a gate, and a gate operating device located in the gate house.

\section*{No. 101,260. Artificial Limb. Mombre artifoicl.}

John K. S. Farris, Saltville, Virginia, U.S.A., 2nd October.
1906; 6 years. Filed 5th May, 1906. Recelpt No. 135,587.
Claim.-1. In an artificial limb, the combination of a flexible foot body, a flexible leg portion, and connecting and stiffening means consisting of side leg irons secured to said leg portion and having a transverse ankle blot connection with said foot body, substantially as specified.
2. In an artificial limb, the combination of a foot body formed of a series of straight flat longitudinal vertical layers of rubber and interlayers of thread having a cement connection to said layers of rubber, a flexible leg portion joined to said foot body, and connecting and stiffening means consisting of side leg irons secured to said leg portion and to said foot body, substantially as specined.
3. In an artificial limb, the combination of a foot body formed of a series of straight fiat longitudinal vertical layers of rubber and interlayers of thread having a cement
connection to said layers of rubber, a flexible leg portion joined to said foot body and formed of layers of felt and

leather having perforations throughout for ventilation and flexibility, the ends of said leg portion having lacing connections, and stiffening and connecting means consisting of side leg irons secured to said leg portion and having a transverse ankle bolt connection with sald foot body, substantially as specified.
4. An artificial limb, the combination with longitudinal vertical flexible layers connected together and forming a foot body. of side leg irons having forward terminal bends, and an ankle bolt passing through said layers and connecting said irons, substantially as specified.
5. In an artificial limb, lateral leg irons having forward terminal bends at their lower ends, a flexible foot body having an ankle recess, a transverse ankle bolt, a transverse bracing bolt, side pads and recess padding, and a foot form covering, substantially as specified.

No. 101,261. Respirator or Inhaler.
Respirateur ou inhalateur.

John L. Hively, Elkhart, Indiana, U.S.A., 2nd October, 1906 ; 6 years. Filed 10th May, 1906. Receipt No. 135,756.
Claim.-1. In an inhaler or respirator the combination of a mask adapted to flt over the nose and mouth of the wearer,
a receptacle \(B\) arranged in said mask in position to be supported beneath the nose of the wearer. sald receptacle having perforations in the top and bottom thereof, the perforditions in the top being arranged in a zigzag manner in relation to those at the bottom, a door having perforations therein hinged at its top opening bencath said receptacle \(B\), a receptacle carried by said door having perforations in the top thereof adapted to be brought into register with the perforations in the bottom of said receptacle \(B\) when said door is in its closed position, a spring adapted to retain said door in its open and closed positions and suitable fllling material for said receptacles, for the purpose specifled.
2. In an inhaler or respirator the combination of a mask adapted to fit over the nose and mouth of the wearer, a receptacle \(B\) arranged in said mask in position to be supported beneath the nose of the wearer, said receptacle having perforations in the top and bottom thereof, the perforations in the top being arranged in a zigzag manner in relation to those in the bottom, a door having perforations therein hinged at its top opening beneath said receptacle \(B\), a receptacle carried by said door having perforations in the top thereof adapted to be brought into register with the perforations in the bottom of said receptacle \(B\) when said door is in its closed position and sultable flling material for said receptacle, for the purpose specified.
3. In an inhaler or respirator the combination of a mask adapted to fit over the nose and mouth of the wearer, a receptacle \(B\) arranged in said mask in position to be supported beneath the nose of the wearer. said receptacle having perforations in the top and bottom thereof, a door having perforations therein hinged at its top onening beneath said rereptacle \(B\), a receptacle carried by said door having perforattions in the top thereof adapted to be brought into register with the perforations in the bottom of said receptacle \(B\) when said door is in closed position, a spring adapted to retain said door in its open and closed positions and suitable flling material for said receptacles, for the purpose specified.
4. In an inhaler or respirator the combination of a mask adapted to fit over the nose and mouth of the wearer, a receptacle \(B\) arranged in sald mask in position to be supported beneath the nose of the wearer. said receptacle having perforations in the top and bottom thereof, a door hinged at the top having perforations therein, opening beneath said receptacle B, a receptacle carried by said door having perforations in the top thereof adapted to be brought into register with the perforations in the bottom of said receptacle \(B\) when said door is in its closed position and suitable fllling material for sald receptacles. for the purpose specified.
5. In an inhaler or respirator the combination of a mask adapted to fit over the nose and mouth of the wearer, a receptacle arranged in said mask in position to be supported beneath the nose of the wearer, sald receptacle having perforations in the top and bottom thereof, the perforations in the top being arranged in a zigzag manner in relation to those in the bottom, a door having perforations therein opening beneath said receptacle, a spring adapted to retaiu sald door in its opening and closed positions and a suitable fllling material for sald receptacle, for the purpose specifled.
6. In an inhaler or respirator the combination of a mask adapted to fit over the nose and mouth of the wearer. a receptacle arranged in said mask in position to be supported beneath the nose of the wearer, said receptacle having perforations in the top and bottom thereof, a door opening beneath said receptacle arranged in front of the mouth of the wearer, a spring adapted to retain said door in its open and closed positions and a suitable flling material for said receptacle, for the purpose specified.
\(\boldsymbol{7}\). In an inhaler or respirator the combination of a mask adapted to fit over the nose and mouth of the wearer. a receptacle arranged in said mask in position to be arnanged beneath the nose of the wearer, said receptacle having perforations in the top and bottom thereof, a door having perforations therein, opening beneath said receptacle arranged in front of the mouth of the wearer and suitable filling material for said receptacle, for the purpose specified.
8. In an inhaler or respirator the combination of a mask adapted to fit over the nose and mouth of the wearer. a perforated receptacle arranged in said mask in position to be supported beneath the nose of the wearer. a door in said mask opening beneath said receptacle and arrangerl in front of the mouth of the wearer and a suitable filling material for sa!d receptacle, for the purpose specified.

\section*{No. 101,262. Pastenrizing Apparatus.}

Appareil a pasteuriser.
Charles H. Loew, Lakewood, Ohio, U.S.A., 2nd October, 1906 ;
6 years. Filed 7th May, 1906. Receipt No. 135,648.
(laim.-1. An apparatus for pasteurizing beer in bottles comprising a pasteurizing chamber, a spraying mechanism within the chamber, means for supplying water thereto and means for gradually heating the water so supplied without interrupting its flow.
2. An apparatus for pasteurizing beer in bottles comprising a pasteurizing chamber, a spraying mechanism within

the chamber, means for supplying water thereto and means for gradually heating the water so supplied without interrupting its flow, consisting of a water tempering chamber provided with a steam supply pipe.
3. An apparatus for pasteurizing beer in bottles comprising a pasteurizing chamber. a spraying mechanism within the chamber, means for supplying water thereto and means for gradually heating the water so supplled without interrupting its flow, consisting of a water tempering chamber provided with a steam supply pipe, and means, as a thermostat, adapted to control and regulate the steam supply.
4. An apparatus for pasteurizing beer in bottles, compris ing a pasteurizing chamber, a spraying mechanism within the chamber, means for supplying water thereto and means for gradually heating the water so supplied without interrupting its flow, until a predetermined temperature for the spray is arrived at and means for maintaining said temperature a suitable length of time.
5. An apparatus for pasteurizing beer in bottles, comprising a pasteurizing chamber, a spraying mechanism within the chamber, means for supplying water thereto and means for gradually heating the water so supplied without interrupting its flow, until a predetermined temperature for the spray is arrived at and means for maintaining said temperature a suitable length of time, consisting of a water iempering chamber, a steam supply pipe and a thermostat rcgulated by the temperature within the water tempering chamber and controlling the steam supply accordingly.
6. In apparatus for pasteurizing beer in bottles comprising a pasteurizing chamber, a spraying mechanism within the chamber, means for supplying water thereto, means for gradually heating the water so supplied without interrupt ing its flow. means for collecting the said water after use, and means for restoring its temperature and returning it to the spraying mechanism.
7. An apparatus for pasteurizing beer in bottles, comprisIng a pasteurizing chamber, a spraying mechanism within the chamber, means for supplying water thereto, means for gradually heating the water so supplied, without interrupt Ing its flow, means for collecting the said water after use. and means for restoring its temperature and returning it to the spraying mechanism consisting of a drip tank, a pump, a water tempering chamber provided with a steam pipe.
8. An apparatus for pasteurizing beer in bottles comprising a pasteurizing chamber, means for supporting bottles therein, a plurality of spraying devices each arranged above a suitable number of bottles, a common means for supplying the spraying devices with heated water, and means for heating the water.
9. In an apparatus of the kind described, a pasteurizing chamber, a plurality of spraying devices arranged one above another within the chamber, means intermediate for supporting the bottles under each spraying device, each support being adapted to allow the water to pass through the same, a drip tank at the bottom of the chamber and means whereby the water from the drip tank is conveyed to the spraying devices under pressure.
10. An apparatus for pasteurizing beer in bottles, comprising a pasteurizing chamber, a spraying mechanism within the chamber, means for supplying water thereto and means for gradually heating the water so supplied without interrupting its fow until a predetermined temperature for the spray is arrived at and means for maintaining said temperature a suitable length of time, and means for finally reflicing the temperature.

No. 101,263. Post Retaining Band.
Bande de retenue pour poteatur.

Olof Olson. Bancroft, Iowa, U.S.A., 2nd October, 1906: 6 years. Filed 13th September, 1906. Receipt No. 139,469. Claim.-1. In a device of the class described a post engaging member, a handle pivoted thereto, a rope passing around one end of the handle secured at one end to the post retaining member and secured at its other end to the handle, a ratchet secured to the post retaining member on the opposite side of the handle from it, and a pawl secured to the handle for retaining the handle against movement in one direction.
2. In a device of the class described a post engaging member, a handle pivoted thereto, a rope passing around one end of the handle secured at one end to the post retaining member and secured at its other end to the handle. a ratchet secured to the post retaining member on the opposite side of the handle from it, a spring actuated pawl secured to the handle for retaining the handle against movement in one direction.
3. In a device of the class described a post engaging mem ber, a handle having a series of openings extending through it, a rounded head having a groove in it at one end of the handle, means for pivotally securing the curved head of the handle to the post retaining member, and a cable secured to the post engaging member passing around the curved head and detachably secured to the handle.
4. In a device of the class described a post engaging mem ber, a handle having a series of openings extending through it, a rounded head having a groove in it at one end of the handle. means for pivotally securing the curved head of the handle to the post retaining member, a cable secured to the post engaging member passing around the curved head, and a hook on the free end of the cable designed to be ingerted into any one of the openings in the handle.
5. In a device of the class described a post engaging member, a handle having a series of openings extending througl it, a rounded head having a groove in it at one end of the handle, means for plvotally securing the curved head of the handle to the post retaining member, a cable secured to thr post engaging member passing around the curved head, a hook on the free end of the cable designed to be inserted Into any one of the openings in the handle, a ratchet wheel non rotatably secured to the post engaging member, and a spring actuated pawl mounted on the handle and designed to engage the ratchet for maintaining the handle in position against the drawing force of the rope when it is shown tight around a post.
6. A post engaging member having a concave surface designed to engage a post and a convex outer surface, a bearing extending outwardly from the convex surface, a handle plvot ally mounted on the bearing, a squared member extending outwardly from the bearing, a ratchet wheel secured to the squared member, a spring actuated pawl pivoted to the handle designed to engage the ratchet, a rope secured to one side of the post engaging member and passing through the other side of the handle and passing around the end of the handle adjacent to the ratchet wheel, and a hook secured to the free end of the rope designed to enter any one of tho openings in the handle, for the purposes stated.
7. A post engaging member having a concave surface designed to engage a post and a convex outer surface, a bearing extending outwardly from the convex surface, a handie pivotally mounted on the bearing, a squared member extending outwardly from the bearing, a ratchet wheel secured to the squared member, a spring actuated pawl pivoted to this handle designed to engage the ratchet, a rope secured to one side of the post engaging member and passing through th other side of the handle and passing around the end of the handle adjacent to the ratchet wheel, and a hook detachably secured to the free end of the rope designed to enter any one of the openings in the handle.

No. 101,264 . System of Electric Train Control. Système électrique de contrôle des convois.
※ヵ. 1

August Sundh and Axel Magnuson, New York City, New York, U.S.A., 2nd October, 1906; 6 years. Filed 29th May, 1905. Receipt No. 125,586.
Claim.-1. The combination with two connected cars adapted to carry goods or passengers, electrical circuits on the cars, an inductive apparatus associating the circuits on the two cars, and a chain for flexibly supporting the inductive apparatus.
2. In combination with two cars, a two part inductive apparatus, one part of which is flexibly connected to one of the cars by means of a chain and the other part of which is flexibly connected to the other of the cars by means of another chain.
2. In combination with two cars, a two part inductive apparatus, one part of which is on one of the cars and the other part of which is on the other of the cars, and means for uniting and rigidly holding the two parts together.
4. In combination with two cars, a two part inductive apparatus, one part of which is on one of the cars and the other part of which is on the other of the cars, and means for uniting and rigidly holding the two parts together under usual conditions but allowing them to be pulled apart when subjected to an undue strain.
5. In combination with two cars, an inductive apparatus comprising two parts, each enclosed in a waterproof casing, one of which parts is supported by one of the cars and the other of which is supported by the other of the cars.
6. In combination with a plurality of cars, a plurality of alternating current circuits on each of the cars, a plurality of inductive devices between the cars adapted to operatively associate the circuits, and a switch arranged to control said circuits.
7. In combination with a plurality of cars, a plurality of alternating current circuits on each of the cars, a plurality of inductive devices between the cars adapted to operatively associate the circuits, and switches on each car for controlling the circuits.
8. In combination with a plurality of cars, a plurality of alternating current circuits on each of the cars, a plurality of inductive devices between the cars adapted to operatively associate the circuits, and switches on each car any one of which may be used for controlling the circuits.
9. In combination with a plurality of connected cars, a plurality of alternating current circuits on each of the cars, a plurality of inductive devices between the cars adapted to operatively associate the circuits and arranged to render such circuits inoperative should the cars become separated.
10. The combination with a plurality of cars, of a motor and a controlling circuit therefor on each car and inductive means for operatively associating the controlling circuits.
11. The combination with a plurality of cars, of a motor and a controlling circuit therefor on some of the cars, and inductive means for operatively associating the controlling circuits.
12. The combination with a plurality of cars, of motors and controlling circuits therefor, inductive means for operatively associating the circuits between the cars and a switch in the controlling circuit.
13. The combination with a plurality of cars, of a motor and a controlling circuit therefor on each car. inductive means for operatively associating the controlling circuits and a switch on each car in the controlling circuit.
14. The combination with a plurality of cars, of a motor and a controlling circuit therefor on each car, inductive means for operatively associating the controlling circuits, and means for controlling the motors from any selected car.
15. The combination with a plurality of cars, of a motor and a controlling circuit therefor on each car, inductive means for operatively associating the controlling circuits, and means for controlling the motor from any selected car whereby the motor may be started in either direction.
16. The combination with a plurality of cars, of motors and controlling circuits on the cars, inductive means for associating the controlling circuits between the cars, master switches at both ends of each car, and means for operatively assoclating the master switches with the controlling circults.
17. The combination with a plurality of cars, of motors and controlling circuits on the cars, means for inductively associating the circults between the cars, master switches on the cars connected in the controlling circuits, and means for rendering any desired master switch or switches inoperative.
18. The combination with a plurality of cars, of a motor and a controlling circuit therefor on each car, inductive means for operatively associating the controlling circuits a master switch and a compensating switch on each car for controlling the circuits.
19. The combination with a plurality of cars, of a motor and a controlling circuit therefor on each car, inductive means for operatively associating the controlling circuits, a master switch on each car for controlling the circuits, and a compensating switch for varying the current in the controlling circuits.
20. The combination with a plurality of cars, of a motor and a controlling circuft therefor on each car, inductive means for operatively associating the controlling circuits, a master switch on each car for automatically controlling the circults, and a compensating switch for varying the current in the controlling circuits in proportion to the number of cars.
21. The combination with a plurality of cars, of a source of alternating current motors, circuits adapted to connect the motors to the source of supply, and controlling circuits therefor on each car, and inductive means for operatively associating the controlling circuits between the cars.
22. The combination with a plurality of cars, motors on some of the cars, an external source of alternating current electrical supply connected to one of the cars. and inductive devices between the cars arranged to establish current in the other cars.
23. The combination with a plurality of cars of a motor and a controlling circuit therefor on each car, and inductive means for associating the circuits so that they will be mutually operative when the cars are together.
24. The combination with a plurality of cars, of a motor and a controlling circuit therefor on each car, and inductive means on the end of each car for associating the circuits So that they will be mutually operative only when the cars are together.
25. In combination with an electric train. controlling circuits therefor adapted to carry a single phase alternating current, a master switch for controlling the circuits, and means for regulating the amount of current in the circults.
26. In combination with an electric train, motors for driving the train. controlling circuits for the motors. said circuits adapted to carry a single phase alternating current. and a master switch for controlling the controlling circuits.
27. In combination with an electric train, motors for driving the train. controlling circuits for the motors, said circuits adapted to carry a single phase alternating current. a motor switch for controlling the controlling circuits, and means for regulating the amount of current in the circuits.
28. In combination with an electric train. a source of mult!phase alternating current supply, multiphase motors for hauling the train, and single phase controlling circuits for the motors.
29. In combination with a plurality of cars, a source of multiphase alternating current supply. multiphase motors for hauling the cars, single phase controlling circuits for the motors, and means for controlling the circuits from any selected car.
30. In combination with an electric train. a source of multiphase alternating current supply, multiphase motors for hauling the train, single phase controlling circuits for the motors. and means for inductively associating the controlling circuits between the cars of the train.
31. In combination with a plurality of cars, a source of multiphase alternating current supply, multiphase motors for hauling the cars. single phase controlling circuits for the motors means for inductively associating the controlling circuits between the cars of the train, and means for controlling the circuits from any selected car.
32. In combination with an electric train, alternating current motors thereon, controlling devices for the motors, said controlling devices being artuated by the single phase alternating current controlled from any selected platform of the train.
33. In combination with an electric train. multiphase altornating current motors thereon, electrically operated controlling devices for the motors, single phase controlling circuits for actuating the controlling devices, and means for inductively associating the controlling circuits between the cars.
34. In combination with an electric train, multiphase alturnating current motors thereon, electrically operated controlling devices for the motors. single phase controlling circults for actuating the controlling circuits between the cars and means for controlling the controlling circuits from a selected platform of the train.
35. The combination with a car having an electric motor, a wurality of controlling circuits therefor and a switch arranged to send a single phase alternating current through onf- or more of the controlling circuits, of another car also having an electric motor and a plurality of similar controlling circuits, and an inductive device between the cars arranged to send a single phase current through such of the circults on the second car as correspond to the circuits of the first car through which current is being sent.
36. The combination with a car having an electric motor, a plurality of controlling circuits therefor and a switch arranged to send a single phase alternating current through one or more of the controlling circuits, of one or more cars cach having an electric motor and a plurality of similar controlling circuits, and inductive devices between the cars arranged to send a single phase current through such of the c!rcuits on the other cars as correspond to the circuits of the first car through which current is being sent.
37. In combination with an electric train, a source of alternating current, an alternating current motor for driving the train, and a direct current generator driven by the movement of the train and arranged to control the acceleration of the motor.
38. In combination with an eiectric train, a source of alternating current, a plurality of motors for driving the train, and a direct currant generator driven by the movement of the train, and a direct current generator driven by the movement of the train, and arranged to control the acceleration of the motors.
39. In combination with an electric train. a source of alternating current. a plurality of motors for driving the train, controllers for the motors, and a direct current generator driven by the movement of the train and arranged to control the acceleration of the motors.
40. In combination with an electric train. an alternating current motor for driving the train. a direct current generator driven by the movement of the train, an electro-responsive device actuated by the direct current for controlling the acceleration of the motor.
41. In combination with an electric train, an alternating current motor for driving the train, a direct current generator driven by the movement of the train, an electro-responsive device comprising direct current magnets actuated by the current from the generator for controlling the acceleratlon of the motor.
42. A car. an alternating current motor for driving the car. a direct current generator driven by the movement of the ear and arranged to control the acceleration of the motor and controlling eircuits. combined with another car having a similar motor, gencrator and controlling circuits and inductive means for operatively associating the controlling circuits on the two cars.
43. The combination of a plurality of cars each having an alternating current motor, a direct current generator driven by the movement of the cars and arranged to control the acceleration of the motor and controlling circuits and inductive means between the cars for operatively associating their controlling circuits.
44. The combination of a plurality of cars each having an alternating current motor. a direct current generator driven by the movement of the car. an electro-responsive device actuated by the current from the generator for controlling the acceleration of the motor and controlling circults and inductive means between the cars for operatively associating the controlling circuits.
45. The combination of a plurality of cars each having an alternating current motor, an opposition element in the motor circuit, a direct curreut generator driven by the movement of the car. an electro-responsive device for removing the opposition element from the motor rircuit, and controlling circuits and inductive means between the cars for operatively associating the controlling circuits.
46. The combination of a plurality of cars each having an alternating current motor, an opposition element in the motor circuit, a direet current generator driven by the movement of the car, an electro-responsive deviee comprising magnets for removing the opposttion element from the motor circuit and controlling circuits and inductive means between the cars for operatively associating the controlling circuits.
47. The combination of a plurality of cars each having an alternating current motor, an opposition element in the motor circuit, a direct current generator driven by the movement of the car, an electro-responsive device comprising magnets for removing the opposition element from the motor circuit step by step and controlling circuits and inductive means between the sars for operatively assoclating the controlling circuits.
48 The combination of a plurality of cars each having an alternating current motor, a direct current generator driven by the movement of the car and arranged to generate a variable voltage in proportion to the speed of the car, an electroresponsive device connected to the generator, said electro-responsive device comprising magnets actuated one by one as the voltage increases, and controlling circuits and inductive means between the cars for operatively associating the controlling circuits.
49. In combination with a car, an alternating current motor, a direct current generator driven by the movement of the car and arranged to generate a.variable voltage, an electro-responsive device connected to the generator for controlling the acceleration of the motor, said electro-responsive device comprising magnets arranged to be acuated one by one, and means for rendering the magnets inoperative.
50. In combination with a car, an alternating current mo tor, a direct current generator driven by the movement of the car and arranged to generate a variable voltage in proportion to the speed of the car, an electro-responsive device connected to the genrator, for controlling the acceleration of the motor. said electro-responsive device comprising magnets arranged to be actuated one by one as the voltage increases. and means for rendering the magnets inoperative.
51. In combination with a car, an alternating curret mo tor, a direct current generator driven by the movement of the car and arranged to generate a variable voltage in proportion to the speed of the car, an electro-responsive device connected to the generator, for controlling the acceleration of the motor, said electro-responsive device comprisions magnets arranged to be actuated one by one as the voltage increases, and means for rendering one or more of the magnets inoperative.
52. In combination with a car, an alternating current motor, a direct current generator driven by the movement o the car and arranged to generate a variable voltage in proportion to the speed of the car, an electro-responsive device connected to the generator for controlling the acceleration of the motor, said electro-responsive device comprising magnets arranged to be actuated one by one as the voltage increases, and manually operated means for rendering one or more of the magnets inoperative.
53. The combination of a plurallty of cars each having an alternating current motor, a direct curren generator driven by the movement of the car and arranged to generate a variable voltage in proportion to the speed of the car, an electro responsive device connected to the generator, said electroresponsive device comprising magnets automatically actuated one by one as the voltage increases, means for rendering said magnets inoperative and controlling circuits, and inductive means between the cars for operatively associating the controlling circults.
54. The combination of a plurality of cars each having an alternating current motor, a direct current generator driven by the movement of the car and arranged to generate a variable voltage in proportion to the speed of the car, an elec tro-responsive device connected to the generator, said elec tro-responsive device comprising magnets automatically actuated one by one as the voltage increases, manually operated means for rendering one or more of the magnets inoperative and controlling ctrcults, and inductive means be tween the cars for operatively associating the controlling ercuits.
55. In combination with a car an alternating current motor for driving the car, a direct current generator driven by the movement of the car, an electro-responsive device actuated by the direct current for automatically controlling the acceleration of the motor, and manually controlled means for controlling the speed of the motor.
56. The combination of a plurality of cars each having an alternating current motor, a direct current generator driven by the movement of the cars and arranged to autumatically control the acceleration of the motor and controlling circuits, inductive means between the cars for operatively as soclating their controlling circuits, and means for controlling the cars from any selected platform of the train.
57. The combination of a plurality of cars each having an alternating current motor, a direct current generator driven by the movement of the cars and arranged to automatically control the acceleration of the motor and controlling cir. cuits, inductive means between the cars for operatively as sociating their controlling circuits, manually controlked means for starting, stopping and controlling the speed of the cars. and means for controlling the cars from any selected platform of the train.
58. In combination with a plurality of cars. alternating motors for the cars, controlling circuits. electrically operated switches in the circuits, said switches comprising alternating and direct current magnets. inductive means between the cars for operatively associating the operating circuits.
59. In combination with a plurality of cars, alternating current motors on the cars, starting switches in the motor circuits, single phase controlling circuits arranged to close the starting switches, and inductive means between the cars for operatively associating the controlling circuits.
60. In combination with a plurality of cars. a source of alternating current supply, altemating current motors on the cars. direct current generators connected to run with the cars, starting switches for the motors primarily closed by the alternating current and held in closed position by the direct current and inductive means between the cars arranged to cause the starting switches to be closed simultaneously.
61. In combination with a plurality of cars a source of alternating current supply, alternating current motors on the cars, direct current generators connected to run with the cars, starting switches for the motors primarily closed by the alternating current and held in closed position by the direct current. inductive means between the cars arranged to cause the starting switches to be closed simultaneously. and means for controlling the switches from a selected point.
62. In combination with a plurality of cars, alternating current motors for starting the cars, a source of direct current controlled by the motors, electrically operated starting switches for the motors, electro-responsive devices actuated by the direct current for controlling the acceleration of the motors, alternating current magnets and direct current magnets for actuating the starting switches, controlling circuits and inductive means for operatively associating the controlling circuits on the several cars.
63. In combination with a plurality of cars, alternating current motors for driving the cars, direct current generators connected to run with the cars, electrically operated starting switches for the motors, electro-responslve devices comprising accelerating magnets actuated by the direct current for automatically controlling the acceleration of the motors. speed controlling switches for controlling the accelerating magnets, alternating current magnets and direct current magnets for actuating the starting switches and the speed controlling switches. controlling circuits and inductive means for operatively associating the controlling circuits.
64. In combination with a plurality of cars, alternating current motors for driving the cars. direct current generators connected to run with the cars, electrically operated starting switches for the motors, electro-responsive devices comfrising accelerating magnets actuated by the direct current for automatically controlling the acceleration of the motors, speed controlling switches for controlling the accelerating magnets, alternating current magnets and direct current magnets for actuating the starting switches and the speed controlling switches, controlling circuits anyl inductive means for operatively associating the controlling circuits. and master switches on the cars for controlling the said starting and speed controlling switches.
65. In an electricetrain the combination of two or more nistor cars, one or more cars without motors, controlling circuits for the motors, and inductive means between all of the cars for operatively associating the controlling circuits. 66. In an electric train the combination of two or more motor cars, one or more cars without motors, controlling circuits for the motors and inductive means between all of the cars for operatively associating the controlling circuits and means for controlling the motors from a selected platform of any of the motor cars.
67. In combination with an electric train, a plurality of controlling circuits therefor adapted to carry alternating currents, a master switch for controlling the circuits, and a plurality of inductive devices between the cars for operatively associating the controlling circuits.
68. In combination with an electric train, a plurality of controlling circuits therefor adapted to carry alternating currents. a master switch for controlling the circuits, a plurality of inductive devices between the cars for operatively assoclating the controlling circuits, and means for controlling the circuits from any selected car.
69. In combination with an electric train, alternating current motors thereon, electrically operated controlling devices for the motors, alternating current circuits for actualing the controlling devices, and means for inductively as sociating the controlling ctrcuits between the cars.
70. In combination with an electric train, alternating current motors thereon, electrically operated controlling devires for the motors, alternating current circuits for actuating the controlling devices, means for inductively assoriating the controlling circuits between the cars, and means for controlling the controlling circuits from a selected platform of the train.
71. In combination with a plurality of cars, alternating current motors on the cars. starling switches in the motor circuits, alternating current controlling circuits arranged to close the starting switches, and inductive means beween the cars for operatively associating the controlling circuits
i2. In combination with two connected cars, electrical circuits on the cars. an inductive apparatus associating the circuits on the cars, flexible conductors to the inductive apparatus and flexible supports for the Inductive apparatus.
73. In combination with two connected cars, electrical circuits on the cars. a ino-part inductive apparatus between the cars associating the circuits, flexible conductors connecting the circuits to the inductive apparatus, and flexible supports for the inductive apparatus connecting one part of the inductive apparatus to one of the cars and the other part to the other car and so arranged that they take all tensile strain between the parts if the cars become separated.
74. In combination with a plurality of cars, alternating current motors for the cars, controlling circuits therefor, electrically actuated switches in the circuit, and alternatink current magnets and direct current magnets, circuits for the magnets. said magnets arranged to operate said switches.
75. In a train system the combination of a motor or motors for hauling the train, and controlling circuits therefor, inductive means for operatively associating the controlling circuit, and means in the controlling circults to weaken and strengthen the current at will.
76. In combination with an electric train, a motor or motors for hauling the train, electrically operated controlling devices for the motor or motors, circuits therefor, and inductive means connected to the cars for associating the controlling circults.
77. In an electric train, a motor or motors for hauling the train electrically operated controlling devices for the motor or motors, controlling circults therefor, means for regulating and means for controlling the circuits from any selected car of the train, and inductive means for associating the circuit between the controlling devices on the several cars.
78. In an electric train, a motor or motors for hauling the train, a source of electric supply conducted to the motor or motors, an electric generator driven by the train and arranged to control the acceleration of the motor or motors.
79. In combination with a plurality of cars, alternating current motors for driving the cars, a source of direct current controlled by the motors. electrically operated starting switches for the motors, electro-responsive devices actuated by direct current for controlling the acceleration of the motors, alternating current magnets and direct current magnets arranged to actuate the starting switches and the speed controlling switches.
80. In combination with a plurality of cars, alternating current motors for driving the cars. direct current generators connected to run with the cars, electrically operated starting switches for the motors. electro-responsive devices comprising accelerating magnets actuated by the direct current for automatically controlling the acceleration of the motors. speed controlling switches for controlling the accelerating magnets, alternating current magnets and direct current magnets arranged to actuate the starting switches and the speed controlling switches.
81. In a train system the combination of two sources of electric energy, one of which is conducted to the train the other of which is on the train and is propontional in strength to the speed of the train, both of which are arranged to control the movement of the train.
S2. In a train system the combination of two sources of current supply, one of which is pulsating and of practically constant value, the other of which is on the train and varies from zero to a maximum in proportion to the speed of the train, both of said supplies arranged to control the train.
83. In a train system, two sources of electrical energy, one of which is generated by the movement of the train and is proportional in strength to the speed of the train, the other of which is conducted to the train and a master switch arranged to control the latter supply from a selected car of the train.
84. In a train system, two sources of current supply, one of which is conducted to the train and is pulsating but practically constant in strength, the other of which is direct and is generated by the movement of the train and is variable, from zero to a maximum, and a controlling circuit on the train and magnetic means in the controlling circuit for controlling the starting, reversing. acceleration and stopping of the train and additional means on the cars to control the current in the controlling circuits.
\(\mathbf{8 5}\). In combination with a plurality of cars, motors fo. driving the cars. an external source of pulsating current conducted to the cars and adapted to control and to drive the motors, controlling switches for the motors actuated by said current, a second source of current supply obtained from a gencrator mechanically connected to the running
mechanism of the cars and driven thereby when the cars are in motion, said second source of supply arranged to automatically control the acceleration of the cars and to cooperate with the first source of supply to operate the controlling switches.
86. The combination of a plurality of cars each having an alternating current motor, an opposition element in the motor circuit, an electric generator driven by the movement of the cars and electro-responsive devices comprising magnets for removing the opposition element from the motor circuit.
87. The combination of a plurality of cars each having an alternating current motor, an opposition element in the motor circuit, an electric generator driven by the movement of the car and an electro-responsive device comprising magnets for removing the opposition element from the motor circuit step-by-step in proportion to the speeding up of the cars.
88. The combination of a plurality of cars each having an alternating current motor, an electric generator driven by the movement of the car and arranged to generate a variable voltage in proportion to the speed of the car, an elec-tro-responsive device connected to the generator, said elec-tro-responsive device comprising magnets actuated one by one as the voltage increases.

89 In a train system, a motor or motors for hauling the train, an electric generator driven by the movement of the car and arranged to generate a variable voltage, an electroresponsive device connected to the generator for controlling the acceleration of the motor. said electro-responsive device comprising magnets arranged to be actuated one by one, and means for rendering the magnets inoperative.
90. In combination with a plurality of cars, alternating current motors for the cars, controlling circuits therefor, alternating and direct current magnets, circuits for the magnets, electrically actuated switches in the motor circuits, said swithces arranged to be operated by the alternating and direct current magnets
91. The combination of a plurality of cars each having an alternating current motor, a direct current generator driven by the movement of the car, an electro-responsive compising magnets actuated by the current from the generator for controlling the accelcration of the motor and controling efrcuits and inductive means between the cars for operatively assoclating the controlling circuits.
92. In combination with two cars, an inductive apparatus comprising two parts each inclosed in a waterproof casing one of which parts is supported by one of the cars and the other of which is supported by the other of the cars.

No. 101,265. Clamp for Afinding Heels.
Mordache pour assujetir les roucs.

Carl C. Schmidt, St. John, New Brunswick, Canada, 2nd October, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,321.
Claim.-1. As an article of manufacture, a metallic clamp for attaching a heel to a boot or shoc, composed of a metallic strip having a flange on one edge, the strip inade with a bevel or curve around the sides and back of the
heel, and having the ends bent at the front of the heel, connected by a screw or bolt and nut, substantially as and for the purposes hereinbefore set forth.
2. As an article of manufacture, a metallic clamp for attaching a heel to a boot or shoe, composed of a metallic strip having a flange on one edge, and having the ends bent and connected by a screw or bolt and nut, substantially as and for the purposes hereinbefore set forth.

No. 101,266. Piano. Piano.

Roland Montague Squire, Montreal, Quebec, Canada, 2nd October, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,484.
Claim.-1. In a piano the combination with a rall, a key, a hammer, the butt of the hammer, a part movable with the key and means including a member effecting a direct and temporarily rigid connection between the said part movable with the key and the hammer, such means being permanently pivotally connected to both the butt and the said part movable with the key, of movable means carried by the rail and the path of movement whereof intersects the said first-mentioned means, and the sald movable means being constructed and arranged to be impinged upon and moved by the first-mentioned means and the said rigid connection broken, substantially as described.
2. In a piano the combination with a rail, a hammer, a key, and a jointed jack the members whereof co-act to retain each other against movement in one direction upon their joint, of a movable member carried by the stationary part of the piano and disconnected from the jointed jack and adapted to be impinged upon the jointed jack to cause the members of the latter to turn on their joint, substantially as described.
3. In a plano action the combination with a hammer. a key, a rail and a jointed jack, of an arm pivoted to the rall adjacent to and disconnected from the jointed jack adapted to be impinged upon by the jointed jack to cause the members of the latter to turn on their joint, substantially as described.
4. In a plano the combination with a rail, a hammer, a key, and a jointed jack the members whereof overlap each other to prevent movement in one direction upon their joint, of a movable ylelding member carried by the stationary part of the piano and disconnected from the jointed jack and adapted to be impinged upon by the jointed jack to cause the members of the latter to turn on their joint, substantially as described.
5. In a plano actioqn the combination with a hammer, a key, a rail and a jointed jack, of an arm pivoted to the rain and disconnected from the jointed jack, a member secured to the free end thereof by a screw adjustable into and out of such end, such member being adapted to be impinged upon by the jointed jack to cause the parts of the latter to turn on their jonnt, substantially as described.
6. In a piano action the combination with a hammer, a key, and a jointed jack, of a duplex rail, an arm extending between the parts of the rail, means pivotally connecting the rear end of the arm to the rear side of the upper part of the rail, the forward end of such arm being in position to be impinged upon by the jointed jack, substantially as described.
7. In a plano action the combination with a hammer. \(a\) key, and a jointed jack, of a duplex rail, an arm extending between the parts of the rail. means pivotally connecting the rear end of the arm to the rear side of the upper part of the rail. the forward end of such arm being in position to be impinged upon by the jointed jack. and a damper lever having a portion thereof curved to accommodate the rear end of the pivoted arm, substantially as described.

\section*{No. 101,267. Leach Tamls Reorvoir.}

James D. Wood, Cheboygan, Michigan, U.S.A., 2nd October. 1906; 6 years. Filed 1st May, 1906. Receipt No. 135,427.
Claim.-1. The combination with a leach tank, of rotatable arms carrying cutters and gravity operating means for controlling the speed of descent of the cutters into the tank.
2. The combination with a leach tank, of rotatable arms carrying cutters and gravity operating means for controlling the speed of descent of the cutters into the tank, and means carried by the arms to regulate the dip of the cutters.
3. The combination with a leach tank of rotatable arms carrying rotatable cutters, an overhead truck carrying means for driving the arms, and gravity controlled counterbalancing devices supported by the truck and operatively connected with the cutting mechanism.

No. 101,268. Gas Burner. Braleur d gaz.

The Michigan Stove Company, assignee of W. J. Keep and Henry C. Maul, all of Detroit. Michigan, U.S.A., 2nd October, 1906 ; 6 years. Filed 5th May, 1906. Receipt No. 135,568.
Claim.-1. In a gas mixer and burner in combination with a base provided with a mixing chamber, a cap provided with rows of holes extending along radial elevations on said cap
and having depressions between consecutive rows of holes which depressions extend from the outside of the cap inward, a chamber under sald cap and a centrally perforated diaphragm separating the two chambers, substantially as described.
2. A burner cap for gas burners provided with two rows of holes crossing at the center and with each row branching into a multiple of sows at points intermediate the center and the circumference, substantially as described.
3. A burner cap provided with a plurality of intersecting rows of holes in the central portion of its surface, and with other rows of holes extending from points adjacent to the ends of said first-mentioned rows toward the outer edge of cap, there being air conveying channels in the surface of sald cap intermediate the several rows of holes, substantially as described.
4. A burner cap having a plurality of rows of holes in the central portion and other rows of holes leading from one of said first-mentioned rows toward the outer edge, there being air conveying channels in the surface of said cap between adjacent rows, substantially as described.
5. In a gas burner in combination with a mixing chamber, a chamber under the gas exit holes, a plate forming a diaphragm between said chambers and provided with an opening for the escape of gas therefrom, a cap seat concentric with the center of said opening, a cap provided with gas exit holes on elevated portions thereof and with depressions of the cap wall between the holes, said depressions of the wall dividing the chamber under the cap radially, substantially as described.
6. A burner having in combination with a base plate provided with a seat, a cap having its under and inner surface provided with a member of radial depressions dividing the chamber beneath the cap into radially arranged chambers, a mixing chamber beneath the radial chambers and a centrally perforated diaphragm between the radial chambers and the mixing chamber, substantially as described.
7. In a gas burner a cap provided on its under side with radial hanging parts, a seat for said cap and a perforated diaphragm forming the underside of a chamber beneath sald cap, the said radial depressions stopping short of the plate whereby there is formed a separate chamber extending over said plate with high parts radiating from the center thereof. substantially as described.
8. A burner cap having in combination a mixing chamber, a diaphragm thereover perforated at its central portion and a plurality of radially extending supply chambers communicating at their inner ends with each other and with the perforation in said diaphragm, the cap being perforated with burner holes over each branch of said supply chamber, substantially as described.
9. In a gas mixer and burner in combination with a mixing chamber, a supply chamber for the burners and an intervening perforated diaphragm, the upper surface of sald supply chamber being provided with rows of holes extending along radial elevations on said surface and having depressions beiween consecutive rows of holes, said depressions extending from the outside of said surface inward, substantially as described.
10. In a gas burner in combination with a mixing chamber and a supply chamber, an intervening perforated diaphragm and rows of holes extending along radial elevations in the upper surface of said mixing chamber, there being intervening depressions in said surface between the rows of holes adapted to provide a free supply of air to all of sald holes, substantially as described.
11. In a gas burner a cap provided on its underside with radial hanging parts, a seat for said cap and a perforated diaphragm forming the underside of a mixing chamber and the top side of a supply chamber, said mixing chamber extending radially over said diaphragm, substantially as described.
12. A burner cap having in combination with a mixing chamber and a centrally perforated diaphragm across the top thereof, elevated burner openings with depressions between them extending radially from the center, substantially as described.

\section*{No. 101,269. Condinit for Flectric Wires. \\ Conduit pour als électriqucs.}

The Conduits Company, Toronto, Ontario, Canada, assignee of Daniel Hayes Murphy, Newcastle, Pennsylvania, U.S.A., 2nd October. 1906; 6 years. Filed 6th March, 1906. Receipt No. 133.585.
Claim.-1. As a new article of manufacture, a metal pipe having a metallic coating on one surdace and a fiexible enamel coating applied directly to the other surface, substantially as described.
2. As a new article of manufacture, a metal pipe having a metallic coating on its outer surface and a flexible en-
amel coating applited directly to its inner surface. substantially as described.

rig 1 101269
3. As a new article of manufacture, a metal pipe having an electro-galvanized metallic coating on its outer surface and a flexible enamel coating applied directly to its inner surface, substantially as described.
4. A iube of iron, electro-plates on the outside with zine and having a flexible inside coating of enamel applied directly to the iron of the lube. substantially as described.

No. 101.270. Bale Band Tie.
Attache de courroies de ballots.

The Southern Bale Tie Company, assignee of Edward L. Pence, both of Memphis, Tennessee, U.S.A., Ind October, 1906; 6 years. Filed 29th June. 1906. Receipt No. 137,398.
Claim.-1. A bale band tle formed of a sheet metal plate provided with an opening, and a plurallty of tongues or spurs, one of which is arranged to be driven through the opening into the material, while the other is arranged at the end of the plate and is also adapted to engage with the material.
2. A bale band tie formed of a sheet metal plate liaving means at one end for engagement with a wire band and provided near its opposite end with an opening, and a pair of tongues or spurs for engagement with the opposite end of the wire and with the material to be bundled.
3. A bale band tie consisting of a plate having spaced apertures, and a tongue extending from one end of the plate with its terminal bent at an angle to the same. said tongue being adapted to be bent over the plate and its bent terminal passed through the adjacent aperture and into the material being bundled.
4. A bale band tif consisting of a plate having spaced apertures, and a tongue and a spur extending from one end of the plate, the terminal of the tongue being bent at an angle thereto to form a prong, said spur being arranged to engage with the material being bundled, and the tongue
forming a wire attaching means, the terminal prong of the tongue extending through the adjacent aperture and into the material.
.7. A balu band tie consisting of a plate bent intermediatr of its ends to form angularly related members, and provided with an aperture in each of said members, and a tongue projecting from one end of one of said members and provided with a terminal prong. said tongue forming a wire engnging member, and the prong being arranged to pass through the adjacent aperture and into said material being bundled.
6. A bale band tie having an opening, a tongue, and a spur projecting from one end of the tie. the spur being bent transversely of the tie in one direction, and the tongue bent back across the tie in the other direction and overlapping the opening, the free extremity of the tongue being formed into a transversely disposed prong capable of being driven through the opening.
7. A blank for a bale band tie having an opening, a tongue projecting from one end of the blank in alignment with the opening, and a spur projecting from the same end of the blank, the tongue being of a length to overlap the opening when bent back across the blank, and the free extremity of the tongue being pointed to form a prong.

No. 101,271. Milling Machinery.
Machine de moulin.

James W. Kennedy, assignee of Edward Grotz, both of Chicago. Illinols. U.S.A., 2nd October, 1906: 6 years. Filed th September, 1:06. Receipt No. 139.226.
Claim.-1. The combination of a revoluble member for supforting the work, a movable tool holder. means for advancing said tool holder comprising a cam secured to said revoluble member outside of the work and in close proximity thereto, an arm which engages said cam and connection between said arm and said tool holder.
2. The combination of a revoluble member for supporting the work, a movable tool holder, means for advancing said tool holder comprising a cam secured to sald revoluble member outside of the work and in close proximity thereto, an arm which engages said cam in substantially the same axial plane of the revoluble member as the cutting tool and connection between sald arm and said tool holder.
3. The combination of a revoluble member for supporting the work, a movable tool holder, means for advancing said tool holder comprising cams secured to rotate with sald revoluble member, one at each side of the work and in close proximity thereto, arms which engage said cams and connection between said arms and said tool holder.
4. The combination of a revoluble member for supporting the work, a movable tool holder, means for advancing said tool holder comprising a cam or cams secured to sald revoluble member, an arm or arms which engage sald cam or cams, connection between said arm or arms and aid tool cams, connection between sald arm or arms and sald tool holder, and a spring applied to said tool holder which malatains the same normally retracted and operates to take up all lost motion under all conditions of use.
5. The combination of a revoluble member, a tool holder. means to maintain soid tool holder normally retracted and means for advancing said tool holder comprising a cam or cams secured to rotate with said revoluble member. an arm or arms which engage saixl cam or cams and rods which directly connect said arm or arms with said tool holder.

\section*{No. 101,27\%. Can Lifter.}

Appareil à soulever les bidons.
Emily A. Austin, Bethel, New York, U.S.A., 2nd October. 1906; 6 years. Filed 8th August. 1906. Recelpt No. 138,480.
Claim.-1. A device for lifting jars consisting of a disc a standard rising therefrom, a bail pivotally mounted upon
said standard and adapted to encircle the jar resting upon said disc, one end of said ball being bent to form an arm

with an eye at the end thereof, and a hook upon the standard adapted to be engaged by said eye whereby said bail may be held in an elevated position, as set forth.
2. A device for lifting jars comprising a disc, a wire bent at its longitudinal center to form an eye, the ends of sald wire secured to said disc, each leg of said wire being bent to form an eye, a ball made of a single piece of wire and adapted to encircle a bar resting upon said disc, portions of said wire forming the bail having bearings in the eyes of said standards, a hook upon the standards and a portion of the wire forming said ball bent to form a resllient arm with an eye at the end designed to engage sald hook, as set forth.

\section*{No. 101,273. Rubber Printing Stamp. Etampe de caoutchouc.}

Lawrence R. Blackmore, Arlington, New Jersey, U.S.A., 2nd October, 1906; 6 years. Flled 18th June, 1906. Receipt No. 137,028.
Claim.-1. In a hand stamp the combination with a stamp block, of a rubber type base attached thereto consisting of an integral strip of rubber formed with intersecting grooves with hollow columns between them, said hollow columns being united at the bottom of the said intersecting grooves by thin narrow webs of less width than the thickness of the side walls of said bollow columns, said webs consisting of the skin at the bottom of said intersecting grooves, and all surfaces of the bank being formed with a smooth continuous surface together with a rubber type plate attached to the rubber type base.
2. In a hand stamp the combination with a stamp block, of a rubber type base attached thereto consisting of an integral strip of rubber formed with intersecting grooves with hollow columns between them, said hollow columns being united by a web consisting of the skin at the bottom of said intersecting grooves, the sides of which latter extend down to said skin where they intersect each other, so as to form sharp and well defined lines of severance for the purpose described, together with a rubber type plate attached to the said rubber type base.
3. As an article of manufacture, a hand stamp consisting of a rubber type plate mounted tpon a hollow flexible rubber cushion formed with a series of adjoining cells having irdependent side walls, the opposed sides of said adjoining cells being united by the thin narrow webs consisting of the 10-3
skin at the base of the cells, said webs being of less width than the thickness of the cell walls and the edges of satd walls being attached to the stamp block together with suid stamp block for the purpose described.
4. A base plate for hand stamps consisting of an integral strip of rubber formed with parallel series of independent hollow columns united by webs or ligatures of less width than the thickness of the walls of the hollow columns, for the purpose described.
5. A base plate for hand stamps consisting of an integral strip of rubber formed with parallel series of hollow columns which are quadrangular in cross section united by webs or ligatures of less width than the thickness of the walls of said hollow columns, for the purpose described.
6. A moulded blank for rubber type bases consisting of an integral strip of rubber formed with two series of parallel severing grooves, one series intersecting the other with hollow columns united by thin narrow webs of less width than the thickness of the walls of the columins, sald webs consisting of the skin at the bottom of the said intersecting grooves.
7. A moulded blank for rubber type bases consisting of an integral strip of rubber formed with two series of parallel severing grooves intersecting each other at right angles, with hollow quadrangular columns united by thin narrow webs of less width than the thlckness of the walls ol said hollow quadrangular columns, said webs consisting of the skin at the bottom of said intersecting grooves.
8. A moulded blank for rubber type bases consisting of ar: antegra strip of rubber formed with a series of longltudinal parallel severing grooves and a series of transyerse parallel severing grooves, with square hollow columas between them united by thin narrow webs of less width than the thickness of the walls of said square hollow columns, said webs consisting of the skin at the bottom of said intersecting grooves.
9. A moulded blank for rubber type bases consisting of an integral strip of rubber fromed with two series of parallel severing grooves, one series intersecting the other with hollow columns between them united by webs consisting of the skin at the bottoms of sald intersecting grooves the sides of which extend down to said skin where they intersect each other to form sharp well defined lines of severance, for the purpose described.
10. A moulded blank for rubber type bases consisting of an integral strip of rubber formed with two series of parallel grooves, one serles intersecting the other with columns between them united by webs consisting of the skin at the bottom of said intersecting grooves the sides of which latter extend down to said skin and intersect it and each other to form sharp well defined lines of severance, for the purpcse described.

No. 101,274. Method of Making Boiler Flues. Méthode de faire des tuyaue de chaudieres.

John M. Crozler, Minneapolis, Minnesota, U.S.A., 2nd October, 1906; 6 years. Filed 7th August, 1906. Recelpt No. 138,463.
Claim.-The process of forming a flue with an enlarged tapered end having a wall of increased thlckness, which consists, first, in reducing the end of the flue both in internal and external diameter, and second, in upsetting the reduced end of sald flue to thicken up the wall thereof and increase the external diameter thereof, substantially as described.

No. 101,275. Apparatus Por Oleaning and Separat-
Apparefl d nettoyer et séparer les graines.

Frederick Malcolm Dossor. Doncaster, England, 2nd October, 1906; 6 years. Filed 26th June, 1906. Receipt No. 137,320.
Claim.-1. In an apparatus for cleaning and separating sceds the combination of a main feed hopper, a series of inclined overlapping upwardly travelling endless belts or bands of velvet, velveteen or like fabric, a series of adjustable rollers carrying the sald belts or bands, and a series of smaller hoppers each having a fine transverse discharge slit so as to feed the seed in a single evenly distributed line across the entire width of each successive band or belt for the purpose of receiving and passing on the seed over the entire width of each successive band or belt for the purpose of receiving and passing on the seed over the entire series of belts or bands, continuously extracting the weed seed and forelgn matter therefrom during such passage, and separately and continuously discharging and delivering the cleaned seed and the extracted matter, substantially as shown and described.
2. In an apparatus for cleaning and separating seeds and the like, the combination of a feed hopper dellvering to a sccond hopper, inclined upwardly travelling endless belts, one overlapping the other, and supporting boards, covers, and guides, all carried on a suitable frame capable of adjustment as to its angle or slope, and constructed and operuting substantially as shown and described.

\section*{No. 101,276. Dough Cutter. Couteau d pate.}

William Vincent Heinz, La Salle, Illinois, U.S.A., 2nd October, 1906 ; 6 years. Filed 30th April, 1906. Recelpt No. 135,379.
Claim.-1. The combination of a frame, a spindle carried by the frame, a serles of cutting discs mounted on the spindle, and a series of washers interposed between the; discs, and having projecting cutting portions extending toward the peripheries of the discs.
2. The combination of a frame, a spindle carried by the frame, a serles of cutting discs mounted on the spindle, washers interposed between the discs, sald washers being of less diameter than the discs but having cutting portions extending to the peripheries of the discs, the discs being arranged with their cutting portions in alignment, and a retaining member on each end of the spindle.
3. The combination of a frame, a spindle carried by the frame, a series of cutting discs mounted on the spindle. washers interposed between the discs, the washers being of less diameter than the discs, and having cutting portions extending to the peripheries of the discs, and a stripping member having teeth disposed between the discs and arranged to have the ends of the teeth in constant engagement with the peripheries of the washers.
4. The combination of a frame, a spindle carrled by the frame, a series of discs mounted on the spindle, washers

interposed between the discs, each washer being of a diameter less than that of the discs and having cutting portions extending to the peripherles of the discs, a retaining means on each end of the spindle, and an elastic stripping member having teeth projecting into the spaces between the discs, the ends of the teeth being in constant engagement with the peripheries of the washers.
5. The combination of a frame, a spindle carried by the frame, a series of cutting discs mounted on the spindle, and a series of radially projecting cutters arranged between the said discs.

No. 101,277. Machine for Cutting Railway Ties. Machine pour couper les dormants de chemins de fer.

Enos W. Hogan, Kashabowie, Ontario, Canada, 2nd October, 1906 ; 6 years. Filed 27 th June, 1906. Receipt No. 137,343.
Claim.-1. A machine for cutting ties and the like comprising a bed adapted to hold a log, a frame hinged at one end on the bed, a steam cylinder and its piston rod operating connections between the piston rod anl the frame, and two longitudinal parallel knives carried by the frame and spaced apart the thickness of a tie, substantially as described.
2. A machine for cutting ties and the like comprising a bed adapted to hold a log, a frame hinged at one end on the bed, means for drawing down the frame, and two longitudinal parallel knives carried by the frame and spaced apart the thickness of a tie, substantially as described.
3. In a machine for cutting ties and the like comprising a bed adapted to hold a log. longitudinal guides secured to the bed, a slide movable therein, a longitudinal knife hinged at one end on the slide, an arm hinged on the bed and having the knife hinged thereon intermediate its ends, a steam cylinder and its piston rod, and a connecting rod pivotally connected with the arm and the piston rod, substantially as described.
4. A machine for cutting ties and the like comprising a bed adapted to hold a log. longitudinal guides secured to the bed, sloping downwardly toward the log. a slide movable therein, a longitudinal knife hinged at one end on the slide. an arm hinged on the bed and having the knife hinged thereon intermediate its ends, a steam cylinder and its piston rod, and a connecting rod pivotally connected with the arm and the piston rod, substantially as described.
5. A machine for cutting ties and the like comprising a bed adapted to hold a log, longitudinal guides secured to the bed, sloping downwardiy toward the log, a slide movable therein, a longitudinal knife hinged at one end on the slide, an arm hinged on the bed and having the knife hinged thereon intermediate its ends, and means for operating the arm, substantially as described.

No. 101,278. Ladder and Trap Door Mechanism. Echelle et mécanisme de trappe.

Thomas Marcus Houghton, London, England, 2nd October, 1906; 6 years. Filed 15th August, 1906. Recelpt No. 138,707.

Claim.-1. A ladder and trap door mechanism, comprising a ladder and actuating means connecting said ladder and said traj door to oden an close said trap door upon lowering and raising the ladder.
2. A ladder and trap door mechanism comprising a ladder, actuating means connecting said ladder with said trap door to open and close same, and means securing said trap door in its open and closed positions.
3. A ladder and trap door mechanism comprising a ladder, actuating means connecting said ladder with said trap door, means securing said trap door in its open and closed positions, and a handrail device.
4. A ladder and trap door mechanism comprising a ladder, actuating means connecting said ladder with the trap door, means securing said trap door in its opened and closed positions, a handrail device, and means hiding said ladder and mechanism from view when closed.
5. A ladder and trap door mechanism comprising a ladder and levers and links connecting said ladder with said trap door adapted to open and close said trap door upon the ladder being lowered and raised respectively.
6. A ladder and trap door mechanism comprising a ladder, levers and links connecting said ladder with the trap door to. open and close the same, and means securing said trap door in its open and closed positions.
7. A ladder and trap door mechanism comprising a ladder, levers and links conneoting said ladder with the trap door, means securing said trap door in its open and closed positions, a hand rail device and actuating means for said hand rail device.
8. In a ladder and trap door mechanism a collapsable ladder hinged or pivoted withdn the well hole and adapted to be shortened to accupy a position wholly within said well hole and extended so as to reach to the floor, and levers and links connecting said ladder with said trap door to open and close the same by lowering and ralsing said ladder.
9. In a ladder and trap door mechanism a collapsable ladder hinged or pivoted within the well hole and adapted to be shortened to occupy a position wholly within sald well bole and extended so as to reach to the floor, levers and links connecting said ladder with said trap door to open and close the same by lowering and raising said ladder and a disposition of the pivotal connections of said levers and links adapted to secure the trap door in the opened and closed positions.
10. In a ladder and trap door mechanism a collapsable ladder hinged or pivoted within the well hole and adapted to be shortened to occupy a position wholly within said well hole and extended to reach to the floor, levers pivoted within sald well hole door lunks connecting said levers with trap door, ladder links connecting said levers with the ladder, and radius links connecting said ladder links with the end wall o? the well hole.
11. In a ladder and trap door mechanism a collapsable ladder of the lazy tongs description comprising members having dished positions, stops formed with end flanges, concave recesses in said end flanges to fit the convexity of the inner members, bolts passing through said flanges and sald members at the points of intersection, lock nuts locking the inner members to said flanges, sleeves intermediate the bolts and the outer members and means securing the whole in positlon.

\section*{No. 101,279. Lid Lifter.}

Apparetl d soulever les couvercles.

Albert G. Kountz, Mount Oliver, Pittsburg, Pennsylvania, U.S.A., 2nd October, 1906 ; 6 years. Filed 8th August, 1906. Recelpt No. 138,478.

Claim.-1. On attachment for utensils comprising a spring supporting clip, a cover engaging clip mounted thereon and a handle extending from the cover engaging clip.
2. A device of the character described comprising a utensil engaging clip consisting of a base and clamping fingers adfacent thereto, a pivot pin supported by said cllp, a cover engaging clip comprising integral overlapping \(U\)-shaped portions pivoted upon the pin and a handle extending from said cover engaging clip.
3. An attachment of the character described comprising a supporting clip formed in a single length of spring wire bent to form a base, eyes and spring fingers for clamping an object upon the base, a cover engaging clip consisting of a single length of spring wire bent to form overlapping \(U\) shaped clamping portions, a handle and eyes integral with said clamping portions and a pivot pin extending through the eyes of the two clips.

\section*{No. 101,280. Manufacture of Paint, Fuel, Eitc. Fabrication de peinture, combustible, eto.}

Rene Adolphe Le Maitre, Brussels, Belgium, 2nd October,
1906; 6 years. Filed 13th June, 1905. Receipt No. 125,998.
Claim.-1. The process of manufacturing an aggultinant consisting in producing sulpho-nitrated of chloro-nitrated compounds by the action of a mixture of nitric and sulphuric acids, or of a hydrochloric and nitric acids or organic substances, and in causing the sulpho-nitrates or chloro-nitrates obtained to act on a hevy hydro-carbon in the presence of an energetic condensation agent, such as baryta, calcium hydrate, sodium hydrate, chlorlde or zinc or chloride of aluminlum
2. The process of manufacturing an agglutinant consisting in utilizing for the production of complex sulpho-nitrated or chloro-nitrated compounds organic substances of animal origin, such as blood, excremental substances, suint, chlos-
terine, raw lanoline or residues and products of purificetion of the residual waters from wool washing establishments.
3. The process of manufacturing an agglutinant consisting In treating 100 parts by weight of suint with two parts by weight of a mixture containing two-fifths of sulphuric acid and three-fifths of nitric acid, stopping the re-action at the desired moment by the addition of alkaline water, extracting the water and drying the sulpho-nitrates obtained, introducIng them into 1,000 parts by weight of heavy mineral olls in the presence of 10 parts of baryta or equivalent substances, and allowing the re-action to take place in a closed vessel at a high temperature until resinification of the mass takes place, substantially as desoribed.
4. As a new product an agglomerate in the form of a compressed briquette moulded block or loose material consisting of a mixture of coal dust or the like, and an agglutinant obtained by the molecular condensation of a hydro-carbon, substantially as described.
5. As a new product, an agglomerate consisting of a mixture of coal dust or charcoal dust saturated with a combustible gas with an agglutinant obtained by the molecular condensation of a hydro-carbon, substantially as described.

No. 101,281. Wire Coiler. Apparell denrouler le 11.

Charles F. Leonard, Nampa, Idaho, U.S.A., 2nd October, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,038.
Claim.-A wire fence machine comprising a main frame, upright and frames rising from sald main fra:ie, each end frame being composed of side standards and top and bottom crossbars, the bottom orossbar of the front end frame being formed at its forward edge with a concavity and sald bar and the co-operating upper crossbar with bearing recesses arranged in rear of the plane of said concavity and in series on opposite sides of the vertical center of the end frame, a reel mounted upon the main frame between the front and rear end frames and provided with operating means, wheeled supports for the forward end of the maln frame arrangei between the front end frame and reel, a roller at the rear of the main frame having supporting and steering means supported by the rear end frame, a horizontal guide roller disposed in the concaved portion of the bottom crossbar of the front end frame and fournalled at its ends in the standards of said frame, and a pair of vertical guide rollers on the front end frame and adapted to be journalled in any cooperating pairs of the aforesaid sets of bearing recesses, whereby said vertical rollers may be relatively adjusted to co-operate with the reels of different lengths, substantially as described.

\section*{No. 101,282. Wire Fence Making Machine. Machine d fairo les clotures on all de fer.}

Charles F. Leonard, Nampa, Idaho, U.S.A., 2nd October, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,039. Claim.-In a steering and break mechanism for wire fence machines, the combination with a frame provided at the rear with supporting wheels, and in advance thereof with a reel, said reel being provided with an actuating device, of a supporting and steering wheel at the front of the frame, a steering post journalled vertically in the frame and carrying said steering wheel, a steering lever extend-

Ing rearwardly from the post toward the reel and provided at its rear or free end with a handle, whereby the

reel actuating device and lever are arranged in relative position to be simultaneously controlled, a guide upon the steering post, a rod slidable vertically in said guide at the rear of the steering post, a brake shoe connected at the lower end of the rod and adapted to engage the steering wheel, a brake lever extending rearwardly with the steering lever and parallel therewith and intermediately fulcrumed thereto, said brake lever being pivotally attached at its forward end to the upper end of the prod and provided at its rear end with a handle arranged to be simultaneously gripped with the handle of the steering lever. whereby both levers and the reel are adapted to be conveniently controlled by a single operator, and a spring arranged between the levers to normally spread their handles apart, substantially as described.

No. 101,283. Brooder. Couveuse.

Nils A. Lybeck, Brooklyn, New York, U.S.A., 2nd October, 1906; 6 years. Filed 31st July, 1906. Recelpt No. 138,291.
Claim.-1. A brooder comprising a coop, and a guard arranged within the coop and provided with a curved passage or space for the chicks, sald guard being also provided with means for preventing the chicks from crowding upon one another in the passage or space.
2. A brooder provided with a guard consisting of inner and outer concentric rings, and slats extending across and forming a top for the guard, said slats being arranged at a height to prevent one chick from standing upon another, and being also spaced apart to provide intervening openings through which chicks are adapted to fall to prevent them from crowding upon the top of the guard.
3. A brooder provided with a removable guard comprising a rectangular frame adapted to fit the interior of the brooder, and inner and outer concentric rings located withing the frame and forming an intervening circular passage, said frame being also provided with an opening forming an entrance to the passage.
4. A brooder provided with a guard comprising a frame, inner an douter rings forming an intervening circular passage and arranged within the frame, the latter being provided with an entrance opening communicating with the passage, and slats secured to the frame at the top thereof and extending across the circular passage and spaced apart to provide openings through which chicks are adapted to fall to prevent them crowding one another upon the top of the guard.
5. A brooder comprising a coop, a frame fitting within the coop, curved walls located within the frame and spaced apart to provide an intervening passage, slats mounted upon the frame and extending across the said passage and spaced apart to provide openings through which chicks are adapt-
ed to fall, and roost bars or perches mounted within the coop above the said slats.
6. A brooder comprising a casing open at the bottom and provided with an entrance, a guard removably fitted within the coop and having a circular passage, said guard being also provided with an entrance communicating with the entrance to the coop, and a bottom fitted within the coop and removably receiving the guard.

ITo. 101,284. Air Brake Hose. Boyau de froin dair.

Frank Allan Magowan, New York City, New York, U.S.A., 2nd October, 1906; 6 years. Filed 4th August, 1906. Receipt No. 138,427.
Claim.-1. A flexible air brake hose comprising an inner tube formed of an oll-proof compound of rubber and inclosed by a layer of caoutchouc, said layer inclosed by a woven copper wire tube of fine mesh upon which is an outside layer of caoutchouc, plies of duck wound upon the lastmentioned layer, a second woven copper wire tube of fine mesh inclosing said duck, and a sultable cover of oll-proof rubber.
2. A tlexible air brake hose comprising an interior tube formed of an oll-proof compound of rubber and inclosed by a layer of caoutchouc, said layer inclosed by windings of wire upon which is an outside layer of caoutchouc, plies of duck wound around the last-mentioned layer, and a sultable cover of rubber.
3. A flexible air brake hose comprising an inner tube, windings of duck, a cover, and a layer of caoutchouc formed in the wall of the hose for preventing access of deletorious substances to the duck.
4. A flexible air brake hose comprising an inner tube, windings of duck, a cover, and layers of caoutchouc inside and outside of the duck for preventing access of deleterious substances thereto, said layers formed between said tube and said cover.
5. A fiexible air brake hose comprising an interior oilproof rubber tube, layers of caoutchouc and woven copper wire thereon, windings of duck upon sald layers, layers of caoutchouc and woven copper wire upon said duck, and an oll-proof cover.
6. A flexible air brake hose comprising an interior oilproof rubber tube, a layer of caoutchouc thereon, windings of iriction muslin upon said caoutchouc, a woven wire tube upon said muslin, windings of duck, and a cover.
7. A flexible air brake hose comprising an interior oilproof rubber tube, a layer of caoutchouc thereon, windings of friction muslin upon said caoutchouc, a woven copper wire tube of fine mesh upon said muslin, windings of duck upon said wire tube, a layer of caoutchouc upon said duck, windings of friction muslin upon the last-mentioned layer, a woven copper wire tube upon the last-mentioned muslin, and a suitable cover.
8. A flexible air brake hose comprising an interior oilproof rubber tube, a layer of caoutchouc thereon, windings of friction muslin upon said caoutchouc, a wire tube upon said muslin, a layer of caoutchouc upon said wire tubes windlags of duck upon the last-mentioned layer, a layer of
caoutchouc upon said duck, windings of friction muslin upon the last-mentioned layer, a wire tube upon the last-mentioned musin, a layer of caoutchouc upon the last-mentloned wire tube. and a suitable oll-proof cover.

No. 101,285. Wrench for Threshing Cylinders.
Cle de écrou pour cylindre d battre.

Martin Mahlen, Osakis, Minnesota, U.S.A., 2nd October, 1906 ; 6 years. Filed 4th July, 1906. Recelpt No. 137,512.
Claim.-1. A wrench of the class described comprising in combination a center presenting a pair of oppositely disposed plates having concavely cut extremities constituting bearings, rotatable heads mounted in said bearings, a socket carried by one of said heads and adapted to be applied to a nut, a spindle for rotating the other of said heads, and a chain passing around said heads to transmit rotation therebetween and lying between sald plates, said chain affording means for retaining said heads.
2. In a wrench of the class described in combination, a center presenting a pair of oppositely disposed plates the extremities whereof are cut concavely so as to constitute bearings, heads rotatably mounted in said bearings, one of said heads constituting a socket to recelve a nut, a spindle attached to the other of said heads and adapted to rotate the same, said heads comprising oppositely disposed spur wheels, and a chain passing around said heads between said plates and retaining said heads, said chains having projecting pins engaging between the spurs of said spur wheels.
3. In a wrench of the class described in combination, a center comprising a centrally disposed block and oppositely disposed plates, rotatable heads mounted at the extremity of said center, said block and sald plates having their extremities concavely cut constituting bearings for said heads, an endless chain passing around sald heads between said plates and adapted to transmit rotation therebetween. said chain affording means for retaining said heads, a spindle attached to one of said heads, and a socket formed at the other of sald heads.
4. In a device of the class described in combination, a center comprising a block and a pair of oppositely disposed side plates, said plates presenting oppositely disposed shoulders formed near the inner faces thereof, said center having concavely cut extremities constituting bearings, rotatable heads mounted at the extremities of said center, one of sald heads comprising oppositely disposed spur wheels, a sprocket chain having pins projecting laterally therefrom and lying in the space above said shoulders, sald chain affording means for driving said spur wheels through the medium of said pins, and a casing surrounding said heads and said center.

\section*{No. 101,286. Ladder. Echelle.}

Samuel B. Martin, Dalton. Ohio, U.S.A., 2nd October, 1906 ; 6 years. Filed 30th August, 1906. Receipt No. 139,114.
Claim.-1. Two ladders spaced apart and connected near their ends by horizontally disposed platforms, a guide cable suspended from a ceiling contiguous to a line of shelving and parallel therewith, a guide track for attachment to said shelving and extending longitudinally thereof. a mast extending from the outer side of said ladder and terminating in a giude pulley for movement on said cable, and glude pulleys for movement on said track and connected to the inner sides of said ladder members.
2. Two arched frames connected by spaced steps to form two ladders spaced apart and connected by their side members at one end and with horizontal platforms connecting the ladders near the ends.
held in a bearing at the central part of one of the heads of the chamber, a fuel supply device connected to the sliding

part of the slip foint, adapted to supply fuel to the chamber while it is rotated, a chimney also connected to this sliding part of the slip joint, and affording means for the escape from the furnace of the products of combustion, and means for holding the sliding part of the slip joint and devices carried by it stationary relative to the rotation of the chamber and causing them to be otherwise moved with the chamber.
2. In combination, a heating chamber, means for rotating it, a slip joint, comprising a part fitted to slide and held in a hollow or chambered bearing at the central part of one of the heads of the chamber, water supply and discharge pipes connected to the chamber of the bearing, a fuel supply device connected to the sliding part of the slip joint, adapted to suply fuel to the chamber while it is rotated, a chimney also connected to this sliding part of the slip joint, and affording means for the escape from the furnace of the products of combustion, and means for holding the sliding part of the slip joint and devices carried by it stationary relative to the rotation of the chamber and causing them to be otherwise moved with the chamber.
3. In combination, a heating chamber provided with a central opening at each end a fuel supplying device and a chimney located at the opening of one end of the chamber, a slip foint comprising a part fitted to slide and held in a bearing at the central part of this end of the chamber and to which is secured the fuel supplying device and the chimney, a door for closing the opening at the other end of the chamber, and means for rotating the chamber.
4. In combination, a heating chamber provided with a central opening at each end, a fuel supplying device and a chimney located at the opening of one end of the chamber, a slip joint comprising a part fitted to slide and held in a bearing at the central part of this end of the chamber and to which is secured the fuel supplying device and the chimney, a muffle door for closing the opening at the other end of the chamber, a door for closing the muffe opening of the mufle door, and means for rotating the chamber.
5. In combination, a heating chamber provided with a central opening at each end, a fuel supply device and a chimney located at one end of the heating chamber, a door for closing the opening of the other ead of the heating chamber, two or more tapping holes formed through this end of the chamber, perforated bricks for closing said tapping holes, means for rotating the chamber, and means for setting the chamber in different angular positions.
6. In a metallurgical heating chamber, in combination, two cylindrical end sections, a cylindrical middle section, twio circular supporting rails, each composed of two parts which are secured to the adjacent edges of the ends and middle sections, means, as bolts, for securing the parts of the two ralls together, ends with central openings secured to the outer edges of the end sections, a refractory lining, as fire bricks, applied to the interior of the chamber, and a frame provided with rollers upon which the chamber by its circular rails rests.
7. In combination, a beating chamber, means for rotatlas it, means for setting it in different angular positions, a trame
in which the chamber is held and rotated, a glip joint connection attached to one end of the chamber, a burner nozzlo extending through this slip joint connection, an air pipe carried by the frame and supplying air to the nozzle, and means whereby said nozzle may be removed from the slin joint connection and set away from the end of the chamber.
8. In combination, a heating chamber, means for rotating it, means for getting it in different angular positions, a slip foint connection attached to one end of the chamber, a frame in which the chamber is held and rotated, a burner nozzle extending through this slip joint conenction, an air pipe carried by the frame and supplying air to the nozzle, a fuel nozzle carrled by and entering the burner nozzle, a fuel pipe carried by the frame and connected to the fuel nozzle, and means whereby said burner, including the air supply connection and the fuel nozzle, may be removed from the slip joint connection and set away from the end of the chamber.
9. In combination, a heating chamber, means for rotating it, means for setting it in different angular positions, a slip joint connection attached to one end of the chamber, a burner nozle extending through this slip joint connection an air pipe supplying air to the nozzle, an oll nozzle carried by and entering the burner nozzle, an oll pipe for supplying oil to the ofl nozzle, a slip joint conencting the burner nozzle to the alr pipe, and a slip joint in the oll pipe. Whereby the burner and oil nozzle may without disarrangement of parts be swung away from the end of the chamber.
10. In combination, a heating chamber provided with a fuel supplying device comprising a compressed air and fuel nozzles at one of its ends, a frame provided with trunnions and in which the chamber is longitudinally rotatably supported. means for rotating the chamber, means for rocking the frame, an alr pipe extending from one of the trunnions of the frame to the fuel supplying device. a slip joint in the air pipe line with the axis of the trunnions, and another slip foint in said pipe adjacent to the nozzle, whereby said nozzle may be swung away from the end of the chamber.
11. In combination, a heating chamber, means for rotating it, a fuel supplying device connected to one end of the chamber and adapted to supply fuel thereto while it is rotated and a chimney aliso connected to this end of the chamber for the escape of the products of combustion therefrom. and a sliding connection foining the fuel supplying device and chimney with the chamber, an air pipe connected to the fuel supply device, and sllp joint in said pipe adjacent to the fuel supplying device. whereby it may be swung away from the end of the chamber.
12. In combination, a heating chamber, means for rotating it, a fuel suppliyng device connected to one end of the chamber and adapted to supply fuel thereto while it is rotated, and a chimney also connected to this end of the chamber for the escape of the products of combustion therefrom, and a hollow or chambered sliding connection foining the fuel supplying device and chimney with the chamber, water supply and discharge pipes connected to said chambered connection, an air pipe and an oil supply pipe conthected to the fuel supplying device, and slip joints in alignment in said air and oil pipes, whereby the fuel supplying device may without disarrangement of parts be swung away from the end of the chamber.
13. In combination, a heating chamber, means for rotating it, means for setting it in different angular positions, a slip joint comprising a part fitted to slide and held in a tearing at the central part of one of the heads of the chamber, a burner nozzle extending through the sliding part of the sllp joint, an air pipe for supplying air to the burner nozzle and adapted to move with the chamber as it assumes Cifferent angular positions, a slip joint in the air pipe arranged so that the burner nozzle may be set away from the end of the chamber, a fuel supply pipe connected to the fiel nozzle, and a sliding detachable connection in the fuel supply pipe.
14. In combination, a heating chamber, means for rotatlog it, means for setting it in different angular positions, a slip joint connection at one end of the chamber, a burner nozale extending through this slip joint connection, a chimney also located at thls end of the chamber and extending through the slip joint connection, an air pipe supplying air to the burner nozzle, a fuel nozzle carried by and entering the burner nozzle, means whereby the sald burner may be removed from the slip joint connection and set away from the end of the chamber, a stationary source of fuel supply. a pipe therefrom connected to the fuel nozzle, and a sliding detachable connection in this plpe.

\section*{No. 101,288. Hydro-Carbon Generator and Carbureting Apparatue. \\ Générateur d hydro-carbone et appareil d carburer.}

Daniel Millior, Paris, France, 2nd October, 1906; 6 years Filed 27th March, 1906. Receipt No. 134,327.
Claim.-1. A generating and carbureting apparatus producing gas by means of kerosene and other hydro-carbons,
comprising a burner having a suitable lid and gas outlets, a carbureter connected with sald burner and having a suit-

able nozzle, and cup suitably hooded and covering in said carbureter and forming a compressing reservoir having a feed opening connected to a suitable vapourizer and a discharge opening into said carbureter, as and for the purpose specifled.
2. A generating and carbureting apparatus producing gas by means of kerosene and other bydro-carbons, comprising a burner having emission holes of suitable dimensions, a cylindrical carbureter secured to one side of said burner and communicating therewith, a nozzle centrally arranged and extending downwardly in sald cylinder, and a cup suitably capped surmounting said carbureter and having a feed opening thereinto connected to a suitable oll supply and a discharge opening, as and for the purpose specifled.
3. A generating and carbureting apparatus producing gas by means of kerosene and other hydro-carbons, comprising a burner having emission holes of suitable dimensions, a eylindrical casing forming a carbureter and secured to one side of said burner and communicating therewith, a plurality of nozzles in said casing forming conical shaped chambers therein having suitable air holes through the walls thereof, adjusting rings encircling said nozzles and having hcles registering with the aforesaid holes and a cup suitably capped surmounting the upper of sald nozzles and havirg a discharge opening thereinto and a feed opening connected to a suitable oil supply, as and for the purpose specifled.
4. A generating and carbureting apparatus producing gas by means of kerosene and other hydro-carbons, comprising \& burner having emission holes of suitable dimensions, a cylindrical casing forming a carbureter and secured to one side of said burner and communicating therewith, a nozzle extending downwardly into said casing having suitable alr holes therethrough, and a cup sultably capped forming a compressing chamber and having a blast nipple leading from an outlet in its lower side into said nozzle and a screen in the interior at the bottom thereof and a feed opening concected to a suitable oll supply, as and for the purpose specifled.
5. A generating and carbureting apparatus producing gas by means of kerosene and other hydro-carbons, comprising a burner having emission holes of suitable dimensions, a cylindrical casing forming a carbureter and secured to one side of said burner and communicating therewith, a nozzle fcrming a conical shaped chamber within said casing, a nozzle correspondingly formed and extending downwardly into the said conical chamber, said nozzles having air holes therethrough, adjusting rings encircling said nozzles and having holes registering with the aforesaid hole, and a cup suitably capped having a screened outlet opening in the lower side and a nipple secured thereover and directing the blast through said nozzles and a feed opening into said cup chamber connected to a suitable oil supply, as and for the purpose specifled.
6. A generating and carbureting apparatus producing gas by means of kerosene and other hydro-carbons, comprising a burner having emission holes of suitable dimensions, a cylindrical casing forming a carbureter and secured to one
side of said burner and communicating therewith, a nozzle in said casing, a cup surmounting sald nozzle having a discharge opening thereinto and a feed opening, a revoluble cap having cam formations on the upper side thereof, and a stirup extending over sald cup and pivotally secured to said casing at its lower ends and engaged by said cam formalions to tighten said cap, as and for the purpose specified.
7. A generating and carburetting apparatus producing gas ly means of kerosene and other hydro-carbons, comprising a burner having suitably dimensioned emission holes through the lid thereof and mixing grate in the interior thereof, a casing secured to one side of sald burner and forming a carburetting chamber having a compressing chamber suitably formed at the upper end thereof and a vapourizer formed of a pipe connected with a suitable oil supply and having a filter in an enlarged part thereof intermediate of the distance between said supply and said burner, and a coll directly over said burner, said coll leadIng to said feed opening of the compressing chamber, as and for the purpose specifled.
8. A generating and carburetting apparatus producing gas by means of kerosene and other hydro-carbons, comprising a burner having suitaby dimensioned emission holes in the lid thereof, a casing forming a carburetting chamber secured to one side of said burner, a nozzle extending into said chamber having air holes therethrough, an adjusting ring having holes registerable with the aforesald holes and handles extending laterally therefrom, a cup surmounting said nozzle, a cap covering sald cup and having a handle projecting laterally therefrom and cam formation on the upper side thereof and a stirrup extending over said cap and engaged by said cam formation on the turning of sald cup, as and for the purpose specifled.

No. 101,289. Chip Breaker for Wood-working Machines.
Brise-copcau pour machines a travailer le bois.

Louls John Nelson, Chicago, Illinois, U.B.A., 2nd October, 1906; 6 years. Flled 16th July, 1906. Recelpt No. 137,872.
Claim.-1. A chip breaker comprising a number of breaker sections arranged in series and loosely assembled and supported from an axis common to all alike, one or more sections being capable of an independent action in accordance with the width of the work.
2. A chip breaker comprising a series of sections loosely assembled on a support common to all, means for retalning the same in thelr relative working position and permit of each section having an independent yielding movement in accordance with the contacting surface of the work.
3. A chip breaker comprising a head plate, a series of breaker sections loosely suspended therefrom and capable of a swinging movement, means for retaining the sections in contact with the work and means for limiting the down movement thereof.
4. A chip breaker comprising a head plate, a series of breaker sections having a hinged or pivotal connection therewith, the free ends swinging in the path of the work, means for excrting a continuous ylelding pressure on said sections, and means for preventing a lateral displacement thereof.

5 In a chip breaker, a supporting head plate having a channel or depression in one edge, and a rib formed on the other edge, a series of breaker sections having parts loosely engaging said channel and rib parts and providing for a swinging hinged movement, an elastic bar recessed in said head plate and having a continuous ylelding bearing on the hinged end of said sections, and meaus for preventing a lateral displacement of said sections.

No. 101,290. Ladder. Uchelle.

John Irving Thompson, Elk Grove, Callfornia, U.S.A., 2nd October. 1906; 6 years. Filed 8th September, 1906. Receipt No. 139,351.
Claim.-1. A ladder comprising a top step, a step section fixedly secured thereto and having side rails converging from the top step, connected brace rails hinged to the step section adjacent to and overlapped by the top step.
2. A ladder comprising a top step, a step section fixedly secured thereto, and having side rails converging from the top step, brace rail hinged adjacent the top step and a reinforcing block interposed within the contracted end of the step section.
3. A ladder comprising hinged sections having the opposite rails of opposite sections substantially parallel and wedge-shaped bearing blocks carried by each section and producing contact surfaces substantially parallel each with the other.

No. 101,291. Borew Driver. Tournoots.

Simon H. Wiessedeppe, Olympia, Washington, U.S.A., 2nd October, 1906;6 years. Filed 21st July. 1906. Recelpt No. 138,020 .
Claim.-1. In a screw driver, a driving head, a spring pressed screw receiver surrounding the head, and a tubular guide within which the screw receiver slides during the operation of the screw driver.
2. In a screw driver, a screw driving head, a shank carrying the same, a handle member in which the shank is secured, a tubular screw recelver fitting around the driving head and having an inturned flange bearing against the shouldered Inner end of the head, a spring encircling the shank and bearing at one end against the lange and at the other end against the handle, a tubular gulde for the screw receiver. said guide forming a housing for the spring and its outer end forming a ferrule for the handle, a locking screw extending through the ferrsle,the handle and the shank.
3. In a screw driver, a driving head, a shank carrying the same, a handle through which the shank extends, the outer end of said shank being of non-circular form, a washer surrounding the non-circular end of the shank and secured to the handle, a screw receiver mounted on the head and having an inturned flange surrounding the shank, a compression spring between said flange and the inner end of the handle. and a tubular guide forming a housing for the spring and rigidly secured to the handle and the shank.

No. 101,292. Stair Routing Machine.
Kachine d rainure pour escaliers.

Silas Paul Woolf, Omaha, Nebraska, U.S.A., 2nd October, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,247. Olaim.-1. In a stair routing machine and in combination a plurality of rectangular frames comprising the longitudinal and crossbars, screw-threaded bolts at the corners of the lower frame and traversing the opening in the upper frame, wing nuts engaging the bolts, the longitudinal bars of the upper frame being provided with grooves, a carriage mounted in the grooves and provided with an inwardly extending bracket, an incline spindle journalled in the bracket and provided at its upper end with a squared portion, a gear wheel on the lower end of the spindle, a vertical shaft journalled in the carriage, a bevel gear on the upper end thereof and meshing with the bevel gear on the spindle, and a bit on the lower end of the vertical shaft.
2. In a stair routing machine, the combination with upper and lower rectangular frames for engaging the stringer, and means for securing the frames together, of a carriage slidably mounted in the upper plate, a vertical shaft journalled in the carriage, a cutting bit on the lower end of the shaft, means fot driving the shaft, said driving means being inclined from the direction of travel of the carriage.
3. In a stair routing machine, the combination with uprand lower rectangular frames for engaging the stringer and means for securing the frames together, of a carriage slidably mounted on the frame, a vertically arranged cutting bit on the carriage, and means for driving the cutting bit said driving means belng inclined from the direction of cravel of the carriage.
4. In a stair routing machine, the combination with a carriage and a support therefor, of a cutting bit journalled vertically in the carriage, and means for driving the bit, said driving means being inclined upwardly and away from the direction of travel of the carriage whereby pressure applled to said driving means will hold the cutter to its work and move the carriage forward.
5. In a stair routing machine, the combination with a sliding carriage, of a cutting bit journalled vertically therein, and means for driving the cutting bit, said driving means being inclined upwardly and away from the direction of travel of the carriage.

\section*{No. 101,293. Soldering Iron. Fer d souder.}

Albert R. Fraser and Wilfred Leroux, co-inventors, Weburn, Saskatchewan, Canada, 2nd October. 1906; 6 years Filed 14th June, 1905. Receipt No. 126.029.
Claim.-1. In a device of the class described the combination of a reservoir section, a small chamber formed within the reservoir. and secured thereto, a burner section detachably connected to the reservoir section and provided with a fuel pipe adapted to project within the said chamber, substantially as described.
2. In a device of the class described the combination of a soldering point having a sleeve extending back from the same and having openings therein adjacent to its rear end, a burner and vapourizer having a tube extending forward
within the sleeve to a point near its forward end and provided with apertures through its sides, and means for longi-

tudinally adjusting the sleeve on the vapourizer, substantially as described.
3. In a device of the class described the combination of a soldering point having a sleeve extending back from the same and having openings therein adjacent to its rear end, a burner and vapourizer having a tube extending forward within the sleeve to a point near its forward end and provided with apertures through its sides, and means for longitudinally adjusting the sleeve on the vapourizer, the reservoir and air pump, substantially as described.

\section*{No. 101,294. Third Rail Protector.}

Protccteur de troisieme rails.

William H. Kober, and Charles E. Watler, both of Lancaster, Ohio, U.S.A., 2nd October, 1906; 6 years. Filed 21st March, 1906. Receipt No. 134,127.
Claim.-In a third rail system, a shleld member formed of a plurality of transversely curved metallic strips, each having an insulating lining, the ends of the strips and the linings overlapping, and the lining of the outer strip serving to insulate the strips from each other, insulated securing bolts connecting said strips, and supporting brackets extending over the strips and rigidly secured thereto to form strengthening braces for the shield.

\section*{No. 101,295. Electric Heater. Ohauffeur bleotrique.}

Louls P. Brown and Frank J. Holmes, both of Chicago, Illinols, U.S.A., 2nd October, 1906; 6 years. Filed 27th March, 1906. Receipt No. 134,343.

Claim.-1. In an electric heating device, a heating coil wound in a double spiral and having its turns closer together near its loop than at a point more remote from the loop, for the purpose of reducing the danger of short circuiting.
2. In an electric heating device, a heating coll wound in a double cylindrical spiral backward from a loup therein, the distance between the turns gradually increased toward the terminals of the coll.
3. In an electric heating device, a metallic heating tip and a resistance coll for heating the same, said coil being wound
in double cylindrical spiral from a return loap therein and said coil having its turns closer together near the sald loop

than at a point more remote therefrom for the purpose described.
4. In an electric heating device, a metallic heating tip, a resistance coll for heating the same, said coll being wound in double cylindrical spiral from a return loop therein, and means at said loop for maintaining the same in fixed relationship with the remaining parts of the coil, said coil having its turns closer together at said loop than at the parts more remote therefrom for the purpose of reducing the danger of short circuiting, the loop part of said codl jying nearest to the operative portion of said tip.
5. In an electric heating device, a heating coin, a central body around which the coil is wound in double spiral, and a strip for holding the coil at the looped extremity thereof, said strip being held in position upon the central body by means of the turns of the coll itself.
6. In an electric heating device the combination of a heating coil, a central body around which the coll is wound in double spirat, and a strip of insulating material for holding the coll at the loop therein, the turns of the coll adjacent to the loop passing over said strip for firmly retaining the same in position upon the said central body.
7. In an electric heating device the combination of a heating coll, a central body around which the coll is wound in double spiral, and a strip of insulating material for holding the coil at the loop therein, the turns of the coll adjacent to the lopp passing over said strip for firmly rotating the same in position upon said central body, and the distance between the turns of the coll becoming greater as the distance from the loop increases.
8. In an electric heating device the combination of a tube, an insulating web therein and an electric conductor mounted upon ald web out of contact with said tube.
9. In an electric heating device the combination of a tube, a web of insulating material in sald tube having a width approximately equal to the inside diameter thereof and an electric conductor mounted upon said web and passing from one surface thereof to the other at suitable intervals, to thereby remein out of contect with said tube.
10. In an electric heating device the combination of a tube, a web of insulating zaterial extending approximately along the center thereof, said web having perforations at sultable intervals theroin, and a conductor threaded through said apertures so as to pass from one surface of the web to the other for remaining out of contact with sald tube.
11. In an electric heating device the combination of a tube, a web of insulating material extending approximately along the center thereof, sald web having perforations therein. substantially in pairs occurring at suitable intervals therein. and a pair of conductors threaded through eaid apertures from one surface of the web to the other and lying on opposite surfaces of the web at any given point therein whereby sald conductors are kept out of contact with each other.
12. In an electric heating device the combination of a metallic tip for heating the object to be heated, sald tip hav-

Ing an annular bevelled shouldar thereon betwren its ence, means for heating said tip, a tube for supporting said tip. and an imperforate diaphragm within gald tube between the ends thereof, said tube having a bevelled surface at its mouth whereonto the bevelled shoulder on sald up may be wedged for sealing said tube.
13. In an electric heating device the combination of a metallic tip for heating the object to be heated, said tip having an anular bevelled shoulder thereon between its ends, means for heating sadd tip, a tube for supporting said tip, an imperforate diaphragm within said tube between the ends thereof, said tube having a bevelled surtace at Its mouth and means for tightly forcing the bevelled shoulder of sald tip down onto the bevelled surface of said tube for gealing the mouth thereof.
14. In an electric heating device the combination of a heating tube having an annular bevelled shoulder thereon, means for heating said tube, and a casing for inclosing said heating means, said casing having a bevelled surface whereby sald casing may be wedged against the bevelled shoulder on sadd tube.
15. In an electric heating device the combination of a heating tube having an annular bevelled shoulder thereon, a heat generating resistance medum upan said tube, a casing for inclosing said resistance medium, said casing having a bevel at one end for contracting the shoulder on sald tube, and means at the rear end of caid casing for forcing and holding it against the said shoulder on said tube.
16. In an electric heating device the combination of an electric heat generator, a terminal block, conductors leading from said block to said heat generator, and binding posts on said block making contact with said conductors and adapted to be connected to suitable supply wires, said binding posts being arranged in tandem upon said terminal block for the purpose desoribed.
17. In an electric heating dovice, the combination of a heat generator, a tube supporting the same, a torminal block secured to said tube at the rear extremity thereof, conductors leading from said heat generator to the terminal block, and binding posts on said blook making obotrteal contact with said conductors and adapted to be conmected to auitable supply wires, said bindiag peats beling arranged in tandem upon said terminal blook, for the perrpose dee cribed.
18. In an electric heater, the comblation of a tube, a resistance medium mounted on said tube for generating heat, a terminal block supported on said tube, conduotors leadins to said terminal block and fastened thereto, other contuctors leading from said terminal block to said resistance medium, said terminal block and all of matd conductors being supported on said tube, and a lonsitudinally worva handle rigidly secured to said tube, satd handie adapted to circumferentially inclose sald terminal block and a portion of said conductors and betns indepsadent of aild terminal black and conductors.
19. In an electric heater, the combination of a tube, a rosistance medium mounted on said tube for generatins hoat. a terminal block supported on said tube, conductors leading to said terminal block and fastened thereta, other conductors leading from sald terminal block to sald realstance medium, said terminal block and all of said canductors boing supported on said tube, a longitudinally bored handie adapted to circumferentially incloge aaid medium black and a portion of said conductors and being independent of taid terminal block and conductors, asid handle sarewing onto said tube from the rear end thereof, and locking means for proventing the accidental unscrewing of sald hasde.
20. In an electric heater, the combination of a stingle an plece tube constituting the foundational structure of the wo vice, a resistance medium wound upon one and thereof, far senerating heat, conductors leading into the other and of said tube for supplying electric current to said resiatance medium, and a longitudinally bored, one piece bandie atting over the rear end of said tube and adapted to be alld thoreunto from the rear thereon.
21. In an electric heater, the combination of a tabe constituting the foundational structure of the device, a resistance medium near one end thereof for genanatiag heat a terminal block lying partialty Fithin said tube and projecting out of the rear end thereof, supply coaductors leading from the source of energy to raid terminal block. ether conductors leading from said termban Wook to said heat generating medium, and a langitudinally bored one piece handle fitting over the rear end of sald tube and adapted to be slid thereonto from the rear thareaf, said handle thereby inclosing said terminal block.
22. In ad. electric heater, the comblimation of a tube, a metallic tip rigidly secured at the forward and thereof. a heating coil upen said tube adjacent to aald tip, aad a handle rigidly secured to sald tube at the rear end thoreof. said tip and coll and handle being all mounted an the mame plece whereby the device is rigid from end to end.
23. In an electric hoater, the combination of a tube having perforations in the side thereof, a metallic tip at the fecwerd end of waid tube, a heat generating resistance lecated upoa the outside of gaid coil adjacent to said tip. conductors within said tube from the rear end thereof and pessing through the said perforations therein to join said beat generating medium, and a wob of insulating material locatod within said tube and supporting said conductors.
24. In an electrical heater, the combination of a tube having perforations in the side thereof, a metallic tip at the forwand end of sald tube, a heat generating resistance medium lecated upon the outside of said coil adjacent to said tip, cenductors leading within said tube from the raar ead thereof and passing outward through the said perforations therein to join sald heat generating medium, and a web of insulating material located within said tube and supporting said conductors to insulate the same, said web having suffient stiffness to carry forward the free forward eads of the sald conductors during assemblage, whereby the said ends many be threaded out through the apertures in said tube to be joined with said heat generating medium.
25. In an electrical heater. the combination of a tube, a handie sorewing onto the rear end thereof, a metallic tip smpported by sald tube at the front end thereof, a heat - generating medium located on the outside of said tube adjacent to said tip. a casing outside of said heating generating medium sildable lengthwise of said tube, a rigid longitudinally slotted collar upon said tube, and an inward projection upon said casing for entering the slot in said collar whereby the casing may be moved longitudinally but is prevented from turning, said casing thereby affording means Whereby the device may be gripped in screwing the handle on or off.

No. 101,896. Telephone. Téléphone.

John H. Boyd, Vaiden, Miesissippl, U.S.A., 2nd October, 1906; 6 years. Filed 21st March, 1906. Recelpt No. 134,123.
Clasm.-1. In e telephone the combination with a box, of a transmitter mounted exterior to the box and including a diaphragm, a wine passed through the box and attached to the diaphragm, a shaft rotatably mounted in said box, a disc carried by the shaft, fingers carried by the disc and projeotIng at an acute angle therefrom and rearwardly from the direction of rotation of said dics, and arranged to engage said wire to vibrate the same when the said shart is rotated.
2. A telephone comprising a box, a transmitter carried by the box and including a diaphragm, a wire passed through the box and attached to the dlaphragm, a spring arm disposed transversely of the wire and normally out of contact therewith, and adapted when vibrated to strike the said .wire, a shaft mounted for rotation in said box, a hub carried by said shaft, fingers carried by said hub, sald fingers having their end portions bent to extend rearwardly from the direction of rotation of the said hub and guides associated with said box and with sald spring arm.

\section*{No. 101.297. Enob for IEetallic Coverw. \\ Bouton pour cowvercles métalliques.}

Thomas Charles Davidson, Montreal. Quebec, Canada, 2nd October, 1906; 6 years. Filed 9th May, 1906. Recelpt No. 115,163.
Claim.-1. The combination with a sheet metal cover having a series of slits in the body thereof, of a sheet metal knob having a series of teeth ingerted in the slits and bent over for the purpose of retaining the knob in place, substantially as deecribed and for the purpose set forth.
2. The cambination with a sheet metal cover having a seriee of shts in the body therof, of a ventilated sheet metal knob having a series of teeth inserted in sald slits and bent
over for the purpose of retaining said knob in place, substantially as described and for the purpose set forth.

3. The combination with an unventilated cover or other sheet metal object, of a ventilated sheet metal knob carried rigidly by said cover or other object, and a single intact coating of enamel covering both cover and knob, subatantially as described and for the purpose set forth.

No. 101,298. Trelley Pole and Stand.
Perche et plateforme de trolle.

William W. Hallenbeck, Burrville, Connecticut, U.S.A., 2nd October, 1906 ; 6 years. Filed 13th September. 1906. Recelpt No. 139,491.
Claim.-1. In a base ar stand for trolley poles. the combination of a base, a pivot mounted upon sald base, a head mounted upon the pivot, the base being provided with a seat concentric of the pivot, a bearing ring in the seat aforesaid, and anti-friction bearings interposed between the bearing ring and the head.
2. In a base or stand for trolley poles, the combination of a base, a pivot mounted upon sald base, a head mounted upon the pivot, the base being provided with a seat concentric of the pivot, a bearing ring in the seat aforesaid, a eecond bearing ring above the first-mentioned bearing ring, anti-friction bearings interposed between the said rings, and an interlocking connectign between the upper ring and the head.
3. In a base or stand for trolley poles the combination of a base, a pivot mounted upon said base, a head mounted upon said plvot, said head comprising a body and an attaching plate, and anti-friction bearings between the attaching plate and the base.
4. In a base or stand for trolley poles the combination of a base having a tubular extension projecting from its underside, a pivot mounted in sald tubular extension, means for preventing displacement of the plvot from the tubular extension, anti-friction bearings between the pivot and the base, a head mounted upon the pivot, and anti-friction bearIngs between the head and the base.
5. In a base or stand for trolley poles the combination of a base having a tubular extension, a sleeve affixed to the base within the tubular extension aforesald, a pivot mounted in the sald sleeve, anti-friction bearings between the sleeve and the plvot, a head mounted upon the pivot anl comprising a body and an attaching plate secured thereto, the base being provided with a seat concentric of the pivot aforesaid, bearing rings disposed in said seat, and anti-friction bearings between said rings, the attaching plate of the head co-operating with rings aforesaid, as specified.

No. 101,299. Vapourizer. Vaporisateur.

Emil Hubert, Budapest, Hungary, 2nd October, 1906; 6 years. Filed 9th May, 1906. Receipt No. 135,722.
Claim.-1. In a vapourizer for liquid combustibles, in combination a spindle fitted in the interior of the vapour tube, a filter formed of a number of gauzes one over the other and placed over the end of the spindle opposite to the outlet aperture, substantially as described and shown in the drawing.
2. In a vapourizer a casing, a tube 2 screwed on to the casing 1 and made hollow for the formation of a preheating chamber 3 and the reception of the spindle 4, a fiter 13 provided at the end of the spindle opposite to the outlet aperture, a needle spindle 6 extending through the vapour tube and connected to an evapourating device in the casing 1 for cleaning the outlet aperture formed in the cap 11, substantially as described and shown in the drawing.
3. In a vapourizer a vapour tube, having the interior of spiral form or the like and a smooth spindle fited within the tube which bears against the edge of the threads, substantially as described and shown in the drawing.
4. In a vapourizer a smooth spindle wound with strips of wire \(n\) the like and bearing with these strips against the interior of tho tube fitted within the smooth vapour tube, substantially as dsecribod and shown in the drawing.
No. 101,300. Telephone Signal Apparatus. Apparetl de sional de téléphone.

David F. Laughlin, Clyde, Kansas, U.S.A., 2nd October, 1906; 6 years. Filed 19th September, 1906. Recelpt No. 139,631.
Claim.-1. In a signalling apparatus, a pair of superposed contact members, a receiver hook having its inner end arranged to form a support for the upper member, the removal of the receiver from the hook permitting such upper members to descend into engagement with the lower member, and the replacing of the receiver serving to separate
said members, and an electro-magnetically controlled petdulum for moving the upper member from the support.
2. In signalling apparatus, a pair of superposed contact members. a pivotally mounted receiver hook having at its inner end a support for the upper member and provided with an inclined arm extending below the support to permit reengagement with said upper member after a circult closing operation, and an electro-magnetically controllod pendulum for moving the upper member from the said support.
3. In signalling apparatus, a pair of superposed contact members, a receiver hook having at its inner end an insulated support for the upper member and provided with a perfect pendent arm arranged in a plane oblique \(t o\) the vertical plane of said upper member, and an electro-magnetically controlled pendulum for moving said upper member from its support.
4. In a signalling apparatus, a lower contact member in the form of a bar having an inturned arm at one end, a second contact member arranged above the first and adapted to engage said arm to close a circuit. a pivotally mounted receiver hook having at its inner end a support for said member, and provided with a pendent inclined arm to permit reengagement with sald upper member after a circult closing operation, and an electro-magnetically controlled pendulum for moving said upper member from its support.

No. 101,301. Trolley Wheel. Rove de troits.

George Lofl, Garrett, Indiana, U.S.A., 2nd October, 1906; 6 year. Filed 17th September, 1906. Receipt No. 189,559.
Claim.-In a trolley, the trolley wheel having a lateral hub, bearings engaging the opposite ends of said hub and supporting an axle extending through the same, said harrings having converging arms united at their extremities and formed into a longitudinal bearing, a pole socket for recelving said longitudinal bearing and provided with spaced ears extending in advance of the longltudinal socket, a pin disposed through said ears and a spring bearing terminally against sald pin and the longitudinal bearing.
No. 101,302. Electro-Magnetic Apparatus. sppareil eleotro-magnttique.

John McIntyre, Jersey City, New Jersey, U.S.A., 2nd October. 1906; 6 years. Filed 27th January, 1906. Recelpt No. 132,331.
Claim.-1. A means for treating live animal, live vegetable or other objects, comprising a pliable cable coil, and a frequency source of electrical energy in circuit with the said coil.
2. A means for treating live animal, live vegetable or other objects, comprising a frequency source of electrical energy, and pliable cable coils arranged in series and in circuit with the said frequency source of electrical energy.
3. A means for treating live animal, live vegetable or other objects. comprising a frequency source of electrical energy, and multiple cable coils in circuit with the said frequency source of electrical energy.
4. A means for treating live animal, live organic vegetable or other objects, comprising a frequency source of electrical energy, a primary circult connected with the said frequency source of electrical energy, and a scicondary circuit induced by the said primary circuit, the conducting cables of the said circuits being arranged in colls for surrounding the object, the cables being flexible to allow any portion thereof being brought nearer to or farther from the object.

No. 101,303. Ruhmlorfi Coils. Serpentin.

John McIntyre, Jersey City, New Jersey, U.S.A., 2nd October, 1906; 6 years. Filed 19th March, 1906.' Receipt No. 134,010.
Claim.-1. A ruhmkorif coil provided with a spring armature lever carrying a contact portion, a bar arranged at an angle to the said armature lever and carrying a contact portion for engagement by the said armature contact portion, and a bearing for the said bar to slide in and for holding the bar against turning to maintain the faces of the said contact portions at all times in the same straight line registering position.
2. A ruhmkorfi coll provided with a spring armature lever carrying a contact portion for engagement by the said armature contact portion, a bearing for the said bar to slide in and for holding the bar against turning to maintain the faces of the said contact portions at all times in the same straight line registering position, and a fastening device for securing the bar in place in the said bearing after the resired adjustment is made.
3. A ruhmkorff coil provided with a spring armature lever carrying a contact portion, a bar carrying a contact portion for engagement by the said armature contact portion, a bearing for the said bar to slide in and for holding the bar against turning, and a spring pressing against the bar at the end opposite the one carrying the contact portion.
4. A ruhmkorff coll comprising a coll cylinder carrying the primary and secondary wires and the core, a spring armature lever fixed at one end and carrying at its free end an armatnre located opposite the said core, a contact portion on the said armature lever, intermediate the fixed end and the said armature, a bar slidable at an angle toward and from the said armature lever and carrying a contact portion opposite the said armature lever contact portion, and means for the bar to slide in and to hold it against ro-
tation to maintain the faces of the said contact portions at all times in the same straight line registering position.
5. A ruhmkorff coil comprising a coil cylinder carrying the primary and secondary wires and the core, a spring amature lever fixed at one end and carrying at its free end an armature located opposite the said core, a contact portlon on the sald armature lever, intermediate the fixed end and the said armature, a bar slidable at an angle toward and from the said armature lever and carrying a contact portion opposite the sald armature lever contact portion, means for the bar to slide in and hold it against rotation to maintain the faces of the said contact portions at all times in the same straight line registering position, and means for holding the said armature and armature lever in position while adjusting the sald bar in the direction of its length.
6. A ruhmkorff coil comprising a coll cylinder carrying the primary and secondary wires and the core, a spring armature lever fixed at one end and carrying at its free end an armature located opposite the said core, a contact portion on the said armature lever, intermediate the fixed end and the said armature, a slidable bar carrying a contact portion opposite the said armature lever contact portion, means for the bar to slide in and to hold it against rotation, a spring pressing the said bar in the direction of its length, and retaining means engaging the sald armature and armature lever for holding the armature lever in position while adjusting the bar.
7. A ruhmkorfif coil comprising a coil cylinder carrying the primary and secondary wires and the core, a spring armature lever fixed at one end and carrying at its free end an amature located opposite the said core, a contact portion on the said armature lever, intermediate the fixed end and the said armature, a slidable bar carrying a contact portion opposite the said armature lever contact portion, means for the bar to slide in and to hold it against rotation, a spring pressing the said bar in the direction of its length, and retaining means engaging the said armature and armature lever, for holding the armature lever in position while adjusting the bar, the said retaining means consisting of a lever fulcrumed in the end of the coll cylinder and adapted to be swung into position between the said cylinder and the inner face of the armature and armature lever.
8. A ruhmorfi coil having an armature lever contact portion and a contact portion opposite the sald armature lever contact portion, and non-rotatable to maintain the faces of the said contact portions at all times in the same straight line registering position, the said non-rotatable contact portion being adapted to be moved at a right angle toward and from the sald armature lever contact portion.
No. 101,304. Game Apparatus. Appared do jou.

Livingston B. Pennell, Stevens Point, Wisconsin, U.S.A., 2nd October, 1906 ; 6 years. Filed 27th February, 1906. Receipt No. 133,381.
Claim.-1. A game apparatus comprising a board with a long main track across the same, a shorter single continuous
curved track or siding, communicating at each end with said main track, and three groups of movable pieces, representing cars, with two pieces representing engines, each of the said groups of cars comprising three pieces, those in one of the groups being wholly detached and those in the two other groups being united together, and each end of each engine being adapted to couple with either end of the two groups of united cars, the described siding being capable of holding only three cars and one engine at any one time.
2. A game apparatus comprising a board with a long main track across the same, a shorter single continuous curved track or siding communicating at each end with said main track, pivoted guards or guides for opening and closing communication between eatd main track and said siding at proper times, a group of three wholly detached movable pleces representing railroed cars, two other groups of similar pieces, three in each group, inseparabiy united together, and two other pleces representing railroad engines, the said engines. and the two last-named groups of cars being provided with coupling deutces for engagement when described, and all of the movable pleces being in engagement with said tracks, the sald siding being capable of holding only one engine and three cars at any time.

Lev 101,805. Dtoan Taxbime. Turbine d vapewr.

Uel Alvin Rutledge, Berkley, Virginia, U.S.A., 2nd October, 1906; 6 years. Filed 10th Auugst, 1906. Receipt No. 138,567.
Claim.-1. In a turbine, a rotating piston, a collar surrounding and receiving said piston and fitting snugly about the entire periphery of the same, said collar having a fluid medium pressure compartment with a channel leading therefrom to the inner periphery of the collar, said collar also having a medium conveying compartment with a channel leading thereto from the inner periphery of the collar.
2. In a turbine, a rotating piston, a collar surrounding and receiving said plston, said collar having a fluid medium pressure compartment with a channel leading therefrom to the inner periphery of the collar, sald collar also having a medium conveying compartment with a channel leading thereto from the inner periphery of the collar, the capacity of the last said channel being greater than the first said channel.
2. In a turbine, a rotating piston, a collar surrounding and recelving said piston and fitting snugly around the entire periphery of the same, said collar having a fluld medium pressure compartment with a channel leading therefrom to the inner periphery of the collar, sald collar also having a medium conveying compartment with a channel leading thereto from the inner periphery of the collar, the capacity of the last said channel being greater than that of the first said collar.
4. In a turbine, a serles of rotating pistons, a collar recelving each piston, each said collar having a fluid medium pressure compartment with a channel leading therefrom to the inner periphery of the collar, each said collar also having fluid medium conveying compartment with a channel leading thereto from the inner periphery of the collar, the pressure wmpartments of one collar being located in allgnment with the conveying compartment of the next adjacent collas
throughout the series and a means for pasaing the fuld medium from the conveying compartment of one collar to the pressure compartment of the next adjacent collar, and 00 on throughout the series.

\section*{No. 101,306. Elactic Fluid Turtime. \\ Turbinc d fuide élastique.}

James Wilkinson, Providence, Rhode Island, U.S.A., 2nd October, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,189.
Claim.-1. An elastic fluld turbine operating by tage expansion and having a warking passage which onlarges across stages, the provision therein of successive nozzles formed in stationary elements and disposed at increased angles across stages to the plane of bucket rotation, and buckets of decreasing concavity co-operating with said nozsles.
2. In a multiple stage turbine, buckets rotatable within the several stages, and nozzle passages discharging fiuid pressure against sald buckets, the nozzle passages for supplying motor fluid to the low pressure stage or stages having a greater angle of inclination than the nozzles for the other stage or stages, substantially as and for the purpose described.
3. In a multiple stage turbine, buckets rotatable within the several stages, nozzle passages discharging fluid pressure against said buckets, the nozzle passages for the low pressure stage or stages having a greater angle or inclination than the nozzles far the other stages, and the buckets cooperating with said nozzle passages having different angles of inclination, substantially as described.
4. In a multiple stage turbine, stationary elements between the stage compartments, nozzle passages leading through said elements and forming condults for the fluid between stages, said nozzles having relatively smaller induction ends, as proportioned to the cross sectional area of the nozsles, and relatively larger angles of inclination, for the low pressure stages than for the high pressure stages.
5. In a multiple stage turbine, partitions between stages and nozzle passages leading through said partitions and having enlarged admission openings and angularly disposed d!scharge passages leading therefrom and constituting the nozzles proper, the cross sectional area of the nozzles proper for the last stages being increased relatively to the cross sectional area of their admission openings.
6. In a turbine operating by stage expansion, nozzle passages formed in stationary elements through which the motor fluid flows in succession to act against rotatable buckets, and supply openings for the nozzles, the cross sectional area of said openings representing a decreasing percentage of the cross sectional area of their respective nozzles for the last stage as compared with the preceding stages.
7. In a multiple stage turbine, fluid supply nozsle passages comprising enlarged admission ends and nozales proper leading therefrom, the cross sectional area of the noxnles proper for the last stage or stages being Increased relatively to the cross sectional area of their admission ends by increasing their angle of inclination to the rotating buckets agalnst which they discharge fiuid.
8. In an elastic fluid turbine subdivided into stages by diaphrgas, nozzle supply openings formed in said diaphragms, nozzles leading therefrom at a determined angle, the angle of the nozzles in the last dlaphragm being greater than that of the nozzles in preceding dlaphragms, and buckcts in the several compartments which co-operate with said nozzles, the buckets for the nozzles having the greater inclination being less concave than the other buckets but having their admission edges disposed at a relatively greater angle to their plane of rotation than sald other buckets.

\section*{50. 101,207. Fienthe Fivid Trarblac. Turotive a mude clastique.}

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Charles Fix, Quincy, Massachusetts, U.S.A., 2nd October, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135,463.
Olain.-1. In an elastic flutd turbine, the combination of a sappert, a plurality of buckets, a supporting base, a device for mohoring the base with respect to the support at one polat, and one or more other devices for attaching the base to the support which permit it to freely expand and contract.
2. In an elastic fluid turbine, the comblnation of a support, a bucket supporting base, a device for anchoring the base, and one or more bolts for securing the base to the mpport which are body bound in the base and are loose in the support.
3. In an olastic fiuid turbine, the combination of a support, a backet supporting base, a screw-threaded means for searing the base and the support, and a wall for preventing the means from loomening.
4. In an elastic fuid turbine, the combination of a bucket supporting base, a holder, a means securing the base to the holder and permitting it to expand and contract, a casing. and means securing the holder to the casing which permit the said holder and casing to expand and contract independontly of each other.
5. In an elastic fiuld turbine, the con.bination of a bucket smpporting base, a holder, a means for locating the position of the base with reapeet to the holder, and a means for securing the base and holder which permit the two to expand and contract independently, a support for the holder, and means uniting the holder and support which permit the two to expand and contract independently.
6. In an elastic fluid turbine, the combination of a bucket supporting base, a holder therefor having a groove to receive the base, screw-headed means for attaching the base to the holder which are prevented from backing out by the support, a support for the holder, and a means for uniting the holder and support.
7. In an elastic fluid turbine, the combination of a bucket base, a holder therefor, screw-threaded means extending inwardly from the periphery of the holder to secure the base, a casing which supports the holder and also prevents the screw-threaded means from backing out, and means for securing the holder to the casing.
8. In an elastic fluid turbine, the combination of bucket bases situated side by side, a holder having grooves to receive the bases and prevent axial movement, radially extending screw-threaded means for uniting the base and the holder, and a support for the holder which prevents the screw-threaded means from backing out and at the same time permits the bases and the holder to expand and contract independently thereof.
9. In an elastic fluid turbine, the combination of a bucket base, a holder therefor, a bolt for securing the holder and base whioh is body bound in both parts, one or more other bolts for securing the parts which are body bound in the base only, a support, and bolts for securing the holder and support which are body bound in the holder only.
10. In an elastic fluid turbine, the combination of relatively movable parts, a casing therefor having an opening through which the clearances between the sald parts can be observed, and a removable closure for the said opening.
11. In an elastic flufd turbine, the combination of a grooved base having a plurality of buckets, and a holder therefor, the metal of which is forced into the groove to prevent the base from creeping circumferentially.
12. In an elastic fuid turbine, the combination of a bucket base having circumferential and radial grooves, with a holder therefor, the metal of which is forced into the said grooves to hold the base against radial movement and also to prevent ereeping.
13. In an elastic fluid turbine, the combination of a support, a segmental bucket base carrying a plurality of overlapping buckets, a recess in the end of one segment registering with the end bucket of the adjacent segment, so that one segmental base can be nomoved without disturbing the other, and a means for eecuring the base to the support.
14. In an elastic fluid turbine, the combination of a aupport, a segmental buoket base carrying a plurality of overlapping buckets, each having a recess in ase ond and an overhanging bucket at the other, the recess and bucket registering when the parts are assembled on the suppolt, and a bucket securing means.
15. In an elastic fluid turbine, the combination of segmental bases, each common to a plurality of overlappins buckets and provided with a recess for regiatering with a bucket on the adjacent segment at one ond and a projecting bucket on the other, and segmental covers for the buckets, the plane of division between cover segments being located between the buckets of adjacent segments.

No. 101,308. Mastic Fluid Turbime.
Turbine a tuide élastique.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Elihu Thompson, Swampscott, Massachusetts, U.E.A., 2nd October, 1906; 6 years. Filed 15th May, 1906. Receipt No. 135,927.
Claim.- 1 . In an elastic fluid turbine, the comblnation of buckets which are relatively rotatable, an enclosing casing, and a means for balancing the thrust on one set of buckets comprising a member which is movable axially of the casing.
2. In an elastic fluid turbine, the combination of buckets which are relatively rotatable, an enclosing casing, and a means for balancing the thrust on one set of buckets which is responsive to changes in fluid pressure within the casing and is movable independently of the buokers.
3. In an elastic fluid turbine, the combination of a casing. buckets carried thereby, a bucket carrying drum, and means for balancing the thrust on the bucket drums, which is movable axially and independently of the bucket drum.
4. In an elastic fluid turbine, the combination of a casing, relatively rotatable buckets enclosed thereby, a shaft carrying one set of buckets, and a drum for balancing the end thrust on one set of buckets which is movable longitudinalIy with respect to said shaft.
5. In an elastic fluid turbine, the combination of a casing, buckets carired thereby, fluid discharging devices, a drum carrying the revolving buckets, a balancing arum 1ocated inside of the bucket drum, which is movable axially with respect thereto, and a means for taking up the thrust on the balancing drum.
6. In an elastic fluid turbine, the combination of a casing. Guid discharging devices carried thereby, a bucket carrying drum which is rotated by the fluid from sald devices, a mainshaft, a means for supporting the drum from the main shaft, a means for supporting the drum from the mam shaft, a balancing drum, a secondary shaft supporting the balancing drum, which is movable longitudinally with respect to the main shaft in response to pressure changes. and means for receiving the thrust of the secondary shaft.
7. In an elastic fluid turbine, the combination of a casing, a bucket carrying drum enclosed thereby, a shast supporting the drum, means for preventing endwise movement thereof. a balanoing drum which supports and centers the bucket drum without constraining its movements due to expansion and contraction, the said balancing drum being free to move slightly in an axial direction, and means arranged to receive the thrust of the balancing drum.
8. In an elastic fluid turbine, the combination of a casing, a bucket carrying drum, a wall carried by the casing al. supporting fluid discharging devices, the said wall co-operating with the surface of the drum to form stages, a balancing drum extending inside of the bucket drum, and means for taking up the thrust on the balance drum.
9. In an elastic fluid turbine, the combination of a casing, a bucket carrying drum, a wall carried by the casing and supporting fluid discharging devices, the said wall co-operating with the surface of the drum to form stages, a balancing drum located inside of the bucket drum and movable longitudinally thereof to a limited extent, and a fluid pressure means for taking up the thrust on the balancing drum.
10. In an elastic fluid turbine, the combination of a bucket carrying drum, a disc for supporting the drum, the opposite sides of which are balanced as to temperature, and a balancing drum which assists in supporting the bucket drum, the opposite ends which are subjected to different temperatures.

No. 101,309. Governor for Turbines.
Gouverneur de turbines.

\(\because\) e Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Oscar Junggren, Schenectady, New York, U.S.A., 2nd October, 1906; 6 years. Filed 3rd August, 1906. Receipt No. 138,393 .
Claim.-1. An elastic fluid turbine comprising relatively rotating parts working at different pressures, in combination with a stage valve automatically responding to changes In stage pressure for controlling the passage of motive fluid, a device opposing the opening of the valve, and means responsive to fluid pressure for assisting said device and thereby relieving it of a certain amount of work, as and for the purpose specified.
2. An elastic fluid turbine comprising relatively rotating parts working at different pressures, in combination with a stage valve automatically responding to changes in stage pressure for controlling the passage of motive fluid, a device opposing the opening of the valve, and a balancing piston responsive to fluid pressure which co-operates with the said device to prevent the valve from opening, as and for the purpose specified.
3. An elastic fluid turbine comprising stages wherein a difference in pressure exists, rotary buckets, and fluid discharging devices, in combination with a stage valve that opens in response to changes in pressure in one of the stages, a device opposing the action of fluid pressure on the valve, a balancing means co-operating with the said device, and a conduit for partially balancing the pressures to which the valve and balancing means are exposed, as and for the Iurpose specifled.
4. An clastic fluid turbine, comprising stages wherein a difference in pressure exists, rotary buckets, and fluld discharging devices, in combination with a stage valve that
opens in response to changes in pressure in one of the stages. a balancing piston attached to the valve and cooperating with the said device, the valve and piston being exposed to high pressure on one side and low pressure on the other, and a conduit connecting the low pressure sides of the valve and piston so that changes in pressure will correspondingly effect both, as and for the purpose specified.
5. An elastic fuid turbine which is divided into stages working at different pressures, comprising relatively rotating parts and fluid discharging devices, in combination with a plurality of successively operating stage valves controlling the passage of fluid through sald devices, each of said valves being provided with a device opposing the effect of stage pressure thereon, and a balancing means which is acted upon by the same pressure which tends at all times to open the valve, as and for the purpose specified.
6. An elastic fluid turbine of the multi-stage type, in combination with a valve which controls the passage of motive fluid from one stage to another, a balancing piston for the valve whose effective action in opposing its opening is less than the effective action of the fluid on the vaive itself, and a device which co-operates with the piston to prevent the valve from opening until the stage pressure exceeds a certain amount and assists in closing it when the pressure falls, as and for the purpose specified.
7. An elastic fluid turbine of the multi-stage type, in combination with a valve which controls the passage of motive fluid from one stage to another, a balancing platon for the valve that is exposed on opposite sides to a difference in fluid pressure, a balancing piston attached to the valve that is exposed on opposite sides to the same difference in fluid pressure, a spring opposing the opening of the valve and which assists in closing it, and a conduit which connects the low pressure sides of the balancing piston and valve, as and for the purpose epectifed.
8. A turbine in combination with a valve that controls the passage of motive fluid from one part to another, the said valve comprising a casing to receive the valve, the latter having a double area, a balancing piston attached to the valve, the effective area of the valve being greater than that of the piston, a spring co-operating with the piston to resist the action of motive fluid on the valve, and means for connecting the low pressure sides of the valve and piston with the pressure of that part of the turbine into which the fluid passing through the valve discharges, as and for the purpose specified.
9. A turbine in combination with a valve and its casing, a balancing piston in line with the valve, a stem connecting the valve and piston, a spring assisting to seat the valve, a stop for limiting the opening of the valve, an indicator to show the position of the valve within its casing, and a conduit for equalizing the pressure on opposite sides of the piston and valve, as and for the purpose specified.

\section*{No. 101,310. Governor for Turbines. \\ Gouverncur de turbines.}

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of John G. Callan, Lynn, Massachusetts, U.S.A., 2nd October, 1906; 6 years. Filed 31st August. 1906. Receipt No. 189,132.

Claim.-1. In a governing mechanism the combination of a regulator, a governor controlling it, and a device co-operating
with and assisting the governor in its action on the regulator, as and for the purpose specified.
2. In a governing mechanism the combination of a regulator, a motor for moving it, a governor for controlling the movements of the motor, and a device co-operating with the governar to reduce the load thereon as it controls the motor, as and for the purpose specified.
3. In a governing mechanism the combination of a regulator, a motor for moving it, means for controlling the motor. a governor for varying the position of said means as the load requirements change, and a device co-operating with and reducing the load on the governor, as it acts on said means, as and for the purpose specified.
4. In a governing mechanism the combination of a regulator, a hydraulic motor for moving it, a pilot valve controlHing the motor, a governor regulating the movement \(s\) of the pilot valve, and a device co-operating with the governor to move the pilot valve, as and for the purpose specifed.
5. In a governing mechanism the combination of a regulator, a motor for moving it, a speed governor controlling the motor, and a device responding to unbalanced pressures for assisting the governor, as and for the purpose specified.
6. In a governing mechanism the combination of a regulator, a hydraulic motor for moving it. comprising a piston, cylinder and pilot valve, a governor acting on the pilot valve. and a device responding to unbalanced pressure for assisting the governor in its action on the pilot valve, as and for the purpose specifled.
7. In a governing mechanism the combination of a regulator, a hydraulic motor for moving it. a speed governor, a pilot valve located in the motor piston so that the latter will follow up the movements of the valve, and a device set lato operation by unbalanced pressures created by a movement of the pilot valve, which acts on the pllot valve in conjunction with the governor, as and for the purpose specified.
8. In a governing mechanism the combination of a regulator, a motor for moving it, comprising a moving and a stationary element, a speed governor for controlling the motor, a device for asissting the governor in its action on the motor, and a spring opposing the said device that is carrled by the movable element of the motor, as and for the purpose specifed.
9. In a governing mechanism the combination of a reguIntor, a piston and cylinder for moving it, a pilot valve for governing the motor, a governor for controlling the action of the pllot valve, a device responding to fluld pressure changes for assisting the governor in its action on the pilot valve, and a spring for opposing the movements of said device which engages the piston, as and for the purpose specified.
10. In a governing mechanism the combination of a regulator. a fluld actuating motor for moving it through which the fluld continuously flows, a valve for creating an unbalanced condition as to pressure on the movable element of the motor when it is desired to move the regulator, a means for moving the pilot valve, and a fluld actuated device which cooperates with the said means, as and for the purpose specifed.
11. In a governing mechanism the combination of a regulator, a hydraulic motor for actuating it, a pilot valve for controlling the motor, which is provided with heads, ports co-operating with the valve head, the relation of parts being such that one head closes its port before another to reduce the load on the actuator, and an actuator for moving the pilot valve, as and for the purpose specified.

\section*{No. 101,311. Horse Collar. Collier de cheval.}

Alfred U. Field and Sidney William Carman, assignee of one-fourth Interest, both of Stockton, California, U.S.A., 2nd October, 1906: 6 years. Filed 28th August, 1906. Receipt No. 139.056 .
Claim.-1. A device of the character described comprising a bearing or draft portion adapted to conform to the shoulders of a horse and a curved portion outward therefrom and, adapted to clear the neck of the horse, and a spring bar? secured to said draft portion and following the periphery of said curved portion, as set forth.
2. A horse collar comprising a draft portion adapted to conform to the shape of a horse's shoulders, a curved portion outward therefrom and adapted to extend beyond and clear the neck of the horse, tongues rearward from said draft portion and adapted to be fastened to the tugs of the barness, all as set forth.
3. In a horse collar a portion conforming to the shape of the shoulders of a horse, a curved portion outward theretrom and adapted to clear the neck of the horse, a spring steel bar rivetted to said draft portion and following the periphery of sald curved portion, as set forth.
4. A device of the character described comprising a bearing or draft portion adapted to conform to the shoulders of

a horse and a curved portion outward therefrom so formed as to extend beyond and clear the neck of said horse, as set forth.

No. 101,312. Hose Coupler. Joint de boyaus.

Alexander W. Irvin and Richard John Hughes, assignee of a balf interest, both of Altoona, Pennsylvanla, U.S.A., 2nd October, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,149.
Claim.-1. In a hose coupling, the combination with the train pipes and angle cocks, of metal connections therefor sa constructed as to permit free movement in every direction, substantially as described.
2. In a hose coupling, the combination with the train pipes, of couplings therefor, each provided with a ball and socket joint, and an elbow joint made wholly of metal, substantially as described.
3. The combination with the train pipe, an angle cock, a perforated ball and socket joint connected thereto, an elbow joint connected to said ball and socket joint, and a coupler joint connected to said elbow joint, substantially as described.
4. The combination with the train pipe and angle cock, of a perforated ball and socket joint connected to said angle cock, a spring tending to force the members of said joint apart, an elbow joint, a coupler joint, and connections be, tween said elbow joint and sald ball and socket and coupler joints respectively, substantially as described.
5. In a hose coupling, the combination with the train pipes, of couplings therefor each provided with a ball and socket foint consisting of a ball member having one large perforation extending from the neck of sald member to the
center of the ball and one or more smaller perforation extending from and connecting with the larger perforation, two socket members adapted to enclose the ball of said ball member, one of said socket members containing perforations, une adapted to contain a spring, a spring adapted to press the ball member away from one of the socket members to form an air passage from the smaller perforations in said ball member through the larger socket member and a washer interposed between said ball member and said spring. substantially as described.
6. In a hose coupling, the combination with the train pipes of couplings therefor each provided with an elbow joint consisting of a male member and a female member, adapted to fit one within the other, and having their abutting ends enlarged and bevelled, and said female member having screw threads formed upon its enlarged portion, a shoulder formed upon the female member, an internally threaded connecting member provided with an inwardly extending flange adapted to engage said shoulder on said female member and to screw upon said male member. said. male member when in engagement being slightly larger than said female member, and a packing ring disposed between the shoulder of said female member and said connecting \(m \in m b e r\), substantlally as described.

No. 101,313. Selective Telephone. Téléphone.

Noble S. McKinsey, Susanville, California, assignec of An ton R. Nelson, Philadelphia, Pennsylvania, U.S.S., 2nd October, 1906; 6 years. Filed 27th August, 1906. Receipt No. 138,995.
Claim.-1. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, means for connecting at central the other wire of said line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said other wire, substantially as described.
2. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, means for connecting at central the other wire of said line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said other wire, means controlled by said magnets for throwing out all other talking circuits except that of the station 80 grounded, substantially as described.
3. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, means for connecting at central the other wire of sald line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said other wire, means, controlled by said magnets preventing grounding at any other station, substantially as described.
4. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, means for connecting at central the other wire of said line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said other wire, means controlled step-by-step by successive energizations of magnets of the other line, for closing in succession the bell cfrcuits of sald other lines. substantiany as described.
5. In a selective telephone system, a party line, one wire of which grounds at central, a resistance therein at central greater than that of any talking circult in the system, magnets at each station bridging said wire with the other wire of the line, means at each station for grounding said other wire, and means at central for connecting said other wire through an interrupter with the corresponding wire of any other party line and also for inserting in the first wire at central an interrupter whereby the magnets on either line can be intermittently energized by central, substantially as described.
6. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, magnets at each station bridging said wire with the other wire, means at each station for grounding said other wire, and means at central for inserting in said first wire an interrupter whereby the magnets can be intermittently energized, substantially as described.
7. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, magnets at each station bridging said wire with the other wire, means at each station for grounding said other wire, and means for inserting in said first wire an interrupter whereby the magnets can be intermittently energized, substantially as described.
8. In a selective telephone system, controlling mechanism comprising magnets and a rotating device advanced a short distance when a weak current passes through the magnets and a long distance in the same direction when a strong current passes therethrough, and means for throwing a resistance into the line through the magnets by taking down the receiver, substantially as described.
9. In a selective telephone system, controlling mechanism comprising magnets and a rotating device advanced a short distance in the same direction when a weak current passes through the magnets and a long distance when a strong current passes therethrough, and means operatable by the calling party for throwing a resistance into the line through the magnets, substantially as described.
10. In a selective telephone system, controlling mechanism comprising a rotating device, clock work mechanism for rotating the same, stops for the same arresting the device, the one after a long movement thereof and the other after a short movement, a magnet, means whereby the first stop is brought into action by a strong current through said magnet, and the second stop by a weak current therethrough, and means operated by taking down the receiver for throwing a resistance into circuit with the coil through the magnet, substantially as described.
11. In a selective telephone system. controlling mechanism comprising a rotating device, clock work mechanism for rotating the same, stops for the same arresting the device, the one after a long movement thereof and the other after a short movement, a magnet, means whereby the first stop is brought into action by strong current through said magnet, and the second stod by a weak current thersthrough, and means operatable by the calling party for throwing a resistance into circuit with the coil through the magnet. substantially as described.
12. In a selective telephone system, controlling mechanism comprising a rotating device, clockwork mechanism for rotating the same, arresting means therefor, a magnet for operating the latter, means for interrupting the currents through the magnet repeatedly in succession with a weak current. a circuit closed after a predetermined number of such interruptions, and means whereby a strong current through the magnet removes the arresting means to break said circuit, and arrests the rotating device in a subsequent position thereof, substantially as described.
13. In a selective telephone system, party lines, one wire of each of which is grounded at central, a resistance therein at central greater than that of any talking circult in the system and the other wire of any line can be connected al central with the corresponding wire of any other line, means for grounding said other wire at any station of the line, and means whereby central can connect the two wires at any station on any line, to form a complete talking circuit, substantially as described.
14. In a selective telephone system, a step-by-step rotating device, clock work mechanism for rotating the same, a magnet controlling the same by interrupted weak currents therethrough. means for simultaneously closing the circuit through said magnet and throwing a resistance intr said circuit to weaken the current to be subsequently so interrupted, means for shutting the resistance to pass a strong current through the magnet, means whereby sald strong current returns the rotating device to its initial position, and means for holding the line closed upon operating said shunting means until said rotating device has turned to its initial position, substantially as described.
15. In a selective telephone system, a line controller at each station, means for closing the circuit by sald line controller, means whereby the rise of the automatic noo. operates the line controller to close the circuit, means for supporting the line controller in a position to be so operthe closing of the circuit influences all the supporting means the closing of the circuit influences all the supporting means on the line to withdraw the controllers except the one alrady operated out of position to be so operated by the risc in the corresponding automatic hook, substantially as described.
16. In a selective telephone system, a line controller at each station, means for closing the circuit by said line controller, means whereby the rise of the automatic hook operates the line controller to close the circuit, neans for supporting the line controller in a position to be so operated by the rise of the automatic hook. and means whereby the closing of the circuit influences all the supporting means on the line to withdraw the controllers except the one already operated out of position to be so operated by the rise in the corresponding automatic hook, and a busy signal brought into signalling position by such actuation of the supporting means, substantially as described.

\section*{No. 101,314. Photographing Machine. Machine photographique.}

Joseph Frederick Roders, New York City, New York, U.S.A., 2nd October, 1906; 6 years. Filed 27th February, 1904. Receipt No. \(112,955\).
Claim.-1. In a machine of the character described a magazine, plates angularly aranged therein relatively to each. other, and means for effecting the edgewise discharge of the first plate by engaging the second and disengaging the first, and so forth.
2. In a machine of the character described, a magazine, plates arranged therein angularly to each other, means for holding the forward plate, and means for rotating the magauinc to cause the disengagement of the holding means from the forward plate and the engagement of said means with the immediately succeeding plate.
3. In a machine of the character described, a magazine, plates arranged therein angularly to each other, stops against which the first plate abuts, and means for effecting the relative movement between the plates and the stops, whereby said stops successively engage the second and disengage the first of said plates.
4. In a machine of the character described, a magazine, plates aranged therein in such manner that each plate is at right angles to its next plate, means for turning the magazine, stops against which the horizontally disposed first plate abuts, and means for transferring the stops from the first to the second plate as the first plate approaches vertical position and the second plate horizontal position.
5. In a magazine of the character described, a magazine, and means for turning the sald magazine to discharge a plate therefrom by the intersection of a coin.
6. In a machine of the character described, a magazine, a shutter, an operating spring therefor, and means for simultaneously effecting a partial rotation of the magazine and a rewind of the shutter spring.
7. In a machine of the character described, means for successively dellvering plates to exposure position and successively exposing and delivering said plates to developing position, and means for simultaneously developing a plurality of plates and transferring them to the fixing bath in order of immersion in the developer.
8. In a machine of the character described, a developing bath having a plurality of compartments one of which is always in register with the exposure position when the bath is at rest. and means for effecting the intermittent rotation of said bath.
9. In a machine of the character described, plate treating baths arranged concentrically one within the other, and neans for transferring a plate from one bath to the other.
10. In a machine of the character described, a ring provided with three concentric channels, containing respectively developing, fixing and washing fluids, and means for transferring a plate from one channel to the other and finally discharging the plate from the machine.
11. In a machine of the character described, a ring provided with troughs or channels, concentrically arranged, and a transferring device, means for bringing a plate supported in one of said troughs or channels to rest underneath the transferring device and means for effecting the operation of the transferring device to grip the plate, withdraw it from the first trough or channel, deposit it in the second trough or channel and subsequently move it to the first position.
12. In a machine of the character described, a ring, a transferring device operating while the ring is at rest to (1) move downward and engage a plate, (2) lift the plate clear of the ring, (3) move along a radius of the ring carrying the plate to position over the next trough or channel in said ring. (4) discharge the plate, and (5) move down and radially back to the first position.
13. A photographic machine comprising a magazine havIng means whereby each plate therein may be held at an angle to the next, means for detaining the foremost plate. and mechanism for effecting relative movement between said magazine and said detaining means, to disengage said detaining means from the foremost plate and engage said detaining means with the succecding plate.
14. A photographic machine comprising a rotatable magazine having means whereby each plate therein may be held at an angle to the next, means for detaining the foremost plate, and mechanism for rotating the magazine, sald magazine and said retaining means being so related that upon rotation of the magazine said detaining means become disengaged from the foremost plate and engaged with the succeeding plate.
15. A photographic machine comprising a magazine havIng means whereby oblong plates may be held therein each crosswise of the next. detents for engaging the four corners of the foremost plate, and mechanism for effecting such relative movement between said magazine and said detents that the latter melease the foremost plate and engage the four corners of the succeeding plate.
16. In combination a rotatable magazine having means for holding a pack of oblong plates each disposed crosswise of the next and means rendered effective through the rotation of the magazine for discharging the foremost plate in edgewise direction.
17. In combination a rotatable magazine formed for holding a pack of oblong plates standing on edge and each disposed crosswise of the next, a spring for advancing sald plates. detents against which the corners of the foremost plate ahut. sald detents and magazine being so related that upon rotation of the magazine the foremost plate is released and the surceeding plate is engaged by the detents, and a guide through which a released plate may drop.
18. In combination a rotatable magazine formed for holding a pack of plates, means for effecting the rotation of the magazine, and means for enabling a rotary movement of the magazine to cause the foremost plate to be discharged in edgewise direction
19. In combination a rotatable magazine formed for holding a pack of oblong plates each crosswise to the next, detents movably mounted upon one end of the magazine for engaging the four corners of the foremost plate, means for giving the magazine quarter revolutions, means for enabling the detents to release the foremost plate and engage the next during each quarter revolution of the magazine, and four guides upon the magazine through which the re. leased plates may drop. narrow end foremost.
20. In combination a rotatable magazine formed for holding a pack of oblong plates each crosswise to the next, and means for giving the magazine quarter revolutions and for Nischarging the foremost plate at each quarter revolution of the magazine.
21. The combination with a magazine for photographic plates. of a series of pivoted detents for engaging the foremost plate, gearing connecting sald detents, and means for operating sald gearing.
22. A combination with a rotatable magazine for holding rblong photographic plates some crosswise to others, of four detents pivoted upon said magazine for engaging the foremost plate, four gears connected to the detents, and a fised ceptral gear meshing with said four gears.
23. The comblnation with a rotatable magazine formed for holding oblong photographic plates some crosswise to Nthers, of means for giving said magazine quarter revolutlons, four two-arm detents pivoted upon said magazine lour gears one rigid with each detent, and a fixed central gear meshing with the said four gears.

\section*{No. 101,315. Method of Making Rubber Hose. \\ Méthode de faire des boyaux de caoutchnte.}

William Henry Adams. Montral, Quebec, Canada. 2nd October. 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138.059.

Claim.- 1 . The herrin described method of making fire hose, which consists in partly curing a wholly vulcanizable rubber tube. inserting the tube into a tube of fabric and causing it to adhere thereto. applying a coating of rubber to the outer surface of the tube of fabric, applying a profecting covering to the outer surface of the rubber to prevent overcuring, and fully curing the inner and outer rubber surfaces.
2. The herein described method of making fire hose, winich conslsts in partly curing a wholly vulcanizable rubber tube, inserting the tube into a tube of fabric, further curing the rubber tube and causing it to adhere to the woven tube, applying a coating of rubber to the outer surface of the tube of fabric. applying a protecting covering to the outer surface of the rubber to prevent over curing, and fully curing the inner end outer rubber surfaces.
3. The herein described method of making flre hose, which consists in partly curing a wholly vulcanizable rubber tube, inserting the tube into a tube of fabric, closing the ends of the rubber tube and admitting live steam to the interior of the rubber tube, cooling the rubber tube, inserting a cold hollow mandrel into the rubber tube, applying a coating of rubber to the outer surface of the tube of fabric, applying a removable protecting covering to the outer surface of the rubber to prevent over curing, and fully curing the inner and outer rubber surfaces.
4. The herein described method of making fire hose, which consists in partly curing a wholly vulcanizable rubber tube, Inserting the tube into a tube of fabric, further curing the rubber tube and distending the same to adhere to the tube of fabric, passing a cooling medium through the Inside of the rubber tube, inserting a cold hollow mandrel inside of the tube of rubber, applying a protecting covering to the outer surface of the rubber coating to prevent over curing, and fully curing the inner and outer rubber surfaces.
5. The herein described method of making fire hose. which consists in partly curing a wholly vucanizable rubber tube, inserting the tube into a tube of fabric, maintaining the tube of rubber and fabric in a desired shape, appying an outer coating of rubber to the tube of fabric, applying a protecting covering of fabric to the outer surface of the rubber and fully curing the inner and outer rubber surfaces.
6. The herein described method of making fire hose, which consists in partly curing a wholly vulcanizable rubber tube, inserting the tube into a tube of fabric. maintaining the tubes of rubber and fabric in a desired shape, applying an outer coating of rubber to the tube of fabric, applying a covering of continuous wet fabric to the outer surface of the rubber to prevent over curing, and fully curing the inner and outer rubber surfaces.

\section*{No. 101,316. Belt or Canvas Tightener.}

Tendeur de courroies, etc.
George Edgar Clarke, Toronto. Ontario, Canada, 2nd October, 1906; 6 years. Filed 15th March, 1906. Recejpt No. 133,916.
Claim.-1. The comblnation with an apron, belt, canvas or conveyer, of means acting under the influence of a torsional force and circulating therewith so as to automatically take up the slack therein or permit of the necessary expansion thereof.
2. The combination with a divided apron, belt, canvas or conveyer, of means acting under the influence of a torsional force and yieldingly connecting the ends together in such a manner as to automatically take up the slack therein or permitof the necessary expansion thereof.
3. The combination with a divided apron, belt. canvas or conveyer, of adjustable means acting under the influence of a torsional force and yieldingly connecting the ends together in such a manner as to automatically take up the slack therein or permit of the necessary expansion thereof.
4. The combination with a divided apron, belt, canvas or conveyer, of a member to which one end of the same is connected, a second member, a spring acting under the influence of torsional force, controlling movement of said second member, and means for connectingtsaid members together in such a manner as to permit of the slack in sald
apron, canvas, conveyer or belt being taken up or permit
of the necessary expansion of same.

5. The combination with a divided apron, belt, canvas or conveyer, of a member to which one end of same is connected, a rotatavie member, a spring acting under the influence of torsional force controlling axial movement of said rotatable member, means for connecting said members together in such a manner as to permit of the adjusting movement of said first-mentioned member so as to decrease or increase the torsional force exerted by said spring upon said rotatable member.
6. The combination with an apron, belt, canvas, or conveyer, of means circulating therwith, and a spring acting under the influence of torsional force and controlling axial movement of said means, which, being so attached or connected to said canvas, belt, apron, or conveyer automatically takes up the slack therein or permits of the necessary expansion thereof.
7. The combination with a divided apron, belt, canvas or conveyer, of a member to which one end of same is connected, a spring controlled member to which the other end of same is yieldingly secured, and means for connecting sald members together in such a manner as to permit of the slack in said apron, canvas, conveyer, or belt, being taken up or permit of the necessary expansion of same through the movement of said spring controlled member.
8. The combination with a divided apron, belt, canvas, or conveyer, of a normally non-rotating roller to which one end of same is connected, a spindle loosely mounted within said roller, a spring controlled roller to which the other end of same is yleldingly secured, and means for connecting said rollers together in such a manner as to permit of the slack in said apron, canvas, conveyer or belt being taken up or permit of the necessary expansion of same through the movement of sald spring controlled roller.
9. The combination with a divided apron, belt, canvas or conveyer, of a normally non-rotating roller to which one end of same is connected, a spindle loosely mounted within said roller, a roller to which the other end of same is yieldingly secured, a spindle mounted within this roller, a spring within said roller having one end attached to said spindle and its other end attached to said roller, threaded rods connecting said spindles together at each end, nuts threaded on sald rods, and means for locking said first-mentioned roller so as to prevent rotation of same, said second-mentioned roller being free to turn on its spiral in order to permit of

Louis V. Gadbois, Aylmer, Quebec, Canada, 2nd October, 1906; 6 years. Flled 16th June, 1906. Receipt No. 136,993.
Claim.-1. In a heating device for incubators, a tank extending practically on the whole area of the egg chamber, a portion of said tang projecting outside of the egg chamber, a heat flue in sadd extension, a regulator boiler closing the top of said flue, a heat regulator actuated by the steam generated in said boller, and means conencted to said regulator to direct the beat on or off sald regulator boller, an ege tray, a solld bottom to said egg tray, a belt on sald bottom, means for moving said belt, an egg separating rods in said tray.
2. A temperature regulator for incubators, a water tank, a regulator boiler embodied in said tank, a flue directing the heat to said boiler. a flue directing the heat off from said bofler, a double damper mounted between sald flues, a steam actuated piston in said regulator boiler, and means connecting the piston and dampers to actuate the same by a predetermined pressure in said boller, an egg tray, a solld bottom to said egg tray, a belt on said bottom, means for moving said belt, and egs separating rods in said tras.

Axel Magnuson, New York City, New York, U.S.A., 2nd October, \(1906 ;{ }^{6}\) years. Filed 1st September, 1905. Receipt No. 128,130
Claim.-1. The combination with an electric motor, of phase current aparas therefor, means for controlling singleand current to operate said motor controlling apparatus, and an electric device for holding said motor controlling apparatus in a predetermined position
2. The combination with a multiphase motor, of controlling apparatus therefor, means in a circult connected across any two of the mains of said motor, for closing a single phase circult to sald motor controlling apparatus, and electric holding means for said controlling apparatus.
3. The combination with an electric motor, of controlling apparatus therefor, holding means for said controlling apparatus, a source of single phase current, a source of direct current, and a single switch device for controlling the single phase current to operate said motor controlling apparatus and for controlling the direct current to operate said holding means.
4. The combination with an electric motor, of starting switches therefor, electro-responsive devices for closing said switches, electro- magnetic apparatus for holding sald sivitches in closed position, a source of single phase current a source of direct current and a single manual switch for controlling the single phase current to operate said electroresponsive devices and for controlling the direct current to operate said electro-magnetic holding apparatus.
5. The combination with an alternating current motor, of reversing switches therefor, single phase magnets for actuating said switches to closed position, direct current magnets for holding said switches in closed position, and means for controlling both the said single phase magnets and the said direct current magnets.
6. The combination with an alternating current motor, of two reversing switches therefor, an electro-responsive device for each of sald switches to actuate the same to closed position, an electro-magnet connected to each switch to hold the same in closed position, and a manual switch for controlling single phase current to operate either of the electro-responsive devices and for controlling direct current to operate the corresponding holding electro-magnet.
7. In combination with a motor, a source of electrical supply, a resistance in series with the motor armature, and a generator connected to the motor and arranged to control sald resistance in starting the motor.
8. In combination with a motor, a source of electrical supply, a resistance in series with the motor armature, and a generator mechanically connected to the motor and arranged to control said resistance in starting and stopping the motor.
9. In combination with an alternating current motor, a source of electrical supply, a resistance electrically connected to the motor, and a generator connected to the motor and arranged to control the movement of the motor upon starting, by controlling the resistance.
10. In combination with a motor, an opposition element in circuit with the motor and a generator mechanically connected to the motor and arranged to control the movement of the motor in starting and stopping by controlling the opposition element.
11. In combination with an alternating current motor, a resistance electrically connected to the motor, and a genfrator connected to the motor and arranged to control the resistance in proportion to the speed of the motor on starting.
12. In combination with a motor, controlling circuits therefor, electro-magnetic switches in the controlling circuits, and means for generating a variable voltage in proportion to the speed of the motor, said voltage applied to said electro-magnetic switches in the controlling circuits which are arranged to be actuated by the varlable voltage.
13. In oombination with a motor, an opposition element in circult with the motor, a generator so connected to the motor that it will generate a voltage in proportion to the speed of the motor, a plurality of electro-magnets in connection with the generator and arranged to control the opposition element.
14. The combination with an electric motor and a mechanism driven thereby, a generator mechanically connected to the driven mechanism, an electro-responsive device connected to said generator, and means electrically connected to the motor and operated by said electro-receptive device for controlling the acceleration of the motor upon starting.
15. In combination with an electric motor, \(\&\) mechanism driven thereby, an opposition element in the motor circuit, an electro-responsive device for controlling the opposition element, and a generator connected to the driven mechanism and arranged to actuate the electro-responsive device to cut the opposition element out of the motor circuit in a number of steps in proportion to the acceleration of the driven mechanism.
16. In combination with an electric motor, a starting device therefor, electric circuits to actuate the starting device, a source of electrical supply, and another source of electrical supply dependent upon the movement of the motor and arranged to co-operate with the first source of supply to hold the starting device during the rotation of the motor.
17. In combination with an electric motor, a starting device therefor, electric circuits to actuate the starting device, a source of electrical supply, and another source of electrical supply dependent upon the movement of the motor and proportional to its speed and arranged to co-operate with the first source of supply to hold the starting device during the rotation of the motor.
18. In combination with an electric motor, an electrically operated starting device therefor, electric circuits to actuate the starting device, a source of electrical supply, another source of electrical supply dependent upon the speed of the motor and proportional to its speed and arranged to cooperate with the first source of supply to hold the starting device during the rotation of the motor, and a manually operated switch to control the circuits to the starting device.
19. A starting device for motors comprising an alternating current motor, a direct current generator connected to run with the motor, and means actuated by the current from the generator to control the starting and accelerating of the motor.
20. In combination with an alternating current motor, a source of alternating current supply, an opposition element in the motor curcuit. a series of electro-magnetic responsive devices for removing the opposition element from the motor circuit, and a source of direct current supply dependent upon the movement of the motor and proportional to its speed. arranged to actuate the electro-responsive devices one by one as the speed of the motor increases.
21. In combination with an alternating current motor, a source of alternating current supply, a starting device for the motor arranged to be actuated by the alternating currcnt, means dependent upon the movement of the motor for generating a direct current, and a magnetic device operated by such direct current to hold the starting device firmly in closed position.
22. In combination with an alternating current motor, a source of alternating current supply, a starting device for the motor arranged fo be actuated by the alternating cur-
rent, a direct current generator dependent upon the movement of the motor arranged to generate a voltage proportional to the speed of the motor, a magnetic device connected to such direct current generator and arranged to hold the starting device firmly in closed position, an opposition element in the motor circuit. and a series of electro-responsive devices for removing the opposition element from the motor circuit. sald electro-responsive devices being connected to the direct current generator and arranged to be actuated one by one as the motor accelerates.
23. In combination with an alternating current motor, an clectrically operated starting device therefor, and circuits for actuating the starting device comprising an alternatiog current circuit and direct current circuit.
24. In combination with an alternating current motor, a starting device therefor, alternating current and direot current circuits, said starting device being actuated by a single phase alternating current and positively held in operative position by a direct current.
25. In combination with an alternating current motor, a starting device therefor. said starting device being actuated by a single phase alternating current and positively beld in operative position by a direct current, alternating curreat and direct current electrical circuits for the starting device. and a manually operated switch for controlling the circuits.
25. In combination with an alternating current motor. \({ }^{2}\) device for starting the motor in one direction and another device for starting the motor in the other direction. alternating current and direct current circuits, sald starting device being actuated by a single phase alternating current and positively held in operative position by a direct movement.
27. In combination with an alternating current motor. a resistance, an electrically operated reversing switch. circuits for the reversing switch for both alternatine and direct currents. a manually operated switch for controling the circuits. electro-resdonsive devices for controlling the resistance and a direct current generator connected to run with the motor arranged to supply the direct current circults for the reversing switch and to automatically actuate the elec-tro-responsive devices.
28. In combination with an alternating current motor. \({ }^{2}\) resistance. an electrically operated reversing switch. circuits for the reversing switch for both alternatine and direct currents, a manually overated switch for controlling the dircuits, electro-resnonsive devices for controlling the resiatance, and a direct current genpratnr connected to run with the motor arranced to supply the dirent current circuits for the reversing switch and to automatically actuate the elentronesnonsive devices in proportion to the acceleration of the motor.
29. In combination with an alternating current motor. a resistance an electricallv nperated reversing switch. dircuits for the reversing switch for both alternating and direct currents. \& manually oderated switch for controlling the circuits. electro-responsive devices for cutting out the resistance step-by-sten. and a direct current generator connected to run with the motor arranged to supnly the diract current circuits for the reversing switch and to automaticallv actuate the electro-responsive device one at a time in pronortion to the acceleration of the motor.
30. In comblnation with a motor, means for reversing the direction of rotation of the motor. a generator connected to run with the motor. means for keeping the direction of the current generated by the generator the same if the direction of rotation of the motor is changed. and means actuated hy the current generated by the generator for controlling the motor.
31. In combination with a motor, means for reversing the direction of rotation of the motor, a resistance for the motor circuit. a generator connected to run with the motor, moans for keeping the direction of the current generated by the generator the same if the direction of rotation of the motor is changed, and means actuated by the current generated by the generator for controlling the motor by cutting the resistance into and out of the motor circuit.
32. In combination with a motor, means for reversing the drection of rotation of the motor. a generator connected to run with the motor, means connected with the generator for keeping the direction of its generated current the same, sald generator arranged to generate a voltage in proportion to the speed of the motor, and electro-responsive devices dependent upon the generated voltage for controlling the acceleration of the motor.
33. In combination with an alternating current motor. \({ }^{\alpha}\) starting device therefor and a direct current generator coanected to run with the motor and arranged to acceleration of the motor in starting the motor.
34. In combination with an elternating current motor. \({ }^{\text {a }}\) starting device therefor actuated by alternating current. and a direct current generator connected to run with the motor and arranged to control the acceleration of the motor.
35. In combination with an alternating current motor, means for starting the motor in one direction or the other, and a direct current generator connected to run with the motor and arranged to control the acceleration of the motor. 36. In combination with an alternating current motor. means for starting the motor in one direction or the other. sald means actuated by alternating current and a direct current generator connected to run with the motor and arranged to control the acceleration of the motor.
37. In combination with an alternating current motor, means for starting the motor in one direction or the other, said means actuated by an alternating current, a manually operated switch for controlling the starting device and a direct current generator connected to run with the motor and arranged to control the acceleration of the motor.
38. In combination with an alternating current motor, a starting device therefor, alternating current and direct current circuits, said starting device being actuated by an alternating current and positively held in operative position by a direct current.
39. In combination with an alternating current motor, a starting device therefor, sald starting device being actuated by an alternating current and positively held in operative position by a direct current, alternating current and cirect current electrical circuits for the starting device, and a manually operated \(s\) witch for controlling the circuits.
40. In combination with an alternating current motor, a device for starting the motor in one direction and another device for starting the motor in the other direction, alternating current and direct current circuits, said starting derices being actuated by an alternating current and positively held in operative position by a direct current.
41. In a starting device for alternating current motors, a source of supply, a starting mechanism, alternating current and direct current circuits, means connected with said source of supply arranged to actuate the starting mechanism to start the motor, and a direct current generator mechanically connected to the motor and arranged to control the acceleration of the motor step-by-step.
42. In a system of motor control, two sources of current supply, one being pulsating and connected to the motor, the cther being a direct current generated by the movement of the motor and variable from zero to a maximum it proportion to the speed of the motor and adapted to control the acceleration of the motor.
43. In a system of motor control two sources of current supply, one of which is not variable and is connected to the motor, the other of which is generated by the movement of the motor and is variable from zero to a maximum in proportion to the speed of the motor.
44. In a system of motor control two sources of current supply, one of which is not variable and is connected to the motor, the other of which comprises a generator connected to the motor and is variable from zero to a maximum in proportion to the speed of the motor.
45. In a system of motor control two sources of current supply, one being obtainable before the motor is started. and the other being dependent upon the movement of said motos means operated by current from one of said sources for starting, reversing or stopping the motor, and means operated by current from the other source for effecting an acceleration of the motor.
46. In combination with an electric motor, an external Rource of current supply of practically constant value, a controlling device in serles with the motor, and a generator mechanically connected to the motor and arranged to control the controlling device.
47. In combination. With an electric motor, an external source of current supply of practically constant value, a starting switch for the motor, a controlling device for the motor, and a generator mechanically connected to the motor and arranged to control the controlling device.
48. In combination with an electric motor, an external source of current supply of practically constant value, an electrically actuated starting switch for the motor, a manually operated circult closer for the starting switch, a controlling device for the motor and a generator mechanically connected to the motor and arranged to control the controlling device.

\section*{No. 101,319. Telephone Switchboard. \\ Commutateur de téléphone.}

Ewing McLean, Greencastle, Indiana, U.S.A., 2nd October, 1906; 6 years. Filed 21st March, 1906. Recelpt No. 134,126.

Claim.-In a telephone switchboard, a shutter occupying a normal vertical position, said shutter being hinged at its lower end and adapted to swing down on its hinge as a signal to the operator, said shhtter having an outwardly projected extension at its hinge end, a magnet having windings connected with the telephone line wires, an armature pivot-
ally supported upon said magnet, an arm carried by said armature having a terminal hook to secure the shutter in

its normal vertical position, a connecting plug, a cord attached to an end of said plug, a weighted pulley supported on said cord, a pivoted lever having one arm contacting with the shutter extension and having the other arm forming a support for said plug when the latter is in its socket.

No. 101,320. Gas Generator. Générateur d gaz.

Jean Patoine, Quebec, Quebec, Canada, 2nd October, 1906 ;
6 years. Filed 11th May, 1906. Receipt No. 135,804.
Claim.-1.A gas generator comprising the combination of a tank having an inclined bottom merging into a T connection, a pipe leading from the \(T\) connection, a rockable pipe provided with an opening adapted to register with the pertical portion of the \(T\) connection and provided with a squared outer end, and means for automatically feeding carbide into the tank.
2. A gas generator comprising the combination of a tank provided with a horizontal partition having an opening therein, a float disposed in the tank, guideways for the float. angle irons secured to the float, a cylinder secured to the angle irons and adapted to work in sald opening in the partition, a water seal carried by the float, a carblde chamber, a cylinder depending from the carbide chamber into the water seal, a closure for the carbide chamber, and means for operating the closure by the upward and downward movement of the float.
3. A gas generating apparatus comprising the combination of a tank, a float disposed in the tank, a water seal carried by the float, a cylinder disposed in the water seal, a carbside chamber carried by the clyinder and provided with downwardly extending sleeves, a link secured to the float, a cross bar pivoted to the link, an arm secured to the carbide chamber and pivoted to the cross bar, rods pivoted to the cross bar and disposed through the sleeves, a cross bar carried by said rods, and a funnel-shaped closure for the carbide chamber carried by the iast-named cross bar.
4. A gas generating apparatus comprising the combination of a tank, a float carried by the tank, a water seal carrled by the float, a carbide chamber disposed above the water seal, a cylinder depending from the carbide chamber into the water seal, a closure for the carbide chamber adapted to be actuated by the upward and downward movement of the fioat, and links carried by one of the members of th water seal and provided with hooked ends adapted to engage a portion of the carbide chamber and lock the same.

No. 101,321. Machine Por Cutting Tubular Bodies. Machine pour tailler des corps tubulaires.

Thomas D. Miller, Woodstock, Maryland, assignee of Eugene J. Logan, Philadelphia, Pennsylvania, U.S.A., 2nd October, 1906; 6 years Filed 26th May, 1906. Receipt No. 136,272.
Claim.-1. The combination with a clamp for tubular bodies, of a circular saw adjacent to an end of said clamp, means for constantly rotating said saw about its axis, and independent means for giving said saw an orbital movement about the axis of the clamp.
2. The combination with a clamp for tubular bodies, of a circular saw adjacent to and end of sald clamp, means for constantly rotating said saw about its axis, and independent means for giving said saw an orbital movement about the axis of the clamp intermittently.
3. The combination with a clamp for tubular bodies, of a pair of circular saws arranged adjacent to the ends of sald clamp, means for constantly rotating said saws about their axis, and independent means for giving sald saws an orbital movement about the axis of the clamp.
4. The combination with a clamp for tubular bodies, of a pair of circular saws arranged adjacent to the ends of said clamp, means for constantly rotating said saws about their axis, and independent means for giving said saws an arbital movement about the axis of the clamp slmultaneously.
5. The combination with a clamp for tubular bodies, of a pair of circular saws arranged adjacent to the ends of said clamp, means for constantly rotating said saws about their axis, and independent means for giving said saws an orbital movement about the axis of the holder simultaneously and irtermittently.
6. The combination with a circular saw, and means for rotating the same about its axis, of a feeding device having one or more holders for tubular bodies thereon, means for moving said feeding devices intermittently to bring the bodies against the saw, and means for giving said saw an orbital movement about the axis of each tubular body after it has been brought into engagement with the saw.
7 The combination of a saw carrier journalled in a sultable bearing and a saw arbour journalled in said carrier at one side of the axis of the carrier, a saw mounted upon said arbour, a shaft extending axially through said saw carrier and geared to said arbour, means for rotating said. shaft, and means for intermittently rotating said saw carrier.
8. The combination of a saw carrier journalled in a suitable bearing and a saw arbour journalled in sald carrier at one side of the axis of the carrler, a saw mounted upon said arbour, a shaft extending axially through said saw carrier and geared to said arbour, means for rotating said shaft, means for rotating said baw carrier, and means for locking means for carrier against movement at the completion of each revolution of the carrier.
9. The combination of a saw carrier journalled in a suitable bearing and a saw arbour journalled in said carrier at one side of the axis of the carrier, a saw mounted upon said arbour, a shaft extending axially through said saw carrier and geared to said arbour, means for rotating said shaft, means for rotating said saw carrier intermittently, comprising a constantly driven clutch member, a co-operating clutch member secured to the carrier, means for automatically connecting said clutch members, and means for automatically disengaging said clutch members at the completion of each revolution of the carrier.
10. The comblnation of a saw carrier journalled in a suitable bearing and a saw arbour journalled in said carrier at one side of the axis of the carrier, a aw mounted upon said
arbour, a shaft extending axially through sald saw carrier and geared to said arbour, means for rotating sald shaft, means for rotating said saw carrier, intermittently, comprising a constantly driven clutch member, a co-operating clutch member secured to the carrier, means for automatically connecting said clutch members, means for automatically disengaging sald clutch members at the completion of each revolution of the carrier, and means for automatically locking the carrier against movement while the clutch members are disengaged.
11. In a machine for cutting tubular bodies the combination with a suitable bearing and a saw carrier comprising a sleeve journalled in said bearing, and having a head adapted to support a saw arbour at one end of the bearing and a clutch member fixed to sald sleeve at the opposite end of the bearing, of a constantly driven clutch member journalled upon sald sleeve, means for automatically engaging and disengaging said clutch members, a shaft extending axially through said sleeve, means for constantly driving said shaft, a saw arbour mounted in said head parallel with the shaft and having a saw thereon, and gearing connecting said shaft and arbour.
12. In a machine for cutting tubular bodies the combination with a suitable bearing and a saw carrier comprising a sleeve journalled in said bearing, and having a head at one end adapted to support a saw arbour and a clutch member secured to said sleeve at the opposite end of the bearing, of a gear forming a clutch member journalled upan said sleeve, a saw arbour journalled in sald head, a shaft extending axially through sald sleeve and geared to sald saw shaft, a countershaft, and gearing connecting sald countershaft. with the shaft extending through the sleeve and with the gear journalled upon said sleeve.
13. In a machine for sawing tubular bodles the comblnation with a saw carrier comprising a sleeve journalled in a suitable bearing, of a clutch upon said sleeve at ane end of said bearing, a collar secured to said sleeve at the opposite end of the bearing, a clutch lever and a locking lever pivoted adjacent to said bearing, said clutch lever being adapted to engage and operate the clutch and sald lock-1 ing lever being adapted to form a locking engagement with the collar, a rod connected to the free ends of sald levers, and a shaft having a cam thereon adapted to operate sald rod.
14 In a machine for sawing tubular bodies, a rotatable saw carrier, a saw carried thereby at one slde of the axis of the carrier, means for rotating said saw, means for intermittently rotating sald carrier, a feed wheel having one or more holders, each adapted to hold a tubular body with its end projecting in the plane of the saw, means for operating sald feed wheel to bring the tubular body or bodies irto engagement with the saw, and means for holding sald feed wheel stationary while the saw carrier is in motion.
15. In a machine for sawing tubular bodies, a rotatable saw carrier and means for rotating the same, a saw arbour journalled in said carrier at one side of the axis of the carrier, said arbour having a saw thereon, a feeding device having one or more holders thereon each adapted to hold a tubular body, means for constantly rotating sald saw, means for holding said carrier stationery, means for moving sald reeding device to bring a holder opposite the ond of the saw carrier with the tubular body in engagement with the saw, means for automatically starting said carrler into saw, means for automatically starting said carrior the the
operation after the tubular body is in engagement with the saw, and means for automatically stopping the rotation of sald carrier after it has made a complete revolution.
16. In a machine for sawing tubular bodies, a rotatable saw carrier, and means for rotating the same, a saw arbour journalled in sald carrier at one side of the axis of the carrier,said arbour having a saw thereon, a feeding derice having a series of holders thereon each adapted to hold a tubular body, means for constantly rotating said saw, means for holding said carrier stationary, means for moving sald feeding device intermittently to bring the holders suocessively into position opposite the end of the saw carrier Tith the tubular body in engagement with the saw, means for automatically starting said carrier into operation each time a tubular body is brought into engagement with the asw, and means for automatically stopping the rotat
arrier after it has made a complete revolution.
17. In a machine for sawing tubular bodies, a rotate
17. In a machine for sawing tubular bodies, a rotatable saw carrier, and means for rotating the same, a saw arbour journalled in said carrier at one side of the axis of the car rier, said arbour having a saw thereon, a feed wheel tubular one or more holders thercon each adapted to hold a tus for body, means for constantly rotating said saw, means leed holding said carrier stationary, means for moving sald feed whel to bring a holder opposite the end of the saw carrler with the tubular body in engagement with the sam, moaner for automatically starting said carrier into operation anans the tubular body is in engagement with the saw, and mafter for automatically stopping the rotation of said carrier alce it has made a complete revolution.
18. In a machine for sawing tubular bodies, a rotatable saw carrier, and means for rotating the same, a saw arbour journalled in said carrier at one side of the axis of the carrier, said arbour having a saw thereon, a leed wheel having a series of holders thereon each adapted to hold a tubular body, means for constantly rotating said saw, means for holding said carrier stationary, means for moving said feed wheel intermittently to bring the holders successively into position opposite the end of said carrier with the tubular body in engagement with the saw, means for automatically starting said carrier into operation each time a tubular body is brought into engagement with the saw, and means for automatically stopping the rotation of the carrier after it has made a complete revolution.
19. In a machine for sawing tubular bodies, a saw, means for rotating the same upon its axis, a feed wheel having one or more holders thereon each adapted to hold a tubular body transversely to the plane of the saw, means for rotating said feed wheel to bring the tubular body into engagement with the saw, means ior holding the feed wheel stationary waile the tubular body is in engagement with the saw, and means for giving the saw an orbital movement about the axis of the tubular body when the feed wheel is at rest.
20. In a machine for sawing tubular bodies, a saw, means for rotating the same upon its axis, a feed wheel having a series of holders thereon each adapted to hold a tubular body transversely to the plane of the saw, means for rolating said feed wheel intermittently to bring the tubular body into engagement with the saw, means for holding the feed wheel stationary each time a cubular body is brought into engagement with the saw, and means for giving the saw an orbital movement each time the feed wheel is stopped.
21. In a machine for sawing tubular bodies, a pair of saws arranged in parallel planes, meaus for rotatiag said saws about their axis, a feed wheel having one or more holders thereon each adapted to hold a cubular body with its end portions projecting beyond the holder into the planes of the saws, means for rotating said teed wheel to briug the cubular body or bodies into contact with the saws, means lor holding the feed wheel stationary while the tubutar body is in engagement with the saws, and moans for giving sald saws a simultameous orbital movement abouc the axis of the tubular body engaged by the sans while the feed wheel is at rest.
2. In a machine for sawing tubular bodies, a saw, means for rotating the same upon its axis, a leeding device having a series ot holders thereon, each adapted to hold a tubular body transversely to the plane of the saw, means for rotating said teed wheel intermittently to bring said tubular bodies successively into engagement with the saw, means tor holding tae teed wheel sationary while each tubular body is in eugagement with the saw, and means for giving sala saw an ordital movement while the feed wheel is stationary.
23. In a machine for sawing tubular bodics, a saw, means for operating the same to sever the tubular bodies, a fecding device having a series of holders thereon each adapted to hold a tubuiar body in the plane of the saw, means for intermittently operating said feeding device to bring suecessive holders opposite the saw, a cleaning device and means for moving said cleaning device into and out of the interior of each holder after it has passed the saw and while the leeding device is at rest.
24. In a machine for sawing tubular bodies, a pair of saws, means for operating the same to sever the tubular bodies, a feeding device having a series of holders thereon each adapted to hold a tubular body with its ends projecting beyond the end of the bolder into the planes of the saws, means ior intermittently operating said feeding device to bring successive holders opposite the saws, a cleaning device and means for moving said cleaning device into and out of the interior of each holder after it has passed the saws and while the feeding device is at rest.
25. In a machine for sawing tubular bodies, a pair of saws arranged in parallel planes, a feed wheel having a series of holders thereon each adapted to hold a tubular body with its end portions projecting transversely of the planes of the saws, means for intermittently moving said feed wheel to bring successive holders between the saws, a longitudinally movable shaft or spindle having a cleaning device thereon arranged in the rear of the saws, and means for giving said spindle a longitudinal reciprocating movement each time the feed wheel is stopped.
26. In a machine for sawing tubular bodies, a pair of saws and means for operating the same to cut said bodies transversely, a feed wheel having a series of holders thereon each holder having a hinged outer jaw and being adapted to hold a tubular body with its ends projecting into the planes of the saws, means for rotating said feed wheel intermittently, a curved gulde extending around the upper and rear portions of the feed wheel and adapted to hold said hinged jaws
closed while the tubular bodies are being cut-off, a cleaning device at the rear of the saws, means for moving said device into and out of the holders while the jaws are closed by said guide and the feed wheel is at rest.
27. In a machine for sawing tubular bodies the combination with a pair of saws arranged in parallel planes, means for constantly rotating said saws about their axes, and means for giving said saws an intermittent orbital movement, of a feed having a series of holders thereon, mechanism for intermittently operating said feed wheel and means for automatically throwing said feeding mechanism out of action after each movement of the feed wheel.
28. In a machine for sawing tubular bodies the combination with a pair of saws arranged in parallel planes, and means for constantly rotating said saws about their axes, of a feed wheel, means for intermittently operating said feed wheel, mechanism for giving said saws an intermittent orbital movement, and means for automatically throwing sald mechanism out of action after each movement of the feed wheel.
29. In a machine for cutting off the heads of sheet metal cans the combination with a pair of saws arranged in parthel planes and means for constantly rotating said saws about their axes, of a clamp arranged to hold a can body with its end portions in ensagement with the saws, and independent means for giving said saws and clamp a complete orbital movement relatively to one another during the engagement of the saws with the can body to cause the severance of the cans heads.
30. In a machine for sawing tubular bodies the combination with a saw, and means for constantly rotating sald saw about its axis, of a clamp arranged to hold a tubular body transversely to the plane of the saw and in engagement with the saw, and independent means for giving sald saw and clamp a complete orbital movement relatively to one another during the engagement of the saw with the tubular body to cause the severance of the tubular body.
31. In a machine for sawing tubular bodies the combination with a saw and means for constantly rotating said saw about its axis, of a feeding device having a c!amp thereon adapted to hold a tubular body transversely to the plane of the saw, means for automatically moving said feeding device to bring said tubular body into engagement with the saw, means fo. automatically locking said feeding device in stationary posltion while the tubular body is engaged by the saw, and means for automatically moving said clamp and saw relatively to oue another while the feeding device is stationary to cause the saw teeth to cut circumferentially around the tubular tody from the interior of the tubular body outwardly.
32. In a machine for cutting off the heads of sheet metal cans the combination with a pair of circular saws arrangel in parallel planes, and means for rotating said saws about their axis. of a feeding device having a holder thereon, said holder being arranged in a plane between the saws and adapted to hold a can body with its end portions projecting into the planes of the saws, means for moving said feeding device to bring the can body into engagement with the saws, means for locking said feeding device in stationary position while the can body is engaged by the saws, and means for moving said holder and saws relatively to one another while the freding device is stationary to cause the feeth of the saws to cut circumferentially around the can body from the interlor of the can outwardly.
33. In a machine for sawing tubular bodies, a circular saw and means for constantly rotating the same about its axis, a clamp adapted to hold a tubular body transversely to the plane of the saw, means for giving the saw and the clamp a relative feeding movement to cause the saw to make an initial cut through the walls of the tubular body at one side thereof, means for stopping this feeding movement after this initial cut has been made, and means for moving safd saw and clamp relatively to one another after the feed movement has ceased to cause the saw teeth to cut circumferentially around the tubular body from the interior outwardly.
34. In a machine for cutting off the heads of sheet metal cans the combination with a pair of circular saws arranged in parallel planes and means for rotating satd saws about their axes, of a holder arranged in a plane between said saws and adapted to hold a can body with its end portions projecting into the planes of the saws, means for giving the saws and holder a relative feeding movement to cause the saws to make initial cuts through the wall of the can body at one side thereof, means for stopping this feeding movement after the initial cuts have been made, and means for moving sald pair of saws and the holder relatively to one another after the feed movement has ceased to cause the teeth of both saws to cut circumferentially around the can body from the interior outwardly.
35. A machine to cut the heads and bottoms from can bodies having in combination a plurality of clamps to stationarily clamp can bodies between their ends, means for intermittently moving sald clamps to bring them successively
to the operative position, and means to simultaneously make position, where each end around the clamped can body in removed while the body remains held will be severed and 36. In a machine of the remains held in the clamp.
a crank, a cutter shaft carriss described the combination of volving said cutter shaft continy satd crank, means for resaid crank intermittently, and a can body means for revolving ter is colncldent with the axis of the cutter clamp whose cen-
37. In a machine of the class de cutter shaft.
a orank, a cutter sbaft carried by said the combination of with a pinion, a shaft at carried by said crank and provided with a pinion, a shaft at the axis of said crank and carrying revolve the latter, means for revolving said gears and cutter shaft continuously, means for revolving sald crank intermittently and thereby move the revolving cutter shaft in a circular path, and a can body clamp whose center is coincident with the axis of the cutter shaft.
38. In a machine of the class described the combination of a stationary table, a bearing supported above said table, a revoluble sleeve extending through said bearing and carrying a crank, means for revolving said sleeve, a cutter shaft carried by said crank, a shaft extending through said sleeve, means for transmilting motion from sald latter shaft to the cutter shaft, and a can body clamp whose center is coincident with the axis of the cutter shaft.
39. In a machine of the class described the combination of a crank, a cutter shaft carried by sald crank, means for revolving sald cutter shaft, means for revolving said crank intermittently whereby to move the cutter shaft in a circular path, a plurality of can body clamps and means for successively moving said clamps into operative position with respect to said cutter shaft.
40. In a machine of the class described the combination of a crank, a cutter shaft carried by said crank, means for revolving said crank to move the cutter shaft in a circular path, a revoluble head carrying a plurality of can body clamps, and means for intermittently revoliving said head to successively bring the clamps into position opposite the crank axis and hold them at rest while the cutter shaft is moved in a circular path.
41. In a machine for cutting can bodies the combination of two cranks confronting each other but spaced apart, a rotary cutter carried by each crank, a plurality of movable clamps each adapted to clamp a can body between its ends, means for successively miving the said clamps to a position in the space between the said two cranks with their centers coinicdent with the axis of the cutter shaft, and means for intermittently revolving both cranks to cause the cutters to sever and remove the head and bottom while the body remains held in the clamp.

\section*{No. 101,322. Extraction of Nickel and Cobalt. Extraction de nickel et cobalt.}

The Metals Extraction Corporation, assignee of Ralph Waldo Emerson MacIvor, all of London, England, 2nd October. 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,769.
Claim.-1. The treatment of recovering nickle and cobalt form ores of oxidized mattes consisting in finely grinding the same and digesting them with or without pressure in a solution of chloride of magnesium at a sultable temperature, drawing off the resulting solutions of cobalt and nickel chlorides as formed and treating the same by known means for the recovery of the metal contents, substantially as described.
2. The manner of separating cobalt from nickel by digesting the finely ground nickel cobalt ores or roasted mattes in a solution of chloride of magnesium at a sultable temperature in such manner that the cobalt is first dissolved and separated as a solution of cobaltous chloride from the ore, the digesting being then continued for the similar removal of the nickel, substantially as described.
3. In the treatment of cobalt and nickel ores or roasted mattes forming the same into a paste with chloride of magmattes iorming, and after drying heating the mass to a temperature of about 300 degrees centigrade and subsequently wasting out the cloride of cobalt and nickel.

\section*{Nn. 101,323. Production of Nickel and Cobalt. Production de nickel et cobalt.}

The Metals Extraction Corporation, assignee of Ralph Waldo Emerson MacIvor, all of London, England, 2nd October, 1906 ; 6 years. Filed 16th June, 1906. Receipt No. 136,959.
Claim.-In the production of mattes from sulphide nickel and cobalt ores, mixing with such ores an alkali or alkaline earth-poly-sulphide together with a small quantity of carbon. for the purpose and in the manner substantially as described.

No. 101,324. Milking Machine.

D. H. Burrell and Company, assignee of Frederic A. Lane, both of Little Falls, New York, U.S.A.S 2nd October, 1906: 6 years. Filed 16th February, 1906. Receipt No. 132,965 .
Claim.-1. In a milking machine the combination with teat cups and a milk pipe, of an interposed connecter comprising a body which is open at the bottom, a bottom remorably secured in the bottom opening of the body, a lateral attaching device for the milk pipe formed on said body above the bottom opening thereof, and individual attaching devices for said cups formed on the top of said body, the interior of said attaching devices being directly accessible upon removing said bottom, substantially as described.
2. In a milking machine the combination of a milk pipe, reat cups and a connector interposed between sald plpe and said cups and provided with a restricted air inlet through which air is constantly admitted to the connector and the milk passages connected therewith, substantially as set forth.
3. In a milking machine the combination of a milk vessel, a pulsator on the same, a milk pipe connected with the pulsator, teat cups connected with the milk pipe, an air inlet which is placed periodically in communication with the milk pipe by the pulsator and an air inlet whlch admils air constantly to the milk pipe, substantially as set forth.
4. In a milking machine the combination of a milk vessel, a milk plpe connected therewith, teat cups connected with the milk pipe and air inlet devices adapted to admit air to both ends of the milk pipe, substantially as set forth.
5. In a milking machine the combination of a milk vessel, a milk pipe connccted therewith, teat cups, a connector interposed between the cups and the pipe and provided with an alr inlet which is constantly open, and a pulsator provided with an air inlet which is periodically placed in communication with the milk pipe, substantially as set forth.
6. A teat cup comprising a rigid tapering body shaped to receive and support the teat and having at its large end an enlargement forming an internal annular cavity which extends outwardly and upwardly from the large end of the tapering body, and a flexlble mouthpiece having an outer wall by which it is attached to sald enlargement and an inver depending packing wall which is located in sald carity above the large end of the tapering body and capable of sidewise movement in sald cavity, substantially as set forth.

No. 101,325. Electric Switch. Commutateur électrique. W. J. O'Leary and Company, assignee of William Coonan, all of Montreal, Quebec, Canada, 2nd October, 1906
years. Filed 3rd August, 1904. Receipt No. 117,443.
years. Filed 3rd August, 1904. Receipt No. 117,44. plate, a gravity actuated erame plvotally mounted thereon-. a pivotally supported locking member, and locking mesns carried by said bed plate in position to engage the respective ends of said pivoted locking member, substantially as described.
2. In an electric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon, a locking
member pivotally connected to sald irame and provided with catches at its respective ends, and locking means carried

by the bed plate in position to engage sald catches, substantially as described.
3. In an electric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon, a locking member pivotally secured to said frame and provided with catches at its respective ends, a fixed member carried by the frame in position to engage one of said catches and a movable member carried by said frame in position to engage the other of said catches, substantially as described.
4. In an electric switch the combination of a bed plate, a gravity actuated frame plvotally mounted thereon, a locking member pivotally secured to said frame and provided with catches at its respective ends, a fixed member adjustably carried by the frame in position to engage one of said catches, and a movable member carried by said irame in position to engage the other of sald catches, substantially as described.
5. In an electric switch the combination of a bed plate, a gravity actuated frame plvotally mounted thereon, a locking member pivotally connected to sald irame and provided with catches at its respective ends, an adjustable means carried by said frame in position to engage one of said catches. an armature plate carried by sald bed plate for engagement with the other of said catches, and a magnet for actuating sald armature plate, substantially as described.
6. In an electric switch the combination of a bed plate, a gravity actuated frame plvotally mounted thereon, a locklog member pivotally connected to said frame, a gravity actuated armature plate arranged to lockingly engage sald plroted locking member, a magent for actuating said armature plate, a stop arranged to limit the movement of said armature plate and provided with means for limiting the swing of said pivoted locking member, substantially as described.
7. In an electric switch the combination of a bed plate, circult terminals electrically insulated on said bed plate, a gravity actuated frame pivotally mounted on the bed. plate, electric conducting members carried by said pivoted frame and adapted to complete the circuit between said circuit terminals, a locking member pivotally connected to said frame, and locking means carried by the bed plate in position to engage the resyective ends of sald pivoted locking member, substantially as described.
8. In an electric switch the combination of a bed plate, circuit terminals electrically insulated on said bed plate, a gravity actuated frame plootally mounted on the bed plate. electric conducting members resiliently supported on sald pivoted frame and adapted to complete the circuit between said circult terminals, a locking member plvotally connected to said frame. and locking means carried by the bed. plate in position to engage the respective ends of said pivoted locking member; substantially as described.
9. In an electric switch the combination of a bed plate. circuit terminals electrically insulated on said bed plate, a gravity actuated frame pivotally mounted on the bed plate, flexible contacts carried by said pivoted frame, and adapted to complete the circuit between sald circult terminals, a locking member pivotally connected to said frame, and locking means carried by the bed plate in position to engage the respective ends of said pivoted locking member, substantially as described.

No. 101,326. Feed Mechanism for Magaxinen. Mécanisme d'alimentation pour magasine de fusils.

Charles Owens and Dwight P. Montague, assignee of a half interest, both of Chattanooga, Tennessee, U.S.A., 2nd October, 1906; 6 years. Filed 13th July, 1906. Recelpt No. 137,787
Claim.-1. In combination in a machine of the class described, a feed drum, a hopper or support for the magazine or other articles whereby the forward portions of the sald magazine are supported upon the said feed drum, means carried by the feed drum for engaging the magazines, and controlling means between which and the feed drum the magazines must pass, substantially as described.
2. In combination a feed drum arranged to support the forward portion of the magazines, means carried by the feed drum for engaging the magazines, controlling means engaging the pile of magazines and arranged opposite the feed.' drum with a space between for the passage of the magazines, said controlling means consisting of a wheel having teeth or projections thereon and adjustable releaser means to cover more or less of said teeth or projections and shield them from the pile of magazines, substantially as des-1 cribed.
3. In combination a feed drum having means to engage the magazines, a controlling ratchet arranged opposite the feed drum, means for rotating the ratchet step-by-step, and releaser means to shield more or less of the ratchet teeth in respect to the pile of magazines, substantially as described.
4. In comblation the feed drum, carrying means to engage the magazine, a ratchet wheel arranged opposite the drum with a space betwren for the passage of the magazines, said ratchet wheel having its teeth adapted to obstruct the forward movement of the magazines. means engaging the said ratchet teeth for operating the ratchet, and releaser means to cover more or less of the ratchet teeth in respect to the pile of magazines, substantially as described.
5. In combination the feed drum, carying means to engage the magazine, a ratchet wheel arranged opposite the drum with a space between for the passage of the magazines, said ratchet wheel having its teeth adapted to obstruct the forward movement of the magazines, means engaging the said ratchet teeth for operating the ratchet, and releaser means to cover more or less of the ratchet teeth in respect to the pile of magazines, said releaser means being adjustable about the axis of the ratchet, substantially as described.
6. In combination a feed drum, an adjustable support for the rear portion of the plle of magazines, a ratchet wheel arranged opposite the feed drum and between which the feed drum the magazines pass, means for operating the ratchet and a releaser adapted to shield more or less of the ratchet teeth in respect to the pile of magazines, substantially as described.
7. In combination a feed drum adapted to receive the magazines thereon, means carried by the feed drum to engage the magazines to feed them forward, and feed controlling means arranged opposite the feed drum with a space therebetween for the passage of the magazines, sald controlling means being adanted to provide a contracting space to make the plle of magazines at the feeding point assume a pyramid-like formation with the magazines in advance of tho one next above, substantially as described.
S. In combination with the feed drum, a rotary device opposite the peripheral surface of the feed drum for controlling the feed of the magazines and a releaser assoclated with sald rotary device and an adjustable stop carried thereby, substantially as described
9. In combination with the feed drum, a toothed wheel opposite the peripheral surface of the drum, a releaser, and means for adjusting the slze of the space between sald releaser and the surface of the feed drum, substantially as described.

No. 101,327. Electric Furnace. Fournaise ćlectrique.

La Soclête Electro-Metallurgique Françals, Forges, assignee of Paul Toussaint Héroult, La Praz, France, 2nd October, 1906; 6 years. Flled 8th June, 1906. Receipt No. 136,708.
Claim.-1. An electric furnace having an electrode, a protecting jacket therefor and means for cooling said jacket.
2. An electric furnace having an electrode, an outer protecting jacket therefor and an inner cooling jacket between the electrode and the outer jacket.
3. An electric furnace having an electrode and a protecting jacket therefor having passages for a cooling fluid therethrough.
4. An electric furnace having an electrode, an outer jacket of heat insulating material and an inner jacket of heat conducting material between the electrode and the outer jacket, and having passages for a cooling fluid therethrough.
5. An electric furnace having an electrode, an outer jacket \(M\) of heat insulating material surrounding the same, and an inner jacket \(N\) of heat conducting material, said inner jacket comprising plates \(\mathbf{P}\) and \(\mathbf{Q}\) with blocks between them forming passages \(R\) for the circulation of a cooling fluid.
6. An electric furnace having an electrode and a protecting jacket therefor adapted to extend down into the furnace, the electrode belng adapted to be adjusted through said jacket.
7. An electric furnace having means for injecting alr thereto comprising an annular space in the furnace wall open to the interior, and a ring surrounding and discharging ints said space.
8. An electric furnace having means for injecting air thereinto comprising an annular space in the furnace wall open to the interior and a ring surrounding and discharging into said space, the wall above said space overhanging the edge of the wall below the space.
9. The combination with an electrode for an electric furrace, of a protecting jacket adapted to extend into the furnace to protect the electrode. and a stuffing box supporting said jacket, the electrode being adapted to be fed through the stuffing box and jacket.
10. The combination with an electrode for an electric furnace, of a stuffing box \(W\) surrounding the electrode, said stuffing box being provided with a gland \(d\) and graphite packing 0.
No. 101,328. Method of Producing Nitrogen Composition.
Methode de production de compose dazote.
Oscar Frederick Carlson, Stockholm, Sweden, 2nd October, 1906 ; 6 years. Filed 18th July, 1906. Receipt No. 137,935. Claim. -1 . The hereln described method of producing nitrogen compositions by heating carbides of alkaline earths in a current of nitrogen gas consisting in adding to the carblde before the heating, one or more fluorides of an alkall or an a!kaline earth, substantially for the purpose set forth.
2. The herein described method of producing nitrogen compositions by heating carbides of alkallne earths in a current of nitrogen gas, consisting in adding to the carbide before the heating, one or more flourides of an alkali or an alkaline earth and a sulphate of an alkaline earth or an alkall, substantially for the purpose set forth.

No. 101,329. Electro-Chemical Process for Producing Nitrogen Compounds.
Procédé élcctro-chimique pour la production de composé d'azote.

John Wilerid Wood, Moulton, Iowa, U.S.A., 2nd October, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,175.
Claim.-1. An electro-chemical process for making nitrogen compounds which consists in continuously charging a liguld electrolyte with air under pressure to furnish it with an excess of nitrogen, and subjecting the liquid to the action of an electric current to dissociate the liquid and removing the nitrogen and other compounds thus formed.
2. An electro-chemical process for making nitrogen compounds which consists in preparing an aqueous solution of nitrogen, continuously charging the solution with air under pressure and subjecting the solution to the action of an electric current to dissociate the solution and removing the nitrogen and other compounds thus formed.
3. An electro-chemical process for making nitrogen comrounds which consists in causing a liquid electrolyte to continuously absorb gaseous nitrogen, sending an electro current through the electrolyte at ordinary temperature for the purpose of dissociating the liquid and liberating the products of electrolysis, and firmly carrying off the nitrogenous compounds.
4. An electro-chemical process for making nitrogen compounds which consists in continuously charging water with air under pressure, to provide it with an excess of altrogen sending an electric current through the water to dissociate the water and to liberate the nitrogen and other products. and finally carrying off at the anode and cathode respectively the nitrogen and other compounds formed.

No. 101,330. Telegraphic Alphabet.
Alphabet télégraphique.

Isidor Kitsee, Philadelphia, Pennsylvania, U.S.A., 2nd October, 1906: 12 years. Filed 17th May, 1:06. Receipt No. 136,023.
Claim.-1. In a telegraphic alphabet, one symbol consisting of two curves opposite as to each other, and the second symbol consisting of two curves opposite as to each other, a zero line between said curves.
2. A telegraphic alphabet comprising two symbols, one consisting of two marks opposite as to each other, the
second symbol consisting of two marks opposite as to each other, and a third mark between sald two marks.
3. A telegraphic code comprising a different grouping of two symbols, one symbol consisting of one mark at one side of the imaginary zero line followed by a second mark at the other side of said zero line, and the second symbol consisting of one mark on one side of the zero line, and one mark at the other side of the zero line.
4. A telegraphic Morse alphabet in which the dash is symbolized by two curves opposite as to each other and connected with each other by a straight line, and in which the dot is symbolized by two connected curves opposite each other.
5. A telegraphic alphabet comprising two characters, one character consisting of two elements, one above and one below an imaginary zero line and the second character consisting of three elements, one above, one at, and one below an imaginary zero line.

No. 101,331. Line Clamp. Frein pour cables.

John E. Baechler, Sarnia, Ontario, Canada, 2nd October, 1906; 6 years. Filed 29th May, 1905. Receipt No. 125,588.

Claim.-1. In a line clamp, the combination with a brass plate formed with apertures, of a boss extending transversely across the plate near one end and provided with a hole extending longitudinally through the same, said boss being cut away at the center to form a bearing at each side, a clamping lever consisting of a short arm and a long arm provided at their junction with an apertured ear on one side adjacent to the plate and curved outwardly toward each end away from the plate and extending through the ear on the lever, a transverse portion formed integral with each end of said lever, arms integral with the ends of said transverse portions and extending at right angles thereto. a serrated transverse rib on the long end of the base plate, the transverse portion of the short arm of said lever being adapted to co-operate with said rib, and a lug at each end of said rib.

No. 101,332. Overahoe Fastener. Attache de galoches. Watson O. Brockway, Chicago, Illinois, U.S.A., 2nd October 1906; 6 years. Filed 25th June, 1906. Receipt No. 137, 247.

Claim.-1. The herein described clamp having means to attach it to a shoe and comprising the stationary jaw member 4 having the offset portion at its center, the swinging jaw member having its inner end pivotally connected to the offset portion of the stationary jaw member, and the spring plate 10 pivotally connected to the upper end of the stalionary jaw member for lateral movement to enable the free
end of the spring plate to bear on the free end of the swinging jaw member, to press the latter toward the stationary

Jaw member, or to be disengaged from the sald swinging: jaw member.
2. The herein described clamp comprising a socket member for attachment to a shoe, a resilient head for engagement with the socket member, a pivot projecting outwardly from said head, the stationary jaw member secured on the plvot and having the offset portion at its center, the swinging jaw member having its inner end pivotally connected to the off set portion of the stationary jaw member, and the spring plate mounted in the pivot for lateral movement with reference to the stationary jaw member to engage and disengage the swinging jaw member.

No. 101,333. Holder for Cartridges. Porte cartouchcs.

John Joyce Burnett and Charles Bubear, both of Wellington, Somerset, England, 2nd October, 1906; 6 years. Filed 14th July 1906. Receipt No. 137,815.
Claim.-1. The combination of a conical spring holder formed of spring metal, bent into a circle with bands of metal near the top and bottom riveted thereto on each side of the joint, and having means for attachment to a band, belt or clothing, substantially as described.
2. As a new article of manufacture a holder for cartridges of spring metal slightly larger than the diameter of the head of the cartridge and having a serles of tongues projecting from it in a straight line without a bead but slightly bent inward so as to form a narrower circle than the cartridge, whereby the cartridge bead rests on the top of the tongue, but can be forcibly withdrawn from the tongues.
3. The combination of a cylindrical portion at top having spring clips \(B\) stamped out of it, and a series of tongues continuing therefrom in a substantially straight line, somewhat smaller but continually lessening in diameter whereby the cartridge rests on the tongues, and is prevented from being shaken out of the cartridge holder in an upward direction by the spring clips.
4. A spring metal holder for cartridges formed of sheet metal having a series of vertical slots \(D\) D and means for supporting the bead of the cartridge near the top of the tongues formed by the slots.
5. A cartridge holder formed of a spring metal body having spring tongues, resilient means for supporting the head o: the cartridge, and spring clips stamped out of the body, whereby the cartridge is prevented from being shaken out in an upward direction.
3. In a base or stand for trolley poles the combination of a base, a plvot mounted upon said base, a head mounted upon said pivot, said head comprising a body and an attaching plate, and anti-friction bearings between the attaching plate and the base.
4. In a base or stand for trolley poles the combination of a base having a tubular extension projecting from its underside, a pivot mounted in sald tubular extension, means for preventing displacement of the pivot from the tubular extension, anti-friction bearings between the pivot and the base, a head mounted upon the pivot, and anti-friction bearings between the head and the base.
5. In a base or stand for trolley poles the combination of a base having a tubular extension, a sleeve affixed to the base within the tubular extension afinesaid, a pivot mounted in the said sleeve, anti-friction bearings between the sleeve and the pivot, a head mounted upon the pivot and comprising a body and an attaching plate secured thereto, the base being provided with a seat concentric of the pivot aforesaid, bearing rings disposed in said seat, and anti-friction bearings between sald rings. the attaching plate of the head co-operating with rings aforesaid, as specified.

No. 101,299. Vapourizer. Vaporisateur.

Emil Hubert, Budapest, Hungary, 2nd October, 1906; 6 years. Filed 9th May, 1906. Receipt No. 135,722.
Claim.-1. In a vapourizer for liquid combustibles, in combination a spindle fitted in the interior of the vapour tube, a filter formed of a number of gauzes one over the other and placed over the end of the spindle opposite to the outlet aperture, substantially as described and shown in the drawing.
2. In a vapourizer a casing, a tube 2 screwed on to the casing 1 and made hollow for the formation of a preheating chamber 3 and the reception of the spindle 4, a filter 13 provided at the end of the spindle opposite to the outlet aperture, a needle spindle 6 extending through the vapour tube and connected to an evapourating device in the casing 1 for cleaning the outlet aperture formed in the cap 11, substantially as described and shown in the drawing.
3. In a vapourizer a vapour tube, having the interior of spiral form or the like and a smooth spindle fited within the tube which bears against the edge of the threads, substantially as described and shown in the drawing.
4. In a vapourizer a smooth spindle wound with strips of wirc \(n\) the like and bearing with these strips against the interior of the tube fitted within the smooth vapour tube, substantially as dsecribed and shown in the drawing.

\section*{No. 101,300. Telephone Signal Apparatus.} Apparell de signal de téléphone.
\[
7 \cdot g^{2}
\]

David F. Laughlin, Clyde, Kansas, U.S.A. 2nd October, 1906; 6 years. Filed 19th September, 1906. Recelpt No. 139,631.
Claim.-1. In a signalling apparatus, a pair of superposed contact members, a recelver hook having its inner end arranged to form a support for the upper member, the removal of the receiver from the hook permitting such upper members to descend Into engagement with the lower member, and the replacing of the receiver serving to separate
said members, and an electro-magnetically controlled petdulum for moving the upper member from the support.
2. In signalling apparatus, a pair of superposed contact members. a pivotally mounted receiver hook having at its inner end a support for the upper member and provided with an inclined arm extending below the support to permit reengagement with sald upper member after a circuit closing operation, and an electro-magnetically controllad pendulum for moving the upper member from the said support.
3. In signalling apparatus, a pair of superposed contact members, a receiver hook having at its inner end an insulated support for the upper member and provided with a perfect pendent arm arranged in a plane obllque 10 the vertical plane of said upper member, and an electro-magnetically controlled pendulum for moving said upper member from its support.
4. In a signalling apparatus, a lower contact member in the form of a bar having an inturned arm at one end, a second contact member arranged above the first and adapted to engage said arm to close a circuit, a pivotally mounted receiver hook having at its inner end a support for sald member, and provided with a pendent inclined arm to permit reengagement with said upper member after a circuit closing operation, and an electro-magnetically controlled pendulum for moving said upper member from its support.

No. 101,301. Trolley Wheel. Rove de trout.

George Loffl, Garrett, Indiana, U.S.A., 2nd October, 1906; 6
year. Filed 17th September, 1906. Receipt No. 189,559.
Claim.-In a trolley, the trolley wheel having a lateral hub, bearings engaging the opposite ends of said hub and supporting an axle extending through the same, said harings having converging arms united at their extremities and formed into a longitudinal bearing, a pole socket for receiving said longitudinal bearing and provided with spaced ears extending in advance of the longitudinal socket, a pin disposed through sald ears and a spring bearing terminally against said pin and the longitudinal bearing.

No. 101,302. Electro-Magnetic Apparatus. Appareil éleotro-magnótsque.

John McIntyre, Jersey City, New Jersey, U.S.A., 2nd October, 1906; 6 years. Filed 27th January, 1906. Receipt No132,331.
Claim.-1. A means for treating live animal. live vegetable or other objects, comprising a pliable cable coll, and a irequency source of electrical energy in circuit with the said coll.
2. A means for treating live animal, live vegetable or other objects, comprising a frequency source of electrical energy, and pliable cable coils arranged in series and in circuit with the sald frequency source of electrical energy.
3. A means for treating live animal, live vegetable or other objects. comprising a frequency source of electrical energy, and multiple cable colls in circuit with the said frequency source of electrical energy.
4. A means for treating live animal, live organic vegetable or other objects, comprising a frequency source of electrical energy, a primary circuit connected with the said frequency source of electrical energy, and a scicondary circuit induced by the said primary circuit, the conducting cables of the said circuits being arranged in coils for surrounding the object, the cables being fiexible to allow any portion thereof being brought nearer to or farther from the object.

No. 101,303. Rnhmkoff Coils. Serpentin.

John McIntyre, Jersey City, New Jersey, U.S.A., 2nd October, 1906; 6 years. Filed 19th March, 1906. Receipt No. 134,010.
Claim.-1. A ruhmkorff coll provided with a spring armature lever carrying a contact portion, a bar arranged at an angle to the said armature lever and carrying a contact portion for engagement by the sald armature contact portion, and a bearing for the said bar to ellide in and for holding the bar against turning to maintain the faces of the said contact portions at all times in the same straight line registering position.
2. A ruhmkorif coil provided with a spring armature lever carrying a contact portion for engagement by the said armature contact portion, a bearing for the said bar to slide in and for holding the bar against turning to maintain the faces of the said contact portions at all times in the same straight line registering position, and a fastening device for securing the bar in place in the said bearing after the resired adjustment is made.
3. A ruhmkorif coil provided with a spring armature lever carrying a contact portion, a bar carrying a contact portion for engagement by the said armature contact portion, a bearing for the said bar to slide in and for holding the bar against turning, and a spring pressing against the bar at the end opposite the one carrying the contact portion.
4. A ruhmkorif coil comprising a coil cylinder carrying the primary and secondary wires and the core, a spring armature lever fixed at one end and carrying at its free end an armatnre located opposite the said core, a contact portion on the said armature lever, intermediate the fixed end and the said armature, a bar slidable at an angle toward and from the said armature lever and carrying a contact portion opposite the said armature lever contact portion, and means for the bar to slide in and to hold it against ro-
tation to maintain the faces of the said contact portions at all times in the same straight line registering position.
5. A ruhmkorff coil comprising a coil cylinder carrying the primary and secondary wires and the core, a spring amature lever fixed at one end and carrying at its free end an armature located opposite the sald core, a contact portion on the said armature lever, intermediate the fixed end and the said armature, a bar slidable at an angle toward and from the sald armature lever and carrying a contact portion opposite the said armature lever contact portion, means for the bar to slide in and hold it against rotation to maintain the faces of the said contact portions at all times in the same straight line registering position, and means for holding the said armature and armature lever in position while adjusting the said bar in the direction of its length
6. A ruhmkorfif coil comprising a coll cylinder carrying the primary and secondary wires and the core, a spring armature lever fixed at one end and carrying at its free end an armature located opposite the said core, a contact portion on the said armature lever, intermediate the nxed end and the said armature, a slidable bar carrying a_contact portion opposite the said armature lever contact portion, means for the bar to slide in and to hold it against rotation, a spring pressing the said bar in the direction of its length, and retaining means engaging the sald armature and armature lever for holding the armature lever in position while adlever for holding
justing the bar.
7. A ruhmkorif coil comprising a coll cylinder carrying the primary and secondary wires and the core, a spring armature lever fired at one end and carrying at its free end an amature located opposite the said core, a contact portion on the said armature lever, intermediate the fixed end and the said armature, a slidable bar carrying a contact portion opposite the said armature lever contact portion, means for the bar to slide in and to hold it against rotation, a spring pressing the said bar in the direction of its length, and retaining means engaging the said armature and armature lever. for holding the armature lever in position while adjusting the bar, the said retaining meang consisting of a lever fulcrumed in the end of the coll cylinder and adapted to be swung into position between the said cylinder and the inner face of the armature and armature lever
8. A ruhmorff coll having an armature lever contact portion and a contact portion opposite the said armature lever contact portion, and non-rotatable to maintain the faces of the said contact portions at all times in the same straight line registering position, the said non-rotatable contact portion being adapted to be moved at a right angle toward and from the said armature lever contact portion.
No. 101,304. Game Apparatus. Appared do jeu.

Livingston B. Pennell, Stevens Point, Wisconsin, U.S.A., 2nd October, 1906 ; 6 years. Filed 27th February, 1906. Recelpt No. 133,381.
Claim.-1. A game apparatus comprising a board with a long main track across the same, a shorter single continuous
curved track or siding, communicating at each end with said main track, and three groups of movable pieces, representing cars, with two pleces representing engines, each of the said groups of cars comprising threo pieces, those in one of the groups being wholly detached and those in the two other groups being united together, and each end of each engine being adapted to couple with either end of the two groups of united cars, the desoribed siding being capable of holding only three cars and one engine at any one time.
2. A game apparatus comprising a board with a long main track aoross the same, a shorter single continuous curved track or siding communicating at each end with said main track, pivoted guards or guides for opening and closing communication between said main track and said siding at proper times, a group of three wholly detached movable pleces reprosenting railmasd cars, two other groups of similar pieces, three in each group. inseparably united together, and two other ploces representing railroad engines, the said engines. and the two last-named groups of cars being provided with coupling dewices for engagement when described, and all of the movable pleces being in engagement with said tracks, the said siding being capable of holding only one engine and three cars at any time.

IVE 101,806. Atean Texblio. Turbinc d vapeur.

Uel Alvin Rutledge, Berkley, Virginia, U.S.A., 2nd October,
1906; 6 yeare. Filed 10th Aurgst, 1906. Receipt No. 138,567.
Claim.-1. In a turbine, a rotating piston, a collar surrounding and receiving said piston and fitting snugly about the entire periphery of the same, said collar having a fluid medium pressure compartment with a channel leading therefrom to the inner periphery of the collar, said collar also having a medium conveying compartment with a channel leading thereto from the inner periphery of the collar.
2. In a turbine , rotating piston, a collar surrounding and receiving said piston, said collar having a fluid medium pressure compartment with a channel leading therefrom to the inner periphery of the collar, said collar also having a medium conveying compartment with a channel leading thereto from the inner periphery of the collar, the capacity of the last said channel belng greater than the first said channel.
2. In a turbine, a rotating piston, a collar surrounding and receiving said piston and fitting snugly around the entire periphery of the same, said collar having a fuld medium pressure compartment with a channel leading therefrom to the inner periphery of the coltar, sald collar also having a medium conveying compartment with a channel leading thereto from the inner periphery of the collar, the capacity of the last said channel being greater than that of the first sald collar.
4. In a turbine, a series of rotating pistons, a collar recelving each piston, each sald collar having a fluid medium pressure compartment with a channel leading therefrom to the inner periphery of the collar, each said collar also having fluid medium conveying compartment with a channel leading thereto from the inner periphery of the collar, the pressure compartments of one collar belng located in alignment with the conveying compartment of the next adjacent collas
throughout the series and a means for passing the fuid medium from the conveying compartment of one collar to the pressure compartment of the next adjacent collar, and to on throughout the series.

No. 101,306. Elactic Fivid Terwimo. Turbinc d tuide élastique.

James Wilkinson, Providence, Rhode Island, U.S.A., 2nd October, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,189.
Olaim.-1. An elastic fluid turbine operating by stage expansion and having a warking pasaage which enlarges across stages, the provision therein of successive nozzles formed in stationary elements and disposed at increased angles across stages to the plane of bucket rotation, and buckets of decreasing concavity co-operating with said nozzles.
2. In a multiple stage turbine, buckets rotatable within the several stages, and nozzle passages discharging fluid pressure against said buckets, the nozzle passages for supplying motor fluld to the low pressure stage or stages having a greater angle of inclination than the nozzles for the other stage or stages, substantially as and for the purpose described.
3. In a multiple stage turbine, buckets rotatable within the several stages, nozzle passages discharging fluid pressure against said buckets, the nozzle passages for the low pressure stage or stages having a greater angle or inclination than the nozzles for the other stages, and the buckets cooperating with sald nozzle passages having different angles of inclination, substantially as described.
4. In a multiple stage turbine, stationary elements between the stage compartments, nozzle passages leading through said elements and forming conduits for the fuld between stages, sald nozzles having relatively smaller induction ends, as proportioned to the cross sectional area of the nosales, and relatively larger angles of inclination, for the low pressure stages than for the high pressure stages.
5. In a multiple stage turbine, partitions between stages and nozzle passages leading through said partitions and having enlarged admission openings and angularly disposed d!scharge passages leading therefrom and constltuting the nozzles proper, the cross sectional area of the nozzles proper for the last stages being increased relatively to the cross sectional area of their admisaion openings.
6. In a turbine operating by stage expansion, nozzle passages formed in stationary elements through which the motor fluid flows in succession to act against rotatable buckets, and supply openings for the nozzles, the cross sectional area of said openings representing a decreasing percentage of the cross sectional area of their respective nozzles for the last stage as compared with the preceding stages.
7. In a multiple stage turbine, fluid supply nozzle passages comprising enlarged admission ends and nozzles proper leading therefrom, the cross sectlonal area of the noxzles proper for the last stage or stages belag increased relatively to the cross sectional area of their admission ends by increasing their angle of inclination to the rotating buckets against which they discharge fuld.
8. In an elastic fluid turbine subdivided into stages by diaphrgas, nozzle supply openings formed in said diaphragms, nozzles leading therefrom at a determined angle. the angle of the nozzles in the last diaphragm being greater than that of the nozzles in preceding diaphragms, and buckets in the several compartments which co-operate with said nozzles, the buckets for the nozzles having the greater inclination being less concave than the other buckets but havirg their admission edges disposed at a relatively greater angle to their plane of rotation than sald other buckets.

\section*{20. 101,807. Mantie Finid Trarblne. Turotive d Aurde clastique.}

The Canadian General Blectric Company, Toronto, Ontario, Canada, assignee of Charles Fix, Quincy, Magaachusetts, U.S.A., 2nd October, 1906; 6 years. Filed 2nd May, 1906. Recelpt No. 135,463.
Oloim.-1. In an olastic fluid turbine, the combination of a suppert, a plurality of buckets, a supporting base, a device for arohoring the base with respect to the support at one polnt, and one or more other devices for attaching the base to the support which permit it to freely expand and contract.
2. In an elastic flutd turbine, the combination of a support, a bucket aupporting base, a device for anchoring the base, and one or more bolts for securing the base to the mpport which are body bound in the base and are loose in the support.
3. In an edastic finid turbine, the combination of a support, a bucket supporting base, a screw-threaded means for seenring the base and the support, and a wall for preventing the means from loceening.
4. In an elastic fluid turbine, the combination of a bucket supporting base, a holder, a means securing the base to the hokder and permitting it to expand and contract, a casing. and means securing the holder to the casing which permit the said holder and casing to expand and contract independontly of each other.
6. In an elastic fluid turbine, the con.bination of a bucket snpporting base, a holder, a means for locating the position of the base with reapect to the holder, and a means for securing the base and holder which permit the two to expand and contract independently, a support for the holder, and means uniting the holder and support which permit the two to expand and contract independently.
6. In an elastic fluid turbine, the combination of a bucket supporting base, a holder therefor having a groove to receive the base, screw-headed means for attaching the base to the holder which are prevented from backing out by the support, a support for the holder, and a means for uniting the holder and support.
7. In an elastic fluid turbine, the combination of a bucket base, a holder therefor, screw-threaded means extending inwardly from the periphery of the holder to secure the base, a casing which supports the holder and also prevents the screw-threaded means from backing out, and means for securing the holder to the casing.
8. In an elastic fluid turbine, the combination of bucket bases situated side by side, a holder having grooves to receive the bases and prevent axial movement, radially extending screw-threaded means for uniting the base and the holder, and a support for the holder which prevents the screw-threaded means from backing out and at the same time permits the bases and the holder to expand and contract independently thereof.
9. In an elastic fluid turbine, the combination of a bucket base, a holder therefor, a bolt for securing the holder and base whioh is body bound in both parts, one or more other bolts for securing the parts which are body bound in the base only, a support, and bolts for securing the holder and support which are body bound in the holder only.
10. In an elastic fiuid turbine, the combination of relatively movable parts, a casing therefor having an opening through which the clearances between the said parts can be observed, and a removable closure for the said opening.
11. In an elastic fluid turbine, the combination of a grooved base having a plurality of buckets, and a holder therefor, the metal of which is forced into the groove to prevent the base from creeping circumferentially.
12. In an elastic fiuld turbine, the combination of a bucket base having ctrcumferential and radial grooves, with a holder therefor, the metal of which is forced into the said grooves to hold the base against radial movement and also to prevent ereeping.
13. In an elastic fluid turbine, the combination of a support, a segmental bucket base carrying a plurality of overlapping buckets, a recess in the end of one megment raistering with the end bucket of the adjacent segment, so that one segmental base can be removed without disturbing the other, and a means for eecuring the base to the support.
14. In an elastic fluid turbine, the combination of a upport, a segmental bucket base carrying a plurality of overlapping buckets, each having a recess in ane end and an overhanging bucket at the other, the recens and bucket registering when the parts are assembled on the suppoft, and a bucket securing means.
15. In an elastic fluid turbine, the combincsion of sagmental bases, each common to a plurality of overlappins buckets and provided with a recess for registering with a bucket on the adjacent segment at one end and a projecting bucket on the other, and segmental covers for the buchets, the plane of division between cover segments being located between the buckets of adjacent segments.

No. 101,308. Flastic Fluid Turbine.
Turbine d Auide élastique.

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Elihu Thompson, Swampscott, Massachusetts, U.E.A., 2nd October, 1906; 6 years. Filed 15th May, 1906. Receipt No. \(135,927\).
Claim.-1. In an elastic fluid turbine, the combination of buckets which are relatively rotatable, an enclosing casing, and a means for balancing the thrust on one set of buckets comprising a member which is movable axially of the casing.
2. In an elastic fluld turbine, the combination of buckets which are relatively rotatable, an enclosing casing, and a means for balancing the thrust on one set of buckets which is responsive to changes in fluid pressure within the casing and is movable independently of the buckers.
3. In an elastic fluid turbine, the combination of a casing. buckets carried thereby, a bucket carrying drum, and means for balancing the thrust on the bucket drums, which is movable axially and independently of the bucket drum.
4. In an elastic fluid turbine, the combination of a casing, relatively rotatable buckets enclosed thereby, a shaft carry. ing one set of buckets, and a drum for balancing the end thrust on one set of buckets which is movable longitudinalis with respect to said shaft.
b. In an elastic fluid turbine, the combination of a casing, buckets carired therebyं, fluid discharging depices, a drum carrying the revolving buckets, a balancing drum \(10-\) cated inside of the bucket drum, which is movable axially with respect thereto, and a means for taking up the thrust on the balancing drum.
6. In an elastic fiuid turbine, the combination of a casing, fluid discharging devices carried thereby, a bucket carrying drum which is rotated by the fluid from said devices, a mainshaft, a means for supporting the drum from the main shaft, a means for supporting the drum from the main shaft, a balancing drum, a secondary shaft supporting the balancing drum, which is movable longitudinally with respect to the main shaft in response to pressure changes, and means for receiving the thrust of the secondary shaft.
7. In an elastic fluid turbine, the combination of a easing, a bucket carrying drum enclosed thereby, a shalt supporting the drum, means for preventing endwise movement thereof, a balancing drum which supports and centers the bucket drum without constraining its movements due to expansion and contraction, the said balancing drum being free to move slightly in an axial direction, and means arranged to receive the thrust of the balancing drum.
8. In an elastic tuid turbine, the combination of a casing, a bucket carrying drum, a wall carried by the casing al.n supporting fluid discharging devices, the said wall co-operating with the surface of the drum to form stages, a balancing drum extending inside of the bucket drum, and means for taking up the thrust on the balance drum.
9. In an elastic fuld turbine , the combination of a casing. a bucket carrying drum, a wall carried by the casing and supporting fluld discharging devices, the said wall co-operating with the surface of the drum to form stages, a balancing drum located inside of the bucket drum and movable longitudinally thereof to a limited extent, and a fluid pressure means for taking up the thrust on the balancing drum.
10. In an elastic fluid turbine, the combination of a bucket carrying drum, a disc for supporting the drum, the opposite sides of which are balanced as to temperature, and a balancing drum which assists in supporting the bucket drum, the opposite ends which are subjected to different temperatures.

No. 101,309. Governor for Turbines. Gouverneur de turbines.

\(\because\) C Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Oscar Junggren, Schenectady, New York, U.S.A., 2nd October, 1906; 6 years. Filed 3rd August, 1906. Receipt No. 138,393 .
Claim.-1. An elastic fluid turbine comprising relatively rotating parts working at different pressures, in combination with a stage valve automatically responding to changes in stage pressure for controlling the passage of motive fluid, a device opposing the opening of the valve, and means responsive to fluid pressure for assisting said device and thereby relieving it of a certain amount of work, as and for the purpose specifled.
2. An elastic fluld turbine comprising relatively rotating parts working at different pressures, in combination with a stage valve automatically responding to changes in stage pressure for controlling the passage of motive fluid, a device opposing the opening of the valve, and a balancing piston responsive to fluid pressure which co-operates with the said device to prevent the valve from opening, as and for the purpose specilled.
3. An elastic fluid turbine comprising stages wherein a difference in pressure exists, rotary buckets, and fluid discharging devices, in combination with a stage valve that opens in response to changes in pressure in one of the stages, a device opposing the action of fluid pressure on the valve, a balancing means co-operating with the said device, and a conduit for partially balancing the pressures to which the valve and balancing means are exposed, as and for the purpose specifled.
4. An elastic fluid turbine, comprising stages wherein a difference in pressure exists, rotary buckets, and fluid discharging devices, in combination with a stage valve that
opens in response to changes in pressure in one of the stages. a balancing piston attached to the valve and cooperating with the said device, the valve and piston being exposed to high pressure on one side and low pressure on the other, and a conduit connecting the low pressure sides of the valve and piston so that changes in pressure will correspondingly effect both, as and for the purpose specified.
5. An elastic fluid turbine which is divided into stages working at different pressures, comprising relatively rotating parts and fluid discharging devices, in combination with a plurality of successively operating stage valves controlling the passage of fluid through said devices, each of eaid valves being provided with a devioe opposing the effect of stage pressure thereon, and a balancing means which is acted upon by the same pressure which tends at all times to open the valve, as and for the purpose specified.
6. An elastic fluid turbine of the multi-stage type, in combination with a valve which controls the passage of motive fluid from one stage to another, a balancing piston for the valve whose effective actlon in opposing its opening is less than the effective action of the fluid on the valve itself, and a device which co-operates with the piston to prevent the valve from opening until the stage pressure exceeds a certain amount and assists in closing it when the pressure falls, as and for the purpose specified.
7. An elastic fluid turbine of the multi-stage type, in combination with a valve which controls the passage of motive fluid from one stage to another, a balancing piston for the valve that is exposed on opposite sides to a difference in fluid pressure, a balancing piston attached to the valve that is exposed on opposite sides to the same difference in fluid pressure, a spring opposing the opening of the valve and which assists in closing it, and a conduit which conneats the low pressure sides of the balancing piston and valve, as and for the purpose specifled.
8. A turbine in combination with a valve that controls the passage of motive fluid from one part to another, the said valve comprising a casing to recelve the valve, the latter having a double area, a balancing piston attached to the valve, the effective area of the valve being greater than that of the piston, a spring co-operating with the piston to resist the action of motive fluid on the valve, and means for connecting the low pressure sides of the valve and piston with the pressure of that part of the turbine into which the fluid passing through the valve discharges, as and for the purpose specified.
9. A turbine in combination with a valve and its casing. a balancing piston in line with the valve, a stem condecting the valve and piston, a spring assisting to seat the valve, a stop for limiting the opening of the valve, an indicator to show the position of the valve within its casing, and a conduit for equalizing the pressure on opposite sides of the piston and valve, as and for the purpose specifled.

No. 101,310. Governor for Turbines.
Gouverneur de turbines.

The Canadian General Electric Company, Toronto, Ontario. Canada, assignee of John G. Callan, Lynn, Massachusetts. U.S.A., 2nd October, 1906; 6 years. Filed 31st August. 1906. Receipt No. 139,132.

Claim.-1. In a governing mechanism the combination of a regulator, a governor controlling it, and a device co-operating
with and assisting the governor in its action on the regulator, as and for the purpose specified.
2. In a governing mechanism the combination of a regu. lator, a motor for moving it, a governor for controlling the movements of the motor, and a device co-operating with the governar to reduce the load thereon as it controls the motor, as and for the purpose specified.
3. In a governing mechanism the combination of a regulator, a motor for moving it, means for controlling the motor, a governor for varying the position of said means as the load requirements change, and a device co-operating with and reducing the load on the governor, as it acts on said means, as and for the purpose specined.
4. In a governing mechanism the combination of a regulator, a hydraulic motor for moving it, a pilot valve controlling the motor, a governor regulating the movement \(s\) of the pilot valve, and a device co-operating with the governor to move the pilot valve, as and for the purpose specified.
5. In a governing mechanism the combination of a regulator, a motor for moving it, a speed governor controlling the motor, and a device responding to unbalanced pressures for assisting the governor, as and for the purpose specified.
6. In a governing mechanism the combination of a regulator, a hydraulic motor for moving it. comprising a piston, cylinder and pilot valve, a governor acting on the pilot valve. and a device responding to unbalanced pressure for assisting the governor in its action on the pllot valve, as and for the purpose specifled.
7. In a governing mechanism the combination of a regulator, a hydraukc motor for moving it, a speed governor, a pilot valve located in the motor piston so that the latter will follow up the movements of the valve, and a device set Into operation by unbalanced pressures created by a movement of the pilot valve, which acts on the pllot valve in conJunction with the governor, as and for the purpose specified.
8. In a governing mechanism the combination of a regulator, a motor for moving it, comprising a moving and a stationary element, a speed governor for controlling the motor, a device for asissting the governor in its action on the motor, and a spring opposing the said device that is carried by the movable element of the motor, as and for the purpose specified.
9. In a governing mechanism the combination of a regulator, a piston and cylinder for moving it, a pllot valve for governing the motor, a governor for controlling the action of the pilot valve, a device responding to fluid pressure changes for assisting the governor in its action on the pllot valve, and a spring for opposing the movements of said device which engages the piston, as and for the purpose specified.
10. In a governing mechanism the combination of a regulator. a fluid actuating motor for moving it through which the fluid continuously flows, a valve for creating an unbalanced condition as to pressure on the movable element of the motor when it is desired to move the regulator, a means for moving the pilot valve, and a fluld actuated device which cooperates with the said means, as and for the purpose specifled.
11. In a governing mechanism the combination of a regulator, a hydraulic motor for actuating it, a pilot valve for controlling the motor, which is provided with heads, ports co-operating with the valve head, the relation of parts being such that one head closes its port before another to reduce the load on the actuator, and an actuator for moving the pilot valve, as and for the purpose specified.

\section*{No. 101,311. Horse Collar. Collier d cheval.}

Alfred U. Field and Sidney William Carman, assignee of one-fourth interest, both of Stockton, Callfornia, U.S.A., 2nd October, 1906; 6 years. Filed 28th August, 1906. Receipt No. 139,056 .
Claim.-1. A device of the character described comprising a bearing or draft portion adapted to conform to the shoulders of a horse and a curved portion outward therefrom and adapted to clear the neck of the horse, and a spring bar: secured to said draft portion and following the periphery of said curved portion, as set forth.
2. A horse collar comprising a draft portion adapted to conform to the shape of a horse's shoulders, a curved portion outward therefrom and adapted to extend beyond and clear the neck of the horse, tongues rearward from said draft portion and adapted to be fastened to the tugs of the harness, all as set forth.
3. In a horse collar a portion conforming to the shape of the shoulders of a horse, a curved portion outward therefrom and adapted to clear the neck of the horse, a spring steel bar rivetted to said draft portion and following the periphery of said curved portion, as set forth.
4. A device of the character described comprising a bearing or draft portion adapted to conform to the shoulders of

a horse and a curved portion outward therefrom so formed as to extend beyond and clear the neck of said horse, as set forth.
No. 101,312. Hose Conpler. Joint de boyaus.

Alexander W. Irvin and Richard John Hughes, assignee of a half interest, both of Altoona, Pennsylvania, U.S.A., 2nd October, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,149.
claim.-1. In a hose coupling, the combination with the train pipes and angle cocks, of metal connections therefor sc constructed as to permit free movement in every direction, substantially as described.
2. In a hose coupling, the combination with the train pipes, of couplings therefor, each provided with a ball and socket joint, and an elbow joint made wholly of metal, substantially as described.
3. The combination with the train pipe, an angle cock, a perforated ball and socket joint connected thereto, an elbow joint connected to said ball and socket joint, and a coupler joint connected to sald elbow joint, substantially as. described.
4. The combination with the train pipe and angle cock, of a perforated ball and socket joint connected to sald angle cock, a spring tending to force the members of said joint apart, an elbow joint, a coupler joint, and connections be, tween said elbow joint and said ball and socket and coupler joints respectively, substantially as described.
5. In a hose coupling, the combination with the train pipes, of couplings therefor each provided with a ball and socket jolnt conslsting of a ball member having one large perforation extending from the neck of sald member to the
center of the ball and one or more smaller perforation extending from and connecting with the larger perforation, two socket members adapted to enclose the ball of said ball member, one of said socket members containing perforations, one adapted to contain a spring, a spring adapted to press the ball member away from one of the socket members to form an alr passage from the smaller perforations in said ball member through the larger socket member and a washe: interposed between said ball member and said spring. substantially as described.
6. In a hose coupling, the combination with the train pipes of couplings therefor each provided with an elbow jeint consisting of a male member and a female member, adapted to fit one within the other, and having their abutting ends enlarged and bevelled, and said female member having screw threads formed upon its enlarged portion, a shoulder formed upon the female member, an internally threaded connecting member provided with an inwardly extending flange adapted to engage said shoulder on said female member and to screw upon said male member, said, male member when in engagement being slightly larger than said female member, and a packing ring disposed between the shoulder of said female member and said connecting member, substantially as described.

No. 101,313. Selective Telephone. Téléphone.

Noble S. McKinsey, Susanville, Callfornia, assignce of An-
ton R. Nelson, Philadelphia, Pennsylvania, U.S.A., 2nd October, 1906; 6 years. Filed 27 th August, 1906. Receipt No. 138,995.
Claim.-1. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, means for connecting at central the other wire of said line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said other wire, substantially as described.
2. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, means for connecting at central the other wire of said line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said other wire, means controlled by sald magnets for throwing out all other talking circults except that of the station so grounded, substantially as described.
3. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking clrcuit in the system, means for connecting at central the other wire of said line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said other wire, means, controlled by said magnets preventing grounding at any other station, substantially as described.
4. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, means for connecting at central the other wire of said line with the corresponding wire of any other party line of the system, selector magnets at each station bridging the wires of the party line, and means at each station for grounding said nther wire, means controlled step-by-step by successive energizations of magnets of the other line, for closing in succrasion the bell circults of said other lines. substantians as
5. In a selective telephone system, a party line, one wire of which grounds at central, a resistance therein at central greater than that of any talking circuit in the system, magnets at each station bridging said wire with the other wire of the line, means at each station for grounding said other wire, and means at central for connecting said other wire through an interrupter with the corresponding wire of any other party line and also for inserting in the first wire at central an interrupter whereby the magnets on either line can be intermittently energized by central, substantially as descrlbed.
6. In a selective telephone system, a party line of which onc wire grounds at central, a resistance therein at central greater than that of any taliking circuit in the system, magnets at each station bridging said wire with the other wire, means at each station for grounding said other wire, and means at central for inserting in said first wire an interrupter whereby the magnets can be intermittently cnergized, substantially as described.
7. In a selective telephone system, a party line of which one wire grounds at central, a resistance therein at central greater than that of any talking circuit in the system, magnets at each station bridging said wire with the other wire, means at each station for grounding said other wire, and means for inserting in said first wire an interrupter whereby the magnets can be intermittently energized, substantially as described.
8. In a selective telephone system, controlling mechanism comprising magnets and a rotating device advanced a short distance when a weak current passes through the magnets and a long distance in the same direction when a strong current passes therethrough, and means for throwing a resistance into the line through the magnets by taking down the receiver, substantially as described.
9. In a selective telephone system, controlling mechanism comprising magnets and a rotating device advanced a short distance in the same direction when a weak current passes through the magnets and a long distance when a strong current passes therethrough, and means operatable by the calling party for throwing a resistance into the line through the magnets, substantially as described.
10. In a selective telephone system, controlling mechanism comprising a rotating device, clock work mechanism for rotating the same, stops for the same arresting the device. the one after a long movement thereof and the other after a short movement, a magnet, means whereby the first stop is brought into action by a strong current through said magnet, and the second stop by a weak current therethrough, and means operated by taking down the receiver for throwing a resistance into circuit with the coil through the magnet, substantially as described.
11. In a selective telephone system, controlling mechanism comprising a rotating device, clock work mechanism for rotating the same, stops for the same arresting the device, the one after a long movement thereof and the other after a short movement, a magnet, means whereby the first stop is brought into action by strong current through said magnet, and the second stop by a weak current thersthrough. and means operatable by the calling party for throwing a resistance into circuit with the coll through the magnet, substantially as described.
12. In a selective telephone system, controlling mechanism comprising a rotating device, clockwork mechanism for rotating the same, arresting means therefor, a magnet for operating the latter, means for interrupting the currents through the magnet repeatedly in succession with a weak current, a circuit closed after a predetermined number of such interruptions, and means whereby a strong current through the magnet removes the arresting means to break said circuit, and arrests the rotating device in a subsequent position thereof, substantially as described.
13. In a selective telephone system, party lines, one wire of each of which is grounded at central, a resistance therein at central greater than that of any talking circuit in the system and the other wire of any line can be connected at central with the corresponding wire of any other line, means for grounding said other wire at any station of the line, and means whereby central can connect the two wires at any station on any line, to form a complete talking circuit. substantially as described.
14. In a selective telephone system, a step-by-step rotating device, clock work mechanism for rotating the same, a magnet controlling the same by interrupted weak currents therethrough. means for simultaneously closing the circuit through said magnet and throwing a resistance intr said circuit to weaken the current to be subsequently so Interrupted, means for shutting the resistance to pass a strong current through the magnet, means whereby said strong current returns the rotating device to its initial position, and means for holding the line closed upon operating said shunting means until sald rotating device has turned to its initial position, substantially as described.
15. In a selective telephone system, a line controller at each station, means for closing the circuit by said line controller, means whereby the rise of the automatic hoos operates the line controller to close the circult, means for supporting the line controller in a position to be so operthe closing of the circuit influences all the supporting means the closing of the circuit influences all the supporting means on the lime to withdraw the controllers except the one alrady operated out of position to be so operated by the rise in the corresponding automatic hook, substantially as described.
16. In a selective telephone system, a line controller at each station, means for closing the circuit by said line controller, means whereby the rise of the automatic hook operates the line controller to close the circuit, means for supporting the line controller in a position to be so operated by the rise of the automatic hook, and means whereby the closing of the circuit influences all the supporting means on the line to withdraw the controllers except the one already operated out of position to be so operated by the rise in the corresponding automatic hook, and a busy signal brought into signalling position by suah actuation of the supporting means, substantially as described.

\section*{No. 101,314. Photographing Maohino. Machine photographique.}

Joseph Frederick Roders, New York City, New York, U.S.A., 2nd October, 1906; 6 years. Filed 27th February, 1904. Receipt No. 112,955.
Claim.-1. In a machine of the character described a magazine, plates angularly aranged therein relatively to each other, and means for effecting the edgewise discharge of the first plate by engaging the second and disengaging the first, and so forth.
2. In a machine of the character described, a magazine, plates arranged therein angularly to each other, means for holding the forward plate, and means for rotating the magazine to cause the disengagement of the holding means from the forward plate and the engagement of sald means with the immediately succeeding plate.
3. In a machine of the character described, a magazine, plates arranged therein angularly to each other, stops against which the first plate abuts, and means for effecting the relative movement between the plates and the stops, whereby said stops successively engage the second and disengage the first of said plates.
4. In a machine of the character described, a magazine, plates aranged therein in such manner that each plate is at right angles to its next plate, means for turning the magazine, stops against which the horizontally disposed first plate abuts, and means for transferring the stops from the first to the second plate as the first plate approaches vertical position and the second plate horizontal position.
5. In a magazine of the character described, a magazine, and means for turning the said magazine to discharge a plate therefrom by the intersection of a coin.
6. In a machine of the character described, a magazine, a skutter, an operating spring therefor, and means for simultaneously effecting a partial rotation of the magazine and a rewind of the shutter spring.
7. In a machine of the character described, means for successively delivering plates to exposure position and successively exposing and delivering said plates to developing position, and means for simultaneously developing a plurality of plates and transferring them to the fixing bath in order of immersion in the developer.
8. In a machine of the character described, a developing bath having a plurality of compartments one of which is always in register with the exposure position when the bath is at rest, and means for effecting the intermittent rotation of said bath.
9. In a machine of the character described, plate treating baths arranged concentrically one within the other, and neans for transferring a plate from one bath to the other.
10. In a machine of the character described, a ring provided with three concentric channels, containing respectively developing, fixing and washing fluids, and means for transferring a plate from one channel to the other and finally discharging the plate from the machine.
11. In a machine of the character described, a ring provided with troughs or channels, concentrically arranged, and a transferring device, means for bringing a plate supported in one of sald troughs or channels to rest underneath the transferring device and means for effecting the operation of the transferring device to grip the plate, withdraw it from the first trough or channel, deposit it in the second trough or channel and subsequently move it to the first position.
12. In a machine of the character described, a ring, a transferring device operating while the ring is at rest to (1) move downward and engage a plate, (2) lift the plate clear of the ring, (3) move along a radius of the ring carrying the plate to position over the next trough or channel in said ring, (4) discharge the plate, and (5) move down and radially back to the first position.
13. A photographic machine comprising a magazine havIng means whereby each plate therein may be held at an angle to the next, means for detaining the foremost plate, and mechanism for effecting relative movement between said magazine and said detaining means, to disengage said detaining means from the foremost plate and engage said detaining means with the succeeding plate.
14. A photographic machine comprising a rotatable magazine having means whereby each plate therein may be held at an angle to the next, means for detaining the foremost plate, and mechanism for rotating the magazine, sald magazine and said retaining means beling so related that upon rotation of the magazine sald detaining means become disengaged from the foremost plate and engaged with the succeeding plate.
15. A photographic machine comprising a magazine having means whereby oblong plates may be held therein each crosswise of the next, detents for engaging the four corners of the foremost plate, and mechanism for effecting such relative movement between said magazine and said detents that the latter release the foremost plate and engage the four corners of the succeeding plate.
16. In combination a rotatable magazine having means for holding a pack of oblong plates each disposed crosswise of the next and means rendered effective through the rotation of the magazine for discharging the foremost plate in edgewise direction.
17. In combination a rotatable magazine formed for holding a pack of oblong plates standing on edge and each disposed crosswise of the next, a spring for advancing said plates. detents against which the corners of the foremost plate abut. said detents and magazine being so related that upon rotation of the magazine the foremost plate is released and the succeeding plate is engaged by the detents, and a guide through which a released plate may drop.
18. In combination a rotatable magazine formed for holdIng a pack of plates, means for effecting the rotation of the magazine, and means for enabling a rotary movement of the magazine to cause the foremost plate to be discharged in edgewise direction.
19. In combination a rotatable magazine formed for holding a pack of oblong plates each crosswise to the next, detents movably mounted upon one end of the magazine for engaging the four corners of the foremost plate, means for giving the magazine quarter revolutions, means for enabling the detents to release the foremost plate and engage the next during each auarter revolution of the magazine, and four guldes upon the magazine through which the released plates may drop, narrow end foremost.
20. In combination a rotatable magazine formed for holding a pack of oblong plates each crosswise to the next, and means for giving the magazine quarter revolutions and for discharging the foremost plate at each quarter revolution of the magazine.
21. The combination with a magazine for photographic plates, of a series of pivoted detents for engaging the foremost plate, gearing connecting said detents, and means for operating sald gearing.
22. A combination with a rotatable magazine for holding oblong photographic plates some crosswise to others, of four detents pivoted upon said magazine for engaging the foremost plate. four gears connected to the detents, and a fixed ceptral gear meshing with sald four gears.
23. The combination with a rotatable magazire formed for holding oblong photographic plates some crosswise to いhers. of means for giving said magazine quarter revolutions, four two-arm detents pivoted upon said magazine. pour gears one rigid with each detent, and a fixed central gear meshing with the said four gears.

\section*{No. 101,315. Method of Making Rubber Hose.} Méthode de faire des boyaux de raoutchoue.
William Henry Adams, Montreal. Quebec, Canada. 2nd October. 1906; 6 years. Filed 23rd July, 1906. Recelpt No. 138.059.

Claim.-1. The herein described method of making fire hose, which consists in partly ruring a wholly vulcanizable rubber tubc. Inserting the tube into a tube of fabric and causing it to adhere thereto. applying a coating of rubber to the outer surface of the tube of fabric, applying a proecting covering to the outer surface of the rubber to prevent overcuring. and fully curing the inner and outer rubber surfaces.
2. The herein described method of making fire hose, winich consists in partly curing a wholly vulcanizable rubber tube, inserting the tube into a tube of fabric, further curing the rubber tube and causing it to adhere to the woven tube, applying a coating of rubher to the outer surface of the tube of fabric. applying a protecting covering to the outer surface of the rubber to prevent over curing, and fully curing the inner end outer rubber surfaces.
3. The herein described method of making fire hose, which consists in partly curing a wholly vulcanizable rubber tube. Inserting the tube into a tube of fabric, closing the ends of the rubber tube and admitting live steam to the interior of the rubber tube, cooling the rubber tube, inserting a cold hollow mandrel into the rubber tube applying a coating of rubber to the outer surface of the tube of fabric, applying a removable protecting covering to the outer surface of the rubber to prevent over curing, and fully curing the inner and outer rubber surfaces.
4. The herein described method of making Are bose, which consists in partly curing a wholly vulcanizable rubber tube, inserting the tube into a tube of fabric, further curing the rubber tube and distending the same to adhere to the tube of fabric, passing a cooling medium through the inside of the rubber tube. Inserting a cold hollow mandrel inside of the tube of rubber, applying a protecting covering to the outer surface of the rubber coating to prevent over curing, and fully curing the inner and outer rubber surfaces.
5. The herein described method of making fire hose, which consists in partly curing a wholly vucanizable rubber tube, inserting the tube into a tube of fabric, maintaining the tube of rubber and fabric in a desired shape, appying an outer coating of rubber to the tube of fabric, applying a protecting covering of fabric to the outer surface of the rubber and fully curing the inner and outer rubber surfaces.
6. The herein described method of making fire hose, which consists in partly curing a wholly vulcanizable rubber tube. inserting the tube into a tube of fabric. maintaining the tubes of rubber and fabric in a desired shape, applying an outer coating of rubber to the tube of fabric, applying a covering of continuous wet fabric to the outer surface of the rubber to prevent over curing, and fully curing the inner and outer rubber surfaces.

\section*{No. 101,316. Belt or Canvas Tightener.}

Tendeur de courroies, etc.
George Edgar Clarke, Toronto. Ontario. Canada, 2nd October, 1906: 6 years. Filed 15th March, 1906. Recelpt No. 133,916.
Claim.-1. The combination with an apron, belt, canvas or conveyer. of means acting under the influence of a torsional force and circulating therewith so as to automatically take up the slack thercin or permit of the necessary expansion thereof.
2. The combination with a divided apron, belt, canvas or conveyer, of means acting under the influence of a torsional force and yieldingly connecting the ends together in such a manner as to automatically take up the slack therein or permitof the necrassary expansion thereof.
3. The combination with a divided apron, belt. canvas or conveyer, of adjustable means acting under the influence of a torsional force and yieldingly connecting the ends together in such a manner as to automatically take up the slack therein or permit of the necessary expansion thereor.
4. The combination with a divided apron, belt. canvas or conveyer. of a member to which one end of the same is connected, a sucond member, a spring acting under the influence of torsional force. controlling movement of said second member, and means for connectingisaid members together in such a manner as to permit of the slack in sald
apron, canvas, conveyer or belt being taken up or permit of the necessary expansion of same.

5. The combination with a divided apron, belt, canvas or conveyer, of a member to which one end of same is connected, a rotatave member, a spring acting under the infuence of torsional force controlling axial movement of said rotatable member, means for connecting said members together in such a manner as to permit of the adjusting movement of said first-mentioned member so as to decrease or increase the torsional force exerted by said spring upon said rotatable member.
6. The combination with an apron, belt, canvas, or conveyer, of means circulating therwith, and a spring acting under the influence of torsional force and controlling axial movement of said means, which, being 80 attached or connected to said canvas, belt, apron, or conveyer automatically takes up the slack therein or permits of the necessary expansion thereof.
7. The combination with a divided apron, belt, canvas or conveyer, of a member to which one end of same is connected, a spring controlled member to which the other end of same is yieldingly secured, and means for connecting sald members together in such a manner as to permit of the slack in said apron, canvas. conveyer, or belt, being taken up or permit of the necessary expansion of same through the movement of said spring controlled member.
8. The combination with a divided apron, belt, canvas, or conveyer, of a normally non-rotating roller to which one end of same is connected. a spindle loosely mounted within said roller, a spring controlled roller to which the other end of same is yieldingly secured, and means for connecting said rollers together in such a manner as to permit of the slack in said apron, canvas, conveycr or belt being taken up or permit of the necessary expansion of same through the movement of sald spring controlled roller.
9. The combination with a divided apron, belt, canvas or conveyer. of a normally non-rotating roller to which one end of same is connected, a spindle loosely mounted within said roller, a roller to which the other end of same is yieldingly secured, a spindle mounted within this roller, a spring within said roller having one end attached to said spindle and its other end attached to said roller, threaded rods connecting said spindles together at each end, nuts threaded on said rods, and means for locking said first-mentioned roller so as to prevent rotation of same. said second-mentioned roller belng free to turn on its spiral in order to permit of
the necessary expansion and contraction of said apron, canvas, conveyer or belt.
10. The combination with a divided apron, canvas, conveyer or belt and a normally non-rotating roller around which same is wound, of a spring controlled roller around which the other end of said apron, canvas, conveyer or belt is wound, and means for connecting or coupling said rollers together. so as to permit of the necessary movement of sald secondmentioned roller so as to provide for the necessary expansion and contraction of said apron, canvas, conveyer or belt.
11. The combination with a divided apron, canvas, conveyer or belt and a normally non-rotating roller around which same is wound, of a spring controlled roller around which the other end of said apron, canvas, conveyer or belt is wound. means for connecting or coupling said rollers together, so as to permit of the necessary movement of said secondmentioned roller 80 as to provide for the necessary expansion and contraction of said apron, canvas, conveyer or belt, and means for permitting of the movement of said firstmentioned roller so as to decrease or increase the action of said spring controlled roller.
12. The combination with a divided apron, belt, canvas or conveger, of a member to which one end of same is connected, a spring controlled member to whaich the other end of same is connected, means for connecting said members together in such a manner as to permit of the necessary expansion and contraction of said apron, canvas, conveyer or belt, and means for permitting of the adjusting movement of said first-mentioned member so as to decrease or increase the action of said spring controlled member.
No. 101,317. Incubator. Inoubatour.

Louls V. Gadbois, Aylmer, Quebec, Canada, 2nd October, 1906;
6 years. Filed 16th June, 1906. Receipt No. 136,993.
Claim.-1. In a heating device for incubators, a tank extending practically on the whole area of the egg chamber, a portion of sald tang projecting outside of the egg chamber, a heat flue in said extension, a regulator boiler closing the top of said flue, a heat regulator actuated by the steam generated in said boiler, and means conencted to said regulator to direct the heat on or off said regulator boller, an ege tray, a solid bottom to said egg tray, a belt on said bottom, means for moving said belt, an egg separating rods in said tray.
2. A temperature regulator for incubators, a water tank, a regulator boiler embodled in said tank, a flue directing the heat to said boiler, a flue directing the heat off from said boiler, a double damper mounted between said flues, a steam actuated piston in said regulator boller, and means connecting the piston and dampers to actuate the same by a predetermined pressure in said boiler, an egg tray, a solid bottom to said egg tray, a belt on said bottom, means for moving said belt, and egg eeparating rods in said tray.
3. In a heating device for incubators, a tank extending in and out of the egg chamber, a heat flue in said tank, a temperature regulator partly in said tank, and a sultable source of heat, an egg tray, a solid bottom to said egg tray, a belt and egg separating rods in said tray.

No. 101,318. System of Motor Control.
Systeme de controble de moteur.

Axel Magnuson, New York City, New York, U.S.A., 2nd October, 1906; 6 years. Filed 1st September, 1905. Receipt No. 128,130 .
Claim.-1. The combination with an electric motor, of controlling apparatus therefor, means for controlling singlephase current to operate said motor controlling apparatus, and an electric device for holding said motor controlling apparatus in a predetermined position.
2. The combination with a multiphase motor, of controlling apparatus therefor, means in a circuit connected across any two of the mains of said motor, for closing a single phase circult to said motor controlling apparatus, and electric holding means for said controlling apparatus.
3. The combination with an electric motor, of controlling apparatus therefor, holding means for said controlling apparatus, a source of single phase current, a source of direct current, and a single switch device for controlling the single phase current to operate said motor controlling apparatus and for controlling the direct current to operate said holding means.
4. The combination with an electric motor, of starting switches therefor, electro-responsive devices for closing said switches, electro- magnetic apparatus for holding sald switches in closed position, a source of single phase current a source of direct current and a single manual switch for controlling the single phase current to operate said electroresponsive devices and for controlling the direct current to operate said electro-magnetic holding apparatus.
5. The combination with an alternating current motor, of reversing switches therefor, single phase magnets for actuating said switches to closed position, direct current magnets for holding said switches in closed position, and means for controlling both the said single phase magnets and the said direct current magnets.
6. The combination with an alternating current motor, of two reversing switches therefor, an electro-responsive device for each of said switches to actuate the same to closed position, an electro-magnet connected to each switch to hold the same in closed position, and a manual switch for controlling single phase current to operate either of the electro-responsive devices and for controlling direct current to operate the corresponding holding electro-magnet.
7. In combination with a motor, a source of electrical supply, a resistance in series with the motor armature, and a generator connected to the motor and arranged to control said resistance in starting the motor.
8. In combination with a motor, a source of electrical supply, a resistance in series with the motor armature, and generator mechanically connected to the motor and arranged to control said resistance in starting and stopping the motor.
9. In combination with an alternating current motor, a source of electrical supply, a resistance electrically connected to the motor, and a generator connected to the motor and arranged to control the movement of the motor upon starting. by controlling the resistance.
10. In combination with a motor, an opposition element In circuit with the motor and a generator mechanically connected to the motor and arranged to control the movement of the motor in starting and stopping by controlling the opposition element.
11. In combination with an alternating current motor, a resistance electrically connected to the motor, and a generator connected to the motor and arranged to control the resistance in proportion to the speed of the motor on starting.
12. In combination with a motor, controlling circuits therefor, electro-magnetic switches in the controlling circuits, and means for generating a variable voltage in proportion to the speed of the motor, said voltage applied to said electro-magnetic switches in the controlling circuits which are arranged to be actuated by the variable voltage.
13. In oombination with a motor, an opposition element in circult with the motor, a generator so connected to the motor that it will generate a voltage in proportion to the speed of the motor, a plurality of electro-magnets in connection with the generator and arranged to control the opposition element.
14. The combination with an electric motor and a mechanism driven thereby, a generator mechanically connected to the driven mechanism, an electro-responsive device connected to said generator, and means electrically connected to the motor and operated by said electro-receptive device for controlling the acceleration of the motor upon starting.
15. In combination with an electric motor, \& mechanism driven thereby, an opposition element in the motor circuit, an electro-responsive device for controlling the opposition element, and a generator connected to the driven mechanism and arranged to actuate the electro-responsive device to cut the opposition element out of the motor circuit in a number of steps in proportion to the acceleration of the driven mechanism.
16. In combination with an electric motor, a starting device therefor, electric circuits to actuate the starting device, a source of electrical supply, and another source of electrical supply dependent upon the movement of the motor and arranged to co-operate with the first source of supply to hold the starting device during the rotation of the motor.
17. In combination with an electric motor, a starting device therefor, electric circuits to actuate the starting device, a source of electrical supply, and another source of electrical supply dependent upon the movement of the motor and proportional to its speed and arranged to co-operate with the first source of supply to hold the starting device during the rotation of the motor.
18. In combination with an electric motor, an electrically operated starting device therefor electric circuits to actuate the otarting device, a source of electrical supply, another source of electrical supply dependent upon the speed of the motor and proportional to lts speed and arranged to cooperate with the first source of supply to hold the starting device during the rotation of the motor, and a manually operated switch to control the circuits to the starting device.
19. A starting device for motors comprising an alternating current motor, a direct current generator connected to run with the motor, and means actuated by the current from the generator to control the starting and accelerating of the motor.
20. In combination with an alternating current motor, a source of alternating current supply. an opposition element in the motor curcuit. a series of electro-magnetic responsive devices for removing the opposition element from the motor circuit, and a source of direct current supply dependent upon the movement of the motor and proportional to its speed. arranged to actuate the electro-responsive devices one by one as the speed of the motor increases.
21. In combination with an alternating current motor, a source of alterating current supply, a starting device for the motor arranged to be actuated by the alternating currcnt, means dependent upon the movement of the motor for generatina a direct current, and a magnctic device operated by such direct current to hold the starting device firmly in closed position.
22. In combination with an alternating current motor, a source of alternating current supply, a starting device for the motor arranged \(f_{0}\) be actuated by the alterating cur-
rent, a direct current generator dependent upon the movement of the motor arranged to generate a voltage propor tional to the speed of the motor, a magnetic device connected to such direct current generator and arranged to hold the starting device firmly in closed position, an opposition element in the motor circuit. and a series of electro-responsive devices for removing the opposition element from the motor circuit. sald electro-responsive devices being connected to the direct current generator and arranged to be actuated one by one as the motor accelerates.
23. In combination with an alternating current motor, an electrically operated starting device therefor, and circuits for actuating the starting device comprising an alternating current circuit and direct current circuit.
24. In combination with an alternating current motor, a starting device therefor. alternating current and direot current circuits, said starting device being actuated by a single phase alternating current and positively held in operative position by a direct current.
25. In combination with an alternating current motor, a starting device therefor. said starting device being actuated by a single phase alternating current and positively held in onerative position by a direct current. alternating curren and direct current electrical circults for the starting device. and a manually operated switch for controlling the circuits.
26. In combination with an alternating current motor. a device for starting the motor in one direction and another device for starting the motor in the other direction, alternating current and direct current circuits, sald starting device being actuated by a single phase alternating current and positively held in operative position by a direct movement
27. In combination with an alternating current motor. a resistance. an electricallv operated reversing switch. circuits for the reversing switch for both alternatine and direct currents, a manually operated switch for controlling the circuits, electro-resnonsive devices for controlling the resist ance and a direct current generator connected to run with the motor arranged to supply the direct current circuits for the reversing switch and to automatically actuate the elec-tro-responsive devices.
28. In combination with an alternating current motor. a resistance. an electrically operated reversing switch. circults for the reversing switch for both alternatine and direct currents. a manually overated switch for controlling the circuits. electro-resnonsive devices for controlling the resist ance. and a direct current penprator connected to run with the motor arrancen to supply the dirent current circuits for the reversing switch and to automaticallv actuate the electrnnesnonsivo devices in proportion to the acceleration of the motor.
29. In combination with an alternating current mintor. a resistance an electrically nperated reversing switch. circults for the reversing switch for both alternating and direct currents, a manually oderated switch for controlling the circults. electro-responsive devices for cutting out the resistance step-bi-sten, and a direct current generator connected to run with the motor arranged to supnly the direct current circuits for the reversing switch and to automatic. ally actuate the electro-responsive device one at a time in pmortion th the acceleration of the motor.
30. In combination with a motor, means for reversing the difection of rotation of the motor. a generator connected to run with the motor. means for keeping the direction of the current generated by the generator the same if the direction of rotation of the motor is changed. and means actuated hy the current generated by the generator for controlling the motor.
31. In combination with a motor means for reversing the direction of rotation of the motor, a resistance for the motor circult, a generator connected to run with the motor, means for keeping the direction of the current generated by the generator the same if the direction of rotation of the motor is changed, and means actuated by the current generated by the generator for controlling the motor by cutting the resistance into and out of the motor circuit.
32. In combination with a motor, means for reversing the direction of rotation of the motor. a generator connected to run with the motor, means connected with the generator for keeping the direction of its generated current the same, said generator arranged to generate a voltage in proportion to the speed of the motor, and electro-responsive devices dependent upon the generated voltage for controlling the acceleration of the motor.
33. In combination with an alternating current motor, a starting device therefor and a direct current generator connected to run with the motor and arranged to control tho acceleration of the motor in starting the motor.
34. In combination with an ziternating current motor. a starting device therefor actuated by alternating current, and a direct current generator connected to run with the motor and arranged to control the accelcration of the motor.
35. In combination with an alternating current motor, means for starting the motor in one direction or the other, and a direct current generator connected to run with the motor and arranged to control the acceleration of the motor. 36. In combination with an alternating current motor. means for starting the motor in one direction or the other. sald means actuated by alternating current and a direct current generator connected to run with the motor and arranged to control the acceleration of the motor.
37. In combination with an alternating current motor, means for starting the motor in one direction or the other, said means actuated by an alternating current, a manually operated switch for controlling the starting device and a direct current generator connected to run with the motor and arranged to control the acceleration of the motor.
38. In combination with an alternating current motor, a starting device therefor, alternating current and direct current circuits, said starting device being actuated by an alternating current and positively held in operative position by a direct current.
39. In combination with an alternating current motor, a starting device therefor, said starting device being actuated by an alternating current and positively held in operative position by a direct current, alternating current and cirect current electrical circuits for the starting device, and a manually operated switch for controlling the circuits.
40. In combination with an alternating current motor, a device for starting the motor in one direction and another device for starting the motor in the other direotion, alternating current and direct current circuits, sald starting devices being actuated by an alternating current and positively held in operative position by a direct current.
41. In a starting device for alternating current motors, a source of supply, a starting mechanism, alternating current and direct current circuits, means connected with said source of supply arranged to actuate the starting mechanlsm to start the motor, and a direct current generator mechanically connected to the motor and arranged to control the acceleration of the motor step-by-step.
42. In a system of motor control, two sources of current supply, one being pulsating and connected to the motor, the cther being a direct current generated by the movement of the motor and variable from zero to a maximum it proportion to the speed of the motor and adapted to control the acceleration of the motor.
43. In a system of motor control two sources of current supply, one of which is not variable and is connected to the motor, the other of which is generated by the movement of the motor and is variable from zero to a maximum in proportion to the speed of the motor.
44. In a system of motor control two sources of current supply, one of which is not variable and is connected to the motor, the other of which comprises a generator connected to the motor and is variable from zero to a maximum in prowrtion to the speed of the motor.
45. In a system of motor control two sources of current supply, one being obtainable before the motor is started. and the other being dependent upon the movement of sald motor means operated by current from one of said sources for starting, reversing or stopping the motor, and means operated by current from the other source for effecting an acceleration of the motor.
46. In combination with an electric motor, an external source of current supply of practically constant value, a controlling device in series with the motor, and a generator mechanically connected to the motor and arranged to control the controlling device.
47. In combination with an electric motor, an external source of current supply of practically constant value, a starting switch for the motor, a controlling device for the motor, and a generator mechanically connected to the motor and arranged to control the controlling device.
48. In combination with an electric motor, an external scurce of current supply of practically constant value, an electrically actuated starting switch for the motor. a manually operated circuit closer for the starting switch, a controlling device for the motor and a generator mechanically connected to the motor and arranged to control the controlling device.

\section*{No. 101,319. Telephone Switchboard. Commutateur de téléphone.}

Ewing McLean, Greencastle, Indiana, U.S.A., 2nd October, 1906; 6 years. Flled 21st March, 1906. Recelpt No. 134,126.

Claim.-In a telephone switchboard, a shutter occupying a normal vertical position, sald shutter being hinged at its lower end and adapted to swing down on its hinge as a signal to the operator, said shhtter having an outwardly projected extension at its hinge end, a magnet having windings conneoted with the telephone line wires, an armature pivot-
ally supported upon sald magnet, an arm carried by said armature having a terminal hook to secure the shutter in

its normal vertical position, a connecting plug, a cord attached to an end of said plug, a weighted pulley supported on said cord, a pivoted rever having one arm contacting with the shutter extension and having the other arm forming a support for said plug when the latter is in its socket.

No. 101,320. Gas Generator. Générateur dgaz.

Jean Patoine, Quebec, Quebec, Canada, 2nd October, 1906 ; 6 years. Filed 11th May, 1906. Receipt No. 135,804.
Claim.-1.A gas generator comprising the combination of a tank having an inclined bottom merging into a \(T\) connecLion, a pipe leading from the \(T\) connection, a rockable pipe provided with an opening adapted to register with the vertical portion of the \(T\) connection and provided with a squared outer end, and means for automatically feeding carbide into the tank.
2. A gas generator comprising the combination of a tank provided with a horizontal partition having an opening therein, a float disposed in the tank, guideways for the fioat, angle irons secured to the float, a cylinder secured to the angle irons and adapted to work in said opening in the partition, a water seal carried by the float, a carbide chamber, a cylinder depending from the carbide chamber into the water seal, a closure for the carbide chamber, and means for operating the closure by the upward and downward movement of the float.
3. A gas generating apparatus comprising the combination of a tank, a float disposed in the tank, a water seal carried by the float, a cylinder disposed in the water seal, a carbide chamber carried by the clyinder and provided with downwardly extending sleeves, a link secured to the float, a cross bar pivoted to the link, an arm secured to the carbide chamber and pivoted to the cross bar, rods pivoted to the cross bar and disposed through the sleeves, a cross bar carried by said rods, and a funnel-shaped closure for the carbide chamber carried by the iast-named cross bar.
4. A gas generating apparatus comprising the comblnation of a tank, a float carried by the tank, a water seal carried by the float, a carbide chamber disposed above the water seal, a cylinder depending from the carbide chamber into the water seal, a closure for the carbide chamber adapted to be actuated by the upward and downward movement of the float, and links carried by one of the members of th water seal and provided with hooked ends adapted to engage a portion of the carbide chamber and lock the game.

No. 101,321. Machine for Cutting Tubular Bodiea. Machine pour tailler des corps tubulaires.

Thomas D. Miller, Woodstock, Maryland, assignee of Eugene J. Logan, Philadelphia, Pennsylvania, U.S.A., 2nd October, 1906; 6 years Filed 26th May, 1906. Recelpt No. 136,278.
Claim.-1. The combination with a clamp for tubular bodies, of a circular saw adjacent to an end of said clamp, means for constantly rotating said saw about its axis, and independent means for giving said saw an orbital movement about the axis of the clamp.
2. The combination with a clamp for tubular bodies, of a circular saw adjacent to and end of said clamp, means for constantly rotating said saw about its axis, and independent means for giving sald saw an orbital movement about the axis of the clamp intermittently.
3. The combination with a clamp for tubular bodies, of a pair of circular saws arranged adjacent to the ends of sald clamp, means for constantly rotating said saws about their axis, and independent means for giving said saws an orbital movement about the axis of the clamp.
4. The combination with a clamp for tubular bodies, of a pair of circular saws arranged adjacent to the ends of said clamp, means for constantly rotating said saws about their axis, and independent means for giving said saws an arbital movement about the axis of the clamp simultaneously.
5. The combination with a clamp for tubular bodies, of a pair of circular saws arranged adjacent to the ends of said clamp, means for constantly rotating said saws about their axis, and independent means for giving said saws an orbital movement about the axis of the holder simultancously and irtermittently.
6. The combination with a circular saw, and means for rotating the same about its axis, of a feeding device having one or more holders for tubular bodies thereon, means for moving said feeding devices intermittently to bring the bodles against the saw, and means for giving sald saw an orbital movement about the axis of each tubular body after it has been brought into engagement with the saw.
7 The combination of a saw carrier journalled in a suitable bearing and a saw arbour journalled in said carrier at one side of the axis of the carrier, a saw mounted upon sald arbour, a shaft extending axially through said saw carrier and geared to said arbour, means for rotating said shaft, and means for intermittently rotating said saw car rjer.
8. The combination of a saw carrier journalled in a suitable bearing and a saw arbour journalled in said carrier at one side of the axis of the carrier, a saw mounted upon said arbour, a shaft extending axially through said saw carrier and geared to said arbour, means for rotating said shaft, means for rotating said saw carrier, and means for locking the saw carrier against movement at the completion of each revolution of the carrier.
9. The combination of a saw carrier journalled in a suitable bearing and a saw arbour journalled in said carrier Et one side of the axis of the carrier, a saw mounted upon said arbour, a shaft extending axially through said saw carrier and geared to sald arbour, means for rotating said shaft, means for rotating sald saw carrier intermittently, comprising a constantly driven clutch member, a co-operating clutch member secured to the carrier, means for automatically connecting said clutch members, and means for automatically disengaging sald clutch members at the completion of each revolution of the carrier.
10. The combination of a saw carrier journalled in a sultable bearing and a saw arbour journalled in said carrier at one side of the axis of the carrier, a aaw mounted upon said
arbour, a shaft extending axially through sald saw carrier and geared to sald arbour, means for rotating said shaft. means for rotating sald saw carrier, intermittently, comprising a constantly driven clutch member, a co-operating clutch member secured to the carrler, means for automatscally connecting said clutch members, means for automatically disengaging said clutch members at the completion of each revolution of the carrier, and means for automatically locking the carrier against movement while the clutch members are disengaged.
11. In a machine for cutting tubular bodies the combination with a sultable bearing and a saw carrier comprising a sleeve journalled in said bearing, and having a head adapted to support a saw arbour at one end of the bearing and a clutch member fixed to sald sleeve at the opposite end of the bearing, of a constantly driven clutch member jourpalled upon said sleeve, means for automatically engaging and disengaging said clutch members, a shaft extending axially through said sleeve, means for constantly driving sald shaft, a saw arbour mounted in said head parallel with the shaft and having a saw thereon, and gearing connecting said shaft and arbour.
12. In a machine for cutting tubular bodies the combination with a suitable bearing and a saw carrier comprising a sleeve journalled in said bearing, and having a head at one end adapted to support a saw arbour and a clutch member secured to said sleeve at the opposite end of the bearing, of a gear forming a clutch member journalled upan said sleeve, a saw arbour journalled in said head, a shaft extending axially through said sleeve and geared to sald saw shaft, a countershaft, and gearing connecting said countershaft, with the shaft extending through the sleeve and with the gear journalled upon said sleeve.
13. In a machine for sawing tubular bodies the combination with a saw carrier comprising a sleeve journalled in a suitable bearing, of a clutch upon said sleeve at ane end of said bearing, a collar secured to sald sleeve at the opposite end of the bearing, a clutch lever and a locking lever pivoted adjacent to said bearing, said clutch lever being adapted to engage and operate the clutch and sald lock-t ing lever being adapted to form a locking engagement with the collar, a rod connected to the free ends of said levers, and a shaft having a cam thereon adapted to operate sald rod.
14 In a machine for sawing tubular bodies, a rotatable saw carrier, a saw carried thereby at one side of the axis of the carrier, means for rotating said saw, means for intermittently rotating said carrier, a feed wheel having one or more holders, each adapted to hold a tubular body with its end projecting in the plane of the saw, means for operating said feed wheel to bring the tubular body or bodies irto engagement with the saw, and means for holding said feed wheel stationary while the saw carrier is in motion.
15. In a machine for sawing tubular bodies, a rotatable saw carrier and means for rotating the same, a saw arbour journalled in said carrier at one side of the axis of the carrier, said arbour having a saw thereon, a feeding device having one or more holders thereon each adapted to hold a tubular body, means for constantly rotating said saw, means for holding said carrier stationery, means for moving said feeding device to bring a holder opposite the end of the saw carrier with the tubular body in engagement with the saw, means for automatically starting said carrier into uperation after the tubular body is in engagement with the saw, and means for automatically stopping the rotation of said carrier after it has made a complete revolution.
16. In a machine for sawing tubular bodies, a rotatable saw carrier, and means for rotating the same, a saw arbour fournalled in said carrier at one side of the axis of the carrier,said arbour having a saw thereon, a feeding device having a series of holders thereon each adapted to hold a tubular body, means for constantly rotating said saw, means for holding sald carrier stationary, means for moving said feeding device intermittently to bring the holders suocessively into position opposite the end of the saw carrier with the tubular body in engagement with the saw, means for automatically starting said carrier into operation each time a tubular body is brought into engagement with the saw, and means for automatically stopping the rotation of the carrier after it has made a complete revolution.
17. In a machine for sawing tubular bodies, a rotatable saw carrier, and means for rotating the same, a saw arbour journalled in said carrier at one side of the axis of the carrier, said arbour having a saw thereon, a feed wheel having one or more holders thercon each adapted to hold a tubuiar body, means for constantly rotating sald saw, means for holding said carrier stationary, means for moving said feed whel to bring a holder opposite the end of the saw carrier with the tubular body in engagement with the saw, means for automatically starting sald carrier into operation after the tubular body is in engagement with the saw, and means for automatically stopping the rotation of sald carrior after it has made a complete revolution.
18. In a machine for sawing tubular bodies a rotatable saw carrier, and means for rotating the same, a saw arbour journalled in said carrier at one side of the axis of the carlier, said arbour having a saw thereon, a feed wheel having a series of holders thereon each adapted to hold a tubular body, means for constantly rotating said saw, means for holding said carrier stationary, means for moving said feed wheel intermittently to bring the holders successively into fosition opposite the end of said carrier with the tubular body in engagement with the saw, means for automatically starting sald carrier into operation each time a tubular body is brought into engagement with the saw, and means for automatically stopping the rotation of the carrier after it has made a complete revolution.
19. In a machine for sawing tubular bodies, a saw, means for rotating the same upon its axis, a feed wheel having one or more holders thereon each adapted to hold a tubular body transversely to the plane of the saw, means for rotating said feed wheel to bring the tubular body into engagement with the saw, means for holding the feed wheel stationary wuile the tubular body is in engagement with the saw, and means for giving the saw an orbital movement about the axis of the tubular body when the feed wheel is at rest.
20. In a machine for sawing tubular bodies, a saw, means for rotating the same upon its axis, a feed wheel having a series of holders thereon each adapted to hold a tubular body transversely to the plane of the saw, means for rotating said feed wheel intermittently to bring the tubular body into engagement with the saw, means for holding the feed wheel stationary each time a tubular body is brought into engagement with the saw, and means for giving the saw an orbical movement each time the feed wheel is stopped.
21. In a machine for sawing tubular bodies, a pair of saws arranged in parallel planes, means for rotating said saws about their axis, a feed wheel having one or more holders thereon each adapted to hold a tubular body with lts end portions projecting beyond the holder into the planes of the saws, means for rotating said feed wheel to bring the tubular body or bodies into contact with the saws, means ior holding the feed wheel stationary while the tubular body is in engagement with the saws, and means for giving said saws a simultaneous orbital movement about the axis of the tubular body engaged by the saws while the feed wheel is at rest.
ze. In a machine for sawing tubular bodies, a saw, means for rotating the same upon its axis, a feeding device having a series of holders thereon, each adapted to hold a tubular body transversely to the plane of the saw, means for rotating said feed wheel intermittently to bring said tubutar bodies successively into engagement with the saw, means tor holding the teed wheel stationary white each tubular body is in engagement with the saw, and means for giving said saw an ordital movement while the reed wheel is stadionary.
23. In a machine for sawing tubular bodies, a saw, means lor operating the same to sever the tubular bodies, a feeding device having a series of holders thereon each adapted to hold a tubuiar body in the plane of the saw, means for intermittently operating said feeding device to bring successive holders opposite the saw, a cleaning device and means for moving said cleaning device into and out of the interior of each holder after it has passed the saw and while the reoding device is at rest.
24. In a machine for sawing tubular bodies, a pair of saws, means for operating the same to sever the tubular bodies, a feeding device having a series of holders thereon each adapted to hold a tubular body with its ends projecting beyond the end of the holder into the planes of the saws, means for intermittently operating said feeding device to bring successive holders opposite the saws, a cleaning device and means for moving said cleaning device into and out of the interior of each holder after it has passed the saws and while the foeding device is at rest.
25. In a machine for sawing tubular bodies, a pair of saws arranged in parallel planes, a feed wheel having a series of holders thereon each adapted to hold a tubular body with its end portions projecting transversely of the planes of the saws, means for intermittently moving said feed wheel to bring successive holders between the saws, a longitudinally movable shaft or spindle having a cleaning device thereon arranged in the rear of the saws, and means for giving said spindle a longitudinal reciprocating movement each time the feed wheel is stopped.
26. In a machine for sawing tubular bodies, a pair of saws and means for operating the same to cut said bodies transversely, a feed wheel having a series of holders thereon each holder having a hinged outer jaw and being adapted to hold a tubular body with its ends projecting into the planes of the saws, means for rotating said feed wheel intermittently, a curved guide extending around the upper and rear portions of the feed wheel and adapted to hold sald hinged jaws
closed while the tubular bodies are being cut-off, a cleaning device at the rear of the saws, means for moving said device into and out of the holders while the jaws are closed by said guide and the feed wheel is at rest.
27. In a machine for sawing tubular bodies the combination with a pair of saws arranged in parallel planes, means for constantly rotating said saws about their axes, and means for giving sald saws an intermittent orbital movement, of a feed having a series of holders thereon, mechanism for intermittently operating said feed wheel and means for automatically throwing sald feeding mechanism out of action after each movement of the feed wheel.
28. In a machine for sawing tubular bodies the combination with a pair of saws arranged in parallel planes, and means for constantly rotating said saws about their axes, of a feed wheel, means for intermittently operating said feed wheel, mechanism for giving said saws an intermittent orbital movement, and means for automatically throwing sald mechanism out of action after each movement of the feed wheel.
29. In a machine for cutting off the heads of sheet metal cans the combination with a pair of saws arranged in parचllel planes and means for constantly rotating said saws about their axes, of a clamp arranged to hold a can body with its end portions in engagement with the saws, and independent means for giving said saws and clamp a complete urbital movement relatively to one another during the engagement of the saws with the can body to cause the severance of the cans heads.
30. In a machine for sawing tubular bodies the combination with a saw, and means for constantly rotating sald saw about its axls, of a clamp arranged to hold a tubular body transversely to the plane of the saw and in engagement with the saw. and independent means for giving sald saw and clamp a complete orbital movement relatively to one another during the engagement of the saw with the tubular body to causo the severance of the tubular body.
31. In a machine for sawing tubular bodies the combination with a saw and means for constantly rotating said saw about its axis, of a feeding device having a clamp thereon adapted to hold a tubular body transversely to the plane of the saw, means for automatically moving said feeding device to bring said tubular body into engagement with the saw, means fo: automatically locking said feeding device in stationary position while the tubular body is engaged by the saw, and means for automatically moving said clamp and saw relatively to one another while the feeding device is stationary to cause the saw teeth to cut circumferentially around the tubular rody from the interior of the tubular body outwardly.
32. In a machine for cutting off the heads of sheet metal cans the combination with a pair of circular saws arrange.i in parallel planes, and means for rotating said saws about their axis, of a feeding device having a holder thereon, said holder being arranged in a plane between the saws and adapted to hold a can body with its end portions projecting into the planes of the saws, means for moving sald feeding device to bring the can body into engagement with the saws, means for locking said feeding device in stationary position while the can body is engaged by the saws, and means for moving s:aid holder and saws relatively to one another while the feeding device is statlonary to cause the teeth of the saws to cut circumferentially around the can body from the interior of the can outwardly.
33. In a machine for sawing tubular bodies, a circular saw and means for constantly rotating the same about its axis, a clamp adapted to hold a tubular body transversely to the plane of the saw, means for giving the saw and the clamp a relative feeding movement to cause the saw to make an initial cut through the walls of the tubular body at one side thereof, means for stopping this feeding movement after this initial cut has been made, and means for moving said saw and clamp relatively to one another after the feed movement has ceased to cause the saw teeth to cut circumferentially around the tubular body from the interior outwardly.
34. In a machine for cutting off the heads of sheet metal cans the combination with a pair of circular saws arranged in parallel planes and means for rotating said saws about their axes, of a holder arranged in a plane between said saws and adapted to hold a can body with its end portions projecting into the planes of the saws, means for giving the saws and holder a relative feeding movement to cause the saws to make initial cuts through the wall of the can body at one side thereof. means for stopping this feeding movement after the initial cuts have been made, and means for moving sald pair of saws and the holder relatively to one another after the feed movement has ceased to cause the teeth of both saws to cut circumferentially around the can body from the interior outwardly.
35. A machine to cut the heads and bottoms from can bodies having in combination a plurality of clamps to stationarily clamp can bodies between their ends, means for intermittently moving said clamps to bring them successively
to the operative position, and means to simultaneously make two cuts one at each end around the clamped can body in position, whereby both ends of the can will be severed and removed while the body remains held in the clamp.
36. In a machine of the class described the combination of a crank, a cutter shaft carried by said crank, means for revolving sald cutter shaft continuously, means for revolving said crank intermittently, and a can body clamp whose center is coincident with the axis of the cutter shaft.
37. In a machine of the class described the combination of a crank, a cutter shaft carried by said crank and provided with a pinion, a shaft at the axhs of sald crank and carrying a gear which meshes with the pinion on sald cutter shaft to revolve the latter, means for revolving sald gears and cutter shaft continuously, means for revolving said crank intermittently and thereby move the revolving cutter shaft in a circular path, and a can body clamp whose center is coincident with the axis of the cutter shaft.
38. In a machine of the class described the combination of a stationary table, a bearing supported above said table, a revoluble sleeve extending through said bearing and carrying a crank, means for revolving said sleeve, a cutter shaft carrled by said crank, a shaft extending through said sleeve, means for transmitting motion from said latter shaft to the cutter shaft, and a can body clamp whose center is coincident with the axis of the cutter shaft.
39. In a machine of the class described the combination of a crank, a cutter shalt carried by said crank, means for revolving said cutter shaft, means for revolving said crank intermittently whereby to move the cutter shaft in a circular path. a plurality of can body clamps and means for successively moving said clamps into operative position with respect to said cutter shaft.
40. In a machine of the class described the combination of a crank, a cutter shaft carried by sald crank, means for revolving said crank to move the cutter shaft in a circular path, a revoluble head carrying a plurality of can body clamps, and means for intermittently revolving said head to successively bring the clamps into position opposite the crank axis and hold them at rest while the cutter shaft is moved in a circular path.
41. In a machine for cutting can bodies the combination of two cranks confronting each other but spaced apart. a rotary cutter carried by each crank, a plurality of movable clamps each adapted to clamp a can body between its ends, means for successively miving the sald clamps to a position in the space between the said two cranks with their centers coinicdent with the axis of the cutter shaft, and means for intermittently revolving both cranks to cause the cutters to sever and remove the head and bottom while the body remains held in the clamp.

\section*{No. 101,322. Extraction of Nickel and Cobalt. Extraction de nickel et cobalt.}

The Metals Extraction Corporation, assignee of Ralph Waldo Emerson MacIvor, all of London, England. 2nd October. 1906 ; 6 years. Filed 11th June, 1906. Receipt No. 136,769 .
Claim.-1. The treatment of recovering nickle and cobalt form ores of oxidized mattes consistlng in finely grinding the same and digesting them with or without pressure in a solution of chloride of magnesium at a suitable temperature, drawing off the resulting solutions of cobalt and nickel chlorldes as formed and treating the same by known means for the recovery of the metal contents, substantially as described.
2. The manner of separaling cobalt from nickel by digesting the finely ground nickel cobalt ores or roasted mattes in a solution of chloride of magnesium at a suitable temperature in such manner that the cobalt is first dissolved and separated as a solution of cobaltous chloride from the ore, the digesting being then continued for the similar removal of the nickel, substantially as described.
3. In the treatment of cobalt and nickel ores or roasted mattes forming the same into a paste with chloride of magnesium, and after drying heating the mass to a temperature of about 300 degrees centigrade and subsequently wasting out the clorlde of cobalt and nickel.

\section*{Nn. 101,323. Production of Nickel and Cobalt. Production de nickel et cobalt.}

The Metals Extraction Corporation, assignee of Ralph Waldo Emerson Marivor, all of London, England, 2nd October, 1906; 6 years. Filed 16th June, 1906. Receipt No. \(134,4: 4\).
Claim.--In the production of mattes from sulphide nickel and cobalt ores, mixing with such ores an alkall or alkaline varth-paly-sulphile togrther with a small quantity of carbon. for the purpose and in the manner substantlally as d:scribed.

No. 101,324. Milking Maohino. Machine d traire.

D. H. Burrell and Company, assignee of Frederic A. Lane, both of Little Falls, New York, U.S.A. 2nd October, 1906: 6 years. Filed 16th February, 1906. Recelpt No. 132,965.
Claim.-1. In a milking machine the combination with teat cups and a milk pipe, of an interposed connecter comprising a body which is open at the bottom, a bottom remorably secured in the bottom opening of the body, a lateral attaching device for the milk pipe formed on said body above the bottom opening thereof, and individual attaching devices for said cups formed on the top of sald body, the interior of said attaching devices being directly accessible upon removing said bottom, substantially as described.
2. In a milking machine the combination of a milk pipe, teat cups and a connector interposed between sald pipe and said cups and provided with a restricted air inlet through which air is constantly admitted to the connector and the milk passages connected therewith, substantially as set forth.
3. In a milking machine the combination of a milk vessel, a pulsator on the same, a milk pipe connected with the pulsator, teat cups connected with the milk pipe, an air inlet which is placed periodically in communication with the milk pipe by the pulsator and an air inlet which admits air constantly to the milk plpe, substantially as set forth.
4. In a milking machine the combination of a milk vessel, a milk pipe connected therewith, teat cups connected with the milk pipe and air inlet devices adapted to admit air to both ends of the milk pipe, substantlally as set forth.
5. In a milking machine the combination of a milk vessel, a milk pipe connccted therewith, teat cups, a connector interposed between the cups and the pipe and provided with an air inlet which is constantly open, and a pulsator provided with an air inlet which is periodically placed in communication with the milk pipe, substantially as set forth.
6. A teat cup comprising a rigid tapering body shaped to recelve and support the teat and having at its large end an enlargement forming an internal annular cavity which extends outwardly and upwardly from the large end of the tapering body, and a flexible mouthpicce having an outer wall by which it is attached to said enlargement and an inner depending packing wall which is located in said cavity above the large end of the lapering body and capable of sidewise movement in said cavity, substantially as set forth.

\section*{No. 101,325. Electric Switch. Commutateur électrique.}
W. J. O'Leary and Company, assignee of William Coonan, all of Montreal, Quebec, Canada, 2nd October, 1906; 6 years. Filed 3rd August, 1904. Receipt No. 117,443.
Claim.-1. In an electric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon-, a pivotally supported locking member, and locking means carrled by said bed plate in position to engage the respective ends of said pivoted locking member, substantially as described.
2. In an clectric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon, a locking
member pivotally connected to sald frame and provided with catches at its respective ends, and locking means carried

by the bed plate in position to engage said catches, substantially as described.
3. In an electric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon, a locking member pirotally secured to said frame and provided with catches at its respective ends, a fixed member carried by the frame in position to engage one of said catches and a movable member carried by said frame in position to engage the other of sald catches, substantially as described.
4. In an electric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon, a locking member pivotally secured to said frame and provided with catches at its respective ends, a fixed member adjustably carried by the frame in position to engage one of said catches, and a movable member carried by said frame in position to engage the other of said catches, substantially as described.
5. In an electric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon, a locking member pivotally connected to said frame and provided with catches at its respective ends, an adjustable means carried by said irame in position to engage one of said catches, an armature plate carried by said bed plate for engagement with the other of sald catches, and a magnet for actuating said armature plate, substantially as described.
6. In an electric switch the combination of a bed plate, a gravity actuated frame pivotally mounted thereon, a locking member pivotally connected to said frame; a gravity actuated armature plate arranged to lockingly engage said pivoted locking member, a magent for actuating said armature plate, a stop arranged to limit the movement of said armature plate and provided with means for limiting the swing of said pivoted locking member, substantially as described.
7. In an electric switch the combination of a bed plate, circuit terminals electrically insulated on said bed plate, a gravity actuated frame pivotally mounted on the bed. plate, electric conducting members carried by sald pivoted frame and adapted to complete the circuit between said circuit terminals, a locking member pivotally connected to said frame, and locking means carried by the bed plate in position to engage the respective ends of said pivoted locking member, substantially as described.
8. In an electric switch the combination of a bed plate, circuit terminals electrically insulated on said bed plate, a gravity actuated irame plvotally mounted on the bed plate. electric conducting members resiliently supported on said pivoted frame and adapted to complete the circult between said circuit terminals, a locking member pivotally connected to sald frame, and locking means carried by the bed plate in position to engage the respective ends of said pivoted locking member; substantially as described.
9. In an electric switch the combination of a bed plate, circuit terminals electrically insulated on said bed plate, a gravity actuated frame pivotally mounted on the bed plate. flexible contacts carried by said pivoted frame, and adapted to complete the circuit between said circuit terminals, a locking member plvotally connected to said frame, and locking means carried by the bed plate in position to engage the respective ends of said pivoted locking member, substantially as described.

No. 101,326. Feed Mechanism for Magazinos. Mécanisme d'alimentation pour magasins de fusils.

Charles Owens and Dwight P. Montague, assignee of a hal interest, both of Chattanooga, Tennessee, U.S.A., 2nd October, 1906 ; 6 years. Filed 13th July, 1906. Receipt No. 137,787
Claim.-1. In combination in a machine of the class described, a feed drum, a hopper or support for the magazine or other articles whereby the forward portions of the said magazine are supported upon the said feed drum, means carried by the feed drum for engaging the magazines, and controlling means between which and the feed drum the maga zines must pass, substantially as described.
2. In combination a feed drum arranged to support the forward portion of the magazines, means carried by the feed drum for engaging the magazines, controlling means engag ing the pile of magazines and arranged opposite the feed drum with a space between for the passage of the magazines, said controlling means consisting of a wheel having teeth or projections thereon and adjustable releaser means to cover more or less of sald teeth or projections and shield them from the plle of magazines, substantially as des-l cribed.
3. In combination a feed drum having means to engage the magazines, a controlling ratchet arranged opposite the feed drum, means for rotating the ratchet step-by-step, and releaser means to shield more or less of the ratchet teeth in respect to the pile of magazines, substantially as described.
4. In comblnation the feed drum, carrying means to engage the magazine, a ratchet wheel arranged opposite the drum with a space between for the passage of the magazines, said ratchet wheel having its teeth adapted to obstruct the for ward movement of the magazines, means engaging the said ratchet teeth for operating the ratchet, and releaser means to cover more or less of the ratchet teeth in respect to the pile of magazines, substantially as described.
5. In combination the feed drum, carying means to engage the magazine, a ratchet wheel arranged opposite the drum with a space between for the passage of the magazines, said ratchet wheel having its teeth adapted to obstruct the for ward movement of the magazines, means engaging the said ratchet teeth for operating the ratchet, and releaser means to cover more or less of the ratchet teeth in respect to the pile of magazines, said releaser means being adjustable about the axis of the ratchet, substantially as described.
6. In combination a feed drum, an adjustable support for the rear portion of the pile of magazines, a ratchet wheel arranged opposite the feed drum and between which the feed drum the magazines pass, means for operating the ratchet and a releaser adapted to shield more or less of the ratchet teeth in respect to the pile of magazines, substantially as described.
7. In combination a feed drum adapted to receive the magazines thereon, means carrled by the feed drum to engage the magazines to feed them forward, and feed controlling means arranged opposite the feed drum with a space therebetween for the passage of the magazines, said controlling means being adapted to provide a contracting space to make the plle of magazines at the feeding point assume a pyramid-like formation with the magazines in advance of the one next above, substantially as described.
8. In combination with the feed drum, a rotary device opposite the peripheral surface of the feed drum for controlling the feed of the magazines and a releaser associated with sald rotary device and an adjustable stop carried thereby, substantially as described
9. In combination with the feed drum, a toothed wheel opposite the peripheral surface of the drum, a releaser, and means for adjusting the size of the space between sald releaser and the surface of the feed drum, substantially as described.

No. 101,327. Flectric Furnace. Fournaise ćlectriquc.

La Societe Electro-Metallurgique Français, Forges, assignee of Paul Toussaint Heroult, La Praz, France, 2nd October, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,708.
Claim.-1. An electric furnace having an electrode, a protecting jacket therefor and means for cooling said jacket.
2. An electric furnace having an electrode, an outer protecting jacket therefor and an inner cooling jacket between the electrode and the outer jacket.
3. An electric furnace having an electrode and a protecting jacket therefor having passages for a cooling fluid therethrough.
4. An electric furnace having an electrode, an outer jacket of heat insulating material and an inner jacket of heat conducting material between the electrode and the outer jacket, and having passages for a cooling fluid therethrough.
5. An electric furnace having an electrode. an outer jacket \(M\) of heat insulating material surrounding the same, and an inner jacket \(N\) of heat conducting material, said inner jacket comprising plates \(P\) and \(Q\) with blocks between them forming passages \(R\) for the circulation of a cooling fluid.
6. An electric furnace having an electrode and a protecting jacket therefor adapted to extend down into the furnace, the electrode being adapted to be adjusted through said jacket.
7. An electric furnace having means for injecting air thereto comprising an annular space in the furnace wall open to the interior, and a ring surrounding and discharging into sald space.
8. An electric furnace having means for injecting air thereInto comprising an annular space in the furnace wall open to the interior and a ring surrounding and discharging into said space, the wall above said space overhanging the edge of the wall below the space.
9. The combination with an electrode for an electric furnace, of a protecting jacket adapted to extend into the furnace to protect the electrode, and a stuffing bor supporting said jacket, the electrode being adapted to be fed through the stuffing box and jacket.
10. The combination with an electrode for an electric furnace, of a stumng box \(W\) surrounding the electrode, said stuffing box belng provided with a gland \(d\) and graphite packling 0.

\section*{No. 101,328. Method of Producing Nitrogen Composition. \\ Méthode de production de composé d'azote.}

Oscar Frederick Carlson, Stockholm, Sweden, 2nd October, 1906 ; 6 years. Filed 18th July, 1906. Recelpt No. 137.935. Claim.-1. The herein described method of producing nitrogen compositions by heating carbides of alkaline earths in a current of nitrogen gas consisting in adding to the carblde before the heating, one or more fluorides of an alkall or an a!haline earth, substantially for the purpose set forth.
2. The herein described method of producing nitrogen compositions by heating carbides of alkaline earths in a curreni of nitrogen gas. consisting in adding to the carblde before the heating, one or more flourides of an alkali or an alkaline earth and a sulphate of an alkaline earth or an alkali, substantially for the purpose set forth.

No. 101,329. Electro-Chemical Process for Producing Nitrogen Compounds.
Procédé élcctro-chimique pour la production de composé d'azote.

John Wilfrid Wood, Moulton, Iowa, U.S.A., 2nd October, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,175.
Claim.-1. An electro-chemical process for making nitrogen compounds which consists in continuously charging a liquid electrolyte with air under pressure to furnish it with an excess of nitrogen, and subjecting the liquid to the action of an electrlc current to dissociate the liquid and removing the nitrogen and other compounds thus formed.
2. An electro-chemical process for making nitrogen compounds which consists in preparing an aqueous solution of nitrogen, continuously charging the solution with air under pressure and subjecting the solution to the action of an electric current to dissociate the solution and removing the nitrogen and other compounds thus formed.
3. An electro-chemical process for making nitrogen comrounds which consists in causing a liquid electrolyte to continuously absorb gaseous nitrogen, scnding an electro current through the electrolyte at ordinary temperature for the purpose of dissociating the liquid and liberating the products of electrolysis, and firmly carrying off the nitrogenous compounds.
4. An electro-chemical process for making nitrogen compounds which consists in continuously charging water with air under pressure, to provide it with an excess of nitrogen sending an electric current through the water to dissociate the water and to liberate the nitrogen and other products. and finally carrying off at the anode and cathode respectively the nitrogen and other compounds formed.

No. 101,330. Telegraphic Alphabet.
Alphabet télégraphique.

Isidor Kitsee, Philadelphia, Pennsylvanla, U.S.A., 2nd October, 1906: 12 years. Filed 17th May, 1:06. Receipt No. 136,023.
Claim.-1. In a telegraphic alphabet, one symbol conslsting of two curves opposite as to each other, and the second symbol consisting of two curves opposite as to each other, a zero line between said curves.
2. A telegraphic alphabet comprising two symbols, one consisting of two marks opposite as to each other, the
second symbol consisting of two marks opposite as to each other, and a third mark between said two marks.
3. A telegraphic code comprising a different grouping of two symbols, one symbol consisting of one mark at one side of the imaginary zero line followed by a second mark at the other side of said zero line, and the second symbol consisting of one mark on one side of the zero line, and one mark at the other side of the zero line.
4. A telegraphic Morse alphabet in which the dash is symbolized by two curves opposite as to each other and connected with each other by a straight line, and in which the dot is symbolized by two connected curves opposite each other.
5. A telegraphic alphabet comprising two characters, one character consisting of two elements, one above and one below an imaginary zero line and the second character consisting of three elements, one above, one at, and one below an imaginary zero line.

No. 101,331. Line Clamp. F'rein pour cables.

John E. Baechler, Sarnia, Ontario, Canada, 2nd October, 1906; 6 years. Filed 29th May, 1905. Receipt No. 125,582.

Claim.-1. In a line clamp, the combination with a brass plate formed with apertures, of a boss extending transversely across the plate near one end and provided with a hole extending longltudinally through the same, said boss being cut away at the center to form a bearing at each side. a clamping lever consisting of a short arm and a long arm provided at their junction with an apertured ear on one side adjacent to the plate and curved outwardly toward each end away from the plate and extending through the ear on the lever, a transverse portion formed integral with each end of sald lever, arms integral with the ends of said transverse portions and extending at right angles thereto. a serrated transverse rib on the long end of the base plate, the transverse portion of the short arm of said lever being adapted to co-operate with said rib, and a lug at each end of said rib.

No. 101,332. Overshoe Fastener. Attache de galoches.
Watson O. Brockway, Chicago, Illinois, U.S.A., 2nd October 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,247.

Claim.-1. The herein described clamp having means to attach it to a shoe and comprising the stationary jaw member 4 having the offset portion at its center, the swinging jaw member having its inner end pivotally connected to the offset portion of the stationary jaw member, and the spring plate 10 plvotally connected to the upper end of the stalionary jaw member for lateral movement to enable the iree
end of the spring plate to bear on the free end of the swinging jaw member, to press the latter toward the stationary

Jaw member, or to be disengaged from the sald swinging. jaw member.
2. The herein described clamp comprising a socket member for attachment to a shoe, a resillent head for engagement with the socket member, a pivot projecting outwardly from said head. the stationary jaw member secured on the plot and having the offset portion at its center, the swinging jaiw member having its inver end pivotally connected to the offset portion of the stationary jaw member, and the spring plate mounted in the pivot for lateral movement with refrrence to the stationary jaw member to engage and disengage the swinging jaw member.

No. 101,333. Holder for Cartridges. Portc cartouches.

John Joyce Burnett and Charles Bubear, both of Wellington, Somerset, England, 2nd October. 1906; 6 years. Filed 14th July 1906. Recelpt No. 137,815.
Claim.-1. The combination of a conical spring holder formed of spring metal, bent into a circle with bands of metal near the top and bottom riveted thereto on each side of the joint, and having means for attachment to a band, belt or clothing, substantially as described.
2. As a new article of manufacture a holder for cartridges or spring metal slightly larger than the diameter of the head of the cartridge and having a series of tongues projecting from it in a stralght line without a bead but slightly bent inward so as to form a narrower circle than the cartridge, whereby the cartridge bead rests on the top of the tongue, but can be forcibly withdrawn from the tongues.
3. The combination of a cyllndrical portion at top having spring clips \(B\) stamped out of it, and a series of tongues continuing therefrom in a substantially straight line, somewhat smaller but continually lessening in diameter whereby the cartridge rests on the tongues, and is prevented from being shaken out of the cartridge holder in an upward direction by the spring clips.
4. A spring metal holder for cartridges formed of sheet metal having a series of vertical slots D D and means for supporting the bead of the cartridge near the top of the tongues formed by the slots.
5. A cartridge holder formed of a spring metal body having spring tongues, resilient means for supporting the head o: the cartridge, and spring clips stamped out of the body, whereby the cartridge is prevented from being shaken out in an upward direction.
J. 101,334. Fone Bupporter. Support de bas.

Henry Baddeley Cooper, Columbus, Ohio, U.S.A., 2nd October, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137,708.
Olaim.-1. A hose supporter employing a flexible cord or tape for sustaining the hose attaching devices. a sliding member or guide comprising a casing closed in on all sides and open at one end for the reception of the cord or tapa, and having a rivet or pulley over which said cord passes, and having also means at the opposite end for attachment of the hose supporting devices, substantially as described.
2. A hose supporter employing a flexible cord for sustainIng the hose attaching devices, a sliding member or guide for sald cord comprising a metal loop and a single plece of sheet metal folded to engage said loop and to provide a chamber having boxed in sides with an open end, and \(a^{\prime}\) rivet in said chamber connecting the sides and over which the cord passes, substantially as described.
3. In a hose supporter the combination with a flexible cord and hose attaching devices, a slide or guide for connecting the hose attaching devices to the cord comprising a metal loop for carrying the hose attaching devices, and a single picce of sheet metal having an end wing embracing a bar of sald loop, and side wings turned over with their edges abutting. and a rivet connecting the side wings to the body and around which rivet the cord passes, substantially as described.
4. A sliding member or cord guide for hose supporters. comprising a metallic loop, and a single sheet metal blank having an end wing embracing one bar of the loop and side wings folded over parallel with the body of the blank and with their edges abutting centrally thereof. said body having a central opening and sald edges being notched to form a corresponding opening, and a rivet in said openings and connecting the opposite sides of the guide, substantially as described.

\section*{No. 101,335. Weight Actuated Apparatus.}

\section*{Appared actionne par une pesce.}

Fugene Fuller, Arctic, Warwick, Rhode Island. U.S.A., 2nd October, 1906; 6 years. Filed 21st June, 1906. Receipt No. 137,126.
Claim.-1. The combination of a device to be actuated, an actuating weight, means for raising the weight, means arranged when put in operation to interrupt the connection between the weight raising means and the weight and transfer the power of the welght to the device to be actuated and reestablish the connections between the weight raising means and the weight subsequent to the actuation of the device and means for putting said means in operation.
2. The combination of a device to be actuated, an actuating weight, means for raising the weight. electro-mechanical means arranged when put in operation to interrupt the connection between the weight raising means and the welght and transfer the power of the weight to the device to be actuated and re-establish the connection between the welght raising means and the weight subsequent to the actuation of the device, and means for putting said electro-mechanical means in operation.
3. The combination of a device to be actuated, an actuating weight, means for raising the weight, an electro-magnet designed to be arranged in an electric circuit, and means controlled by the said electro-magnet for interrupting the connection between the weight raising means and the weight and transferring the power of the weight to the device to be actuated and re-establishing the connection between the weight raising means and the weight subsequent to the actuation of the device.
4. The combination of a device to be actuated, an actuating weight, means for raising the weight, an electro-magnet de-
signed to be arranged in an electric current, and means controlled by the said electro-magnet for interrupting the con-

nection between the weight ralsing means and the welght and transferring the power of the weight to the device to be actuated and re-establishing the connection between the weight raising means and the welght subsequent to the actuation of the device, the said means comprising a finger movement of which in one direction is prevented by the device to be actuated when said device is in its normal position.
5. The combination of a device to be actuated, an actuating weight, means for raising the weight, a connection intermediate said weight raising means and the weight comprising a clutch, an electro-magnet, means controlled by the said electro-magnet for transferring the power of the weight to the device to be actuated, and a lever connected with the said means and having an arm for moving one member of the clutch and also having means disposed at one side of the device to be actuated whereby said device in its normal position is enabled to prevent re-establishment of the connection between the weight raising means and the weight.
6. The combination of a device to be actuated, an actuatIng weight, a drum, means whereby motion is transmitted from the drum to the device when the drum is rotated in one direction and the device is left idle when the drum is rotated in the opposite direction, a cable passed over a sheave and connecting the drum and the welght, means for raising the welght. and electro-mechanical mrans for interrupting the connection between the weight raising means and the weight and transferring the power of the weight to the device to be actuated and re-establishing the connection between the welaht ralsing means and the weight subsequent to the actuatlon of the device.
7. The combination of a device to be actuated, an actuating weight, a drum, means whereby motion is transmitted from the drum to the device when the drum is rotated in one direction and the device is left idle when the drum is rotated in the opposite direction, a cable passed over a sheave and connecting the drum and the welght, means for ralsing the wetght. a driving connection intermediate said means and the welght comprising a clutch, an electro-magnct. an armature complementary thereto, means connected with said armature for controlling the transmission of motion from the irum to the device to be actuated, and a lever connected with the latter means and arranged to open the clutch and having a finger arranged to be held against movement in one dircction hy the actuating device when sald device is in its normal position.
8. The combination of a device to be actuated. an actuating weight, a connection between the weight and the device, an clectro-motor, a connection betwenn said motor and the welght for raising the latter by the former, a source of clectric energy arranged in circuit with the motor, a switch als, arranged in circuit with the motor and the source of electric
energy, means on the weight and the switch for closing the switch when the weight moves downwardly and opening the switch when the weight moves upwardly, and means for interrupting the connection between the weight raising means and the weight and transferring the power of the weight to the device to be actuated and re-establishing the connection between the weight raising means and the weight subsequent to the actuation of the device, the said means comprising a finger, movement of which in one direction is prevented by the device to be actuated when the latter is in its retracted position.
9. The combination of a device to be actuated, an actualing weight, connection between the welght and the device, an electro-motor, a connection between said motor and the weight for raising the latter by the former, a source of electric energy arranged in circuit with the motor, a switch also arranged in circuit with the motor and the source of electric energy, means on the weight and the switch for closing the switch when the weight moves downwardly and opening the switch when the weight moves upwardly, an auxiliary circuit including a source of electric energy and a signal, and means whereby the auxiliary circuit is completed when the welght moves downwardly subsequent to completing the firstmentioned circult.
10. The combination of a device to be actuated, an actuating weight, means for ralsing the weight, and means for interrupting the connection between the weight raising means and the weight and transferring the power of the weight to the device to be actuated and re-establishing the connection between the weight raising means and the weight subsequent to the actuation of the device, the said means comprising a finger movement of which in one direction is prevented by the device to be actuated when the latter is in its normal positlon.
11. The combination of a device to be actuated, an actuating weight, means for raising the welght, a connection intermediate said weight raising means and the welght comprising a clutch, means for transferring the power of the weight to the device to be actuated, and a lever connected with the said means and having an arm for opening the sald clutch and also having a finger disposed at one side of the device to be actuated whereby the latter is enabled in its retracted position to prevent re-establishment of the connection between the weight raising means and the welght.
12. The combination of a device to be actuated, an actuating weight, a drum, means whereby motion is transmitted from the drum to the device when the drum is rotated in one direction and the device is left Idle when the drum is rotated in the opposite direction, a cable connected with the drum and the weight. means for raising the weight, means arranged when put in operation to interrupt the connection between the weight raising means and the weight and transfer the power of the weight to the device to be actuated and reestablish the connection between the weight raising means and the weight subsequent to the actuation of the device, and means for putting said means in operation.

\section*{No. 101,336. Manufacture of Carbide. Fabrication de carbure.}

Herman Lewis Hartenstein, Constantine, Michigan, U.S.A. 2nd October, 1906 ; 6 years. Filed 19th May, 1906. Receipt No. 136,078.
Claim.-1. In the manufacture of carbide from limestone and carbonaceous material, the herein described process which conslsts in calcining the limestone to produce lime before the carbonaceous material is added, then mixing with such resultant lime before it cools to atmospheric temperature, the proportion of carbonaceous material and finally while the mixture is still heated above atmospheric temperature subjecting it to a fusing degrea of heat, excluded from oxygen.
2. In the manufacture of carbide from limestone and carbonaceous material, the herein described process which consists in calcining pulverized limestone to proauce pulverized lime before the carbonaceous material is added, then mixing with such resultant lime before it cools to atmospheric temperature the proportion of carbonaceous material, and finally while the mixture is still heated above atmospheric temperature subjecting it to a fusing degree of heat, excluded from oxygen.
3. In the manufacture of carbide the herein described process which consists in calcining limestone, mixing with the resultant lime before it cools to atmospheric temperature a carbonaceous material, and while the mixture is still heated mixing therewith calcium carbide, black oxid of maganese, bituminous coal, aluminum and chlorate of potash and finally subjecting the mass before it cools to a fusing degree of heat.
4. In the manufacture of carbide the herein described process which consists in calcining limestone, mixing with the resultant lime before it cools to atmospheric tempera-
ture, a carbonaceous material and adding a superheating flux to the mass while still heated and finally subjecting the mass to a fusing degree of heat excluded from oxygen.

5. In the manufacture of carbide from limestone and carbonaceous material the herein described process which consists in calcining the limestone to produce lime, then after the lime is produced and while the lime is still heated above atmospheric temperature, introducing thereinto carbonaceous material and mixing the same therewith and while the mixture is stlll heated, raising its temperature to \(a\) fusing degree of heat.

No. 101,337. Mechanical Movement.
Mouvement mécanique.

Peter Hesselius, Chicago, Illinols, U.S.A., 2nd Ictober, 1906 ; 6 years. Filed 24th April, 1906. Receipt No. 135,235.
Claim.-1. The combination with a shaft, of a winding passage, means for guiding a weight or ball in a path intersecting said winding passage and the gravity operated ball arranged to travel through said path or passage.
2. The combination with a rotary shaft, of a winding ball path thereupon, a guide path arranged substantially parallel to the long axis of said shaft and a weight arranged in said ball path and guide path to move through both paths simultaneously and thereby revolve one of said paths.
3. The combination of a stationary with a revoluble part one of said parts having a spiral path therein and the other part having a straight path therein, a series of balls arranged to move by gravity through said paths, and means for returning some but not all of said balls automatically to their starting point.
4. The combination of a stationary element with a rotary element, one of said elements having one or more straight paths therein and the other element having one or more paths inclined relatively to said straight paths, and a weight
or welghts arranged to be moved by gravity through said paths and thereby impart motion to the rotary element,
5. The combinaton with a stationary element, of a rotary element one of said elements having a spiral path therein and the other element having a straight path thereln running parallel with the axis of the spiral path, a series of balls or weights arranged to move by force of gravity in both of sald paths simultaneously and thereby impart motion to one of said elements and a conveying mechanism adapted to llft a portion of the operating balls or welghts back to their starting point.

No. 101,338. Laggage Carrier. Portc-effets.

David Daniel Leavy, Wabaseka, Arkansas, U.S.A., 2nd Oc tober, 1906; 6 years. Filed 12th July. 1906. Receipt No. 137,740.
Claim.-1. In a device of the character described, the combination of a box or case, metal straps secured to the back of said box, the upper ends of said straps being bent so as to form suspension hooks adapted fit upon the shoulders of the wearer, strips connected to the upper portion of the metal straps, one end of the straps extending into the interior of the box and both ends of the straps being provided with means for securing a bundle thereto, and a waist band secured to the lower portion of the box.
2. In a device of the character described. the combination of a box or case, metal straps secured to the back of said box. the lower ends of said straps being bent so as to embrace the bottom of the box while the upper ends of the straps are bent so as to form suspension hooks adapted to fit upon the shoulders of the wearer, strips secured to the upper portion of the metal straps and provided at both ends with means for securing a bundle thereto, one of the ends of said straps passing into the interior of the box, and a waist band connected to the metal straps at the lower portion of the box by means of spring members.
3. In a device of the character described, the combination of a box or case, straps secured to the back of the box the lower ends of said straps being bent so as to embrace the lower side of the box while the upper ends are bent to form suspension hooks which are adapted to fit upon the shoulders of the wearer, a ring secured at each end of the portion of the strap embracing the lower side of the box by means of which a package can be secured to the bottom of the bua.

\section*{No. 101,339. Pulverized Fuel Burner for Furnaces.} Srileur de combustible pulvérisé pour fournaist.
Charles Arthur Matcham, Allentown, Pennsylvania. U.S.A., 2nd October, 1906: 6 years. Filed 1st June, 1906. Receipt No. 136,480.
Claim.-1. The rombination in a pulverized fuel burner for furnaces, of a fuel supply nozzle arranged to discharge the pulverized fuel into the furnace at or over the furnare wall through which the fuel passes to the furnace. said nozzle having fuel and air supply passages, and having its walls vertically and laterally remote from the boundaries of the fuel supply mouth. Whereby said walls exercis. no direct confining or rontracting influence upon the expanding volume of fuel issuing from said mouth, substantlally as spicified.
2. The combination in a pulverized fuel burner for furnaces, of a fuel supply nozzle arranged to discharge the pulverized fuel into the furnace at or near the furnace wall through which the fuel passes to the furnace. wherehy the pulverized fuct is free to expand immediately upon issuance from sald nozzle, and air passage flanking said nozzle and discharging air currents into the furnace in close proximity to the discharge of the fuel nozile so that the currents of air from the said air passages meet the fuel immediately upon its issuance from its nozzle, and one
or more air passages arranged to discharge currents of air into the fuel as it leaves the nozzle and in the same direc-

tlon as the first-mentioned air currents, substantially as speciffed.
3. The combination in a pulverized fuel burner for furnaces, of a neck fitted into an opening in the furnace wall, a pulverized fuel supply passage having its mouth terminating in said neck from which mouth the pulverized fuel is free to expand, and superposed air passages below said fuel supply mouth, said upper passage supplying air in lesser volume but with greater force than the lower passage, substantially as specified.
4. The combination in a pulverized fuel burner for furnaces, of a neck fitted into an opening in the furnace wall. a pulverized fuel supply nozzle having its discharge end terminating in said neck and from which the pulverized fuel is free to expand as it issues from the nozzle, air passages flanking said nozzle and arranged to discharge air currents into the furnace in proximity to the discharge of the fuel nozzle so that the currents of air meet the fuel immediately upon its issuance from sald nozzle, and one or more air nassages arranged to discharge currents of air Into the fuel as it leaves the nozzle and in the same direction as the first-mentioned air currents, substantially as specified.

\section*{No. 101,340. Apparatus for Separating Particles of Metal.}

\section*{Appareil pour séparer des particules de métal.}

Geurge Moore, London. England, 2nd October, 1906; 6 years. Filed 7th March, 1906. Heceipt No. 133,620.
Claim.-1. In a separating apparatus the combination comprising a frame, an endless belt disposed to run over the frame, a second endless belt disposed to run with the first endless belt, and means for applying a fluid to the belt.
2. In a separating apparatus the combination comprising an inclined frame, rotatable drums carried by the frame, fexible belts disposed around the drum, means for rotating the drums and an intermediate belt supporting drum carried by the frame.
3. In a separating apparatus the combination comprising ar inclined frame, rotatable drums carried by the frame. flexible belts disposed around the drums, gears adapted to rotate with the driven shaft and to engage one of the drum rotating gears, pivoted handles secured to the slldable gears, a.Ld means for supporting the belts intermediate of their erds.
4. In a separating apparatus, the combination comprising ar inclined frame, rotatable drums supported by the frame, flexible belts disposed around the drums. projecting flanges carried by the edges of the belts, means for rotating the drums. and an intermediate support for the belts.
5. In a separating apparatus the combination comprising an inclined frame. rotatable drums carried by the frame, flexible belts disposed around the drums. supporting rollers carried by the frame, means for rotating the drums, and means for discharging a fluid on the belt.
6. In a separating apparatus the combination comprising ar inclined frame. rotatable drums supported by the frame at different altitudes. flexible belts disposed around the drums. means for discharging tuid on the belts, means for rotating the drums, and an intermediate belt supporting Irum carricd by the frame.
7. In a separating apparatus the combination comprising an inclined frame, rotatable drums carried by the opposite rods of the frame. flexible belts disposed around the drums. pipes arranged with branches above the belts, means for roiating the drum, an intermediate belt supporting drum on the frame.
8. In a separating apparatus the combination comprising ar. inclined frame, rotatable drums supported by the frame,

Hexible belts disposed around the drum, means for rotating the drums. a second belt disposed over the first-named belt to leave a space therebetween, and a supporting drum for the second belt.
9. In an apparatus for separating particles of metals from the gangue or material with which they are associated, the combination comprising two side frames of greater height at one end than at the other, end frames adapted to connect the side frames, bearings carried at the upper end of the frames, transverse horizontal spindles disposed in the bearings, drums fixed upon the spindles, adjustable bearings carried at the lower end of the frames, spindles rotatably disposed in the bearings, drums flxed on the latter spindles, endless flexible belts having continuous projecting flanges on their outer edges disposed around the upper and lower drums, bearings carried by the upper end of the frames and arranged directly below the upper spindles, drums upon the latter spindles, a belt disposed around said drums, and around said first-named belt, a transverse spindle carried near the center of the frames, drums disposed to revolve freely upon this latter spindle, over which drums the returning part of the belts are arranged to travel and said latter drum being arranged to raise said belts as they pass to the drums at the lower end of the frame.

No. 101,341. Process of Concentrating Nitric Acid. Procédé pour concentrer l'acide nitrique.

Harry Pauling, Gelsenkirchen IV, Westhalia, Prussia, German Empire, 2nd October. 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,643 .
Claim.-1. The herein described process consisting in clectrolysing aqueous nitric acid and passing the nitric oxides,
formed at the cathode, into the acid surrounding the anode, substantially as and for the purpose specified.
2. The herein described process consisting in electrolysing aqueous nitric acid. liquefying the nitric oxides orginated at the cathode, and in passing such liquefled gases into the acid surrounding the anode, substantially as and for the purpose set forth.
3. The herein described process consisting in flling the anode leg of a U-tube, adapted for electrolysis, with nitrosulphuric acid, and the cathode leg with diluted nitric acid, and then electrolysing such liquid, substantially as and for the purpose set forth.

No. 101,342. Trunk. Coffre.

Hermann Romünder, Milwaukee, Wisconsin, U.S.A., 2nd
October, 1906 ; 6 years. Filed 29th May, 1906. Receipt No. 136,366 .
Claim.-1. An individual trunk adapted to form the lower member of a united assemblage of trunks and consisting of a receptacle having a cover and closure devices, the upper surface of said trunk being flat and smooth, a number of half round metal straps secured across the bottom, front and back of said trunk and a number of flat bands across the top, in alignment respectively with said metal straps, and means for connecting said trunk to an adjacent trunk.
2. An individual trunk adapted to form an intermediate member of a united assemblage of trunks and consisting of a receptacle having a cover and closure devices, the lower and upper surfaces of said trunk being flat and smooth, a number of metal straps secured across the front and back of said trunk, and a number of flat metal banils across the top and bottom in alignment respectively with said metal straps, and means for connecting said trunk 10 an adjacent trunk.
3. An individual trunk adapted to form the upper member of a united assemblage of trunks and consisting of a receptacle having a cover and closure devices, the lower surface of said trunk being flat and smooth, a number of half round metal straps secured about the front. top and back of sald trunk, and a number of flat metal bands across the bottom in alignment respectively with said metal straps.
4. A combination trunk comprising a plurality of individual trunk sections assembled one upon another, each of said trunk sections comprising a receptacle having a cover and closure device, the opposed surfaces of said trunk sections being flat and smooth, attaching means placed near adjacent edges of said sections to unite them, strap loops placed in aligned position upon each section, and straps passed through said loops and secured to reinforce the union between said assembled sections, together with a number of half round metal straps connected to the exposed surface of each of said trunk sections and a number of flat metal bands across each of the opposed surfaces of said trunk sections in alignment with said half round metal straps respectively.
5. A combination trunk comprising a plurality of individual trunk sections assembled one upon another, each of said trunk sections comprising a receptacle having a cover and closure device, the opposed surfaces of said trunk sections being flat and smooth, corner plates upon sald opposed surfaces having respectively recesses and projections adapted to interlock, attaching means placed near adjacent edges of said sections to unite them, strap loops placed in aligned positions upon each section and straps passed through said loops and secured to reinforce the union between sald assembled sections together with a number of half round metal straps connected to the exposed surfaces of each of sald trunk sections, and a number of flat metal bands across each of the opposed surfaces of said trunk sections in alignment with said half round metal straps respectively.
6. A combination trunk comprising a lower individual trunk section whose upper surface is flat and smooth and which conslsts of a receptacle having a cover and closure devices, and an upper individual trunk section whose lower surface is flat and smooth and which consists of a receptacle having a cover and closure device, both said trunk sections being
arranged to be assembled one upon the other and provided with altaching means placed near adjacent odges of sald sections and with corner plates at all the corners of said sectious, the corner plates extending over the mecting surfaces of said trunk sections being flat and arranged to interlock hy meaus corresponding recesses and projections provided respectively on said opposed corner plates.
7. A combination trunk comprising a lower individual trunk section, a number of intermediate individual trunk sections and an upper individual trunk section, each of said sections consisting of a receptacle portion, a cover and closure devices, the upper surface of said lower section and the lower surface of said upper section, and the upper and lower surfaces of the said intermediate sections being flat and smooth, means secured to adjacent edges of said sections to attach the assembled sections to one another and plates provided at all the corners of the said sections, the corner plates provided on the corners of the bottom of the upper section and the top of the lower section and on all the corners of the intermediate sections being substantially flat and arranged to interlock by means of corresponding recess and projections on said opposed corner plates respectively.
8. A combination trunk comprising a lower individual trunk section, one or more intermediate individual trunk sections and an upper individual trunk sections arranged to be as riembled one upon the other, each of said trunk sections comprising a receptacle portion, a cover and closure devices, means secured to adjacent edges of said sections to attach the assembled sections to one another and plates provided at all the corners of the said sections, the corner plates extending over the meeting surface of said trunk sections being flat and provided respectively with recesses and corresponding projections, a number of half round metal straps secured to the front and back of each of said sections and to the top of the upper and the bottom of the lower trunk section, and a number of flat metal bands secured to and reinforcing the meeting surfaces of sald trunk sections.

No. 101,343. Garment Marker.
Marqueur pour vêtements.

John B. Spencer, Butte, Montana, U.S.A., 2nd October, 1906 6 years. Filed 12th July, 1!4ti. Receipt No. 137,i45.
Qlaim.-1. A device of the character described comprising movable jaws, a screw rod for clamping said jaws together and an identifying or marking device attached to said serew rod. substantially as described.
- A device of the character described comprising movable jaws, a screw eye passing frecly through an opening in olle of said jaws and encaged with the threaded opening in the other of said jaws and a tag upon the eye of said serew, substantially as described.
3. A device of the character described comprising two pivotally connected members having co-acting jaws at thei: frce ends, a screw eye passing freely through an opening in one of said jaws and engaged with the threaded opening in the other of said jaws, a washer upon sald screw beneath the said eye and an identifying tag pivoted upon the eye of said screw, substantially as described.

\section*{No. 101,344. Enepender. Birtclles.}

Harlon B. Stevenson and William Thomas. Jr., co-inventors, both of St. Regis Falls, New York, U.S.A., 2nd October, 1906: 6 years. Filed 23rd July, 1906. Recelpt No. 138.074.

Claim.-1. A clasp comprising a fixed and a pivoted jaw, said fixed jaw having a bent piece extending upward along its rear surface, said bent piece having its lower extremity bassing through the fixed jaw and adapted to engage the arlicle to which the clasp is attached.
\(\therefore\). A clasp comprising a fixed and a pivoted jaw, sald fixed jaw having a bent plece extending upward along its rear surface. sald bent piece having its lower extromity polated did passing through the fixed jaw and adapted to engage the article (o whteh the clasp is attached.
3. A clasp comprising a fixed and a pivoted jaw. sald fixed faw having a bent plece extending upward along its rear

surface, said bent piece having its lower extremity pointed and passing through the fixed jaw, said pivoted jaw having d socket piece of ylelding material forming a seat for said pointed extremity.
4. A clasp comprising a fixed and a pivoted jaw, sainl fixed jaw having a bent piece extending upward abong its rear surface for the purpose specifled, said bent plece having a plurallty of pointed ends passing through the fixed jaw, said pivoted jaw having a socket piece of yielding material forming a seat for sald polnts.
5. A clasp comprising a fixed and a pivoted jaw, said fixed jaw having a bent piece extending upward along its rear surface for the purpose specified. a socket piece of ylelding material secured to said fixed jaw, said bent piece having a pointed extremity passing through said fixed Jaw and its socket piece. the pivoted jaw having a projection adapted to fit the socket in said socket piece, said projection itself having a socket plece of yielding material to seat said pointed extremity of said bent plece.

No. 101,345. Oscillaphone. Oscillaphonc.

Walter Wentworth Massie, Providence, Rhode Island. l'S.A.. 2nd October, 1906; 6 years. Flled 5th February. 1306. Receipt No. 132,582.

Claim.-1. The combination of an insulating element. stop means upon the upper side of the insulating element, terminals between which the stop means is located, a bridging element to rest on the terminals and a permanent mag. net. the insulating element being bored to receive the magnet.
2. The combination of an insulating element, stop pins *xtended into the insulating element and above the upper surlace thereof. terminals between which the stop pins are located, a bridging element to rest on the terminals and a permanent magnet, the insulating element being bored to receive the legs of the permanent magnot and said legs bearing against said pins.
3. In an oseillaphone the combination with a base support, an insulating element and terminals engaging the element and having a conducting element thereon, of conducting members secured to the element and fasteninge applied to the base and engaging the said terminals and constituting the sole connecting means for the apparatus with respert to the base support.

\section*{No. 101,346. Eelective Telephone Eystem.} Système sélcctif de téléphone.
Noble S. McKinsey and Anton R. Nelson, both of Susanvillo. California, U.S.A., 2nd October, 1906: 6 years. Filod 22nd October, 1903. Receipt No. 109,528.
Claim.-1. In a telephone system the combination of a maln wir. having a switch at each telephone station. a return wire, a bridge at each telephone station between the main and roturn wires having therein the secondary winding and car phone, a break closed by the opening of the main line.
and a second brake closed by a revolving device. the revolution thereof being controlled by the opening and closing

of the main line, only one of said devices making said closure at a time. substantially as described.
2. In a telephone system the combination of a main wire having a switch at each telephone station. a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break closed by a revolving device, the revolution thereof being controlled by the opening and closing of the maln line, only one of said devices making said closure at a time, and means independent of the opening and closing for impelling said device, substantially as described.
3. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break closed by a revolving device, the revolution thereof being controlled by the opening and closing of the main line, said devices all moving in unison but making their closures in succession, substantially as described.
4. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by a revolving device, the revolution thereof being controlled by the opening and closing of the main line, said devices all moving in unison but making their closures in succession, and means independent of said opening and closing for impelling each device, substantially as described.
5. In a telephone system the combination of a main wirc having a switch at each telephone station. a shunt around sald switch and a switch in said shunt. a return wire. a bridge at each telephone station between the main and return wires having therein the secondary winding and car phone, a break closed by the opening of the main line. and a second break closed by a revolving device. the revolution thereof being controlled by the opening and closing of the main line. only one of said devices making said closure at a time, substantially as described.
6. In a telephone system the combination of a main wire having a switch at each telephone station. a shunt around said switch and a switch in said shunt. a return wire. i bridge at each telephone station between the main and return wires having therein the secondary winding and far phone, a break closed by the opening of the main line. and a second break closed by a revolving device. the revolution thereof being controlled by the opening and closing of the main line, only one of said devices making said closure at a time, and means independent of said opening and closing for impelling said device, substantially as described.
7. In a telephone system the comblnation of a main wir having a switch at each telephone station, a shunt around said switch and a switch in said shunt. a return wire. a bridge at each telenhone station between the main and return wires having therein the secondary winding and ear phone. a break closed by the omening of the main line, and a second break closed by a revolving device, the revolu: on thereof being controlled by the opening and closing of the main line. said devices all moving in unison but making their closures in succession, substantially as described.
8. In a telephone system the combination of a main wire having a switch at each telephone station. a shunt around said switch and a switch in said shunt. a return wire, a bridge at each telephone station between the main and return wires having thereln the secondary winding and ear phone, a break closed by the opening of the main line, and a socond break closed by a revolving device, the revolution thereof being controlled by the opening and closing of the
main line, said devices all moving in unison but making their closures in succession, and means independent of said opening and closing for impelling each device, substantially as described.
9. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break. one of said closures being made by a revolving wheel, all of said wheels moving in unison but closing in succession and the other closure being made by means of an independent switch, substantially as described.
10. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, only one of such closures being operatable at a time for all the wheels and the second closure being made by an independent switch. substantially as described.
11. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of sald closures being made by a revolving wheel, the revolution being controlled by the opening, and closing of the main line and the second closure being made by an independent switch, substantially as described.
12. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, and the second closure being made by an independent switch, substantially as described.
13. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, only one of said wheels making a closure at a time. and thn second closure being made by an independent switch, substantially as described.
14. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary and ear phone, a break closed by the opening of the main llne, and a second break and two closures for said break, one of sald closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, only one of said wheels making a closure at a time, and the second closure being by an independent switch. substantially as described.
15. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and tow closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line. means independent of said opening and closing for impelling said wheel, said wheels moving in unison but closing in succession, and the second closure being made by an independent switch, substantially as described.
16. In a telephone system the combination of a maln wire liaving a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break. one of said closures being made by a revolving wheel, all of said wheels being in unison but closing in succession and the other closure being made by means of an Independent switch and means for preventing more than one of the series of said independent switches being closed at a time, substantially as described.
17. In a telephone system the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station, between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, only one of such closures being operatable at a time for all the wheels and the second closure being made by an independent switch, and means for preventing more than one of the series of said independent switches being closed at a time, substantially as described.
18. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and r-turn wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line and the second closure being made by an independent switch, and means for preventing more than one of the scries of said independent switches being closed at a time, substantially as described.
19. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said clcsures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, and the second closure being made by an independent switch. an means for preventing more than one of the series of said independent switches being closed at a time, substantially as described.
20. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, only one of said wheels making a clasure at a time, and the second closure being made by an independent switch, and means for preventing more than one of the scries of said independent switch being closed at a time, substantially as described.
21. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line. means independent of said opening and closing for impelling said wheel, only one of said wheels making a closure at a time, and the second closure being by an independent switch. and means for preventing more than one of the series of said independent switches being closed at a time, substantially as described.
22. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening. and closing for impelling said wheel, said wheel moving in unison but closing in succession, and the second closure being made by an independent switch, and means for preventing more than one of the series of said independent switches bleng closed at a time, substantially as described.
23. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line. and a second break and two closures for said break, one of said closures being made by a revolving wheel, all of said wheels moving in unison but closing in succession and the other closure being made by the opening of the switch on the main wire, substantially as described.
24. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and
a second break and two closures for said break, one of said closures being made by a revolving wheel, only one of such closures being operatable at a time for all the wheels and the closures being operable at a time for all the wheels and the second closure being made by the opening of the switch on the main wire, substantially as described.

25 . In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line and the second closures being made by the opening of the switch on the main wire, substantially as described.
26. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, and the second closure being made by the opening of the switch in the main wire, substantially as described.
27. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line. only one of said wheels making a closure at a time, and the second closure being made by the opening of the switch on the main wire, substantially as described.
28. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, only one of said wheels making a closure at a time, and the second closure being by the opening of the switch on the main wire, substantially as described.
29. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear fhone, a break closed by the opening of the main line, and a second break and two closures for said break one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, said wheels moving in unison but closing in succession, and the second closure being made by the opening of the switch on the main wire, substantially as described.
30. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of sald closures being made by a revolving wheel, all of said wheels moving in unison but closing in succession and the other closure being made by means of an independent switch, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
31. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, only one of such closures being operatable at a time for all the wheels and the second closure being made by an independent switch, and means for preventing the closures of the latter switch more than once for each complete revolution of the wheel, substantially as described.
32. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, 3 bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said
closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line and the second closure being made by an independent switch, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
33. In a telephone system, the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, and the second closure being made by an indepeadent switch, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
34. In a telephone system. the combination of a main wire having a switch at each telephone station, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line. and a second break and two closures for said break. one of said closures being made by a revolving wheel, the revolution being controlled by the opening and clasing of the main line, only one of said wheels making a closure at a time. and the second closure being made by an independent switch, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
35. In a telephone system. the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, only one of said wheels making a closure at a time, and the second closure being made by the switch in shunt, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
36. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for each break, one of said closures being nade by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling sald wheel, said wheels moving in unison but closing in succession, and the second closure being made by the switch in shunt. and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
37. In a telephone system, the combination of a main wire l:aving a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station, between the main and return wires, having therein the secondary winding and ear phonc, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, all of said wheels moving is unison but closing in succession and the other closure being made by means of the switch in shunt, substantially as described.
38. In a telephone system, the combination of a main wire laving a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, only one of such closures being operatable at a time for all the wheels and the second closure being made by the switch in shunt, substantially as described.
39. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled
by the opening and closing of the main line and the second closure being made by the switch in shunt, substantially as described.
40. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel. and the second closure being made by the switch in shunt, substanitally as described.
11. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel. the revolution being controlled by the opening and closing of the main line, only one of said wheels making a closure at a time, and the second closure being made by the switch in shunt, substantially as described.
42. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires kaving therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, only one of said wheels making a closure at a time, and the second closure being by the switch in shunt, substantially as described.
43. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break. one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel said wheels moving in unison but closing in succession, and the second closure being made by the switch in shunt, substantially as described.
44. In a telephone system, the combination of a main wire baving a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, all of said wheels being in unison but closing in succession and the other closure being made by means of the switch in shunt, and means for preventing more than one of the series of said latter switches being closed at a time, substantially as described.
45. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station, between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel. only one of such closures being operatable at a time for all the wheels and the second closure being made by the switch in shunt, and means for preventing more than one of the series of said latter switches being closed at a time, substantially as described.
46. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line and the second closure being made by the switch in shunt, and means for preventing more than one of the series of said latter switches being closed at a time. substantially as described.
47. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge
at each telcphone station between the main and return wires having thereln the secondary winding and ear phone, a break closexd by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling sald wheel, anil the second closure being made by the switch in shunt, and means preventing more than one of the series of saivl latter witches being closed at a time, substantially as described.
48. In a telephone system, the combination of a main wirn having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for sald break, one of sald closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line. only one of said wheels making a closure at a time, and the second closure being made by the switch in shunt, and means for preventing more than one of the series of sald latter switches being - losed at a time. substantially as described.
49. In a telephone system, the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, only one of said wheels making a closure at a time, and the second closure being made by the switch in shunt, and means for preventing more than one of the series of said latter switches being closed at a time. substantially as described.
50. In a telephone system, the combination of a main wire
having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling sald wheel, said wheels moving in unison but closing in succession, and means for preventing more than one of the serles of latter switches being closed at a time, substantially as described.
51. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a sccond break and two closures for said break, one of said closures being made by a revolving wheel, all of said wheels moving in unison but closing in succession and the other closure being made by the opening of the switch on the main wire, substantially as described.
52. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in sald shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and car phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, only one of such closures being operatable at a time for all the wheels and the second closure being made by the opening of the switch on the main wire, substantially as described.
53. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break rlosed by the opening of the main line, and a second break and two closures for said break, one of sald closures being made by a revolving wheel, the revo:ution being controlled by the opening and closing of the main line and the second closure being made by the opening of the switch on the main wire, substantially as described.
54. In a telephone system the combination of a main wire having a switch at each telephone station, a shumt around sald switch, a switch in sald shunt, a return wire. a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone. a break closed by the opening of the maln line, and a second break and two closures for sald break. olle of said closures being made by a rewolving whenl. the revolution being coutrolled by the opening and closing of the main linc. means independent
of said opening and closing for impelling said wheel, and the second closure being made by the opening of the switch on the main wire, substantially as describea.
55. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said switch. a switch in sald shunt, a return wire, a bridg" at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break end two closures for said break. one of sald closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, only one of said Wheels making a closure at a time. and the second closure bring made by the opening of the switch on the main wire, ubstantially as described.
56. In a telephone system the combination of a main wirc having a switch at each telephone station, a shunt around said switch. a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line. and a second break and two closures for said break. one of said closures being made by a revolving wheep, the revolution being controlled by the opening and closing of the main line. means indepenlint of said opening and closing of the main line. means inpileendent of said opening and closing for impelling said wheel. only one of said whee's making a closure at a time and the second closure being by the opening of the switch on the main wire. substantially as described
57. In a tolephone system the combination of a main wire heving a switch at cach telephone station. a shunt around seid switch, a switch in sald shunt. a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and car phone. a break closed by the onening of the main line. and a coinond break and two closures for said break, one of said closures belng made by a revolving wheel, the revolution being controlled by the opening and closing of the main line. means independent of said opening and closing for impelling gaid wheel. caid wheels moving in unison but ckosing in succession, and the second closure being made by the opening of the switch on the main wire, substantially as described.
58. In a telephone system the combination of a main wire having a switch at each telephone station. a shunt around said switch. a switch ic said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for sald break, one of said closures bring made by the revolving wheel, all of said whecls moving in unison but closing in succession and the other closure being made by means of an independent \(\mathbf{s w i t c h}\). and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
59. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt. a return wire, a bridge at each telephone station between the main and return wires having therein the sccondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break. one of sald closures being made by a revolving wheel, only one of such closures being operatable at a time for all the wheels and the second closure being made by the switch in shunt, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described
60. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said 8 witch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the sccondary winding and ear phone. a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution belng controlled by the opening and closing of the main line and the second closure being made by the switch io shunt, and means for preventing the closure of the latter switch more than once for pach romplete revolution of the whecl. substantially as described.
61. In a telephont system the combination of a main wire having a switch at each telephone station, a shunt around said switch. a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone. a break closed by the opening of the main line. and a second hroak and two closures for sald break. one of said closures being made by a revolving wheel. the revolution being controlled be the opening and closing of the main line. means mdependcut of said opening and cosivg for impelling said "herel, and the serond closure being made by the switch in shuil. and means for priventing the closure of the latter
; witch more than once for each complete revolution of the wheel, substantially as described.
62. In a telephone system the combination of a main wire having a switeh at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second ureak and two closures for said break, one or sald closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, only one of said wheels making a closure at a time, and the second closure being made by the switch in shunt, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described
63. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for said break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, only one of said wheels making a closure at a time, leing made by the switch in shunt, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
64. In a telephone system the combination of a main wire having a switch at each telephone station, a shunt around said switch, a switch in said shunt, a return wire, a bridge at each telephone station between the main and return wires having therein the secondary winding and ear phone, a break closed by the opening of the main line, and a second break and two closures for each break, one of said closures being made by a revolving wheel, the revolution being controlled by the opening and closing of the main line, means independent of said opening and closing for impelling said wheel, said wheels moving in unison but closing in succession, and the second closure being made by the switch in shunt, and means for preventing the closure of the latter switch more than once for each complete revolution of the wheel, substantially as described.
65. In combination with a main wire and a return wire, a series of telephones distributed therealong, each telephone comprising a line bridging the main wire and the return wire and containing the receiver and the secondary winding of the induction coll, containing also a condenser, and having a break to be closed by the opening of the main wire, said main wire having a relay for opening said break, a branch shunting said relay and containing a condenser, and means for breaking the main wire at any telephone, substantially as described.
66. In combination with a main wire, ad a return wire, a series of telephones distributed therealong, each telephonc comprising a line bridging the main wire and the return wire and containing the receiver and the secondary winding of the induction coil, containing also a condenser, and having a break arranged to be closed by the opening of the main wire, and said main wire having a relay for opening said break, a branch shunting said relay and containing a condenser. means for breaking the main wire at any telephone, and a shunt for said means containing additional means for breaking and closing said main wire, substantially as described.

6i. In a telephone sysiem the combination of a main wire and a return wire or the earth, a series of telephones distributing along the main wire, each telephone being on a bridge being normally disconnected from the main wire, and means for breaking the main wire and connecting the bridge thereto. said bridge comprising the secondary inductiou coil and receiver, and means operatable at the station where said main wire has been so broken for connecting the bridge at any other desired station with the main wire, substantially as described.
68. In a telephone system the combination of a main wire and a return wire or the earth, a series of telephones distributed along the main wire, each telephone being on a bridge between the main wire and the return wire or earth, said bridge being normally disconnected from the main wire, and means for breaking the main wire and connecting the bridge thereto, said bridge comprising the secondary induction coil and receiver, and meang operatable at the station where said main wire has been so broken for connecting the bridge at any other desired station with the main wire, and shunts on the main wire for each of the intervening telephones, substantially as described.
69. In a telephone system, the combination of a main wire and a return wire of the earth, a series of telephones distributed along the main wire, each telephone being on a bridge between the main wire and the return wire or earth
said bridge being normally disconnected from the main wire, and means for breaking the main wire and connecting the bridge thereto, suid bridge eomprising the secondary induction coil and receiver, and a condenser, and means operatable at the station where said main wire has been so broken for connecting the bridge at any other desired station with the main wire, substantially as described.
70. In a telephone system. the combination of a main wire and a return wire or the earth, a series of telephones distributed therealong. each telephone having a bridge between the main wire and the return wire having a break closed by the removal of the ear phone from its hook, a local battery. the circuit of which has two branches, one of which contains the bell and the other the transmitter and primary winding, the former branch being closed and the latter being broken when the ear phone i; on its hook and the latter being closed and the former broken when the ear phone is removed, and means operatable in any telephone of the system for breaking the main wire and connecting the bridge thereto, the breaking of the main wire operating to prevent such break being made by any other station in the system. substantially as described.
71. In a telephone system, the combination of a main wire, a return wire, a series of telephones distributed along the main wire comprising a bridge between the main and the return wire normally disconnected from the main wire, a break in the main wire normally closed at each station, means operatable at any station in the system for opening said break and thereby preventing the opening of the remainder of such breaks in the system, a sluunt for the main wire around said break containing an auxiliary break or shunt, and synchronously moving device at all the stations for successively connecting the bridges of the main wire, said devices moving when the main circuit is open and stopping when the main circuit is closed whereby the closure of the shunt breaks at any desired point of advance of said sychronously moving devices closes the corresponding bridge and brings the desired telephone into the circuit, substantially as described.
72. In a telephone system, in combination with the main line, a series of telephone mechanism thereon, each mechanism comprising an ear phone, contact spring normally closing the main line, a device for separating said contact springs when the ear phone is removed from the hook. a spring actuated and suitably controlled rotary wheel, the wheels of all the mechanisms being arranged to rotate in unison, said wheels at a certain point in their movement actuating said devices to bring them into position to separate the contact springs of all the ear phones, and means whereby when any ear phone has been removed from the hook and the corresponding contact springs have been so separated, the devices of all the mechanisms of the system are shifted out of their relative position to separate said springs whereby the signalling party has the uninterrupted control of the line, substantially as described.
73. In a telephone system, the combination with the main line of a series of telephone mechanism therefor, each mechanism comprising a rotary wheel, means independent of the continuity of the electric circuit whereby said wheels of all the mechanism may be made to rotate in unison. means for arresting all the wheels at a corresponding point of rotation thereof, said wheels only when so arrested being in position to co-operate with a device for breaking the rircuit and a device in each mechanism co-operating with the device for breaking the circuit thereat. said co-operating device being operatable by the signalling party. and means whereby on the operating of sald latter device the circuit is broken and the wheels are free to advance, whereby the signalling party has the only break on the line for the insertion of a telephone, substantially as described.
i4. A telephone system comprising a main line having at each station therealong a normally closed break. a signalling circuit having a break therein, a device for closing said break, said devices all moving in unison, but operating to exclusively close the breaks in succession. means for moving said devices, operative when the main line is closed but inoperative when it is open, and means for opening any of the said breaks in the line and thereby preventing the opening of any other of sald breaks whereby control of the line is had at the break so opened, substantially as described.
75. A telephone system comprising a main line having a break at each station arranged to be opened by the ranoval of the ear phone from its hook, synchronously moving contact changers at the respective stations controlled by the opening and closing of the main line, and a loop line with switch insertion in each break so made, for so controlling said changers, substantially as described.
76. A telephone system comprising a main line having a break at each station arranged to be opened by the removal of the ear phone from its hook, synchronously moving contact changers partly closing in succession and exclusively a series of branch lines at the respective station controlled
by the opening and closing of the main line at sald break, means separatable at said break for further closing said limes simultancously. and means actuated by the removal from its hook of the ear phone of the party whosi bratich lite: is so exclusively partly closed. for completely closing said branch line. substantially as described.
iT. A telephone system romprising a main line having a briak at each station arranged to be opered by the removal of the car plione from its hook. synchronously inoving conlact changers eaused to move a short distance only from their zero position upon the brraking of the main line. means whereby the closing of the main line again starts said contact changers, said contact changers partly closing in succession and exclusively the talking clrcuits at the several stations, and means whereby the removal of the selected party's ear phone from its hook completely closes said talking circuit. substantially as described.
78. A telephone system comprising a main line having a break at pach station arranged to be opened by the removal of the ear phone from its hook. synchronously moving contact changers caused to move a short distance only from their zero position upon the breaking of the maln line, means whereby the closing of the main line again starts said contact changers, said contact changers partly closing in succession and exclusively the talking circuits at the soveral stations and means whereby the removal of the sclected party's ear phone from its hook completely closes said talking circuit, and also the primary transmitter circuit. substantially as described.
79. A telephone system comprising a main line having a break at each station arranged to be opened by the removal of the ear phone from its hook. synchronously moving contact changers caused to move a short distance only from their zero position upon the breaking of the main line, muans whereby the closing of the main line again starts said rontact changers, sald contact changers partly closing it succosion and exclusively the talking circuits at the several stations means whereby the breaking of the main circuit further partly closes the talking circuit, and means whereby the removal of the selected party's ear phone from its hook completely closes said talking circuit, substantially as deseribed.

Su. A tilephone system comprising a main line having a bruak at each station aranged to be opened by the removal of the ear phone from its hook, synchronously moving contact changers caused to move a short distance only from :heir zero position upon the breaking of the main linie, morans whereby the closing of the main line again starts said contact changers, said contact changers partly closing i: succession and exclusively the bell circuits of the several stations, and means whereby the breaking of the main circuit completely closes a selected bell circuit, substantially as described.
81. A telephone system comprising a main line having a break at each station arranged to be opened by the remuval of the ear phone from its hook. synchronously moving contact changers caused to move a short distance only from their zero position upon the breaking of the main line, means whereby the closing of the main line again starts said contact changers. said contact changers partly closing in succession and exclusively the bell circuits of the several stations. and means whereby the breaking of the main circuit completely closes a selected bell circuit, means under the control of the signalling party closing the talking circuit of the selected part, and means whereby the removal of the latter party's arar phone from its hook breaks his bell circuit and closes his talking circuit, substantially as described.
s2. A telephone system comprising a main llae having a brak at each station arranged to be opened by the removal ot the ear phone from its hook, synchronously moving contact changers cansed to move a short distance only from their zero position upon the breaking of the main line, means whereby the closing of the main line again starts said contact changers, said contact changers partly closing in succession and exclusively the bell circuits of the several stations, and means whereby the breaking of the main circuit complete closes a selected bell circuit. means under the control of the signalling party for partly closing the talking circuit of the selected party, and means whereby the removal of the latter party's ear phone from its hook breaks his bell circuit and closes his talking circuit and primary transmitter circuit, substantially as described.
s3. A telephone system comprising a main line having a Irrak at each station arranged to be opened by the removal of the ear phone from its book, syachronously moving contint changers controlled by the opening and closing of the uatin line. said contact changers partly closing in succession and exclusively the talking circuits at the several stations, morans whereby the breaking of the main circuit further partly closes the talking circults, and means whereby the romoval of the called subscriber's ear phone from its hook
zompletely closes his talking circuit, substantially as desrlbed.
st. A telephone system comprising a main line having a break at each station arranged to be opened by the removal of the car phone from its hook, synchronously moving contact changers controlled by the opening and closing of the main circult, said contact changers partly closing in succession and exclusively the talking circuits at the several stations, means whercby the breaking of the main circuit further partly closes the talking circuits and means whereby the removal of the called subscriber's ear phone from its hook completely closes his talking circuit and primary transmitter circuit, substantially as described.

S5. A telephone system comprising a main line having a break at each station aranged to be opened by the removal of the ear phone from its hook, synchronously moving contact changers controlled by the opening and closing of the main circuit, said contact changers partly closing in succession and exclusively the bell circuits of the several stations, means whereby the breaking of the main circult completely closing the selected bell circuit and means whereby the removal of the called subscriber's ear phone from its hook breaks his bell circuit, substantially as described.
86. A telephone system comprising a main line having a break at each station arranged to be opened by the removal o! the ear phone from its hook, synchronously moving contact changers controlled by the opening and closing of the wain circuit, said contact changers partly closing in succession and exclusively the bell circuits of the several stations means whereby the breaking of the main circult completely closes the selected bell circuit, means whereby the removal o: the called subscriber's ear phone from its hook breaks his bell circuit means operatable by the calling subscriber for partly closing the signalled party's talking circult and means whereby the removal of the latter's ear phone from his hook completely closes said talking circuit, substantially as described.
s7. A telephone system comprising a main line having a break at each station arranged to be opened by the removal of the ear phone from its hook, synchronously moving contact changers at the respective stations controlled by the opening and closing of the main line, said contact changere partly closing in succession and exclusively the bell clrcuits and talking circuits, at the remaining stations, means whereby the breaking of the main circuit completely closes the bell circuit then partly closed by the contact changers further closes the coresponding talking circuit, and means whereby the removal of the corresponding phone from its hook breaks said bell circuit and closes the corresponding talking circuit, substantially as described.
s8. A telephone system comprising a main line having a break at each station arranged to be opened by the removal of the ear phone from its hook, synchronously moving contact changers at the respective stations controlled by the opening and closing of the main line, said contact changers partly closing in succession and exclusively the bell circuits and talking circuits, at the remaining stations, means whereby the breaking of the main circuit completely closes the bell circuit then partly closed by the contact changer and further closes the corresponding talking circuit, and means whereby the removal of the corresponding phone from its hook breaks said bell circult and closes the corresponding talking circuit and also primary transmitter circuit, substantially as described.
89. A telephone system comprising synchronously moving contact changers at the respective stations. means whereby the breaking of the main circuit permits said contact chamgers to advance a short distance, but immediately afterward arrests them, means whereby the closing of said circuit again starts said changers, said changers partly closing in succession and exclusively the bell clrcuits of the system, means whereby the breaking of the main circuit completely closed the bell circuit then partly closed, and means for closing the corresponding talking circuit, substantially as described.
90. A telephone system comprising synchronously moving contact changers at the respective stations, means whereby the breaking of the main circuit permits said contact changers to advance a short distance, but immediately afterward arrests them, means whereby the closing of said circuit again starts sald changers, said contact changers partly closing in succession and exclusively the talking circuits of the system, means whereby the breaking of the main circuit further closes the selected talking circult then thus partly closed, and means whereby the removal of the corresponding ear phone from its hook completely closes sald talking circtits, substantially as described.
91. A telephone system comprising synchronously moving contact changers at the respective stations, means whereby the breaking of the main circuit permits said contact changes to advance a short digtance, but immediately afterward arrests the means whereby the closing of sald circuit again starts said changers, said contact changers partly closing in
succession and exclusively bell circuits and talking circuits of the system, means whereby the breaking of the main circuit at any time completely closes the bell circuit then thus partly closed and further partly closes the talking circuit then thus partly closed, and means whereby the removal of the corresponding ear phone from its hook breaks the bell circuit and closes the talking circuit, substantially as described.
92. A telephone system comprising a series of contact changers at the respective stations, means whereby said changers are permitted to advance when the main circult is closed, said changers partly closing in succession and exclusively bell circuits of the system, means whereby the breaking of the main circuit at any time completely closes the bell circuit then thus partly closed, and means for closing the corresponding talking circuit, substantially as described.
93. A telephone system comprising a series of contact changers at the respective stations, means whereby said changers are permitted to advance only when the main circuit is closed, sald contact changers partly closing in succession and exclusively talking circuits of the system, means Whereby the breaking of the main circuit at any time still further partly closes the talking circuit then thus partly closed, and simultaneously closes the corresponding bell circuft, and means whereby the removal of the called subscriber's ear phone from its hook completely closes said talking circuit, substantlally as described.
94. A telephone system comprising a serles of contact changers at the respective stations, means whereby said changers are permitted to advance only when the main circuit is closed, said contact changers partly closing in succession and exclusively bell circuits and talking circuit of the system, means whereby the breaking of the main circuit at any time completely closes the bell circuit then partly closed and further partly closes the corresponding talking circuit and means whereby the removal of the called subscriber's ear phone closes his talking circuit, substantially as described.
95. A selective telephone system comprising in each telephone, clockwork, all the clockworks moving synchronously, a controller, a device moving with the clockwork, holding the controller in position to be actuated by the automatic hook, means whereby the movement of the automatic hook starts the clockworks in all the telephones and means whereby the starting of the clocwork in any telephone in which the controller was not so actuated renders said holding device inoperative, substantially as described.
96. A selective telephone system comprising in each telephone, clockwork, all the clockworks moving synchronously, a controller, means operated from the outside of the telephone box for actuating said controller, and for starting the clockwork in all the telephones, a device moving with the clockwork holding the controller in position to be actuated by said means, and means whereby the starting of the clockwork in any other telephone in which the controller was not so actuated renders said holding device inoperative, substantially as described.
97. A selective telephone system comprising telephones each having clockwork mechanism a wheel revolved thereby, line controller, a stud carried by sald wheel engaging said line controller, and means for starting the clockwork meohanism, the stud then being withdrawn from the controller, and the latter being inoperative, substantially as described.
98. In an apparatus of the character described the combination of a llne controller, an automatic hook arranged when released to contact with said line controller, and means operated by said contact for releasing all the other lime controllers of the system whereby no other automatic hook can contact with its corresponding line controller, substantially as described.
99. In an apparatus of the character described the combination of a line controller, an automatic hook for the receiver, means operated by the release of said hook for actuating the line controller to change the circuit and control the line, and means operated by said changing of the circuit for rendering all the other line controllers unresponsive to the action of the corresponding automatic hook, substantially as described.
100. A telephone system comprising a series of telephones, each having a line controller and a clockwork mechanism, said clockwork mechanism moving in unison throughout the system, means whereby when the line is not in use any line controller of the system may be actuated to permit the clockwork mechanism to start, and means whereby such actuation of one controller renders the other controllers inoperative, substantially as described.
101. A telephone system comprising a series of telephones each having a clockwork mechanism and a line controller, means whereby the taking down of the receiver in any telephone whenthe line is not in use actuates the corresponding line controller and starts the clockwork mechanism through-

Out the system, and means controlled by said line controller when so actuated, for rendering the other controllers of the system inoperative, substantially as described.
102. A telephone system comprising a series of telephones, each having a clockwork mechanism means whereby said cmehanisms move in unison, means under the control of any party on the line when the line is not in use, for stanting all of sald clockwork mechanisms, means for automatically arresting said clockwork mechanisms after moving through a short distance, and selective means operatable only by the party calling, for restarting said clockwork mechanisms and for stopping them at a predetermined point in their synchronous movement, substantially as described.
103. A selective telephone system comprising telephones each having clockwork meohanism, a line controller, a device moved by the clockwork mechanism engaging said line contnoller, and means for starting the clockwork mechanism, the device then being withdrawn from the-controller and the later being inoperative, substantially as described
104. In a selective telephone system, a line controller at each station, means whereby the rise of the automatic hook operates the line controller to influence the circuit, means for supoprting the line controller in a position to be so operated by the rise of the automatic hook, and means whereby the influencing of the circuit causes all the supporting means on the line to withdraw the controllers except the one already operated, out of position to be so operated by the rise in the corresponding automatic hook, substantially as described.
105. In a selective telephone system, a line controller at each station, means whereby the rise of the automatic hook operates the line controller to influence the circuit, means for supporting the line controller in a position to be so oper ated by the rise of the automatic hook and means whereby the influencing of the circuit causes all the supporting means on the line to withdraw the controllers except the one already operated out of position to be so operated by the rise in the corresponding automatic hook, and a busy signa! brought into signalling position by such actuation of the supporting means, substantially as described.

No. 101,347. Apparatus for Electrically Operating Bulhhead Doors, Hatches, Etc.
Moyen d'actionner par l'électricité les portes de cloisons et écoutilles de vaisseaux.

The Long Arm System Company, assignee of Robert H Kirk, both of Cleveland, Ohio, U.S.A., 2nd October, 1906; 6 years. Filed 9th June, 1906. Receipt No. 136,727.
Claim-1. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, means for completing the circuit through sald motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the distant control, a spring adapted to re sist the thrust on said gearing, and mechanism operated upon the yielding of said spring for automatically cutting off the current from said motor when the load on the motor exceeds a predetermined limit, substantially as described.
2. An electric apparatus for the operation of watertigh bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the distant control, and means for automatically cutting off the current from said motor and for breaking the circuit for the distant control when the load on the motor excceds a predetermined limit, substantially as described.
3. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, means for completing the circuit through said motor
from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the distant control, a spring adapted to resist the thrust on said gearing. and mechanism operated upon the yielding of said spring for automatically cutting off the current from said motor when the load on the motor exceeds a pre determined limit, and a signal circuit for making a signal at the distant point. with means for automatically closing said signal circuit when the door rraches the closed pesition, substantially as deseribed.
4. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the distant control, and means for automatically cutting off the current from said motor and for breaking the circuit for the distant control when the load on the motor exceeds a predetermined limit, and a signal circuit for making a signal at the distant point. with means for automatically closing said signal circuit when the door reaches the closed position. substantially as described.
5. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship. comprising an clectric motor and worm gearing driven thereby for operating the door, a solenoid circuit, a solenoid and a controller operated thereby for completing the eircuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the solenoid control, and means for automatically cutting off the current from said motor when the load on the motor exceeds a predetermined limit, substantially as described.
6. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, a solenoid circuit, a solenoid, and a controller operated thereby for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the solenoid control, and means for automatically cutting off the current from said motor and for breaking the circuit through the solenoid when the load on the motor exceeds a predetermined limit, substantially as described.
7. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an clectric motor and worm gearing driven thereby for operating the door, a solenoid circuit, a solenoid, and a controller operated thereby for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the solenoid control, and means for automatically cutting off the current from said motor when the load on the motor exseeds a predetermined limit, and a signal circuit for making a signal at the distant point with means for automatically closing said signal circuit when the door reaches the closed position, substantially as described.
8. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, a solenoid circuit, a solenoid, and a controller operated thereby for completing the circuit through said motor from a distance, hand operated mechanism for completing the circult through said motor in either direction and dominating the solenold control, and means for automatically cutting off the current from said motor and for breaking the circuit through the solenoid when the loal on the motor exceeds a predetermined limit. and a signal circuit for making a signal at the distant point, with a means for automatically closing said signal circuit when the door reaches the closed position, substantially as described.
9. An electric apparatus for the operation of watertight bulkbead doors and hatches aboard ship, comprising an electric motor and a pin rack and pin wheel, with worm gearing for driving said pin wheel, driven by said motor for operating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either directic, and dominating the distant control, and means for automatically cutting off the current from sald motor when the load on the motor exceeds a predetermined limit substantially as described.
10. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a pin rack and pin wheel with worm gearing for driving sald pin whecl, driven by said motor for operating the door. means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direc-
tion and dominating the distant control, and means for auto-
matically cutting off the current from said motor and for breaking the circuit for the distant control when the load on the motor exceeds a predetermined limit. substantiallv as described.
11. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a pin rack and pin wheel, with worm gearing for driving said pin wheel, driven by said motor for cperating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either dirpe. tion and duminating the distant control, and means for automatically cutting off the control from said motor when the load on the motor excreds a predetermined limit. and a signal circuit for making a signal at the distant point, with means for automatically closing said signal circult when the door reaches the closed position, substantially as descrbed.
12. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a pin rack and a pin wheel, with worm gearing for driving said pin wheel, driven by said motor for operating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the distant control, and means for automatically cutting off the current from said motor and for breaking the circuit for the distant control when the load on the motor exceeds a predetermined limit, and a signal circuit for making a signal at the distant point, with means for automatically closing said signal circuit when the door reaches the closed position, substantially as described.
13. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and worm gearing driven thereby for operating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circult through said motor in either direction. means for causing the hand operated mechanism to automatically dominate the distant control, and means for automatically cutting off the current from said motor when the load on the motor exceeds a predetermined limit, substantially as described.
14. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction, means for causing the hand operated mechanism to automatically dominate the distant control, and means for automatically cutting off the current from said motor and for breaking the circuit for the distant control when the load on the motor exceeds a predetermined limit, substantially as described.
15. An electric apparatus for the operation of watertight buikhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, means for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction, means for causing the hand operated mechanism to automatically dominate the distant control, and means for automatically cutting off the current from said motor and for breaking the circuit for the distant control when the load on the motor exceeds a predetermined limit, and a signal circuit for making a signal at the distant point, with means for automatically closing said signal circuit when the doo reaches the closed position, substantially as described.
16. The combination with a bulkhead door, of a pin rack secured thereto, a pin wheel meshing in said rack, an electric motor, and a gearing driven by said motor for driving said pin wheel, substantially as described.
17. The combination with a bulkhead door, of a pin rack secured thereto, a pin wheel meshing in said rack, an electi ic motor, and worm gearing driven by said motor for driving said pin wheel, substantially as described.
18. The combination with a bulkhead door, of a pin rack secured thereto, a pin wheel meshing in said rack, an electric motor and gearing driven by said motor for driving said pin wheel, with a cut-out automatically operated by a member of said gearing for cutting off the electric current when the load on the motor exceeds a predetermined limit, substantially as described.
19. The combination with a bulkhead door, of a pin rack secured thereto, a pin wheel meshing in said rack, an electric motor and worm gearing driven by said motor for driving said pin wheel, with a cut-out automatically operated by a member of said gearing for cutting of the electric current when the load on the motor exceeds a predetermined limit, substantially as described.
20. The combination with a bulkhead door, a pin rack secured thereto, a pin wheel engaging in sald rack, a worm wheel driving said pin wheel, a worm engaging in sald worm wheel, and means for driving said worm either by
power or by hand as may be desired, substantially as described.
21. The combination with a bulkhead door, a pin rack secured thereto, a pin wheel engaging in said rack, a worm wheel, a worm engaging in said worm wheel, a worm shaft carrying said worm, and hand gearing for onerating said worm shaft by hand, substantially as described:
22. The combination with a bulkhead door, a pin rack secured thereto, a pin wheel engaging in said rack, a worm wheel driving said pin wheel, a worm engaging in said worm wheel, a worm shaft carrying said worm, and an electric motor connected to said worm shaft for driving the same, substantially as described.
23. The combination with a bulkhead door, a pin rack secured thereto, a pin wheel engaging in said rack, a worm wheel driving said pin wheel, a worm engaging in said worm wheel, a worm shaft carrying said worm, hand gearing connected to said shaft near one end for turning the same by hand, and an electric motor connected to the other end of said shaft for driving the same by electricity, substantially as described.
21. The combination with a bulkhead door, of a pin rack secured thereto, a pin wheel meshing in said rack. means for driving said pin wheel by hand, and independent means io: driving sald pin wheel by electricity, substantially as described.
25. The combination with a bulkhead door, of a pin rack secured thereto at right angles to the face thereof. a pin wheel meshing in said rack, an electric motor and worm gearing driven by sald motor for driving sald pin wheel, substantially as described.
26. The combination with a bulkhead door, of a pin rack secured thereto at right angles to the face thereof. a pin wheel meshing in said rack, an electric motor and worm gearing driven by said motor for driving said pin wheel, and independent hand gearing for driving the pin wheel by hand when desired, substantially as described.
27. The combination with a bulkhead door, of a pin rack sfcured thereto at right angles to the face thercof, a pin wheel meshing in said rack, an plectric motor and gearing driven by said motor for driving said pin wheel. with a cut-out automatically operated by a member of said gearing for cutting off the electric current when the load on the motor exceeds a predetermined limit. and independent hand gearing for driving the pin whed by hand when desired, substantially as described.
28. The combination with a bulkhead door, of a pin rack secured thereto at right angles to the face thereof, a pin wheel meshing in said rack, an electrin motor and gearing driven by said motor for driving said pin wheel, with a cut-out automatically operated by a member of said gearing for cutting off the electric current when the load on the motor exceeds a predetermined limit, substantially as described.
29. The combination with a bulkhead door. of a pin rack secured thereto at right angles to the face thereof. a pin wheel meshing in said rack, an electric motor and worm gearing driven by said motor for driving said pin wheel. with a cut-out automatically operated by a member of said gearing for cutting off the electric current when the load on the motor exceeds a predetermined limit, substantially as described.
30. The combination with a bulkhead door, a pin rack secured thereto at right angles to the face thereof. a pin Wheel engaging in said rack, a worm wheel driving said pin wheel. a worm engaging in said worm wheel. and means for driving said worm either by power or by hand as may be desired, substantially as described.
31. The combination with a bulkhead door, a pin rack secured thereto, a pin wheel engaging in said rack, a worm wheel driving said pin wheel. a worm engaging in said worm Wheel, a worm shaft carrying said worm and adapted to slide axially, a stout spring normally holding said worm shaft in the initial position. an electric motor connected to said worm shaft for driving the same, and means controlled by the sliding of the worm shaft for cutting off the current from the motor when the load exceeds a predetermined limit, substantially as described.
32. The combination with a bulkhead door a pin rack secured thereto, a pin wheel engaging in said rack, a worm Wheel driving said pin wheel, a worm engaging in said worm Wheel, a worm shaft carrying said worm and adapted to slide axially, a stout spring normally holding said worm shaft in the initial position, an electric motor connected to said worm shaft for driving the same, means for operating said electric motor either locally or from a distance, and means controlled by the slfding of the worm shaft for cutting off the current from the motor when the load exceeds a predetermined limit. substantially as described.
33. In an apparatus for operating sliding doors by electrlcity, the combination with a door and a rack secured thereto, of a power box secured across the door frame, gearin; mounted in sald power box for engaging said rack and mov;
ing the door, and an electric motor journalled in sald power box and having the consequent pole of its fleld magnet integral with the cover of said box and removable therewith, substantially as described.
34. The combination with a sliding door provided with a pin rack secured on the face therof, of a power box mounted across the door frame and provided with a combined worm bearing and oil trough rigidly held therein, a pin wheel meshing with said rack, a shaft for said pin wheel journalled in said power box. a worm wheel mounted on said shaft and enclosed in the power box, a worm mounted in said oil trough and engaging said worm wheel with mechanism mounted in said power box for operating said worm from either end thereof, substantially as described.
35. The combination with a sliding door provided with a pin rack sccured on the face thereop. of a power box mounted across the door frame and pivoted with a combined worm bearing and oil trough rigidly held therein, a pin wheel meshing with said rack, a shaft for said pin wheel journalled in sain power box a worm wheel mounted on sald shaft and enclosed in the power box, a worm monnted in said oll trough and angaging said worm wheel, with hand gears connected to said worm shaft near one end thereof for turning said shaft by hand when desired, and an electric motor mounted in saikl nower box and ronnected to the other end of said worm shaft for turning the same by clectricity, substantially as described.
36. In an apparatus for operating sliding doors by electricity. the combination with a door and a rack secured thereto, of a power box secured across the door frame, worm s"aring mounted in said power box for engaging said rack and moving the door. and an electric motor for operating said worm gearing journalled in said power box and having the consequent pole of its fleld magnet integral with the cover of saix box and removable therewith, substantially as described.
37. The combination with a sliding door provided with a pin rack secured on the face thereof, of a power box mounted across the door frame and provided with a removable cover, a pin wheel meshing with said rark, a shaft for said pin wherl journalled in said power box, a worm wheel mounted on sald shaft and enclosed in the power box, a worm engaging said worm wheel, and an electric motor connected to said worm and journalled in said power box and having the conscquent pole of its field magnet integral with the cover of said box and removable therewith. substantially as described.
38. The combination with a sliding door provided with a rack sccured on the face thereof, of a power box mounted across the door frame and provided with a removable cover. a gear wheel meshing with said rack, a shaft for said wheel journalled in said power box. a worm wheel mounted on said shaft and enclosed in the power box, a worm engaging said worm wheel, and an electric motor connected to said worm and journalled in sald power box and having the conseguent pole of its field magnet integral with the cover of said box and removable therewith, substantially as describe.i.
39. In an apparatus of the character described the combination with a controller drum, of a solenoid and a solenold plunger, means operated by said plunger for rocking the said drum, a spring for restoring said plunger to the initial position when not attractod by the said solenoid, and independent hand operated means for rocking said drum in either direction independent of said solenoid, substantiallv as described
40. In an apparatus of the character described the combination with a controller drum, of a solenoid and a solenoid plunger, means operated by said plunger for rocking the said drum, means for restoring said plunger to the initial position when not attracted by the said solenoid, and independent hand operated means for rocking said drum in either direction independent of said solenold. with automatic means controlled by said hand operated means for locking said plunger against the action of said solenoid when said hand operated means is in operation. substantially as described.
41. In an apparatus of the character described, the combination with a controller drum. of a solenoid and a solenoid plunger, means operated by said plunger for rocking the said drum, means for restoring said plunger to the initial position when not attracted by the said solenold, and independent hand operated means for rocking said drum in efther direction independent of said solenold, with a spring catch automatically released by the operation of the hand cperating mechanism and holding said plunger against the action of said solenoid while said hand mechanism is being operated, substantially as described.
42. In an apparatus of the character described, the combination with a controller drum, of a spring impressed plunger normally adapted to hold sald controller drum in the mid position, a solenold for operating said plunger in one direction thus rocking said controller drum, hand operated mechanism for rocking said controller drum independent of said plunger, and automatic means operated by sald hand operated mechanism for locking said plunger during the
cperation of said hand operated mechanism, substantlally as described.
43. In an apparatus of the character described, the comtination of a controller drum, of a spring impressed plunger normally adapted to hold said controller drum in the mid position, a solenoid for operating said plunger in one direction thus rocking said controller drum, hand operated mechanism for rocking said controller drum independent of said plunger, and automatic means operated by said hand operated mechanism for locking said plunger during the operation of sald hand operated mechanism, comprising a spring impressed catch automatically controlled by the hand operating mechanism, and a lug carried by the said plunger engaging said catch, when released, substantially as described.
44. In an apparatus of the character described. the combination with a controller drum, of a solenoid and a solenold plunger, means operated by said plunger for rocking the said drum, a double acting spring for restoring said plunger to the initial position when not attracted by said solenold, and irdependent hand overated means for rocking said drum in either direction independent of said solenold, substantially as described.
45. In an apparatus of the character described, the combination with a controller drum, of a solenold and a solenold plunger, means operated by said plunger for rocking the said drum, a double acting coll spring for restoring sald plunger to the inltial position when not attracted by the sald solenold, and independent hand operated means for rocking said drum in elther direction indenendent of said solenold, with automatic means controlled by sald hand oprated means for locking said plunger against the action of said solenold when said hand operated means is in operation, substantially as described.
46. In an apparatus of the character described, the combination with a controller drum, of a solenoid and a solenotd plunger, means operated by said plunger for rocking sald drum, a double acting coll spring for restoring said plunger to the initlal position when not attracted by the said solenoid, and independent hand operated means for rocking said drum in either direction independent of sald solenoid with a spring catch automatically released by the oneration of the hand operating mechanism and holding said plunger against the action of said solenold while said hand mechanism is being operated. substantially as described.
47. In an apparatus of the character described. the combination with a controller drum. of a plunger connected to said controller drum, a coll soring normallv adapted to hold sald plunger in the mid position, a solenoid for moving said nlunger in one direction thus rocking said controller dirum, hand operating mechanism for rocking said controller drum it:dependently of sald plunger. and automatic means operated by sald hand operated mechanism for locking said plunger against the action of sald solenoid during the oneration of said hand operated mechanism. substantially as described.
48. In an apparatus of the character described, the combination with a controller drum. of a plunger connected to sald controller drum. a coil soring normallv adapted to hold sald plunger in the mid position, a solenold for moving said plunger in one direction thus rocking sald controller drum, hand operating mechanism for rocking sald controller drum irdependentlv of said olunger, and automatic means operated by said hand onerated mechanism for locking said plunger against the action of said solenoid during the operation of sald hand operated mechanism. comprising a spring impressed catch antomatically controlled by the hand operating mechanism, and a lug carried by the sald plunger engaging sald catch when released. substantially as described.
49. In an apparatus of the character described, the combination with a controller drum. of a solenold and a solenold plunger, means operated by said plunger for rocking the sald drum, means for restoring sald plunger to the Initial position when not attracted by said solenoid. independent hand operated means for rocking said drum in elther direction independent of sald solenoid, and automatic means for restoring the hang operated means to the initial position after each operation, substantíally as described.
50. In an apparatus of the character described, the combination with a controller drum, of a solenoid and a solenoid plunger. means operated by said plunger to the initial position when not attracted by the said solenoid, independent hand operated means for rocking sald drum in elther direction independently of said solenoid, with automatic means controlled by seld hand operated means for locking said arum in either direction independently of said solenoid, with automatic means controlled by said hand operated means for locking said plunger against the action of said solenold mhen said hand operated means is in operation, and automatic means for restoring the hand operated means to the Initial position after cach operation, substantially as descrlbed.
51. In an apparatus of the character described, the comblation with a controller drum, of a solenold and a solenold
plunger, means operated by said plunger for rocking the said drum, means for restoring sald plunger to the Initial position when not attracted by the said solenoid, independent hand operated means for rocking said drum in either direction independently of eald solenold, and rutomatic means for restoring the hand operated means to the initial rosition after each operation, with a spring catch automatically released by the operation of the hand operating mechanism and holding said plunger against the action of said solenoid while said hand mechanism is being opsrated, substantially as described.
52. In an apparatus of the character described, the combination with a controller drum, of a spring impressed jlunger normally adapted to hold said controller drum in the mid position. a solenoid for operating said plunger in one direction thus rocking sald controller drum hand operated mechanism for rocking said controller drum independently of said plunger, and automatic means for restoring the hand operated means to the initial position after each operation, and automatic means operated by sald hand operated mechanism for locking sald plunger during the operation of said hand operated mechanism, substantially as described.
53. In an apparatus of the character described, the combination with a controller drum, of a spring impressed plunger normally adapted to hold said controller drum in the mid position, a solenoid for operating said plunger in one direction thus rocking said controller drum, hand operated mechanism for rocking said controller drum independently of said plunger, and automatic means for restoring the hand operated means to the initial position after each operation, and automatic means operated by sald hand operated mechanism for locking said plunger during the operation of said hand operated mechanism. comprising a spring impressed catch automatically controlled by the hand operating mechanism, and a lug carried by the said plunger engaging sald catch when released, substantlally.
54. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, a solenoid circuit. a solenoid and a controller drum for completing the circuit through said motor from a distance, and hand operated mechanism for completing the circuit through said motor in elther direction and dominating the solenoid control, comprising a control shaft, and a system of levers operated thereby connected to the controller drum, with a spring adapted to return the system of levers to the initial position, substantially as described.
65. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship,comprising an electric motor and gearing driven thereby for operating the door, a solenoid circuit, a solenoid, and a controller operated thereby for completing the circuit through said motor from a distance, hand operated mechanism for completing the circult through said motor in efther direction and dominating the solenold control, comprising a control shaft, and a system of levers operated thereby connected to the controlled drum, with a spring adapted to return the system of levers to the initial position. and means for automatically cutting on the current from said motor when the load on the motor exceeds a predetermined limit, substantially as described.
56. An electric apparatus for the operation of watertight bulkheard doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, a solenold circult, a solenoid, and a controller operated thereby for completing the circuit through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and domInating the solenoid control, comprising a control shaft, and a system of levers operated thereby connected to the controller drum, with a spring adapted to return the system of levers to the initial position, means for automatically cutting off the current from sald motor when the load on the motor exceeds a predetermined limit, and a signal circuit for making a signal at the distant point. with means for automatically closing said signal circuit when the door reaches the closed position, substantially as described.
57. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor and gearing driven thereby for operating the door, a solenoid circuit, a solenoid, and a controller operated thereby for completing the circult through said motor from a distance, hand operated mechanism for completing the circuit through said motor in either direction and dominating the solenoid control, comprising a control shaft, and a system of levers operated thereby connected to the controller drum, with a spring adapted to return the system of levers to the initial position, and means for automatically cutting off the current from said motor and for breaking the circuit through the solenold when the load on the motor exceeds a predotermined limlt.
58. In an apparatus of the character described the combinatin with a controller drum, of a solenoid and a solenoid plunger, means operated by said plunger for rocking the said drum, a double acting spring for restoring said plunger to the initial position when not atacted by sald solenoid, and independent hand operated means for rocking said drum in either direction independent of sald solenoid, with automatic means for interlocking said plunger with said hand operated means, thus holding said plunger agzinst the action of said solenoid, substantially as described.
59. In an apparatus of the character described the combination with a controller drum, of a solenoid and a solenoid pliunger, means operated by said plunger for rocking the drum, means for restoring sald plunger to the initial position when not attracted by said solenoid, independent hand operated means for rocking said drum in either direction independently of said solenoid. comprising a control shaft, and a system of levers operated thereby, and automatic means for restoring the hand operated means to the initial position after each operation, substantially as described.
60. In an apparatus of the character described the combination with a controller drum. of a solenoid and a solenold plunger, means operated by said plunger for rocking the said drum, means for restoring said plunger to the initial position when not attracted by said solenoid, independent hand operated means for rocking said drum in either direction independently of said solenold. comprising a control shaft, and a system of levers operated thereby, and automatic means for restoring the hand operater means to the initial position after each operation, comprising a spring impressed lever having arms co-acting with said system of levers, and restoring them to the initial position when released.
61. In an apparatus of the character described the combination with a controller drum. of a solenold and a solenold plunger, means operated by said plunger for rocking the said drum, means for restoring said plunger to the initial position when not attracted by the said solenoid, independent hand operated means for rocking said drum in either direction Independently of said solenold. with automatic means controlled by sald hand operated means for locking said plunger against the action of said solenoid when said hand operated means is in operation, and automatic means for restoring the hand operated means to the initial position after each operation, comprising a spring impressed lever having arms coacting with said system of levers. and restoring them to the initial position when released. substantially as described.
62. In an apparatus of the character described the combination with a controlling drum. of a solenoid and a solenoid plunger. means operated by said plunger for rocking the said irum. means for restoring sald plunger to the initial position when not attracted by the, said solenoid, independent hand operated means for rocking said drum in either direction independently of sald solenold, automatic means for restoring the hand operated means to the initial position after each operation. corcprising a spring impressed lever having arms co-acting with sald system of levers, and restoring them to the initial position when released. with a spring catch automatically released by the operation of the hand operation of sald solenoid while said hand mechanism is being operated. substantially as described.
63. In an apparatus of the character described the combination with a controller drum. of a soring impressed olunger normally adapted to hold sald controller drum in the midprsition, a solenoid for operating sald plunger in one direction thus rocking said controller drum, hand operated mechanlsm for rocking said controller drum independently of said plunger. antomatic means for restoring the hand operated means to the inltial position after each operation, comprising a spring impressed lever having arms co-acting with sald system of levers, and restoring them to the initial position when released, and means automatically operated by sald hand operated mechanism for locking said plunger during the operation of sald hand operated mechanism, substantlally as described.
64. In an apparatus of the character described, the combination with a controller drum, of a spring impressed plunger normally adapted to hold said controller drum in the mid position, a solenoid for operating said plunger in one direction thus rocking said controller drum. hand operated mechanism for rocking said controller drum independently of said plunger, a spring and mechanism operated thereby for restoring the hand operated means to the initial posilion after each operation. and automatic means onerated by said hand operated mechanism for locking said plunger during the oyeration of said hand operated mechanism. comprising a spring impressed catch automatically controlled by the hand operating mechanism, and a lug carried by the said plunger engaging said catch. when released, subtantially as described.
65. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship. comprising an electric motor and gearing driven thereby for operating the door, a solenoid circuit, a solenold and a controller drum
or completing the circuit through sald motor from a dislance, and hand operated mechanism for completing the circuit through said motor in either direction and dominating the solenoid control, comprising a control shaft, and a system of levers operated thereby connected to the conroller drum. and a spring impressed lever adapted to return the system of levers to the initial position, substantially as described.
66. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship. comprising an slectric motor, a controller drum with means for normally restoring the same to the initial position, gearing driven by sald motor for operating the door, means for completing the circuit through said motor, and means for automatically breaking said circuit when the load on the motor exceeds a predetermined limit. comprising a spring impressed shaft connected to or included in said gearing and yielding when the thrust thereon exceeds a predetermined limit, a lever connected to said shaft, and means operated by said lever or releasing said controlled drum, substantially as described.
67. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a controller drum, and a spring impressed plunger connected to the controller drum, a solenoid adapted to act on said plunger, gearing driven by said motor for operating the: door, means for completing the circuit through said solenoid thus operating said controller drum and closing the circuit through said motor, and means for automatically breaking the circuit both through said motor and through said solenoid when the load on the motor excceds a predetermined limit, comprising a spring impressed shaft connected to or included in sald gearing and adapted to yield when the thrust thereon exceeds a predetermined limit, a lever connected to said shaft, and means operated by said lever for releasing said controller drum and for breaking the current though sald solenoid, substantially as described.
68. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a controller drum with means for normally restoring the same to the initial position, gearing driven by said motor for operating the door, means for rocking said controller drum thus completing the circuit through sald motor, and means for automatically breaking said circuit when the load on the motor exceeds a predetermined limit comprising a spring impressed member of said gearing adapted to yield when the thrust thereon exceeds a predetermined limit, a lever connected to said member, and means operated by said lever for releasing said controller drum, substantially as described.
69. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a controller drum with means for normally rsetoring the same to the initial position, means for rocking said controller drum either from a distance or locally, thus completing the circuit through said motor, gearing driven by said motor for operating the door, and means for automatically breaking the circuit through the motor when the load on the motor exceeds a predetermined limit, comprising a spring impressed member of said gearing adapted to yield when the thrust thereon exceeds a predetermined limit, a lever connected to said member, and means operated by the said lever for releasing sald controller drum Inde pendently of the local or distant control, substantially as described.
70. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a controller drum, and a spring impressed plunger connected to the controller drum, a solenoid adapted to act on said plunger, gearing driven by said motor for operating the door, means for completing the circuit through said solenoid thus operating said controller drum and closIng the circuit through said motor, and means for auto matically breaking the circuit through sald solenoid when the load on the motor exceeds a predetermined limit. com prising a spring impressed member of said gearing adanted to yield when the thrust thereon exceeds a predetermined limit, a lever connected to said member, and means operated by said lever for releasing said controller drim and iur breaking the current through said solenoid, substantially as described.
71. An electric apparatus for the operation of watertight bulkhead doors and hatches aboard ship, comprising an electric motor, a controlling drum, and a spring impressed plunger connected to the controller drum, a solenoid adapted to act on sald plunger, means independent of said solenoid for rocking said controller drum, gearlng driven by said motor for operating the door. means for completing the circult through said solenold thus operating said controller drum and closing the circult through said motor, and means for automatically breaking the circuit both through said motor and through said solenold when the load on eth motor
xceeds a protetermined llmit, comprising a spring impressed member of said gearing adapted to yleld when the thrust thereon exceeds a predetermined limit, a lever connected to sald member, and means operated by said lever for releasing said controller drum and for breaking the current through said solenoid, substantially as described.
72. An electric apparatus for operation of watertight bulkhead doors and hatches aboard ship, comprising an eleotric motor and gearing driven thereby for operating the door, a solenold circuit, a solenoid, and a controller operated thereby for completing the circuit through sald motor from a distafice, with means for automatically restoring the concroller to the initial position when released, hand operated mechanism for operating said controller and thus completing the circuit through said motor in either direction and dominating the solenoid control, and means for automatically cutting off the current from said motor and for breaking the circuit through the solenoid when the load on the motor exceeds a predetermined limit, comprising a spring mpressed member of said gearing adapted to yield when the thrust thereon exceeds a predetermined limit. a lever connected to said member, and means operated by said l.ver for releasing said controller drum and for breaking the current through said solenold, substantially as described.
73. An electric apparatus for the operation of watertight bulkbead doors and hatches aboard ship, comprising an elecric motor and gearing driven thereby for operating the door a solenold circuit. a solenoid, and a controller operated hereby for completing the circuit through said motor from distance, with means for automatically restoring the controller to the initial position when released, hand operated mechanism for operating said controller and thus completing the circult through eaid motor in elther direction and dominating the solenoid control, and means for automatically cutIng off the current from said motor when the load on the motor exceeds a predetermined limit. comprising a spring impressed shaft included in said gearing and adapted to yield when the load on the motor exceeds a predetermined limit, a cuer connected to said shaft, and means operated by said lever for releasing the controller substantially as described
74. In an apparatus of the character described the combin-
ation with a controller drum. of a solenoid and a solenoid plunger, means operated by said plunger for rocking the said lrum, means for restoring said plunger to the initial posiion when not attracted by sald solenoid. Independent hand operated means for nocking said drum in either direction independently of saitd solenoid, automatic means for rotating the hand operated means to the initial position after each peration, and mechanism for automatically releasing said ontroller drum from either the hend control or the solenold control, when the load on the motor exceeds a predetermined limit, substantially as described.
75. In an apparatus of the character described the combination with a controller drum, of a solenold, means operated ty said solenoid for rocking the said drum, means for automatically restoring said drum to the initial position. Independent hand operated means for rocking sald drum in either direction independently of said solenoid, automatic means for cotating the hand operated means to the initial position after ach operation, and mechanism for automatically releasing said controller drum from elther the hand control of the solenoid control, when the load of the motor exceeds a predetermined limit, substantially as described.
76. In an apparatus of the character described the combination with a controller drum, of a solenold and a solenoid plunger, means operated by said plunger for rocking the said drum, means for restoring said plunger to the initial position when not attracted by the solenold, hand operated means for rocking said drum in either direction independent ly of said solenold, with automatic means controlled by said hand operated means for locking said plunger against the action of sald solenold when said hand operated means is in operation. and automatic means for restoring the hand operated means to the initial position after each operation, comarising a spring impressed lever having arms co-acting with prising a spring impressed lever having arms co-actiag with tion when released, and mechanism for automatically releasing said controller drum from either the hand control or the solenold control when the load on the motor exceeds a pre determined llmit. substantially as described.
77. In an apparatus of the character described. the combination with a controller drum, of a solenold and a solenoid plunger, means operated by said plunger for rocking the said drum, means for restoring said plunger to the initial position when not attracted by the satid solenoid, hand operated neeans for rocking said drum in either direction independent ly of sald solenold, automatic means for restoring the hand operated means to the inltial position after each operation. comprising a spring impressed lever having arms co-acting vith sald system of levers, and restoring them to the initial position whin released, with a spring catch automatically
released by the operation of the hand operating mechanism and holding said plunger against the action of said solenoid while said hand mechanism is being operated, and mechanism for automatically releasing said controller drum from either the hand control or the solenoid control, when the load on the motor exceeds a predetermined limit, substantlally as described.
78. In an apparatus of the character described, the combination with a controller drum, of a spring impressed plunger normally adapted to hold said controller drum in the mid position, a solenoid for operating said plunger in one direction thus rocking said controller drum, hand operated mechanism for rocking said controller drum independently of said plunger, automatic means for restoring the hand operated means to the initial position after each oper ation comprising a spring impressed lever having arms co acting with said system of levers, and restoring them to the initial position when released, means automatically oper ated by sald hand operated mechanism for locking sald plunger during the operation of said hand operated mechanism, and mechanism for automatically releasing said con troller drum either from the hand control or the solenoid control, when the load on the motor exceeds a predetermined limit, substantlally as described.
79. The combination with a bulkhead door or hatch and means for operating the same electrically from a distant point, of a signal located at the distant point, means for uperating said signal consisting of an electric circuit leading from the distant point to the door, a bell crank pivoted to the door frame and adapted to open and close the circuit to the signal, and an arm carried by the door and adapted to strike said bell crank and close said circuit when the door reaches the cldsed and locked position, substantially as described
80. The combination with a bulkhead door or hatch and means for operating the same electrically from a distant pcint, of a signal located at the distant point, means for operating said signal consisting of an electric circuit leading from the distant point to the door, a bell crank plvoted to the door frame and adapted to open and close the circuit to the signal, and an arm carrled by the door and adapted to strike said bell crank and close said circuit when the door reaches the closed and locked position, with a spring nor mally throwing the sald bell crank to the open circuit position when the door is raised from its seat, substantially as described.
81. The combination with a bulkhead door or hatch and means for operating the same electrically from a distant point, of a signal located at the distant point, means for operating said signal consisting of an electric circuit leading from the distant point to the door, a bell crank pivoted to the door frame and adapted to open and close the circuit to the signal, and an arm carried by the door and adapted to strike said bell crank and close said circuit when the door reaches the closed and locked position, and a coil spring mounted on the pivot of said bell crank lever and adapted to throw the same to the open circuit position when the door is lifted from its seat, substantially as described

S2. A tightening device for use on watertight bulkhead door, comprising a wedge bracket secured to the door frame, and a wedge button having a rounded face detachably connected to the door, substantially as described.

No. 101,348. Fuel Feeding Devioe.
Apparcil dalimentation de combustible.

Susan V. Cooke, Rochester, New York, U.S.A., 2nd October. 1:06; 6 years. Filed 5th May, 1906. Recelpt No. 135.608. Claim.-1. In an automatic fuel feeder the comblnation with a fuel supply. of a spout adapted to discharge fuel upon
the grates, means for conveying fuel from sald supply to said spout, and means for automatically oscillating the discharge end of the spout at angles with both the horizontal and vertical planes.
2. In an automatic fuel feeder the combination with a fuel supply, a spout adapted to discharge fuel upon the grates means for conveying fuel from said supply to said spout, means for automatically oscillating the discharge end of the spout at angles with both the horizontal and vertical planes, and an automatic feeding device, whereby fuel is fed to said conveyer from said supply.
3. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates means for conveying said fuel from said supply to said sprout, means for automatically oscillating the discharge end of the spout at angles with both the horizontal and vertical planes, an automatic feeding device, whereby fuel is fed to said conveyer from said supply, and means for regulating the reed.
4. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, means for automatically oscillating the discharge end of the spout at angles with both the horizontal and vertical planes, an automatic feeding device, a driven wheel, and driving connections between said driven wheel and both sald conveying means and said means for oscillating said spout.
5. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel into the firebox, and having its mouth at an angle with its axis, means for conveying fuel from said supply to said spout, and means for automatically both rocking said spout and oscillating its mouth vertically.
6. In an automatic feeder the combination with a fuel supply of a spout adapted to discharge fuel into the fire box, and having its mouth at an angle with its axis, means for conveying fuel from said supply to said spout, means for automatically both rocking and vertically oscillating said spout. a driven wheel, and driving connections between said wheel and both the said means for rocking said spout and those for oscillating it vertically.
7. In an automatic fuel feeder the combination with a fuel supply. of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to sald spout. a rotative support for said spout having a pivotal connection therewith, means for independently oscillating said spout and its support whereby fuel is discharged from the spout upon the grates in zigzag course.
8. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, a rotative support for said spout, having a pivotal connection therewith, a driven wheel, and connections between said driven wheel and said spout and its said support respectively, whereby said spout and its said support are independently oscillated to discharge fuel upon the grates in zigzag course.
9. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, a rotative support for said spout, having a segmental gear and a pivotal connection with said spout, a driven wheel, and connections between said driven wheel and said spout and said segmental gear respectively, whereby said spout and its said support are independently oscillated to discharge fuel upor the grates in zigzag course.
10. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, a rotative support for said spout having a pivotal connection therewith, a lever arm attached to sald spout, a driven wheel, and connections between said driven wheel and said lever arm and said support respectively, whereby said spout is reciprocated and its said support is rocked.
11. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from sald supply to said spout, a rotative support for said spout, a ring pivotally supported within said support, means for detachably securing said spout to said ring, and means for rocking said support and reciprocating said spout.
12. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, a rotative support for said spout. a ring pivotally supported within said support, adjustable means for attaching said spout to sald ring, whereby the direction in which fuel is discharged therefrom is determined, and means for rocking said support and reciprocating said spout.
13. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said
spout, the rotative ring support 42, having the segmental gear 45, and a pivotal connection with said spout, a bearing for said ring, the lever arm 52 attached to said spout, and means operating upon sald segmental gear and said lever arm respectively. for oscillating said spout.
14. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, the rotative ring support 42, having the segmental gear 45, a support for sald rotary ring, the ring 46 pivotally supported within said ring 42, means for attaching said spout to the ring 46 , means for reciprocating sald spout, and ineans for rocking the ring 42.
15. In an automatic fuel feeder the combination with a inel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, the rotative ring 42, baving the segmental gear 45, and a pivotal connection with said spout, a support for said ring, the lever arm 52 attached to said spout, the drive wheel 62, and operating connections between said wheel 62 and the segmental gear 45 and said lever respectively, Whereby said spout is both reciprocated vertically and rocked.
16. In an automatic fuel feeder the combination with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, the rotative ring 42 having the segmental gear 45 and a pivotal connection with said spout, a support for sald ring, the lever arm \(5 \overline{2}\) attached to said spout, the driven wheel 62, and operating connections between said wheel 62 and the segmental gear 45, and said lever respectively, whereby said spout is both reciprocated vertically and rocked, and means for adjusting the rotation of said ring 42.
17. In an automatic fuel feeder the combluation with a fuel supply, of a spout adapted to discharge fuel upon the grates, means for conveying fuel from said supply to said spout, the rotative ring 42 having the segmental gear 45 and a pivotal connection with said spout. a support for said ring, the lever arm 52 attached to said spout, the driven wheel 62, and operating connections between said wheel 62 and the segmental gear 45 , and sald lever, respectively, whereby said spout is both reciprocated vertically and rock--d, and means for adjusting the throw of said lever arm 52 . 18. In an automatic fuel feeder the combination with an fuel supply of means for conveying fuel from said supply to the frebox of a furnace or boiler, a separate spout as a part of said conveying means through which the fuel is discharged, means for pivotally supporting said spout at one end, and means for automatically oscillating the discharge end of said spout at angles with both the horizontal and vertical planes, so that the fuel is discharged therefrom upon the grates in zigzag course.

\section*{No. 101,349. Graphite Separator.} Séparateur de plombagine.

John H. Davis, Merritt Aimes and William E. Baldwin, each an assignee of a fourth interest, all of Glen Falls. New York, U.S.A., 2nd October, 1906; 6 years. Flled 21st March, 1906. Recelpt No. 134,137.
Claim.-1. A graphite separator comprising a main trough. means for fecding graphite ore and water thereto, means for maintaining a water lever in the rtough, and a series of partitions in the trough, each provided with a separating plate having its front end located just below said water level, each of sald plates being provided with means for carrying away fine sand and mud from a point near the surface of the water.
2. A graphite separator comprising a main trough, means for feeding graphite ore and water thereto means for maintaining a water lever in the trough, and a series of partitions in the trough each provided with a separating plate having its front end located just below said water level, each of said plates being provided with means for carrying
away fine sand and mud from a point near the surface of the water and each of said plates being located at a lower Irvel than those between it and the point at which the ore enters.
3. A graphite separator comprising a main trough, means for feeding graphite one and water thereto, means for maintaining a water level in the trough, a series of partitions in the trough each provided with a separating plate having its front end located just below said water level. a ach of said plates being provided with means for carrying away fine sand and mud from a point near the surface of the water and a dam located beyond the last plate and extending downwardly from a point above it
4. A graphite separator comprising a trough having a partition, means for maintaining a water level in the trough and a plate located upon said partition and projecting inwardly therefrom, the upper surface of said plate being incllned. sald plate being provided with means for collecting ?nd discharging fine sand and mud from a point just below the water level.
5. A graphite separator comprising a trough having a partuon, an inclined plate located on said partition, said plate having a passage opening from a point just below the water level, and means for conveying water from said passage to the outside of the trough.
6. A graphite separator comprising a trough having a partition, a plate located adjacent to said partition and projecting inwardly therefrom, the upper surface of said plate being inclined and the plate being provided with means for collecting and discharging flne sand and mud from a point just below the water level.
