9. In devices for controlling water supply, and in combination, a regulating chamber comprising a lower box and an upper conical chamber, an inlet and outlet pipe having its inlet end in said chamber, a movable cylinder suspended in said chamber forming a sluice for said inlet. means for balancing said cylinder, and means connected with said cylinder whereby the movement of the latter is controlled to keep constant the water supply.
10. In devices for controlling water supply, and in combination, a regulating chamber, an inlet and outlet pipe having its inlet end in said regulating chamber, a movable cylinder suspended in said conical chamber forming a sluice for said inlet, means for balancing said cylinder whereby the movement of the latter is controlled to keep constant the water supply.
11. In devices for controlling water supply, and in combination, a regulating chamber comprising a lower box and an upper conical chamber, an inlet and outlet pipe having its inlet end in said regulating chamber, a movable cylinder suspended in said conical chamber forming a sluice for said inlet, means for balancing said cylinder, and means comprising an inner cylinder rigidly attached within said movable cylinder and projocting into said inlet pipe, and a cone fiustum carried by said inner cylinder for controlling the movement of both the inner and movable cylinders to keep cocstant the supply of wate.
12. In a device for controlling water supply, and in combination, a regulating chamber comprising a lower box and an upper conical chamber, an inlet and outlet pipe having its inlet end in said regulating chamber, a movable cylinder suspended in said conical chamber forming a sluice for said inlet, a separate cylindrical chamber adjacent to the regulating chamber, an adjustable balance weight located in said cylindrical chamber, a balanced lever connecting said balance weight and said movable cylinder, and means in connection with said movable cylinder for controlling the movement thereof to keep constant the supply of water.
13. In devices for controlling water supply, and in combination, a regulating chamber having an inlet on the supply side and an outlet on the outfall side, discharge notches, movable cylinders in connection with said chamber, means for balancing said cylinders. means for controlling the movement of said cylinders to keep constant the supply of water to the chamb \({ }^{2} \mathrm{r}\), an outfall pipe, and means for regulating the opening of said discharge notches, and means for gauging and indicating the amount of the water supply.
14. In devices for controlling water supply, and in combination, a regulating chamber, a supply inlet in said chamber, a movable cylinder adjacent said chamber forming
a sluice to close said inlet, a fulcrumed lever to which said movable cylinder is attached, a balance welght suspended from said lever, means for adjusting said weight, a dash pot device in connection therewith, a second balance lever attached to said balance weight, means attached to the second lever whereby the movement of the movable cylinder is controlled to keep constant the supply of water an outfall pipe acting in conjunction with said means notches acting in conjunction with said outiall pipe and means for regulating the amount of opening of said notches to regulate the supply of water therethrough.
No. 101,910. Method of Making Stitches.

\section*{Méthode de faire des points à l'aiguille.}

Fred. La Chapelle, Lynn, Massachusetts, U.S.A., 6th November, 1906; 6 years. Filed 24th September, 1906. Receipt No. 139,744.
Claim.-1. A sewed seam comprising a compound article or plece of work composed of two or more layers, a series of loops drawn through the work and connected at their bases by stretches of thread integral with the loops and bearing against one face of the work, loops encircling the bases of the first-mentioned loops, and stretches of an extra thread integral with the second-mentioned loops.
2. A sewed seam comprising a compound article or piece of work composed of two or more layers, a series of loops drawn through the work and connected at their bases by stretches of thread integral with .the loops and bearing against one face of the work, said loops being enchained on the other face of the work, loops encircling the bases of the first-mentioned loops, and stretches of an extra thread inuegral with the second-mentioned loops.
3. A method for forming a seam, consisting in forming a loop of an extra thread, inserting a hooked needle through the material and by said needle drawing a loop of a main or needle thread through said loop of extra thread and through the material.
4. A method for forming a chain stitch seam, consisting in repeatedly forming a loop of an extra thread, and drawing a loop of a main or needle thread through said loop of extra thread and through a previously formed loop of sald main or needle thread.
5. A method of making chain stitches consisting in forming a loop of an extra thread, drawing a loop of a main or needle thread through said loop of extra thread and through the materials, forming a second loop of said extra thread, and drawing a second loop of said main or needle threail through said second loop of extra thread, through sald materials and through the first loop of main or needle thread, substantially as described.

\section*{No. 101,911. Leather Sewing Machine.}

\section*{Machine a coudre le cuir.}

Fred La Chapelle, Lynn, Massachusetts, U.S.A., 6th November, 1906; 6 years. Filed 24th September, 1906. Receipt No. 139,745.
Claim.-1. In a shoe sewing machine, complemental stitch forming mechanism for successively forming loops of sewing thread, and means for forming about the bases of said loops other loops of an auxiliary or extra thread.
2. In a shoe sewing machine, complemental stitch forming mechanism including a hooked needle for successively forming loops of the sewing thread in combination with an auxiliary instrument for olling or looping on the side of the work away from the needle, a loop of an auxiliary or exthe work away from the needle, a loop of an auxilary through which the loop of the nedede thread is
thre drawn.
3. In a chain stitch shoe sewing machine, complemental stitch forming mechanism, including a hooked needle for
successively forming enchained loops of the sewing thread, in combination with an auxiliary instrument for forming
outside of the housing, a rope having at one end a weight and connected at its other end to the stem, guide pulleys for

the rope, a doorway in the housing and a door therein connected to the rope between the stem and the weight.

No. 101,913. Door Check and Closer. Arrête-porte.

George W. Mallory, Blenheim Kent, Ontario, Canada, 6th November, 1906; 6 years. Filed 23rd November, 1905. Recelpt No. 130,348.
Claim.-1. The combination of a casing, a movable member guided in said casing, means yieldingly connecting aaid member and casing, a pivoted dog carried by the movable member and means on the door adapted to trip the dos and co-operating therewith to close the door.
2. In a door check and closer the combination with a base or casing, of a movable member in said casing, a spring connecting said member and casing, a pivoted dog carried by the movable member to lock the same in one position against the action of the spring and a plate carried by the doar and adapted to trip the dog to close the door.
3. In a door check and closer the combination with a base or casing, of a member movable in said casing, a spring connecting said member and casing, a dog pivoted on the movable member and co-operating with the casing to lock said member in one position, fingers on said dog, and an aper tured plate carried by the door co-operating with said fingers to trip the dog.
4. In a door check and closer the combination of a supporting base or casing adapted to be secured to a door casing. a movable member in said casing, a pivoted dog carried by the movable member and co-operating with the casing to lock said member in one position, fingers on the dog, a plate carried by the dool co-operating with said Angers to trip the dog and a spring to return the parts to their normal position upon the release of the dog.
5. In a door check and closer the combination of a base plate formed with guides, a slide mounted ir said guides, a dog pivoted in said slide and adapted to engage the base plate, a spring connecting the slide and base plate and a plate on the door adapted to trip the dog.
6. In a door check and closer the cuinbination of a base plate formed with guldes, a slide mounted in said guides, a pivoted dog adapted to engage the base plate carried by said slide, a spring connecting the slide and base plate, and an apertured plate carried by the door co-operating with said dog to release the same and hold the door closed.
7. In a device of the character described the combination of a base plate formed with guides, a slide formed by doubling the metal upon itself arranged to travel in said guides, a spring connecting the slide and base plate, a dog pivoted in the slide and adapted to engage the base plate, to hold the spring under tension, an apertured plate carried by the door and fingers on the dog co-operating with said plate to trip the dog.
8. In a device of the character described the combination of a base plate formed with guides, an apertured slide formed by doubling the metal upon itself and with lateral flanges travelling in said guides, a dog formed with fingers pivoted in sald doubled over portion of the slide with one of its fingers projecting through said aperture, a shoulder on the dog co-operating with a lip on the base plate, a coil spring connecting the adjacent end of the base plate and slide and an apertured plate on the door co-operating with sald fingers to trip the dug.
9. In a device of the character described the combination of a base plate adapted to be secured to the door casing and formed with guides, an ear at one end and shoulders forming spurs at the opposite end of said plate, a lip intermediate said shoulders, a slide travelling in sald guides, a dog havIng a shoulder co-operating with sald lip pivoted on the slide, a spring connecting said sllde and ear, fingers on the dog and an apertured plate co-operating with sald fingers to trip the dog.
10. In a door check and closer the combination of a base plate adapted to be secured to the door casing and formed with guldes on opposite sides, an apertured ear at the end of said base plate and shoulders terminating in spurs adapted to be driven into the door jam at the opposite end, a lip intermediate said shoulders, an apertured slide formed by doubling the metal upon itself and with lateral flanges travelling in said guides, a dog pivoted in said doubled over portion of the slide and formed with fingers one of which projects through sald aperture, a shoulder on the dog cooperating with said lip. a coll spring connecting said slide and ear to retract the slide, stops to limit the return movement of the slide and an apertured plate carried by the door co-operating with said fingers to trip the dog.

No. 101,914. Door Catch. Arrete-porte.

George W. Mallory, Detroit, Michigan, U.S.A., 6th November. 1906; 6 years. Filed 27th April, 1906. Recelpt No. 135,322. Claim.-1. In a device of the character described the combination of a base plate adapted to be secured to a door casing, of a housing guided on said plate, a spring interposed between the rear wall of the housing and a shoulder on the base plate, a dog pivoted in the housing and co-operating with the base plate and a plate carrled by the door adapted to trip the dog.
2. In a device of the character described the combination \(0:\) a base plate formed with guides adapted to be secured to a door casing, of a housing movable in said guides, a wall on tho base plate, a coil spring interposed between said wall and the rear wall of the housing, a dog pivoted in the housing and co-operating with the base plate to lock the housing in one position, fingers on said dog and an apertured plate carried by the door co-operating with said fingers to trip the dog.
3. In a device of the character described the combination o' a basc plate formed with longitudinal guides, a housing firined with lateral flanges sliding in said guides, a spring for normally holding sald housing retracted, a dog formed with ingers pivoted in the housing, a shoulder on sald dog
co-operating with the base plate and an apertured plate on the door co-operating with said fingers to trip the dog.
4. In a device of the character described the combination of a base plate formed with guides, a housing formed with lateral flanges travelling in said guides, a dog pivoted in said housing, a shoulder on said dog co-operating with a lip on the buse plate, a coil spring within the housing for normally holding the same retracted, a lever for locking the housing in its retracted position and a plate on the door to trip the dog.
5. In a device of the character described the combination of a base plate formed with guides along its sides and stops at one end, shoulders terminating in spurs at its opposite end and a wall struck up from the base plate at its middle, a rousing movable in said guides, a coll spring interposed between said wall and the rear wall of the housing. a dog pivoted in the housing and co-operating with the base plate, fingers on said dog, an apertured plate carried by the door co-operating with sald fingers to trip the dog and a lever for lociking sald housing.
6. In a device of the character described the combination of a base plate formed with guides and a transverse wall struck up therefrom, a housing formed with lateral fanges travelling in said guides, a coil spring interposed between said wall and the rear wall of the housing having a slot formed therein, a dog pivoted in the housing on a transverse pin, a slotted lever projecting through said slot and loosely engaing sald pin, a finger piece and a locking lug on the free end of said lever co-operating with an aperture in the base plate to lock the housing in its retracted position and a lug in said slot frictionally engaging said lever.
7. In a device of the character described, a base plate, \(a\) movable member gulded on said plate, a dog formed with firgers plvoted in the movable member and adapted to hold said member in its projected position, a spring for holding said member in its retracted position, and an apertured plate co-operating with the fingers to trip the dog and formed with a curved base adapted to be secured to a door.

\section*{No. 101,915. Hydrant. Bornc-fontaine.}

Walter Scott Phelps, Muncie, Indiana, U.S.A., 6th November.
1906; 6 years. Filed 24th July, 1906. Recelpt No. 138,120.
Claim.-1. A hydrant including a valve box having a cham\(b \in r\) therein to receive from a supply pipe, a valve cylinder extending through the chamber and having long ports opening into the chamber and also relatively shorter ports opening into the main portion of the valve box exterior to the chamber, and a valve movable in the valve cyllader and haring two pistons spaced apart a distance approximately equal to the length of elther of the long ports.
2. A hydrant including a valve box having a chamber therein to receive from a supply pipe, a main valve cylinder extending through the chamber and having ports thereln. a basin at the bottom of the valve box, a draln valve cylinder attached to the bottom of the basin, a drain valve cylinder supported by bridges in the basin, and a main valve in the main valve cylinder and having a drain valve attached thereto and extending through one end into the other one of the drain valve cylinders.
3. A hydrant including a valve box having a main ralve therein and a basin below the valve, a drain valve attached to the main valve and having a bore therein and a lateral port to the bore, a drain valve cylinder in the basin, a drain valr. rylinder beneath the basin, a stand pipe attached to the valro box, a rotative shaft mounted in the wall of the stand pipn and carrying a crank pin, and operative connections between the main valve and the crank pin.
4. A hydrant including a valve box having a basin in the bottom thereof, a main valve cylinder in the valve box, a drain valve cylinder in the basin of the valve box, a drain valve cylinder beneath the basin of the valve box, a main valve in the main valve cylinder, a drain valve attached to the main valve and extending through one and into the other one of the drain valve cylinders, the drain valve being open when the main valve is closed and closed when the main valve is open, a standpipe attached to the valve box and having a receiving chamber therein, an alr chamber below the receiving chamber, an air chamber above the receiving chamber, a guide in the top of the standpipe, a valve rod attached to the main valve and extending into the guide, a rotative shaft mounted in the standpipe and carrying a crank pin, and a connecting rod pivotally connected to the crank pin and also with the valve rod.

No. 101,916. Valve. Soupape.

John Thomas Wilson, Jersey Shore, Pennsylvania, U.S.A., 6th November, 1906; 6 years. Filed 27th July, 1906. Receipt No. 138,194.
Claim.-1. The combination with a steam chest and a cylinder provided with a valve seat having steam inlet ports to the cylinder and an exhaust port, of a slide valve, a balance plate, and a pressure plate. packing strips being located between the balance plate and pressure plate to form two inclosed spaces, one at each side of the balance plate, and to exclude from steam pressure the central portion of the balance plate, and said balance plate having ports communicating with the said two inclosed spaces whereby steam may be admitted to and discharged from said inclosed spaces simultaneously with the admission of steam to and its discharge from the cylinder ports.
2. The combination with a steam chest having a removable cover and a cylinder provided with a valve seat having steam inlet ports to the cylinder, and an exhaust port, of a slide valve, a balance plate, a pressure plate, and bolts for holding the pressure plate relative to the removable cover, packing strips being located between the balance plate and pressure plate to form two inclosed spaces one at each side of the balance plate, and exclude from steam pressure the central portion of the balance plate, and said balance plate having ports communicating with the said two inclosed spaces whereby steam may be admitted to and discharged from said inclosed spaces simultaneously with the admission of steam to and its discharge from the cylinder.
3. The combination with a steam chest and a cylinder provided with a valve seat having steam inlet ports to the cylinder and an exhaust port, of a slide valve, a balance plate, and a pressure plate, packing strips 27 and 30 and all said strips being located between the balance plate and the pressure plate to form two inclosed spaces, one at each side of the balance plate and to exclude from steam pressure the central portion of the balance plate. and said balance plate having ports communicating with the said two inclosed spaces whereby upon the reciprocation of the slide valve steam may alternately be admitted to and discharged from said inclosed spaces.
4. The combination with a steam chest, and a cylinder provided with a valve seat having steam inlet ports to the cylinder and an exhaust port, of a slide valve, a balance plate, and a pressure plate, packing strips 27 and 30 being located between the balance plate and the pressure plate within channels formed within one of the sald plates, to form two inclosed spaces, one at each side of the balance plate, and to exclude from steam pressure the central portion of the balance plate, and said balance being provided with ports communicating with the sald two inclosed spaces, for the purpose set forth.
5. The combination with a steam chest, and a cylinder provided with a valve seat having steam inlet ports to the cylinder and an exhaust port, of a slide valve, a balance plate, and a pressure plate, packing strips 27 and 30 being located between the balance plate and the pressure plate and within channels formed in one of said plates, and openings for admitting steam to the backs of the two strips 27 and 30 being provided, and sald balance plate having ports communicating with each inclosed space formed at the sides of the balance plate by the sald packing strips. in substance as set forth.
6. The combination with a steam chest and a cylinder provided with a valve seat having steam inlet ports and an exhaust port, of a slide valve, a balance plate above said valve, and means for forming two inclosed spaces above the balance plate and for excluding from steam pressure the central portion of the balance plate, said means embracing end packing strips 27 . side packing strips 30 . and an element with a horizontal surface between which surface and the balance plate said packing strips are located, said balance plate being nrovided with ports communicating with the said two inclosed spaces, whereby upon the reciprocation of the valve steam may simultaneously be admitted to and discharged from a cylinder port and one of the inclosed spaces.

\section*{No. 101,917. Artificial Stome. Pierre artifotelle.}

The Lithographic Stone and Marble Company, London assignee of Thomas Matheson Thom, Cheshunt. Hertfordshire, both in England, 6th November, 1906; 6 years. Filed 13th July, 1906. Receipt No. 137,765.
Claim.-A process for producing artificial stone in imitation of natural building stone which consists in so crushIng fragments of natural stone and screening the crushed mass as to obtain the constituent granules as they occur in said natural stone, mixing said granules with line with or without colouring medium, slaking the mixture, moulding the same, drying the moulded blocks and finally indurating the latter with carbonic acid gas, substantially as described.

No. 101,918. Bust Snpporter. Support de buste.

Johannes Brec. Charlottenburg, Prussia, Germany, 6th November, 1906; 6 years. Filed 9th December, 1905. Receipt No. 130,850.
Claim.-1. Bust supporter with two back parts consisting of thin and stiff material applled to the female body, which back parts are combined to each other by elastic straps and also connected by elastic straps with the longside edges and with the two tips of the cages going across the shoulders, the cages enveloping the breasts, and connected by elastic straps with an elastic girdle which latter can be tightened and loosened.
2. Bust supporter with two back parts consisting of thin and stiff material applied to the female body, which back parts, combined to each other by elastic straps, which straps are kept apart by a bridge, are connected by elastic straps at the outside edges and upper edge with a horizontal support girdle for the breasts and at their lower edge with a girdle that can be tightened and loosened.

No. 101,919. Tooth Brash. Brosse d dents.

Lavitt Havelock Crowell, Hallfax. Nova Scotia, Canada, 6th November, 1906; 6 years. Filid 23rd January, 1906. Receipt No. 132.164.
Claim.-1. A tooth brush comprising a head and a handle, a shield removably disposed adjacent the head, and means for locking the shield in place.
2. A tooth brush comprising a head. a handle. a shield provided with an opening through which the handle may be inserted, and means for fllling the space between the handle and the walls of the opening
3. A tooth brush comprising a head, a handle, a shield provided with an opening through which the handle may be inserted, and resillent means for filling the space between the handle and the walls of the opening.
4. A tooth brush comprising a head, a handle, a shicld provided with a central opening through which the handle may be inserted, and a rubber gasket disposed in the opening and provided with fianges.
5. A tooth brush comprising a head, a handle in screwthreaded engagement with the head, and a shield carried by the handle.
6. A tooth brush comprising a head provided with an interiorly screw-threaded socket, a handle provided with a reduced end having exterior screw-threads and a shield carried by the handle
7. A tooth brush comprising a head having an interiorly screw-threaded socket. a handle having a reduced end leaving shoulders and having a portion of its reduced end provided with screw threads, and a shield provided with a central hub disposed on the non-screw-threaded portion of the reduced end of the handle and held in place by the shoulders.

No. 101,920. Apparatus for Distilling Fluid.
Appareil d distiller les tuides.

Josef Fischer, Vienna. Austria, 6th November. 1906; 6 years. Flled 26th July. 1905. Receipt No. 127,213.
Claim.-1. In an apparatus for the continuous distillation of fuids, a heater casing containing upright partitions spaced apart and connected with each other alternately at their tops and bottoms, and thereby forming a plurality of fluid chambers open at their tops and closed at their bottoms and alternating with heating chambers closed at their tops and open at their bottoms.
2. In an apparatus for continuous distribution of fulds. a heater casing containing upright partitions spaced apart and arranged parallel to each other, said partitions being connected with each other alternately at their tops and bottoms, and thereby forming a plurality of fluid chambers open at their tops and closed at their bottoms and alternating with heating chambers closed at their tops and open at their bottoms.
3. In an apparatus for continuous distillation of fluids, a heater casing containing upright partitions spaced apart and connccted with each other alternately at their tops and botoms and therrby forming a plurality of fluid chambers open at their tops and closed at their bottoms. sald fuid chambers connected by passages arranged in the direction of flow of the liquid, and alternating with heating chambers closed at their tops and open at their bottoms.
4. In an apparatus for continuous distillation of fluids. a heater casing containing upright partitions spaced apart and connected with each other alternately at their tops and bottoms and thereby forming a plurality of fluld chambers open at their tops and closed at their bottoms and alternating with heating chambers closed at their tops and open at their bottoms, in combination with a heating canal arranged underneath the partitions referred to and opening to the heating chambers mentioned.
5. In an apparatus for continuous distribution of fluids, a heater casing containing upright partitions spaced apart and ronnected with each other alternately at their tops and bottoms and thereby forming a plurality of fluid chambers open a their tops and closed at their bottoms and alternating with heating chambers closed at their tops and open at their bottoms, in combination with a neating canal arranged underneath the partitions referred to and opening to the heating chambers mentioned and with a vertical partition in said canal and extending upwardly into a heating chamber.
6. In an apparatus for continuous distribution of flulds. a heater casing contalning upright partitions spaced apart and connected with each other alternately at their tops and bottoms and thereby forming a plurality of fluid chambers open at their tops and closed at their bottoms and alternating with heating chambers closed at their tops and open at their bottoms, in combination with a heating canal arranged underneath the partitions referred to and opening to th. heating chambers mentioned, a discharge outlet for the fluid chambers and additional discharge outlets connectid with the bottoms of the aforesaid fluid chambers.
7. In an apparatus for continuous distillation of fluits. a heater casing containing upright partitions spaced apart an! connected with rach other alternately at their top and bottoms and thereby forming a plurality of fluid chambers op. f at their tops and closed at their bottoms and alternating with heating chambers closed at their tops and open at th. :1 bottoms, in combination with a heating canal arranged al the bottom of the apparatus and opening to the heating chambers mentioned. said fluid chambers extending downwardly into the heating canal.
8. In an apparatus for continuous distillation of fluids. a connected succession of -devices each comprising a heater casing contalning upright partitions spaced apart and connected with each other alternately at their tops and bottoms and thereby forming a plurality of fluid chambers open at thrir tops and closed at their bottoms and alternating with hrating chambers closed at their tops and open at their bottoms. in combination with a feed canal common to the several devices and with a discharge canal common to the several devices.

\section*{No. 101,921. Apparatng for Burning Powdered Fuel.}

\section*{Appareil d brîler le combustible en poudre.}

Robert Donald Hassan, Ottawa, Ontario, Canada, 6th November, 1906; 6 years. Flled 19th May, 1906. Receipt No. 136,081.
Claim.-1. In apparatus for burning powdered fuel the combination with the combustion chamber, a bridge wall at the rear thereof hi:ving an Inclined surface of a nozzle cxtending through the front wall of the combustion chamber. and inclined at such angle that the particles passing therethrough will impinge substantially normally on the bridge wall, an air supply connected to the nozzle, a fuel conveying pipe entering into said air supply pipe and means in said conveying pipe for regulating the passage of the fuel therethrough, as and for the purpose speclfed.
2. In apparatus for burning powdered fuel the combination with the combustion chamber, the air supply pipe leading thereto and the bin contalning the powdered fuel. of a conveying pipe extending from the bln to the air supply pipe. a spiral conveyer operating therein, a second fuel bin locsted above the first-mentioned bin, a passage connecting the two, means for closing and opening the passage, and a conducting pipe for the waste gases leading from the furnace to the second fuel bin, as and for the purpose specified.
3. In apparatus for burning powdered fuel the combination with the combustion chamber, a bridge wall at the rear

thereof having an inclined face, of a nozzle extending through the front wall of the combustion chamber and so inclined that the particles passing therethrough will impinge substantially normally in the bridge wall, an air supply pipe connected to said nozzle, a fuel bin, a conducting pipe leading from the fuel bin into the air supply pipe, a spiral conveyer operating therein, a second bin located above the first, a passageway between the two bins, means for opening and closing the same and a conducting pipe for the waste gases leading from the furnace to the second bin, as and for the purpose specified.
4. In apparatus for burning powdered fuel the combination with the furnace, apparatus for feeding the powdered fuel thereto and the receptacle containing the powdered fuel of a conducting pipe for the waste gases leading from the furnace to the receptacle containing the powdered fuel, as and for the purpose specified.

No. 101,922. Coiling Mechanism. for Flezible Condnctors.
Mécanisme à enrouler les conducteurs flexibles.

\(n\)
\(\alpha\)
\(\alpha\)
2
2

Samuel Quincy and Charles Harrison, co-inventors, 136 Kentish Town Road, London, England, 6th November, 1906; 6 years. Filed 26th December, 1905. Receipt No. 131,300.
Claim.-1. Means for adjusting the effective length of a flexible connector adapted to conduct gas or other fluid or electricity from one place to another, wherein the connector is secured at one end and is colled upon a drum adapted to be held stationary, and is led away past a rotary winding device that is connected to the drum through the spring, the arrangement being such that when the connector is pulled, it will be unwound from the drum, and will rotate the winding device against the action of the spring, which will act to rotate the said winding device in the opposite direction, and wind the connector around the drum when the connector is relieved from the pull thereon.
2. Means for adjusting the effective length of a flexible connector, comprising a drum adapted to be fixed to a gas or other supply main. a flexible connector adapted to be secured at one end to the said main, and having its other end adapted to carry a desired fitting, a rotary part or winder adaptedto coil the connector on the drum, and between the drum and winder, a spring adapted to be wound up when the winder is rotated in one direction by a pull on the connector, and to rotate the winder so as to coil or wind the connector around the drum when the connector is relieved from weight. substantially as described.
3. Means for adjusting the effective length of a flexible connection in which the flexible connector passes from the stationary drum, through a hole or eye in the rotary winder which revolves adjacent to one end of the drum, a curved bridge piece or equivalent carried by the winder being provided for supporting and guiding the connector whilst being wound on the drum, substantially as described
4. Means for adjusting the effective length of a flexible connection, in which the drum is adapted to be supported vertically. and the rotary winder is located adjacent to the lower end of the drum, and has connected to and below it a centrally arranged eye through which the flexible connector is led by one or more suitable arranged guide pulleys, substantially as herein described.

\section*{No. 101,923. Sensitive Plate for Photography in Colonrs.}

Plaque sensitive pour la photographie.

Auguste Lumiere and Louis Lumlére, Lyons, France, 6th November, 1906; 6 years. Filed 21st May, 1906. Receipt No. 136,117 .
Claim.-1. A sensitive plate for colour photography comprising a layer of crushed coloured particles interposed between the sensitive coating and the support.
2. The herein described process consisting in placing a layer of coloured particles on a transparent support, then softening the particles, then subjecting the particles on the support to pressure to crush the particles and finally covering said layer with the sensitive layer.

No. 101,924. Mop Wringer. Essoreuse.

Willoughby Moffat, Hamilton. Ontario, Canada, 6th November, 1906 : 6 years. Filed 30th June, 1906. Receipt No. 137.448.

Claim.-1. In a mop wringer the combination with a receptacle, of a stationary roller journalled in brackets resting Lepon the top edge of said receptacle and provided with ears overhanging the side thereof which together with fastening means for lowering their lower portions hold them firmly in position, a spring controlled frame plvoted to the side of said rcceptacle and in which said movable roller has bearing and whereby said movable roller is brought into contact with said stationary roller so as to exert a downward pressure thereupon.
2. In a mop wringer the combination with a receptacle, of a statlonary roller journalled within said receptacle and at the top thereof, a frame constructed to operate outside of sald receptacle, brackets secured tothe outside of sald receptacle and provided with stub pins upon which said frame is journalled, a roller journalled in the upper end of sald frame a spring coiled around said stub pins and having its lower crd provided with a downward turn which engages with a horn sccured to or formed part of sald brackets, and the upper end of sald spring provided with a turned end which engages said frame in such a manner so that the force exerted by said spring will normally keep sald rollers apart, the said frame operating said movable roller so that it will be brought into contact with said stationary roller and press downward thereupon.
3. In a mop wringer the combination with a receptacle, of a stationary roller journalled within said receptacle and at the top thereof, a frame constructed to operate on the outside of said receptacle and comprising the member \(E\) shaped as shown which is secured to the lower end of the upright niember \(D\), a brace additionally securing sald members together, brackets secured to the outside of said receptacle and provided with stub pins upon which sald frame is journalled through the medium of said member \(D\), a roller journalled in the upper end of said frame, a spring colled around sald stub pins and having its lower end provided with a downward turn which engages with a horn secured to or formed part of said brackets, and the upper end of sald spring provided with a turned end which engages sald frame in such a manner so that the force exerted by sald spring will normally keep sald rollers apart, the sald frame operating said movable roller so that it will be brought into contact with said stationary roller and press downward thereupon.
4. In a mop wringer the combination with a receptacle, of a stationary roller journalled within sald receptacle and at the top thereof, brackets secured to sald receptacle in which sald roller is journalled, the ears provided with offset upper ends and secured to said receptacle and on the inner side thercof, mop guards supported from sald ears and sald brackets and so placed in relation to sald stationary roller as to prevent the mop from becoming entangled in the mechanism, a spring controlled frame pivoted to the side of said receptacle and in which said movable roller has bearing and uhereby said movable roller is brought into contact with said stationary roller so as to exert a downward pressure thereupon.

No. 101,925. Vacuum Machine. Muchinc à vide.

Albert Manvers and Henry Phlllips, co-inventors, both of Sydney, New South Wales, Australia, 6th November. 1906: 6 years. Filed 11th May, 1906. Receipt No. 135.793.
rlaim.-1. In apparatus for creating a vacuum, an outer casing adapted to be connected to the vessel to be exhausted. a tube in sections axially within the outer casing, such tube being adapted to be connected with a sultable water supply under pressure, collars connecting the adjacent sections of tube together, and perforations in the collars whereby communication is established between the interior of the the cas ing and the interlor of the tube, as specified.
2. In apparatus for creating a vacuum, an outer casing adapted to be connuched to the vessel to be exhausted, a tube in sections axially within the outer casing, such tube being adapted to be connccted with a suitable supply of water under pressure, and a perforated disc placed at the inner end of the first section of tube whereby the column of water in the tube may be split up into a number of smaller columns. as herein set forth.
3. In apparatus for ereating a vacuum, an outer casing her metically scaled against the outer air, means for connecting such casing with the vessel to be exhausted, a tube in sec tions axially placed within the outer casing, means for connecting the first section of the tube with a suitable supply of water under pressure, a perforated disc terminating the first
scction of the tube, collars to connect the adjacent sections of tube together, such collars having perforations whereby communication is established between the inside of the casing and the inside of the tube, all as and for the purposes spccified.
4. In apparatus for creating a vacuum, a hermetically s.aled outer casing, a tube in sections axially withla the casing, perforated collars for connecting together the sections of tube, a bulbous cover entirely covering the discharge end of the apparatus, such cover being screwed over the end of the outer casing, and a discharge or waste pipe leading from the bulbous cover, as and for the purposes hereln set forth.

No. 101,926. Brush. Brosse.

Melburn H. Tupper, Toledo Ontario, Canada, 6th November, 1906; 6 years. Filed 11th May, 1906. Receipt No. 135,823. Claim.-1. In a folding brush the combination with the rotatably supported brlstle bases and means for rotating the same. of means for locking the bases when in position with the bristles raised independent of the means used for raising them, as and for the purpose specified.
2. In a folding brush the combination with the casing. the bristle bases rotatably mounted therein and means for turning the bristle braces, of a sliding base and means thereon for locking the bristle braces with the bristles in their raised position, as and for the purpose specifled.
3. In a folding brush the combination with the casing. and bristle bases rotatably mounted therein having downwardly projecting portions, of means for rotating the bristin bases, a sliding base and means thereon for engaging said ciownwardly projecting portions with the bristles in their raised position, as and for the purpose specified.
4. In a folding brush the combination with the brisile bases, shafts mounted in the casing supporting the same. of means for rotating the shafts and means simultaneousiy operated with the rotation of the shaft for locking the bristle bases with the bristles in their raised position. as and for the purpose specified.
5. In a folding brush the combination with the casing and the bristle bases and shafts supporting the same mounted in the casing of cranks integral with the ends of the shafts, a sliding base having upwardly extending sldes engaging the ends of the cranks, and means for operating the sliding base to turn the cranks, as and for the purpose specified.
6. In a folding brush the combination with the casing and the bristle bases and shafts supporting the same mounted in the casing of cranks integral with the ends of the shafts. a sliding base having upwardly extending sides rngaging the ends of the cranks, means for operating the sliding base to turn the cranks and means for locking the bases with the bristles in their raised position, as and for he purposes specified.
7. In a folding brush the comblnation with the casing and the bristle bases of shafts mounted in the casing supporting the bristle bases, cranks integral with said shaft. a iliding base having upwardly extending sides engaging the nds of the cranks, a second sliding base, locking means hereon adapted to lock the bases when the bristles are in ihicir raised position and means for operating both bases. is and for the purpose specified.
8. In a folding brush the combination with the casing and the bristle bases, of shafts rotatably mounted in the casing supporting the bristle bases, cranks integral with the ends thercof, a sliding base having upwardly extending idies engaging the ends of the cranks. a second sllding base having raised portions thercon adapted to engage the edges of the bristle bases, and lock them in position. and an operating plate for the two sllding beses pivotalis
connected to each and extending through a slot in the upper base, as and for the purpose specified.
9. In a folding brush the combination with a plurality of parallel bristle bases having the bristles in each alternate row staggered with regard to each other and having a plurality of recesses in the edges of each base into which the bristles of the adjacent bases will fit when the bristles aro in a substantially horizontal position, as and for the purpose specified.
10. In a folding brush the combination with a plurality of parallel bristle bases having a plurality of projections in each forming between them recesses into which the bristles of the adjacent braces are adapted to extend when in their lowered position, of a sliding base having thereon upwardly extending projection's adapted to engage the projections on the bases and thus lock the bases when the bristles are in a raised position, as and for the purpose specified.
11. In a folding brush an improved bristle brace formed of a single blank of metal having a series of outwardly extending projections on each side designed to register each other when the blank is folded over, perforations in the projections of one side of sald blanks, and eyelets in said perforations through which the bristles are adapted to extend, as and for the purpose specifled.
12. In a folding brush an improved bristle base formed of a single blank of metal having a series of outwardly cxtending projections on each side designed to register with each other when the blank is folded over, perforations in the projections of one side of said blank, eyelets in said perforations through which the bristles are adapted to extend, and bars extending across the bottom of the eyelets and adapted to extend through the loops of the bristles, as and for the purpose sptcified.
13 In a folding brush an improved bristle base formed of a single blank of metal having a series of outwardly extending projections on each side designed to register with each other when the blank is folded over, perforations in the projections of one side of said blank, eyelets in said perforations, through which the bristles are adapted to extend, and tongues cut in the sides of the eyelets and bent across the same adapted to extend through the loops of the bristles extending through the eyelets, as and for the purpose specified.
14. In a folding brush the combination with the casing. the bristles rotatably mounted therein, of a sliding base and projections on the bristle bases adapted to be engaged by the sliding base to cause the movement of the same to rotate the bristle base, as and for the purpose specified.

No. 101,927. Pump. Pompe.

Basil Alfred Slade, 27 Charles Street, Berkley Square, Middlesex, England, 6th November, 1906; 6 years. Filed 7 th August, 1906. Receipt No. 138,475.
Claim.-1. The combination in a rotary motive power engine, of a cylinder \(a\), cylinder ends \(c, d\), bearings and stuffing boxes \(e, f\), shaft \(g\), radial pistons \(n\) having curved surfaces on their sides \(j\) and ends \(h^{1}, h^{2}\), radial diaphragms \(m\), radial chambers \(l\), recesses or enlargements \(n\), inlet passages 1, 1, and exhaust passages 2, 2, through the central part of the piston \(h\), projecting boss \(p\), cover \(q\), concentric recesses 3 and 4, inlet pipe 11, exhaust plpe 12, holes 5, 6; 7, from the recess 3 , and holes \(8,9,10\) from the recess 4 , cover \(r\) on cylinder end \(d\), central recess in cover \(r\), loose disc 19 in recess, passages \(13,14,15\) partly through cylinder end \(d\) opening at their outer parts through passages 17 into openings 22 in disc 19, of such shape that steam admitted into them is directed in one position of the disc 19 into one of the radial passages 18 and to one side of the diaphragm \(m\). and when the disc 19 is turned into the other of the parallel
radial passages 18, and to the other side of the diaphragms, the radial passages 18 passing to enlargements \(n\) on one or other side of the diaphragm \(m\) according to the position to which the disc 19 is turned, and means for turning the disc 19, all substantially as set forth.
2. In a rotary motive power engine having a cylinder, radial sliding diaphragm and a central driving shaft, the piston \(h\) having its outer ends \(h^{1}, h^{2}\) curved to fit in the cylinder and its sides \(j\) which connect the ends \(h^{1}, h^{2}\) curved to a much larger radius so as to leave spaces \(k k^{1}\) between them and the inside of the cylinder, packing at \(i, i\), in the ends \(h^{2}, h^{2}\) of the piston, and concentric passages 1,1 and 2, 2 through the body of the piston for the inlet and outlet of steam, the inlet passages 1,1 being at a greater radial distance from the center than the outlet passages 2,2 , substantially as set forth.
3. In a rotary motive power engine having a cylinder, a central driving shaft and revolving piston and radial sliding diaphragm, the combination with the sliding diaphragm of a concave sliding piece 23 pivoted by a pin 24 upon the rounded end of the sliding diaphragm \(m\), spring packing strips 26 and a radial passage 27 having lateral openings at its lower end each covered and uncovered alternately by the packing strips 26, substantially as set forth.
4. The reversing disc 19 having pairs of triangular shaped openings 22, their outer longer side concentric with the edge of the disc and their outer corners corresponding with the inner ends of the passages 18, and their inner corners corresponding with the opening 17 for the inlet of steam, substantially as set forth.
5. In a rotary engine the combination with the rotary plston, a casing enclosing the same, a driving shaft, of a plurality of radially sliding diaphragm, sliding bases pivoted to the diaphragms and contacting with the periphery of the piston, two steam passageways through each diaphragm and means operated by the rotation of the engine for alternatively opening each passageway, as and for the purpose specified.

No. 101,928. Spark Arrester. Arrête-étincelles.

Olof G. Sunden, Chicago, Illinios, U.S.A., 6th November, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,262.
Claim.-1. A device of the class described comprising an inner and an outer casing, and major and minor blades carried by said inner casing, said minor blades having their upper ends lying in substantially the same plane as the upper end of said major blade and having their lower ends terminating short of the lower ends of said major blades.
2. A device of the class described comprising an inner and an outer casing and major and minor deflector blades disposed upon the said casing, said major and minor blades being inclined at different angles with respect to each other.
3. device of the class described comprising an inner and an outer casing, and major and minor deflector blades carried by the said inner casing, said minor blades being disposed at an acute angle with respect to sald major blades.
4. A device of the class described comprising an inner and an outer casing and major and minor blades carried by said inner casing, sald minor blades being disposed at an acute angle with respect to said major blades and extending in the same general direction as the said major blades.
5. A device of the class described comprising an inner and an outer casing and deflector blades carried by said inner casing and having their deflector portions lying at an acute angle to the wall of said inner casing.

No. 101,929. Conpler for Converers.
Joint de transport.

Clemens Fohr von Bechtolsheim. Munich, Germany, 6th November. 1906; 6 years. Filed 29th November, 1905. Receipt No. 130,554 .
Claim.-1. A mechanism of the class described comprising a driving shaft, a traveller. a hoisting mechanism carrled by the traveller, a traveller shifting mechanism, and means for automatically throwing into operation one of sald mechanisms when the other is thrown out of operation.
2. A mechanism of the class described comprising a driv. ing shaft, a traveller, a hoisting mechanism carried by the traveller, a statlonary traveller shifting mechanism, and means operated by the traveller on its return to connect the hoisting mechanism to the driving shaft and throw the shifting mechanism out of connection with the driving shaft and movable to throw the shifting mechanism in and the hoisting mechanism out of connection with the driving shaft.
3. A mechanism of the class described comprising a driving shaft, a traveller, a hoisting mechanism carried by the traveller, a stationary traveller shifting mechanism, means operated by the traveller on Its return to connect the hoist ing mechanism to the driving shaft and throw the shifting mechanism out of connection with the driving shaft and movable to throw the shifting mechanism in and the hoisting mechanism out of connection with the driving shaft, and a brake acting on sald means to avoid shocks.
4. A mechanism of the class described comprising a driving shaft, a traveller. a hoisting merhanism carried by th? traveller. a stationary traveller shifting mechanism, means operated by the traveller on its return to connect the hoisting mechanism to the driving shaft and throw the shifting mechanism out of connection with the driving shaft and moved by the hoisting mechanism when the latter reaches a certain position, to effect a connection between the driving shaft and the shifting mechanism and break the connection between the drive shaft and the hoisting mechanism.
j. A mechanism of the class described comprising a driving shaft, a traveller, a hoisting mechanism carried by thr traveller, a traveller shifting mechanism. a coupling for -flecting connection between the hoisting mechanlsm and the driving shaft. a coupling for effecting connection between the shifting mechanism and the driving shaft. a connection buiwern the couplings embodying a releasable dethat, means for shifting one of said couplings upon the relatise of the detent. and means for restoring the latch operated by the traveller.
6. A merhanism of the class described comprising a driv. shaft. a traveller a hoisting mechanism carried by the traweller, a traveller shifiting mechanism, a coupling for efferting ronnection betworn the hoisting mechanism and the driving shaft, a coupling for effeciang connection between the shifting merhanism and the driving shaft, a connection betwonn the couplings embodying a releasable detent operati. 1 hy the hoisting mechanism when the latter reaches a certai: positfor, means for shifting one of said couplings upon th release of the detent, and means for restoring the latih operated by the traveller.
7. A mechanism comprising a driving shaft, a traveller. a hoisting mechanism carried by the traveller, a traveller shifting mechanism, a coupling for effecting connection between the shifting mechanism, means acting to effect said connection and a detent holding said means against action and operated by the hoisting mechanism when the latter reaches a certain position.
8. A mechanism comprising a driving shaft, a traveller. a !oisting mechanism carried by the traveller, a traveller shifting mechanism, a coupling for effecting connection between the shifting mechanism, means acting to effect said ronnection and a detent holding said means against action.

No. 101,930. Aerator. Aćrateur.

Bert H. Thomas, Miller's Station and William Knox Andrews, Mill Village, both in Pennsylvania, U.S.A., 6th November, 1906; 6 yeurs. Flled 27th June, 1906. Re ceipt No. 137,332.
Claim.-1. In a device of the class described the combinalion of a pair of tubes formed integral with each other, a collar adapted to rotate on sald tubes, said coslar being provided with means for attaching the device to a wilk can, one of said tubes having a lateral projection connected with a vertically disposed tube, and means for forcing air through said tubes, substantially as described.
2. In a device of the class described the combination of \(a\) pair of tubes, formed integral with each other, one of said tubes having a lateral projection connecting with a veriically disposed tube, sald vertically disposed tube being provided with a groove or way, adapted to slldably receive a convenient form of thermometer, said vertical tube being also provided at its lower end with apertures, substantially as described.

No. 101,931. Liquid Separator.
Néparateur de liquide.

Frank S. Smith and Ashley C. Smith, assignee of Ernest \(C^{\bullet}\) Pawley, all of Chicago. Illinois, U.S.A.. 6th November. 1906; 6 years. Flled 14th August, 1:06. Recelpt No. 138,679.
Claim.-1. In a centrifugal separating apparatus the comhination with the bowl, of a central stem having a recep tacle in its upper portion, and spraying pipes communlcatiag at their upper ends with sald receptacle and nxtending dowawardly alongside said stem.
2. In a centrifugal separating apparatus the combination with the bowl, of a central stem having a receptacle in its upper portion for the introduction of milk, spraying pipes fed from the receptacle and extending downwardly alongside said stem and having small spraying apertures on their outer sides and larger apertures on their inner sides.
3. Inl a centrifugal separating apparatus the combination with the bowl, of a central stem having a receptacle in its upper portion for the introduction of milk, spraying pipes fed from the receptacle and extending downwardly alongisde said stem, and conoldal discs detachably mounted on the spraying pipes and surrounding said stem at a distance therefrom.
4. In a centrifugal separating apparatus the combination with the bowl having in its upper portion an outlet for the cream and its bottom outlets for the milk, of a central stem having a receptacle in its upper portion and a conoldal base at its other end, spraying pipes communicating at their upper ends with said receptacle and extending downwardly alongside said stem at a distance therefrom, the lower ends of said pipes converging, and a serles of spaced apart conoidal discs detachably mounted on the spraying pipes and surrounding the central stem at a distance therefrom.

No. 101,932. Eleotric Fire Alarm.
Avertisseur électrique pour incendies.

The Pearson Fire Alarm, Limited, assignee of Alfred Henry MoNeil, both of London, England, 6th November, 1906 ; years. Filed 2nd January, 1906. Receipt No. 131,521.
Claim.-1. In an electrical fire alarm in which an electric circuit is completed at a predetermined temperature by the deflection of a thermal strip, a box or chamber having an opening in one of its sides, an insulated contact spring fixed inside the box and normally closing the said opening, an adjustable contact also mounted within the box in close proximity to the spring contact, a thermal strip fixed at its ends outside the box, and a plunger attached to the thermal strip and arranged to profect into the opening in the side of the box and to operate the contact spring, substantially as described.
2. In an electrical fire alarm in which an electric circuit is completed at a predetermined temperature by the deflection of a thermal strip, a box or chamber provided with stuffing boxes or glands at its ends and an opening in one side, an insulating slab or support fixed inside the box, contacts mounted on the insulating support, one of said contacts being adapted to close the opening in the side of the box, means for adjusting the other contact electric leads or conductors connected to the contacts and passing through the stuffing boxes, a thermal strip fixed at its ends outside the box, and a plunger on the strip adapted to enter the box through the opening in the side thereof and when the strip is deflected to the required degree to close the contacts and operate the alarm.

\section*{No. 101.933. Flne Cutter. Coupe-tubes.}

Daniel W. Amos and Charles H. Jones, co-inventors, both of Saxton, Pennsylvania, U.S.A., 6th November, 1906; 6 years. Filed 25th June, 1906. Recelpt No. 137,258.
Claim.-1. In a device of the character described, a tubular portion, the forward end of which is adapted to be inserted within the flue or tube to be cut, means for limiting the depth of the insertion, two ears extending upward from the tubular portion a distance apart, a lever pivoted between tie two pars and lying within the tubular portion, the tubular portion being slotted the length of the lever and in conformity to the shape of the same, a rotary cutting tool 11-5
journalled in the forward end of said lever and adapted to protrude beyond the periphery of the tubular portion, a

sleeve adapted to slide over the rearward end of the tubular portion, a cam lever pivoted intermediate of its two ends to the sleeve, the lower end of the cam lever being curved rearwardly and bearing against the upper surface of the rearward end of the cutting tool lever so that when the lower end of the cam lever is forced forward the rearward end of the lever will be depressed, a screw-threaded rod pivoted to the upper end of the cam lever, the other end of the rod pivoted between the ears extending upward from the tubular portion, an extension extending upward from the sleeve, nuts threaded upon the screw-threaded rod each side of said extension, and a wrench hold formed upon the outer end of the sleeve, as and for the purpose set forth.

No. 101,934. Box for Displaying Shirts, Etc.
Boîte à étalage pour chemises, etc.

Frederick George Campbell, Montreal, Quebec, Canada, 6th November, 1906 ; 6 years. Filed 1st August, 1906. Receipt No. 138,322 .
Claim.-1. In a device of the class described the combination of a box, a hinged cover therefor, a downwardly projecting flange on said cover, a prop hinged to the box and adapted to maintain said cover in elevated position, a hinged front for said box adapted to be engaged by the cover flange, a plurality of compartments within said box and flexible members for supporting the front in the same plane as the bottom of the box.
2. In a device of the class described the combination of a box, a plurality of transverse partitions within said box, a hinged cover therefor, a downwardly projecting flange at the front of the said cover, a prop pivoted to the box and adapted to maintain said cover in a partially elevated position, a transparent hinged front for said box adapted to be engaged by the cover flange, and flexible means for supporting the front in the same plane as the bottom of the box.

No. 101,935. Paper Perforating or Impressing Machine.
Machine d perforcr les tuyaux.

Cortland Carlton, Kansas City, Missouri, U.S.A., 6th November, 1906 ; 6 years. Filed 20th August, 1906. Receipt No. 138,847.
Claim.-1. In a paper perforating machine in combination with the rotating platen roll, feed rolls for delivering the paper thereto and an intermediate roll for supporting the paper in its passages from the delivery side of the feed rolls on to the platen roll.
2. In a paper perforating machine in combination with a platen roll and means for rotating it, feed rolls for delivering the paper thereto and an intermediate roll driven frictionally by the platen roll and frictionally driving the lower feed roll.
3. In a paper perforating machine in combination with the platen roll and means for rotating it, a roll mounted for frictional contact at its end portions only with the platen roll, and lower feel rolls for delivering the paper to the platen roll in frictional contact with said end portions only of staid intermediate roll.
4. In a paper perforating machine the combination with the platen roll, a lower feed roll for delivering the paper thereto, and a roll for transmitting rotation from the platen roll to the feed roll lodged between the two in frictional contact with both and springs pressing it yieldingly into said interval.
5. In a paper perforating machine in combination with a platen roll and means for rotating it, a lower feed roll for delivering the paper to the platen roll, an intermediate roll of greater diameter than the shortest distance between the platen roll and sald feed roll lodged between said two rolls above their point of nearest approach, springs attached to the frame and bearings for said intermediate roll connected to the ends of the springs respectively for pressing said intermediate roll toward the other two rolls.
6. In a paper periorating machine in combination with a platen roll and means for rotating it, a lower platen roll for delivering the paper thereto, an intermediate roll of greater diameter than the shortest distance between the platen roll and said feed roll lodged at its end portions upon both said rolls above the point of their nearest approach, spring pressed bearings for said intermediate roll, said roll being reduced in diameter between said end portions and annularly grooved, a paper stop bar mounted for movement toward and from said grooved roll having fingers taking into the grooves of the latter, and means for lifting and depressing sald bar.
7. In a paper perforating machine in combination with a platen roll and means for rotating it, a pair of feed rolls for delivering the paper to the platen roll, means for driving the lower of said feed rolls by connection with the platen roll, means for raising and lowering the upper feed roll to intermit the feed, an annularly grooved roller intermediate the lower feed roll and the platen roll adapteg to support the paper in passing from the former to the latter, a paper stop bar mounted for movement toward and from sald grooved roll having fingers adapted to enter the grooves of the latter at the depressed position of the bar, means for raising and lowering said feed bar and connections between sald means and the means for raising and lowering the upper feed roll for causing said roll and said bar to have reverse movement.
8. In a paper perforating machine in combination with a rotating platen, a lower feed roll and means for rotating it, an upper feed roll and bearings for the same movable to-
ward and from the lower roll, a paper stop bar mounted for up-and-down movement in the interval between the feed rolls on the one hand and the platen roll on the other hand. connections between the upper feed roll bearings and said stop bar for causing them to move oppositely, a cam rotatIng with the platen roll and means operated thereby for giving said upper feed roll and the stop bar such opposite movement.
9. In a perforating machine in combination with a platen roll, means for feeding the paper thereto, perforating or impressing dises and means for advancing them to or retracting them from the platen cylinder, cams for controlling the feeding devices and the impressing discs, said cams consistIng of discs mounted on the platen roll shaft. the feed controlling cam having the dise which controls the commence. ment of the feeding action fixed with respect to the shaft. two dises of the cam for controlling the perforating discs heing adiustable about the shaft. a graduated disc or dial plate non-rotatable on the shaft adjacent to said two cam discs respectively, and means for said cam discs for reading their position on the respectively adjacent graduated discs.
10. In a machine for the purpose indicated in combination with a platen roll, means for feeding the paper thereto, a cam for controlling said paper feeding means mounted on the platen roll shaft and having the part thereof which controls the commencement of the feed fixed with respect to the shaft, perforating or impressing rolls mounted for movenent toward and from the platen roll, means for operating them comprising a cam consisting of two dises mounted on the platen roll shaft adjustable thereabout for controlling resnectively the lifting and depressing of the perforating discs each having an index, two discs mounted non-rotatably on the shaft adiacent to sald cam discs respectively each having a graduated scale for indicating the nosition of the ram disc respectivelv, the zero point of the said scales being related to the fced controlling cam so as to correspond to the point at which the forward edge of the paper reaches the perforating disc.
11. In a machine for the purpose indicated, in combination with a platen cylinder, means for feeding the paper thereto comprising a cam on the platen roll shaft. perforating discs mounted for movement toward and from the platen roll, means for so operating said perforating discs at the line of compression comprising a cam consisting of two discs for controlling respectively the movement of the perforating discs toward and away from the platen cvilinder, said discs being adjacent to each other on the shaft and adjustable thereabout, dial plates on the shaft fixed relatively to the point of the feed controlling cam which controls the commencement of the feeding movement, said dial plates being adjacent to the two cam discs respectively, and means for clamping all said cam discs and dial plates rigidly together and holding them fixed to the shaft.
12. In a machine for the purpose indicated, in combination with a platen cylinder, a perforating disc co-operating therewith to impress the paper, a roll mounted for bearing against the platen cylinder beyond the perforating disc for holding the paper onto the cylinder after it is impressed by the disc.
13. In a machine for the purpose indicated, in combination with the platen cylinder, a perforating or impressing dise co-operating therewith to imprese the paper, a roll bearing upon the platen cylinder beyond the disc. and curlers mounted below the line of delivery of the paper past said roll at the opposite sides of the path of the sheet concave upwardly and toward each other oblique to the normal path of the edge of the sheet, and means for recelving the paper located beyond and lower than said curlers.
14. In a machine for the purpose indicated, in combination with a platen cylinder, the perforating or impressing disc co-operating therewith, a deffecting roller bearing upon the cylinder beyond the perforating discs, curlers mounted for lateral adjustment below the path of delivery of the paper from the under side of said roll, a receiving table mounted beyond and lower than the curlers, and adapted to be set inclined downward away from the curlers, lateral gauges and an end guage or paper stop mounted adjustably on such table.
15. In a machine for the purpose indicated, in combination with a platen cylinder, a perforating or impressing disc, a carriage in which the same is mounted, a rock shaft parallel with the axis of the cylinder on which said carriage is mounted, means for rocking the shaft to lift and lower the disc, the means for mounting the disc in the carriage comprising a lever in which the disc is journalled pivoted to the carriage, a spring reacting between the carriage and said lever for fieldingly holding the disc carrying end of the latter toward the cylinder, \({ }^{a}\) second lever pivoted to the carriage at the side of the
rock shaft toward the cylinder, a roll mounted in the free end of sald last-mentioned lever adapted to bear on the cylinder beyond the delivery side of the perforating disc, and a spring reacting on said lever arm to hold the roll yieldingly against the cylinder.
16. In a machine for the purpose indicated, in combination with a platen cylinder, a rock shaft mounted parallel to the axis thereof, means for rocking the shaft, a carriage mounted on the rock shaft for rocking therewith, a lever pivoted to the carriage and extending from its pivot past the shaft-toward the platen cylinder, a perforating disc mounted on the free end of the lever, a spring reacting between the lever and the carriage to press the disc upon the platen cylinder, a collar on the shaft, a second lever pivoted to the carriage on the side of the shaft toward the cylinder, a pressure roll mounted on the free end of the last-mentioned lever for bearing on the cylinder in the path of the perforating disc, a stop on the collar encountered by the disc carrying lever in opposition to the action of its spring, a spring reacting between the second lever and the collar for holding the latter onto the cylinder, and a second stop on the collar for limiting the action of such spring.
17. In a machine for the purpose indicated, in combination with a platen cylinder, a rock shaft mounted parallel to the axis thereof and means for rocking it, a carriage mounted on the rock shaft consisting of a collar or disc which is split radially and bolts for clamping it to the shaft, said collar being also forked or split trangversely to the shaft, a disc carrying lever pivoted in the transverse fork, and a perforating disc mounted in its free' end, a spring reacting against the lever to hold the disc toward the platen cylinder, a collar on the shaft within the transverse fork of the carriage having a stop for the disc carrying lever, a second lever pivoted in said fork outside of the shaft toward the cylinder, a pressure roll mounted in the free end of such lever, a spring reacting between said lever and collar for holifing the pressure roll onto the cylinder, the collar having a stop for the second lever at the opposite side of the fulcrum of the latter from the pressure roll.
18. In a machine. for the purpose indicated in combination with the platen cylinder and means co-operating therewith for perforating the paper, means for deflecting the paper from the cylinder and edge curlers mounted beyond the deflecting device in position for receiving the lateral edges of the paper. and means beyond the curlers for receiving the sheets delivered therefrom.
19. In a machine for the purpose indicated in combination with a platen on which the paper is supported during perforation, and means co-operating therewith for perforating the paper. means for advancing the paper from the supporting platen, a support for the paper on to which it is advanced comprising curlers in position to be encountered by the lateral edges of the paper in its advance and a receptacle for the paper beyond such support.
20. In a machine for the purpose indicated in combination with a platen on which the paper is supported during perforation. means co-operating therewith for perforating the paper, means for advancing the paper off from the platen, a transevrse bar and curlers mounted adjustably therueon in position to be encountered by the lateral edges of the paper as it is advanced off the platen and intermediate paper supporting fingers also adjustable longitudinally on the bar.

\section*{No. 101,836. Method of Purifying Gasen. Méthode de purifler le gaz.}

Albert Elsenhans, Ruttenscheid, near Essen-on-the-Ruhr, Germany, 6th November, \(1906 ;\); 6 years. Filed 18th April,
1906. Receipt No. 135,026 . 1906. Receipt No. 135,026.

Claim.-1. In gas purifying mechanism, a pair of opposed disc-like devices and mechanisms for rotating the same, a casing surrounding the sald parts, means for introducing gas to the space between them, and means for introducing a washing fluid to the same space, the said disc-like parts being provided with series of concentric annular walls arranged so that the walls of each disc-like part enter the annular spaces between the walls of the other and thesia Walls in their position act centrifugally on the gas, a liquid to thoroughly mix them and finally throw them outward against the said casing, substantially as set forth.
2. In a gas purifying mechanism, a pair of opposed disclike devices provided with means for admitting gas and purifylng fluid to the space between them and concentric series of annular walls in combination with an enclosing casing and means for rotating the said devices, the annular walls
of one device entering the annular spaces between the corresponding walls of the other and the annular walls of both

devices being cut away obliquely, substantially as and for the purpose set forth.
No. 101,937. Cash Cabinet. Cabinet d monnaie.

Thomas A. Ferris, Waxahachie, Texas, U.S.A., 6th November, 1906 ; 6 years. Filed 25th July, 1906. Receipt No. 138,158.
Claim.-1. In a device of the character described the combination of a receptacle, comprising a primary section having one side entirely open and a cover, a tray mounted therein, said tray projecting beyond the opened side end of said receptacle, and said cover adapted to partially inclose the ends and one of the sides of the tray.
2. In a device of the character described the combination of a receptacle, comprising a primary section provided with a base, back, and end portions, said end portions of varying widths throughout their length, trays mounted one above the other within said primary section, said trays projecting beyond the ends of said primary section, one of sald trays provided with an open iront and a cover pivotally secured to said primary section and adapted to enclose portions of the ends of each tray and one of their sides.
3. In a device of the character described the combination with a receptacle, comprising a primary section having one side entirely open and a similarly constructed auxiliary section pivotally secured thereto, a tray position within said primary section and partially projecting beyond the end portion of the same, and said auxiliary section adapted to enclose the projecting portion of said tray when in a closed position upon said primary section.
4. In a device of the character described the combination of a receptacle, said receptacle comprising a pair of simllarly constructed sections, each section comprising a back wall, sides secured thereto, said sides varying in width throughout their length, a lower tray mounted within said casing, comprising a receptacle provided with a plurality of parallel partitions, transverse partitions interposed between said parallel partitions forming a scalloped base portion in each of the compartments formed by said parallel partitions. an intermediate tray mounted within said casing and above said lower tray, comprising a receptacle provided with a compartment extending its entire length and with a plural-
ity of compartments provided with inclined floors, an upper tray comprising a receptacle provided with an opened side and with a plurality of pockets extending its entire width, and means for securing the sections of said receptacle in a closed position.
5. In a device of the character described the combination with a receptacle, comprising two sections, of a tray positioned within sald receptacle comprising a base, end and side walls secured to said base, parallel partitions spaced apart at varying widths within said tray forming compartments of different dimensions, each compartment provided with a scalloped floor.
6. In a mechanism of the class described, the combination with a receptacle, of a tray removably positioned therein comprising a base, end walls secured to said base, compara tively narrow sides secured to said end walls and base, parallel partitions positioned within said tray at different widths forming compartments therein, and the floor of each compartment provided with approximately V-shaped grooves.
7. A device of the character described, comprising a sec tional receptacle, a tray removably positioned therein, comprising end walls, comparatively narrow side walls secured to said end walls, parallel partitions positioned between said end and side walls, said partitions spaced apart at different widths, each compartment provided with a floor having approximately \(V\)-shaped grooves of varying depths formed therein, and one of the compartments having the grooved portion of its floor formed in a different horizontal plane from that in which the remaining floors are constructed.
8. In a device of the character described the combination of a sectional receptacle, comprising similarly constructed sections, trays positioned within said receptacle and partially extending beyond an end of one of the sections, one of said trays provided with an opened side and a plurality of pockets, a top secured upon said tray and partially inclosing said pockets, the other tray positioned within said receptacle provided with partitions forming compartments, each of said compartments provided with a scalloped floor.
9. In a device of the character described the combination with a primary and an auxiliary section pivotally connected. each of said sections similarly constructed, a plurality of trays, positioned within the primary section and extending beyond the end thereof, one of said trays provided with partitions forming compartments, said compartments having opened ends, and another of said trays provided with a narrow side portion and with a floor having approximately \(V\) shaped grooves.
10. A device of the character described comprising two similarly constructed pivotally connected sections, trays positioned within one of said sections and projecting beyond the ends thereof, one of said trays provided with comparatively narrow sides and with compartments, said compartments having scalloped floors of varying dimensions, and means for retaining said sections in a folded position.
11. In a device of the character described the combination of a primary section, said section provided with a pivotally connected cover, differently constructed trays positioned within said primary section and extending beyond the ends thereof, one of said trays provided with a floor having approximately V-shaped grooves formed therein, the cover adapted to partially inclose one end of each tray when closed upon said primary section, and) means for retaining said cover in a positive closed position.
12. A cash and currency cabinet, comprising two pivotally connected sections, trays removably positioned within said sections, one of said trays provided with a plurality of parallel partitions extending the entire width thereof, said partitions providing a plurality of compartments, said tray having an opened end, another tray provided with a transverse partition extending the entire width thereof, a longitudinal partition positioned within said tray, a plurality of transverse partitions connecting said longitudinal partition with the sides of said tray, another tray provided with comparatively narrow sides and a plurality of parallel partitions positioned within said tray, said partitions forming compartments therein, said compartments provided with floors having substantially \(V\)-shaped grooves of varying dimensions formed therein.
13. In a device of the character described the combination of a receptacle, comprising a base section and a cover, a partitioned tray mounted within the base section, said tray projecting beyond the opened end of said section, and said cover adapted to be closed upon said section for inclosing the projecting portion of the tray.
14. In a device of the class described, a tray provided with longitudinal partitions spaced apart at varying distances and producing compartments of different widths, and each compartment provided with a scalloped floor.
15. In a device of the character described a tray provided with parallel partitions spaced apart for producing compartments of different dimensions and said compartments provided with scalloped floors of different dimensions.

\section*{No. 101,938. Driving Mecluanism.}

Mécanisme de commande.

Frederick Kleinvogel, Newport, Kentucky, U.S.A., 6th Novvember, 1906; 6 years. Filed 14th August, 1906. Receipt No. 138,689.
Clain.-1. The combination with a frame, of a shaft carried by the frame and having at its ends crank arms provided with rollers, levers pivoted to the frame and engaging the rollers of the crank arms, treadle levers pivoted to the frame and connections interposed between the treadle levers and the crank engaging levers adapted to transmit power to the latter, bars pivoted to the frame and pivotally suspending the interposed connections, links pivoted to the crank engaging levers and pivotally connected to the interposed connections and links pivoted to the treadle levers and also pivoted to the interposed connections, substantially as described.
2. The combination with a frame, of a driven shaft mountad thereon, a driving shaft having at each end a crank arm provided with a roller, a fly wheel rotatably supported upon the frame, sprocket wheels and co-acting chains adapted to transmit action from the driving shaft to the driven shaft and to the fly wheel crank, operating levers pivoted to the frame and engaging by rolling contact the rollers of the crank arms, treadle levers pivoted to the frame, and connections interposed between the treadle levers and the crank engaging levers adapted to transmit power to the latler, bars pivoted to the frame and pivotally suspending the interposed connections, links pivoted to the crank engaging levers and pivotally connected to the interposed connections and links pivoted to treadle. levers and also pivoted to the interposed connections, substantially as described.

\section*{No. 101,939. Barber's Chair. Fauteuil de barbic's.}

Alfred Miller, Toronto, Ontario, Canada, 6th November, 1906; 6 years. Filed 17 th April, 1906. Receipt No. 134,974.
Claim.-1. The- combination with the head rest, of a roller located in front of the head rest, a cylinder hung from the rear of the head rest and carrying a roll of paper, the paper from which extends through a slot in the cylinder up over the head rest around the front roller and backwardly again underneath the upper layer of paper and down in front of the cylinder, as and for the purpose specified.
2. The combination with the headrest, of a roller located in front of the head rest, a cylinder hung from the rear of the head rest and carrying a roll of paper, the paper from which extends through a slot in the cylinder up over the head rest around the front roller and backwardly again underneath the upper layer of paper and down in front of the cylinder and a knife bar carried by the cylinder, as and for the purpose specified.
3. The combination with the head rest, of a roller located in front of the head rest, a paper carrying means located to the rear of the head rest, the paper of which extends up over the head rest around the front roller and backwardly again underneath the upper layer of paper and down in front of the paper carrying means, as and for the purpose specified.
4. The combination with the head rest, of a roller located in front of the head rest, a paper carrying means located to the rear of the head rest, the paper of which extends up over the head rest around the front roller and backwardly again in front of the paper carrying means, and means
located behind the head rest for severing the paper, as and for the purpose specified.

5. The combination with the head rest, of a roller located in front of the head rest and a roller hung from the rear of the head rest and carrying the roll of paper, the paper from which extends over the head rest around the front roller and backwardly again underneath the upper layer of paper and downwardly in front of the rear roller, as and for the purpose specified.

No. 101,840. Fastener for Aprons. Attache de tablier.
:

Michael Joseph OConnor, Denver, Colorado, U.S.A., 6th November, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,072.
Claim.-1. A device of the character described, comprising a waist belt and a pair of clips each of which is mounted to slide on said belt independently of the other, said clips being provided with fingers adapted to engage the grommets of an apron.
2. A device of the character described, comprising a waist belt, and clips mounted to slide thereon and provided with means for automatically limiting the sliding movement to one direction, said clips being provided with fingers designed to take the grommets of an apron.
3. A device of the character described, comprising a waist belt, and clips mounted to sllde on said belt, said clips being provided with spring latch plates designed to permit the free movement of said clips in one direction only, and sald clips being also provided with fingers designed to take into the grommets of an apron.
4. A device of the character described, comprising a waist belt provided with a series of holes or eyes, and clips mounted to slide on said walst belt and each provided with a finger designed to take into the grommet of an apron, said clips comprising base piates each formed with an aperture and pivoted latch plates each having a bevelled lug designed to extend through the apertures and into the holes in the waist belt, as and for the purpose set forth.
5. A device of the character described comprising a waist belt, and a pair of clips adjustably mounted on said belt, said clips being movable independently of each other on the belt and being provided with means for engaging an apron.
6. A device of the character described, comprising a waist belt provided with apertures, and clips mounted to slide on said belt and provided with lugs adapted to enter said apertures to hold the clips at different adjusted positions on the belt, each clip being provided with means for holding an apron.
7. A device of the character described, comprising a waist belt provided with two series of apertures and a slot interposed between said series, and clips provided with retaining lugs engaging two longitudinal portions of the belt produced by said slots and provided with means for cngaging in said apertures, substantially as set forth.

No. 101,941. Flaz Retting Apparatus.
Appareil pour le rouissage du lin.

Charles Robert Rogers, South Melbourne, Victoria, Australia 6th November, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138,574.
Claim.-1. My improved process of retting or degumming and subsequently cleaning and drying fibrous materials preparatory to obtaining the fibre therefrom, consisting in boiling the material to be treated in water to which has been added an emulsion of linseed oil, passing the material between a set of squeezing rollers and spraying same with water to which has been added an emulsion of linseed oil, and then spraying same with water alone while passing between other sets of rollers, and subsequently passing it over a drying table, as described.
2. The process of retting and degumming and subsequentiy cleaning and drying fibrous materials, which consists in boiling the material to be treated at about \(98^{\circ} \mathrm{C}\) in water to which has been added an emulsion of linseed oil, then removing the material from the bolling vat to a tank, divided into compartments, then passing the material between spring pressed squeezing rollers, and spraying the same with water to which has been added an emulsion of linseed oil, and then spraying the same with water alone while passing between other sets of rollers, and subsequently passing it over a steam heated drying table, substantially as described.
3. The process of retting and degumming fibrous materials, which consists in treating the material with heated water to which has been added an emulsion of linseed oll, substantially as specifled.
4. In apparatus as described, the combination with a tank 12 having three compartments, of the squeezing rollers 16,18 and 19 , conveying rollers 22 and 24 , means for operating sald rollers and regulating the pressure, and means for raising and spraying the contents of the compartments of said tank 12 on to the material as it enters between each set of the said rollers, substantially as herein described.
5. In apparatus as described, the combination with the longitudinal pipes 43 heated by steam from steam supply pipe 35 , of a tap 44 to control the amount of steam passing from said pipe 35, endless chains 45 provided with straps or laths 49, and means for transmitting motion to said endless chain. perforated pipes 38 in proximity to the squeezing rollers, the depending pipes 39 open at the bottom, and the injector 40, substantially as described and for the purpose specified.

No. 101,942. Razor. Rasoir.
Rollin Breed Fuller. Chicago. Illinios, U.S.A., 6th November, \(1906: 6\) years. Filed 17th October, 1906. Receipt No. 140.390.

Claim.-1. A safety razor comprising a guard leaf and handle leaf having pivotal connection and a blade clampingly secured against the inner surafce of the guard leaf, for the purpose set forth.
2. A safety razor comprising a guard leaf, a handle leaf and an interposed clamping leaf pivotally connected, and a
wardly extending cylinder being placed in communication by a duct or pasage, a rod pasing vertically through the

valve casing and through the cylinder at the bottom thereof and connected with the piston in the hydraulic cylinder, said rod being also provided below the partition in the valve casing with a valve adapted to close the port or passage in said partition and below said valve with a piston movable in the cylinder at the bottom of said valve casing and automatic devices in operative connection with sald rod for holding the same in a depressed position and holding said valve open.
2. In an automatic variable cut-off governor for steam pumps adapted to be connected to the water end of a pump and to the steam supply pipe of the same, a hydraulic cylinder and piston with one end of which the water delivery pipe is connected, a throttle valve for the steam supply pipe provided with an ancillary piston movable in a cylinder forming part of the steam valye casing. springs and weights for holding the steam and hydraulic piston in one position with the steam valve normally open, said piston being operated in one direction so as to close the steam valve by pressure in the water delivery pipe and in opposite direction by springs and weights, and an automatically operated condonsed watar drain valve placed in the steam supply pipe whereby said drain valve is held normally open when the governor closes the steam supply pipe.

No. 101,944. Controller for Electric Motors.
Contrôlcur pour moteurs f́lcctriqucs.

G. A. Edward Kohler and Franklin W. Kohler, assignee of Charles A. Dresser, all of Chicago, Illinols, U.S.A., 6th Charles A. Dresser, all of Chicago, Illinois, U.S.A., 6th
November, \(1906 ; 6\) years. Filed 4th October, 1904. Receipt No. 118,915 .
Claim.-1. A controlling device for motors comprising two sets of resistance contacts having resistances associated therewith, an intermediate neutral contact. a contact device adapted to be moved along said contacts, a solenoid for actuating said contact device, and a series of circult connections arranged so that when the contact device is moved in one direction from the neutral contact, the motor will run forward and when moved in the opposite direction from said dead or neutral contact the motor will be reversed, means for controlling said contact device from a distant point, and switches for changing the connections and solenoids for operating them.

Charles Palmer McMullen and William Elmer Nye, Wareham. Massachusetts, U.S.A.. 6th November, 1906 ; 6 years. Filed 7th July, 1906. Receipt No. 137.620.
Claim.-1. In an automatic variable cut-off governor for steam pumps adapted to be connected with the water end of a pump and with the steam supply pipe thereof, a hydraulic cylinder connected with the water dellvery pipe of the pump and provided with a piston, a valve casing arranged over sald cylinder and connected therewith and provided with oppositely arranged inlet and outlet ports. a steam pipe adapted to connect the inlet port with a steam supply, a steam pipe adapted to connect with the outlet port with the pump. said valve casing being also provided with a horizontally ranging partition having a central port or passage and with a downwardly extending cylinder, the outlet end of the valve casing and the bottom of the down-

\footnotetext{

}
lade interposed urpose set forth.
3. A safety razor comprising a guard leaf, a handle leaf and an interposed clamping leaf pivotally joined together at one longitudinal edge, and means clampingly connecting the guard leaf and clamping leaf together at the end edges thereof, for the purpose set forth.
4. A safety razor comprising a guard leaf, a handle leaf plvotally joined to a longitudinal edge and having limited opening movement with relation thereto, an interposed pivoted clamping leaf having its end edges equipped with means for clampingly engaging the end edges of the guard leaf and a blade confined between the clamping leaf and guard leaf, for the purpose set forth.
5. In a safety razor the combnation of a guard leaf, a handle leaf and a clamping leaf having aligned pivot lugs, a common pivot for the leaves joining said lugs together, a blade interposed between the guard leaf and clamping leaf, and means clampingly securing the ends of the guard leaf and clamping leaf together, for the purpose set forth.
6. In a safety razor the combination of a handle leaf and guard leaf plyotally joined together at one longitudinal edge, a blade and blade clamping means carried by the end portions of the guard leaf, for the purpose set forth.
7. In a safety razor the combination of \(n\) handle leaf, guard leaf interposed clamping leaf having aligned pivot lugs at one longitudinal edge, a common connecting pivot for the leaves. a blade interposed between the clamping leaf and guard leaf, blade clamping means caspied by the end portions of the guard leaf, and clamping means carried by the end portions of the clamping leaf and engaging the ends of the guard leaf.
8. The combination of a guard leaf, clamping leat and handle leaf having common pivotal connection at one longitudinal edge, a blade and lug and notch connection between one of said two first-named leaves and the ends of the blade, for the purpose set forth.
9. The combination of a guard leaf, clamping leaf and handle leaf having common pivotal connection at one longitudinal edge, a blade. lugs carried by the end portions of the guard leaf received by notches in the ends of the blade and lugs carried by the end portions of the clamping leaf clampingly engaging the ends of the guard leaf, for the purpose set forth.

\section*{No. 101,943. Governor for Pumping Engines. Gouverneur pour pompes.}
2. A controlling device for motors comprising a solenoid, a core therefor provided with a contact device, a series of contacts along which said core is adapted to move, an intermediate point where said contact device normally stands when the motor is not running, and means for returning said contact device to said intermediate point when moved in rither direction therefrom.
3. A controlling device for motors comprising two sets of contacts, a contact device adapted to move therealong. a solenoid for moving it, an intermediate neutral contact or contacts engaged by said contact device when the motor is Idle, means controlled from a distant point for moving the contact device in one direction from the neutral contacts, and a separate means controlled from a distant point for moving the contact device in the other direction, whereby the contact device cannot be moved from one set of contacts to the other without being stopped at the neutral contacts, and switches for changing the connections and solenoids for operating them.
4. A controlling device for motors comprising a series of forward resistance contacts and a series of reversing resistance contacts, an intermediate neutral contact or contacts, a contact device normally associated with the neutral contacts, an electric magnetic device for controlling said contact device, two switches located at a distant point, one adapted when operated to cause the contact device to move to the neutral point and the other adapted when operated to move the contact device along the reversing contact.
5. A controlling device for motors comprising two sets of resistance contacts, one for starting the motor forward and the other for reversing 1 t , an intermediate neutral point, a solenoid provided with al core, a contact device associated with said core and adapted to be moved along said contacts. a stop device for the contact device, inoperative when the contact device is moving along the reverse contacts but adapted to stop the contact device at the neutral point, and suitable electro-magnetically controlled switches for chano ing the circuits.
6. A controlling device for motors comprising two sets of resistance contacts, one for starting the motor forward and the other for reversing it, an intermediate neutral point, a contact device adapted to move along said contacts, a controlling solenold therefor, a circuit controlling device in the motor circuit, a switch device controlled by said solenoid and adapted to cause the circuit controlling device to break the motor circuit when the contact device is moved toward the neutral point.
7. A circuit controlling device for motors comprising two sets of resistance contacts, one for starting the motor forward and the other for reversing it, a neutral point between said contacts, a contact device adapted to move along said contacts, an electro-magnetic controlling device therefor, two electrically controlled switches in the motor circuit, one adapted to be actuated when the contact is moved in one direction from the neutral point and the other adapted to be actuated when the contact is moved in the other direction from the neutral point.
8. A circuit controlling device for motors comprising two sets of resistance contacts, one for starting the motor forward and the other for reversing it, a neutral point between sald contacts, a contact device adapted to move along said contacts, an electro-magnetic controlling device therefor, two electrically controlled switches in the motor circuit, one adapted to be actuated when the contact is moved in one direction from the neutral point and the other adapted to be actuated when the contact is moved in the other direction from the neutral point, and a circuit controlling device associated with said contact device and adapted to control said switches.
9. A controlling device for motors comprising two sets of resistance contacts, one for starting the motor forward and the other for reversing it, an intermediate neutral point, a contact device adapted to be moved along said contacts, a controlling solenold therefor, two circuits associated with said solenoid, one adapted when closed to cause the contact device to move along the forward contacts and the other adapted when closed to cause the contact device to move along the reverse contacts.
10. A controlling device for motors comprising two sets of resistance contacts, one for starting the motor forward and the other for reversing it, an intermediate neutral point, a contact device adapted to be moved along said contacts, a controlling solenoid therefor, two circuits associated with said solenoid, one adapted when closed to cause the contact device to move along the forward contacts and the other adapted when closed to cause the contact device to move along the reverse contacts, two electrically operated switches in the motor circuit, one controlled by each of sald solenoid circuits.
11. A controlling device for motors comprising a series of resistance contacts, a movable device adapted to move therealong, a controlling solenoid for said movable device, a
switch in the motor circuit, a controlling switch at a distant point adapted when moved to cause the switch in the motor circuit to be opened and the solenold to be energized so as to move the movable device to its initial position, and suitable circuit connections between the various devices.
12. A contrblling device for motor comprising a series of resistance contacts with resistances associated therewith, a contact device adapted to move therealong so as to cut resistance into or out of the motor clrcuit, two circuits leading through said controlling solenoid, one adapted to be closed at a distant point, and the other normally closed when the current is turned on.
13. A controlling device for motors comprising a series of resistance contacts with resistances associated therewith, a contact device adapted to move therealong, a controlling solenoid for controlling said contact device, two circuits through said solenold, one normally open and the other normally closed, and means at a distant point for closing one of said circuits and for opening the other circuit.
14. A controlling device for motors comprising a series of resistance contacts with resistances associated therewith, a contact device adapted to move therealong, an electro-magnetic controlling device therefor, a series of electrically controlled switches adapted to be controlled from a distant point so as to vary the motor circuit through the said contacts and resistances to cause the armature to be rotated in either direction.

No. 101,945. Find Gate for Wagong.
Arvière-panneau pour zoagons.

Robert R. Tichenor and Andrew Johnson, both of Feeley, assignee of Plwtebus Walker, Wadena, all of Minnesota,
U.S.A., 6th November. 1906 ; 6 years. Filed 22nd August, 1906. Recelpt No. 138,908 .

Claim.-1. In a wagon the combination with the side boards 2 and the narrower top box 4, of the end gate formed in two sections 20 and 22 , one of said sections being provided at one end with a locking device arranged to engage with the top box and the side boards, substantially as described.
2. The combination in a wagon having side boards 2 and extension boards 4 of a less width than said side boards of the end board 20 having a width equal to that of the side boards 2 and the end board 22 of a width equal to that of the extension boards 4 , one end of said board 20 being provided with projecting hooks 23 adapted to enter slots 10 in the side board 2 and the opening 14 in the extension boards 4. the other end provided with movable hooks adapted to enter similar slots 10 in the side board 2 and opening 14 in the extension board 4, said hooks being adapted to be lock"d in position when so entered whereby the side boards and extension boards are severally locked to the end board.
3. The combination in a wagon of the side boards 2 and oxtension boards 4 , angle irons 8 with roughened inner siles and having slots 10 and angle irons 12 having opening 14. end boards 20 and 22 provided in the projecting hooks 23 and the levers 25 and 11, said lever 41 being provided with a hook end roughened and pivotally connected to swinging hinge 43 , which is also pivotally connected to the plate 37 through the lugs 39, substantially as described and for the purpose specified.

No. 101,946. Cable Conpling. Joint pour cables.

Dossert and Company, assignee of John Joseph Dossert, all of New York City, New York, U.S.A., 6th November, 1906; 6 years. Filed 23rd March, 1904. Receipt No. 113,778.
Claim.-A coupling for stranded electric cables having a covering of soft metal such as lead and provided with an internal insulating wrapping between the metal covering and the cable strands, the said coupling consisting of coupling members for the individual cable wires inclosed in a second independent gas and water tight coupling sleeve connecting the ends of the soft metal jacket, in combination with a ring 11 with a tapered edge inserted between the soft metal covering and the insulating covering. the arrangement being such that the coupling members are pushed upon the cable ends in such a way that they do not lie upon the outermost ends of the lead jacket and of the inserted ring. whereby a direct strain upon these parts by pressure is avoided.

Nio. 101,947. Clasp. Agrafe.

The Hercules Safety Clasp Cempany, assignee of Isaac Steinberg, all of Nashville, Tennessee. U.S.A., 6th November, 1906; 6 years. Filed 15th August. 1906. Receipt No. 138,722.
Claim.-1. In a clasp and in combination a casing provided with a horizontal slit at one end thereof. an arched spring secured at one end to the bottom of the casing adjacent to the slit, a hook on the rise of the arch adjacent to the slit, a button scoured to the rise of the arch adjacent to the free end of the spring and projecting through the upper face of the casing and a slide traversing the slit in the casing and provided with an opening to encage the hook.
2. In a clasp the combination of a casing provided with an opening at one of the ends thereof. an archid spring secured at ond end to the bottom of the casing adjucwnt to the openink. a slifle traversing the opening on the casing, means actuated by the spring to engage the slldr. and means without the casing for depressing the spring to release the enfaging means.

No. 101,948. Device for Producing Sound Signals in Water.
Appareil pour produire par le son des signeaux dans l'eak.

submarine Signal Company. Waterville, Maine, assignee of Horace Bigelow Gale, Boston, Massachusetts, U.S.A.. 6th November, 1906; 6 years. Filed 9th August, 1906. Receipt No. 138,053.
Claim.-1. In an apparatus for producing sound signals in water by which they are transmitted, the combination of a resonant body having a portion of its surface adapted to be exposed to contact with water, and a portion thereof shielded therefrom, and means whereby the resonant body may be excited to produce and transmit sound signals in the water, said means being located to act upon the shielded portion of said resonant body.
2. In an apparatus for producing sound vibrations in water by which they are transmitted, the combination of a resonant body adapted to be exposed upon the one side to contact with water, means for excluding water from the other side thereof, and means adapted to excite the resonant body located upon the side thereof from which water is to be excluded, whereby said resonant body will be caused to produce and transmit sound signels through the water.
3. In an apparatus for producing sound vibrations in water by which they are transmitted, the combination of a resonant body, the outside surface of which is adapted to be exposed to contact with water, means for exclullin' water from the inside surface thereof, and means for exciting the resonant body located to act upon the side thereof from which water is to be excluded.
4. In an apparatus for producing sound vibrations in water by which they are transmitted, the combination of a resonant case adapted to be immersed in water, and from the interior of which water is to be excluded, means enclosed in the case for exciting the resonant body to impart sound vibrations to the surrounding water, and means for operating the exciter from a point outside the case. as set forth.
5. In an apparatus for producing sound vibrations in water, by which they are to be transmitted, the combination of a resonant case immersed in water from the inside of which water is excluded, a striker adapted to strike against the inner surface thereof to cause the vibration of said case, means for operating said striker and means for causing the actuating of said striking operating means from a point outside the casing, as described.
6. In an apparatus for producing sound vibrations in water, by which they are transmitted, the combination of a closed metallic case, a striker enclosed in the said case and adapted to strike upon the inside surface thereof, electrical mechanism, enclosed in the case, for actuating the said striker, and a cable or insulated wire attached to the case and entering the same through a sealed opening whereby electrical power may be conveyed inside the case for operating the striker, thereby transmitting sound signals through the water, in which the case is immersed.
7. In an apparatus for producing sound vibrations in water, by which they are transmitted, the combination of a cylindrical metallic case, having a thickened portion forming a circumferential ring, a striker enclosed in the said case and adapted to strike the said ring, an electrical mechanism for actuating the striker, and a cable or insulated wire entering the case through a sealed opening whereby electrical impulses may be conveyed inside the case for operating the striker, substantially as set forth.
8. A water tight case, a portion of whlch is capable of exciting vibrations in water in contact with It, and means adapted within the case whereby the vibrating portion of said case may be set in motion, as described.
9. A water tight case capable of vibration and of transmitting vibrations to water in which such case is sub. merged, and means located within sald case whereby vi. brations may be set up in said case, as described.
10. A water tight case capable of transmitting vibrations to water in which such case is submerged and means located within said case whereby such vibrations may be excited, as get forth.
11. A water tight case capable of transmitting vibrations to water in which it is submerged, means located within said case whereby such vibrations may be excited, and mechanism located outside the case whereby said exciting means may be operated, as set forth.
12. A water tight case having two or more faces each capable of transmitting vibrations to water and each attuned differently from the other, said case being adapted to be submerged in water, said case being provided with means located therein whereby such vibrations may be excited, in combination with means located outside the case whereby sald exciting means may be operated.

No. 101,949. Air Brake for Antomobiles.
Frein à air pour automobiles.

The Kalisch Air Brake Company, assignee of Frederick Kalisch, all of St. Louis, Missouri, U.S.A., 6th November, 1906; 6 years. Flled 12th June, 1906. Recelpt No. 136,810.

Claim.-1. The combination with the engine of an automobile, of a friction pulley riding on the fly wheel of the engine, an air pump operated by the rotation of the friction pulley, a storage tank, a brake cylinder, tubular connections from the storage tank to the air pump and to the brake cylinder, and means whereby the pressure within the storage tank is utilized to automatically move the friction pulley into and out of engagement with the fly wheel of the engine, substantially as spectifed.
2. In an apparatus of the class described, a friction pulley mounted so as to move into engagement with the fly wheel of an engine, an air brake pump, driving mechanism from the friction pulley to the air pump, a storage tank, a brake cylinder, tubular connections from the air pump to the tank and from the tank, to the brake cylinder, a small cylinder connected to the storage tank, a spring actuating piston actuating therein, and suitable connections from the piston tc the friction pulley for moving the same into and from irictional engagement with the fly wheel of the engine, substantially as specifled.

\section*{No. 101,950. Wrench. Clé à écrou.}

Benjamin F. Nedrow and Hiram R. Andirews, Seattle, Washington, U.S.A., 6 th November, \(1906 ; 6\) years. Filed 18th September, 1906. Receipt No. 139,600.
Claim.-1. A wrench comprising a handle formed with a jaw, and a movable jaw, a U-shaped yoke straddling said handle and provided with teeth, pins on said movable jaw for engagement with the teeth of said yoke, and means to swing said yoke.
2. A wrench comprising a handle provided with a jaw, a frame secured to sald jaw, a second jaw pivoted in said frame, a yoke straddling said handle and being formed with teeth, pins on snid pivoted jaw for engagement with said teeth, and a tan le pivoted to said first handle, sald yoke, being pivoted to sald last handle.
3. A wrench comprising a handle provided with a fixed jaw, a movable jaw having a rearwardly extending portion, of pins secured to the rearwardly extending. portion of safd movable jaw, a handle pivoted to the first-named handle, a
toothed means pivoted to the last-named handle and hating its teeth engaging said pins, and resilient means for for-

mally holding the teeth of said means in engagement with said pins.

No. 101,951. Wrench. Clé à Ecrou.

Francis M. Straube, Boulder, Colorado, U.S.A., 6th Novethber, 1906; 6 years. Filed 19th October, 1906. Receipit No. 140,435.
Claim.-1. A wrench comprising the combination with a fixed jaw and a handle having a rack face, of a sliding jaw longitudinally movable on said handle, a threaded arm secured to said sliding jaw, an internaliy threaded collar on said threaded arm, said collar having external rings for cóoperating with the rack portion of the handle, means at the free end of the arm for locking the same with the hadmate and a spring device carried by the handle for engaging the free end of the arm to force it away from the hamofe, substantially as shown and described.
2. A wrench of the character stated comprising the combination with the flxed jaw and a handle having a rack portion, of a movable jaw longitudinally slidable on said handle, an arm pivotally secured to said slidable jaw, said arm comprising a head portion and a threaded shank, an internatly threaded collar on said threaded shank, said coltar havitg external rings for co-operating with the rack portion of the handle, a U-shaped locking pawl pivotally secured to the said threaded shank at its free end and adapted to lock over said handle and spring devices carried by the handle for en'gaging the arm to force it away from the handle, substan. tially as shown and described.
3. A wrench of the character stated comprisfing the combination with the fixed jaw and a handle having a rock portion, of a movable jaw longitudinally slidable on said handle, an arm pivotally secured to said slidable jaw, said arm comprising a head portion and a threaded shank, an internaily threaded collar on said shank, said collar having external

Digitized by
8
rings for co-operating with the rack portion of the handle, s U-shaped locking pawl pivotally secured to the said threaded shank at its free end and adapted to lock over the said handle, said portion having a finger end and a locking spring secured to said pawl in sald finger end for locking with said handle, substantially as shown and described.
4. A wrench of the class described comprising the combination with a fixed jaw and a, handle integrally secured thereto, of a movable jaw longitudinally slidable on said handle, an arm pivotally secured to the sliding jaw, said arm and said sllding jaw having co-operating shoulders, a collar longitudinally adjustable on said arm, said collar having external rings for co-operating with the rack portion of the handie, a locking pawl pivotally secured to the free end of said arm for locking with said handle and a spring device carried by the handle for engaging the free end of the arm to force it away from the handle, substantially as described.
5. A wrench comprising the combination with a fixed jaw and a handle having a rack face and a grooved portion, of a sliding jaw longitudinally movable on said handle and a threaded arm pivotally secured to said sliding jaw, an internally threaded collar on sald threaded arm. said collar having external rings for co-operating with the rack portions of the handle, means at the free end of the arm for locking the same with the handle, said free end of the arm adapted to rest in the grooved portion of the handle and a spring in the grooved portion of the handle for engaging the free ent of the arm to force it away from the handle, substantially as shown and described.

No. 101,952. Gas Tank. Réservoir d gaz.

Percy C. Avery, Milwaukee, Wisconsin, U.S.A., 6th November, 1906; 6 years. Flled 22nd October. 1906. Receipt No. 140,491.
Claim.-1. An apparatus for storing and delivering gas having in combination a tank, a body of flbrous material flling the tank, a solvent of the gas to be stored with which the flbrous material is saturated, said solvent being supersaturated with the stored gas, the tank being provided with a comparatively small opening and a removable closure for said opening, the flbrous material aforesaid being arranged in the form of a strand.
2. An arparatus for storing and delivering gas having in combination a tank, a body of fibrous material filling the tank, a solvent of the gas to be stored with which the fibrous material is saturated, said solvent being supersaturated with the stored gas, the tank being provided with a comparatively small opening and a closure for said qpening. the fibrous material aforesaid being arranged in the form of a strand, one end of which is attached to said closure, substantially as described.
3. In an apparatus for storing and delivering gas the comblnation of a tank having a comparatively small opening. a valve device having a threaded portion occupying said opening, a body of fibrous material flling the tank, said fibrous material being arranged in the form of a strand and having one end attached to the valve device and a solvent of the gas to be stored with which solvent the fibrous material is saturated, said solvent belng supersaturated with the stored gas, substantially as described.
4. In an apparatus for storing and delivering gas the combination of a tank having an opening, an absorbent body flling the tank, a solvent of the gas to be stored with which the absorbent body is saturated, said solvent being supersaturated with the stored gas, a valve device closing said opening and a perforated tube extending from the valve device into the absorbent body, substantially as described.
6. In an apparatus for storing and dellvering gas having In combination a tank, having through one of its end walls a comparatively small openling, a removable closure for said opening. a body of fibrous material flling the tank, a solvent of the gas to be stored with which the flbrous material is saturated, sald solvent being supersaturated with the stored gas and the fibrous material being arranged in the form of a strand, substantially as described.

\section*{No. 101,953. Back for Eeats. Dos de fautoull.}

Archibald Conrad Clark, Lillington, North Carolina, U.B.A.
6th November, 1906; 6 years. Filed 1st September, 1906.
Receipt No. 139,169.
Claim.-1. A back support comprising side frames, means adjustably securing said frames together, clamps at the lower portion of the frames for attaching the frames to the seat, and braces extending forwardly from each frame.
2. A back support comprising side frames, means adjustably securing said irames together, clamps at the lower portion of the frames for attaching the frames to the seat, and adjustable braces extending forwardly from the outer end portion of each frame and having attaching means for securing same to the seat.
3. A back support for seats comprising side frames, each frame embodying horizontal and vertical bars, braces adjustably connecting the horizontal bars to each frame, clamps at the lower ends of the vertical bars of each prame, adjustable braces extending forwardly from the upper end portion of each frame, clamps at the outer ends of said braces, back rests for the frames, and rings and spring engaging members carried by each back rest to engage the vertical bars of the frames.

No. 101,954. Button. Bouton.

Richard H. A. D'Ally, Tiptonville, Tennessee, U.s.A., Gh November, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,326.
Claim.-1. The combination with a fabric, of plates disposed against opposite faces thereof and having aligning perforations, a staple passed through certain of the perforations and the fabric with their ends against one of the plates, and a wire having its central portion looped and its end portions passed also through perforations of the plates and through the fabric and having-their extremities bent against one of the plates.
2. In a button the combination with a plate having openings therethrough, of a wire having its central portion loopei and having portions bent to lle behind the loop and to extend bryond the latter, sald portions outwardly of the loop being bent to extend through the openings of the plate and said wire having end portions bent beyond the plate in opposite directions.

\section*{No. 101,955. Electric Motor. Noteur électrigme.}

Dugald Caleb Jackgon, Madison, Wisconsin, U.S.A.- 6th November. 1906; 6 years. Flled 6th October, 1902. Recelp: No. 99,572 .
Claim.-1. In an induction motor the combination with teid poles, of an armature provided with a normally short circuited induction motor winding, an auxiliary windiog also
provided upon the said arinature, a commutator in electrical connection with the said auxiliary winding, brushes adapted

for engagement with the sald commutator, a closed circuit eleotrically connecting the brushes, means for controlling the continuity of the circuit through the said brushes, means for varying the resistance between commutator segments of the said commutator, and supplemental field magnet coils applied to the fleld magnet included in the circuit uniting the said brushes for the purpose of increasing the amount of current passing through the said auxiliary winding, substantially as descrited.
2. In an induction motor the combination with field poles, of an armature provided with a normally short circuited induotion motor winding, an auxiliary winding also provided upon the said armature, a commutator in electrical connection with the said auxiliary winding, brushes adapted for engagement with the said commutator, a closed circuit electrically connecting the brushes, means for controlling the continuity of the circuit through the said brushes, and auxiliary resistance adapted for inclusion between adjacent commutator segments, substantially as described.
3. In an induction motor the combination with field poles, of an armature provided with a normally short circuited induction motor winding, an auxiliary winding also provided upon the said armature, a commutator in electrical connection with said auxiliary winding, brushes adapted for engagement with the said commutator, a closed circuit electrically connecting the brushes, means for controlling the continuity of the circuit through the said brushes, auxiliary resistance adapted for inclusion between adjacent commutator segments, and means for varying said resistance, substantially as described.
4. In an induction motor the combination with field poles, of an armature provided with a normally short circuited induction motor winding, an auxiliary winding also provided upon the said armature, a commutator in electrical connection with said auxiliary winding, a frame acting in cooperation with sald commutator and movable longitudinally thereof for including resistance between the commutator segments, brushes adapted for engagement with the said commutator, a closed circuit electrically connecting the brushes, and means for controlling the continuity of the circuit through the said brushes, substantially as described.
5. In an alternating current motor the combination with field magnets, of an armature therefor, a winding provided upon the sald armature, a commutator for sald winding, brushes adapted to engage the said commutator, a frame act Ing in connection with the said commutator and movable longitudinally thereof for including resistance between adjacent plates thereof, substantially as described.
6. In an alternating current motor the combination with field magnets, of an armature therefor, a winding provided upon the said armature, a commutator for sald winding. and means movable longitudinally of the said commutator and associated therewith for including a varying amount of resistance between adjacent plates of the said commutator, substantially as described.
7. In an alternating current motor the combination with feld magnets, of an armature therefor, a normally short circuited induction motor winding provided upon said armature, a second winding provided upon said armature, a commutator for said second winding. and means for including a varying resistance between adjacent plates of the said commutator. substantially as described.
8. In an alternating current motor the comoination with field magnets, of an armature therefor, a winding provided upon sald armature, a commutator for said winding, and means co-operatively associated with said commutator for including a varying amount of resistance between adjacent plates thereof. substantially as described.
9. In an alternating current motor the combination with a field winding, of an armature associated therewith having a winding, and means for including resistance in circuit between armature coils, substantially as described.
10. An alternating current motor, provided with field and armature portions, the armature portion being provided with a commutator, and resistances interposed between the armature coil connections with the commutator, substantially as described.
11. In an alternating current motor the comblnation with a field winding, of an armature associated therewith having a winding, means for including resistances in circuit beween armature coils, and means for varying said resistances, substantially as described.
12. In an alternating current motor the combination with the armature and field portions thereof, of a commutator for the armature having connections therewith, and resistances intervening between the connections of the armature with the commutator, each resistance forming with the corresponding armature coil a closed circuit, substantially as described.
18. In an alternating current motor the combination with field windings, of an armature winding therefor, terminals leading from intermediate positions around said winding. resistances interposed between said terminals, and means for varying said resistances. substantially as described.
14. In an induction motor the combination with field poles, of an armature provided with a normally short circuited induction motor winding, an auxiliary winding also provided upon the sald armature, a commutator in electrical cannection with the said auxiliary winding, brushes adapted for engagement with the said commutator, a closed circuit electrically connecting the brushes, means for controlling the continuity of the circuit through the said brushes, and supplemental field magnet coils applied to the feld magnet included in the circuit uniting the said brushes, substantially as described.
15. In an alternating current motor the combination with field magnets, of an armature therefor, a winding provided upon the said armature, a commutator for sald winding brushes adapted to engage the said commutator, and auxiliary resistances for inclusion between adjncent commutator segments, substantially as described.
16. An alternating current motor provided with field and armature portions, the armature portion being provided with a commutator and resistances bridging between commutator segments, substantially as described.
17. An alternating current motor provided with field and armature portions, the armature portion being provided with a commutator, and resistances bridging between the adjacent commutator segments, substantially as described.
18. An alternating current motor, provided with field and armature portions, the armature portion being provided with a commutator, and resistances bridging between suitable commutator segments, each reslstance being in parallel with an armature coll connecting between the segments, substantially as described.
19. An alternating current motor provided with field and armature portions, the armature portion being provided with a commutator, and resistances bridging between the adjacent commutator segments. each resistance being in parallel with the corresponding armature coil, substantially as described.
20. In an alternating current motor the combination with the armature and fleld portions thereof, of a commutator for the armature having connections therewith. and resistances intervening between the connections of the armature with the commutator, each resistance forming with the corresponding armature coll a closed circuit, the brushes bearing upon the commutator being directly united electrically, substantially as described.
21. In an alternating current motor the combination with the armature and field portions thereof. of a commutator for the armature having connections therewith, resistances intervening between the connections of the armature with the commutator, each resistance forming with the cor responding armature coll a closed circuit, the brushes bearing upon the commutator being directly united electrically, and a controller in association with the brushes to vary the torque of the armature, substantially as desrribed.
22. An alternating current dynamo electric machine, having its armature provided with a short circuited winding and a commutated winding, and having a field winding in circuit with the brushes upon the commutator of the commutated winding, substantially as described.
23. An alternating current dynamo electric machine, having its armature provided with a short circuited winding and a commutated winding, and having a field winding in series with the brushes upon the commutator of the commutated winding, substantially as described.
24. An alternating current dynamo electric machine having its armature provided with a short circuited and a commutated winding, and having a field winding adapted for serial connection with an external circuit, and an auxiliary or supplemental fleld winding in circuit with the brushes upon the commutator of the commutated winding, substantially as described.
25. An alternating current dynamo electric machine havIng its armature provided with a shore circuited, and a commutated winding, and having a fleld winding adapted for serial connection with an exteraal circult, and an auxiliary or supplemental field winding in series with the brushes upon the commutator of the commutated winding, substantially as described.
26. A dynamo electric machine having a commutated armature, the commutator of the armature having resistance directly interposed between the connections of the armature colls with the commutator, substantially as described.
27. A dynamo electric machine baving a commutated armature, the commutator of the armature being divided into gections of segments, and resistances directly bridged between the segments of the commutator so as to be interposed between the connections of the armature with the cammutator, substantially as described.
28. A single phase alternating current motor having a computated armature, the commutator of the armature belas divided into sections or segments, and resistances directly bridged between the eegments of the commutator 89 as to be interposed between the connections of the armature with the commutator, substantially as described
29. A single phase alternating current motor having a commutated armature, the commutator of the armature being divided into sections or segments, and resistances directly bridged between the segments of the commutator so as to be interposed between the connections of the armature with the commutator; substantially as described.
30. An alternating current dynamo electric machine havIng a commutated -armature, the commutator of the armature having resistance directly interposed between the connections of the armature colls with the commutator, substantially as described.
81. An alternating current dynamo electric machine havIng a commatated armature, the commutator of the armature being divided into sections or segments, and resistances directly bridged between the segments of the commutator so as to be interposed between the connections of the armature with the commutator, substantially as described.
32. A dynamo electric machine having a field winding and two armature windings, one being a short circuited winding and the other a commutated winding, the short circuited Winding having its colls electrically joined. substantially as described.
83. A dynamo electric machine having a commutated armature winding and resistances interposed between the connections of the armature coils with the commutator. each resistance being included in closed circult with the carresponding armature coll, while a commutator brush when bearing upon the commutator at a point between the connections of an armature coll and the commutator is brought into parallel relation with the corresponding resistance and also with the corresponding armature coll, substantially as described.
34. A dynamo electric machine, having a commutated armature winding, the commutator being in the form of a continuous conductor of high resistance, substantially as deacribed.

Fip. 191,086. Anspondor. Bretelles.

Thomas Gabriel Mason, Toronto, Ontario, Canada, 6th November, 1906: 6 years. Filed 29th August, 190e. Receipt No. 139.071 .
Claim.-1. In a suspender the combination of the straps having the fooped lower ends and the tabs having the looped upper ends and the circular coil extending through the loops of the straps and tube, as and for the purpose speciB. 4.
2. In a suspender the combination of the straps having the looped lower ends and the tabs having the looped upper ends and the circular coll extending through the loops of the straps and tabs, and having one end of the coll fitting and held in the opposite end, as and for the purpose spectfled.
3. In a suspender the combination of the straps having the detachable looped lower ends and the tabs having the detachable looped upper ends and the circular coll extending through the loops of the straps and tabs, and having one end of the coil fitting and held in the opposite end. as and for the purpose specified.
4. In a suspender, support or the like for wearing apparel, a coiled spring arranged in circular or ring form and having the ends fastened together and designed to connect the two members of the support, as and for the purpose specified.

No. 101,957. Truck. Camion.

Pitt Pray, St. Paul, Minnesota, U.S.A.. 6th November, 19wf; 6 years. Filed 20th June, 1906. Receipt No. 137.0:5.
Claim.-1. A device of the class set forth, consisting in comblnation with the bed of a truck, having a nose plece. of an extension frame journalled on the forward end of the body of said truck, having a palr of spring arms, and catch shoulders on the sides of sald truck between which said arms are adapted to impinge when said frame is turn--d down on the bed of sald truck, for the purposes spectfled.
2. A device of the class set forth consisting in combination with the bed of a truck, having a nose piece on it forward end, of an extension frame, having a pair of spring rams journalled on sald bed to frictionally engage said truck when said frame is in superior position and resting against said nose piece, and catches on said bed, betweea which said arms are adapted to impinge when said frame is turned down upon said bed, for the purposes specifed.
3. A device of the class set forth consisting in combination with the bed of a truck, having a nose on its forward end, of an extension frame adapted to rest against sald nose when in superior position and flat upon sald bed when depressed. a journal connection between said extension frame and the bed of said truck, a pair of shoulders. against which sald erame is adapted to implnge when in lowered position, and a pair of stops near the opposite end of said truck adapted to co-act whith said extension frame. for the purposes specifled.
4. A device of the class set forth consisting in cambination with the bed of a truck, having a nose on tis forward end, of an extension frame having a pair of spring arms and a bevelled face between said arms surface strips on the bed of said truck, having bevelled edses, and a journal connection between the arms of sald extension prame and the bed of said truck, the arms of said frame. When turned down, adapted to engage sald bevelled edges of said surfac: strips, for the purpose specified.
5. A device of the class set forth consisting. in combination with the bed of a truck, having a nose upon its forward end. of side bars. having surface strips 12 attached thercto and provided with bevelled edges 14 and a crossbar ac. ad extension frame, having spring arms 8 and 9 . journal connoctions between the ends of said arms and said slife bars. said arms adapted to engage sald bevelled edges when the axtension prame is turned down upon the bed of the track. stops 18 adjoining sald crossbar, and journal connections between sald stops and side bers, for the purposes apecifled.

Mo. 101,058. Electric Rallway.
Chemin de fer électrique.

Robert Cooke Sayer, 11 Ciyde Road, Redland, Bristol, Eng land, 6th November, 1906; 6 years. Filed 29th August, 1904. Receipt No. 118,067 .

Claim.-1. The improved system of eleotric regulation of steam, electric, or other pressure rallways and tramways for effecting the automatic and simultaneous control of all vehicles on the system, comprising an electric generator, a continuous feed rail or conductor connected with the generator, two series of gectional return conductors arranged with the continuous ends of adjacent conductors running alongside each other, a trolley or current collector on each vehicle or train of vehicles arranged to traverse the feed rail, contacts on the trolley or collector of each vehicle or train for connecting the sectional conductors of its particular section to complete the circuit to the generator, and means for insulating portions of the said sectional conductors from the contacts, such insulated parts being so arranged that the circuit is only complete so long as the vehicles remain on alternate adjacent contacting end parts of the sectional conductors.
2. The improved system of electric regulation of steam, electric or other pressure railways and tramways for effecting the automatic and simultaneous control of all vehicles on the system, comprising an electric generator, a continuous feed rail or conducior connected with the generator, two series of sectional return conductors aranged with the contiguous ends of adjacent conductors running alongside each other! gapped return conductors adjacent the generator to prevent short c!rcuiting thereto, a trolley or current collector on each vehicle or train of vehicles arranged to traverse the feed rail, contacts on the trolley or collector of each vehicle or train for connecting the sectional conductors of its particular section to complete the circuit to the generator, and means for insulating portions of the said sectional conductors from the contacts, such insulated parts being so arranged that the circuit is only complete so long as the vehicles remain on alternate adjacent contacting parts of the sectional conductors.
3. In a system of electric regulation for rallways and tramways as described, comprising an electric generator, a continuous feed rall or conductor connected with the generator, two series of sectional return conductors arranged with the contiguous ends of adjacent conductors running alongside each other. a trolles or current collector on each vehicle or train of vehicles arranged to traverse the feed rail, and contacts on the trolley or collector of each vehicle or train for connecting the sectional conductors of its particular section to complete the circuit to the generator, means for insulating the conductors consisting of a continuous flexible cover, adapted to be raised by the trolley or collector as it runs on the feed rail, an underpart of insulating material in the cover adapted to receive the return conductors and insulate the adjacent end portinns of the said conductors from each other, and also to insulate the intermediate portions of the ronductors from the trolley contacts.
4. In a system of electric regulation for rallways and tramways as described, comprising an electric generator, a continuous feed rail or conductor connected with the generator, two series of sectional return conductors arranged with the contiguous ends of adjacent conductors running alongside each other, a trolley or current collector on each vehicle or train of vehicles arranged to traverse the feed rail, and contacts on the trolley or collector of each vehicle or train for connecting the sectional conductors of its particular section to complete the circuit to the generator, means for insulatIng the conductors consisting of a continuous flexible cover, adapted to be raised by the trolley or collector as it runs on the feed rail, means for normally holding the cover down on
the feed rail, an underpart of insulating material in the cover adapted to receive the return conductors and insulate the adjacent end portions of the said conductors from each other, and also to insulate the intermediate portions of the conductors from the trolley contacts.

No. 101,959. Spring Terminal Clip.
Boucle d ressort.

John Schade, Jr., New York City, New York, U.S.A., 6th November, 1906 ; 6 years. Filed 14th November, 1904. Receipt No. 119,944.
Claim.-1. A fastening device for electrical conductors formed from a single piece of resilient metal and comprising two opposing normally separated members, one of said members being provided with a V-shaped retaining portion projecting towards the opposite member and adapted to co-act with said opposite member to firmly clamp a conductor when said members are forced into operative relationship.
2. A fastening device for electrical conductors formed from a single plece of resilient metal and comprising a flat body member, adapted to lie upon a base and be fastened thereto, an opposing spring memper situated opposite and normally separated from said body member, one of said members provided with a hook-shaped wire retaining portion projecting towards the opposite member and adapted to co-act with said opposite member to clamp a conductor in deflned position therein when said members are forced into operative relationship.
3. A fastaning device for electrical conductors formed from a single piece of resillent metal and comprising two opposing normally separated members provided with acute angled retaining portions projecting towards each other, with the angles in proximity so that when the members are forced together a conductor may be inserted in the angles of the angular portions and firmly gripped in defined position therein by the retractive force of at least one of the members.
4. A fastening device for electric conductors comprising a single piece of resilient metal having normally separated opposing members, one being provided with an inwardly projecting acute angled portion and the other with a hook-shaped retaining portion projecting towards the tirst member and adapted to co-act therewith, whereby when the members are forced together a conductor may be inserted in said hook-shaped retaining device, and firmly gripped in defined position therein by the retractive force of at least one of the members.
5. A fastening device for an electric conductor formed of a single piece of resilient metal, comprising a body member, a stationary resistant member projectind apward from the body member and having a hook portion at its upper end, and an opposing spring member projecting upwardly from the body member at the forward end of the body nember, then downwardly toward the resistant member and in proximity thereto, then upwardly away from the body member.
6. A fastening device for electrical conductors formed of a single plece of resilient metal, comprising a recessed portion shaped to form a body member adapted to be secured to a support, a resistant member adapted to engage a conductor projecting upwardly from the body member and an opposing spring member situated over and enclosing the resistant member.
7. A fastening device for electrical conductors, comprising a single piece of resilient metal looped on itself to form a spring and having one end bent in a reverse direction to the loop to form with the bend of the loop an angular retaining portion, and a hooked portion projecting from the opposite end of the loop towards the angular retaining portion, whereby when the spring is forced towards the hook a conductor may be inserted in the angle of the hook and firmly gripped in a defined position therein by the retractive force of the spring.
8. A fastening device for electrical conductors formed from a single piece of resilfent metal and comprising two
opposing normally separated members, one member being provided intermediate the length thereof with a hook-shaped retaining portion adapted to engage a conductor and adapted to co-operate with the opposing member to clamp the conductor when said members are forced into operative relatlonship.
9. A lastening device for electrical conductors formed from a single piece of resilient metal bent in the form of \(a \quad U\) and having a hooked portion adapted to engage a conductor and a slotted portion near to the bend of the U at opposite ends thereof and normally separated, but so situated that when the ends of the \(U\) are pressed together the slotted portion encloses the hooked portion to grip an inserted conductor in defined position, a finger piece being provided at a greater distance from the bend of the \(U\) than are the slotted and hooked portion for flexing the spring, by means of which finger plece an increased leverage is obtained, and the spring may be flexed by the exertion of less force than is exerted retractively on the conductor by the spring.
10. A fastening device for an electrical conductor formed of a single piece of resilient metal, comprising a slotted portion shaped to form a body member, and upwardly projecting and curved resistant member adapted to engage a conductor, and a spring member situated over and enclosing the resistant member.
11. A spring fastening device for electrical conductors formed of a single plece of resilient metal, comprising a slotted body portion, a projecting resistant member, adapted to engage a conductor. and a soring portion situated over and enclosing the resistant portion.
12. A fastening device for an electrical conductor comprising a body member and a spring member, one of said members being slotted centrally to form a projecting hook tongue adapted to co-act with the opposite member to clamp a conductor.
13. A fastening device for electrical conductors, comprising a single piece of resillent metal looped on itself to form a spring and having one end bent in a reverse direction to the loop to form with the bend of the loop an angular retaining portion, and a resistant portion projecting from the opposite end of the loop towards the tagular retaining portion. whereby when the spring is forced towards the resistant portion a conductor may be inserted between the resistant and retaining portions and firmly gripped in defined position to the retractive force of the spring.
14. A fastening devien for an electrical conductor. comprising a body member and a soring member. one of sald members being provided with a hook tongue cut nut of the body of the metal ans adapted to co-act with the opposite member to clamp a conducter.

No. 101,960. Farness Buckle.Boterle de harnais.

Ira Sellers, Edmonton, Alberta, Canada. 6th November, 1906; 6 years. Filed 9th August, 1906. Receipt No. 138,519.
Claim.-1. In a harness buckle, a plate provided with hooks and with an opening, and an insertible member disposed in the opening and provided with a hook.
2. In a harness buckle, a plate provided with hooks and with an opening, and an insertible rockable member disposed in the opening and provided with a houk.
3. In a harness buckle, a plate provided with hooks and with an opening, and an insertible rockable member disposed in the opening and provided with a hook and with means to prevent its rocking.
4. In a harness buckle, a plate provided with hooks adjacent one edge and provided with an opening adjacent its opposite edge, and an Insertible member member provided with a recess in which the wall of the opening is disposed and provided with a hook.
5. In a harness buckle. a plate provided with hooks adjacent one edge and provided with an opening adjacent its opposite edge. and an insertible member provided with a recess in which the wall of the opening is disposed and provided with a hook and provided with a guard lug.
6. In a harness buckle. a plate provided with means for attaching to a part of the harness, provided with an open-
ing, and provided with caulks on its under face, and an Insertible member provided with means for engaging the wall of the opening, and means for attaching to a part of the harness.
No. 101,961. Vacrum Cleaning Apparatue.
Apparell a mettoyer a olde.

Henry Sorensen, Copenhagen, Denmark, 6th November, 1906; 6 years. Flied 5th May, 1906. Receipt No. 135.577.
Claim.-1. In a vacuum cleaner system a dust separator so constructed that a dead zone is formed baneath the curre ntof air in the separator and the momentum which is given the dust or impurities can be utilized to separate said impurities from such current of air which is sucked through impurities from such curd deposit them in said dead zone. the vacuum chamber and deposit them in said dead zone.
2. A dust separator for vacuum cleaner systems situated In the conduit between the nozzle and the suction pump and so constructed that a dead zone is formed beneath the current of air in the separator and the momentum which is given the dust and impurities can be utilized to separate said impurities from suich current of air, which is sucked through the vacuum cleaner, and to deposit the dust and impurities in said dead zone.
3. In a separator for separating and collecting dust from vacuum cleaners the combination with the conduit between the nozzle and the suction pump, of a receptacle provided with a rinse hole, a perpendicular or downward slanting inlet pipe leading from the nozzle for air and dust, and an outlet pipe for air placed higher than the inlet thus allowing the air to be drawn upward whilst the momentum of dust and impurities will force them downwards.

No. 101,962. Fifth Wheel. Roue d'avant-train.

Ira Teeter, Chatham, Ontarto, Canada, 6th November. 1906 6 years. Flled 25th June, 1906. Recelpt No. 137,233.
Claim.-1. In a vehicle the combination of an axle, \(n\) afth wheel secured thereto comprising a cylindrical portion and a mutilated bead, a cap fitting on the fifth wheel and provided with an integral crossbar connected to the springs and a forked reach engaging extension, said cap beias chambered to receive the bead on the ifth wheel, and a forked brace extending from the reach forward and upward to the front of the cap.
2. In a vehicle the combination of an axle, a fift wheel secured thereto comprising a cylindrical portion and a mutilated bead, a cap fitting on the fifth wheel and provided with means to engage the springs and an extension to engage the double reach, said cap being chambered to recelve the bead of the fifth wheol, a plate extending below the axle and having a cylindrical extansion, a forked brace oxtending from the double reach forward and upward through a lug on the front of the cap and provided with a socket to recelve the extension on said plate, and a bolt extending through said plate and brace.

No. 101,963. Fifth Wheel. Rove d'avant-train.

James Harris Booth, Great South Road, Jumbunna, Victoria, Australia, 6th Noven.ber, 19n5; 6 years. Filed 13th September, 1906. Receipt No. 139,485.
Claim.-1. A turn coupling for the purpose speciffed, consisting of two rings, one fitting and working within the other and held together by a sliding lock bar, each coupling ring being provided with ears or lugs whereby the upper one may be secured to the vehicle frame, and the lower one to the fore carrlage or front axle bar, substantially as described and shown.
-2. A turn coupling for the purpose specifled, consisting of two coupling rings of angular section constructed to fit one within the other, the upper ring having a holed upper lug at one side and a holed lower lug at the other side, both designed to receive the end parts of a sliding lock bar of the form shown, and both rings being provided with ears or lugs by which they can be clamped or otherwise secured in position, substantially as described and shown.
3. A turn coupling for the purpose specifed, conslsting of two angular section rings designed to fit and rotate or work one within the other and each provided with ears or lugs by which they are secured in position combined with a two part sliding lock bar having a telescopic joint at its center and withend jaws to grip the two rings and take into a holed lug at one side and lie between jaws at other side of the upper ring, substantially as described and shown.

No. 101,964. Vehicle Tongue. Timon de voiture.

James Benton Harral, Evert, Arkansas, U.S.A., 6th November, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,720.
Claim.-1. A device of the character described formed from a strip of metal bent upon itself adjacent to its center to form the loop 3 and upper and lower arms 4, 5, the latter arm being doubled and bent to form the hooks 6 and projection 7, substantially as described.
2. The combination with a vehicle tongue or pole of the de vice 1 formed from a strip of metal bent upon itself adjacent tc its center to form the loop 3 and the substantially parallel upper and lower arms 4, 5, which respectively engage the upper and lower faces of the tongue, the lower arm. 5 having the hooks 6 and the projection 7 formed by folding and bending the same, as shown, and fastening bolts or the like passed through slining openings in sald arms and in said tongue, substantially as shown and described.

No. 101,965. Vehicle Body. Boîte de voiture.

Edwin George Hines, Drums, Pennsylvania, U.S.A., 6th November, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,153
Claim.-1. A support for vehicle bodies comprising a transverse member having a longitudinal groove or depression upon its upper face, standards projecting upwardly from the transverse member and located upon opposite sides of the vehicle body, a supporting bar slidably mounted between the standards and bearing the weight of the vehicle body, and spring members interposed between the base of the beforerentioned groove in the transverse member and the support ing bar.
2. A support for vehicle bodies comprising a transverse member having a longitudinal groove or depression upon its upper face, standards projecting upwardly upon opposite sides of the vehicle body and having their lower ends secured in the before-mentioned groove, a supporting bar slidably mounted between the standards and bearing the weight of the vehicle body, and spring members interposed between the supporting bar and the base of the before-mentioned groove if. the transverse member.
3. A support for vehicle bodies comprising a transverse member having a longitudinal groove or depression in its upper face, standards projecting upwardly from the transverse member and located upon opposite sides of the vehicle body, a supporting bar located between the standards and having its opposite ends formed with notches by means of which it is slidably mounted upon the said standards and spring members interposed between the supporting bar and the base of the longitudinal groove in the transverse member
4. A support for vehicle bodies comprising a transverse member having a longitudinal groove or depression in its upper face, standards projecting upwardly from the trans verse member and fitting upon opposite sides of the vehicle bcdy, a supporting bar slidably mounted between the stand ards and bearing the weight of the vehicle body, coll springs interposed between the supporting bar and the base of the longitudinal groove, plates to which ends of the coil springs are tastened, and means for securing the plates to the supporting bar and the transverse member respectively.
5. A support for vehicle bodies comprising a transverse member having a longitudinal groove or depression in its upper face, standards projecting upwardly from the trans verse member and located upon opposite sides of the vehicle body, a supporting bar slidably mounted between the standards and bearing the weight of the vehicle body, plates secured to the supporting bar and the transverse member respectively, and coll springs interposed between the trans\(v \in r s e\) member and the base of the longitudinal groove in the transverse member, said springs having thelr ends secured to the before-mentioned plates.
6. A support for vehicle bodies comprising a transverse member having a longitudinal groove in its upper face, standards projecting upwardly from the transverse member upon opposite sides of the vehicle body and having their lower ends secured in the groove, a supporting bar having its ends formed with notches which engage with, and by means of which it is slidably mounted upon the standards, discs sccured to the lower face of the supporting bar and the base of the longitudinal groove in the transverse member, and coll springs disposed in groups and having their opposite धnds secured to the before-mentioned plates by means of perforations therein.

No. 101,966. Vehicle Top. Souflet de voiture.
John M. Marmon, Zanesfleld, Ohio, U.S.A., 6th November, 1906; 6 years. Filed 19th June, 1906. Receipt No 137,068.
Claim.-1. The combination with a collapsable buggy top, of forwardly and rearwardly extending collapsable guides secured to the under face thereof, a curtain arranged to lie at times upon the guides, and at times to extend down-
wardly from the rearward edge of the top, means for holding the curtain yieldably in its last-named position, and

means for holding the curtain in its trst-named position against the action of the first-mentioned holding means. 2. The combination with a buggy top, of guides secured to the under face of the top, a curtain arranged to lie at times upon the guldes, and at times to extend downwardly from the rearward edge of the top, guldes for the slde edges of the curtain when in its last-named position, a rod secured to the rearward edge of the top, and a handle carried by the curtain and by which it may be moved from its last-named to its first-named position. sald handle being arranged for co-operation with the rod to prevent disengagement of the upper edge of the curtain from the rearward edge of the top.

No. 101,96\%. Curtain Holder for Vehicles.
Porte-rideau de voiture.

Cyrus W. Noble and Earl O. McHenry. co-Inventors, both of Hoytville, Ohio. U.S.A., 6th November, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137.154.
Claim.-1. In combination a carriage top embodying a plurality of bows, curtain holders arranged at opposite sides of the top, each curtain holder having permanent connection at one end with one of the bows of the top. the opposite end of each curtain holder having detachable connection with another of the bows of the ton, whereby said curtain holders may be lowered, and curtaine carried by said holders.
2. In combination a carriage top embodying a plurality of bows, a curtain holder pivotally connceted at one end with one bow, and detachably connected at its other end with a second bow, and a curtain carricd by said holder.
3. In combination a carriage top embodying front and rear bows, a curtain holder pivoted at one end to the upper end portion of the rear bow, means for detachably connectIng the front end of the curtain holder with the upper portion of the front bow, and a curtain carrled by said holder.
4. In combination a carriage top embodying front and rear bows, a curtain holder arrangel at the upper portion of the ton and connected with said front and rear bows. means admitting of lowering and holding said curtain holder in a lowered position, and a curtain caried by said holder.
5. In combination a carriage top embodying a plurality of bows, curtain holders arranged at opposite sides of the top, cach curtain holder having pivotal connection with the upper end of a side of the rear bow, a catch at the upper end of each side of the front bow adagted to co-act with the other end of the adjacent eurtain holder to hold the same in oberative postion, but admitting of lowering th, holdur to permit collapsing of the top. and catches arranged to congaze ends of the curtain holders after the same have bern lowered, and curtains carrled by said holders.
6. In combination a carriage top cmbodying a plurality of bows, a curtain holdir comprising a bar pivoted at one
end to one bow and detachably connected at its opposite end to a second bow, a curtain holder mounted upon sald bar, and a curtain carried by said holder.
7. In combination a carriage top embodying front and rear bows, a curtain holder comprising a bar pivoted at one end to the upper end portion of a side of the rear bow. means for detachably connecting the opposite end of said bar with the front bow, and means for detachably connecting said opposite end of the bar to the lower portion of the rear bow after said bar has been lowered.

No. 101,968. Fantener for Wason End Gates. Attache d'arrière-panneau de wagon.

Herschel A. Schermerhorn, Shabbona, Illinois, U.S.A., 6th November, 1906; 6 years. Filed 26th Junc, 1906. Receipt No. 137,305.
Claim.-1. In a fastening for wagon end gates, the combination with the sides of the body each provided with an opening near its rear end, of a bearing plate having an eccentrically located opening therein and secured to the outer surface of one of the sides over the opening in said side, an end gate located between said sides and a tie rod having a crank at one of its ends to engage the bearing plate, substantially as described.
2. In a fastening for wagon end gates, the combination with the sides of the body each provided with an openiag near its end, of a bearing plate having an elongated opening eccentrically arranged therein and secured to the outer surface of one of said sides over the opening therein, an and gate located between said sides, and a the rod haying a crank at one of its ends to engage the bearing plate and a crank handle at its other end, substantially as described.
3. In a fastening for wagon end gates, the combination with the sides of the body each provided with an opening near its rear end, of an apertured plate secured to the outer surface of one of the sides over the opening therein and having on its outer face an upright cam, an end gate located between said sides, and a tie rod having a crank at one of its ends and an obtuse angled crank handle at the other ad to engage said cam, substantially as described.
4. In a fastening for wagon end gates, the combination with the sides of the body each provided with an opening near its rear end, of a bearing plate having an opening eccentrically arranged therein and secured to the outer surface of one of said sides over the opening therein, an apertured plate secured to the outer surface of the other side over the opening therein and having on its outer face an upright cam, an end gate located between sald sides, and a tie rod having a crank at one of its ends to engage the bearing plate and an obtuse angled crank handle at its other end to engage the cam, substantially as described.

\section*{No. 101,969. End Gato for Wagon. Arricre-panneau de wagon.}

Frederic S. Converse, Lyons, New York. U.S.A., 6th November, 1906; 6 years. Filed 6th Junc, 1906. Receipt No. 136,593.
Claim.-1. In a latch for end gates, the combination with the gate hinged to the wagon body and having two studs brojecting from its side, of a latch proper pivoted to th. wagon body and having a notch adapted to engage the outis stud when the gate is closed, a hanger mounted on the sam: pivot and having notches adapted to engage the inner stud when the gate is open, and connections between the lation and hanger for ralsing the latter by the movement of the iormer but permitting a certain lost motion between then. 23 and for the purpose set forth.
2. In a latch for end gates, the comblation with the vate hinged to the wagon body and having two studs projueting from its side, of a latch proper pivoted to the wagon body and having a notch adapted to engage the outer siud when the gate is closed, a hanger mounted on the same
pivot and having notches adapted to engage the inner stud when the gate is open, and a lip on the latch standing

under the hanger for disengaging the hanger from its stud when the latch is raised but permitting lost motion when the latch is depressed.
3. In a latch for end gates, the combination with the gate hinged to the wagon body and having studs, of hangers having notches adapted to engage said studs, brackets to which said hangers are pivoted, and stops thereon for limiting the rise and fall of the hangers.
4. In a latch connecting two members, the combination With the latch proper pivoted to one member and having a projection adjacent its pivot, and a brace leading from said member to the outer end of the pivot and adapted to be engaged by said projection to support the latch, of a second member connected with the first, and a stud on this membcr adapted to engage the notch of the latch.

No. 101,970. Dump Wagon. Wagon de bascule.

Adam J. Koob, Cedar Rapids, Iowa, U.S.A., 6th November, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,401. Claim.-1. In a dump wagon, the body portion having hinged bottom leaves, and one or more shafts rotatively mounted and inclined to the transverse plane of the body and provided with lateral arms lextending beneath said leaves.
2. In a dump wagon, the body portion having hinged bottom leaves, and one or more shafts rotatively mounted and inclined to the transverse plane of the body and provided at one end with lateral arms extending beneath the leaves and with operating levers at the other ends.
3. In a dump wagon, the body portion having hinged bototm leaves, one or more shafts rotatively mounted and inclined to the transverse plane of the body and provided at one end with lateral arms extending beneath said leaves and with operating levers at the other ends and springs for extending into the paths of said lefers, and means under the control of the driver for operating said stop members.
4. In a dump wagon, the body portion having hinged bottom leaves, one or more shafts rotatively mounted and inclined to the transverse plane of the body and provided at one end with lateral arms extending beneath said leaves and with operating levers at the other ends, stop members movably disposed for extension into the path of said levers and provided with foot rests, and springs operating to hold said stop members yieldingly in operative position.
5. In a dump wagon, the body portion having spaced sides and hinged bottom leaves, shafts spaced apart and mounted for rotation upon said sides and inclined to the transverse plane of the body, arms extending at one end laterally from said shafts beneath said leaves, crank arms extending laterally from said shafts, connecting rods between the crank arms at each side of the body portion, and means for rotating said shafts.
6. In a dump wagon, the body portion having spaced sides and hinged bottom leaves, shafts spaced apart and mounted for rotation upon said sides and inclined to the transverse plane of the body, arms extending at one end laterally from 11-7
said shafts beneath said leaves, crank arms extending laterally from said shafts, connecting rods between the crank arms at each side of the body portion, and an operating lever connected to the other end of one of said shafts at each side.
7. In a dump wagon, the body portion having hinged bottom leaves, means operative from said body portion for opening and closing said leaves, the forward axle rotative beneath said body portion and brackets connected to said axle and extending rearwardly thereof for bearing against said leaves when depressed and passing beneath the same.

\section*{No. 101,971. Dumping Cart. Charrette d bascule.}

Herbert S. Long, Marion Ohio, U.S.A., 6th November, 1906;
6 years. Filed 29th June, 1906. Receipt No. 137,399.
Claim.-1. A tilting cant body, spindle bearing plates upon the ends of the same and having annular flanges, and draft rings supported for rotation by said flanges.
2. A tilting cart body, spindle bearing plates upon' the ends of the same and having annular grooved fianges, and draft rings supported for rotation by said grooved flanges.
3. A tilting cart body, spindle bearing plates upon the ends of the same said plates being provided with reinforcing arms connected with the cart body and with grooved flanges concentric with the spindles, and draft rings supported for rotation by said fianges.
4. A tiltable cart body having spindles and grooved flanges surrounding the same, in combination with draft rings supported for rotation by said grooved flanges, and draft members connected with said rings.
5. A tiltable cart body having spindles and grooved flanges surrounding the same, draft rings engaging said grooved flanges and having flanged supporting brackets, and draft members supported upon and connected with said bracketg.
6. A tiltable cart body having spindles and grooved flanges surrounding the same, draft rings engaging said grooved flanges, said rings comprising hingedly connected members, and draft members connected with the free ends of said draft rings and thereby securing the latter in position upon the grooved flanges.
7. A tiltable cart body having concentric spindles and flanges, rings engaging said flanges for rotation, said rings comprising hingedly connected members having reinforcements combining to form flanged shoulders, and draft members supported upon and connected with said flanged shoulders and thereby connecting the free ends of the hinge members constituting the rings.
8. A sheet metal cart body of approxlmately semi-cylindrical shape, spindle bearing plates having divergent arms secured upon the ends of said body, draft rings connected for rotation with said plates, and draft members connected with said rings.
9. A tiltable cart body, a forward extension member supported permanently upon the front side and the forward portlons of the ends of said body, and a rear extension member normally supported upon the rear side and the rear portions of the ends of said body and connected pivotally with the side members of the front extension member.
10. In a tiltable cart body, a permanently supported front extension member having sides connected with the ends of the cart body, a rear extension member connected pivotally with the front extension member and foldable over the latter, and means for supporting said rear extenhion member when thus folded.
11. A tiltable cart body having a permanently supported front extension, side brackets, and a rear extension member pivotally connected with said brackets and with the front extension member and foldable over the latter.
12. A tiltabla cart body, a front extension member supported permanently upon the same, upward extending brackets connected with the ends of the cart body, a rear extension member connected plyotally with said brackets and with
the front extension member and foldable over the latter, means for retaining said rear extension member against displacement when in normal positign upon the rear part of the cart body, and means for supporting said rear extension member in a forwardly folded position.
13. A tiltable cart body, a front extension member supported permanently upon the same, a rear extension member connected pivotally with and foldable over the front extension member. means for supporting the rear extension member in its forwardly folded position. and means for temporarily securing said member in said position.
14. A tiltable cart body, a rear extension member connecten pivotally therewith. means for tilting said cart body. and means for retaining it in a tilted position while being loaded. 15. A tiltable cart body, a front extension member permanently supported upon the same, a rear extension member connected pirotally with and foldable over the front extension member, means for supporting the rear extension member in its forwardly folded position, means for temporarily securing said member in said position. lever means for tilting the cart body, draft means connected with the latter, and means for securing the cart body in tilted position at various adjustments with relation to the draft means.

No. 101,972 . Garment Hanger. Accroche-vêtciment.

James Louis Muller, New Canaan, Connecticut. U.S.A.. 6th November, 1906; 6 years. Filed 29th August, 1906. Receipt No. \(139,085\).
Claim.-1. A hanger of the class described, consisting of a strip or plate adapted to be secured in a vertical position to a support and provided at its lower end with an outwardly extending arm and at its upper end with an outwardly extending member, a lock secured to the outwardly extending member at the upper end, a movable rod passing vertically through said lock and through said member and the lower end of which is adapted to operate in connection with said arm, a spring pressed device forming a part of said lock and normally bearing on said rod and adapted to be moved out of connection with said rod by a key, said rod and said spring pressed device being provided with ratchet teeth which are adapted to engage in the upward movement of said rod, and a spring for holding said rod in a raised position. substantially as shown and described. 2. A hanger of the class described, consisting of a strip or plate adapted to be secured in a vertical position to a support and provided at its lower end with an outwardly extending arm and at its upper end with an outwardly extending mentber, a lock secured to the outwardly extending member at the upper end, a movable rod passing vertically through said lock and through said member and the lower end of which is adapted to operate in connection with said arm, a spring pressed device forming a part of said lock and normally bearing on said rod and adapted to be moved out of connection with said rod by a key, said rod and sald spring pressed device being provided with ratchet teeth which are adapted to engage in the upward movement of said rod, a spring for holding said rod in a raised position, and means for moving sald rod downwardly, substantially as shown and described.
3. A hanger of the class described. consisting of a strip or plate adapted to be secured in a vertical position to a support and provided at its lower end with an outwardly extending arm and at its upper end with an outwardly extending member, a lock secured to the outwardly extending member at the upper end, a movable rod passing vertically through said lock and through said member and the lower end of which is adapted to operate in connection with said arm, a spring pressed device forming a part of said lock and normally bearing on said rod and adapted to be moved out. of connection with said rod by a key, sald rod and sald spring pressed device being provided with ratchet teeth which are adapted to engage in the upward movement of said rod, a spring for holding said rod in a
raised position, and means for moving said rod downwardly, consisting of a lever pivoted to said strip or plate and through which the lower end of said rod passes, substantially as shown and described.

No. 101,973. Garment Hanger. Acriocherritunt:

Jacob M. Stein, Washington, District of Columbia, U.S.A.. 6th November, 1906; 6 years. Filed 15th March, 1906. Receipt No. 133.925.
Claim.-1. A garment hanger comprising a body provided with a projection intermediate its ends, and a suspendin; hook secured to the body, the sides of the projection flaring downwardly from substantialiy a point to receive the neck of the garment below the apex of the projection and hold the said neck out of engagement with said hook. the ends of the body upon opposite sides of the projection having their upper faces directed downwardly upon substantially straight lines for co-operation with said projection to hold the garment in contact with said upper face portions throughout their lengths.
2. A garment hanger comprising a body provided with a projection intermesiat" its ends. and a suspending hook secured to the body, the sides of the projection flaring downwardly from substantially a point to receive the neck of the garment and hold the latter out of engagement with the suspending hook. the ends of the body upon opposite sides of the projection being directed downwardly upon substantially straight lines for co-operation with said projection to hold the garment in contact with said upper face portions throughout their lengths, and a covering fitted over the projection.
3. A garment hanger, comprising a body provided with a projection intermediate its ends, a suspending hopk securad to the body. and a covering fitted over said projection.

\section*{No. 101,974. Garment Supporter. \\ No. 101,974. Garment Supporter.}

Joseph William Schloss, New York City. New York, U.S.A.. 6th November, 1906; 6 years. Filed 20th July, 1906. Recelpt No. 138,002.
Claim.-1. A garment stiffener or fastener comprising a strip of resilient material having an incut portion at each end, whereby a hook is produced in the material.
2. A garment stiffener or fastener comprising a strip of resilient material having an incut portion at each end curved around and terminating in an eye, said incut portions having a restricted channel adjacent to the eye.
3. A garment stiffener or fastener comprising a strip of resilient material having an incut portion at each end. the entrance of which is rounded, said incut portion being curved around and terminating in an eye and having a reduced part or channel adjacent to said eye, the ends of sald stiffener being rounded adjacent to sald incut portions whereby a hook is formed at each end of the strip capable of being secured upon a loop or button of a fabric.

No．101，975．Machine for Preparing Cereals for Food．
Machine pour préparer les céréales pour nourriture．

1ヵノジ

The Natural Food Company，assignee of Frederick Regnier， both of Niagara Falls，New York，U．S．A．， 13 th Nowmber， 1906： 6 years．Filed 28th March，1406．Receipt No． 134．357．
Claim．－1．In a shredding machine the combination with a pair of shredding rolls，one of which is provided with grooves，of vibratory needles of elastic character engaging said grooves，substantially as specified．
2．In a shredding machine the combination with a pair of shredding rolls，one of which is provided with grooves，of a bank of adjustable self cleaning discharging needles held un－ der elastic tension in engagement with the grooved roll，sub－ stantially as specified．
3．In a shredding machine the combination with a pair of shredding rolls，one of which is provided with grooves，of a bank of separate discharging needles in lateral contact with each other．substantially as specifled．
4．In a shredding machine the combination with a pair of shredding rolls，one of which is finished with a series of fine circumferential V－form grooves，a valved hopper above said rolls and a moving receiver below the same，of a bank of ad－ justable self cleaning discharging needles held under elastic tension in engagement with the grooved roll，and means for operating said rolls and receiver．substantially as specificd．
5．In a shredding machine the combination with a pair of shredding rolls，one of which is finished with a series of fine circumferential grooves，a valved hopper above said rolls， and a reciprocating receiver below the same，of a bank of separate discharging needles in lateral contact with each other．and a grooved clamp having curved bearing surfaces， whereby said discharging needles are held under clastic ten－ sion in engagement with the shredding roll grooves，substan－ tially as specified．

No．101，976．Bluing Package．I＇utuct de bleu．
The Sawyer Crystal Blue Company，assignee of Alvah \(W\) ． Holway，both of Boston．Massachusetts．U．S．A．，13th November，1906； 6 years．Filed 22nd October，1906．Re－ ceipt No．140，522．
Claim．－1．A bluing device comprising an imperforate re－ ceptacle，an imperforate cover therefor，having a stem or shank rigidly connected thereto and depending from its un－ der side，and a supply of bluing carricd by sald stem within the receptacle，the stem or shank being of a length to sup－ port the bluing clear of the bottom of the receptacle，the stem or shank being of a length to enable the cover to be grasped and used as a handle without liability of contact of the hluing supply with the fingers of the user．

2．A bluing device comprising an imperforate receptacle，an imperforate cover closely fitting one end thereof and having

a stem or shank rigldly connected thereto and extending within the receptacle，said stem or shank having an enlarged lower end and a filter bag of bluing secured to said shank With its lower portion clear of the bottom of the receptacle， the stem or shank being of a length to enable the cover to be grasped and used as a handle without liability of contact of the bluing supply with the fingers of the user．

No．101，977．Railway Joint Chair．
Coussinet de joint de rails．

William Boker Davis，Bolingbroke，Georgia，U．S．A．，13th November，1906； 6 years．Filed 19th October，1906．Re－ ceipt No．140，416．
Claim．－1．A rail joint comprising a box provided with a lengitudinal opening，abutting rail ends disposed within the opening，a fish－plate disposed within the opening and be－ tween the rail and the boxing，and means whereby a lateral movement of the fish－plate produces a clamping strain be－ tween the fish－plate and the box and between the fish－plate and the rall．
2．A rail joint comprising abutting rail ends，a flsh－plate spanning the foint and provided along its lower edge with an outturned flange wedge－shaped in cross section，and a box embracing the ralls and fish－plate and presenting a bearing surface for co－operation with the wedge－shaped flange．
3．A rail joint comprising abutting rail ends，a flsh－plate spanning the joint and provided along its longitudinal edges with out－turned flanges wedge－shaped in cross section，and a box embracing the rails and flsh－plate and presenting bear－ ing surfaces for co－operation with the wedges of the flanges． 4．A rail joint comprising abutting rail ends，a fish－plate spanning the joint and provided along its longitudinal edges with outturned flanges wedge－shaped in cross section，a box with a longitudinal opening embracing the ralls and fish－ plate and presenting bearing surfaces for co－operation with the wedges of the flanges，and means for moving the fish－ plate laterally within the box and into gripping contact with the rail and the bearing surfaces of the box．

No．101，978．Car Coupler．Attelage de chars．
Robert Abbott Hadfield，Sheffieid，England，13th November， 1906； 6 years．Filed 19th October，1906．Receipt No． 140，438．
C＇laim．－1．As a new article of manufacture，a manganese steel coupling knuckle of regulation size and form produced by casting it in the form in which it is to be used as a completed knuckle，and then toughening such knuckle．
2．As a new article of manufacture，a manganese steel coupling knuckle of regulation size and form produced by casting it in the form in which it is to be used and there－ upon toughening the knuckle by heating it and then cooling it．
3. As a new article of manufacture, a manganese steel coupling knuckle of regulation size and form produced by

casting it in the form in which it is to be used, gradually heating the knuckle after solidification up to a red heat, and then quickly to a predetermined temperature, and then cooling it rapidly, to toughen and harden the knuckle.
4. As a new article of manufacture, a manganese steel coupling knuckle of regulation size and form produced by casting it in the form in which it is to be used, gradually heating the knuckle after solidification up to a red heat, and then quickly to between \(900^{\circ} \mathrm{C}\) and \(1,000^{\circ} \mathrm{C}\), and then rapidly cooling the knuckle.
5. As a new article of manufacture, a cast manganese steel coupling knuckle having a hollow body portion and hook, whereby the thickness of the metal is so disposed that the knuckle can be toughened and hardened by heat treatment.
6. As a new article of manufacture, a cast manganese steel coupling knuckle having a body portion provided with parallel holes therethrough for the pivot pin and the draw bar connection respectively, and a hook, the body portion having a cavity formed in it communicating with one of the holes and the hook having a cavity communicating with the other hole.
7. As a new article of manufacture, a cast manganese steel coupling knuckle having a hollow body portion provided with an external recess at one end, and a hollow hook projecting from the body portion and.having an external recess in one side thereof, whereby the thickness of the metal is reduced to permit toughening and hardening of the knuckle by heat treatment.
8. As a new article of manufacture, a cast manganese steel coupling knuckle having a body portion having a hole therethrough and a cavity communicating with said hole and a hook extended from the body portion. the base of the hook having a pivot hole through it and the hook having a cavity formed in it communicating with such pivot hole

No. 101,979. Rall Brace. Etai de rails.

James F. Kelly, Galena, Illinols, U.S.A., 13th November, 1906; 6 years. Filed 23rd October, 1906. Receipt No. 140.542.

Claim.-1. A rail brace having a depending tongue at one end and a base portion at its other end, and means for fulcruming the brace between its ends to permit the tongue to be forced against the rall when the base portion is moved downward and secured.
2. The combination of a fixed block or casting. a rail brace fulcrumed thereon, bearing at one end against a rail and secured at its other end.
3. The combination of a block or casting to be secured on a rall base, a brace fulcrumed on said block or casting. a tongue on the inner end of the brace to engage the rall. and a base portion on the other end of the brace to be secured against movement.
4. The combination of a block or casting to be secured on a rail base, a brace fulcrumed on said block or casting.
a tongue on the inner end of the brace movably mounted between flanges on the block or casing, and a base portion on the outer end of the brace having openings ?. spikes to secure the same to a tie.
j. The combination of a block or casting to be secured on a rail base, an upright extension on the block or casting having spaced flanges on its inner face, a bra:e fulcrumed on the upper edge of the extension, a tongur on the brace movable in the flanges of the extension and when the outer base portion of the brace is forced down, ill bear tightly against the rail, and means for securing L. י nuter base portion of the brace to a tie.
6. The combination of a block or casting to be secured on a rail base, a brace fulcrumed on the block or extenslon, a depending tongue on the inner end of the bra?e to engage the rall web, a base portion on the outer end of the brace to be secured to a tie, and an enlargement on the brace to engage the wheel head or tread portion of the rail.

No. 101,980. Railway 8witoh signal.

\section*{Signal d'aiguille de chemin de fer.}

Anthony John Pieszak and Frank Harry Poole, both of Dunkirk, New York, U.S.A.. 13th November, 1906; 6 years. Filed 17th October, 1906. Recelpt No. 140,398.
Claim.-1. The combination of a railroad switch mechanism, a torpedo operating mechanism adapted to place a torpedo upon and remove it from the rallroad rail, a box enclosing the torpedo when it is withdrawn from the rail, a gate closing said box mechanism for operating said gate. and mechanism connecting sald switch mechanism and the torpedo and gate operating mechanism, substantially as and for the purpose set forth.
2. The combination of a rallway switch with a bell crank lever connccted with the operating mechanism of asif switch, a signal station located at a point distant from sald switch consisting of a bell crank lever, a slide bar pivotel to one arm thercof. a support for the pree end of said sllde bar, a torpedo removably attached to the free end of said bar, a danger signal light and target connected with and operated by said torpedo operating mechanism, and means for operatively connecting the bell crank lever at the switch with the bell crank lever at the signal station, substantially as and for the purpose set forth.
3. The combination of a railway switch mechanism. mectanism for operating the same, a signal station at a poin: distant from said switch consisting of a torpedo operatioe mechanism. means for operating the same, a box for supporting the free end thereof, a torpedo removably secured thereto. means opening and closing sald box when the iorpero moves forward and back, a danger signal light and target connected to said torpedo operating mechanism and operated theroby, and means for convecting the torped, ouerating mechanism with the switch operating mechanisin whereby the corpedo and signal mechanism are operated in unison with the switch. substantlally as and for the purpose set forth.

No. 101,981. Rail Joint. Joint de rail.

Henry A. Rhinelander, Freedom, Pennsylvania, U.S.A., 13th November, 1906; 6 years. Filed 19th October, 1906. Receipt No. 140,417 .
Claim.-1. In a rail joint the combination with rail sections and a tie, of a base plate, said base plate having a seat formed therein, flanges carried by the longitudinal edges of said plate, the ends of two of said flanges extending over said seat and adapted to engage the bases of sald ralls, a liner adapted to be mounted upon said seat, fish plates mounted upon the en of said plate between said flanges, and means to secur. said base plate and said fish plates in engagement with said tie and said rail sections, substantially as described.
2. In a rail joint the combination with rall sections and tie, of a base plate having a seat formed therein adapted to upport said rails, flanges carried by the longitudinal edges of said plate, a liner adapted to be mounted upon said seat and engaging one edge of the base of the rail, fish plates adapted to be mounted upon the ends of said base plate to engage said rail sections, and means to secure said fish plates and said base plate upon said tie.
3. In a rail joint the comblnation with rail sections, of a base plate having a seat formed therein adapted to support said rails, a liner adapted to be mounted within said seat and to bear against the base of the rail to retain said rails therein, two separable fish plates mounted upon the ends of said base plate, and means to secure said fish plates in engagement with said base plate, substanfially as described.
4. In a rail section the combination with a plate having a seat formed therein. flanges carried by the longitudinal edges of said plate, two fish plates adapted to be mounted upon the ends of said plate and between said flanges, said fish plates being separable from said first-named plate, and means to secure said fish plates in engagement with said plate, substantially as described.

No. 101,982. Stove Support. Support de poêles.

Charles W. Rowley, Geneva, New York, U.S.A., 13th November, 1906; 6 years. Filed 19th October, 1906. Receipt No. 140,422.
Claim.-1. In a stove support, in combination, a leg and a skirting having laterally extending tongues which lap the. joint on the front and back thereof, and a rib at the end of each tongue which fits behind a projection on the other.
2. In a stove support, in combination, a leg and a skirting. the abutting edges of which have each a tongue which laps: the joint on opposite faces or sides thereof, and a vertically extending rib at the end of the tongue of each, fitting within a groove in the other.
3. In a stove support, In combination, a skirting having ribs on the front and back thereof, and a leg having projecting tongues one of which laps the front of the skirting and the other the back, with ribs at the ends of the tongues engaging behind the ribs on the skirting.
4. In a stove support, in combination, a leg and a skirting, the back of the skirting having vertically extending ribs and horizontal ledges at the lower ends thereof, and the leg having lateral tongues extending behind the skirting and engageable with the aforesaid ribs and ledges, a shoulder on the back of the leg, and a lateral tongue extending from the skirting and behind the leg, and engageable with sald shoulder.
5. In a stove support, in combination, a leg and a skirting, the back of the skirting having vertically extending ribs and horizontal ledges at the lower ends thereof, and the leg having lateral tongues extending behind the skirting and engageable with the aforesaid ribs and ledges; the skirting and leg below the aforesaid tongues overlapping, and having interlocking ribs and grooves, shoulders on the back of the leg above the aforesaid tongue, and tongues extending from the skirting and behind the leg, and engageable with said shoulders.

No. 101,983. Stove. Poéle.

Clinton Almeron Case, Council Bluffs, Iowa, U.S.A., 13th November, 1906; 6 years. Filed 23rd October, 1906. Receipt No. 140,539.
Claim.-1. A stove comprising a drum, a firebox in said drum, a draft pipe in the drum, a damper arranged to control an opening from the drum to the draft pipe and said damper being adapted to close by gravity, a fuel door, and a link operatively connected to said door at one end, the other end of said link being formed with an elongated slot, there being provided a lug on said damper, said lug taking into said slot, whereby the opening of the door will open the damper, and whereby the closing of the door will allow the damper to close by gravity, and means for opening said damper independent of the door.
2. A stove comprising a drum, a firebox held at the upper end of said drum, whereby the lower portion of the drum constitutes a radiator, a draft pipe connected to the drum near the lower end thereof, a fuel door mounted at the upper end of the stove directly in communication with the upper end of the firebox, said door being provided with a draft opening and means for controlling the :ame, a branch pipe connected to the draft pipe at the - pper end of the stove, and onening into the upper end of the firebox, a damper controlling said branch pipe, a bracket secured to the fuel door, a link provided with one end curved sharply upwardly and connected to said bracket and provided in its other end with an elongated
slot, there being provided a lug on the damper on the branch pipe, said lug taking into said slot, whereby the opening of the door will likewise open the said damper, and means for opening said damper independently of the door.
3. A stove comprising a drum, a firebox held at the upper end of said drum, whereby the lower portion of the drum constitutes a radiator, a draft pipe connected to the drum near the lower end thereof, a fuel door mounted at the upper end of the firebox, said door being provided with a draft opening and means for controlling the same, a branch pipe connected to the draft pipe at the upper end of the stove, and opening into the upper end of the firebox, a damper controlling said branch pipe, a bracket secured to the fuel door, a link provided with one end curved sharply upwardly and connected to said bracket and provided in its other end with an elongated slot. there being provided a lug on the damper for the branch pipe, said lug taking into said slot, whereby the opening of the door will likewise open said damper, and a rod connected to said damper and slidably mounted through the branch pipe. whereby said damper may be opened independently of the door.
4. A stove comprising a drum, a firebox within said drum, a draft pipe for the drum, a fuel door at the upper end of the drum, a branch pipe connected to the draft pipe at the upper end of the drum and opening into the latter, a damper controlling said branch pipe, a bracket secured to the fuel door, a link provided with one end curved sharply upwardly and connected to said bracket and provided a lug on the damper for the branch pipe, said lug taking into said slot. as and for the purpose set forth.
5. A stove comprising a drum, a firebox in said drum, a draft pipe for the drum, a damper arranged to control one of the openings from the drum to the draft pipe and said damper being adapted to close by gravity, a fuel door. a link provided with one end curved sharply upwardly and operatively connected to said door the other end of said link being formed with an elongated slot, there being provided a lug on said damper. said lug taking into said slot, and means for opening said damper independently of the door.
6. A stove comprising a drum, a firebox in said drum, a draft pipe connected to the drum and provided with openings communicating therewith. a damper controlling one of said openings and arranged to be closed by gravity. a fuel door, means whereby the opening of the fuel door will effect the opening of said damper and whereby the closing of the fuel door will permit the damper to automatically close by gravity, and means for opening said damper independently of the door.
7. A stove comprising a drum, a firebox in said drum. a draft pipe connected to the drum at the lower end thereof and provided with a branch connecting it to the upper end of the drum, a fuel door for the upper end of the drum and damper for said branch pipe, said damper being arranged to close by gravity and provided on one edge with a lug, a link provided at one end with a slot. receiving said lug and operatively connected to the fuel door at its other end, for the purpose specified, and a rod 14 connected to the rear face of said damper and extendingly upwardly and sliding through the upper side of said branch pipe, as set forth.
8. In a stove provided with direct and indirect flues for the products of combustion and with a fuel door. the combination with a damper for said direct flue, said damper being held in its closed position by gravity, a slotted link or bar between said damper and said fuel door, said link or bar permitting movement of said damper independent of the fuel door, and means for manually operating said damper.

\section*{No. 101,984. Cultivator. Vulticatcur.}

Hans Anderson, Crystal, North Dakota. U.S.A., 13th November, 1906; 6 years. Filed 23rd October, 1906. Receipt No. 140,543.
Claim.-1. An implement such as described comprising a beam, wings pivotally attached to the beam, a leer mechanism for swinging sald wings, a blade carried by the beam, and blades pivotally attached at their forward ends to the farst said blade and connected at their rear portions with said wings.
wings.
2 . An implement such as described comprising a beam, wings pivotally attached to said beam, a lever mechanism for swinging said wings. a blade carried by the beam, and blades pivotally attached to their forward ends to the first said blade and being capable of adjustment into horizontal or inclined positions and being connected at their rear portions with said wings.
3. An implement such as described comprising a beam, nings pivotally attached to sald beam and carrying ploughs,
a blade carried by said beam, blades pivotally attached at their forward ends to the first said blade and being connected

at their rear portions to said wings and lever merhanism for operating said wings.

\section*{No. 101,985. Grain Cleaning Process.}

Procédé pour nettoyer le grain.

Frederick Stephen Blackmarr, Minneapolis, Minnesota, 13th November. 1906: 6 years. Filed 20th August, 1906. Receipt No. 138.842.
Claim.-1. Apparatus of the class set forth comprising a mixer for the grain, a liquid dissolving tank having meaus for feeding the liquid or solution to sald mixer, a dryer connected with the mixer composed of a column having air inlet and outlet ports, said outlet ports being larger than the inlet ports, a blower connected with the inlet ports, and means for charging the current of air issuing from said blower with ozone and passing it into said dryer.
2. Apparatus for treating grain comprising a mixer for d:mpening said grain having an inlet and outlet, a liquid supply tank connected with said mixer, a dryer with which the outlet of said mixer is connected and means for passing a current of air or other medium under pressure through and expanding i, \(n\) said dryer.
3. In combination with apparatus of the class set forth, an \(\therefore\) ir try r romprising a substantially vertical column provided with a grain outlet at its upper end, a grain outlet at its lower end and air ports at its sides adapted to receive a rurrent of air or other drying medium under pressure, sald l.crts being proportioned in size to admit the drying medium i:nder pressure and permit it to expand and freely pass out of said dryer.
4. Apparatus of the class set forth comprising in combination a suitable mixer for dampening grain, a tank for supplying liquid to said mixer provided with a connecting passageway and a valved inlet for liquid into the same, a dryer connected with said mixer provided with means for retarding the flow of grain therethrough, a blower sonnected with said dryer and an ozone generator connected with said blower.
5. The process of preparing grain for cleaning consisting or subjecting the grain to the combined action of ozone and a liquid applied to the grain having affinity to said ozone.
6. The process of preparing grain for cleaning, consisting of dampening the grain with a solution of salt and treating the dampened grain to the action of air charged with ozone.
7. The process of preparing grain for cleaning, consisting of subjecting the grain to the artion of dampening with a suspended solution of saline or other suitable substance and drying with a gaseous medium.
8. The process of preparing grain for cleaning consisting 0 : coating each berry with a deposit of sallne material and drying said deposit by a medium charged with ozone.
9. The process of coating grain for cleaning by applying a material in suspended solution and then drying the grain.
10. The process of coating grain for cleaning by applying a liquid and subsequently drying the grain by air charged with orone.
11. The process of coating grain for cleaning, consisting of dampening the grain and drying it by means of expanding air charged with ozone.

\section*{No. 101,986 . Radiator for Heat.}

Calorifère pour la chaleur.

William James Butroughs and William James Burroughs, Jr.. co-inventors, both of London, England, 13th November, 1906 ; 6 years. Filed 31st August., 1906. Receipt No. 139,137.
Claim.-1. A radiator, the coil or coils of which is or are rccessed to recelve a water tank or drawer, substantially as described.
2. In a radiator, a water tank or drawer arranged to be inserted into a recess inside the radiator coiles, substantially as described.

No. 101,987. Water Heater. Chauffeur d•cau.

Edward N. Collins, Los Angeles. California, U.S.A., 13th November, 1906 : 6 years. Filed 23nd October, 1906. Receipt No. 140,490.
Claim.-1. A gas water heater consisting of a burner having radial lines of jet outlets and raised water chambers disposed between said lines.
2. A gas water heater consisting of a burner having a gas chamber provided with radial lines, of jet outlets and raised water chambers disposed between said lines and ex\(t\) ending below the plane of the gas chamber.
3. A gas water heater consisting of a burner having a gas chamber, water chambers below the plane of the gas chamber, the latter being provided with radial lines of jet outlets, raised water chambers disposed between the said lines and communicating with the fater chambers below the gas chamber.

No. 101,988. Stone Paller. Arache-picirc.

Alfred Deschambault, Whitewood, Saskatchewan, Canada
13th November, 1906 ; 6 years. Filed 23 rd October, 1906.
Receipt No. 140,546.
Claim.-1. A stone puller comprising the combination of a central bar, side bars bolted to the central bar, sald side bars being bent outward and backward in diverging lines, and all of said bars being bent downward and forward to form tines. a draught attaching member secured on the central bar and a handle secured to the central bar.
2. As one puller comprising the combination of a central bar, side bars bolted to the central bar, said side bars bars being bent outward and backward in diverging lines, and all of said bars being bent downward and forward to form tines, a draught attaching member secured on the central bar and a bifurcated member riveted to the central bar and bent upward and formed into a handle.
3. A stone puller comprising the combination of a central bar, side bars bolted to the central bar, said side bars being bent outward and backward in diverging lines and all of said bars being bent downward and forward to form tines, a draught attaching member secured on the central bar, a handle secured to the central bar and a brace disposed through the tines below the handle.
4. In a stone puller the combination comprising a centra! bar. side bars removably secured to the central bar intermediate of its ends and all of said bars being bent to form tines, a draught attaching member secured to the central bar and a handle disposed centrally of the implement.

\section*{No. 101,989. Stop Cock for Air Brake System.} Robinet d'arrêt pour frein a air.

Samuel H. Dunning, Peterson, New Jersey, U.S.A., 13th November. 1906; 6 years. Filed 20th October, 1906. Receipt No. 140,464
Claim.-1. In an air brake system. a stop cock comprising the body portion formed with an integral shell, the rotating valve having a radial bolt receiving recess and a spring actuated key operative bolt arranged in sald shell in operative position to engage in said recess. substantially as described
2. In an air brake system, a stop cock comprising the body portion formed with an integral shell, the rocating valve having a radial bolt receiving recess a key operativ' bolt arranged in opposite walls of said shell in operative position to engage said recess and having within the shell. a shoulder and a spring interposed between one wall of said shell and the shoulder and soiled about said bolt. substantially as described.
3. In an air brake system, a stop cock comprising the body portion and the valve having a part thereof overhanging and disposed close to said body portion, said body portion having a port leading from the main port of ths stop cock to the valve bore and said valve having a port adapted to register with said first-named port and leading to the atmosphere through the surface of said overhanging part which is next adjacent to the body portion, substantially as described.

No. 101,890. Pneumatic Valve. Soupapc pneumatique.

George Patrick Finnigan, Greenc, New York, U.S.A., 13th November, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,963.
Claim.-1. In a pneumatic brake valve the combination of a pneumatic member provided with an aperture to be vented for the purpose of supplying air brakes, a fragile disc normally closing said aperture, a hammer for breaking said disc, mechanical means for restraining said hammer and electrically operated mechanism for releasing said restraining means.
2. In a pneumatic brake valve the combination of a hollow pneumatic member provided with an opening, a disc of glass disposed adjacent to said opening and having a convex conformity for the purpose of resisting air pressure, and means ior automatically breaking said disc so as to allow the free passage of air through said opening.
3. In a pneumatic brake valve the combination of a pneumatic member provided with an aperture to be vented for the purpose of applying air brakes, said aperture being normally closed, means controllable at will for adjusting the capacity of said aperture, and mechanism for sudden's opening said aperture to the full extent allowed, for when thus adjusted said mechanism being independent of said adjusting means.
4. In a pneumatic brake valve the combination of a pneumatic member to be vented for the purpose of applying air brakes, means for venting said pneumatic member, and mechanism adjustable by hand for controlling the facility with which said pneumatic member is vented, said mechanism being independent of said means for venting said member.
\(\overline{5}\). In a pneumatic brake valve the combination of a pneumatic member located upon a vehicle, means controllable by movements of said vehicle for venting said pneumatic member, and mechanism adjustable by hand for controlling the facility with which said pheumatic member is vented, said mechanism being independent of said means for venting said pneumatic member.
f. In a pneumatic brake valve the combination of a pneumatic member to be vented for the purpose of applying air brakes, said pneumatic member being nor:nally closed. means for opening said pheumatic member, and mechanism for controlling the facility with which said pneumatic membur is vented, satid mochanism being independent of said means for oprning said pneumatic member.
7. In a pneumatic brake valve the combination of a pneumatic member to be vented for the purpose of applying air brakes, electrically operated magnetic mechanism for venting said pneumatic member, and mechanism controllable at
will for adjusting the facility with which said pneumatic member is thus vented, said mechanism being independent of said means for venting said member.
8. n a pneumatic brake valve the combination of a hollow pneumatic member provided with a web and with apertures disposed within said web, a revoluble member provided with aportures and movable relatively to said web so as to canse sald apertures to partially register with each other, a cap connected with sald pneumatic member and provided with an opening, a glass closure member engaging said cap and normally obstructing the passage of air through said apertures and means for breaking said glass member.
9. In a pneumatic brake valve the combination of a pneumatic member provided with a brittle substance normally cobstructing the passage of air, a hammer for breaking said brittle substance thereby allowing the escape of air, lever inechanism for normally holding said hammer in a retracted position, and electric mechanism for automatically operating said lever mechanism so as to release said hammer.
10. In a pneumatic brake valve the combination of a pneumatic member provided with an opening, a glass disc disposed adjacent to said opening and normally closing the same, a hammer for breaking said glass disc, a spring connected with said hammer for forcing the same toward said disc, a lever provided with a dog for holding said hammer in a retracted position, a slide engaging said lever for the purpose of temporarlly holding the same in position to engage said hammer, a lever engaging said slide and free to nove the same, an armature connected with said lever, an electro-magnet connected with said armature, and means controllable automatically by movements of a vehicle for energizing said electro-magnet.
11. In a pneumatic brake valve the combination of a movable member for suddenly venting the train pipe, a lever temporarily engaging said movable member, a slide for holding said lever in a predetermined position, and mechanism controllable by an electro-magnet for actuating said slide so as to release said lever.

No. 101,991. Grate. Grille.

Oscar Eugene Halderman, Marion, Indiana, U.S.A., 13th November, 1906; 6 years. Filed 22nd October, 1906. Receipt No. 140.511 .
Claim.-1. The combination with a firebox, of a shaft lotatably supported thereon, a member having a recess and being fixed upon the shaft, curved grate bars carried by th: Shaft, and a door movable over the end of the shaft and cowierating with the recess to llmit the rotation of the shaft. 2. The combination with a firebox, of a shaft rotatably supported thereon, a member having a recess and being fixed upon the end of the shaft outside the firebox. curred grate bars carried by the shaft and a door hinged upon the firebox and having a projection to enter the recess.

No. 101,992. Broiler. Gril.
James John Jones, New York City, New York, U.S.A.. 13t. November, 1906; 6 years. Flled 19th October, 1906. Receipt No. 140,423.
Claim.-1. A broiler comprising a corrugated sheet meital , late having elongated longitudinally disposed openings in similar positions in each corrugation, the upper edge of -ach openings being out-turned to form a llp overhangiag said openings to prevent the escape therethrough of th. Heat juices in broiling.
2. A broiler comprising a corrugated sheet metal platr having elongated longitudinally disposed openings similarls paced in each corrugation, each opening being wider s: whe end than at the other and having its upper edgi ou'. iurned to form a lip overhanging said opening to preveat the escape therethrough of the meat juices in broling
3. A broller comprising a corrugated sheet metal bla: havfag elongated longltudinally disposed openings sim-

Harly placed in each corrugation. each opening being wider at one end than at the other and having its upper

edge and longer short edge out-turned to form lips, the upper lip overhanging said opening to prevent the escape therethrough of meat juices in broiling.
4. A broiler comprising a corrugated sheet metal plate having elongated longitudinally disposed openings similarly placed in each corrugation, each opening being wider at one end than at the other and having its upper and both short edges out-turned to form lips, the upper lip overhanging said opening to prevent the escape therethrough of the meat juices in broiling.
5. A broller comprising a corrugated sheet metal plate having elongated longitudinally disposed openings in similar positions in each corrugation, the upper edge of each opening being out-turned so as to form a lip inclined to the edge of the apices of the corrugated plate and overhanging sald opening to prevent the escape therethrough of the meat juices in brolling.
6. A broller comprising a corrugated sheet metal plate having elongated longitudinally disposed openings in similar positions in each corrugation, the upper edge of each opening being out-turned to form a lip overhanging the opening to catch the meat juices, a wire frame, and means for detachably connecting the sheet metal plate to the said irame.

No. 101,993. Boot and Shoe. Chaussure.

John Staunton King, Toronto, Ontario, Canada, 13th November, 1906; 6 years. Filed 20th October, 1906. Receipt No. 140,474.
Claim.-1. A boot or shoe having a recess formed in the insole, and a flling of soft resilient material suitably secured within the recess, as and for the purpose specified. 11-8
2. A boot or shoe having a recess formed in the ingole, and a filling of soft resilient material suitably secured within the recess of the forepart of the shoe, as and for the purpose specified.
3. A boot or shoe having a recess formed in the insole, thereof, the said recess having an overhanging edge, and a filling of soft resilient material suitably secured within the recess and beneath the overhanging edge thereof, as and for the purpose specified.
4. A boot or shoe having a recess formed in the insole thereof, said recess having an overhanging edge, a fllling of soft resilient material suitably gecured within the recess and beneath the overhanging edge thereof and a covering of thin leather designed to be secured around its edge to the under side of the overhanging side of the recess and to the filling, as and for the purpose specifled.
5. A boot or shoe having a recess formed in the insole, a filling of soft resilient material suitably secured within the recess and a covering of thin leather secured to such resilient material, as and for the purpose specified.

6 In a boot or shoe, the combination with the insole having a recess in the forepart thereof and a flling of soft resilient material for such process, of a cross strip extending between the sides of the insole and across the recess, as and for the purpose specified.

\section*{No. 101,894. Unloading Apparatus.}

Appareil d̀ décharger.

Jesse Earnest Knight, Park, Washington, U.S.A., 13th November, 1906; 6 years. Filed 17th October, 1906 Receipt No. 140,380 .
Claim.-1. In an unloading apparatus the combina:ion with a way adapted to have a vehicle moved along the same, of a swinging boom having its free end ©Jjacent to the way and adapted to move in an arc converging toward said way, lor the purpose specifled, a line in connection with said bnom, as elevated part to which the line is joined, and a weight at tached to the line intermediate its ends.
2. In an unloading apparatus the combination of \(a\) way adapted to have a vehicle moved along the same, a swinging boom having its free end juxtaposed to said way, the boom being adapted to have its free end moved through an a:c converging toward and intersecting said way, illine in connection with said boom, an elevated part with which the line is connected, and a weight attached to the line intermedlate its ends, for the purpose specified.
3. In an unloading apparatus the combination with a way adapted to have a vehicle moved along the same, of a swinging boom having its free end arranged to move in an arc converging toward the way, a rotary member carried by the free portion of the boom, and means for rotating the said member during the swinging of the boom, sald rotating member having spurs in its periphery adapted to engage the material unloaded.
4. In an unloading apparatus the combination with a way adapted to have a vehicle moved along the same, of a swinging boom having its free end arranged to move in an arc converging toward the way, a rotary member carried by the free portion of the boom, and means for rotating the said member during the swinging of the boom, said means for retating said member comprising a stationary rack, and a pinion carried by the boom and meshed with the rack and having connection with the rotary member.
5. In an unloading apparatus the combination with a way adapted to have a vehicle moved along the same, of a swinging boom having its free end arranged to move in an arc converging toward the way, a rotary unloading member the free portion of the boom and means for rotating said unloading member during the swinging of the boom.
6. In an unloading apparatus the combination with a way adapted to have a vehicle moved along the same, of a swinging boom having its free end arranged to move in an arc converging toward the way, a rotary unloading member car-
ried by the free portion of the beam and adapted to engage the load on the vehicle, means for connecting the boom with the vehicle, and means for rotating sald unloading member during the swinging of the boom.
i. In au untoadiug apparatus the combination with a way adapted to have a vehicte moved along the same, of a swingtug boom having its iree end arranged to move in an arc ccaverging toward the way, a rotary unloading member carried by the free portion of the boom and adapted to engage the load on the vehicle, means for connecting the boom with the vehicle, means for rotating said unloading member during the swingling of the boom, and means in connection with the boom tor automatically returning the same to a position removed from the way.
8. In an untoading apparatus the combination with a way and a venicle adapted to move over the same, of a boom wounted to swing its free end in an arc converging toward the way and to sweep over the floor of the vehicle to engage the load thereot, aud throw the same laterally from the vehicle.
y. In an unloading apparatus the combination with a way and a vehicie adaplea to muve over the sume, or a boom mounted to swing its iree end in an arc converging toward the way and to sweep over the Hoor of the vehicle to engage the load thereof, and throw the same laterally from the vehicle and means for connecting said free portion of the boom to the vehicle whereby to swing the boom througn the medium of the vehicle.
10. In an unloading apparatus the combination with a way and a venicte adapted to move over the same, of a boom mounted to swing 11 iree end in an arc converging toward the way and to sweep over the floor of the vehicle to engage the load thereot and throw the load laterally trom the vebicle, and a means for automatiaally returning the boom to Inactive position.
11. In an unloading apparatus the combination with a way and a vehicle adapted to move over the same, or a boom mounted to swing its free end in an arc converging toward the way and to sweep over the floor of the vehicle to engage the load thereol and throw the load laterally from the vehicle, means for connecting said irce portion of the boom to the vehicle whereby to swing the boom through the medium of the vehicle, and means for automatically returning the boom to its inactive position upon disconnection from the vehicle.

\section*{No. 101,995. Potato Digger. Arrache-patatcs.}

Joseph Moreau, St. Germain de Grantham, Quebec, Canada 18th November, 1906 ; 6 years. Filed 23rd October, 1906. Receipt No. 140,545.
Claim.-1. In a potato digger the combination comprising a pair of supporting wheels, separating drums secured to the whels and a digging member disposed between the drums.
2. In a potato digger the combination comprising a supmental member rockably supported on the axle, a digging member carried by the segmental member means for rocking the segmental member on the axle and rotatable separating drums carried on the wheels.
3. In a potato digger the combination comprising a supporting axle, wheels on the supporting axle, a segmental member provided with ears disposed on the supporting axle, a digging member carried by the segmental member, means for rocking the segmental member on thr axle, and rotatable separating drums carried by the wheels.
4. In a potato digger the comblation comprising a supporting axle. a pair of supporting wheels on the axle, a segmental member rockably supported on the axle and provided with upwardly extending outwardly flared wings on its opposite sides. a digging member carrled by the segmental member. means for rocking the segmental member on the axle and rotatable separating drums carried on tha whoels.
5. In a potato digger the combination comprising a sup porting axle, a pair of supporting wheels on the axic, a segmental member rockably supported on the axle and provided with wings on its opposite sides, a digging member carried by the segmental member and extending above the plane thereof to form channels on each side, means for rocking the segmental member on the axle and rotatable separating drums carried on the wheels.
6. In a potato digger the combination comprising a supporting axle, a pair of wheels carried on the axle, a seg mental member rockably supported on the axle, a digging member carried by the segmental member a draft veam pivoted to the digging member, a rockable depth regulatiay nember pivoted to the digging member, means for locking the rockable member against movement and rotatable separating drums carried on the wheels.
7. In a potato digger the combination comprising an axle, suporting wheels on the axle, a rockable segmental memver carried dy the axie, a digging member carried by the segmental member, a link rockabiy connected to thte digfing member, a roller on the link, a rod connected to tue ank, means for locking the rod against movement and drums fixed on the supporting wheels.
s. in a potato digger tue combination comprising an axle, suporting wheels on the axle, a rockable segmental memver carried by the axle, a digging member carried by the segmental member, a link rockably connected to the digging member, a roller on the hink a rod connected to the unk and provided with openings, handles carried by the segmental member, a pin carried by the handles and adapted to enter the openings and drums nixed to the supporf--ug wheels.
y. In a potato digger the combination comprising a supporting axie, a pair of wheels on the supporting axle, drums secured to the wheess, a segmental member rockady disposed on the axle, a digging member carried by the segnental member and provided with an opening, a dralt veam having a rear birurcated end disposed through the opening, a link disposed in the bifurcated end of the drast beam, a pin carried by the digging member and disposed through the biturcated end of the draft beam and the link, a roller carried by the iree end of the link means for lockIng the link against movement and handles secured to the segmental member and adapted to rock the segmental member and the digging member.
10. In a potato aisger the combination comprising a supporting axle, a pair of wheels on the supporting axle, a segmental member rockably disposed on the axle and provided with wings, the rear sides of which are curved, a digging member on the segmental member, means for rocking the segmental member to regulate the depth of the cut of the digging member and annular members secured to the wheels and provided with horizontal flanges having Hugers thereon.
11. In a potato digger the combination comprising a supporting axle, a pair of wheels carried by the supporting axle, a rockable segmental member carried by the supporting axle, a digging member carried by the segmental memver, means for rocking the segmental member, rings carrie by the wheels and separating drums carried by the wheels each comprising a vertical fiange riveted to said rings and a horizontal flange provided with slots to form inwardly projecting fingers.

No. 101,896. Check Eook. Crochet de fausse-rines.

Peter S. Peterson, Jamesville, Wisconsin, U.S.A., 13th November, 1906: 6 years. Filed 9th October, 1906. Receipt No. 140,160 .
Claim.-1. A check hook comprising a member and a hinged rein receiving member disposed opposite the axid member, and means for temporarily uniting the freo ents of said members and permitting the release of the hing 1 member when it is subjected to abnormal straln throug' the checkrein.
2. A check hook comprising a fixed member, a rein receiving member disposed opposite the fixed member and hiaged
thereto, said fixed member constructed to clamp the hinged member, normally hold it against movement and permit its release when subjected to abnormal strain through the checkrein.
3. A check hook comprising a fixed member, and a reln receiving hook disposed opposite the fixed member and hinged thereto, one of said members having a recess to receive the other member and normally hold the rein receiving hook until the latter is subjected to abnormal pulling strain through the checkrein.
4. A check hook comprising a fixed member, a rein receiving hook disposed opposite the fixed member and hinged thereto, and sald slit member slit to clamp the rein receiving end of the hook and release said hook when the latter is subjected to abnormal strain through the checkrein.
5. A check hook, comprising a fixed member, a rein receiving hook disposed opposite the fixed member and hinged thereto near one end and at such end constructed to overlap and rest on the base of the fixed member, said fixed member projecting upward at its rear end and slit longitudinally and having notches formed in opposite faces to recelve and hold the rein receiving free end of the hook and release said hook when the latter is subjected to abnormal strain through the checkrein.
6. A check hook comprising a fixed member constructed to be rigidly secured to a harness, a rein recelving hook disposed opposite the fixed member and hinged to the forward end thereof, the rear end of the fixed member, curved upward, slit longitudinally and flared, and having notches formed in opposite faces to receive and hold the free end of the rein receiving hook until the latter is subjected to undue strain through the checkrein.
7. A check hook comprising a fixed member, and a rein receiving hook member disposed opposite the fixed member and hinged thereto, one of said members having an opening to permit the passage transversely through it of the free end of the other member and retain the rein receiving hook member until it is subjected to undue strain through the checkrein.

No. 101,997. Movable Grate. Grille mobile.

Anders Borch Reck, 16 Christiansvej, Hellerup, Denmark, 13th November, 1906 ; 6 years. Filed 23rd October, 1906. Receipt No. 140,555.
Claim.-1. A grate consisting of movable parts which slope down against a narrow space separating the parts, the said parts being movable to-and-fro in a direction across the said narrow space.
2. A grate consisting of movable parts which slope down against a narrow space separating the parts, the said parts being movable to-and-fro in a direction across the said narrow space and being provided with teeth along the edges adjoining the said narrow space.
3. A grate consisting of movable parts which slope down against a narrow space separating the parts, the said parts being provided with teeth along the edges adjoining the said narrow spaces, and means for varying the limits of the movement of the movable parts of the grate.
4. A grate consisting of movable parts which slope down against a narrow space separating the parts, the said parts being provided with teeth along the edges adjoining the said narrow spaces and being movable by a handle to-and-fro In a direction across the said narrow space, the said handle belng provided with movable slide which strikes against a fixed stopper when left in its normal position on the handle, but passes the stopper when the movable slide is pushed back.

No. 101,998. Mail Deliverer. Appareil d livrer la malle.

Gordon Souther, Ludlow, Kentucky, U.S.A., 13th November, 1906; 6 years. Filed 23rd October, 1906. Receipt No. 140,538.
Claim.-1. In means for delivering mail the combination of a carriage adapted to receive the mall upon the exterior of the car and to deliver the same upon the interior of the car, means for holding the carrlage upon the exterior of the car in given position and to be overcome by the superior weight or force of the mail taken up by the carriage and to return the latter to normal position when relleved of the weight of the mail.
2. In means for delivering mail the combination of an inclined track having a portion arranged exterior to the car and a portion located upon the interior thereof, said track inclining towards the inner or delivery end, a carriage mounted to travel upon said track, and means for normally holding the carriage in given position to receive the mall from a station or point along the rallway and overcome by the weight of the mail so received and adapted to return the carriage to normal position after it has discharged the mall.
3. In means for delivering mail to a moving train the comhination of a track having portions arranged upon opposite sides of a portion of the car at one side of the door opening and curving around the jamb thereof. said track inclining from ita outer end downwardly towards its inner end, and a carriage arranged to travel upon said track around and through the door opening to carry mall from the outside of the car to the inside thereof.
4. In means for delfvering mall to a moving car the combination of an inclined track comprising end portions located upon opposite sides of a portion of the car at one side of the door opening, and an. Intermediate portion curving around a jamb of the door opening and connecting the inner and outer portions of the track. and a carriage adapted tc travel upon sald track and to receive and support the mall.
5 . In means for delivering mall of the character substanti lly as specified, the combination of a track, a carriage mounted to travel thereon. an engaging device, means for setting said engaging device. and a trip for releasing the indicating setting means to throw the latter into operative position.
6. In mail delivering mechanism of the character apecifled the combination of a track, a carriage adapted to travel thereon. an engaging device carried by sald carriage, means normally holding the engaging device out of operative position, setting mechanism for throwing the engaging device into working position and normallv held in restraint, and a trip mechanism for releasing the setting mechanism, whereby the engaging device is thrown into operative position.
7. In mall delivery mechanism the combination of a carrlage. an indicating device attached thereto and adapted to take up the mall and normally held out of the path of the mail. means for holding the carriage in normal position and adapted to throw the engaging device into operative position. and a trin mechanism for releasing the actuating means for the carriage and engaging device. whereby the latter is thrown into operative nosition to engage with and take up the mail to be delivered to the moving car.
8. In means for delivering mail from a moving car the comblnation of a carriage. an engaging device connected therewith and normally held out of action, actuating means for returning the carriage to normal position and having connection with said engaging device to throw it into operative position. a trin. and a stop pivotally connected with said trip and adanted to hold sald actuating means in restraint and when released to admit of the actuating means throwing the engaging device into operative position to take up the mall. which mall imparts automatic movement to the carriage and overcomes its actuating means.
9. In mechanism of the character specified the combination of a car provided with a self opening door, a catch for normally holding the door closed, a carriage adapted to recelve the mail to be delivered to the car, and means tripped by sald carriage to effect release of the door to admit of the carriage and mail passing through the opening closed thercby.
10. In means of the character specified the combination of a car provided with a self opening door, means for holding the door closed, a carriage, a trip adapted to be operated by the carriage to effect release of the door, and a trip mechanlsm for setting the carriage to take up mall from a given point or etation.
11. In means for delivering mail the combination of a crane adapted to swing under the influence of gravitative force resulting from the mall suspended therefrom, and means for returning sald crane to normal position and adapted to be overcome by the weight of the mail applied to the crane for dellvery.
12. In combination with a mail car, a crane applled thereto and adapted to swing through the door opening, and a buffer applied to and carried by the crane to form a stop and limit the outward swinging movement of the crane.
13. In a mail car the combination of a crane pivoted thereto and having its axis inclined to the perpendicular whereby the crane will automatically swing in one direction under the weight of the mall applied thereto for delivery, and means for returning the crane to normal position after release of the weight of the mail.
14. In a mail car the combination of a crane pivoted thereto to swing through the door opening, means for limiting the swinging mmovement of the crane in each direction, and means for imparting positive movement to sald crane both to swing it without and within the car.
15. In means for delivering mail, substantially as set forth, the combination of a swinging crane mounted upon the car, a lock device for holding the crane in a given position, a carriage, and means adapted to be tripped by the carriage to effect release of the crane to permit free movement thereof.
16. In mechanism of the character set forth, the combination of a self opening door, a swinging crane, lock devices for holding the door and crane in given position, a carriage, and means tripped by the carriage to effect release of both the door and crane.
17. In a mail car, the combination of a track curving around a jamb of the door opening and extending upon opposite sides of a portion of thte car, and a carriage adapted to travel upon said track and composed of sections joined to admit of flexing of the carriage when passing around the curved portion of the track.
18. In means for delivering mail the combination of a support for receiving mail to be delivered, a hook connected with the mall and spaced fingers extended from safd support to hold the said hook in given position.
19. In means for delivering mall the combination of a support, spaced spring fingers extended therefrom and a hook adapted to be received between sald fingers to be held in a given position thereby and having connection with the mail to be sustained by said support.

No. 101,999. Bmut Machine. Smut.

William H. Thompson, Fairmount, North Dakota, U.S.A., 18th November, 1906 ; 6 years. Filed 23rd October, 1906. Receipt No. 140,536.
Olatm.-1. In a machine of the character described th 3 combination of a frame work embodying said bars, a longitudinally vibrating inclined shoe, a transversely vibrating inclined sluice above side shoe and designed to discharge thereon, a grain hopper adapted to discharge on to the upper end of the sluice, means for actuating the sluice and shoe, means for spraying the grain as it passes down the sluice, the sluice being provided at its lower end with an apertured
plate, a chamber into which the apertures lead and sald chamber being provided with a lateral extension, and a spost secured to and projecting outwardly from one side bar of the frame wark and in which sald lateral extension loosely rests.
2. A machine of the character described comprising a irame work, a hopper mounted thereon, crossbars 4 secured to the side bars of the framework, an inclined sluice supported on said crossbars and mounted to slide thereon, a spray reservoir mounted in the framework above the sluice. the sluice being provided at its lower end with an apertured plate and a chamber into which the aperture of the plate leads, said chamber being provided with a lateral extension. a spout secured to and projecting outwardly from one side bar of the framework, the said lateral extension of the chamber resting in and adapted to slide in said spout. a reversely inclined shoe mounted in the framework or hangers pivotally supporting said shoe to swing longitudinally. means for swinging sald shoe, an arm 6 projecting latorally from the sluice and out beyond one side bar of the framework and a vertical shaft 8 mounted in a boxing in the outer side of one side bar of the framework. sald shaft being providef at end end with a crank operatively connected to the lateral arm 6 of the sluice and being provided at its other ent with a lateral secured to the under side of the said shoe, as and for the purpose set forth.
No. 102,000. Device for Unloading Gravel.
Apparefl d décharger le gractor.

Charley H. Williamson, Blissfield, Ohio, U.S.A., 13th November, 1906: 6 years. Filed 19th October, 1906. Receipt No. 140,486 .
Claim.-1. The combination of a car provided in its bottom with a central discharge openig and two spaced apart laterally adjustable ploughs designed to be drawn over the bottom of the car on opposite sides of said opening.
2. The combination of a car provided in its bottom with a central discharge opening. a frame arranged to be drawn along the bottom of the car, and two ploughs hinged at opposite sides of said frame with their apexes free from altachment to each other and arranged to be laterally adjusted, as and for the purpose set forth.
8. An unloading device for gravel cars or the like comprising a frame designed to be drawn over the botfom of the car, two spaced apart laterally adjustable ploughs carried by said frame, and means for holding said ploughs in dituerent lateral positions with respect to each other, and means for drawing said frame over the bottom of a car.
4. An unloading device for gravel cars or the like rninprising a frame, means for drawing said frame over the bottom of the car. two angular ploughe hingen to said frame nt onnosite sides thercof with their front ends fren from conrimetion with each other, and means connected with sals irame for holding said two ploughs in different angular positinns.
5. An unloailing device for gravel cars or the thee comprising a frame fesigned to move over the bottom of the car. meanc for drawing sald frame forwardly. two nomeed apart angular nloughs hinged at opposite sldes of sald framr at one end onlv. and means connected to the other end of cach of sald ploughs for adjusting the same laterallv.
6. The rombination with a car noovided with a tiltine discharge section. of a nlunger designed to be drawn nepr then bottom of the car and arranged to automaticallv unlock and tilt sald section and a scraping device operatively connected with said plunger to move therewith, as and for the purpose set forth.
7. The enmbination with a car having a tilting botinia section of a frame insigned to move over the bottom of the car and provided with a scraping device, and \(n\) plunger carried by sald frame and extending beyond sald scranine de. vice and arranged to automatically unlock the said tilied section, as and for the purpose set forth.
8. The combination with a car of the character described embodying a tilted bottom section, of an unloading device comprising a frame, means for moving the frame over the bottom of the car, laterally adjustable ploughs carried by said frame and said ploughs being angular, and means for holding said ploughs in different lateral positions with respect to the frame, said means including a hand operated lever and links connecting the same with the ploughs and means for automatically unlocking and tilting said section in advance of the movement of the ploughs and frame in alignment with said section.
9. An unloading device for gravel cars or the like comprising a frame, two angular ploughs hinged at one end to opposite sides of said frame, links connected to the other ends of said ploughs and arranged to move said ploughs laterally With respect to each other, and a hand operated lever carried by said frame and connected to said links whereby to hold said ploughs in different angular positions with respect to each other.

\section*{No. 102,001. Water Purifying Process.} Procéd pour purifer l'eau.

The American Steel and Wire Company, Chicago, Illinois, assignee of Charles Arthur Browne, Lorain. Ohio, U.S.A., 13th November, 1906; 6 years. Filed 4th July, 1906. Receipt No. 137,507.

Claim.-1. The herein described method of purifying water, which consists in treating the water with a coagulent compound in the presence of a relatively smaller amount of a compound which is decomposed to form a germicidal precipitate, and filtering the water through such precipitate.
2. The herein described method of purifying water, which consists in treating the water with a coajulent compound in the presence of sulphate of copper, the latter being decomposed and precipitated to form a germicidal layer, and filtering the water through such precipitate.
3. The method herein described of purifying water, which consists in treating the water with a coagulant compound in the presence of sulphate of copper, and filtering.
4. The method herein described of purifying water, which consists in treating the water with sulphate of iron and sulphate of copper.
5. The method herein described of purifying water, which consists in treating the water with sulphate of Iron and sulphate of copper, and filtering.
6. The method herein described of purifying water, which consists of treating the water with sulphate of iron and sulphate of copper and caustic lime.
7. The method herein described of purifying water, which consists of treating the water with sulphate of iron and sulphate of copper, and caustic lime, and flltering.
8. The method herein described of purifying water, which consists of treating the water with sulphate of iron and a smaller proportion of sulphate of copper.
9. The method herein desoribed of purifying water, which consists of treating the water with sulphate of iron and a smaller proportion of sulphate of copper, and filtering.
10. The herein described method of purifying water, which -consists in treating water with a soluble sulphate of sesquioxide forming substance and germicide compound which is decomposed and precipitated to form a germicidal layer and filtering the water through such layer, the amount of germicide compound being less than the amount of th coagulant substance.
11. The method herein described of purifying water, which consists in treating the water with a soluble sulphate of gesqui-oxide forming substance, and sulphate of copper.
12. The method herein described of purifying water, which consists in treating the water with a soluble sulphate of a sesqui-oxide forming substance, and sulphate of copper. and filtering.

\section*{No. 102,002. Fiminace. Fournalse.}

Nelson W. Dempsey and Lewis C. Hanmer, both of Detroit. Michigan, U.S.A., 13th November, 1906 ; 6 vears. Filed 15th Octoher, 1906. Receipt No. 140,315.
Claim.-1. In a heater the combination of a firepot having openings in its sides and closed at its upper end, a chamber surrounding the firepot and enclosing the openings, and means for conducting the products of combustion and gases from the upper end of the firepot to the said chamber.
2. In a beater the combination of a firepot having openings in its sides and closed at its upper end, a radiating chamber above the firepot in communication with the upper end thereof to receive the products of combustion and gases therefrom a consuming chamber surrounding the firepot and communicating with said radiating chamber, and a smoke pipe communicating with said consuming chamber.
3. In a heater the combination of a firepot having the form of an inverted truncated cone and formed with open-

ings in its sides, a dome to close the upper end of said firepot, a flue leading upward from said dome, a consuming chamber surrounding the fire pot and covering the openings therein, a smoke pipe communicating with said consuming chamber, a flue leading upward from said chamber, and a radiating chamber connecting said flues.
4. In a heater the combination of a firepot having openings in its sides, a consuming chamber surrounding said firepot a smoke pipe opening into said chamber and extending upward, a radiating chamber above the firepot and the consuming chamber with the radiating chamber, a short pipe connecting the radiating chamber with the other smoke pipe, and a damper in the short pipe.
5. In a heater the combination with a firepot having openings, of a dome section to close the upper end of the firepot, a consuming chamber surrounding the firepot, a smoke pipe leading from said chamber, an air chamber supported by the dome and having openings in its bottom, a radiating chamber supported by the air chamber and having a central opening for the passage of the air from the air chamber, flues extending through the air chamber and connecting the dome and the consuming chamber with the radiating chamber, and a short smoke plpe having a damper connecting the radiating chamber and the smoke pipe.
6. In a heater the combination with a firepot having openIngs in its sides, of a dome to close the upper end of the firepot, a radiating chamber above the dome, a smoke flue connecting the dome and chamber, a consuming chamber surrounding the firepot, a smoke pipe opening into the consuming chamber, a flue connecting the consuming chamber with the radiating chamber, and an alr plpe opening into the dome.
7. In a heater the combination with an ash pit section and a firepot having openings supported by said section, of a chamber surrounding the firepot having a channel in its bottom provided with openings, a revoluble ring having openings to correspond with said openings, and means for turning the ring.
8. In a heater the combination of an ash pit section, an inverted truneated conical firepot supported by the ash pit section and having openings in its sides, a grate in the bottom of said pot, a dome to close the upper end of the pot and provided with a fire door, an air chamber on the dome of greater diameter than the dome and having openings in its bottom outside said dome, a radiating chamber on the air chamber having a center opening for the passage of air from the air chamber, a flue connecting the dome and radiating chamber, air pipes provided with dampers opening into the dome, a consuming chamber surrounding the firapot, a flue conncting the radiating chamber and consuming chamber, a smoke pipe communicating with the consuming and radiating chamber, and a damper to prevent communication between said pipe and radiating chamber.
9. In a heater the combination of an ash pit section, a firepot supported by said section and provided with perforations, a dome section in the firepot provided with a fire door, an air chamber of greater diameter than the dome provided with openings in its bottom outside the dome, a radiating chamber having a central opening for the passage of air from the air chamber, a consuming chamber surrounding the firepot and having a channel in its bottom provided with openings, a revoluable damper to close said openings, a smoke pipe opening into the consuming chamber, flues connecting the top of the consuming chamber with the bottom of the radiating chamber, a flue connecting the top of the dome with the bottom of the radiating chamber, a short smoke pipe connecting the radiating chamber with the smoke pipe, a damper in said short pipe, and a casing enclosing the sections.

\section*{No. 102,003. Punching Bag.}

Sac pour coups de poings.

Charles L. Finney and Lester R. Lantz, co-inventors both of Wyalusing, Pennsylvania, U.S.A.. 13 th November, 1906: 6 years. Filed 28 th June, 1906. Receipt No. 137,363.
Claim.-1. In a device of the class described, a standard having a perforated head, a vibrating striking bag mounted on the said head and adapted to roll thercon when struck, a spring in the standard, a flexible connection extending through the perforation of the head and connecting the spring and the bag, and means to regulate the tension of the spring.
2. In a device of the class described, a telescoping standard composed of two members, the upper one of which is hollow and provided with a flat head a vibrating punching bag mounted on the head, a cable extending through the aperture in the head and connected at one end to the bag, a spring in the standard connected at one end to the cable, a rod attached to the other end of the spring. and means for adjusting the rod to regulate the tension of the spring.
3. In a device of the class described, a standard composed of upper and lower posts. which telescope the lower end of the upper post having recesses. a washer provided with lugs engage the recesses and also having a central aperture, a threaded bolt extending thmough said aperture and held against rotation therein, a nut on the bolt. a spring secured to the bolt and located in the post of the standard. a cable secured to the spring. and a vibrating punching bag secured to the cable whereby the bag may be maintained in an upright position on the standard and the tension of the spring regulated.
4. In a device of the class described. a telescoping hollow standard having an apertured head piece, a bushing fitted In the aperture and having its bore flared at the upper end, a punching bag. a post secured to the punching bag, a cable secured to the lower end of the post and extending through the bore of the bushing and a resetting device mounted in the standard and connected with the cable.
5. In a device of the class described, a hollow standard having an apertured head. a post 18 a punching bag secured to the top of the post, a knob on the lower end of the post adapted to roll upon the head of the standard when the punching bag is struck a cable secured to sald knob and extending through the aperture in the head and a resetting device in the standard connected with the cable.
6. In a device of the class described a standard having a head, post having a knob at its lower end to rest upon said head, said post provided at its upper end with a concaved seat, punching bag secured to sald seat, and means secured to the knob extending through the head and into a standard for maintaining the post and the bag in an upright position.
7. The combination with the post 2 , having a lug therein, of a hollow post 5 fitted in the first-mentioned post, a punching bag mounted on the top of the hollow post, a spring in the hollow post connected with the bag's supporting member an adjusting rod eneaged with the spring and projecting from the end of the post 5, and a nut on the end of the rod adapted to be engaged with the lug in the first-mentioned post.

\section*{No. 102,004. Car Compler. Attclage de chars}

Frank H. Norwood and William H. Smith, assignee of a half interest, both in Pasadena, California, U.S.A.. 13th November, 1906; 6 years. Flled 17th July. 1906. Receipt No. 137,916.
Claim.-1. A car coupler comprising a casing, a coupler bar arranged in the casing at one side of the longitudinal center thereof, and made up of a lower section having a notch in one side and a tongue at its outer end and also
having a vertically disposed aperture, and an upper section having a vertical!y dis? osed aperture registered with that

of the lower section, and also having a tapered nose, a recess in its side in rear of sald nose to receive a gravitating pin of a complementary coupler, a recess in its under side to receive the outer end of the lower member and a groove in the wall of said recess to recelve the tongue and the outer end of the lower member, a pin resting in the casing and the registered apertures in the sections of the coupler bar, and a gravicating pin reating in the casing and having a lower reduced portion disiposed in the notch of the lower coupler bar section and a beveled shoulder arranged to be engaged by the tapered nose of the upper coupler bar section of a complementary coupler and to seat in the recess in the side of said section.
2. A car coupler comprising a casing. a coupler bar arranged in the casing at one side of the longitudinal center thereof and made up of an inner section having a vertical aperture and an outer section arranged to be engaged by a gravitating pin of a complementary coupler and having an aperture registered with that of the inner section, a pin resting in the casing and the reglstered apertures of the coupler bar sections, and a gravitating pin engaging the inner coupler bar section and arranged to be engaged by the outer coupler bar section of a complementary coupler.
3. A car coupler comprising a casing, a coupler bar arranged in the casing at one side of the longitudinal center thereof and made \(u p\) of an inner section having a vertical aperture and also having a passage and an outer section arranged to be engaged by a gravitating pin of a complementary coupler and having an aperture registered with that of the inner section, a pin resting in the casing and the registered apertures of the coupler bar sections. a gravitating pin engaging the inner coupler ber section and arranged to be engaged by the outer coupler bar section of a complementary coupler, and a cable connected to the lower portion of sald gravitating pin and extending upwardly through the casing and the passage in the inner coupler bar section.
4. An automatic car coupler comprising a coupler bar composed of two parts connected by a pin, a tapered nose on one of said bars, and a coupling pin having a curved cam to be engaged by sald nose. sald bar having a notich or recess into which the pin is dropped by gravity when in alignment therewith.
5. In an automatic car coupler, a casing, a two-part coupler bar connected together by a tongue, a groove. and a pin, one of said bars having a recess and a tapered cam nose, a coupling pin having a curved cam surface designed to be engaged by the cam nose, and to drop by gravity into the recess, sald coupler bar occupying one half of the space within the caslng, and belng removable therefrom to convert the coupling into an ordinary hand operated coupling.
6. A car coupler comprising a casing, a coupler bar arranged in the casing at one side of the longitudinal center thereof and having an inner portion and an outor portion. the latter portion being arranged to be engaged by a gravitating pin of a complementary coupler, and a gravitating pin engaging the inner partion of the coupler bar and arranged to be engaged by the outer portion of the coupler bar of a complementary coupler.
7. A car coupler comprising two members of identical construction. cach member comprising a casing having a coupler bar secured at one side thereln and occupying sut. stantially one half of the space within the casing. said -oupler bars having each a recess and a tapered nose. anit automatic coupling pins each having a cam to be engaged by the noses to seat sald pins in the reoesses.
8. A car coupler comprising a casing, a coupler bar arranged in the casing at one side of the longitudinal center thercof and having an inner portion and an outer portion, the inner portion being provided in one side with a notch and the other portion being arranged to be engaged by a gravitating pin of a complementary coupler. and a gravitating pin resting in the casing and having a lower reduced portion disposed in the notch of the inner coupler bar portion and also having a beveled shoulder arranged to be engaged by the outer coupler bar portion of a complementary coupler.
9. A car coupler comprising a casing, a gravitating pin extending through the casing and having a portion at an intermediate point of its length arranged to be engaged by a coupler bar of a complementary coupler, and an uncoupling cable connected to the said pin at a point below the casing.
10. In a car coupling, the combination of two members. each of which members comprises a casing. a coupler bar secured in the casing at one side thereof, and a gravitating pin extending through the casing and having a portion at an intermediate portion of its length arranged to be engaged by a coupling bar by the other member.
11. In a car coupling, the combination of two members. each of which comprises a casing, a spacing bar, a coupler, bar superposed on the spacing bar, a pin extending through and connecting the casing, the spacing bar and the coupler bar, and means for automatically engaging the coupler par of the other member.

\section*{No. 102,005. Governor for Plectric Pumps. Gouverneur pour pompes électriques.}

The Canadian Westinghouse Company, Hamilton, Ontario, Cuauua, assignee of walter \(V\). turner, wikinsdurg, rennsyivania, U.S.A., lota Novemder, 1906; o years. riled liztn February, 19ub. Keceipl No. 132, 773.
Cłaim.-1. a pressure governor comprising a controlling device, an actuating piston for the same and a low tension reguatimg means operallug when the pump pressure diminishes to a certalu posut to positively retedse nuid unuer pressure rom the actuating piston and cause the pump to cut in.
2. A pressure governor comprising a controlling device and a piston for actuating the same, a main valve for controlling the release of thid under pressure trom the actuating piston, and a low tension regulating means for causing the movement of the main valve when the pump pressure diminishes to a predetermined point.
3. A pressure gonvernor comprising a controlling device and a piston for actuating the same, a main valve for controlling the release of fluid under pressure from the actuating piston, a movable abutment for operating said valve, and a low tension regulating valve, means for varying the pressure on said abutment when the pump pressure diminishes to a predetermined point.
4. A pressure governor comprising a controlling device and an actuating piston, a main valve and abutment for controlling the pressure on said actuating piston and a regulating valve, means operated by the pump pressure for governing the release of fluid under pressure from one side of said abutment.
5. A pressure governor comprising a controlling device and actuating piston, a low tension regulating means for causing the movement of the piston to cut in the pump and a high tension regulating means for causing the movement of the piston to cut out the pump.
6. A pressure governor comprising a controlling device and actuating piston, a main valve for controlling the pressure on said piston, and a low tension regulating valve means and a high tension. regulating valve means both operated by the pump pressure for governing the action of the main valve.
7. A pressure governor comprising a controlling device and actuating means, a main valve for controlling the pressure on said piston, a differential abutment for actuating sald main valve, a low tension regulating valve means operated by the pump pressure for governing the pressure on one face of sald abutment, and a high tension regulating valve means operated by the pump pressure for governing the pressure on another face of the differential abutment.
8. A pressure governor comprising a controlling device and actuating piston, a main valve for controlling the pressure on said piston, a differential abutment subject to the pump pressure for actuating said main valve, a low tension regulating valve means governing the release of fluid from one face of said abutment, and a high tension regulating valve means governing the release of fluld from another face of said abutment.
9. A pressure governor comprising a controlling device and actuating piston, a main valve with abutment subject to pump pressure for governing the pressure on said piston, means for permitting an equalization of pressure around said abutment, a regulating valve for releasing fluid from one side of the abutment and a diaphragm subject to the opposing pressures of the pump and an adjustable spring for operating the regulating valve.
10. A pressure governor comprising a controlling device and actuating piston, a main valve with abutment subject to pump pressure for governing the pressure on said piston, means for permitting an equalization of pressure around said abutment, a regulating valve for releasing fluid from one side of the abutment, means operated by the movement of the abutment for closing the outlet through the release port and a diaphragm subject to the pump pressure for operating the regulating valve.
11. A pressure governor comprising a controlling device and actuating piston, a main valve with abutment subject to pump pressure for governing the pressure on said piston means for permitting an equalization of pressure around said abutment, a regulating valve for releasing fluid from one side of the abutment, a diaphragm for of rating the regulating valve, and means operated by the movement of the abutment for relcasing pressure from the diaphragm chamber.
12. A pressure governor comprising a controlling device and an actuating piston, a movable abutment and valve for controlling a supply port to the actuating piston, a regulating valve means governed by the pump pressure for releasing fluid from one side of said abutment, and means operated by the preliminary movement of the abutment for venting pressure from one face of said abutment to cause a quick movement of the valve.
13. A pressure governor comprising a controlling device and an actuating piston, a movable abutment and main valve for controlling the pressure on said piston, and a regulating valve means subject to the opposing pressures from different pumps for varying the pressure on said abutment.
14. A pressure governor comprising a controlling device and an actuating piston, a movable abutment and main valve for controlling the pressure on said piston, a low tension regulating valve operated by the pump pressure and a spring for varying the pressure on said abutment, and an auxiliary regulating valve means subject to the opposing pressures from different pumps for also governing the pressure on said abutment.
15. A pressure governor comprising a controlling device and an actuating piston, a movable abutment and main valve for controlling the pressure on said piston, low tension and high tension regulating valves operated by the pump pressure for governing the pressure on said abutment, and an auxiliary regulating valve means subject to the opposing pressures from different pumps for also varying the pressure on said abutment.
16. A pressure governor comprising a controlling device and an actuating piston, a main valve and movable abutment subject on one side to the pump pressure for governing the pressure on said actuating piston, means for permitting an equalization of pressures around the abutment, and a regulating valve operated by the opposing pressures from different pumps for controlling the release of pressure from the other side of said abutment.
17. A pressure governor comprising a controlling device and an actuating piston, a main valve and movable abutment subject on one side to the pump pressure for governing the pressure on said actuating piston, means for permitting an oqualization of pressures around the abutment, a regulating valve means operated by the pump pressure for releasing
fluid under pressure from the other side of the abutment, and an auxiliary regulating valve operated by the opposing pressures from different pumps for also controlling the releatse of fluid from one side of the abutment.

No. 102,006. Fluid Pressure Regulator.
Régulateur pour presseur de fuide.

The Canadian Westinghouse Company, Hamilton, Canada, assignee of Walter, V. Turner, Wilkinsburg, Penrsylvania, U.S.A., 13th November. 1906 ; 6 years. Filed 19th April, 1906. Receipt No. 135,052.
Claim.-1. A fluid pressure regulator comprising a main valve, a movable abutment for operating said valve, and means governed by the fluid on the outlet or low pressure side for controlling the pressures acting on the opposite faces of said abutment.
2. A fluid pressure regulator comprising valvular means for controlling the flow of fluid, pistons for operating said means, and mechanism governcd by the outlet pressure for controlling the pressure of said pistons.
3. A fluid pressure regulator comprising a main valve, a movable abutment for operating said valve, and means governed by the fluid on the outlet or low pressure side for controlling the release of fluid from the opposite faces of said movable abutment.
4. A fluid pressure regulator comprising main valve means, a piston for opening and a piston for closing said valve means, and mechanism governed by the outlet pressure for controlling the pressure acting on sald pistons.
5. A fluid pressure regulator comprising main valve means. a piston for opening and a piston for closing said valve means, and regulating valve mechanism governed by the outlet pressure for controlling the release of fluid from one face of each of said pistons.
6. A fluid pressure regulator comprising a main valve, pistons subject to fluid pressure on one of their faces for operating said valve, and regulating mechanism governed by the outlet pressure for controlling the pressure on the opposite faces of said pistons.
7. A fluid pressure regulator comprising a main valve, pistons subject on one side to the pressure of the valve chamber for operating said valve, means for permitting a slow leakage of fluid past said pistons, and regulating mechanism for controlling the release of fluid from the chambers on the opposite faces of said pistons.
8. A fluid pressure regulator comprising a main valve, pistons subject on one side to the pressure of the valve chamber for operating said valve, means for permitting a slow leakage of fluid past said pistons, a regulating valve for venting fluid from the opposite side of one piston to the low pressure compartment, another regulating valve for venting fluid from the opposite side of the other piston to the atmosphere, and means governed by the outlet pressure for actuating the regulating valves.
9. In a fluid pressure regulator the combination with a main valve and movable abutment for operating the same, of a regulating valve for controlling the pressure on one face
oi said abutment, another regulating valve for controlling the pressure on an opposite face of said abutment, and a diaphragm subject to the outlet pressure for actuating said regulating valves
10. A fluid pressure regulator comprising a main slide valve normally held to its seat by the inlet pressure, a mov able abutment subject to the inlet pressure for operating said slide valve, and regulating valve mechanism governed by the outlet pressure for controlling the release of fluid from opposite faces of said abutment.
11. A fluid pressure regulator comprising a main valve, pistons subject to the inlet pressure for operating sald valve, regulating valves for controlling the release of fluid from the opposite faces of said pistons, a diaphragm subjrct to the outlet pressure for actuating said regulating valves, an adjustable spring, and adjustable stops for limiting the range of adjustment of said spring.
12. A fluid pressure regulator comprising a valve for controlling the flow of fluid, means subject to the fluid pressure on one side and an adjustable spring on the other for controlling the action of said valve, a casing and adjusting nut for said spring, two friction bands mounted on the casing and each having a projection or stop, and an arm carried by the adjusting nut for engaging said stops.

No. 102,007. Safety Valve. soupape de süretc.

Edward Joseph Clark, Scranton, Pennsylvania, U.S.A., 13th November, 1906; 6 yearsff. Filed 13th November, 1906. Receipt No. 139,374.
Claim.-1. A safety valve for steam boilers comprising a casing, a valve therein adapted to open at a desired steam pressure, and thermostatic means for independently controlling the valve.
2. A safety valve for steam bollers comprising a casing. an escape valve therein normally operative to open at a desired steam pressure, and thermostatic means for controlling the valve, said valve being arranged to open inriependently under steam pressure or the action of the thermostatic means.
3. A safety valve for steam boilers comprising a casing having an outlet passage and a discharge port, a valve con irolling the outlet passage, means normally holding said valve closed to open under a determined steam pressure, and a thermostatic device for opening the valve independently of steam pressure.
4. A safety valve for steam boilers comprising a casing having an outlet and a discharge port, a valve controlling the outlet passage, a spring operating to hold the valve seated to open under a determined steam pressure, and a thermostatic device operating to open the valve against the resistance of the spring under a determined temperature in the boiler independent of the steam pressure.
5. A safety valve for steam bollers comprising a casing having an outlet passage, a valve controlling the outlet passage, means for setting the valve to open under a desired steam pressure and auxiliary means affected by variations in temperature in the steam space of the boiler for opening the valve at a determined temperature independent of steam presure.
6. A safety valve for steam boilers embodying means for permitting exhaust of steam from the boiler at a determinded pressure and the exhaust of evolved gases from the steam space of the boiler at a determined temperature independent of the steam presure
7. A safety valve for steam boilers having an exhaust valve and controlling means therefor operative to permit of the exhaust of steam at a determined presure and of the exhaust of gases under certain condition independent of the steam presure.
8 A safety valve for steam boilers comprising a casing a valve therein operative to permit of the exhaust of steam under a determined pressure and a thermostat controlling the valve irrespective of steam pressures.
9. A safety valve from steam boilers comprising a casing having an outlet a valve controlling the outlet means for holding the valve closed to open under a determined steam pressure opposed and a thermostat for operating said means.
10. A safety valve for steam boilers comprising a casing having an outlet port, a valve controlling said port, means acting upon the valve to hold it seated and permit it to open under a determined steam presure, levers operallivery collnected to the valve and a thermostat for actuating said levers.
11. A safety valve for steam boilers comprising a casing having an outlet port, a valve controlling said port, means for holding the valve seated to open under a determined steam pressure, levers movably connected with the valve and a thermostat operatively connected with the levers.
12. A safety valve for steam boilers comprising a casing having an outlet port, a valve controlling the same, adjustable spring means for holding the valve closed, a thermostat operatively connected with the valve the latter being adapted to be opened by the thermostat and to open independently thereof under steam pressure, and means for regulating the action of the thermostat.
13. A safety valve for steam boilers provided with means for opening the same, said means being influenced by interior boiler temperature to open the valve for the vent of gas when a determined temperature is reached.
14. A safety valve for steam boilers having thermostatic means for opening the same at any determined temperature in the steam space of the boiler.
15. A safety valve for steam boilers comprising a casing having a depending support, a valve disposed in said casing, a thermostat carried by said support and operatively connected with the valve, said thermostat being adapted to be subjected to variations of temperature in the steam space of a boiler to open the valve when the temperature reached any determined degree.
16. A safty valve for steam boilers comprising a casing adapted for connection with the boiler, said casing being provided with a support to project within the steam space of the boiler, a safety valve in the casing and a thermostat carried by said support and operatively connected with the valve to open same for the escape of gases when the temperature in the steam space of the boiler reaches a determined degree.
17. A safety valve mor steam boilers comprising a casing, valve operating therein, a thermostat controlling the valve, and means for adjusting the valve to regulate its seating action under the operation of the thermostat.
18. A safety valve for steam boilers comprising a casing adapted to be secured to the boiler and having a portion to extend in to the steam space thereof, a valve operating in the casing and a thermostat supported by the casing and the said extended portion thereof and operatively connected with the valve to open same when a determined temperature exists in the steam space.
19. A safety valve for steam boilers comprising a casing having an outlet port, a valve controlling said port, a thermostat comprising bars supported by the casing and levers connected with said bars and valve.

No. 102,008. Valve. Soupape.

Harry C. Root, Charleston, Illinois, U.S.A., 13th November, 1906 ; 6 years. Filed 15th May, 1906. Receipt No. 135,942.
Claim.-1. A pressure controlling valve structure consisting of a casing having an intermediate chamber with a passage communicating therewith, a pair of cylinders one at each end of sald chamber, a by-pass forming a communication between the opposite ends of one of said cylinders and a passage forming a communication between the outer end of said last-mentioned cylinder and the exterior, and a pair of connected plstons mounted one in each of said cylinders, one of said pistons controlling the by-pass.
2. A pressure controlling valve structure consisting of a casing having an intermediate chamber with a passage communicating therewith, a pair of cylinders one at each end of said chamber, a by-pass forming a communication between the opposite ends of one of said cylinders, and a passage forming a communlcation between the outer end of said
last-mentioned cylinder and the exterior, a pair of connected pistons mounted one in each of said cylinders, one of said pistons controlling the by-pass and a pressure controlling spring engaging said piston structure.
3. A pressure controlling valve structure consisting of a casing having an intermediate chamber with a passage communicating therewith, a pair of cyllnders one at each end of said chamber, a by-pass forming a communication between the opposite ends of one of said cylinders, and a passage forming a communication between the outer end of said last-mentioned cylinder and the exterior, a pair of connected pistons mounted one in cach of sald cylinders, one of said pistons controlling the by-pass and means for loading the valve structure.
4. A pressure controlling valve structure consisting of a casing having an intermediate initial pressure chamber, an inlet passage leading thereinto, a pair of cylinders arranged at opposite ends of said initial pressure chamber, a by-pass forming a communication between the opposite ends of one of said cylinders, and an outlet passage leading from the outer end of said last-mentioned cylinder, a piston structure mounted in said casing and consisting of a pair of connected pistons, one mounted in each of said cylinders ond one of said pistons controlling the effective area of the by-pass, and a pressure controlling spring arranged in the outer end of the other cylinder.
5. A pressure controlling valve structure consisting of a casing having an intermediate initial pressure chamber, an initial passage leading thereinto, a pair of cylinders arranged at opposite ends of said initial pressure chamber, a bypass forming a communication between the opposite ends of one of said cylinders and an outlet passage leading from the outer end of said last-mentioned cylinder, a piston structure mounted in said casing and consisting of a pair of connected pistons, one mounted in each of said cylinders and one of said pistons controlling the effective area of the bypass, a pressure controlling spring arranged in the outer end of the other cylinder, and means for adjusting the effective pressure of said spring.

No. 102,009. Derrick. Grue.

Diedrich William Krellwitz, St. Catherines, Ontario, Canada, 13th November, 1906; 6 years. Filed 20th October, 1306. Receipt No. 140,475.
Claim.-1. In portable hoisting derricks the combination of hoisting derricks with a swinging platform having one end attached with a ball bearing socket joint to the boom and the other end carrying a counter weight and a wheel beneath this end carrying said platform with counterweight. as specified.
2. In portable hoisting derricks the combination of hoisting derrick derricks with sliding cleats, as specified.
3. In portable hoisting derricks the combination of hoisting derrick with sliding cleats, as specified.

\section*{No. 102,010. Guard for Chandeliers. \\ Garde pour chandelicrs.}

Victor J. Janser, and Henry Meyer. Springfield Massachusetts, U.S.A., co-inventors, 13th November, 1906 ; 6 years. Filed 4th July, 1906. Receipt No. 137.514.
Claim.-1. In an appliance of the character described, a sleeve or ring made in hinge connected sections, providud with means for locking the sleeve sections in their closed relations, and formed with three or more holes radially therethrough, three or more studs having threaded shanks screw engaged through said radial holes and protruding beyond the inner wall of the sleeve to assume engagements with the depending chandelier gas pipe to secure the ap-
pllance to said pipe, at different points therearound, and said studs being provided with tubular extensions and rods,

undwise adjustable in said tubular extensions and carrying guards or canopies at their outer ends.
2. In an appliance of the character described, in combination a sleeve or ring made in hinge connected sections and provided with means for locking the sections -losed, and constructed with three or more screw-threaded holes therethrough, a corresponding number of studs having threaded shanks screw-engaged through said radial holes, nad protruding beyond the inner wall of the sleeve for engagement with the variably sized chandelier pipes to secure the appliance to said pipes and studs having the outwardly open axial sockets, tubular arms having their inner ends engaged in said sockets, and the rods fristionally engaged, and endwise adjustable, in said tubes and having gas light guards at their outer ends.
3. In an appliance of the character described, a supporting ring comprising a plurality of movably connected regments together. said segments being formed with a plurality of radially disposed threaded openings extending cntirely therethrough, a plurality of radiating studs, each of which is formed with a threaded end engaging one of said openings and projecting withln the segmental ring to impinge against a plpe to secure the appliance in position thereon, the outer end of each stud belng formed with an axial socket, arms rigidly mounted in the sockets and shields on the arms.

No. 102,011. Method of Illumination in Connection with Photography.
Méthode d'illumination pour photographie.

Finuard Mertens, Gross-Lichterfelde, near Berlin, Germany, 13th November, 1906; 6 years. Filed fth July, 1906. Recelpt No. 137.516.
Claim.-1. A method of illuminating in connection with toking photographs consisting in arranging an object to be photographed. in arranging an objective and a sensitive flim to photograph said object. in arranging one or more sources of light adapted to illuminate said object, and in causing a movement of said source of light along the object and between the same and the objective so that all parts of said object are not photographed simultaneously, but the different parts thereof in succession.
\(\because\) A me:hod of illuminating in connertion with taking photographs consisting in arranging an object to be phoiographed, in arranging an objective and a sensitive film to piotograph sald object. In arranging one or more sources of liche adapted to illuminate sald object, and in callsing a deftitely determined movement of said source of light along the oblject and between the same and the objective so that all paris of sald object are not photographed simultanmonaly. but the different parts thercof in succession.
3. A method of illuminating in connection with taking plotographs consisting in arranging a transparent object to be photographed, in arranging an objective and a sensitive film to photograph said object, in arranging one or more sources of light adapted to illuminate said object at the side of the object remote from the objective, and in causing a movement of said object and said source of light relatively one to the other so that all parts of said object are not p!otographed simultaneously, but different parts thereof in succession.
4. A method of iluminating in connection with taking plotographs consisting in arranging an object to be photographed, in arranging an objective and a sensitive flm to photograph said object, in arranging one or more sources of light adapted to illuminate said object, in causing a movement of said obiect, and a sburce of light relatively one to the other so that all parts of said object are not photographed simultaneously, but the different parts thereof in siccession, and in maintaining the intensity of said source of light in correspondence with the angle of refiection dopending on the relative position of said source of light, sald objective and film, for the purpose of obtaining a uniform exposure of the sensitive film in all parts.
j. A method of illuminating. in connection with taking photographs consisting in arranging an object to be photographed, in arranging an objective and a sensitive flm to photograph said object, in arranging one or more sources of light adapted to lluminate sald object, in causing a movement of said object and said source of light relatively, one tc the other so that all parts of said object are not photographed simultaneously, but the different parts thereof in succession, and in regulating the intensity of said source of light in correspondence with the variation of the angle of rctlection depending on the relative position of said source of light, said object, and said objective and film, for the purpose of obtaining a unlform exposure of the sensitive film in all parts.
6. A method of illuminating in connection with taking photographs consisting in arranging an object to be photographed on a cylindrical surface, in aranging a sensitive thlm on a cyllndrical surface concentric with sald object, and in moving an objective, a frame having a slit, and one or more soarces of light mounted on sald frame concentrically with aud at a uniform speed between said object and sald flm, so that all parts of said object are not photographed simultanewisly, but the different parts thereof successively.
7. A method of llluminating in connection with taking photographs consisting in arranging an object to be photographed, in arranging an objective and a sensitive film to photograph said object. In arranging one or more sources of light adapted to illuminate said object, in causing a movement of said object and said source of light relatively to one another, and varying the speed of the source of light relatively to the object during the taking of a photograph in proportion to the variation of the intensity of the illumination or account of the continuous change of the angle of refection.
8. A method of illuminating in connection with taking photographs consisting in arranging an object to be photographed, in arranging an objective and a sensitive fim to photograph said object, in arranging one or more sources of lioht alapted to illuminate said object, in causing a movement of said object and said source of light relatirely to ont anothir and in varying the distance of the source 0 : light from the object during the taking of a photograph in preparation to the variation of the intensity of the illumination on account of the continuous change of he angle of reflection.
9. A method of illuminating in connection with taking photographs consisting in arranging an object to be photograhed, in arranging an objective and a sensitive film in photograph said object, in arranging one or more sources of light adapted to illuminate said object, and in causing a movement of said object and sald source of light relatively one to the other, and in varying the brightness of the soure: of light during the taking of a photograph in proportion to the varlation of the intensity of the illumination on account of the continuous change of the angle of refection.
10. A method of illuminating in connection with taking photographs consisting in arranging an object to be photographed, in arranging an objeotive provided with a diathragm and a stnsitive film to photograph sald object. ir arranging one or more sources of light adapted to flluminate said objoci, in causing a movement of said object and said source of light relatively to one another and in vars. ins the opening of the diaphragm of the objective during the taking of a photograph in proportion to the variation of the int"nsity of the illumination on account of the change of the augle of reffection.
11. A method of illuminating in connection with takinz photographs consisting in arranging an object to bn photosraphol. in arranging an objective and a sensitive film io whotograph said object. in arranging one or more sources of
light adapted to illuminate said object, in causing a movement of said object and said source of light relatively one to the other so that all parts of said object are not photographed simultaneously, but the different part thereof in succession, in arranging a transparent screen between said source of light and said object, and in varying the transparency of said screen during the taking of a photograph in proportion to the variation of the intensity of the \(11-\) lumination on account of the continuous change of the angle of reflection
12. A method of illuminating in connection with taking photographs consisting in arranging a movable object to be photographed, in arranging a stationary objective and a movable sensitive film to photograph said object, in arranging one or more stationary sources of light adapted to illuminate said object, and in moving said object and said film symmetrically parallel to one another, but in opposite directions, so that all parts of said object are not photographed simultaneously but the different parts thereof in succession and so that the part of the object situated at cach time under the slit is not only always illuminated at a constantly equal angle, but also photographed at a constantly equal angle.

\section*{No. 102,012. Holder for Lamps and Lanterne.}

Porte-lampes et lanternes.

William N. Roberts and Henry B. Mathews, co-inventors, both of Ansonia, Ohio, U.S.A., 13th November, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,486.
Claim.-1. The combination with a lamp or lantern provided with a socket, of a standard designed to fit at one end in said socket and provided near its other end with a shoulder, and a clamp mounted to turn on the lantern and provided with a portion designed to be turned up over the shouldered end of the standard into binding engagement with said shoulder.
2. A lamp or lantern holder comprising a socket piece designed to be secured to a lantern and provided with a downwardly opening socket, a standard arranged for attachment to the vehicle or some stationary part and designed to fit upwardly in said socket, and a clamp mounted to turn on sald socket piece and provided with a clamping portion arranged to be turned up around and over the lower end of said standard whereby to lock the same in said socket.
3. The combination with a lamp or lantern provided with a socket plece formed with a socket, of a standard designed to fit upwardly in said socket, and provided on its outer face with a downwardly facing shoulder, and a rounded portion extending from sald shoulder to its lower edge, and a wire clamp mounted to turn in said socket piece and provided with an intermediate angular portion designed to be carried around the lower round end of the standard into binding engagement with said shoulder.
4. The combination with a lamp or lantern of a socket plece secured thereto and provided with a tapered socket, a standard having a tapered upper end designed to fit in said socket, said standard being provided with a lower rounded end and a downwardly facing shoulder on its outer side, a wire clamp mounted to turn in said socket piece and bent or buckled intermediato its ends to produce an angular portion adapted to be carried around the lower round end of the standard into engagement with said shoulder and having one of its ends bent angularly and formed with a finger piece and lock designed to spring over some stationary part to hold the clamp in locked position.
\(\overline{5}\). The combination with a lamp or lantern, of a plate secured thereto, a strap attached at its ends to sald plate and provided with an intermediate upwardly tapering angufar portion producing a socket, a standard having an upper tapered end designed to fit in said socket, and a clamn mounted in sald plate and provided with an intermediate angular portion adapted to be carried around the lower end of said standard and into engagement therewith to clamp the standard in the socket.
6. The combination with a lamp or lantern of a standard in the form of a block designed for detachable connection to the lamp or lantern to directly support it, said standard being provided with a screw-threaded aperture by which it is adapted to be screwed on to the post of a side of a buggy top in place of the regular nut which holds the side brace on said post, as and for the purpose set forth.

\section*{No. 102,013. Diastatic Substance.}

Substance diastatique.
Jokich1 Takamine, New York City, New York, U.S.A., 13th
November, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,493.
Claim.-1. The process for producing a disastatic substance, which consists in making a fluid extract of grains or roots of the character described, or of such materials after the removal therefrom of the whole or a portion of their starchy constituents, precipitating from said extract associated extractive matters which have a deteriorating effect on the stability or permanence thereof, and adding the fluid extract so obtained in desired quality to a substance having starch liquefying properties.
2. The process for producing a diastatic substance, which consists in making a fluid extract of grains or roots of the character described, or of such materials after the removal therefrom of the whole or a portion of their starchy constituents, precipitating from said extract associated extractive matters which have a deteriorating effect on the stability or permanence thereof, treating the fluid extract obtained with alcohol, collecting the precipitate and adding the same in desired quantity to a substance having starch liquefying properties.
3. The process of producing a saccharifying diastatic substance having practically no liquefying action on liquefied or gelatinized starch, said process consisting in making a fluid extract of grains or roots of the character described, or of such materials after the whole or a portion of their starchy constituents have been removed and precipitating from said extract associated extractive matters having a deteriorating influence on the permanence, stability and keeping qualities of said saccharifying diastatic substance.
4. The process of producing a saccharifying diastatic substance having practically no liquefying action on starch but having marked saccharifying action on liquifled or gelatinized starch, said process consisting in making a fluid extract of grains or roots of the character described, or of such substances after the whole or a portion of their starchy consituents have been removed, inducing an acid condition in said extract, and separating the fluid from the precipitate formed.
5. The process of producing a saccharifying diastatic substance in a permanent and stable form, which consists in making an aqueous extract of grains or roots of the character described, or of such substance after the whole or a portion of their starchy constituents have been removed, subjecting said extract to acid fermentation, and removing the precipitate formed.
6. The process of producing a saccharifying diastatic substance in a permanent and stable form, which consists in making an aqueous extract of grains or roots of the character described, or of such substance after the whole or a portion of their starchy constituents have been removed, subjecting sald extract to acid fermentation, removing the precipitate formed, treating the fluid with alcohol and collecting the desired precipitate.
7. The process of producing a saccharifying diastatic substance in a stable form which consists in making an aqueous extract of grains or roots of the character described, or of such eubstances after the whole or a portion of their starchy constituents have been removed, subjecting said extract to a temperature of from \(80^{\circ}\) to \(90^{\circ} \mathrm{F}\) for a period of from thirty to flfty hours and removing the precipitate formed.
8. The herein described diastatic substance having a whitish colour in dry form, soluble in water, difficultly soluble in alcohol, having practically no liquifying action on starch, but having marked saccharifying action on liquified starch, and substantially free from foreign or associated matters which have a destructive or deteriorating effect on its saccharifying properties.
9. A diastatic substance, possessing both starch liquefying and saccharifying properties, and in which the saccharifying properties are constituted in whole or in part by an extrinsic diastatic substance having practically no liquefying action on starch.
10. A diastatic substance in stable form or condition consisting of a mixture of a substance having a liquefying action on gelatinized starch and a diastatic substance having substantially no action upon gelatinized starch but having marked saccharifying action on liquefied starch or starch solution and freed from deteriorating ingredients.

No. 102,014. EIydrant. Bornc-fontaine.

Charles A. Peak and Louls Amlet, assignee of a half interest both of Henderson, Kentucky, U.S.A., 13th November, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,870.
Claim.-1. In a hydrant the comblnation with a casing having a water passageway therethrough, a plug seat disposed transversely of the water passageway, and a waste passage also disposed transversely of the passageway, said waste passage communicating with the passageway and having its outer end out of alignment with the plug seat, of a turning plug rotatably mounted on the seat and projecting below the casing, and a valve carried by the projecting portion of the plug, and constltuting means for retaining the plug in its seat, said valve being located outside of the casing and movable over and from the outer end of the waste passage.
2. In a hydrant the combination with a boxing having an opening in its bottom, of a tubular guide connected to the top of the boxing, a casing located within the boxing above the bottom thereof and having a waste passage in its lower side that is located over the opening of said boxing. a supply pipe connected to one end of the casing. a delivery pipe connected to the other end, a turning plug journalled in the casIng beneath the guide tube and at one side of the waste passare, said plug projecting above and below the casing, an actuating stem for said plug extending downwardly through said tube and connected to the upper projecting end of said plug. and a closure secured to the lower profecting end of the plug outside the rasing, and operating in the boxing between the waste passage and opening. said closure betng movable to and from a position over the outer end of the waste passage when said turning plug is operated, and furthermore constituting means for retaining the plug in the casing.

No. 102,015. Electric Arc Lamp. Lampe à arc.

John James Rathbone and Eric Rivers Smith, assignce of a half interest, both of London, England, 13th November. 1906; 6 years. Filed 8th August, 1904. Receipt No. 117,573.
Claim.-1. In electric arc lamps the combination of a thermostatic ransule \(E\) for controlling the feed of the carbon \(P\). ciectrical means \(R\) for gencrating heat to actuate the capsule E. an electro-magnetic device or cut out \(A\) for controlling the current to said means \(R\), an adjustable contact spring \(\mathbf{B}\) arranged in operative relation with respect to said device \(A\). and a set scriw \(C\) for adjusting the spring so as to cut off the heat supply at any given amperage.
2. In elertric arc lamps. a pulley and cord ford merhanism \(F\) for the carbons. a thermostatic capsule \(E\) for controlling the said mechanism \(F\), means \(R\) for generating heat to actuate the capsule \(E\), an electro-magnetic device A for control-
ling the passage of the current through said heating means K , an adjustable contart spring B arranged in operailve relation with respect to sald electro-magnetic device A so as to cut \(n\) the heat supply at any given amperage, and a shunt coil I arranged in operative relation with respect to said device.

No. 102,016. Watering Bowl. Bol d arroser.

Tha Metal Shingle and Siding Company, assignce of Cyrus Dolph. all of Preston. Ontario, Canada, 13th Norember. 1906; 6 years. Filed 26th April, 1906. Receipt No. 185,2s7. Claim.-1. In a watering bowl the combination with a bowl having a central orifice and water pipe leading thereto. of a disc and a valve support therefor yieldingly held on its seat. as and for the purpose specifled.
2. In a watering bowl the combination with a bowl having a. central orifice and water pipe leading thereto, of a disc and a valve support therefor resiliently held on its seat, as and for the purpose specified.
3. The combination with the watering bowl having a central orifice and the flanged sleeve extending through such orifice, of the dished disc and a valve sultably connected to the bottom thereof and means for normally holding the dished disc raised and the valve on its seat, as and for the purpose specified.
4. The combination with the watering bowl having a central orifice and the eentral sleeve extending through such orlfice. of the dished dise and a valve suitably connected to the bottotn therenf and spring means for normally holding the dished dise raised and the valve on its seat, as and lor the purpose specifled.
5. The combination with the watering bowl having a central orifice, of a perforated disc carrying a valve designed to normally close such orifice, as and for the purposo specified.
6. In combination a watering bowl having a rentral orifice a central sleeve fitting in such orifice having an internal shoulder and valve seat at the bottom, a ball valve having a efntral stem, a disc secured on the upper end of the stem and a spring extending between the bottom of the disc and the irternal shoulder of the sleeve designed to normally hold the valve on its scat, as and for the purpose specifled.

No. 102,017. Felted Feather Fabric. Tissu de feutre enplumer.

The Warren Featherbone Company, assignee of Edward \(k\). Warren, and Jones H. Holden, Three Oaks, Michigan. U.S.A., 13th November, 1906 ; 6 years. Filed 19th May. 1906. Receipt No. 136,084.
(Vaim.-1. A felt fabric consisting of feather plumage filled together, and having rows of stitching through the same.
\(\because 2\) A fult fabric consisting of feathers felted together. having crossed rows of stitching through the same.

No. 102,018. Brake Rod. Bielle de frein.

William Stephen Atwood, Westmount, Quebec, Canada, 13th November, 1906; 6 years. Filed 28th September, 1906. Receipt No. 139,871.
Claim.-1. An article of manufactur's comprising male and female members adapted to fit one over the other, the coinciding portions being tapered in two directions at right angles to each other and means securing the opposite ends of the article thus constituted to parts to be connected together, substantially as described and for the purpose set forth.
2. The combination with a rod of male and female members each of semi-annular cross section and provided with lateral flanges, the flanges of the female member enclosing the side edges of the male member the said slde edges of the male member converging and the exposed faces of the said flanges being inclined, the internal surface of the female member being inclined correspondingly to the side edges and exposed surfaces of the male member, means for connecting the rod to the said members, and means whereby the said members are connected to a separate part, substantially as described and for the purpose set forth.
3. The combination with a rod having one end bent at right angles, of male and female members each of semiannular cross section and provided with lateral flanges, the flanges of the female member enclosing the side edges of the male member, the said side edges of the male member converging and the exposed faces of the said flanges being inclined, the internal surfaces of the female member being inclined correspondingly to the said side edges and exposed surfaces of the male member, the said male member having a hole at the inner end of its concavity to receive the bent end of the rod, and means whereby the sald members are connected to a separate part, substantially as described and for the purpose set forth.
4. The combination with a rod having one end bent at right angles, of male and female members each consisting of a shank with an offset lug and each shank being of semiannular cross section and provided with lateral flanges. the flanges of the female member enclosing the side edges of the male member, the said side edges of the male member converging and the exposed faces of the sald flanges being inclined, the internal surfaces of the female member being inclined correspondingly to the said side edges and exposed surfaces of the male member, the sald male member having a hole at the inner end of its concavity to receive the bent end of the rod, and the said lugs being perforated, substantially as described and for the purpose set forth.

\section*{No. 102,019.. Valve for Burial Caskete. Soupape.}

Frederick Edward Cooper. Grand Forks, British Columbia, Canada, 13th November, 1906; 6 years. Filed 20th August 1906. Receipt No. 138,862 .

Claim.-1. A valve having in combination a stem which is screw-threaded exteriorly on its inner end, and interiorly on its outer end, said valve having a reduced passage from the inner end to said interiorly screw-threaded bore portion, a perforated packing forming a valve seat at the outer end of said reduced passage, a screw-threaded plug fitting within the bore of the outer screw-threaded portion, a vent tube tapping the said screw-threaded bore portion and a screw-threaded ring fitting onto the outer screwthreaded portion.
2. A valve having in combination a stem which is screwthreaded exteriorly on its inner end and interiorly in its outer end, said valve having a reduced passage from the
inner end to said interiorly screw-threaded bore portion, a perforated packing forming a valve seat at the outer end

of said reduced passage, a screw-threaded plug fitting within the bore of the outer acrew-threaded portion, a vent tube tapping the said screw-threaded bore portion and a screw-threaded ring fitting onto the outer screw-threaded portion, and a burial casket which is adapted to be hermitically sealed when said screw-threaded plug is at its innermost position.

\section*{No. 102,020. Machine for Forming Flexible Bands} Across Sheets of Paper.
Machine pour faire des bandes flexibles à travers des feuilles de papier.

Rolla L. Crain, Ottawa. Ontario, Canada, 13th November, 1906; 6 years. Filed 10th October, 1906. Receipt No. 140,192.
Claim.-1. An improved machine for forming flexible bands across sheets of paper having means therein for producing a corrugation in the paper on one side thereof combined with means for reversing the corrugation to protrude from the opposite side, as and for the purpose specified.
2. An improved machine for forming fiexible bands across sheets of paper having means therein for producing a corrugation in the paper on one side thereof combined with means for reversing the corrugation to protrude from the opposite side thereof and means for flattening the corrugation and smoothing the paper, as and for the purpose specified.
3. In a machine for forming flexible bands across sheets of paper the combination of two pairs of corrugating rollers, the second pair being adapted to reverse the corrugations formed by the first, as and for the purpose specifled.
4. In a machine for the purpose specified the combination with the two pairs of corrugating rollers of which the second Dair is adapted to reverse the corrugations formed by the first of a pair of flattening rollers adapted to remove the corrugations and smooth the sheet of paper, as and for the purpose specified.
5. In a machine for the purpose specified the combination with the two pairs of corrugating rollers of which the second pair is adapted to reverse the corrugations formed hy the first, of means for feeding the paper sheet by sheet to the rollers, as and for the purpose specified.
G. In a machine for the purpose specified the combination with two pairs of corrugating rollers having the corrugations in the second set reversed to those of the first, of means for moving the rollers of each set closer together during certain narts of their revolution, as and for the gurpose specified.
7. In a machine for the purpose specifled the combination with the two sets of corrugating rollers having the corrugations in each set reversed. of slidable blocks secured to pintles on the end of one roller of each set and means for intermittently moving the said bearing blocks closer to the opposite roller, as and for the purpose specified.
8. In a machine for the purpose specified the combination with the two sets of corrugating rollers having the corrugations in each set reversed, of slidable blocks secured to pintles on the end of the roller of each set and cam operated means for intermittently moving the said bearing blocks closer to the opposite roller, as and for the purpose specified.
9. In a machine for the purpose specified the combination of three sets of rollers and means for successively moving the rollers of each pair closer together, as and for the purpose specified.
10. In a machine for the purpose specified the combination with three sets of rollers, of cam operating means for successively moving the rollers of each pair closer together, as and for the purpose specified.
11. In a machine for the purpose specifled the combination with the three sets of rollers, of bearing blocks secured to the lower rollers of each pair, means for slidably supporting the same, a plurality of cams and connecting means extending between the cams and the bearing blocks whereby the same are intermittently raised and lowered, as and for the purpose specified.
12. In a machine for the purpose specified the combination with a pair of rollers having a series of grooves formed in a portion of the periphery of one roller, and a series of ribs in a portion of the periphery of the other adapted to extend into said grooves when the rollers are rotated in opposite directions, of a second pair of rollers therein oppositely placed, and means for operating the rollers. as and for the purpose specified.
13. In a machine for the purpose specified the combination with a pair of rollers having a series of grooves formed in a portion of the periphery of one roller and a series of ribs in a portion of the periphery of the other roller adapted to extend into said grooves when the rollers are rotated in opposite directions. of a second pair of rollers provided with like grooves nd ribs but having the rollers therein oppositely placed, means for rotating the rollers. and means for moving the rollers of each pair closer together during the parts of the revolution when the ribs on the roller are opposite the grooves of the other, as and for tre purpose specified.
14. In a machine for the purpose specifled the combinatlon with a nair of rollers having one roller provided with a series of grooves on a portion of the periphery thereof. and the other roller with a series of ribs adapted to extend into said grooves when the rollers are rotated in opposite directions, of a second set of rollers having grooves in one roller and ribs in the opposite roller oppositely placed to the first-mentioned rollers, the second set of gating means will operate to reverse the corrugations formed by the first roller, and means for rotating the rollers, as and for the purpose specifled.
15. In a machine for the purpose specified the combination with a set of nollers having corrugating means formed on a portion of their peripherles, of a second set of rollers having corrugating means also formed on their peripheries but reversed in direction to the corrugating means on the first-mentioned rollers. the second set of rollers being placed such a distancc from the first set that the corrugating means will operate to reverse the corrugations formed by the first set of rollers, and means for rotating both sets of rollers, as and for the purpose speclifed.
16. An improved machine for the purpose specified having two pairs of corrugating rollers, the second rollers being adapted to produce a corrugation reversed in direction to the first, the corrugating means of each set of rollers only being thrown into operation when the rollers are moved closer together, as and for the purpose specified.
17. An improved machine for the purpose specifled having two pairs of corrugating rollers, the second set being adapted to produce a corrugation reversed in direction to the first. the corrugating means being formed on the rollers wholly within the peripherics thereof whereby they will only be thrown into operation when the rollers are brought closer together, as and for the purpose syecffed.
18. In a machine for the purpose specifled the combination with the two sets of corrugating rollers, the second set being adapted to produca a corrugation reversed in direction to the first, of means for moving the rollers of each set closer together during certain portions of their revolution, and means for adjusting the distance the said rollers are moved, as and for the purpose specified.
19. In a machine for the purpose specified the combination with the two sets of corrugating rollers having the lower rollers of each set movable, of means for intermittently moving the lower rollers closer to the upper ones
and means for adjusting the distance the said lower rollers are moved, as and for the purpose specifled.
20. In a machine for the purpose specified the comblnation with the two sets of corrugating rollers having one movable roller in each set. of means for intermittently moving the movable rollers closer to the fixed rollers, as and for the purpose specified.
21. In a machine for the purpose specified the combination with the two sets of corrugating rollers having one movable roller in each set, of means for intermittently moving the movable rollers closer to the fixed rollers and means for independently adjusting the intermittent movement of the movable rollers, as and for the purpose specified.
22. In a machine for the purpose specifled the combination with the two pairs of corrugating nollers having one movable roller in each pair, of bearing blocks journalling the movable rollers, means for slidably supporting the same, a standard having an externally screw-threaded top, a nut screwed on said top and extending outwardly therefrom and abutting the bearing blocks, means for locking said nut in position, and means for intermittently raising and lowering the standard, as and for the purpose specified.
23. In a machine for the purpose specified the combination with the two pairs of corrugating rollers having one movable roller in each pair, of bearing blocks journalling the movable rollers, means for slidably supporting the same, a standard having an externally screw-threaded top, a nut screwed on said top extending outwardly therefrom and abutting the bearing blocks. means for locking said mut in position, a cam, and a roller secured to the bottom of the standard adapted to bear on the cam, as and for the imupose specified.

No. 102,021. Method of Rendering Sheets of Paper More Flexible.
Méthode de rendre des feuilles de papier plus flexibles.

Rolla L. Crain, Ottawa, Ontario, Canada 13th November. 1906; 6 years. Flled 29th September, 1906. Receipt No. 139,910.
Claim.-1. The herein described method of treating a sheet of paper to increase its flexibility which consists in stretching a portion of the paper a definlte amount to one side thereof and then stretching it an equal amount to the opposite side, substantially as described.
2. The herein described method of treating a sheet of paper to increase its flexibility which consists in stretching a portion of the paper a definite amount to one side thereof, then stretching it an equal amount to the opposite side and then bringing it back to its normal position, substantially as described.
3. The herein described method of treating a sheet of paper to increase its flexibility which consists in forming a corrugation in the paper on one side and then reversing the corrugation so that it protrudes from the opposite side substantially as described.
4. The herein described method of treating a sheet of paper to increase its flexibility which consists in forming a corrugation in the paper on one side, then reversing the corrugation so that it protrudes from the opposite side, and then removing the corrugations and smoothing the paper, substantially as described.
5. The herein described method of treating a sheet of paper to increase its flexibility which consists in forming a series of parallel corrugations in the paper on one side thereof, then reversing the series of corrugations so that: cach corrugation protrudes from the opposite side to which it previously did and then removing the corrugations and smoothing the paper, substantially as described.
6. The herein described method of treating a sheet of paper to increase its flexibility which consists in stamping a portion thereof outwardly from one slde thereof, then
stamping sald portion to protrude from the opposite side. substantially as described.
7. The herein described method of treating a sheet of paper to increase its flexibility which consists in stamping a portion thereof outwardly from one side thereof, then stamping said portion to protrude from the opposite side and then smoothing the paper and causing the stamped portion to again lie flat with the remainder of the sheet. substantially as described.

No. 102,022. Faucet. F'ultsset.

Samuel A. Dennis, Los Angeles, California, U.S.A., 13th November, 1906; 6 years. Filed 26th September, 1906. Receipt No. 139.787.
Claim.-The combination with a pipe having its outer end exteriorly screw-threaded, of a cap arranged for detachable screw-threaded engagement with the said outer end of the pipe, said pipe having a passage, a valve therethrough and a circumscribing flange surrounding the passage, a valve casing engaged with said circumscribing fiange and provided with openings at its lower end, a removable valve seat arranged upon the bottom of said valve casing. and a nozzle passed through the passage in said cap and into the casing for longitudinal movement within the latter to move the lower edge of the nozzle toward and away from said valve seat to close and establish communication between the pipe and the nozzle.

No. 102,023. Underground Conduit and Joint.
Conduit et joint souterrain.

Bingley R. Fales and Eugene L. Barnes, co-inventors, both of Detroit, Michigan, U.S.A., 13th November, 1906; 6 yeans. Flled 12 th October, 1906. Receipt No. 140,235.
Claim.-1. In an expansion joint the combination of two tubular members, diaphragms connected to each at their inner edges, and a positively longitudinally moved rigid ring connecting their outer edges.
2. In an expansion joint, the combination of two tubular members, a multiple of diaphragms forming a sealed connection between sald pipes, each movable within fixed limits, and a rigid backing for each diaphragm after it has reached its fixed limit of movement.
3. In an expansion joint the combination of two tubular members, clamping rings for each member, annular diaphragms secured by sald rings at their inner edges, a loose ring to which the outer edges are clamped, means for moving each diaphragm within fixed limits, said clamping rings forming backings for the diaphragms after they have reached their limit of movement.
4. In an expansion joint, the combination with two tubular members, diaphragms connected to each at their inner cdges, and a longitudinally movable rigid ring, of rings clamping said diaphragm to said members and operating to move said longitudinally movable rigid ring.
5. In an expansion joint. a multiple of diaphragms each movable within fixed limits, and a clamping ring for the inner edge of each diaphragm, said clamping ring forming a backing for said diaphragm and tending to transmit further movement to the next diaphragm when said limit of motion has been reached.
6. The combination of a conduit. a \(T\) therein, a casing for the condult spaced therefrom and having separated ends between which the \(T\) is located, of a bridging casing between the ends of the conduit casing, of a cement tube supported on and bridging the space between the ends of the couduit casing, one member of the \(T\) projecting into said cement tube.
7. The combination of a conduit, an expansion joint therefor consisting of a \(T\), one member of which is connected in the line of the conduit and the other extends at an angle thereto, of a diaphragm expansion joint on each side of the \(T\) and an anchor for the \(T\).
8. The combination of a conduit, an anchored \(T\), the conduit connected to the opposite ends of one member of the \(T\), an expansion joint between the \(T\) and one conduit, a conduit casing spaced from the conduit and having separated ends, and a tubular cement casing connecting the ends of the conduit casing and enclosing the \(T\).
9. In an expansion joint, the combination of a tubular member, a diaphragm secured at one edge to said tubular member, the ring I forming such securing means, said ring having a curved inner face forming a backing for the diaphragm, when the limit of expansion is reached, and means on the ring for preventing further expanding movement of the diaphragm beyond such limit.
10. In an expansion joint, a ring such as \(I\), the diaphragm, the ring being substantially the width of the diaphragm and combined therewith to form a backing for the diaphragm when the same has reached its limit of expansion.
11. In an expansion joint, the combination with a conduit, a flexible diaphragm, and the ring such as I having a curved inner face forming a backing for the diaphragm when its limit of expansion is reached, and having circumferential lugs for preventing further expansion of the diaphragm.
12. In an expansion folnt, the clamping ring I having a curved inner face, a diaphragm having its inner edge bent around said curved face, means for clamping the edge of the diaphragm to the outer face of said ring, and clamping means for the outer edge of the diaphragm.

No. 102,024. House Service Box.
Boîte au service des maisons.

Daniel William Crockett, Frederick Gisborne Crockett, and Thomas Frazer, all of Westville, Nova Scotia, Canada, 13th November, 1906; 6 years. Filed 5th September, 1906. Receipt No. 139,267.

Claim.-1. In a pipe stand a base member provided with a depression intermediate its ends, vertical flanges at each side of said depression, a pipe seat nearer each end of the base member and flanges rising at each side of said pipe seats.
2. In a pipe stand, a base member provided with a depression intermediate its ends, vertical flanges at each side of said depression, a pipe seat nearer each end of the base member and flanges rising at each side of said pipe seats, in combination with a stand pipe having a flanged and hollow base position with openings in approximate alignment with the inner faces of said flanges.
3. In a pipe stand, a base member having a valve seat extending longitudinally thereof, flanges at each side of said valve seat, flanges between said valve seat and the ends of said base, and a rib extending longitudinally beyond said flanges at each end of said base, said ribs serving as pipe supporting means.
4. In a pipe stand, a base member having a valve seat extending longitudinally thereof, flanges at each fide of said valve seat, flanges between said valve suat and the ends of said base, and a rib extending longitudinally heyond said flanges at each end of said base. said ribs serving as pipe supporting means. in combination with a stand pipe having a flanged, hollow base portion with openings in the wall thereof in allgnment with said longitudinal flanges.
No. 102,025. System of Water Supply. systeme d'approvisionnement d'cati.

Wallace Pratt Groom, Brooklyn, New York. U.S.A., 13th November, 1906; 6 years. Filed 9th July, 1906. Receipt No. 137,644
Claim.-1. An aero-hydrostatic system of water supply for a building or buildings, comprising the combination of an air compressor stationed and installed at a distance more or less remote from said bullding or buildings, an air and water reservoir in said building or buildings for receiving and storing compressed air and water, a water pipe 72 connected with said reservoir and provided with outlets 74, a compressed air passage connecting the air compressor with the compressed air and water reservoir in said building or buildings for supply of compressed air to such reservoir, and a water pipe connected with a water main and the reservoir for supplying said compressed air and water reservoir with water, substantially as and for the purpose set forth.
2. As part of a system of aero-hydrostatic water supply for a building or group of buildings. the combination of an air compressor, a storage compressed air and water reservoir connected with the outlet of sald compressor by a valve controlled pipe or passage, a valve controlled compressed air main pipe connected with said reservoir and also with the aero-hydrostatic apparatus in said building or buildings, a valve controlled return air main pipe, a passage for air from said aero-hydrostatic apparatus to and into said return air main plpe, and a receiver 4 connected with such return main pipe and having a valve controlled pipe connected with the induction pipe of sald compressor, substantially as and for the purpose set forth.
3. In a system of apparatus for aero-hydrostatic water supply for a building or group of buildings, the combinatlon of an air compressor, a central station compressed air reservoir connected with said air compressor by a valve conirolled pipe or passage, a valve controlled compressed ai: main connected with said air reservoir, an aero-hydrostatic reservoir in sald building or bulldings and connected with the compressed air main pipe by a valve controlled compressed air service pipe, a valve controlled water service pipe connceted with the aero-hydrostatic reservoir, and a water main or other source of water supply, a fire extinguishing service plpe connected with sald aero-hydrostatic reservoir and extending up through floors of said building or buildings and provided with valve controlled outlets for allachment of hose or other fire extinguishing appliances, and a return air mair pipe connected by a valve controlled pipe with said aero-hydrostatic reservoir and with said rompressor hy a valve controlled return air pipe, substantally as and for purposes deseribed.
4. In an arro-hydrostatic system of water supply for a building or buildings. the combination with an alr and water storage reservoir placed in the cellar or basement of any of such building or buildings, and supplied with wator and compressed air through a water supply pipe and a compressed air main pipe, substantially as herein set forth. of a relay of compressed air and water storage reservoir placed at a higher level in sald building and provided with valve controlled alr vents, \(a\) valve controlled water pipe
connecting the water spaces in sald reservoirs, a compressed air pipe connected with the upper part of the relay reservoir and with the compressed air main pipe, and a water pipe connected with the lower part of said relay reservoir and extending to floors above said relay reservoir. all substantially as and for purposes set forth.
5. The combination of a central station air compressor. a central station cmpressed air and water storage reservoir, air passage connecting said reservoir with said compressor, means for supplying water to said reservolr, a valve controlled water main pipe connected with sadd reservoir and extending out from the central station to a point near a building or buildings to be protected from fire, a hydrant placed near such building or buildings, plipe 53 connecting said water main with said hydrant, riser pipe i? in the interior of said bullding or buildings and provided with valve controlled outlets, pipe 54 connected with said water main, and valve controlled pipe 94 connecting plpes 54 and 72, substantially as described and for purposes set forth.
6. The combination with a central station air compressing plant. comprising an air compressor and duplicate air and water storage reservoirs connected with the outlet of said compressor, means for supplying said reservoirs with water, means for separate or simultaneous operation, of a valve controlled water main pipe connected with each of said reservoirs, aero-hydrostatic water elevating apparaius in a building or puildings at a distance more or less remotfrom the central station, a hydrant 55, pipe connecting said water main pipe with said hydrant and means for operating the duplicate reservoirs in the central station, said hydrant, and said aero-hydrostatic water elevating apparatus simultaneously, substantially as and for purposes described.
7. The combination of a central station air compressor. a central station compressed air and water reservoir is connected by valve controlled pipe connections to the outlet of said compressor, a separate central station compressed air and water reservoir 25 connected by valve controlled pipe connections to said outlet, a valve controlled water main pipe 44 connected with reservoir 25 and also by separate valve controlled pipe connections with reservoir 18, valve controlled water pipes 23 and 30 respectively connected with said reservoirs, an aero-hydrostatic water clevating apparatus placed in a building or buildings more or less remote from the central station, a valve controlled compressed aif main pipe and a return alr main pipe, both of said main pipes connecting said central station and said aero-hydrostatic apparatus, substantially as and for purposes described.
8. The combination of a central station air compressor. duplicate central station compressed air and water reservoirs, each connected by valve controlled compressed air pipe connection with the discharge outlet of said compressor, water main pipe connected with each of said reservoirs by valve controlled pipe connection, a return air receiver 4 connected by valve controlled pipe connection with thi inlet of said compressor, an aero-hydrostatic water elevating apparatus situated in a building or bulldings more or less remote from said compressor and connected with said water main, valve controlled compressed air main pipe connected by valve controlled pipe connecting with said reservolrs and also with said aero-hydrostatic apparatus, and a valve controlled return air main pipe connected with sald aero-hydrostatic apparatus and with said recelver, substantially as and for purposes described.
9. The combination of a central station air compressor. a compressed air reservoir 15 connected by valve controlled pipe connection with the outlet of sald compressor. a valve controlled compressed air main pipe 34, means for connecting said compressed alr reservoir with and disconnecting it from said compressed air main plpe, an aerohydrostatic water elevating apparatus situated in a building or buildings more or less remote from said central station and connected with said compressed air main pipe a central station return air reservoir 4, valve controlled pipe connection connecting said reservolr with the outlet of the air compressor, and a valve controlled return air main pipe connected with both said aero-hydrostatte apparatus and said reservoir, substantially as and for purposes specifled.
10. The combination of central alr compressing statio', containing un air compressor, and separate air storage r.servoirs, an aero-hydrostatlc water elevating apparatu: situated in a building or buildings more or less remote fro a said central station, means for passing compressed atr se parately or simultaneously from said reservoirs to san:1 acro-hydrostatic water elevating apparatus. means for r... turning air discharged from sald aero-hydrostatic apparatu* back to said central station compressor and meabs fir charging said reservoirs separately or simultancously with compressed air from said compressor, substantially a- .ait for purpose's set forth.
11. The combination of a central air compressing, air and water storage station, containing an air compressor and separate reservoirs for storage of compressed air and water, an aero-hydrostatic water elevating apparatus situated in a building or buildings more or less remote from said central station, means for passing compressed air separately or simultaneously from said reservoirs to said aero-hydrostatic apparatus, means for passing water separately or simultaneously from said reservoirs to said aero-hydrostatic apparatus, means for returning air discharged from said aerohydrostatic apparatus back to said central station compressor, and means for charging separately or simultaneously said reservoirs with air returned from said aerohydrostatic apparatus, substantially as specified and for purposes described.
12. As part of añ aero-hydrostatic system for a building or buildings, comprising an air compressora air and water storage reservoirs 15,18 and 25 , air and water storage reservoirs 58 and 59 , installed in a building or buildings more or less remote from said compressor, means of passing air from said compressor to reservoirs 58 and 59, and means for returning air from said reservoirs 58 and 59 back to said compressor, the combination with sald compressor, reservoirs and means for passing air from the compressor to reservoirs 58 and 59, and returning such air to the compressor, of a relay air and water storage tank placed at a higher level in said building or buildings, valve controlled compressed air pipe connecting compressed air service pipe 56 with said relay reservoir, valve controlled water plpe 72 connected with either or both of the reservoirs 58 and 59, and a valve controlled return air pipe connected with the upper part of said relay tank, and with the return air service pipe 57, substantially as described.
13. As part of a system of aero-hydrostatic water supply apparatus for a building or buildings, the combination of a compressed air and water storage reservoir placed in the lower part of said building or buildings and means for supplying air from a central station more or less remote from such reservoir, of duplicate relay air and water storage reservoirs placed at a higher level, valve controlled pipes connected with the air spaces in said reservoirs, valve controlled pipes connected with water spaces in said reservoirs, and a water supply pipe extended to floors above and connected with said relay reservoirs, all being constructed to permit separate operation of either or simultaneous operation of both said relay reservoirs, substantially as described and for the purposes set forth.
14. As part of a system of aero-hydrostatic apparatus for a building or group of buildings, the combination of duplicate alr and water storage reservoirs placed in the lower part of said building or group of buildings, means for supplying air from a central air compressing station and with water from a separate source, valve controlled pipe connections constructed to permit separate operation of either or simultaneous operation of both said reservoirs, duplicate relay air and water storage reservoirs, placed on a higher level than the said lower reservoirs, pipe connections connecting the air and water spaces in said reservoirs, and so constructed that either of them may operate separately or all may operate together, and a pipe connected and extended to floors higher than said relay reservoirs, substantially as and for purposes specifled.
15. As part of a system of aero-hydrostatic water supply for a bullding or a group of buildings, the combination of a compressed air and water storage reservoir placed in the lower part of such building or buildings, valve controlled water service pipe connected with said reservoir, compressed air main pipe, valve controlled air service pipe connected with said compressed air main pipe and with said reservoir, a valve controlled pipe connected with said reservoir for supply of water to any part or parts of said building or buildings, a valve controlled blow-off or flushing pipe connected with the lower part of said reservoir and a drainage pipe connected with said blow-off or flushing pipe, substantially as and for the purposes described.
16. As a part of an aero-hydrostatic system of water supply for a building or buildings the combination with duplicate compressed air and water storage reservoirs located in the lower part of such building or buildings, each having an independent valve controlled water service pipe, and each connected with an independent valve controlled compressed air service pipe and air discharge pipe, and each having a valve controlled water pipe for supply of water to any part or parts of said building or buildings of a valve controlled blow-off or flushing pipe connected with each of said reservoirs and with a drainage pipe, all constructed to permit the separate or simultaneous blowing off or flushing of said reservoirs, substantially as specifled.
17. A system of water supply comprising an air compressor at a distance from the place to be supplied, an air and water reservoir at the place, a source of supply connected to the reservoir, a water pipe rising from the reservoir and pro-

11-10
vided with outlets, together with suitable valves and connections.
18. The combination of an air compressor, a serles of air and water reservoirs̄ placed at different levels, a water supply, connections from the water supply and the air compressor to the various reservoirs and suitable valves, by the operation of which the water may be lifted by a step-by-step movement.
19. A system of water supply comprising an air compressor at a distance from the place to be supplied, an air and water reservoir at the place, a source of supply connected to the reservoir, a water pipe rising from the reservoir and provided with outlets, a return air pipe leading back directly or indirectly to the compressor, together with suitable valves and connections, for the purpose set forth.
20. The combination of an air compressor, a series of air and water reservoirs placed at different levels, a water sup ply, connections from the water supply and the air compressor to the various reservoirs, suitable end valves by the operation of which the water may be lifted by a step-by-step movement, together with a return air plpe leading back directly or indirectly from the air and water reservoirs to the compressor.
21. A system of water supply comprising an air compressor an air and water reservoir, an air storage reservoir, a source of water supply connected to the water reservoir, a water pipe rising from said reservoir and provided with outlets together with suitable valves and connections.
22. A system of water supply comprising an air compressor, an air water reservoir, a source of supply connected to the reservoir, a water pipe rising from the reservoir and provided with outlets, pressure regulating valves connected with said outlets and adapted as described to deliver water at uniform pressure on different levels together with suitable vaives and connections, for the purpose set forth.
23. A system of water supply comprising an air compressor un air and water reservoir, a source of supply connected to the reservoir, a water pipe rising from the reservoir and provided with outlets, together with suitable valves and conuections and a supplemental water supply continually under pressure and valve controlled connections leading to the riser pipe, whereby the additional supply may at any time be utilized
24. In a system of water supply, a reservoir provided with a shield located above the bottom, an outlet and an inlet, the latter of which discharges immediately over said shleld, all substantially as and for the purpose set forth.
25. As a part of an aero-hydrostatic system of water supply for a building or buildings, the combination with a compressed air and water reservoir in the lower part of said builidng or buildings, having an independent water supply pipe connected with and extending into the interior of such reservoir to a point near the middle of the bottom of the same, and a shield fast to supports attached to the bottom of the reservoir, said shield having a convex surface, the middle of which is placed under the discharge opening of said water pipe, substantially as described.

No. 102,026. Fire-Cracker Pistol. Pistolet.

Gustaf William Hanson, Marquette, Kansas, U.S.A., 13th November, 1906; 6 years. Filed 27th January, 1906. Recelpt No. 132,340.
Claim.-1. A fire-cracker holder having a handle or frame provided with bearings, a barrel having trunnions resting in said bearings, a spring having its support in the frame and bearing against the barrel to close the breech, a hook on the barrel, and a hooked trigger pivoted in the frame in position te engage said barrel hook, all combined.
2. A fire-cracker pistol having a pivoted barrel. means for opening and closing the barrel, a fixed breech piece having a groove therein in rear of the barrel, and a stock with an opening for punk extending to the rear of the breech plece, all combined.
3. In a fire-cracker pistol, the stock having an opening extending in substantially vertical direction through the same, and a spring pressed dog within the stock and projecting slightly into sald opening.
4. In a fire-cracker holder, the frame composed of two sections divided vertically and having trunnion bearings in each section, a barrel pivoted between the sections, a breech piece fined to the frame sections in rear of the barrel, said sections having a substantially vertical opening in rear of said breech piece to receive the igniter, and means for holding the frame suctions together.

No. 102,027. Funnel. Entonnoir.

George Nathan Haskell, Groton, South Dakota, U.S.A., 13th November, 1906; 6 years. Filed Sth June, 1906. Receipt No. 136,721.
Claim.-1. A funnel having means to prevent circular motion of the liquid poured into the funnel.
2. A funnel having a partition to prevent circular motion of the liquid to the funnel and facilitate its discharge therefrom.
3. A funnel having a partition extending through and dividing the spout, and also extending upwardly into the lower portion of the funnel above the spout to prevent circular motion of the liquid in the funnel and facilitate its discharge therefrom.

No. 102,028. Blectric Lighting System.
Système d'éclairage électriyue.

Henry Leitner, Woking, Surrey, and Richard Norman Lucas, Rose Villa, Byfleet, Surrey, England, co-inventors, 13th November, \(1906 ; 6\) years. Filed 3rd October, 1906. Recelpt No. 109,059.
Claim.-1. In a system of electric lighting by means of accumulations charged by a main generator or dynamo driven at variable speed and a subsidiary dynamo driven at the same or proportional speed and adapted to weaken the field or fields of the main generator as the speed of driving increases the combination therewith, of a resistance having a negative temporature co-efflcient arranged in series with the shunt or fine wire winding of the subsidiary dynamo, substantially as described.
2. In a system of electric lighting by means of accumulators charged by a main generator or dynamo driven at variable speed, and a subsidiary dynamo driven at the same or proportional speed and adapted to weaken the field or flelds of the main generator as the speed of driving increases the combination therewith, of a resistance having a positive temperature co-efficient arranged across the main generator fi. Id and armature. substantially as described.
3. In a system of electric lighting by means of a main zיnerator or dynamo driven at variable speed, and a subsidiary dynamo driven at the same or proportlonal speed and adapted to weaken the fleld or flelds of the main generator as the spied of driving increases the combination therewith,
of a self-acting switch comprising a magnetic flerd wth tine wire and coarse wire windings, a movable armature and morable contact pieces adapted to be operated by the latter so as to bridge successively gaps in the system, the said selfacting switch being arranged in the circuit in such a manner that when the generator excites itself the switch closes one gap thereby permitting the ine wire field winding of the demagnetizing dynamo to receive normal current and simultaneously or subsequently when the voltage of the maln generator rises the said switch closes a second gap through which when closed the generator current by way of the coarse wire winding of the field of the self-acting switch passes to charge the accumulators, substantially as described and set forth.

No. 102;029. Pipe Flange. Rebord de tuyan.

Edward Ludlow Maxwell, Mulberry, Florida, U.8.A.. 18th November, 1906; 6 years. Filed 25th August, 1906. Receipt No. 138,987.
Claim.-1. As an improved article of manufacture, a pipe flange comprising a male and a female section, both sections having an opening for the reception of a pipe, one section being provided at its inner face with a recess around the pipe receiving opening, pins at the said recessed portion, and a gasket fitted in the said recess and engaging with the pins. the female section having side grooved wings spaced at the top and at the bottom, the male section being shaped to it between the wings of the female section and provided with a marginal tongue to enter the groove of the said wings, the male section being also provided with a lip which enters the lower space between the wings.
2. A pipe flange comprising a male and a female section, the female section consisting of a ring body having side wings at its front face and grooves in the inner faces of the said wings, the upper portions of the grooves being straight and the lower portions curved, spaces intervening between the upper and the lower portions of the wings, the said body of the female section being also provided with a recess for the reception of the gasket, the male section comprising a body having straight side edges, rounded lower edges and a downwardly extending lower lip centrally located, the salid body being likewise provided with an opening to receive a pipe and said body being also provided with a marginal up having straight sides and rounded lower ends, the lower portions of the tongues being at the rear of the said lip. the tongues being adapted to the grooves in the female section and the body being adapted to fit between the wings of the said female section while the lip extends through the lower space between the wings.
3. In a flange for pipes the combination with a female section comprising a disc body having an opening for the reception of a pipe and a recess in its front face around the said opening and pins in the recessed portion of the body. the said body being further provided with a gasket engaging the pins and with front wings at its sides, which wings are provided with downwardly tapering grooves in their inner faces, having straight upper sections and curved lower sections, the inner faces of the wings beling correspondingly formed, the said body being likewise provided with apaces between the wings at its top and bottom, of a male section comprising a body having an opening to receive a plpa. which body is provided with straight walls at its upper portion and with convexed side walls at its lower portion, the convexed side walls meeting a downwardis extending lip and the said body being also provided with a downwardly tapering or wedge-shaped marginal tongue at its rear portion, the upper portlons of which tongue are straight and the lower portions convexed, the sald body being adapted to at Into the space between the wings, the tongues to enter the grooves in the female section and the lip to enter the lower space between the wings of the female section, substantially as described.

No. 102,030. Feed Water Heater.
Chauffcur d'eau d'alimentation.

Walter Andrew Moffat, Denver, Colorado, U.S.A., 13th November, 1906; 6 years. Filed 1st October, 1906. Receipt. No. 139,958
Claim.-1. In a device of the class described, a boiler having a steam space and a combustion chamber, a feed water receptacle having a steam space operatively connected with the steam space of the boiler, connections between the receptacle and boiler for supplying water to the latter, and a circulating pipe communicating at its ends with the receptacle and extended between its ends through the combustion chamber.
2. In a device of the class described, a boller provided with a combustion and smoke chamber and having a steam space, a feed water receptacle communicating with the boiler for supplying water thereto and also having a steam space, a duct communicating with the steam spaces of the boiler and receptacle, and a circulating pipe communicating at its ends with the receptacle and having intermediate coils disposed in the combustion chamber, said pipe being extended between its ends through the smoke chamber.
3. In a device of the class described, a boiler provided with a combustion chamber and a smoke chamber and having a steam space, a feed water receptacle having a steam space, and provided with an inner flue communicating with said smoke chamber, a duct connecting the steam spaces of the boiler and receptacle, connections between the latter and the boiler for supplying water thereto, and a circulating pipe communicating at its ends with the receptacle and extending between its ends through the combustion and smoke chambers.
4. In a device of the class described, a boller provided with a firebox and smoke chamber, and having a steam space, a feed water receptacle having a steam space, and provided with an inner flue communicating with sald smoke chamber, a duct connecting the steam spaces of the boiler and receptacle, connections between the latter and the boiler for supplying water to the boller, and a pipe connected at both ends with the receptacle and extended through the smoke chamber, and provided between its ends with coils disposed in the firebox, for heating the water in the receptacle, said pipe having the usual valves for operating and cleaning the same.
5. In a device of the class described a boller provided with a firebox, smoke chamber and ash pit, and having a steam space, a feed water receptacle having a steam space, and provided with an inner flue communicating with said smoke chamber, a duct connecting the steam spaces of the boiler and receptacle, connections between the latter and the boiler for supplying water to boiler, and a circulating pipe connecting at both ends with the receptacle and extended through the smoke chamber, and provided between its ends with coils disposed in the flrebox and ash pit for heating the water in the receptacle, sald pipe having the usual valves for operating and cleaning the same.
6. In a device of the character described. a boiler with a firebox and smoke chamber, a feed water receptacle having a steam space and orovided with an inner flue communicating with said smoke chamber, a duct connecting the steam space of the boller with the steam space of said receptacle, a valve for controlling said duct under the control of the steam pressure, connections between said receptacle and boller for supplying water to the boller, and a circulating pipe for said receptacle having a heating coil or coils disposed in said firebox.
7. In a device of the character described, a boiler with a firebox and smoke chamber, a feed water receptacle having a steam space and provided with an inner flue communicating with said smoke chamber, a duct connecting the steam space of the boiler with the steam space of said receptacle, a valve for controlling said duct under the control of the steam pressure, a valve for the feed water re-
ceptacle adapted to be controlled by the pressure of steam therein, connections between said receptacle and the boiler for supplying water to the boiler, and a circulating pipe for said receptacle having heating coil or coils disposed in sald fire box.
8. In a device of the character described, a boller with a firebox and smoke chamber, a feed water receptacle having a steam space and provided with an inner flue communicating with said smoke chamber, a duct connecting the steam space of the boiler with the steam space of said receptacle, a valve for controlling sald duct under the control of the steam pressure, connections between said receptacle and boiler for supplying water to the boiler, and a circulating pipe having heating colls disposed in said firebox below the grate thereof.
9. In a device of the character described, a boller with a fire box and smoke chamber, a feed water receptacle having a steam space and provided with an inner flue communicating with said smoke chamber, a duct connecting the steam space of the bollor with the steam of said receptacle, a valve for controlling said duct under the control of the steam pressure between said receptacle and boller for supplying water to the boller, a circulating pipe for said receptacle, the same extending from the smoke chamber and having heating coils disposed within said firebor.

No. 102,031. Spraying Maohine. Machine darroser.

John Wilber Patterson, Reed City, Michigan, U.S.A., 13th
November, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,927.
Claim.-1. In a spraying machine in combination with means for discharging liquid in the form of spray, means for discharging a blast of air to turn the leaves of plants with their under side exposed to the spray.
2. In a spraying machine in combination with means for discharging a spray of liquid, a fan, means for retaining the fan, a nozzle for discharging air from the fan in the direction that the spray is discharged, and pipes for connecting the fan and nozzle.
3. The combination of a tank to contain liquid, a spraying nozzle connected to the tank, a pump to supply air under pressure to the tank, a fan blower, and a nozzle connected to the fan blower to discharge a blast of air in the direction that the spray is discharged.
4. The combination of a tank to contain liquid, means for supplying air under pressure to the tank, a fan blower, an air nozzle and a spraying nozzle, manually operated means for supporting and adjusting said nozzles, and flexible pipes respectively connecting the fan and the tank with the respective nozzles.
5. The combination of a hood open at the bottom and front, an air nozzle and a spraying nozzle supported beneath the hood, a fan blower connected to the air nozzle a tank to contain liquid and connected to the spraying nozzle. means for supplying air under pressure to the tank, and an adjustable pivotal support for the hood.
6. The combination of a rotative and longitudinally inovable rock shaft, a manually operated lever attached thereto, an arm rigidly extending from the rock shaft, a hood, an air nozzle and a spray nozzle supported by the sald arm, a fan blower, a flexible pipe connection between the blower and the air nozzle, a tank, flexible pipe connections betwen the tank and the spraying nozzle, means for supplying liquid to the tank, means for supplying alr under pressure to the tank, and means for rotating the fan.
7. The combination of a frame, a rotative axle supporting the frame, wheels attached to the axle and rotating the same, a fan blower mounted on the frame, sprocket wheels and chain connecting the axle and the blower, a liquid tank mounted on the frame, an air pump, a crank shaft journalled on the frame, gears connecting the crank shaft and the axle, a pitman rod connecting the srank shaft and
pump, an air nozzle connected to the fan, a spraying nozzle connected to the tank, flexible pipe connections between the respective nozzles, the fan and the tank, and means for manually adjusting the nozzles.

\section*{No. 102,032. Wire Fence Making Machine.}

Machine à faire les clôturcs de fil de fer.

Theodore M. Connor, Kokomo, and John B. Dougan, assignee of one-third of the interest, Richmond, both in Indiana, U.S.A.. 13th November, \(1906: 6\) years. Filed 26th September, 1906. Receipt No. 139,799.
Claim.-1. A machine of the character described employing line and stay wire feeding devices, line wire guiding devices, means for relatively disposing the stay wire sections pivoting upon said guiding devices, devices for interlocking said stay wire sections as they are laid upon the line wire, and means for intertwisting said stay wire sections upon said line wire.
2. A machine of the character described, employing stay wire feeding rolls and line wire guiding or delivering spindles, means for severing the stay wires into suitable lengths, means for relatively disposing said sections pivoting upon said line wire guiding spindles, means for bringing said sections into position to be acted upon by twisting pins carried by said spindles, and means for actuating said twisting pins.
3. A machine of the character described, employing stay and lline wire feeding devices, means for severing the stay wires into suitable lengths or sections, means pivoted to swing laterally for receiving and carrying said sections into longitudial alignment, means adapted to interlock and intertwist said sections with the line wires, and means adapted to depress said sections at their ends into position to be acted upon by said interlocking and intertwisting means prior to such action.
4. A machine of the character described employing stay and line wire feeding devices pivoted cutters arranged and adapted to cut the stay wire into suitable lengths or sections, laterally swinging devices having longitudinal grooves to receive said stay wires prior to the severing thereof, vertically reciprocated devices for depressing or downwardly bending said sections at their ends, twisting pins for engaging the downwardly bent portions of said sections, and means for actuating or rotating said twisting ping.
5. A machine of the character described, employing stay wire feeding rolls, laterally swinging depositors adapted to receive the stay wires, means for severing said stay wires into sections, after the reception thereof by said depositors, line wire receiving and delivering spindles carrying twisting pins and adapted to form the axes or pivots of said depositors, means for depressing the end portions of said sections if.to position for the action of said twisting pins, and means for actuating said twisting pin carrying spindlez.
6. A machine of the character described, employing stay wire feeding rolls, laterally swinging depositors adapted to receive the stay wires, wire conducting tubes arranged between said feeding rolls and depositors to deliver said wires to sald depositors, cutters for severing said wires into sectlons, reciprocating depressors for bending downward the end pertions of said wire sections, spindles having the line wires passing therethrough and provided with twisting pins adapted to interlock and intertwist sald wire sections together ard upon sald line wires and means for actuating said spindles.
7. A machine of the character described, employing stay wire feeding rolls, laterally swinging depositors having for their axes or pivots spindles through which are passed the line wires, said spindles being equipped at their upper ends with twisting pins, cutters for severing sald stay wire into sections, depressors adapted to bend downward the end portions of said sections into position for the action of said
twisting pins, means for actuating said spindles, and wire conducting tubes having right lined portions adjacent, and receiving the stay wires from said feeding rolls, and their remaining portions extending diagonally towards and in a!ignment with the corresponding initial position of said clepositors.
8. A machine of the character described, employing peripherally opposed stay wire feeding rolls of graduated diameters, laterally swinging depositors adapted to receive the stay wires and arranged at varrying intervals apart relatively corresponding to the differential diameters of said rollers, said repositors having for their axes or pivots line wire delivering spindles provided at their upper ends with twisting pins to engage sald stay wires, cutters for severing said wires into sections, means for actuating said spindles, depressors for bending downward said stay wire sections for the action of said twisting pins, and stay wire conducting tubes of varying or gradated lenfths as suggested by the arrangement of sald depositors and diameters of said feeding rolls.
9. In a machine of the character described the combination with wire feeding rolls and cutters for severing the stay wires irito sections, of laterally swinging depositors adapted to receive said wires, rotary spindles equipped at their upper ends with twisting pins for actuating upon sald stay wires and adapted to permit the passage therethrough of the line wires, said depositors having diagonally opposite reduced end portions for the purpose set forth.
10. In a machine of the character described the combination with wire feeding rolls and cutters for severing the stay wires into sections, of laterally swinging depositors adapted to receive said wires, rotary spindles equipped at their upper er:ds with twisting pins for acting upon said wire sections and adapted to permit the passage therethrough of the line wires, bell cranks linked to said depositors, a slide connected to said bell cranks. a rack having an arm engaging said slide, and means for actuating sald rack.
11. In a machine of the character described the combination with wire feeding rolls and cutters for severing the stay wires in sections, of laterally swinging depositors adapted to receive said wires, rotary spindles equipped at their upper ends with twisting pins for acting upon said wire sectlons and adapted to permit the passage of the line wires therethrough, bell cranks linked to said droositors. a slide connected to said bell cranks, a rack having an arm actuating said slide, and a wheel, cam and slotted arm mechanism for actuating said rack.

13 . In a machine of the character described the combination with wire feeding rolls and cutters for severing the stay wires into sections, of laterally swinging depositors adapted to receive said wires, rotary spindles equipped with twisting pins for acting upon said wire sections and adapted to permit the passage of the line wires therethrough, means for actuating sald depositors, and depressors and mechanism for actuating the same including a rock shaft, a cam wheel, a spring pressed lever operating in conjunction with said cam wheel, and a pivoted bar, said rock shaft having its crank arm coupled to sald lever.
13. In a machine of the character described the combination with wire feeding rolls and cutters for severing the slay wires into sections, of laterally swinging depositors adapted to receive said wires, line wire delivering or feeding means, means for twisting said wire sections, reciprocating depressors for bending downward the stay wire sections at their ends and holding devices or arms arranged upon the shaft carrying said depressors and adapted to overlie said depositors and retain said stay wire sections in the latter at a certain step in the fabric weaving operation.
14. In a machine of thec haracter described the combination with wire feeding means and wire severing cutters, of rivoted bridge pieces arranged alongside of said cutt \(\cdot \mathrm{r}\) s and cach having in its upper edge near one end a notch to perinit the passage of the wire, and its other end adaptai to rest under the rod connecting the heel ends of said cutters.
15. In a machine of the character described the combination of means for feeding stay and line wir s , means for c:itting the stay wire in sections, means for derositing said sections after the wire severing operation, in right lined arrangement, means for intertwisting sald sections, a shalt carrying depressors adapted to act upon said wire sections to bring them into position for the action of the twisting means. and means for Intermittently actuating said shaft including a cum wheel equipped with cam faces arranged at certain intervals apart, and a lever adapted to be engaged bs said surfaces and conneoted via certain other parts to said shaft. and means for actuating said cam wheel.
16. A machine of the character described, employing pivoted depositors for disposing the stay wire sections in proper relation to the line wires, and twisters forming the pivots for said depositors and adapted to cause one stay wire section to initially assume a substantially U-shape alongside of the line wire, and thereafter and continuously to effect the interlocking of sald stay wire sections and the applying
of the terminals of said stay wire sections upon the line wires.
17. A machine of the character described, employing pivoted depositors to receive and carry the stay wire sections into position with relation to the line wires, and twisters adapted to cause one stay wire section to initially assume a substantially U-shape alongside of the line wires and thereafter and continuousiy to effect the interlocking of said stay wire sections and the applying of the terminals of said stay wire sections upon the line wires.
18. A machine of the character described, employing line and stay wire feeding devices, line wire guiding devices. means for relatively disposing the stay wire sections, pivoting upon said line wire guiding devices. depressors for depressing said stay wire sections, after having been brought into position with relation to the line wires for the action ot the twisters, devices for interlocking said stay wire sections as they are laid upon the line wires, and means for intertwisting sald stay wire sections and said line wires.

No. 102,033. Carbureter. C'arburatcur.

The Buffalo Carbureter Company, assignee of William John Steinbrenner and Godfried John Mayer, all of Buffalo. New York, U.S.A., 13th November, 1906; 6 years. Filed 4th May, 1906. Recelpt No. 135,537.
Claim.-1. In a carbureter the combination of a carbureter chamber having a conical wall provided with a port, a rotary conical valve lying against the inner side of said wall and having an opening therein, a vapourizing nozzle terminating adjacent said port, a device for maintaining level for the liquid hydro-carbon in sald nozzle, and a throttling valve between said conical valve and the combustion chamber of the engine.
2. In a carbureter the combination with a gasoline chamber, of a carbureter chamber having a conical wall provided with a port, a rotary valve lying against the inner side of said wall and having an opening therein, a vapourizing nozzle disposed substantially parallel with said conical wall, a gasoline conduit connecting the gasoline chamber with said vapourizing nozzle and having a guide tube extending upward through the ton of the carbureting chamber, a needle valve regulating the flow of gasoline to the vapourizing nozzle and extending through said guide tube, means for mixing the vapourized air, and a throttling device to regulate the quantity of explosive mixture drawn Into the combustion chamber of the engine.
3. In a carbureter the combination with a gasoline chamber, of a carbureter chamber having a wall therein with a port, an air inlet and a mixture outlet, a valve adapted to throttle said port and having a stem extending through the casing, a vapourizing nozzle positioned with relation to said port that the air passing through the latter has an aspirating effect on said nozzle, a gasoline valve controlling the flow of gasoline to said nozzle, a throt tling device in the mixture outlet, and means for simultaneously actuating said throttling valve and the throttling device in the mixture outlet.
4. In a carbureter the combination with a gasoline chamber, of a casing having a mixing chamber and a vapourizing chamber separated by a conical wall provided with a port, a conical valve seated against said conical wall to throttle said port and having a bnllow stem extending through the top of the casing, a throttling lever on said stem. an air inlet, and a mixture outlet, a vapourizing nozzle in aspirating relation to the port in said conical wall and having connection with the gasoline chamber, a valve regulating the flow of the gasoline to sald vapourizing nozzle, and connection between said conical valve and the gasoline valve for causing the two to move simultaneously.
5. In a carbureter the combination with a gasoline supply and means for maintaining the gasoline at a constant level., of a chamber having an air inlet, a mixture outlet, and a valve controlling ported wall between the two, a vapourizing nozzle in aspirating relation to the nort in said wall. and a nozzletting device in said mixture outlet.
6. In a carbureter the combination with a gasoline supply and means for maintaining the easoline at a constant level, of a chamber having an air inlet, a mixture outlet, and a
valve controlled ported wall between the two, a vapourizing nozzle in aspirating relation to the port in said wall, and a butterfly valve in said mixture outlet.
7. In a carbureter, a mixing chamber having a conical bottom provided with opposite ports and having a mixture passage leading to the engine, vapourizing nozzles held in such relation to said ports that the air passing therethrough has an aspirating effect on said nozzles, and a conical valve seatud against said conical wall and having two openings therein, said valve serving to throttle the ports.
8. In a carbureter, a mixing chamber having opposite ports and a mixture passage above said ports, vapourizing nozzles held in aspirating relation to said ports, and a valve to throttle said ports.
9. In a carbureter, a mixing chamber having a conical bottom provided with opposite ports and having a mixture passage leading to the engine, a radial wing at one side edge of each port on the outer face of said conical wall, vapourizIng nozzles in line with the other side edges of said ports and in aspirating relation to the latter, and a conical valve seated against the inner face of the conical wall and serving to throttle said ports.
10. In a carbureter the combination with a gasoline chamber, a casing having an air inlet, a mixture outlet, and a conical wall dividing the casing into a vapourizing chamber and a mixing chamber, said wall havilig opposite ports and radial wings extending from one of the side edges of said ports, vapourizers located in line with the other side edges of said ports in aspirating relation to the latter and being connected with the gasoline chamber, a conical valve seated against the conical wall and serving to throttle said ports, and a valve for regulating the flow of gasolinc to said vapourizing nozzles.
11. In a carbureter the combination with a gasoline chamber, of a carbureter chamber having an air inlet a mixture outlet, and a conical wall between the two provided with opposite ports, a conical valve seated against the inner face of said wall to throttle said ports and having opposite openings and a hollow stem projecting through the top of the casing. a gasoline conduit connected to the gasoline chamber and having a guide tube extending upward through the valve and the hollow stem thereof and projecting above the upper end of said hollow stem, vapourizing nozzles on said conduit held in aspirating relations to the ports in sald conical wall, a neodle valve in said guide tube to regulate the flow of gasoline to the vapourizing nozzle and having threaded connection with the upper end of said tube, a throttle lever secured to the projecting end of the valve stem, a lock bar loosely straddling the needle valve underneath the head thereof and being connected with said throttle lever to move therewith. and a clamping nut on the needle valve between said lock bar and the upper end of said guide tube to clamp said lock bar to the needle valve, or to lock the latter against movement.
12. In a carbureter the combination with a gasoline chamber, of a vapourizing nozzle, a valve for regulating the flow of gasoline to the vapourizing nozzle, a mixing chamber having a port for the vapourized airga valve for throttling said port, and means for connecting both valves to move them in common and to permit of locking one of said valves against movement, as desired.
13. In a carbureter the combination with a gasoline chamber, of a vapourizing nozzle, a valve for regulating the flow of gasoline to the vapourizing nozzle, a mixing chamber havIng a port for the vapourized air, a valve for throttling said port, a lock bar connected for movement with the throttling valve at all times, and clamping means to cause the gasoline valve to move with said locking bar or to hold said gasoline valve against movement.

No. 102,034. Talking Machine. Machine à parler.
Landay Brothers assignees of Wilhelm Rabe and Carl Kamratt. all of New York Clty, New York, U.S.A.. 13th November, 1906; 6 years. Filed 2nd August, 1906. Receipt No. 138,369.
Claim.-1. In a talking machine, the combination of a sound conveying horn connection mounted to vibrate in a plane parallel with the record carrying table, a sound box suitably connected to sald horn connection, a guiding arm for the sound box curved in an arc concentric with the pivot of the horn and having a series of grooves or projections on its under face, a record carrying table and an annular crown spiral carried by the record carrying table: and engaged by the grooves or projections on the under face of the gulding arm, substantially as described.
2. In a talking machine, the combination of a flat record crirying table, a suitable record table carried thereby, an annular crown spiral having projections to engage with the record tablet to which it is applied, a sound conveying horn connection mounted to vibrate in a plane parallel with the record carrying table, a sound box suitably connected

With the said sound conveying horn connection and an arcshaped arm mechanically connected to the sound box and
terial and finally subjecting the material to heat to render the binding material insoluble.
4. The method of making an artificial cork consisting in taking pulverized base, mixing therewith a binding material and finally hardening said binding material and readering it in soluble by heat, substantially as described.
5. The method of making arificial cork, consisting in laking granulated cork, mixing therewith a coagulable binding material and finally submitting the composition to a moist heat under pressure to render the binding material insoluble.
6. The method of making artificial cork, consisting in taking granulated cork, mixing therewith albumen and subjecting the composition to such heat as will render the albumen insoluble and retain the natural elasticity and flexibility of the cork, substantially as described.
7. The method of making artificial cork, consisting in taking granulated cork, mixing it with albumen and subjecting the composition to moist heat, substantially as described.
8. The method of making artificial cork. consisting in taking granulated cork, cleansing and purifying the same, adding thereto albumen as a binding material, subjecting the composition to pressure and to a moist heat whereby the albumen is coagulated and becomes insoluble, while the product rotains all the elasticity and flexibility of the natural material, substantially as described.
9. The method of purifying granulated cork or the like. consisting in placing the granules in a receptacle, submerging the receptacle in a liquid and allowing the granules to escape from the receptacle whereby the granules rise to the surface cleansed and purified while the impurities sink. substantially as described.
10. The method of purifying granulated cork or the like. consisting in placing the granules in a closed receptacle. submerging the receptarles in thalh of purifying or cleansing liquid and then allowing the granules to escape to the surface, becoming clcansind ont rurified in their passage and leaving the impurities behind, substantially as described.
No. 102,036. Rotary Gas Engine.
Machine d gaz rotatoire.

Edwin R. Langford, Lowell, Arizona, U.S.A., 13th November, 1906; 6 years. Flled 16th May, 1906. Récelpt No. 135,980. Claim.-1. In a rotary internal combustion engine. two piston cylinders, constituting respectively compressina and explosion cylinders an intervening abutment cylinder, rotary piston members carrying pistons working in the pistod cylinders a rotary abutment member working in the abutment rylinder and having a plurality of cavities to permit passage of the pistons. and means for intermittently rotating the abutment.member during the passage of the pistons. 2. In a rotary internal combustion engine compression and expansion cylinders, rotary piston members working therein, an intervenjng abutment cylinder, a rotary abutment therein co-operating with the piston members in both cylinders, means for intermittently rotating said abutment. said abutment having cavities permitting passage of the pistons during the partial rotation of the abutment. and with packing portions engaging with the rotary piston members through an extended arc of contact, while the abutment is stationary.
3. In a rotary internal combustion engino. compresswy and expansion cylinders. rotary pistons working therein. an abutment cylinder between the aforesaid cylinders, air supply means connected to reccive air compresred by thcompression cylinder and opening into the abutment cylinder, an abutment provided with cavities permitting the passage of the pistons in said cylinders, and adapted to expose the air supply openjng in the abutment cylinder and means for intermittently rotating gaid abutment.
4. In a rotary internal combustion engine, a casing provided with cylinders piston members working therein, an intervening cylinder and an abutment member working therein, an arm connected to each piston member, and a part connected to the abutment member and having slots engaged by said arms on opposite sides of the abutment axis to intermittently rotate the abutment member.
5. In a rotary internal combustion engine, a casing provided with cylinders, a piston member and an abutment member working therein, an arm connected to the piston member, a part conneoted to the abutment member and having slots engaged by said arm to intermittently rotate the abutment member, locking means for sald abutment, and a cam operated by the engine to release said locking means.
6. A reversible rotary internal combustion engine, comprising a cylinder, a piston member working therein, air supply means, a sotary valve connected to and operated by the engine, a second valve engaging directly with and movable on said first-named valve and co-operating with said finst-named valve and with caid air supply means to control admission of aif to the cylinder, and means for varyIng the position of said second valve.
7. A reversible rotary internal combustion engine, comprising a cylinder, a piston working therein, air supply means, a rotary valve connected to and operated by the engine, a second valve engaging directly with and movable on said first-named valve and co-operating with said rotary valve and with said air supply means to control admission of air to the cylinder, and a reversing device connected to vary the position of said second valve to admit air at different parts of the revolution.
8. Ino a rotary internal combustion engine, two cylinders, a piston member working in one cylinder, an abutment member working in the other cylinder, and provided with cavithes adapted to receive and permit passage of the piston, and a rotary valve in the abutment dylinder engaging directly with and movable on the abutment member and adapted to open into an abutment cavity and connected to be operated by the engine.
9. In a reversible rotary internal combustion engine, an explosion cylinder, a piston member working therein, an abutment cylinder opening into the explosion cylinder and a rotary abutment working therein and having cavities adapted to recelve and permit passage of the piston. a rotary valve in said abutment cylinder having a port adapted to open into said cavities, air supply means and a valve in caid abutment cylinder, provided with a port co-operating with said air supply means and with the port in the rotary valve, and movable to vary the time of admission through said valves.
10. An internal combustion engine comprising compression and explosion cylinders, rotary piston and abutment members working therein and provided with parts adapted for the compression of air and for the expansion of exploded mixture, by rotatively acting parts, means for supplying the air compressed in the compression part to the expansion part of the engine, fuel supply means and igniting means, reversing means adapted and arranged to shift the point of admission of fuel and air to the expansion part of the engine, to cause operation in reverse directions, a reservoir, air connections to said reservolr from each side of the compression cylinder, provided with outwardly opening check valves, and air inlet means to each side of said cylinder provided with inwardly opening check valves.
11. An internal combustion engine comprising compression and explosion cylinders. rotary piston and abutment members working therein and provided with parts adapted for the compression of air and for the expansion of exploded mixture, by rotatively acting parts, means for supplying the air compressed in the compression part of the expansion part of the engine fuel supply means and igniting means, reversing means adapted and arranged to shift the point of admission of fuel and air to the expansion part of the engine, to cause operation in reverse directions, a reservolr, air conneotions to said reservoir from each side of the combustion cylinder, and valve means in said connections reversing the connection to the reservoir from one side to the other of the compression cylinder on reversal of the engine.

\section*{1To. 102,037. Carbureter. Carburateur.}

Charles D. Shain, Rockaway Park, New York, U.S.A., 13th November, 1906: 6 years. Filed 19th June, 1906. Reoeipt No. 137,070.
Claim.-1. In a vapourizer or carbureter, a ball located In the mixing chamber and a supporting seat and a tube for gasolene or liquid fuel discharging under the ball the lift of the ball being automatioally caused both by suction of the engine and pressure of the gasolene in the tube under it, all substantially as set forth.
2. In a vapourizer or carbureter, a ball located in the mixing chamber and seated in a support and a tube for
gasolene or liquid fuel discharging under the ball and sllding rods to control the lift of the ball, moved by a thumb-

screw situated below the bottom of the air chamber, all substantially as set forth.
3. The combination in a vapourizer or carbureter of a ball seated in a support and a tube for gasolene or liquid fuel discharging under the ball and sliding rods to control the lift of the ball, moved by a thumb-screw below the bottom of the air chamber. with two shutters hinged to the bottom of the vapourizer or carbureter to automatically control by suction from the engine, the quantity of air taken into the air chamber, all substantially gs set forth.

No. 102,038. Controller for Sparking Devices.
Contrôleur pour appareil à étinccler.

Daniel Brower Willix, Alexandria Bay, New York, U.S.A., 13th November, 1906; 6 years. Filed 1st May. 1906. Recelpt No. 135,423.
Claim.-1. In a gas engine or the like, means for controlling the current to the igniters, comprising a set of contact terminals for each igniter, each set consisting of a contact terminal connected in a primary circuit of an induction coil, and contact, terminals connected in the secondary circuit of the coll and to the igniter, all of said contacts being arranged in a single row, and means operating with the main shaft of the engine to close said contacts.
2. In a gas engine or the like, means for controlling the current to an igniter, comprising a source of electricity, and an induction coil in primary circuit therewith, the circuit having contacts, asecondary circuit connected to the igniter and having contacts, and means actuated by the engine to close said contacts, comprising a series of brushes arranged to brush successively over all of said contacts.
3. In a gas engine or the like, means for controlling the current to a plurality of igniters, comprising a source of electricity, an induction coil in primary circuit therewith, the circuit having contacts, a secondary circuit having contacts corresponding in number to the igniters and separate connections therefrom to the igniters respectively, all of said contacts being arranged in a single row, and means actuated by the engine to successively close said contacts.
4. In a gas engine or the like, means for controlling the circuit to the igniters, comprising, in combination, a plurality of sets of brushes arranged in a single row around a shaft of the engine, the sets corresponding in number to the igniters, each set having a brush in the primary circuit of an induction coil and a pair of brushes in the secondary circuit, and contacts carried by the shaft and revolving under said brushes and adapted to close the respective circuits.
E. In a gas engine or the like, means for controlling the current to the igniters, comprising in combination a single shiftable ring extending around a shaft of the engine, a series of sets of brushes aranged in a single row. one set for cach igniter, carried by the ring, each set having a brush in the primary circuit of an induction coil, and a pair of brushes in a secondary circuit of the coil connected to an igniter. and contacts carried by the shaft and revolving therewith across the brushes, one of said contacts being a terminal in the primary circuit and the other being a connector to connect said pair of brushes.

No. 102,039. Internal Combustion Engine.
Combustion interne.

Francis M. Uhler, Seneca, Nebraska, U.S.A., 13th November, 1906; 6 years. Filed 14th May, 1906. Receipt No. 135,921.
Claim.-The combination in an internal combustion engine, of a frame, a crank shaft journalled in said frame, a cylinder arranged below the shaft, said cylinder having heads at its opposite ends, stuffing boxes carried by the heads, a pair of pistons arranged in said cylinder and movable in opposite directions respectively, tubes connected to the outer faces of the pistons and leading through sald stufting boxes, the cylinder being thus divided into a central explosion chamber and end pumping chambers, inlets through which the explosive mixture may pass to the end pumping chambers when the pistons are at the limit of in stroke, ports leading from said pumping chambers and connected to a port that is placed in communication with the central explosion chamber, when the pistons are at the limit of out stroke, one of the pistons controlling the inlet port, and an exhaust port leading from the combustion chamber and controlled by the opposite piston the ports being disposed respectively, at opposite ends of said explosion chamber, connecting rods leading from the pistons through the tubular portions thereof, brackets extending outward from the frame to the points beyond the ends of the cylinder, levers pivoted on said brackets, the lower arms of said levers being connected to the rods, and uper rods extending from the upper arms of said levers to the crank shaft.

No. 102,040. Trase. Bandage herniaire.

James H. Campbell, Lakeport. New Hampshire, U.S.A., 13th November, \(1: 16 ;\) t yars. Filed 25 th June, 1916 . Receipt No. \(137,245\).
Claim.-1. In a truss the conbination with a pad having a concave hearing surface, of a bell-shaped holder for said mad, means to adjustably and ylelitingly contrert said pad to sad holder. and moans to yieldingly altath the pad and holdur to the body, substantially as deseribed.
2. In a truss the combination with a pad having a concave bearing surface and a threaded shank, of a bell-shaped holder, an attaching bolt adapted to be screwed into engagement with said shank, yielding connections between said bolt and said holder, and means to yieldingly atach said holder to the body. substantially as described.
3. In a truss the combination with a pad having a concave bearing surface and threaded shank, of a bell-shaped holder. an attaching bolt adapted to be screwed into engagement with said shank, a flanged head formed on said bolt. springs to connect said holder with said fianged head of the bolt. attaching straps and yielding connections arranged between the ends of said strap and said holder, substantially as described. \({ }^{\bullet}\)
4. In a truss the combination with a pad having a concare bearing surface and a threaded shank, of a bell-shaped holder, an attaching bolt adapted to be screwed into engagement with said shank, springs to conenct said holder with said bolt, side attaching springs. and a centrally disposed lower attaching spring arranged on the outside of said holder. and body and thigh attaching straps adapted to be comnected to said springs, substantially as described.
5. In a truss the combination with a pad having a concave bearing surface and a hollow interiorly threaded shank. of a bell-shaped holder, an attaching bolt adapted to be screwed inito engagement with said shank, a flanged head formed on said bolt, radially disposed spiral springs to connect said holder with a flanged head of said bolt. parallel coll.i side attaching springs connected to the outer side of said holder and having spring metal bracing rods arranged ther.. in, body attaching straps adapted to be connected to said springs, a lower centrally disposed colled attaching soring connected to the holder, said coiled spring having a spring metal bracing rod arranged therein, and a thigh strap adap. ted to be connected to said lower spring. substantiflly as described.

No. 102,041. Sink, Bowl, Etc. Erirr. bol, etr.

Join Croswell, Wellesley, Massachusetts, U.S.A.. 13th November, 1906; 6 years. Filed 8th July. 1905. Receipt No 126,711.
C'laim. - 1 . A sink having a pocket in lts bottom and an la-trenally-threaded opening in said pocket combined with a cuupling member externally and internally threaded at lis "ibier portion, the external thread of the coupling beine firmed to engage the internal thread of sald opening. while the internal thread of the coupling surrounds the outlot of said pocket. and a strainer formed to cover the mouth of sitid porket and provided with a tubular. externally thranded shank formed to engage the internal thread of the coupling. the sald coupling having means at its lower end for cagiscoment with a waste plpe.
2. A sink having a pocket in its bottom and an internally threaded opening in said pocket, combined with a coupling member externally and internally threaded at its upper portion, the external thread of the coupling being formed to engage the internal thread of said opening while the internal thread of the coupling surrounds the outlet of said pocket, and a stralner comprising a plate formed to cover the mouth of said pocket and having arms extending downward from its outer edge and fitting the inner surface of the pocket and provided with a tubular externally threaded shank at the lower ends of said arms, said shank being formed to engage the internal thread of the coupling, the sald coupling having means at its lower end for engagement with a waste pipe.

No. 102,042. Floor Scraper. (irattoir de plancher.

Constantin Duda, Chicago, Illinols, U.SA., 13th November, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,388.
Claim.-1. A plane comprising a block mounted on wheels at one end and having at the other end a pivoted face plate for contact with the work, and a blade secured at the front end of the block and projecting through said plate.
2. A. plane comprising a block having a handle projecting at the rear end and wheels upon which the block is carried at said end, a weight on the block, a face plate at the front end of the block, for contact with the work, and a blade secured to the front end of the block and extending through sald face plate.
3. A plane comprising a block mounted on wheels at its rear end and having projecting cheeks at each slde at its front end, a face plate pivoted between the cheeks at the bottom thereof, to contact with the work, and a blade clamped to the front end of the block, between the cheeks, and projecting at its lower edge through the face plate.

No. 102,043. Talking Machine Record and Tablet. Record et tablette de machine d parler.

Victor H. Emerson, New York City, New York, U.S.A., 13th November, 1906; 6 years. Filed 30th July, 1906. Recelpt No. 138,243.
Claim.-1. A tablet for sound records, consisting of a hard and self-sustaining body contalning shellac in addition to the ingredients of celluloid.
2 A sound record tablet composed of a homogeneous body containing shellac and the ingredients of celluloid.
3. A sound record tablet consisting of a self-sustaining body composed of shellac and the ingredients of celluloid.
4. A sound record tablet consisting of a self-sustaining body composed of shellac, crocus powder and the ingredients of celluloid.
5. A sound record tablet consisting of a self-sustaining body composed of celluloid and shellac.
6. A sound record consisting of a tablet composed of shellac and the ingredients of celluloid and having irregularities corresponding to sound waves formed therein.
No. 102,044. Plane. Rabot.
Andrew N. Gabrielson, Chrosholm, Minnesota, U.S.A., 13th November, 1906; 6 years. Filed 4th September. 1906. Receipt No 139,219.

Claim.-In a plane, the combination with a body having longitudinal rabbets at its lower side angles and having vertical threaded passages communicating with the rabbets, of set of screws engaged in the passages, guldes ocnnected with the lower ends of the set screws for rotation 11-11
of the latter with respect thereto, said set screws being operable to move the guides into and out of the rabbets,

and means for holding the set screws with the guldes at different points of their movement.
No. 102,045. Line Centering Device.
Appareil d centrer une ligne.

Abram S. Hamilton, Nanaimo, British Columbia, Canada, 13th November, 1906; 6 years. Filed 19th September 1306. Receipt No. 139,617.

Claim.-1. As a means for adjusting a line, a base portion having means for attachment of the same to a support and an opening through it toward the support, a member vertically slidable on the face of the base portion and having ing an opening through it approximately corresponding to that through the base portion, means for endwise moving the vertically slidable member on the face of the base portion and for securing it in any desired position of endwise movement, a stem horizontally slidable in the be-fore-mentioned vertically slidable portion such stem being prevented from rotating in its supports and having a small aperture through it at its midength, means for endwise moving the stem and for securing it in any desired position, and a small roller the upper side of which is in alignment with the aperture in the middle of the laterally movable stem.
2. In a device of the class described, a base portion having ing means for the attachment of it to a support and an aperture through it toward the support, an open frame vertically slidable between guideways on the outer face of the base portion and having a shelf outwardly projecting from its upper side, means for adjusting and securing such vertically slidable frame at any desired position of such movement, a stem horizontally movable in the vertcally movable frame, means for adjusting and securing the endwise movement of such stem, an aperture through thi stem at its midlength, and a roller the upper side of which is on a level with the aperture in the stem.
3. In a device of the class described, a base portion having means for securing the same to a support such base portion having an aperture through it toward the support and also side guides, a member vertically slidable in such side guides having an aperture corresponding to that of the base portion and a downwardly projecting screw passing through the projection on the base portion, nuts threaded on the screw and engaging both sides of the projection through which the screw passes, a stem having screwed ends and an aperture through it at its mid-length, such stem being horizontally slidable in the verticilly slidable membor, a nut threaded on each side of the screw and engaging the outer sides of its supports, a roller the upper side of which is about the level of the aperture in the stem, and a shelf on the upper side of the vertically slidable member the plane of which is parallel to the axis of the horizontally slidable stem.
No. 102,046. Mowing Machine. Faucheuse.

Emanuel Kaufman, Cleora, Indian Territory, U.S.A., 13th November, 1906; 6 years. Filed 8th October, 1906. Receipt No. 140,119.
Claim.-1. A mowing machine comprising in combination with an axle and traction wheels carried thereby, a gear secured to the axle at one end thereof, a pair of rods pivotally connected with said axle intermediate the traction wheels, means connecting said rods, a bracket attached to sald connecting means, a drive shaft jour:alled in said bracket and comprising a pair of sections con nected by a universal joint, a gear mounted on the rear shaft section, in mesh with the axle gear, cutting mechanism connected with said bracket, and a driving connection between said cntting mechanism and said drive shaft.
2. A mowing machine comprising in combination with an axle, and traction whecls carrisd thereby, a gear mounted upon one end of satd axle, a swinging frame pivotally connected to said axle intermediate said traction whols, a bracket connected to said frame, a drive shaft journalled in said bracket, and comprising a pair of sections connected by a unlversal joint. a gear mounted on said rear shaft section for mesh with said axle gear, cutting mechanism connected with sald bracket, and a driving connection between sald cutting mechanism and said drive shaft.
3. A mowing machine comprising in combination with an axle, , and traction wheels carried thereby, a gear mounted upon one end of said axle, a swinging frame pivotally connected to said axle intermediate said traction wheels, a bracket connected to said Prame, a drive shaft journalled in sald bracket, and comprising a pair of sections connected by a universal joint, a gear mounted on said rear shaft section for mesh with said axle gear, a cutter bar connected to said bracket, pins mounted upon opposite ends of said cutter bar, wheels loosmly mounted upon said pins, a knife chain passing around sald wheels and comprising a purality of knives connected together. a gear carrled by :aid front fhaft section, and a gear formed upon the faco of the adiacent wheel in mesh with said last-mentioned guar. for urlving sald chain.
4. A mowing machine comprising in combination with an axle and traction wheels carried thercby, a pair of sloeves mounted upon said axle intermediate said traction wheels. a pair of rods pivotally connected at one end to said sleeves and provided with eyes at their opposite ends, a rod mounted in sald eyes, an armed bracket connected to one end of said last-mentioned rod, a drive shaft journalled in the arms of said brarkrt, and comprising a pair of sections connceted by a universal foint, a gear carricd by the rar shaft section, a gear carried by the axle in mesh with sald Lear, a cutter bar connected with sald bracket, pins mounted upon opposite ends of said cutter bar, wheels loosely mounted upon said pins, a knife chain passing around sald wheels and comprising a plurality of knives connected together, a gear carried by sald front shaft section, and a gear formed upon the face of the adjacent wheel in mesh with said last-mentioned gear, for driving said chain.
No. 102,047. Cup-and-Ball Joint. Godet et joint de boule.

Jesse C. Martin. Jr., San Francisco, California, U.S.A., 13th November, 1906 ; 6 years. Flled 4th April, 1906. Receipt No. 134,604.
Claim.-1. A connection for pipes of the like comprising an udwise adjustable connecting gimbal enclosed within a rietallic flexible fluid tight conveyer.
2. A flexible connection for pipes or the like comprising a movable fluid-tight conveyer member, a universally movable connecting member, within the conveyer member, having a tubular abutment adapted to engage with the converer member.
3. A flexible connection for pipes or the like comprising a movable metallic fluid-tight conveyer member, a universally movable connecting member, within the conveyer member, having a tubular abutment adapted to engage with the conveyer member.
4. A flexible connection for pipes or the like comprising \(s\) ball and socket joint, a universally movable connecting member, with the ball and socket joint, having a tubular abutment adapted to engage with the ball and socket joint.

4 A flexible connection for pipes or the like comprising an axially rotatable connecting glmbal enclosed within a metallic flexible fluid-tight conveyer member.
5. A flexible connection for pipes or the like comprision axially rotatable connecting gimbal enclosed within a met.1. lic flexible fluid-tight conveyer member.
7. A flexible connection for plpes or the like comprising ar axially rotatable connecting gimbal enclosed within a ball and socket joint.
8. A connection for pipes or the like comprising a cup of sceket member, a ball member having operative conta.. therewith and projecting from the contact surface beynd its full diameter and a gimbal having unrestricted rotatabi. movement adapted to hold the parts in operative association.
9. A connection for plpes or the like comprising a cup of socket member, a ball member having operative contar: therewith and projecting from the contact surface beyond
its full diameter, a gimbal having unrestricted rotatable movement adapted to hold the parts in operative association, and joint packing between the two members.
10. A connection for pipes or the like comprising a cup or socket member, a ball member having operative contact therewith and projecting from the contact surface beyond its full diameter, a gimbal having unrestricted rotatable movement adapted to hold the parts in operative assoclat!on, and a gland or stuffing between the members.
11. A fiexible connection for pipes or the like comprising a ball and socket joint, and an endwise adjustable gimbal connecting the ball and socket and enclosed by the ball and socket joint.
12. A flexible connection for pipes or the like comprising a ball and socket joint provided with suitable joint packing. and an endwise adjustable gimbal connecting the ball and socket and enclosed by the ball and socket joint.

No. 102,048. Needle for Graphophones and the Like.
Aiguille de graphophone, etc.

FIG.2.

Fred. Petmecky, Austin, Texas, U.S.A., 13th November, 1906 ; 6 years. Filed 30th August, 1906. Receipt No. 139,112.
Claim.-1. A needle of the class described comprising a shank and a point, the shank being flattened adjacent to Its junction with the point, and the needle being provided with oppositely arranged concavities between the flattened portions of the shank and the point, whereby to permit the vibrations of the point.
2. A needle of the character described having a rigid shank, a rigid point, a thin section connecting the shank and point and entirely within the body of the needle, and a thinner flexible portion located at the lower end of said thin portion and above the point of the needle.
3. A needle of the character described having a thin partion extending along the body thereof above the point, and a flat flexible portion at the base of said thin portion and at the head of said point.
4. A needle of the character debcribed having a thin portion extending along the body thereof above the point, and a flat flexible portion at the base of said thin portion and at the head of said point, the point having a general pyramidal shape.
5. A needle or stylus for graphophones and the like, having a thin flat flexible portion located immediately at the rear of the point of the needle, the point having a general pyramidal shape with concave sides.
6. A needle or stylus for graphophones and the like having a pyramidal-shaped point.
7. A needle or stylus for graphophones and the like having a pyramidal-shaped point with concave faces.

No. 102,049. Solid Deodoriser or Disinfectant. Iésinfcctant.

Willoughby Hamilton Power, London, England, 13th November, 1906 ; 6 years. Filed 17th April, 1906. Receipt No. 134,949.
Claim.-1. A solid disinfecting or deodorizing piece or tablet consisting of a solid volatile disinfectant substance combined with a perfume and a balsam.
2. A solid disinfecting or deodorizing piece or tablet, consisting of naphthaline combined with a perfume and a balsam.
3. A solid disinfectant or deodorizing plece or tablet, consisting of a solid volatile disinfecting substance, combined with a perfume, a balsam and carbolic acid or phenol.
4. A solid disinfectant or deodorizing piece or tablet, consisting of napthaline combined with a perfume, a balsam and carbollc acid or phenol.
5. A solld disinfectant or deodorizing piece having a recess formed therein, in combination with a solid disinfectant or deodorizing piece which is adapted to fit into the recess in the first-mentioned plece and which comprises a solid volatile disinfectant substance, a perfume and a balsam.
6. A piece of naphthaline having a recess formed therein, in combination with a piece or tablet which is adapted to fit into the recess in the first-mentioned piece and which comprises naphthaline, a perfume and a balsam.
7. A holder comprising a back with supports \(\mathrm{E}, \mathrm{E}, \mathrm{F}, \mathrm{F}\), and \(G\), which allow substantlally the whole of the edge and face of the tablet to be exposed to the air, substantially as described.

\section*{No. 102,050. Prisile. Jeu de pationce.}

Clarence Edward Hall, Winnetka, assignee of Leo B. Lincoln, Chicago, both in Illinois, U.S.A., 13th November, 1906; 6 years. Flled 23rd January, 1906. Receipt No. 132,155.
Claim.-1. The puzzle described consisting of a base card bcaring numerals or digits on its front face and a plurality of perforated cards adapted to be laid upon the base card and each other in superposed order, through the perforations of which certain numerals of the base card are disclosed.
2. The puzzle described consisting of a base card bearing numerals or digits on its front face and a plurality of perforated cards adapted to be laid upon the base card and each other in superposed order, each of sald cards bearing on its rear face a group of key numbers for the purpose set forth.
3. The puzzle described consisting of a base card bearing digits on its front face and a plurality of perforated cards adapted to be laid upon the base card and each other in superposed order, certain of the perforated catds bearing on their front faces digits designed to be combined with the digits on the base cards to produce numerals one of which is designed to be exhibited through the registering perforations of the cards.
4. A puzzle described consisting of a base card bearing digits on its front face and a plurality of perforated cards
adapted to be laid upon the base card and each other in superposed order. certaln of the perforated cards bearing on

their front faces digits designed to be combined with the digits on the base cards to produce numerals one of which is designed to be exhibited through the registering perforations of the cards, each of said cards bearing on its rear face a group of numbers composed from, but less than all, the numbers compounded from the digits on the base and perforated cards.
5. The puzzle described consisting of a base card bearing digits on its front face and a plurality of perforated cards adapted to be laid upon the base card and each other in superposed order, certain of the perforated cards bearing on their front faces digits designed to be combined with the digits on the base cards to produce numerals one of which is designed to be exhibited through the registering perforations of the cards, each of said cards bearing on its rear face a group of numbers composed from, but less than all, the numbers compounded from the digits on the base and perforated cards, and characters on the cards indicating the top and bottom ends thereof.

\section*{No. 102,051. Cap or Olosure.}

\section*{Capuchon on fermeture.}

Whlliam Hatfleld Dodge, Montclair, New Jersey, U.S.A., 13th November. 1906; 6 years. Filed 20th January, 1906 Receipt No. 132,087 .
Claim.-1. A cap or closure for bottles, jars, or similar vessels, comprising a cover, a compressible disc and a holding flange, one part of said flange being in form of a depending rim integral with said cover, and the other part being detached from the periphery of said cover, the two parts of said flange being connected together by a weakened band or fold.
2. A cap or closure for bottles. jars, or similar vessels, comprising a cover, a compressible disc and a holding flange, substantially one half of sald flange being in form of a depending rim integral with said cover, and the other half being detached from the periphery of said cover but having an inwardly projecting gripping rim which overlaps sald periphery or practically that part of the covers
edge having no integral depending rim, the two parts of said holding flange being held together by a band or fold.

3. A cap or closure for bottles, jars, or similar vessels. made from one piece of sheet metal, comprising a cortr and a holding flange, one part of said flange being a depending flange from said cover and integral therewith, and the other part having an inwardly projecting gripping rim overlapping the periphery of said cover a part of the way round, the two parts of said holding flange being held together on one side by a breakable connection.
4. A one piece shell for forming a cap or closure for bottles, jars, or similar vessels, consisting of a top plate and a depending flange around the same and integral therewith, a part of the way, said shell being longer in diameter across the top in one direction than in the other, or slightly oblong in form substantially of two semi-circles joined logether by a rectangle or narrow space between the same.
5 . In a sheet metal cap or closure for bottles, fars, or similar vessels, made from a shell having a top and a depending flange integral therewith, a cut or opening substantlally crescent-shaped, in the top of sald shell on one side thereof leaving a gripping rim or edge on a part of said depending flange, whereby said flange may be circumferentially contracted.
6. In a sheet cap or closure for bottles, jars, or similar vessels, made from a shell having a top and a depending flange integral therewith, a cut or opening substantialls crescent-shaped in the top of said shell on one slde thereof, leaving a gripping rim or edge on a part of sald depending flange, whereby said flange may be circumferenlially contracted, and the edge on one side of said cut may be made to overlap that on the other side.
7. A cap or closure for bottles, jars, or similar vessels. made from a one-piece sheet metal shell, said shell comprising a top and a holding flange, partially oeparated therefrom, said flange having a greater circumferential length than the peripheral length of the top. and including an integral foldable web of a width less than that of the flange.
8. A can or closure for bottles, jars. or similar vessels. made from a one-piece sheet metal shell, sald shell comprising a top and a holding flange partially separated therefrom, sald flange being of greater oircumferentia length than the peripheral length of the top and including an integral poldable web whereby said flange may be cir an integral foldable web, whereby said fange cumferentially contracted by folding sald web.
9. A cad or closure for bottles, jars, or similar vessels. made from a one-piece sheet metal shell, said shell comprising a ton, and a holding flange of greater circumference than said top, and one part of said flange having an inwardly projecting gripping rim, wherebs said fange may be circumferentially contracted, and said gripping rim be made to overlap the peripheral edge of said top.
10. A cap or closure for bottles, jars or similar vessels. comprising a cover, a compressible disc and a holding flange, substantially one-half of said flange being in form of depending rim integral with said cover, and the otber part being detached from the periphery of said cover but having an inwardly projecting gripping rim which overlays practically that part of the covers edge or periphery having no depending rim, the two parts of said flange being joised together near the points where a part thereof is detachid from the periphery of said cover, on practically opposit. sides of said can or closure, said flange being circumferentially contracted by one or more folds or breakable vertical crimps or ribs therein.
11. A sheet metal cap or closure for bottles, jars or simflar vessels. comprising a cover and a holding fange. one part of said flange being a depending tange from ail!
cover and integral therewith, and the other part having an inwardly projecting scallopped gripping rim, overlapping the periphery of said cover a part of the way round.
12. A sheet metal cap or closure for bottles, jars or simllar vessels, comprising a cover and a holding flange, one part of said flange being a depending flange from said cover and integral therewith, and the other part having an inwardly projecting scallopped gripping rim, overlapping the periphery of said cover a part of the way round, the two parts of said flange being connected together by one or more folds or vertical crimps or ribs therein.
13. A sheet metal cap or closure for bottles, jars, or similar vessels. comprising a cover and a holding flange, one part of said flange being a depending flange from said cover and integral therewith. and the other part having an inwardly projecting scallopped gripping rim, overlapping the periphery of said cover a part of the way around, said flange being circumferentially contracted by one or more folds or vertical crimps or ribs therein.
14. A cap or closure for bottles, jars, or similar vessels, made from one piece of sheet metal, comprising a cover and a continuous or endless holding flange, one part of said flange being a depending flange from said cover and integral therewith, and the other part having an inwardly projecting gripping rim overlapping the periphery of said cover a part of the way round, the two parts of said holding flange being connected by one or more folds or vertical crimgs or ribs.
15. A cap or closure for bottles. jars. or similar vessels, made from a one-plece sheet metal shell, sald shell comprising a top and a holding flange, said flange being of greater circumference than sald top, whereby said flange may be circumferentially contracted by projecting a fold or bow therefrom, or by forming one or more vertical crimps or ribs therein.
16. A cap or closure for bottles, fars. or similar vessels. comprising a cover and a holding flange, one part of said flange being in form of a depending rim integral with said cover, and the other part belng detached from and made to overlap the periphery of said cover, said flange where divided on one side being connected together by a lever or bar pivoted to one or both of the ends of sald flange.
17. A cap or closure for bottles. jars, or similar vessels. comprising a top plate and a holding flange. both of sheet metal, and a pliable sealing cover under sald top plate, one part of said holding flange being in form of a depending rim, integral with said top plate, and the other part being detached from and made to overlan the periphery of said top plate, sald flange and made to overlap the periphery of sald top plate, said flange where divided on one side being connected together by a lever or bar pivoted to one or both of the ends thereof.
18. A cap or closure for bottles. jars, or similar vessels. comprising a cover consisting of two parts hinged together across the top, and a holding flange, one part of said flange being in form of a depending rim integral with one part of said hinged top, and the other part being detached from and made to overlap the periphery of the other part of said top.
19. A cap or closure for bottles, jars, etc., comprising a cover, a compressible disc and a holding flange, substantially cne-half of said flange being in form of a depending rim integral with said cover, and the other half being detached from the periphery of said cover but having an inwardly projecting gripping rim which overlaps said periphery or practically that part of the cover's edge having no integral depending rim.
20. A cap or closure for bottles, jars, etc., comprising a cover, a compressible disc and a holding flange, substantially one-half of said flange being in form of a depending rim integral with said cover, and the other half being detached from the periphery of said cover but having an inwardly profecting gripping rim which overlaps sald periphery or practically that part of the cover's edge having no integral depending rim, the two parts of said flange being held together by detachable connections.
21. A cap or closure for bottles, jars, etc., made from one piece of sheet metal, comprising a cover and a continuous or endless holding flange, one part of said flange being a depending flange from said cover and integral therewith, and the other part having an inwardly projecting gripping rim overlapping the periphery of said cover a part of the was around.
22. A cap or closure for bottles, jars, etc., made from one piece of sheet metal, comprising a cover and a holding flange, one part of said flange being a depending flange from said cover and integral therewith, and the other part having an inwardly projecting gripping rim overlapping the periphery of said cover a part of the way round, said holding flange being continuous on one side and held together by detachable connections on the other side.
23. A cap or closure for bottles, jars, etc., made from one plece of sheet metal, comprising a cover and a holding flange, one part of said flange being a depending flange from said cover and integral therewith, and the other part having an inwardly projecting gripping rim overlapping the reriphery of sald cover a part of the way round, the lower edge of said holding flange being forced or spun under a projecting shoulder on the bottle or other receptacle, when the cap or closure is in use.
24. A cap or closure for bottles, jars, atc., made from a one-piece sheet metal shell having a tod and a peripheral depending flange or rim, said shell being slightly oblong or in form substantially of two semi-circles joined by a rectangle between, a part of the top of said shell being cut out from near the periphery on one side, leaving a gripping rim around the inner upper edge of the depending flange on that side, and allowing that part of the flange to be pressed in wardly so as to form practically one continuous holding flange or rim.
25. A one-piece shell for forming a cap or closure for bottles, jars, etc., consisting of a top plate and a continuous depending flange around the same and integral therewith. for substantially one-half its length, said shell being longer in diameter across the top in one direction than in the other.
26. In a sheet metal cap or closure for bottles, jars, etc., made from a shell having a top and depending flange integral therewith, a cut or opening, substantially crescentshaped, in the top of said shell on one side thereof, leaving a gripping rim or edge on a part of said depending flange, Whereby said flange may be circumferentially contracted, and said gripping rim be made to overlap the inner edge of sald top where cut.
27. A locking device for holding together the ends of the locking band or flange around a cap, cover or closure for bcttles, jars, or cans, consisting of an outwardly projecting tongue on or near one end of said band and a transverse slot in the band near the other end thereof, said slot extending upwardly from the lower edge of said band a part of the way across the same.
28. A cap or closure on bottles, jars, etc., comprising a top plate provided with a downwardly pending locking band or flange, both top plate and band being made of one plece of sheet metal, said top plate being made in two partially scparate parts. the inner edge of one of which overlaps the outer rdge of the other, for a part of the way around the periphery of said top plate in combination with a sealing ining made of cloth or other fabric dipped in parafine, wax or some other suitable liquid.
No. 102,052. Wrench. Clé áécrou.

Hustead B. Shaver, Flemington, West Virginia, 13th November, 1906; 6 year. Filed 22nd October, 1906. Recelpt No. 140,515 .
Claim.-1. In a wrench, the combination with a toothed shank, of a sliding jaw on said shank, a pair of spring pressed detents carried by sald jaw, one of said detents being mounted directly oveh the other, the teeth of one of said detents being adapted for operative engagement with the teeth of the shank while the other is half withdrawn from such engagement, and vice versa, and means whereby both detents may be simultaneously disengaged from the leeth of the shank.
2. A wrench comprising a coarse toothed shank having an integral jaw, a jaw slidable upon said shank, two spring controlled dogs pivotally mounted in said slidable jaw, one of said dogs being mounted directly over the body of the other and engaging the toothed shank at a point in
advance of the other, each of sald doga having coarse teeth corresponding with the teeth of the shank, said dogs being adapted to ride on the teeth of the shank and so arranged in relation to each other that they will alternately fall into operative engagement with the teeth of the shank as moved forward thereon, and means whereby sald dogs may be simultaneously disengaged from the shank.
3. A wrench comprising a coarse toothed shank having a fixed jaw, a jaw slidably mounted on the shank. a pair of dogs piroted within the movable jaw, each dog being of a width substantially the same as that of the shank and having coarse teeth corresponding with the teeth of the shank, one of said dogs being mounted directly over the body of the other and engaging the shank in advance of the other, said dogs being so arranged in relation to each other that but one dog is in operative engagement with the shank at a time, a slot extending across the top and down the sides of said movable jaw, and a stirrup movably mounted in said slot with a pin connecting its extremities directly over the upper of said dogs whereby said dogs may be depressed out of engagement with the shank.
4. A wrench comprising a coarse toothed shank, a sliding jaw on said shank, a pair of spring controlled detents carried by the jaw, one over the body of the other, and cooperatively engaging the toothed partion of the shank, one in advance of the other, said detents being mounted upon a common pivot and adapted to ride on and to alternately drod into operative engagement with the teeth of the shank, the teeth of each detent corresponding with the teeth of the shank, and one of sald detents normally standing half withdrawn from engagement with the teeth of the shank when the other detent is in operative engagement therewith, and means oparatively mounted over said detents whereby the latter may be simultaneously depressed and held out of engagement with the shank.
5. A wrench comprising a toothed shank, a fixed jaw carried by sald shank, a movable jaw upon said shank, a pair of detents carried by sald movable jaw, said detents being mounted upon a common pivot and both lying substantlally parallel to sald shank with their toothed portions in engagement with sald shank, one in front of the other, said detents beling so arranged relativels that the tecth of one is half withdrawn from the teeth of the shank while the other is in operative engagement therewith, and vice versa, and means whereby sald detents may be forced out of engagement with the shank.

No. 102,053. Meang of Splicing Telegraph Poles.
Moyen d'épisser les poteaus de télégraphe, etc.

Jchn D. Soseman, Monroe, Wisconsin. U.S.A., 13th November, 1906; 6 years. Filed 20th October, 1906. Receipt No. 140,467 .
Claim.-1. The herein described device for the purpose specifed comprising a pole clamp adapted to be fitted to or removed from operative position by movement in a direction transverse to the length of a pole, and a plurality of extensible ligs connected with said clamp.
2. The hereln described device for the purpose specifled comprising a pole clamp adapted to be fitted to or removed
from operative position by movement in a direction transverse to the length of a pole, and a plurality of legs extending downwardly and outwardly from sald clamp, and each having an enlarged base or show at its lower end.
3. The herein described device for the purpose specifed comprising a clamp adapted to be detachably secured in position on a pole and adjustable to engage poles of different diameters and a plurallty of legs connected with said clamp.
4. The herein described device for the purpose specifed comprising a clamp adapted to be detachably secured in position on a pole and adjustable to engage poles of different diameters and a plurality of extensible legs connected with sald clamp.
5. The herein described device for the purpose specilled comprising a pole clamp, a plurality of legs adapted to extend downwardly and outwardly from sald clamp, and a shoe or base adjustably connected with each leg, the face of each shoe to which the leg is connected forming an acute angle with the lower face or surface thereof.
6. In a device for the purpose described the combination of a pole clamp comprising a plurality of separated blocks and a cable connecting said blocks and adapted to secure them to a pole, and a plurality of legs each pivotally connected to one side of sald blocks.
7. In a device for the purpose described the combination of a pole clamp, a plurality of legs connected with ald clamp, a base or shoe for each leg, and an adjusting screw between each leg and the base or shoe therefor.
8. In a device for the purpose described the combination of a pole clamp, a plurality of legs connected with said clamp and each having a socket opening through its lower end a shoe or base plece for each leg, a screw connected to each base or shoe and extending into the socket in the leg, and a nut mounted on the screw and supporting the leg at the desired elevation thereon.
9. In a device for the purpose described the combination of a pole clamp, a plurality of legs each comprising two telescoping sections one pivotally connected with said clamp and the other connected with a suitable shoe or base plece. and means for adjusting both sections of elther leg. longitudirally relative to its said shoe or base plece.
10. In a device for the purpose described the combination oi a plurality of separated supporting blocks, a cable คrtending through a passage in each of sald blocks, and adaptrid to encircle a pole, a grip block with which one end of the eable is engaged and provided with a passage for the other end of the cable, means for drawing the cable through said blocks and holding it in the desired position, and leg= rich plootally connected at its upper end to one of the supporting blocks.
No. 102,054. Governor for Explosive Engines. Gouverneur pour machine explosive.

Alcxander Winton, Cleveland, Ohio, U.S.A., 13th November. 1906 ; 6 years. Filed 17th January, 1906. Recelpt No. 131,970.
('laim.-1. In a motor vehicle the combination of a plursl ity of transver:sly arranged explosive engine cylinders. thi power imils of the cylinders located at one side of the vebi
cle, each cylinder having an explosive inlet port, a passageway extending longitudinal the vehicle and in communication with all of the said explosive inlet ports, and a carbureter in communication with said passageway for providing thereto the explosive mixture.
2. In a motor vehicle the combination of a plurality of transversely arranged explosive engine cylinders, the power ends of the cylinders being located at one side of the vehicle, each cylinder having a projecting explosive inlet chamber, a lengitudinally arranged pipe located at one side of the vehicle, and establishing communication between all of the sald inlet chambers, and a carbureter or gas making device in communication with the said pipe.
3. In a motor vehicle the combination of an explosive engine, an explosive inlet port, a valve controlling the said jort, a gas making device in communication with the inlet fort, a gas making device having a controlled gasoline inlet, and means common to and adapted to control the said gasoline inlet and the explosive Inlet valve, said means being ander the control of the operator whereby the size of the explosive charge and its quality are under the control of the operator.
4. In a motor vehicle the combination of a plurality of explosive engine cylinders each having an explosive inlet port and a valve controlling the said port, means common to and adapted to control both the said inlet valves, and a manually operated device controlling the sald means.
5. In a motor vehicle, the combination of a plurality of explosive engine cylinders, each having explosive inlet ports and valves for said ports, a carbureter in communication with the said inlet ports, said carbureter having a gasoline inlet, a valve controlling the gasoline inlet, and means under the control of the operator and common to and adapted to control said gasoline and explosive inlet valves, for the purpose described.
6. In a motor carriage, the combination of a plurality of explosive cylinders having each explosive inlet ports, valves adapted to control the said ports, means operated by the engine in communication with and adapted to act upon said valves to keep them closed, and means under the control of the operator adapted to control the engine operative means.
7. In a motor carriage, the combination of a plurality of explosive engine cylinders, each having explosive inlet ports, valves controlling the said inlet ports, a carbureter in communication with all of the said ports, a gasoline inlet for said carbureter, a valve controlling the said inlet, and means operated by the engine and adapted to control the said inlet and gasoline valves, and means under the control of the operator adapted to control the engine operating means.
8. In a motor vehicle, the combination of a plurality of explosion engine cylinders, each having an explosive inlet port, a pressure producing device common to and adapted to control the said inlet valves, and pressure escape opening under the control of the operator for regulating the pressure simultaneously in respect to the said inlet valves.
9. In a motor vehicle, the combination of a plurality of explosive inlet cylinders, each having an explosive inlet port, valves therefor, a pressure producing device common to and adapted to act upon and control the said inlet valves, a pressure escape opening for keeping the pressure at a predetermined degree and regulating the normal speed of the engine, and a pressure escape opening under the control of the operator to vary instantly the degree of pressure and hence vary the speed of the engine.
10. In a motor vehicle, the combination of an explosion engine having an explosive inlet port, a valve controlling the said port, a carbureter in communication with the said port, the carbureter having a controlled gasoline inlet independent of the explosive inlet valve, and a pressure producing device adapted to act upon the said inlet and gasoline valves independently.
11. In a motor vehicle, the combination of a plurality of explosion cylinders having each explosive inlet ports, valver for the controlling of the sald ports, a carbureter common to and in communication with all of the sald inlet ports, the carbureter having a controlled gasoline inlet independent of the explosive inlet valves, and a pressure producing device acting upon and controlling the explosive inlet valves and the gasoline inlet.
12. In a motor vehicle, the combination of an explosion engine having an explosive inlet port, a valve for the said port, a carbureter in communication with the explosive inlet port, a gasoline inlet for the said carbureter, means actuated by the suction of the engine independent of the explosive inlet valve and adapted to open the gasoline inlet, and a pressure producing device acting upon the controlled gasoline inlet in opposition to the suction of the engine, and means for controlling the pressure.
13. In a motor vehicle, the combination of an explosion engine having an explosive inlet port, a valve controlling
the said port, a piston or diaphragm connected with the said valve, a carbureter in communication with the explosive inlet port, the carbureter having a gasoline inlet, a gasoline valve controlling the said Inlet, a piston or diaphragm under the influence of the engine suction for opening the gasoline valve, a pressure actuated piston operatively connected with the gasoline valve and adapted to operate in opposition to the valve which is under the influence of the engine suction, a pressure producing device in comunication with and acting upon the explosive inlet piston and the gasoline valve pressure piston, and means for controlling the pressure.
14. In a motor vehicle, the combination with an explosive engine, of a carbureter in communication with the engine, the carbureter having an air passage, a gasoline passage, a valve adapted to control the gasoline passage, a pressure actuated piston acting to close the gasoline valve, a pressure device in communication with the said piston, means for controlling the pressure and a valve located in the carbureter passage way and connected with the gasoline valve, the said valve being under the influence of the engine suction to oden the gasoline valve.
15. In a motor carriage, an explosive engine, an explosive inlet valve therefor, a pressure producing device controlling said inlet valve, a foot relief valve for said pressure and a hand rellef valve for sald pressure, both valves located to be controlled by the foot and hand of the operator,
16. In a motor carriage, an explosive engine, an explosive inlet valve therefor, an air pressure producing pump in connection with said rellef valve for controlling it, the engine having a crank case, and a connection between the said pump and crank case through which the pump draws its air.

No. 102,055. Grain Door. Porte d grain.

Edward Frank Atkinson, Peterboro, Ontario, Canada, 13th November, 1906; 6 years. Filed 1st June, 1906. Recelpt No. 136,475 .
Claim.-1. In a grain door for cars in combination with a frame having upright posts in pairs arranged at each side of a doorway, a pair of upright guldes suitably secured and located between the posts of each pair respectively and having the upper ends thereof arched and extending across sald car and suitably seoured at the outer ends, a plurality of horizontally arranged sections vertically arranged one above the other and the ends thereof resting against said posts, and means secured to said sections for embracing said guides and adapted to slide loosely thereon, and means for holding sald sections in a downward position and retaining them in a raised pgsition, as and for the purpose specified.
2. In a grain door for cars in combination with a frame having upright posts in pairs arranged at each side of a doorway, a pair of upright guides suitably secured and located between the posts of each pair respectively and having the upper ends thereof arched and extending across sald car and sultably secured at the outer ends, a plurality of horizon-
tally arranged sections vertically arranged one above the other and the ends thereof resting against sald posts, eye bolts suitably secured in said guides, and means for retainlt:g said sections in a downward position and in a raised position, as and for the purpose specifled.
3. In a grain door for cars in comblnation with a frame having upright posts in pairs arranged at each side of a doorway, a pair of upright guides suitably secured and lorated between the posts of each pair respectively and having the upper ends thereof arched and extending across said car in proximity to the roof thereof and suitably secured, a plurality of horizontally arranged sections having the upper edge bevelled on the inside and a lip or projection extending irom the lower edge and registering with the bevelled edge of the scction immediately below, pairs of eye bolts fixedly secured in said sections in proximity to the ends thereof having the eye portlons surrounding said guides and sllding loosely thereon, pivotal dogs or members pivotally secured in said upright posts having a downwardly extending lip or projection at the outer end thereof adapted to engage the edge of the upper one of said sections, and means for limiting the movement of said pivotal members, as and for the purpose specifed.
4. In a grain door for cars in combination with a frame having upright posts in pairs arranged at each side of a doorway, a pair of upright guldes sultably secured and located between the posts of each pair respectively and having the upper ends thereof arched and extending across sald car in proximity to the roof thereof and suitably secured, a plurality of horizontally arranged sections having the upper edge bevelled on the inside of allp or projection extending from the lower edge and registering with the bevelled edge of the section immediately below, the lower section having an opening therethrough, a gate or door hingedly secured to said section and closing sald opening, means for holding sald door in a closed position, pairs of eye bolts fixedly secured in said sections in proximity to the ends thereof having the eye portions surrounding said guides and sliding loosely thereon, pivotal dogs or members pivotally secured in said upright posts having a downwardly extending lip or projection at the outer end thereof adapted to engage the edge of the upper one of said sections, and means for limiting the movement o: sald pivotal members, as and for the purpose specified.

No. 102,056. Hook. Crochet

-

Edward Jacob Hill, Wistminster, London, England, 13th November, 1906; 6 years. Filed 18th September, 1906. Receipt No. 139.604.
Claim.-1. The combination of an \(S\) hook comprising a length of rod or wire bent to a nearly closed \(S\) form or approximate figure of eight with its ends recurved to constitute short open terminal hooks extending in the plane of the \(S\) and a mousing link adapted to be engaged with sald teruinal hooks so as to close both loops of the \(S\) by completing

Edward Southworth, Portland, Maine, U.S.A., 13th November, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,266 . 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,266 .
Claim.-1. In a machine for perforating paper, the combination of a series of perforating punches, a corresponding die plate, a guide plate above said die plate through which ald punches pass, a vertically movable punch holding frame carrying said series of punches, a cam shaft journalled so that it passes horizontally through said frame and operating that it passes horizontally through said frame and operating
to raise and lower said frame and means for rotating aald shaft.
2. In a machine for perforating paper the combination of a series of perforating punches, a corresponding die plate, a
guide plate above sald die plate through which sald punches a series of perforating punches, a corresponding die plate, a
guide plate above sald die plate through which sald punches pass, a vertically movable punch holding frame to which the upper ends of sald punches are secured having thereln a horiupper ends of said punches are secured having thereln a horl-
zintal slot. a cam shaft journalled within sald frame having a gear tooth flting said slot and means for rotating said shaft.
3. In a machine for perforating paper the combination of a scries of perforating punches having heads on their upper ends, a corresponding die pate, a gulde plate above sald d:c
plate through which sald punches pass, a vertically morable ends, a corresponding die pate, a gulde plate above sald d:c
plate through which sald punches pass, a vertically morable punch holding frame having a lower bar through which the tepper ends of said punches pass, a face plate having an edge or shoulder for resisting the upward thrust of said punches and having a horizontal slof or groove, a cam shaft journalled within said frame and having a tooth or projection
fitting sald slot to empart motion to said frame and means nalled within said frame and having a tooth or projection
fitting sald slot to empart motion to said frame and means for rotating sald shaft.
4. In a machine for perforating paper the combination of a series of perforating punches, a corresponding die plate. a guide plate above sald dle plate through which said punches pass, a vertically movable punch holding frame to which th. upper ends of the punches are secured, a cam shaft journalled parallel with and adjacent to sald frame, sald cara shaft and sald frame having interlocking projections whereb. the rotation of sald shaft moves said frame vertically.
the figure of eight, and to be disengaged from elther or both of the terminal hooks at will, substantially as described.
2. The combination of an \(S\) hook comprising a length of rod or wire bent to a nearly closed \(S\) form or approximate figure of eight with its ends recurved to constltute short open icrminal hooks extending in the plane of the \(S\) and a mousing link adapted to be engaged with said terminal hooks so as to close both loops of the \(S\) by completing the figure of eight, and to be disengaged from either or both of the terminal hooks at will, each loop of the \(S\) being of greater tranverse breadth than the internal length of the mousing link. substantially as described.

No. 102,057. Perforating Machine.
Machine d perforer.

No. 102,058. Combuntion Enginc.
Machine a combustion.

Harry Ball Stilz, Philadelphia, Pennsylvania, U.S.A., 13th November, 1906; 6 years. Filed 9th March, 1906. Receipt No. \(133,717\).
Clasm.-1. The combination of an air compressor provided with a means of cooling the air during the process of compression, a motor cylinder into which the compressed air is intermittently introduced from the compressor and is therein raised to a high temperature and partially expanded at constant pressure by the burning therewith of a combustible and then further expanded adiabatically, a piston in said cylinder, means for introducing said combustible under pressure into said cylinder, conduits for the ingress and egress of said fluids to the air compressor and motor cylinder, valves for controlling the passage of the fluids through said conduits, and means actuated by the power generated in said cylinder for operating said compressor and the valves.
2. In an Internal combustion engine, the combination with the working cylinder, the piston and the power shaft operated thereby, of a source of supply of compressed air which has been relieved of the heat produced in the act of compression; a heater in which heat in the exhaust gases from the engine is transmitted to the compressed air delivered from sald source of supply, means for conveying the compressed air to said cylinder, means for introducing a combustible under pressure into said cylinder, valves actuated by the engine shaft for controlling the supply of air and combustible admitted to the cylinder so as to cause combustion therein at constant pressure, and an exhaust valve for controlling the passage of the combustion gases from the cylinder.
3. In an internal combustion engine, the combination with the working cylinder, the piston and the power shaft operated thereby, of an air compressor provided with a means of cooling the air during the process of compression, a heater in which heat in the exhaust gases from the engine Is transmitted to the air delivered from said compressor, means for introducing a combustible under pressure into said cylinder, valves actuated by the engine shaft for controlling the supply of air and combustible admitted to the cylinder so as to cause combustion therein at constant pressure and an exhaust valve for controlling the passage of the combustion gases from the cylinder.
4. In combination of a cylinder and piston of an internal combustion engine, a source of supply of compressed air, a source of supply of a combustible under pressure; valves for controlling the compressed air and combustible admitted to and the products of combustion discharged from said cylinder, and a rellef valve in the combustible supply pipe to said cylinder, substantially as described.
5. In an internal combustion engine, an air compressor, means for cooling the air during the process of compression an engine cylinder, a valve mechanism for admitting com-11-12
pressed air and a combustible to said cylinder, sald valve mechanism being constructed and arranged 80 as to cause the whole charge of combustible to be introduced into and burned in the cylinder before the air controlling valve is closed in order that the compressed air in the cylinder may be heated at constant maximum pressure and then expand adiabatically, and means for then exhausting the air from the cylinder.
6. In an internal combustion engine, an air compressor, means for cooling the air during compression, an engine cylinder, a reservoir between sald compressoz and said cylinder, valve mechanism for admitting compressed air and a combustible to said cylinder, sald valve mechanism being constructed and operated so as to cause the whole charge of combustible to be introduced into and burned in the cylinder before communication between the cylinder and the reservoir is shut off in order to cause the air in the cylinder to be heated at constant maximum pressure, means for then permitting the heated air in the cylinder to expand adiabatically, and means for finally exhausting the air from the cylinder.
7. In combination with the cylinder and piston of an internal combustion engine, a source of supply of compressed air, a source of supply of a combustlble under pressure, valves for controlling the compressed air and combustible admitted to and the products of combustion discharged from said cylinder, and means for automatically varying the rate at which the combustible is supplied inversely with varlations in the pressure in the compressed air system in order to maintain the pressure in said system practically constant.
8. In an internal combustion engine, a compressor system, an engine cylinder, means for burning a combustible in said cylinder at the pressure of the said system, and means governed by said pressure for controlling the amount of combustible burned so as to maintain the pressure in said system uniform.

No. 102,059. Cuff Holder. lorte-poignet.

William T. Robinson, Toronto, Ontario, Canada, and Harris A. Bateman, Aberdeen, South Dakota, U.S.A., assignee of a half interest, 13th November, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,146.
Claim.-1. A cuff holder comprising a cuff receiving section having a resillent tongue, a swinging section or locking lever connected with the cuff receiving section for operating the tongue, and a sleeve member slidable on the swinging section or locking member and provided with means for engaging a coat sleeve.
2. A cuff holder comprising a cuff receiving section having a resilient tongue, a locking lever detachably connected with the cuff receiving section, and a sleeve member slidable on the locking lever and retained thereon by the cuff receiving section.
3. A cuff holder comprising a cuff receiving section having a movable cuff engaging portion, a lever detachably interlocked at its inner end with the cuff receiving section and provided with means for operating the movable portion thereof, said lever being provided at its outer end with a stop, and a sleeve member slidable on the lever and detachably retained thereon by the cuff receiving section.
4. A cuff holder, comprising a cuff engaging device, and an adjustable sleeve member slidable on the cuff engaging device and provided with a pin movable on the sleeve member for engaging a coat sleeve, said pin being also provided with means for securing the sleeve member in its adjustment.
5. A cuff holder comprising a cuff engaging device, and an adjustable sleeve member slidable on the cuff engaging device and provided with a slidable pin having a resilient loop for locking the sleeve member in its adjustment.
6. A cuff holder comprising a cuff engaging device, and an adjustable sleeve member slidable on the cuff engaging device and provided with a pair of slidable prongs or pins for engaging a coat sleeve, and prongs or pins baving a resilient connecting loop arranged to lock the sleeve member in its adjustment.
7. A cuff holder comprising a cuff engaging device, and an adjustable slceve member composed of a slidable body portion having guides to recelve the cuff engaging device and a pair of slidable prongs or pins provided with a connecting lcop arranged to lock the sleeve member and the cuff engaging device in their relative adjustment.
8. A cuff holder comprising a cuff engaging device, and a sleeve member composed of a plate or body portion slidably connected with the cuff engaging device and having an opening and a pair of pins or prongs adjustable on the said plate or body portion and having means extending through the sald opening for locking the sleeve member and the cuff engaging device in their relative adjustment.
9. A cuff holder comprising a cuff engaging device, and a sleeve member adjustable on the cufl engaging device and provided with an opening bevelled at one side, said sleeve member having slidable means for engaging the sleeve and provided with a resilient portion extending through the opening for securing the sleeve member and the cuff engaging device in their relative adjustment, said resilient portion being movable over the bevelled portion of the sleeve member to carry it into and out of engagement with the cuff engaging device.
10. A cuff holder comprising cuff engaging means, and ar adjustable sleeve member composed of a plate or body' haviug opposite guides and provided with eyes spaced from the guides, and a palr of pins or prongs slidable in the guides and fitting in the eyes, said prongs or pins being provided with a connecting loop for engaging the cuff engaging means.
11. A cuff holder comprising cuff engaging means, and a slceve nember composed of a plate or body adjustable on the cuff engaging means and provided with spaced guides and having a lug arranged between the guides, pins or prongs slidable in the guides, and a loop connecting the pins or prongs, said loop being located between the guides and arranged to be engaged by the sald lug.
12. A cuff holder comprising cuff engaging means provided with a series of shoulders, and a sleeve member composed ot a plate slidable on the cuff engaging means and having an opening, said plate being also provided with a stop spaced from the opening, and a pair of pins or prongs slidable on the plate and having a connecting loop extending through the opening to engage the said shoulders and arranged to be evgaged by the said stop.
13. A cuff holder comprising a cuff engaging device provided with means for engaging the cuff, a sleeve engaging member having means for engaging a coat sleeve, and means independent of the sleeve engaging means for slidably connecting the said device and the sald member so as to permit - the said parts to have relative sliding movement and adjustment without disengaging the sleeve member from the sleeve, said sleeve engaging means having a locking device for sccuring the sleeve member and the cuff engaging device in their relative adjustment.
14. A cuff holder comprising a cuff engaging device. an adjustable sleeve member slidable on the cuff engaging device, a pin slidable on the sleeve member for engaging a coat sieeve, and a locking device carried by the pin for securing the sleeve member and the cuff engaging device in their relative adjustment.

\section*{150. 102,060. System of Electricil Regriation. Système de régulation électrique.}

The Canadian General Electric Company, Toronto. Ontario. assignee of William L. R. Emmet, Schenectady, New York. U.S.A., 13th November. 1906; 6 years. Flled 6th October, 1904. Receipt No. 118,973.
Claim.-The combination of an alternating current generator having alternating current mains leading therefrom, and having a direct current exciting circuit connected there: to. a source of exciting current, a booster interposed in the exciting circuit, a regulator for the sald booster responsive both to the voltage of the alternating current mains and to the resultant voltage of said exciting source and booster, and
a resistance coll located in a shunt wire between the booster and the regulator and adapted to be inserted in the feld cir-

cuit of the booster in response to the action of the regulator, as and for the purpose specifed.
No. 102,061. Fose Supporting Clagp. Agrafe de jartelles.

The Sperella Company, assignee of Francis William Liallitt, all of Meadville. Pennsylvania, U.S.A., 13th November, 1906; 6 years. Filed th September, 1906. Receipt No. 139,210.
Clain.-1. A clasp consisting of a base plate formed with a hook-shaped jaw on one end, a strap receiving slot in the
opposite end, an aperture in the central portion and longitudinal flanges on its sides, a lever fulcrumed on said flanges opposite the central aperture of the plate and formed with ears extending beyond the fulcrum of the lever and adapted to enter the said aperture, and a clamping tongue pivoted to said ears, as set forth.
2. A clasp consisting of a base plate formed with a hookshaped jaw on one end, a strap receiving slot in the opposite site end, an aperture in the centre of the plate, and longitudinal flanges extending from end to end of the plate, a thumb lever formed with inwardly deflected ears pivoted to said flanges, opposite the central aperture and supplemental ears extending from the said deflected ears and adapted to enter the central aperture, and the clamping tongue pivoted to the supplemental ears, as set forth.
3. The improved hose supporting clasp consisting of the base slate formed with a hook-shaped jaw on one end, an aperture in the center of the plate, longitudinal flanges projecting at right angles from the plane of the plate and extending from end to end thereof and enlarged in depth at the central aperture, the thumb lever pivoted to the flanges at said aperture and provided with ears extending beyond the pivot, and the clamping tongue pivoted to said ears, in combination with the suspending strap extending across the central aperture and secured to both ends of the base plate, as set forth.
4. A hose supporting clasp consisting of a base plate formed with a hook-shaped hose receiving jaw on one end, means for attaching the plate to the strap at the opposite end of the plate and longitudinal flanges projecting at right angles from the plane of the plate, a transverse rod connected to the flanges, a lever pivoted on said rod and formed with supplemental ears extending beyond the pivot of the lever, the clamping tongue pivoted to said supplemental ears, and a spring disposed to press the free end of said tongue outward from the base plate as set forth.
5. A hose supporting clasp consisting of a base plate formed with the hose receiving jaw on one end, means for attaching the plate to the strap, an aperture in the central portion of the plate and longitudinal flanges on the sides of the plate, a transverse rod attached to the flanges opposite the central aperture, a thumb lever formed with inwardly deflected ears pivoted to said rod and with supplemental ears extending beyond the pivot, a transverse rod attached to the supplemental ears, the clamping tongue provided with ears pivoted to the last-mentioned rod. and a spring consisting of a wire baving its end portions each colled around one of the aforesaid transverse rods and terminating in fingers earing on the backs of the thrumb lever and clamping tongue, substantially as set forth and shown.
6. The base plate formed with the hose receiving Jaw on one end, an aperture in its central portion. transverse slots in the ends of the plate, and longitudinal flanges projecting at right angles from the plane of the plate, a transverse rod attached to the flanges opposite the central aperture, a thumb lever pivoted to said rod and formed with supplemental ears extending beyond the pivot, a transverse rod attached to sald supplemental ears, the clamping tongue formed with ears pivoted to the transverse rod on the supplemental ears, a spring wire having its central portion bent V-shaped and its end portions coiled around the transverse rods and terminating in fingers bearing on the backs of the thumb lever and clamping tongue, and the suspending strap extending along the back of the base plate to cover the central aperture thereof and around the jaw to cushion the same and passing through the transverse slots to retain the clasp on the strap, all constructed and combined to operate, substantially as set forth.

No. 102,062. Vapour Apparatus. Appareil d vapcur.
The Cooper Hewitt Electric Company, New York City, New York, assignee of Percy Holbrook Thomas, Montclair, New Jersey, U.S.A., 13th November, 1906; 6 years. Filed 24th February, 1905. Receipt No. 122,815.
Glaim.-1. The combination with a gas or vapour electric apparatus composed of fragile material and containing one or more electrodes of mercury or other conducting liquid, of one or more devices attached to the interior of the apparatus and forming a constriction near such point or points as are especially liable to shock from the movement of the liquid.
2. The method of regulating the flow of mercury within a fragile chamber, which consists in interposing between different parts of the contained a constriction wihich prevents the free passage of the liquid from one end to the other but allows the passage of a certain amount which
may act as a vent to relieve any hammer effect tending to result from the sudden stoppage of the liquid and also

serving to prevent a momentary agitation from displacing the liquid from its own position.

No. 102,063. Telephone. T'ćléphone.

Robert Bines, assignee of David Henry Wilson, both of Chi
cago. Illinois. U.S.A., 13th Novemebr, 1906; 6 years. Filed 3rd April, 1905. Recelpt No. 123,912.
Claim.-1. An induction coil comprising two cores, one formed into opposed pole pleces, the other located between said opposed pole pieces so as to form part of the magnetic circuit, and a primary and secondary coil on both of said ccres.
2. An induction coil comprising two cores, one formed into orposed pole pleces, the other located between said opposed pole pieces so as to form part of the magnetic circuit, and a primary and secondary coil on both of said cores, the two sets of coils connected in multiple.
3. An induction coll comprising a core formed into opposed pole pieces, a current reversing device associated therewith, an actuting device therefor comprising a movable part provided with an armature placed in proximity to one of said pole pleces.
4. An induction coil comprising a core formed into opposed pole pieces, a current reversing device associated therewith, all actuating device therefor, comprising a movable part provided with an armature placed in proximity to one of said pole pieces, and an adjustable regulating device associated therewith.
5. The combination in a telephone system of an induction coil provided with a core having pole pieces projecting therefrom, and a second core interposed between said pole piece, said cores each provided with a coll connected in the transmitter circuit and with a coil connected to the main line.
6. A telephone system comprising an induction coll having a core provided with projecting pole pieces, a second core interposed between sald pole pieces and magnetically insulated therefrom, each core provided with a coil connected in the transmitter circuit, and with a coil connected in the main circuit.
7. A telephone system comprising an induction coil having a core provided with projecting pole pieces, a second core interposed between said pole pieces, a coll on each of said cores, a connection between said coils and a generator, a second coil on each of said cores, and a connection from said latter colls to the transmitter circuit.
8. A telephone system comprising an Induction coll having a core provided with projecting pole pleces, a second core Itterposed between said pole pleces and magnetically insulated therefrom, a coll on each of sald cores, a connection between sald colls and a generator, a second coll on each of said cores, and a connection from sald latter colls to the transmitter circuit.
9. The combination in a telephone system of an induction ccil having two cores, each provided with a coll connected in the transmitter circuit, and also with a coil connected in the main line, the coil connected in the main line being divided into two sections on each core, and placed at the outer ends thercof, the coil in the transmitter circuit on each core being located between the two sections of the other coll, the core of one coil having projecting pole pleces between which the other core is located, said latter core having an insulating cap at each end Intermediate or between it and the pole pieces.
10. The combination in a telephone system of an Induction coil provided with two cores, one having extended pole pleces between which the other is located, sald latter core magnetfcally insulated from the pole pieces, a coil on each of said cores connected in the transmitter circuit, a coll on each of said cores divided so that one part is on one side of the coll in the transmitter circuit. and the other on the other side, sald coils connected with the maln line, and a source of electric supply connected with said main line so as to supply a current thereto.
11. The combination in a telephone system of an induction coll having a core provided with projecting pole pieces, a second core inserted between said pole pleces and magnetically insulated therefrom by pleces of insulating material, a coll on each of said cores, a transmitter, and a source of electric supply in circuit with said coils, another coil on each of sald cores, and a source of electric supply, and a receiver connected in circuit with said colls.
12. The comblnation in a telephone system of an induction ccil baving a core provided with projecting pole pieces, a second core between the pole pieces and magnetically instilated therefrom, a coll upon each of said cores, one connected with the main line, and the other connected in a local circuit, a pole changing device mounted upon said induction coll \(s 0\) as to be actuated by the poles thereof, an alarm device normally in circuit with the main line, a switch device for cutting the alarm device out of circuit and varying the circult so that the pole changing device is in circuit.
13. The combination in a telephone system of an induction coil having two cores, each provided with a coil connected in the transmitter circuit. and also with a coll connected in the main line, a circuit making and breaking device associated with said induction coll, and means for cutting the home signal out of circult when the circuit making and breaking device is operated.
14. The combination in a telephone system of an induction coil having a core provided with projecting pole pieces, a second core interposed between said pole pleces, a cap of magnetic insulating material between the ends of sald second ecre and said pole pieces, each of sald cores provided with a coil connected to the main line. a source of electric supply and a receiver in said main line, a second coll on each of sald cores connected in a local circuit, a source of electric supply and a transm!tter in said local circuit.
15. The combination in a telephone system of an induction coil having a core provided with projecting pole pieces, a second core interposed between said pole pleces, a cap of nagnetic Insulating material between the ends of sald second core and said pole pieces, each of said cores provided with a coll connected to the main line, a source of electric supply and a recelver in said main line, a second coll on each of said cores connected in a local clrcuit, a source of electric supply and a transmitter in sald local circuit, an automatic pole changing device assoclated with said induction coll, and monss for cutting said pole changing device in and out of circuit.
16. A telephone apparatus comprising an induction coil having a core provided with projecting pole pieces, a second core interposed between sald pole pleces and magnelically insulated therefrom, each core provided with a coil connected in the transmitter circuit. and a coll connected In the main line circuit leading to the distant station, and an electric generator in said main line circuit, as herein shown and escribed.
17. A telephone apparatus comprising an induction coll having a core with projecting pole pleces associated therewith. a second core interposed between said pole pleces. a cap of magnetic insulating material etween the cnds of said second core and said pole pleces, cach of said cores provided with a coll conccted in the main line, a source of clectric supply and a recelver in said main line, a second coil on each of said cores connected In a local circuit. a source of electric supply and a transmitter in sald local elrcuit.

\section*{No. 102,064. Telephone Transmittor. Transmetteur de teléphone.}

Robert Bines, assignee of David Henry Wilson, both of Chicago, Illinols, U.S.A., 13th November, 1906; 6 years. Flled 3rd April, 1905. Receipt No. 123,914.
Claim.-1. A telephone transmitter comprising two opposed eliaphragms, telescoping cups between said diaphragms, one conected to each diaphragm, said telescoping cups containing material the resistance of which is varied by the relative movement of the diaphragms.
2. A telephone transmitter comprising two side pieces, a separating piece between them, two diaphragms held between said side pieces and separating plece, and a connecting plece outside of said separating piece and engaging the two side pieces.
3. A telephone transmitter comprising two opposed diaphragms, two telescoping carbon cups between sald diaphragms and smaller than the diaphragns 80 that the diaphragms project beyond the edges thercof, one of said carbon cups connected to each diaphragm
4. A telephone transmitter comprising two opposed diaphragms, two telescoping carbon cups interposed between them, each provided with a bottom separate from the cup. the bottoms of said cups connected respectively with the said diaphragms, and an Intermediate piece between each cup and its associated diaphragm.
5. A telephone transmitter consisting of a receptacle divided into three chambers each of the exterior chambers provided with an outlet which leads to a mouth piece. the interior chamber provided with opposed electrodes each of which is adapted to be moved while the device is being used, opposed diaphragms carrying said electrodes, telescoping cups on said diaphragms, sald electrodes contained within telescoping cups which co-operate with each other.
6. A telephone transmitter comprising two opposed dia phragms, a carbon receptacle between said diaphragms and carrled thereby, a mouth plece provided with two branches, one leading to one diaphragm and the other to the other diaphragm, side pieces between which said diaphragms are contained, each provided with an opening. and means for removably connecting the branches of said mouth piece with said side plece.

\section*{No. 102,065. Crosg-Line Buchle.}

\section*{Boucle pour rêncs croisćes.}

Danicl Gilbert Hawkins, Lamont. Oklahoma, U.SA.. 13th November, 1906; 6 years. Flied 13th September, 10.6. Recelpt No. 139,430.
Claim.-1. A cross line buckle comprising side pieces. a cross bar connecting the side pleces and provided with a strap engaging stud, a pair of crossbars connecting the side pleces and lying in a plane spaced from the frst-mentioned crossbar, and a clamping member mounted upon one of the pair of crossbars and adapted to hold the strap lato a close engagement with the stud upon the first-mentioned crossbar.
2. A cross line buckle comprising side pieces, a crossbar connecting the side pleces and provided upon its inner facc with a strap cugaging stud, a pair of crossbars lying in a plane snaced from the first-mentioned crossbar, and a clamping member mounted upon one of the pair of cross. bars and adapted to hold the strap into a close engagement with the before-mentioned stud upon the first-mention crossbar. said clamping member comprising two arms disposed at angles to each other and so arranged as to be turned out of engagement with hte strap for adjusting purposes.
3. A cross line buckle comprising side pleces, a crossbar connecting the side pieces and provided on its inner
kets against movement, and automatic devices for moving the baskets together when unlocked.

3. In a trap the combination with a frame having guides therein, of oppositely disposed baskets movably mounted on the guides, locks for holding the baskets against movement, means for automatically moving the baskets together when unlocked, and mechanism for moving the baskets apart.
4. In a trap the combination with a frame having guides therein, of oppositely disposedispring pressed baskets mounted on the guides and normally contacting at their open ends, neans for separating the baskets, and simultaneously movable locks for holding the baskets apart.
5. In a trap the combination with a frame having guides therein, of oppositely disposed spring pressed baskets mounted on the guides and normally contacting at thelr open ends, means for separating the baskets and locks for engaging and holding the baskets, and means for simultaneously actuating the locks.
6. In a trap the combination with a frame having guides therein, of a lamp, oppositely disposed baskets movable upon the guides and normally inclosing the lamp, and means for simultaneously moving the baskets in opposite directions.
7. In a trap the combination with a frame having guides therein and a lamp, of oppositely disposed baskets mounted upon the guides and normally inclosing the lamp, sleeves secured to the baskets and slidably mounted on the guldes, springs within the sleeves normally holding the baskets in contact, means for compressing the springs and separating the baskets, and locks for holding said baskets separated.
8. In a trap the combination with a frame having guides therein and a lamp, of oppositely disposed baskets mounted upon the guides and normally inclosing the lamp, sleeves secured to the baskets and slidably mounted on the guides, aprings within the sleeves normally holding the baskets in contact, means for compressing the springs and separating the baskets, locks for holding said baskets separated, and means for simultaneously actuating the locks to release or lock the baskets.
9. The combination with a trap having oppositely disposed baskets spaced apart and means for simultaneously bringing the baskets together, of an electric lamp within the baskets and adapted to be submerged therewith.
10. In a trap of the character described the combination with oppositely disposed slidable baskets and means for holding the baskets normally spaced apart, of means for simultaneously moving said baskets toward each other.
11. In trap of the character described the combination with guides, of oppositely disposed baskets slidably mounted on the guides, means for holding the baskets spaced apart, and means for simultaneously moving said baskets toward each other.

\section*{No. 102,067. Skirt Hanger. Support de jupes.}

Peter Ten Broeck Nevins, Flemington, New Jersey, U.S.A.,
13th November, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,370.
Claim.-1. A skirt hanger comprising a support and a plurality of skirt engaging mernbri clidably mounted thereon each of said skirt engaging members being formed of wire and comprising a depending arm having a bentportion at the lower end thereof, and a pair of loops engaging the supporting member, one of said loons being open at its lower end. and having the terminal portion thereof bent to form a handle.
2. A skirt hanger comprising a support and a plurality of skirt engaging members slldably mounted thereon, said skirt engaging members being adanter to be automatically locked in adjusted position when a skirt is engaged therewith, each
of said skirt engaging members being provided with a handle portion, and the handle portion of one of said skirt engaging

members being located on the side of the support opposite the handle portion of the other skirt engaging member.

No. 102,068. Oollar and Oni Button. Bouton de col et poignet.

Charles S. Pederson, Maddock, North Dakota, U.S.A., 13th November. 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,375.
Claim.-1. A collar button comprising two members, each provided with a peripheral flange adapted to engage with each other and form a cylindrical head, a stem projecting from one of the members and having a laterally projecting arm at its free end, and a sleeve projecting from the other member and formed with a housing mounted in the sleeve, and means for locking the members, said means being housed and concealed by the members.

No. 102,069. Measuring Vessel. Vaisseau d mesurer.

Clarence Schock, Mount Joy, Pennsylvanla, U.S.A., 13th November, 1906; 6 years. Filed 17th September, 1906. Receipt No. 139,583.
Claim.-1. A measuring vessel having a drain tube, the edge ot the inlet of which is at varying distances from the bottom
of the vessel and that portion of said edge nearest the bottom of the vessel being at all times in line with the axis of the vessel.
2. A measuring vessel having a drain tube rigidly mounted therein, the edge of the inlet of said tube being at varying distances from the bottom of the vessel, and that portion of said edge nearest the bottom of the vessel being at all times in line with the axis of the vessel.
3. A measuring vessel having a rigid drain tube therein of less length than the sides of the vessel, the edge of the inlet of said tube being at varying distances from the bottom of the vessel and that portion of said edge nearest the bottom of the vessel being at all times in line with the axis of the vessel.
4. The combination with a measuring vessel, of a discharge tube therfin having its inlet end obliquely cut away, that portion of said end nearest the bottom of the vessel being at all times in line with the axis of the vessel.
5. A measuring vessel having a drain tube adjustably mounted therein, the edge of the inlet of said tube being at varying distances from the bottom of the vessel, that portion of said edge nearest the bottom being at all times in line w:th the axis of the vessel.
6. In a measuring vessel the combination with the body portion having a threaded opening in its bottom, of a discharge tube adapted to fit in said threaded opening and disposed parallel with the sides of the measuring vessel and having its upper end obliquely cut away whereby the position of the lower side of said obliquely severed end will determine the quantity of contents in the measuring vessel, the position of the discharge point of the tube being varied by rotating the discharge tube.
7. The combination with an elevator, of a measuring vessel connected thereto and having an overflow tube, the edge of the inlet of sald tube being at all times intersected by the longitudinal axis of the vessel.
8. The combination with an elevator, of a measuring vessel connected thereto and having an overfiow tube rigidly mounted therein, the edge of the inlet of said tube being at all times intersected by the longitudinal axis of the vessel.
9. The combination with an elevator, of a measuring vessel connected thereto and having a rigid overflow tube adjustably mounted therein, the edge of the inlet of said tube being at all times intersected by the longitudinal axis of the vessel.
10. The combination with an elevator, of a measuring vessel movably connected thereto and having an overfiow tube, the inlet of which is at all times intersected by the longitudinal axis of the vessel.
11. The combination with a suitable support, of a measuring vessel connected thereto and adapted to swing thereon, said vessel having an overfiow tube, the edge of the inlet of which is at all times intersected by the longitudinal axis of the vessel.
12. The combination with a sultable support, of a measuring vessel connected thereto and adapted to swing thereon, said vessel having an overflow tube rigidly mounted therein, the edge of the inlet of said tube being at all times intersfcted by the longitudinal axis of the vessel.

\section*{No. 102,070. Screw Propeller. Hélice.}

Norman Rogers Smith. Seattle. Washington, U.S.A., 13th November, 1906: 6 years. Filed 22nd August, 1906. Receipt No. 138,914 .
Claim.-1. A propeller having blades extending through a material portion of its pitch length, the outer portion of one side face of the blades being concavely curved throughout the greater portion of its length, said surface at one end of the wheel reversing to a convex curve.
2. A propeller wheel having one side of the blades of increasing pitch from the front to the rear and the other slde mainly of uniform pitch. the pitches of the two sides being equal near the middle of the width of the blades.
3. A propeller wheel having the outer portions of its blade curving forward or in the direction of turning and having the rear portion of its hub tapering to a wedge which merges with the blades.
4. A propeller wheel having one side of the blades of increasing pitch and the other side mainly of uniform pitch. said last-mentloned side having it forward portion bevelled or rounded back to meet the surface of the opposite side.
5. A propeller wheel having one side of the blades of increasing pitch from the front to the rear and the other side mainly of uniform pitch, the pitches of the two sides being equal near the middle of the width of the blades and the forward portion of the surface of uniform pitch being rounded over towards the opposite surface to produce a narrow front edge.
6. A propeller wheel having blades with one side face of increasing pitch from front to rear and the other face of substantially constant pitch, the side faces of both surfaces of the blades, from a point near the hub to their outer ends.
curving concavely or away from the helical planes passing through their bases and at a constantly increasing angle.

7. A propeller wheel having blades with one side face of increasing pitch from front to rear and the other side face of substantially constant pitch, both side faces curving from near the hub to their outer ends concavely or away from the helical planes passing through their bases and at an angle progressively increasing outwardly, and the rear end of the hub tapering to a wedge which merges with the blades.
8. A propeller wheel having blades with one side face of increasing pitch from front to rear and the other face of substantially constant pitch, the side faces of both surfaces o? the blades curving concavely and away from a radius at a constantly increasing angle from a point near the hub to their outer end and also having an exterior groove or valley extending along the end edges of the blades between the side surfaces.

1To. 102,071. Animal Trap. Pidge d animal.

Jesse J. Swint, Milltown, Alabama, C.S.A., 13th November, 1906; 6 years. Filed 8th September, 1906. Receipt No. 139,350.
Claim.-1. In a trap the combination of a casing having an ertrance opening, a depressible platform arranged within the casing, a normally open door located at the entrance openirg, and a rock shaft mounted on the casing independently of the door and the platform and provided with arms connected respectively with the platform and with the door for closing the latter when the platiorm is depressed.
2. In a trap the combination of a casing having an entrance opening, a depressible platform mounted within the casing and provided with projecting arms, a normally open door located at the entrance opening of the casing, and a rock shaft
mounted on the casing independently of the platform and the door and provided with terminal arms connected with the arms of the platform, sald rock shaft being also provided With an intermediate arm arranged to engage and close the door when the platform is depressed.
3. In a trap the combination of a casing having an entrance opening and provided with an outlet adapted to communicate with a cage, inner and outer reversely operating doors, a depressible platform located within the casing, and rock shafts mounted on the casing independently of the doors and the platform and connected with and actuated by the platform for operating the said doors.
4. In a trap the combination of a casing having an entrance opening and provided with an outlet, inner and outer doors located at the outlet and at the entrance opening, the inner door being arranged to swing horizontally, and means for communicating motion from the platform to both the inner and outer doors whereby the latter will be reversely operated.
5. In a trap the combination of a casing having an entrance opening, a normally open door located at the entrance opening, a depressible platform, springs secured to the casing and located at the front and rear portions of the platform and baving free ends supporting the same.
6. In a trap the combination of a casing having an opening, a horizontaliy swinging door mounted at the opening and provided with an arm, a depressible platform, and a rock shaft having a loop connected with the platform, said rock skaft being also provided with an arm connected with and arranged to ascillate the arm of the door for opening and closing the same.
7. In a trap the combination of a casing having an opening, a door hinged at the opening, a guard having flanges recelving the free edges of the door and projecting outward from the casing for preventing a captured animal from opening the door, and means for operating the door.

No. 102,072. Car Door. Porte de chars.

William D. Thompson, Detroit, Michigan, U.S.A., 13th November, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,937 .
Claim. -1 . The combination of a car provided with a suitable doorway, a vertical guard plate arranged above said doorway, to protect the upper joint of the sliding door, a tread member extending inwardly and inclined downwardly from the guard plate, the sliding door, and hangers for the door, cylindrical rollers therein engaging the inclined tread journalled parallel thereto.
2. The combination with a car provided with a suitable dcorway, a vertical guard plate arranged above said doorway protecting the upper joint of the sliding door, a tread member extending inwardly and inclined downwardly from the guard plate, a sliding door, hangers for the door, rollers therein engaging the, inclined tread and journalled parallel thereto, and means for limiting the inward lateral movement of the door.
3. The combination with a car provided with a suitable doorway, of a sliding door therefor, a vertical guard plate arranged above said doorway and protecting the upper joint of the sliding door, a tread member extendingly inwardly and downwardly from the guard plate, and hangers for the door comprising a door plate attached to the outer side of the deor, a roller supporting bracket, a yoke member thereon, a raller journalled therein parallel with the tread member of sa!d guard plate and substantially above the center of weight of said door whereby said door tends to hang vertically.
4. The combination with a car provided with a suitable doorway, a sliding door therefor, a vertical guard plate arranged above said doorway and protecting the upper joint of said door, a tread member extending inwardly and downwardly from the guard plate, hangers for the door, rollers therein engaging the inclined tread and journalled parallel thereto, and wear plates on baid hangers engaging said guard plate and extending above said tread, for the purpose described.

No. 102.073. Metallic Ceiling. Plafond métallique.

Charles Frederick Wagner. Toronto, Ontarlo, Canada, 13th November, 1906; 6 years. Filed 5th September, 1906. Receipt No. 139,275.
Claim.-1. As a new article of manufacture, a metallic sauare or shingle provided with a backing of sound proofing material.
2. As a new article of manufacture, a metallic square or shingle provided with a flexible backing of sound proofing riaterial.
3. As a new article of manufacture, a metallic square or stingle provided with a flexible backing of sound proofing material, and cementing material for securing said sound proofing material to said metallic celling.
4. As a new article of manufacture, a metallic square or sbingle having a coating of paint only on its under side, and piovided with a backing or layer of sound proofing material.

No. 102,074. Ohain Machine Eplitter Bit.
Mèche a fendre.

Thornton S. Hardesty, Rivesville, West Virginia, U.S.A., 13th November, 1906; 6 years. Filed 27th September, 1906. Receipt No. 139,818 .

Claim.-1. A bit for coal mining machines, having a shank portion and a cutting portion, said cutting portion lying at an angle with the shank portion and having its front face wider than its rear face and also having a sharp, curved cutling edge adapted to enter the coal ahead of sald faces.
2. A bit for coal mining machines comprising a shank portion and a cutting portion lying at an angle to sald shank
portion in a horizontal plane and also lying at an angle to said shank portion in a vertical plane, the front face of sald cutting portion being wider than the rear face thereof, sald cutting portion having a sharp, curved cutting edge adapted to enter the coal ahead of said faces.

No. 102,075. Flevator. Elévateur.

Michael E. Neenan, New York City, New York, U.S.A.. 20th November, 1906; 18 years. Filed 24th October, 1906 Recelpt No. 140,589.
Claim.-1. The combination with a frictional driving apparatus, of flexible means driven thereby, a load carrying device connected to said means and a connection between the ofposite leads of the same winding respectively on and off the driving apparatus whereby tension on all the said leads changes with the load.
2. The combination with a frictional driving apparatus,of flexible means driven thereby, a load carrying device and a ccnnection between the load carrying device and all the leads or the flexible means winding respectively on and oft the driving apparatus whereby tension on all the sald leads changes with the load.
3. The combination with frictionsl driving apparatus, of flexible means Ariven thereby, a load carrying device connected to said flexible means and a connection between the load carrying device and the opposite leads of the said liexible means whereby tension changing with the load and in predetermined ratio to the weight of the load is applied to ali the said leads winding respectively on and off the driving apparatus.
4. The combination of a frictional rope driving apparatus, flexible means driven thereby, a load carrying device and a take-up device connected to all the leads of the flexible means winding respectively on and off the driving apparatus and applying tension to all said leads varying with the load.
5. The combination of a frictional driving apparatus, ropes driven thereby, a load carrying device connected to sald ropes and a give and take connection between the load carrying dovice and all the leads of the rope winding respectively on and off the driving apparatus whereby tension on all the leads of the ropes changes with the load.
6. In a friction driving elevator mechanism the combination of a load carrying device, a frictional driving apparatus. flevible means looped around the driving apparatus and driven thereby, and a connection between the leads of the driven flexible means whereby the welght of the car and its lead holds tight all the said leads winding respectirely on and of the driving apparatus and the tension on sald leads changes with the load.
7. In a friction driving elevator mechanism the combinatlon of a car, a frictional driving drum, a rope take-up device and a holsting rope looped around the drum and connected by its on-winding and off-winding leads to car suspcnsion means and to rope take up device whereby tension
changing with the load, and in predetermined ratio thereto is applied to all the leads of the rope winding on and off the frictional driving drum in the operation of the elevator
8. In a friction driving elevator mechanism the combination of a car, a hoisting rope or ropes therefor, a driving device on which the ropes are colled and a rope take-up device actuated by the weight of the car and its load, said car and take up device being connected to all the leads of the ropes winding on and off the driving apparatus and applying to all said ropes tension changing with the load.
9. A friction driving elevator mechanism comprising a car, a driving drum, a rope colled thereon and having a suitable suspensory connection with the car and a rope take-up device connected to the car and applying tension therefrom to the lead of the rope opposite to that by which hte car is suspended, whereby tension, changing with the load, is applled by the weight of the car and its load to all the leads of the rope winding on and off the drum.
10. In a frictional driving elevator mechanism the combination of a car, a driving drum, suspension ropes driven by said drum and in suitable suspensory connection with the car, a rope take-up device actuated by the weight of the car and its load and applying tension, changing with the load, to the lead of the ropes on the driving drum opposite that from which the car is suspended, and a chain so connected thereto as to counteract the weight of the ropes on sald take-up device.
11. In a friction driving elevator mechanism the combination of a car, a frictional driving drum, suspension ropes passing down on the side of the car and a rope take-up device connected with the car and with said ropes, so that the weight of the car can apply tension, changing with the load, to all the leads of the ropes winding respectively on and off the driving apparatus.
12. In a friction driving elevator mechanism the combination with a car, a frictional driving drum, ropes driven by said drum; in, suitable suspensory connection with the car, separating at top of the car and passing down on opposite sides thereof, and movable sheaves connected respectively to the ends of sald descending ropes so as to be drawn apart thereby and having the section of the ropes opposite to that from which the car is suspended looped around them so as to recelve tension by the drawing apart of said sheaves.
13. In a friction driving elevator mechanism the combination of a car 11, suspension ropes 12, frictional driving drum 14, guide sheaves 25 at the sides of the car, movable take up sheaves 17 to the boxes of which the extremities of the upper sections of the ropes 12 are connected so as to draw said takeup sheaves apart by the weight of the load, and the take-up device 16, 19 carrylng the lower parts of the ropes 12 around the take up sheaves 17 so as to draw said sheaves together in opposition to the weight of the car and apply tension, changing with the load, to all the leads of the rope winding on and off the driving drum 14, as explained.
14. In a friction driving elevator mechanism the combination with the car 11 and the frictional driving drum 14, of suspension ropes 12 , suitably connected to the car and drum. a take-up device applying tension to the lower section of the suspension ropes, and a dash pot device 20,21 connected to the suspension ropes 12 and car 11, so as to prevent sudden movement of the car.
15. In a friction driving elevator mechanism the combination of a car, a frictional driving drum, suspension ropes, a dash pot deyice through which the suspension ropes are connected to the car, and means for fixing the suspension ropes adjustably with relation to the dash pot device.
16. In a friction driving ele, ator mechanism the combina tion of a car 11, suspension ropes 12, dash pot cylinder 21 flxod to the car, hollow dash pot piston 20 through which the ropes are passed, and clamps 22, 23, above and below the dash pot piston by means of which the ropes are secured adjustably therein.
17. In a frictional driving elevator mechanism the combination with a car and driving drum, and suspension ropes sult ably connected therewith of a tension slack rope take-up device operating substantially as herein described to apply variable pressure and tension to the ropes, and frictional driving mechanism graduated by the load on the car.
18. In a frictional driving elevator mechanism the combination with the car 11, of suspension ropes 12 , frictional driving drum 14 and a take-up device. said ropes being suitably connected to the car ard to tho take up device, and applying fariable tension to the rope which is actuated by the drivitig mechanism.
19. In a frictional driving elevator mechanism the combination of a car 11, irictional driving drum \({ }^{14}\), suspension ropes 12 passing down on the side of the car, and a take-up device connected with said rope and applying variable tension to the lower section thereof.
20. In a frictlonal driving elevator mechanism the combination with the car 11, of suspension ropes 12 and fric-11-13
ional driving drum 14, said ropes in sultable connection therewith, separating at the top of the car and passing down on the opposite sides of the same, each connected to a movable sheave, applying tension to the lower section of the ropes.
21. In a frictional drive the combination with frictional driving apparatus, of a load carrying device, connecting means between the frictional driving apparatus and sald load carrying device, and means for regulating the tension of sald connecting means to effect a variation of tension throughout the latter in proportion to variations of load.
22. In a frictional driving elevator the combination with frictional driving apparatus, of a load carrying device, fiexible means for connecting the driving apparatus and said load carrying device, and means for regulating the tension of said flexible means to effect a variation of tension throughout the latter in proportion to variation of load.
23. In a frictional driving elevator the combination with driving apparatus, of an elevator car, ropes connecting the driving apparatus and car, and means for effecting the application of tension to the leads of all the ropes winding respectively on and off the driving apparatus in the opertion of the elevator.
24. The combination with a frictional driving apparatus, of a load carrying device, flexible means for connecting the load carrying device to the driving apparatus. and means for effecting a variation in the tension of all the leads of said connecting means in direct proportion to variations of the load.
25. The combination with a frictional driving apparatus, of a load carrying device. flexible ropes or cables connecting said load carrying device to the driving anparatus. and means for effecting a variation in the tenision of all the leads of sald ropes in a predetermined ratio to the weight of the load.
26. In an elevator the combination with frictional driving apparatus, of a load carrying device. flexible roves or cables connecting said load carrving device to the driving apnaratus, and means connected to the leads of the cables winding respectively on and off the driving apparatus for automatic effect.
27. The combination of a Prictional rope driving apnaratus. flexible means driven thereby. a load rarrying device and a rotatable take-up for changing the tension of the loads winding on and off the driving apparatus in proportion to changes of load.
28. In an elevator the combination with frictinา7l driving apparatus, of load carrying device. flexible roves or cables connecting said load carrying device with the driving apparatus, and an equalizing device having a limited degree of movement and boing asanciated with said cables to tighten the leads on sald driving annaratus when the load varies.
29. In an elevator the combination with frictional rope driving apparatus, of a load carrying device, power transmission means comprising flexible ropes or cables, and a tilting or rotating tension device for tightening the leads on said rope driving apparatus upon changes of load.

\section*{No. 102,076. Railway Switch.}

Aiguille de chemin de fer.
John B. Alderich and Arbia L. Aldrich, New York City, New York, U.S.A., co-inventors, 20th November, 1906; 6 years. Filed 26th October, 1906. Receipt No. 140,635.
Claim.-1. An emergency crossover rallway switch comprising track sections of greater height than ordinary rallroad. rails so that the heads of said track sections are higher than those of ordinary rails, switch points for the ends of said sections having their upper sides inclined for the purpose set forth, and crossover sections recessed in and detachably connected to the opposing ends of the firstmentioned sections where the latter are approximate to the inner track rails and bearing on the heads of said inner track rails, substantially as described.
2. In a switch of the class described, switch rail sections having recesses at their opposing ends and their upper sides, in combination with crossover sections fitted in sald recessed ends of said switch sections and having depending members bearing on opposite sides of the webs of said switch sections, substantially as described.
3. In an emergency crossover railway switch the combination of switch rail sections having their heads removed for suitable distances from their inner ends to form recesses and having their webs at said ends widened to form shoulders spaced from the heads at the recessed ends of said sections, in combination with crossover sections to bear on said webs and overlapping said recessed sections,
said crossoyer sections having depending members bearing on opposite sides of the webs of said switch sections and

against the shoulders formed on said webs. substantially as described.

No. 102,077. Railway Switch .
Aiguille de chemin de fer.

John G. Ryan, Montreal, Quebec, Canada, 20th November,
1906; 6 years. Filed 24th October, 1906. Recelpt No. 140,581.
Claim.-1. In an automatic switch, a rotatable member, an eccentric track thereon, a reciprocatable member engaging sald track, means connecting said reciprocatable member and switch point, and means carried by a car for engaging said rotatable member.
2. In an automatic switch, a rotatable member, an eccentric track thereon, a reciprocatable member, a pair of rollers mounted thereon and engaging opposite sides of said track, a spring tensioning sald reciprocatable member. means connecting sald reciprocatable member and switch foint and means carrled by a car for engaging sald rotatable member.
3. In an automatic switch, a rotatable member, an approximately elliptical track thereon, depressions in said track at the extremities of its minor and major axis, a reciprocatable member, means mounted on said member adapted to engage the track, a spring tensioning said member, means connecting said reciprocatable member and switch point, and means carried by a car for engaging sald rotatable member.
4. In an automatic switch, a rotatable member, an eccentric track on one side of said member, a plurality of radial members on the other side of said members, a reciprocatable member, means mounted on said member adapted to engage the track, a spring tensioning said member, means connecting said reciprocatable member and switch point, and means carried by a car for engaging said rotatable member.
5. In an automatic switch, a rotatable member, a track mounted thereon, a plurality of radial arms attached to said member, shoes at the extremities of sald arms, a tensioned reciprocatable member, means mounted thereon for engaging said track, means connecting said reciprocatable member and switch point, and means carried by a car for engaging said rotatable member.
6. In an automatic switch, a rotatable member, a track mounted thereon, a plurality of radial arms fixed to said rotatable member, a tensioned reciprocating member, means mounted thereon for engaging said track, a casing enclosing said mechanism, a slot in the top thereof, a pair of gates adapted to close said slot, springs normally maintaining said gates closed, yieldable means connecting said reciprocating member and the switch point, and means carried by a car adapted to enter said slot and engage said radial arms. 7. In an automatic switch, a rotatable member, an elevated track on one side thereof, a plurality of radial arms on the opposite side thereof, a tensioned reciprocatable member, means mounted thereon for engaging opposite sldes of said track, means connecting said reciprocatable member and the switch point, and means carried by a car for engaging the radial arms.
8. In an automatic switch, a rotatable member, a raised track on one side thereof, a plurallty of shoe bearing radial larms on the opposite side thereof, a tensioned reciprocatable member, rollers mounted thereon for engaging opposite sides of said track, a casing enclosing said mechanism. a slot in the top thereof, spring actuated gates normally closing said slot. yieldable means connecting said reciprocatable member and the switch point, and means carried by a car adapted to traverse said slot and engage the radial arms.
9. In an automatic switch. a rotatable member. an ecren. tric track on one side therenf. a plurality of radial arma curved towards their extremities to be tangential to sail rotatable member on the opposite side thereof. shoes on the "xtremitles of the arms, a tensioned reciprocatable memin. rollers mounted thereon for engaging opposite sides of said track, a casing enclosing sald mechanism, a slot in the top thereof. spring actuated gates normally closing sald slot. vicldable means connccting sald reciprocatable member and the switch noint, and means carried by a car adapted to traverse said slot and engage the radial arms.
No. 102,078. Railway Switoh.
Aiguille de chemin de fer

Frederick Vogel, La Plata, Missourl, U.S.A., 20th November. 1901; 6 years. Filed 27th October, 1906. Receipt No 140,675.
Claim.-1. In a switch mechanism the combination with main ralls, siding ralls and movable points, of a shift rod connected with the points for movement thereof into and out of position to close the siding, a crosshead carries by the switch rod, guldes for the crosshead, a lug carried by the crosshead, a plate plvoted to one of the culdes and extending through the path of movement of the lug a trip block carried by a plece of rolling stock and adsptu! for engagement of the plate to move the latter and thlug to shift the points, means for holding the plate wit the points in position to close the siding, said trip block
being movable into and out of operative position and means located beyond the plate for moving the trip block in operative position.
2. In a switch mechanism the combination with main track rails, siding rails and points movable into and out of position to close the siding, of means for moving the rails, a trip block carried by a piece of rolling stock and movable into and out of operative position, said trip block when in operative position being adapted for engagement of point moving means for operation thereof, and a rall brace located beyond the point moving means and adapted for engagement of the trip block after the latter has passed the point moving means to move the trip block into operative position.
3. In a switch mechanism the combination with main rails, siding rails and points movable into and out of position to close the siding, of a shift rod connected with the points for movement thereof and extending laterally beyond the rails. forward and rearward guides located at opposite sides of the shift rod, a crosshead carrled by the outer end of the shift rod and slidably engaged between the guldes, a segmental plate pivotally connected at its forward portion with the forward guide and extending across the shift rod between the crosshead and the rails, a lug carried by the crosshead, said plate lying in the path of movement of the lug. said plate being adapted for engagement by the lug and for movement therewith to extend toward the ralls when the switch is in open position. a track instrument carried by a plece of rolling stock and adapted for engagement of the plate when in its last-named position to move the plate and therewith the lug to close the switch and means for holding the plate with the switch in closed position.
4. The combination with a locomotive, of vertical guides carried thereon, trip blocks slidably mounted in the guides and having spaced ears at their upper ends, a rock shaft mounted adjacent to the guides and having cranks at its ends, said cranks being pivoted between the ears of the trip blocks, a finger carried by the rock shaft, an arm pivoted to the finger, an operating lever pivoted to the arm and means for holding the lever at different points of its movement in one direction.

No. 102,079. Brale. Frein.

Walter E. McKay, Leland, Idaho, U.S.A., 20th November, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,217.

Claim.-1. A brake shoe or chock for use as described, consisting of a body, the top surface inclining downward from the center in opposite directions, and the bottom surface inclining upward from the center in opposite directions.
2. A brake shoe or chock for use as described, consisting of a body, the top surface inclining downward from the center in opposite directions, and the bottom surface inclining upward from the center in opposite directions, and pendent flanges on each side of the inclined bottom surface.
3. A brake shoe or chock for use as described, consisting of a body, the top surface inclining downward from the center in opposite directions, and the bottom surface inclining upward from the center in opposite directions, the bottom surface being provided with tecth or serrations inclining from the ends toward the center.
4. The combination with two wheels of a truck, af a double brake shoe or chock arranged between them and having a frictional bottom surface to act upon the rails, a bar or supporting device extending between the wheels for raising and lowering the brake shoes, and a flexible means
for connecting the brake shoes with the bar, whereby when the brake shoes are lowered unon the rails of the track. the shoe will drag and the rear portion will trail and become engaged by the rear wheels as a chock.

No. 102,080. Brake Mechanism. Mécanisme de frein.

John Post, Philadelphia, Pennsylvania, U.S.A., 26th November, \(1906 ; 6\) years. Filed 25th October, 1908. Receipt No. 140,624.
Claim.-1. In a car brake, cylinders, pistons in said cylindres, the brake shoes operatively connected with said pistons, a pipe connected with a source of steam, controller valves, tubular connections between sald valves and the steam pipes and tubular connections between sald valves and the cylinders, all of said pipes and tubular connections arranged so as to drain to said cylinders, substantially as shown and described.
2. In a car brake, cylinders, pistons in said cylinders, coll springs in said cylinders bearing against said pistons, the brake shoes operatively connected with said pistons, a steam pipe controller valves, tubular connections between said valves and the steam pipe, tubular connections between said valves and the steam pipe, tubular connections beconnections being arranged so as to drain said cylinders, substantially as shown and described.
3. In a car brake, cylinders, pistons in said cylinders, the brake shoes operatively connected with said pistons, a steam pipe. controller valves, tubular connections between said velves and the steam pipe, tubular connections between said valves and cylinders and drain valves in said pistons to relleve the cylinders and connecting pipes of water of condensation, substantially as shown and described.
4. In a car brake, cylinders, pistons in said cylinders, the brake shoes operatively connected with said pistons, a steam pipe controller valves, tubular connections between said valves and the steam pipe, tubular connections between said valves and cylinders, said tubular connections arranged to drain into said cylinders, valves in said pistons and springs to actuate said valves when steam is cut of from said cylindders to drain the tubular connections and cylinders of water of condensation, substantially as shown and described.
5. In a car brake, cylinders, pistons in said cylinders. coll springs in said cylinders bearing against said pistons, the brake shoes operatively connected with said pistons, a steam pipe, controller valves, tubular connections betweel، said valves and the steam pipe, tubular connections between the valves and the cylinders and drain valves in sald pistons to relieve said cylinders and tubular connections of water of condensation, substantially as shown and described.
6. In a car brake cylinders, pistons in said cylinders coll springs in said cylinders bearing against said pistons, th.
brake shoes oneratively connected with said pistons, a steam fice, cont ol'er valles, tubular ronnections between saia valies and the steam pipe, tubular connections between the valves and the rylinders. said tubular connections arranged to drain into said cylinders, valves in said pistons and springs to artuate sald valves to open them when the supbly of steam is cut of from said cylinders, substantially as shown and described
7. In a car brake. cylinders, pistons in said cylinders, coll springs in said cylinders bearing against said pistons, a piston rod secured to each piston, brake shoes, arms connecting said brake shoes and piston rods, transverse plpes connecting said cylinders in pairs and arranged to drain into satd cylinders a pipe connecting said transverse pipes and arranged to drain theretnto a valve in each piston, a coll spring to lift each valve and a plpe connected with each controller valve and a source of steam supply, substantially as shown and described.
8. In combination with a railway car having a platform at each end. cylinders. pistons in said cylinders, the brake shoes operatively connccted with said pistons, a pipe connerted with a source of fluld pressure, a controller valve mounted on each platform, tubular connections between said valves and the said pipe and tubular connections between sald valves and the cylinders, substantially as shown and described.
9. In combination with a rallway car having a platform at each end, cylinders, pistons in said cylinders, the brake shoes operatively connected with said pistons, a pipe connected with a source of steam, a controller valve mounted on each platform, tubular connections between sald valves and the steam plpe, tubular connections between sald valves and the cylinders, and means to drain the pipes cylinders and tubular connections substantially as shown and described.
10. In combination with a railway car having a platiorm at each end, cylinders, pistons in said cylinders, the brake shoes operatively connected with said pistons, a pipe connected with a source of steam, a controller valve mounted on each platform, tubular connections between sald valves and steam pipes, tubular connections between sald valves and the cylinders and spring actuated drain valves in said pistons to drain the cylinders, pipes and tubular connections substantlally as shown and described.
No. 102,081. Brake shoe. sabot de frein.

William H. V. Rosing, St. Louis, and Frank Lee Gordon, Chicago; Illinois, U.S.A., co-inventors, 20th November, 1906: 6 years. Filed 29th October, 1906. Receipt No. 140. 00 .

Claim.-1. A brake shoe comprising two parts separated opposite the rail wearing portion of the wheel tread and bridges uniting said parts, said bridges extending upwardly and beyond the back of said shoe, substantially as described.
2. A brake shoe comprising two separated parts and one or more bridges uniting the same, the bottom of the bridge coinciding with the back of said shoc, substantially as described.
3. A brake shoe comprising a body and fiange with a space betwren them and one or more bridges uniting the same, the bottom of the bridge coinciding with the back of the shoe. substantially as described.
4. A brake shoe comprising a body and flange so separated as to prevint contact with that portion of the wheel tread adjacent to the flange. and one or more bridges uniting said body and flange of the shoe and extending outwardly from the hack of said shoe. substantially as described.
5. A brake shoe comprising a body and flange with a space Intervening betworn them and one or more bridges uniting Hh, same. the bottom of said brilge coinciding with the hark of the shore. sald bridge being formed with a key opening theroin, substantially as described.
6. A brake shoe comprising a body and flange with an intervening space between them. end and central bridges uniting the same and formed with key openings therein. the lottom of said bridges coinciding with the back of the shoe, substantially as described.

No. 102,082. Car Brake. Vrein de chars.

Charles L. Schultz, Wheeling, West Virgina, U.S.A.. 20th November, 1906; 6 years. Flled 27th October, 1906. Recelpt No. 140,672.
Claim.-1. In an automatic brake for cars or the like the combination with a frame and whecled trucks thereon, of swinging brake beams carrying shoes to engage the wheels of said tracks, actuating cams disposed between said brake beams, sliding drawbars, a centrally disposed lever, links connecting said lever and said cams, levers actuated by said sliding drawbars, links connecting the last-mentioned levers and said centrally disposed lever, and swinging elements upon the ends of said frame adapted to engage said slidin. drawbars to hold them against movement.
2. In an automatic brake for railway cars or the like the combination with a frame and wheeled trucks mounted thereon, of brake beams plvotally suspended from said trucks, brake shoes upon said beams adapted to engage the wheels of said trucks, cams pivoted centrally between said brake beams and adapted to actuate the latter. a centrally disposed lever pivoted at its center upon said frame. links connecting sald lever and said cams. longitudinally slidable drawbars in the ends of sald lever, levers pivoted upon said frame adjacent to said drawbars and adapted to be actuated by the inner ends of the latter, links connecting the lastmentioned levers and sald centrally disposed lever. shoulders upon said drawbars, levers plroted upon the ends of said frame and adapted to be swung into and out of cogagement with the shoulders of said drawbars. and means for actuating sald levers.
3. In an automatic brake for rallway cars or the lik. the combination of a brake mechanlsm. sliding drawbark for actuating the same. levers for locking said drawbars ayainst movement and sliding rods operatively connected at on. end and having inclined faces at their onoosite end adaperd to actuate said levers.
4. In an automatic brake for rallway cars or the lik, th. combination of a brake mechanism. sliding drawbars for actuating the same. levers for locking said drawbars againgt movement and sliding rods nneratively connected at on. rnd. springs for actuating sald rods and bumpers upon the outer ends of said rods.
5. In an automatic brake for rallway cars orthe like th. combination of a hrake mechanism, sliding drawbars for actuating the same. levers for locking said drawbars neafast moviment. a mair of levers pivotally mounted unon sill frame at their outer ends and loosely eonnerted at thelr inner ends. sliding rods connected to sald levers and haviog
at their outer ends oppositely inclined faces adapted to actuate the first-mentioned levers, springs for actuating said sliding rods and bumpers upon the outer ends of said sliding rods, substantially as described.

No. 102,083. Brake. F'ria.

Charles Christopher Woodman Simpson, 3 King street, Wagan, Lancaster, England, 20th November, 1906 ; 6 years. Filed 30th October, 1906. Receipt No. 140,748.
Claim.-1. In brakes for railway vehicles, winding drums and the like, a horn plate, brake blocks, bars connected to said brake blocis and bearing in said horn plate, a wedge device slidable in said horn plate with its taper part between the ends of said bars, and means for raising and lowering said wedge device from either side of the vehicle or the like.
2. In brakes for railway vehicles, winding drums and the like, a horn plate, brake blocks, bars connected to said brake blocks and bearing in said horn plate, a wedge device slldable in said horn plate with its taper part between the ends of said bars, a brake lever pivoted to said horn plate and engaging with said wedge device, a rocking shaft across the vehicle, a crank arm on said rocking shaft engaging with said wedge device, and a brake handle connected to said rocking shaft.
3. In brakes for rallway vehicles, winding drums and the like, a horn plate, brake blocks, bars connected to said brake blocks and bearing in sald horn plate, a wedge device slidable in said horn plate with its taper part between the ends of said bars, projecting lugs on both sides of said wedge device, a brake lever pivoted to said horn plate and located between said lugs on one side of the wedge device, a rocking lever, a crank arm on said lever located between the lugs on the other side of said wedge device, and a brake lever on the opposite side of the vehicle or the like from said first brake lever connected to said rocking shaft.
4. In brakes for railway vehicles, winding drums and the like, a horn plate, brake blocks, bars connected to said hrake blocks and bearing in said horn plate, means for adjusting the length of said bars, a wedge device slidable in said horn plate with its taper part between the ends of said bars, and means for raising and lowering said wedge device from either side of the vehicle or the like.
5. In brakes for rallway vehicles, winding drums and the like, a horn plate, brake blocks, bars connected to said brake blocks and bearing in said horn plate, a wedge plece slidable in sald horn plate, a straight portion towards the lower end of said wedge plece, and means located on either side of said vehicle and its opposite ends thereof for raising or lowering said wedge piece.
6. In brakes for railway vehicles, winding drums and the like, a horn plate, brake blocks, rods secured to sald brake blocks and slidably bearing in said horn plate, a wedge device slidable in said horn plate located with its narrowed part normally between said bars. a brake handle on one side of the vehicle or the llke directly engaging sald wedge device, a brake handle on the other side of the vehicle, a cross
shaft connected to sald second brake handle, and a crank arm connected to said rocking shaft engaging directly with said wedge device.
7. In brakes for rallway vehicles, winding drums and the like, a wedge device, a support and guide for said wedge device, brake blocks, means intermediate sald wedge device and sald brake blocks for positively actuating said brake blocks, a handle for raising and lowering said wedge device.
8. In brakes for railway vehicles, winding drums and the like, a horn plate, a wedge device slidable in sald horn plate, brake blocks, means for positively actuating said brake blocks from said wedge device, a tongue on said wedge device, a strap or guide plece about said tongue and secured to said horn plate, and means for operating said wedge device from either side of the vehicle and opposite ends thereof.
9. In brakes for railway vehicles, winding drums and the like, a horn plate, a wedge device slidable in said horn plate, brake blocks, means Intermediate said wedge device and sald blocks to positively operate sald brake blocks, means for operating said wedge device from either side or from opposite ends of caid vehicle or the like, a power cylinder, and means intermediate said power cylinder and said brake blocks for operating said brake blocks independently of said hand levers.
10. In brakes for rallway vehicles, winding drums and the like, a wedge device brake blocks positively actuated from sald wedge device, hand means for actuating said wedge device, a power cylinder, a plunger in said cylinder, a \(T\) lever connected to said plunger, means for supporting said \(T\) lever, links connected to said \(T\) lever and to said brake blocks.
11. In breaks for rallway vehicles, winding drums and the like, a wedge, brake blocks positively actuated from said wedge device, hand means for actuating sald wedge device, a power cylinder a plunger in said cylinder a \(T\) lever connected to said plunger, means for supporting sald \(T\) lever links connected to said \(T\) lever and to said brake blocks and slots in sald links.
12. In brakes for railway vehicles, winding drums and the like a horn plate, a wedge device slidable in said horn plate, brake blocks, bars connected to sald brake blocks and slidable in said horn plate, a brake handle pivotal on said horn plate and connected to said wedge device, a rocking shaft, a crank arm on said rocking shaft connected to said wedge device, a handle on said rocking shaft and on the opposite side of said vehicle from said first handle, a T-shaped lever with two short and one long arm mounted on said rocking shaft, a power cylinder, a plunger in said cylinder connected to the long arm of said T plece. links connected to the short arm of said \(T\) plece and to the brake blocks.
13. In brakes for railway vehicles, winding drums and the like the combination with hand means for operating the brakes, of a cross shaft connected to said hand operating means, of a lever on said cross shaft, a power cylinder, connections between said lever and said power cylinder, and means connected with said lever for braking the vehicle.
14. In brakes for railway vehicles, winding drums and thas like, a horn plate, a wedge device slidable in sald horn plate, brake blocks, bars connected to sald brake blocks and slidable in said horn plate, a brake handle pivotal on said horn plate and connected to said wedge device, a rocking shaft, a crank arm on said rocking shaft connected to sall wedge device, a handle on sail rocking shaft and on the opposite side of said vehicle from sald first handle, a T-shaped lever with two short and one long arm mounted on sald rocking shaft, a power cylinder, a plunger in said cylinder connected to the long arm of sald \(T\) plece, and means connected to the long arm of said \(T\) levers for operating said brake blocks and permitting said brake handles and said brake cylinder to operate the brake independently one of the other.
15. In brakes for railway vehicles, winding drums and the like, brake blocks, wedging means connected to handles at either side and at different ends of said vehicle or the like for operating said brake blocks, a power cylinder, means for operating said brake blocks therefrom independently of said hand levers and wedging means.
16. In brakes for railway vehicles. winding drums and the like, a horn plate. a wedging device slidable in sald horn plate, lugs on both sides of sald horn plate, a hand lever pivotal in said horn plate located between the lugs of said wedge device on one side thereof, a rock shaft, a crank arm on said rock shaft located between the lugs of the wedge device on the opposite side thereof, a second hand lever on said rock shaft and on the opposite side and at the opposite end of said vehicle from said first brake handle, brake blocks, adjustable rods connected to said brake blocks and slidably bearing in said horn plate and located on elther side of said wedging device a downwardly projecting tongue on said wedging device, guiding means for said tongue
on said horn plate spring means on said horn plate for holding the wedge device in given positions, a \(T\) lever on said rock shaft with two short and one long arm; a power cylinder, a plunger adapted to work in said power cylinder and connected to the long arm of said \(T\) lever, links between said brake blocks and the short arms of said T lever, and means for permitting movement of said brake blocks to their braking position without affecting said T lever.

No. 102,084. Car Replacer.
Appareil d remettre les chars sur la voice.

Edward Henry Best, St. Thomas, Ontario, Canada, 20th November, 1906; 6 years. Filed 26th October, 1906. Receipt No. 140,663.
Claim.-1. A car replacer comprising a pair of members, each provided with a body having outwardly and downwardly inclined sides and a top inclined downwardly from its center to its ends, ribs upon the tops of said members to receive the treads of car wheels, and means upon said members for directing the car wheels from said ribs and onto the track rails.
2. A car replacer comprising a pair of members, each provided with a body having outwardly and downwardly incline sides and a top inclined downwardly from its center to its ends, ribs upon the tops of said members to receive the treads of car wheels, and movable devices upon the tops of said members for deflecting the car wheels from said ribs and onto the track rails.
3. A car replacer comprising a pair of members, each provided with a body having outwardly and downwardly incline sides and a top inclined downwardly from its center to its ends, ribs upon the tops of said members to receive the treads of car wheels, one of said members having a deflecting or guiding roller at its upper and inner end and the other of said members having a guide rib and a movable element to form a continuation of said guide rib.
4. A car replacer comprising a pair of members, each provide with a body having outwardly and downwardly incline sides and a top inclined downwardly from its center to its ends, ribs upon the tops of. said members to receive the treads of car wheels, one of said members having a deflecting or guiding roller at the upper and inner end of its rib and the other of said members having a guide rib, and a deflecting point pivoted upon said guide rib and adapted to be swung into engagement with either of the tread engating ribs on said member, substantially as shown and described.
5. A car replacer comprising a body having outwardly and downwardly inclined sides and a top inclined downwardly from its center to its ends and formed with a central opening, longitudinally tapered ribs extending longitudinally and disposed centrally upon the top of said body at its opposite ends, said ribs terminating at the ends of said opening in the top of the body and formed with vertical grooves and a roller disposed in the opening in the top of said body and having trunnions to enter said grooves, substantially as idesscribed.
6. A car replacer comprising a body having outwardly and downwardly inclined sides, a top inclined downwardly from its center to its ends and having a depression or cavity at its center and upon one side, longitudinally extending ribs
upon the top of said body adapted to receive the treads of car wheels and formed with seats at their inner ends, a guide rib upon the opposite side of the top of said body, and a deflecting point pivoted in a recess in said guide rib and adapted to be swung into engagement with either of the seats of said tread engaging rib, substantially as described.
7. In a car replacer, a body having its top inclined down. wardly from its center to its ends, ribs upon said body to engage the treads of car wheels, a guide rib upon said body and a swinging deflector point mounted to engage either of said tread engaging ribs and to form a continuation of said guide rib.

No. 102,085. Car Axle. Essieux de chars.

William Hartill-Law, Toronto, Ontario, Canada, 20th November, 1906; 6 years. Filed 30th October, 1906. Receipt No. 140,747.
Claim.-1. An axle comprising two parts, one journalled within the other in combination with a complete metal ring fitted in an annular flat-sided channel formed partly in one part of the axle and partly in the other, substantially as described.
2. An axle comprising two parts, one journallel within the other, an annular channel being formed partly itu one part and partly in the other, and a slot cut in the outer past communicating with the said channel, in combination with a ring completely filling the channel and formed in segments of an annulus insertible through the said slot, substantially as described.
3. An axle comprising two parts, one journalled within the other, an annular channel being formed partly in one par: and partly in the other, and a slot cut in the outer part communicating with the said channel in combination with a ring fitting the channel and formed in segments insertible through the said slot, and a locking piece secured in the said slot, substantially as described.
4. An axle comprising two parts, one journalled within the other, an annular channel being formed partly in one part and partly in the other, and a slot cut in the outer part communicating with the said channel in combination with a ring fitting the channel and formed in segments insertible through the said slot, and a locking piece secured ir: the said slot and formed as part of one of the segments of the ring, substantially as described.
5. An axle formed in two parts, the end of one journalled within the end of the other, the inner part having collars integral therewith, having a space between them and the outer part an annular recess forming with the space between the collars, an annular channel in combination with a metal ring completely filing said channel, substantially as idescribed.
6. An axle formed in two parts, the end of one journalled Within the end of the other, the inner part having collars integral therewith, having a space between them and the outer part, an annular recess forming with the space between the collars, an annular channel in combination with a ring fitting the channel and formed in segments insertible through the said slot, and a locking piece secured in the said slot and formed as part of one of the segments of the ring, substantially as described.

No. 102,086. Machinc for Fooping Casks, Barrels, Ftc.
Machine a poser les cercles de baril, etc.

William Jamieson, Grays, Essex, and Robert Burn, London, both in England, co-inventors, 20th November, 1906; 6 years. Filed 4th October, 1906. Recelpt No. 140,043.
Claim.-1. In a machine for driving hoops on to a cask or the like, the use of telescopic or extendable arms which may be arranged in one, two or more series so as to deal with one hoop or several hoops at a time.
2. In a machine for driving hoops on to a cask or the like the arrangement of arms round a common center so that the said arms can be adjusted radially according to the diameter of the cask to be hooped is greater or less.
3. In a machine for driving hoops on to a cask or the like, having arms depending round a common center and adjustable radially, the device for automatically opening out or spreading the said arms by means of a disc worked by the rise and fall of the movable table or platform, substantially as described.
4. In a machine for driving hoops on to casks or the like, the arrangement whereby the rising table having risen to a predetermined and adjusted helght automatically acts on the driving gear so as to reverse the motion and cause the table to descend and stop at its lowest position.
5. In a machine for driving hoops on to casks or the like, having movable and adjustable top bottom plates or tables, the method described of adjusting the same by means of screw nuts, chain wheels and chain to suit the varying sizes of casks to be dealt with, substantially as described.
6. In a machine for driving hoops on to casks or the like, the arrangement of a rising table, depending arms which are adjustable both as to length and distance from a common center, automatic reversing arrangement to ensure the table only rising to a predetermined height and the descending automatic opening out or spreading of the arms so as to make room for a cask to be put in or taken out, all substantially as described as and for the purpose set forth with reference to the accompanying drawings.

No. 102,087. Apparatus for Washins Linen Appareil pour laver le linge.

Frederick Ludwig Bartelt, 3 Kensington Place, Breslington, Bristol, England, 20th November, 1906; 6 years. Filed 30th October, 1906. Recelpt No. 140,753.
Claim.-1. In apparatus for washing linen a tank and structures placed thereon comprising movable portions so arranged as to provide a zig-zag channel for the linen and means for giving to the movable portions movement in rotary paths in opposite directions whereby the linen is advanced and submitted to friction in the manner exnlained.
2. The apparatus for washing linen comprising two structures made up of stationary and movable frames and means for moving the movable portions in rotary paths in opposite directions, substantially as described.
3. In combination with apparatus for washing linen comprising a tank and a structure forming a zig-zag channel therein, feeding rollers for the linen to prepare the same and to prevent choking or blocking of the channel by the linen, substantially as set forth.

\section*{No. 102,088. Packet Closer. Fermeture de robes.}

Joseph Parrish Baumgartner, Philadelphia, Pennsylvania, U.S.A., 20th November, 1906; 6 years. Filed 24th October, 1906. Receipt No. 140,579.
Claim.-1. In a closer, a flexible support, clips carried by said support, guides adapted to be secured to the sides of a base or holder and with which guides said clips slidingly engage, and sald guides having means on the ends whereby said clips may be connected with and disengaged from said guides laterally.
2. In a closer, a flexible support, clips carried by sald flexible support, guides adapted to be secured to the sides of a base or holder and which guides sald clips slidingly engage, and a plate adjacent the ends of said guides whereby said clips may be connected with and disengaged from said plates laterally.
3. In a closer, guides adapted to be secured to the sides of a base or holder, a stop on one of said guldes, plates adjacent an end of each of sald guides, a flexible support, and clips each formed of jaws engaging and joining the guides, said jaws slidingly engaging said guides, and movable laterally upon sald plates.
4. In a closer, a flexible support, clips each formed of jaws. guides adapted to be secured to the sides of a base or holder and with which said jars slidingly engage, a
stop on one of said guides and a plate on each of said guides, said plates being adapted to pass sald jaws lat-

erally whereby said clips may be caused to engage with and be disengaged from said guides.
E. In a closer, of the character stated, a clip formed of zections, means for connecting said sections whereby jaws are formed joined by an intermediate neck, and a plece of flexible material seated between said sections and which is adapted to support said clips.
6. In a closer of the character stated, a clip formed of separable sections, means for securwing sald sections together and a piece of flexible material secured between said sections and serving to support the clips.
7. In a closure of the character stated, guides adapted to be secured to the sides of a base or holder, a clip formed of separable sections, means for securing said sections together, and two pieces of flexible material secured between said sections serving to support the clips and to surround the guides on each side thereof.
8. In a closure, a flexible support, clips each forming jaws, suides adapted to be secured to the sides of a base or holder and with which said jaws slidingly engage, plates on each of sald guides, sald plates being adapted to pass laterally said jaws, whereby sald clips may bo caused to engage with and be disengaged from said guides.
9. In a closer, a flexible support, clips carried by said support, guides adapted to be secured to the sides of a base or holder and with which guides said clips slidingly engage, said guldes having means adjacent to remote ends thereof whereby said clips may be connected with and disengaged from said guides laterally.
10. In a closer, a fiezible support, clips carried by said flexible support, suides adapted to be secured to the sides of a base or holder and with which guides said clips slidingly engage, and a plate adjacent the remote ends of sald guides whereby said clips may be connected with' and disengaged from said guldes laterally.

\section*{No. 102,089. Diggins Machine.}

Machine d creuser.
Jon V. Constaninescu, Bucarest, Roumania, 20th November 1906; 6 years. Flled 24th October, 1906. Receipt No. 140 「8/
Claim.-A digging machine in which the movement of one of the road wheels is transmitted by a gearing to a horizontal crank shaft at the top of the machine on the cranks of which, placed at suitable angles to each other, cutting tools or blades are attached with one end. the other ends bearing the tools proper which have lugs engaging into slots
provided at the interior of the frame of the machine, and directing the cutters so that they are caused to cut or dis

the ground in a direction perpendicular to that of the traction and throw the cut clods backwards.

No. 102,090. Wood Sawing Machinc.
Machine d scier le bois.

Melber H. Cox, Wyoming, Illinois. U.S.A., 20th November. 1906: 6 years. Flled 26th October. 1906. Receipt Na. 140.661.

Claim.-1. In a sawing machine the combination of a work support, a stationary stop comprising a transversely extending arm in longitudinal alisnment with the work upon eald
support, a transversely movable saw and a stop movable transversely between said saw and said stationary stop in close proximity to the latter, whereby when said stop is retracted the work cut by said saw will be permitted to drop between said stationary stop and said saw.
2. In a sawing machine the combination of a support or frame, a work feeding means thercon, a transversely movable saw carrier, a stationary stop having a transverse arm in longitudinal alignment with said work feeding means. means for adjusting said stop longitudinally toward and from said saw carrier and an adjustable mounted movable stop to work between the work upon said feeling means and said stationary stop in close proximity to the latter, substantially as described and for the purpose set forth.
3. In a sawing machine the combination of a suitable frame, a work feeding means thereon, a transversely movable saw carrier, a longitudinally extending support. a stationary stop slidable upon said support, means for securing sald stop in an adjusted position, a longitudinally extending shaft and a swinging stop adjustably secured upon said shaft and adapted to move between said work feeding means and said stationary stod in close proximity to the latter, substantially as described.
4. In a sawing machine the combination of a suitable frame, a work feeding means thereon, a transversely movable saw carrier, a longitudinally extending support, a stationary stop slidable upon said support. means for securing said stop in an adjusted position, a longitudinally extending shaft, a swinging stop adjustably secured upon said shaft and adapted to move between sald work feeding means and said stationary stop in close proximity to the latter and means actuated by said saw carrier for oscillating said shaft, substantially as described and for the purpose set forth.
5. In a sawing machine the combination of a suitable frame, a work feeding means thereon. a traversely swinging saw carrying frame. a longitudinally extending support, a stationary stop slidably and adjustably mounted upon said support and having a transversely extending arm in longitudinal alignment with said work feeding means. a longitudinally extending shaft. a transversely swinging stop adjustably mounted upon said shaft and adapted to swing in close proximity to the inner face of said stationary cton. a crank upon said shaft. a double crank shaft. a connertion hetween one of the cranks of said double rank shaft and said swingIng frame and a connection between the other crank of said double crank unon the first-mentioned shaft, substantially as described.
6. In a sawing machine the combination of a movable frame having a horizontally extending portion and a vertically extending portion at one end of the latter, a work feeding means upon said horizontally extendino nortion. a saw carrying frame mounted in the vertical nortinn of said frame to swing transversely across said feeding means, a longitudinally extending beam formen with rows of avertures arranged in staggered relation. a stationary stop having a transversely extending arm and a bracket nortinn to engagn caid avertured beam and slide thereon. said bracket portion being formed with anertures to on-gct with the rows of anprtures in said beam, a pin passed through aligning apertures in said stop and beam to adjustablv cocirro the former upon the latter. a longitudinally extending shaft. a transversely swinging ston slidably and adiustably secured upon said shaft and adanted to swing in closn nroximity to said stationary stop. a crank upon said shaft. a double crank shaft upon said frame and connections between the cranks of said double crank. the crank upon sald longitudinally extending shaft and said transverselv swinging saw carrying frame, substantially as shown and described.

\section*{No. 102,091. Gang Plough. Charrue en ligne}

John Clopton Farley, Kiowa, Indian Territory, U.S.A., 20th November. 1906; 6 years. Filed 29th October, 1906. Receipt No. 140,716.

Olaim.-1. In a machine substantially as described the combination of the main frame having a crossbar grooved or recessed longitudinally in its rear side and having the web formed by said groove slotted vertically for the passage of a bolt flange and provided at the ends of said crosbbar with guideways for axle bars said guideways having undercut grooves, the land side wheel, the axle bar therefor having a spindle for said wheel and said bar being movable vertically in its guideway of the main frame, a toothed segment for adjusting said axle bar, detent mechanism in connection with said toothed segment, a cant wheel having its spindle provided with a head bar and with a headed lug projecting from the inner face thereof, the axle bar for said cant wheel having a vertical slot for said head, means for adjusting the headed bar of the cant wheel relative to its axle bar, the segment on the main frame for operating said axle bar, detent mechanism operating in connection with
said segment, and a plough having its beam provided at its front end with a headed plate fitting and secured with

the longitudinal groove or recess of the crossbar of the main frame, all substantially as and for the purpose sel forth.
2. The combination of a main frame having at its opposite sides vertical guideways for axle bars, a land side wheel having an axle bar movable vertically in its respective guideway of the main frame, a cart wheel, an axle bar for said wheel movable vertically in its respective guideway of the main frame, means for securing the opposite axle bars in any suitable adjustment relative to the main frame and means for securing the cant wheel in any suitable adjustment relative to its axle bar, substantially as set forth.
3. In a machine of the character described a main frame having a crossbar grooved or recessed longitudinally in its rear face for the reception of a headed plate on a plougu beam and provided at its ends with vertical guideways, axle bars movable vertically in said guideways, means for securing said axle bars in any desired adjustment and means carried by their respective axle bars, substantially as set forth.
4. The combination of a main frame having a crossbar, wheels at the opposite sides thereof, axle bars connected with said wheels and adjustable vertically relatively to the main frame, a plough beam secured at its front end to the main frame having a plough share, a trail wheel in rear of said plough share, and means for adjusting the trail wheel vertically relatively to the plough share whereby the plough may be elevated or lowered in correspondence to the adjustments of the wheels at the opposite sides of the main frame, substantially as set forth.
5. In an apparatus, substantially as described, a main frame having a crossbar and vertical guideways at the opposite ends thereof, the guideways having undercui grooves for the reception of axle bars, and the cross bar being grooved or recessed longitudinally in its rear face for the reception of a headed plate on a plough beam and having a web formed by said groove or recess slotted for the passage from rear to front of a bolt flange on a plough beam, substantially as set forth.
6. The combination in a machine substantially as described with a cant wheel and a main frame having a vertical guideway with an undercut groove, of an axle bar movable vertically in said undercut groove, means for vertically moving said axle bar relatively to the main frame, a spindle for the cant wheel, a head bar carrying said spindle and held to and movable vertically along the axle bar and means io: securing said head bar in any desired adjustment relative to said axle bar, substantially as set forth.
7. The combination with the main frame and an axle bar movable relative thereof, of a wheel having a head bar movable longitudinally along the axle bar and provided with a rack, and a toothed segment connected with the axle bar and engaging with the rack of the head bar whereby to adjust the same relatively to the axle bar and means for securing said head bar in any desired adjustment relative to its axle, substantially as set forth.

No. 102,092. Fork. Fourche.

Leonard E. Fatch, Crown Point, Indiana, U.S.A., 20th November, 1906; 6 years. Filed 26th October, 1906. Receipl No. 140,659 .
Claim.-1. A fork of the class described having a sockel Fiece provided with a longitudinal slot and stop notches ex. tending in reverse directions from the opposite ends of saill slot, said fork being further provided with a tine having directing elements, a sliding rod having pivoted dogs at its outer ends turned outwardly by the directing elements of the said tines when said rod is moved outwardly, a sliding and partly revoluble sleeve on said socket piece, a handle fastened in the socket piece and having a longitudinal slot registering with that of the socket piece, and a pin projecting from the rod, operating in the slots of the handle and socket plece and attached to the sleeve, for operation thereby, substantially as described.
2. A hand fork of the character described comprising a body section having one of its tings grooved and a socket portion in alignment with said grooved tine, a top plate or section secured upon said body section and having a socket portion, said socket portions being adapted to receive said handle and formed with longitudinal slots. a sliding rod in said grooved tine and said socket portions, spurs pivoted upon the lower end of said rod and adapted to be projected through openings in said grooved tine, a sliding sleeve upon said socket portions and handle, and a transverse pin extending through said slecve, said slots and an opening in said rod, substantially as described.
3. A hand fork of the character described comprising a body section having one of its tines grooved and a socket portion in allgnment with said grooved tine. a top plate or section secured upon said body section and having a socket portion. said socket portions being adapted to receive said handle and formed with longitudinal slots. a sliding rod in said grooved tine and said socket portions. spurs plvoted upon the lower end of said rod and adapted to be projected through openings in said grooved tine, a sliding sleeve upon said socket portions and handle. and means for locking said sleeve against longitudinal movement.

No. 102,093. Trousers Presser. Prossc ì pantalons.

Rubert P. Koons. Lee's Summit, Missourl, L.S.A., 20th Novיmber, 1906; 6 years. Filed 21st September, 1:06. Receipt No. 13963.
rlaim.-1. In a trousers presser, a back board having hooked surings at one end thereof, a front board proporfinned for disposition within the springs. clamps carried by the sorinss and adapted to engag" the adjacent end of the
front board, and means for yieldably clamping the boards tog'ther at their opposite ends.
2. In a trousers presser, a back board provided at one end with laterally turned hooked springs, notehed latch members pivoted to the opposite end of the back board, a front board froportioned for disposition within the hooked springs. flamping levers pivoted to the springs and arranged to clamp the adjacent end of the front board, and a resilient bar iivoted to the front board and proportioned to engage the latches.
:3. In a trousers presser, a back board, hooked springs detachably secured to one end of and turned laterally of the lack board, a front board proportioned to be disposed Within the hooks of the springs, clamping levers pivoted to the springs and arranged to exert a yielding pressure upon one end of the front board, and means for yieldably clamping the opposite ends of the boards.
4. In a trousers pressure, a back board, socket members secured to one end of the board, hooked springs adjustably disposed within the sockets and turned laterally upon ond side of the front board when in operative position, and extending beyond the end of the board. when out of operative position. a front board proportioned for disposition within the springs. clamping levers pivoted to the springs and arranged to exert a yieldable pressure upon one end of the board, and means for clamping the opposite ends of the boards.

No. 102,094. Stocking. Bas.

Iames Edward Lewitt. Goderich, Ontario, Canada, 20th November. 1906; 6 years. Filed 25th October, 1406. Keceipt ㅅo. 140.602.
claim.-The combination with the plain knitting at th. top of any plain stockings of a strip or band of ribbed or tucked knitted fabric or any other such-like fabric. substantialiy as hereinbefore described.

No. 102,095. Beehive. Rucher.

George W. Mann, San Luis Obi-po. Califorala, C.si. : November, 1906: 6 years. Filed 2ith October, 190t. Receipt No. 140,671.
Claim.-1. In a device of the class described, a hive having an opening, a main slid for normally partially closide said opening, means connecting the slide for vertical movement on the hive, an auxiliary slide for closing the rmainder of sald opening, and means connecting the auxiliars side for verical and horizontal movement relative to eth. main slide.
2. In a device of the class described, a hive having \(a\). -longated doorway. a main slide provided with transvers. fots, fastening members entered through said slots for =:
curing the slide in place, and an auxillary slide having longitudinal slots terminated in transversely disposed slot extensions, said slots being designed to receive said fastening members for securing the auxiliary side movably in place.

No. 102,096. Nnt Lock. Arrétc-icrou.

Harvey Tanner Moler, Shepherdstown, West Virginia, U.S.A., 20th November, 1906 ; 6 years. Filed 26th October, 1906. Recelpt No. 140,657
Claim.-The herein described nut lock comprising the bolt having the longitudinal groove in one side extending to its end and provided near the outer end of said groove with a recess communicating with the bottom of said groove, the nut of the bolt having a groove in its bore. said groove being deepened outwardly at its outer end and the flexible nonresilient locking key inserted in the groove of the bolt and nut having its outer end projecting beyond the outer end of the bolt and provided near said end with the projection entering the recess in the bottom of the groove in the bolt, substantially as described.

No. 102,097. Mine Hoist. Ascenscur de mine.

Austin B. Paige, Iowa Falls, Iowa, U.S.A., 20th November, 1906; 6 years. Filed 26th October, 1906. Receipt No. 140,634.
Claim.-1. A drum for cables comprising a drum portion of relatively large diameter, a drum portion of relatively small diameter adjacent thereto and a flange at the end of the smaller drum portion opposite from the larger drum portion, said flange formed with a cable receiving notch.
2. A cable drum comprising a large cylindrical drum portion, a small cylindrical drum portion adjacent thereto, a flange adjacent to the small cylindrical drum portion and a drum portion on the other side of the flange. said flange formed with cable notches.
3. In a mine hoist, a drum having a notched annular flange, intermediate its ends, a reduced part adjacent the flange, ratchet faced flange, a dog to engage the ratchet face, an integral annular extension and a band brake for engaging the annular extension.
4. In a mine hoist. a shaft having a drum thereon, bearings for the said shaft, a clutch member on the ends of said shaft, a second shaft having balanced wheel thereon, bearings for said second shaft, a clutch member on said shaft, a sheave on the second shaft, a second sheave mounted on a shaft in suitable bearings, laterally removed from the first
sheave, a rope for embracing the sheaves, means for rotating the said second sheave, means for moving the clutch members into and out of engagement and a brake for controlling the speeed of the first-mentioned shaft.
5. In a mine hoist a shaft having a drum thereon, bearings tor said shaft, a second shaft having a balance wheel thereon, bearings for said second shaft, a third shaft having a balance wheel thereon, bearings for said third shaft, clutch members on the ends of the first-mentioned shaft, mating clutch members on the inner ends of the second and third shafts, means for moving the clutch members into and out of engagement and separate means for imparting motion to the second and third shafts.

No. 102,098. Heating Stove. Poêlc de chauffage.

m.

William A. Standing, Sharpsbury, Pennsylvania, U.S.A., 20th November, 1906; 6 years. Filed 25th October, 1906. Receipt. No. 140,605.
Claim.-A drum comprising a series of superimposed chambers spaced from one another, said chambers being oro \(\because\) ided with longitudinal partitions extending from one etill of the drum and terminating short of the other end thereof, connections between the chambers at the end of the drum from which said partitions extend, said connections being arranged alternately on opposite sides of said partitions, and means for supporting said chambers.

\section*{No. 102,099. Cart Saddle for Farnesses.}

Selle de charrette.
George John Theobald, Alton Reed and Harry H. Reed, each an issignee of a third interest, all of Boston, Massachip ptts, U.S.A., 20th November, 1906; 6 years. Filed 30t in October, 1906. Receipt No. 140,766.
Claim.-1. In a cart saddle, the combination with a jointed bow, of two pads, one carried by each section of the bow. 2. In a cart saddle, the combination with a jointed bow, of two pads, one rigidly secured to each section of the bow.
3. In a cart saddle, the combination with a jointed bow, of two ventilated pads, one secured to each section of the bow.
4. \(n\) a cart saddle, the combination with a bow jointed between its ends, of means to lock the sections of the bow in adjusted position, and a pad carried by each section of the bow.
5 . In a cart saddle, the combination with a bow, of a pad support sustained thereby and a ventilated pad carried by said pad support.
6. In a harness, a pad support, a perforated metallic foundation member secured thereto, and an exterior padding surrounding the foundation member.
7. In a harness, a pad comprising a pad support, a foundation secured to the pad support having a perforated face which is snaced from the nad support, and a padding covering said perforated face.
8. In a cart saddle, the combination with a bow, of two and adanted to set into the pan on the bottom thereof pads carried thereby, each pad comprising a pad support.

a foundation member having a perforated face spaced from the pad support, and a padding covering said perforated face.

No. 102,100. Orchard Heater.
Chauffeur pour vergers.

The Utica Orchard Heater Company, assignee of Charles S. Brown, and Frank M. Bremillier, all of Utica, New York, U.S.A.. 20th November. 1906: 6 years. Filed 29th October, 1906. Receipt No. 140,7:3.
Claim.-1. The combination in a heating device of the character described, of a shallow pan, a circular wick basket of comparatively large diameter adapted to be set into the pan on the bottom thereof, and having a closed outer wall and perforate or netting inner wall, and a capilllary material in the wick basket, substantially as set forth.
2. The combination in a heating device of the character described. of a shallow pan. a circular wick basket of comparatively large dlameter closed near the bottom, and adapted to be set into the pan on the bottom thereof. and having a closed outer wall above the plane of said closure in the basket, and a perforate or netting inner wall, and a capillary material in the wlek basket, substantially as set forth.
3. Thr combination in a heating device of the character dosiribed, of a shallow pan of comparatively largo diameter. a circular wick basket of greater height than the depth of the pan, having at its upper end a closed outer wall and casily removable therefrom, and a capillary material in the wick basket between the walls, substantially as set forth.
4. The combination in a heating device of the character described, of a shallow pan of comparatively large diameter, open at the top, a circular wick basket adapted to be set into the pan on the bottom thereof through sald opening, a capillary material in the wick basket and a draft tube adapted to set over the wick basket into the pan on the bottom thereof, having openings at or near the lower end, the draft tube and wick basket being readily suparable from the pan. substantially as set forth.

No. 102,101. Coal Space for Locomotive Tomder Tanles.
Espace pour charbon dans les tenders de locomotives.

The Canada Foundry Company, Toronto, assignee of John William Harkom, Davenport, both in Ontario, Canada. 20th November, 1906; 6 years. Filed 25th October, 1906. Receipt No. 140,610.
Claim.-1. In a coal space in locomotive tender tanks the combination with the sides of the tender and vertical back plates, of the inclined central back plate and the inclined sides converging to the front, and a shovel space at the foruard end at substantially the point of converging, as and for the purpose specifled.
2. In a roal space in locomotive tender tanks the combination with the sides of the tender and vertical back plates. of the inclined central back plate and the inclined sides convergiing to the iront, a shovel space at the forward en! at substantially the point of converging and angle strips at the meeting angles of the central inclined back and Inclined sides, as and for the purpose specified.
3. In a coal space in locomotive tender tanks the combination with the sides of the tender and vertical back plates of the inclined central back plate and the inclinal sides converging to the front, a shovel space at the forward and at subsiantialiy the point of converging and the cupboards having the inclined sides and the doors hinged to the cuphoards and extending down to a point in proximity with the outer edge of the shovel space, as and for the purpose specified.
4. In a coal space in locomotive tender tanks the com bination with the sides of the tender and vertical baih plates. of the inclined central back plate and tho inclined sidis convorging to the front. a shovel space at the formant end at subsiantially the point of converging and comprist:a scoop-shape plate supported on vertical crossbars, as add for the purpos. specifled.

No. 102,102. Plaster Board. Planche d platre.

Henry Kimmet and Charles E. Thornton, assignee of a half interest, both of St. Joseph, Missouri, U.S.A., \(20 t h\) November, 1906; 6 years. Filed 11th October, 1906. Receipt No. 140,206.
Claim.-1. In a plaster board the combination with a layer of plastic cement and shale, a layer of co-mingled cement and straw or flber, and a second layer of cement and shale interposed thereupon of a layer of coarse fabric secured to one of the faces of thte board.
2. In a plaster board the combination with two layers of plastic cement and shale, of an intermediate layer of straw and cement and a layer of burlap secured to one face of the tlock.
No. 102,103. Prepayment Moter.
Mêtre actionné par une pièce de monnaic.

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Frank Conrad, Edgewood Park, Pennsylvania, U.S.A., 20th November, 1906; 6 years. Filed 20th January, 1906. Receipt No. 132,085.
Claim.-1. In a prepayment meter the combination with a coin wheel and a coin chute into which the wheel projects, of a device that projects movably into the chute adjacent to the wheel to prevent withdrawal of coins.
2. In a prepayment meter the combination with a coin wheel and a coin chute into which the wheel projects, of a spring actuated device that projects into the chute adjacent to the wheel to prevent withurawal of colns.
3. In a prepayment meter the combination with a coin wheel and a coin chute into which the wheel projects, of a fivoted arm having a portion that projects into the coli chute to prevent withdrawal of coins.
4. In a prepayment meter the combination with a coin wheel and a chute into which the wheel projects, of a spring actuated pivoted arm having a shoulder that projects into said chute to prevent wilhdrawal of coins.
5. In a prepayment meter the combination with a coiri wheel and a chute into which the wheel projects, of a spring actuated device that normally prevents rotation of the conn wheel but is movable out of its path by a coin of the proper size.
6. In a prepayment meter the combination with a coin wheel having lugs and a chute into which the wheel projects, of a device that normally projects into the path of movement of the wheel lugs and is movable out of said path by coins of the proper dimensions.
7. In a prepayment meter, the combination with a coln wheel and a chute into which the wheel profects, of a device having a part that normally projects into the coin chute and a part that normally projects into the path of movement of the wheel lugs.
8. In a prepayment meter the combination with a coin wheel and a coin chute into which the wheel projects, of means for diverting undersized coins from the coln wheel and means for preventing the withdrawal of a coin after it has actuated the coin wheel.
9. In a prepayment meter, the combination with a coin actuated device and a chute for guiding coins thereto, of means for diverting undersized colns from said device and means for preventing withdrawal of a coin that has served to actuate said device.
10. In a prepayment meter the combination with a coin actuated device and a chute for guiding colns thereto, of means for preventing withdrawal of a coin that has served to actuate the device and means for preventing reverse operation of the coin actuated device.

\section*{No. 102,104. Electrical Measuring Instrument.}

Instrument électrique d̀ mesurer.

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Paul MacGahen, Wilkinsburg. Pennsylvania, U.S.A., 20th November, 1906; 6 years. Filed 20th January, 1906. Receipt No. 132,086.
Claim.-1. The combination with a translating device of ar electrical measuring instrument comprising circuit terminals, stationary windings respectively of high and low resistance, a movable winding having a high resistance circuit, a resistance, and means whereby the translating device may be connected between the circuit terminals in series circuit with the low resistance stationary winding and the movable winding may be connected in shunt thereto, or whereby the translating device may be connected between the circuit terminals In series with the resistance, and the high resistance stationary winding and the movable winding may be connected in series with each other and in shunt to the translating device.
2. The combination with a translating device of an electrical measuring instrument comprising circuit terminals. stationary windings respectively of high and low resistance, a movable winding having a high resistance circuit, resistances, and means whereby the circuit relations of the parts may be adjusted to adapt the instrument to the measurement of either voltage or energy.
3. The combination with a translating device of an electrical measuring instrument comprising circuit terminals, stationary windings respectively of high and low resistance, a movable winding having a high resistance circuit, resistances, a plurality of differently callbrated scales, means•

Digitized by -
that co-operate therewith to indicate the torque between the stationary and movable windings, and means for arranging the circuit relations of the parts of the instrument to udapt it to the measurement of either voltage or energy.
4. The combination with an electrical translating device, of a measuring instrument comprising circuit terminals, stationary windings respectively of high and low resistance, a movable winding having a high resistance circuit, a resistance approximately equal to that of the low resistance stationary winding, and means whereby the circuit relations of the barts may be so adjusted as to enable the instrument to operate either as a voltmeter or as a wattmeter and whereby the translating device may be connected in series circuit with the resistance in the former instance and in series circuit with the low resistance stationary winding in the second instance.
5. The combination with an electrical translating device, of a measuring instrument comprising circuit terminals, stationary windings respectively of high and low resistance, a movable winding having a high resistance circuit, a resistance approximately equal to that of the low resistance stationary winding, and means whereby the circuit relations of the parts may be so adjusted as to enable the instrument to operate either as a voltmeter or as a wattmeter and the rcsistance in series clrcuit with the translating device to be maintained gpproximately the same under either condition.
6. The combination with an electrical translating device of a measuring instrument comprising circuit terminals, stationary windings respectively of high and low resistance, a movable winding having a high resistance circuit, resistances and means whereby the circuit relations of the parts may be so adjusted as to enable the instrument to operate either ar. a voltmeter or as a wattmeter and the amount of resisance in the circuit of the movable winding to be altered according to the character of the quantities measured.

No. 102,105. Mowing Machine. Faucheusc.

John L. Tomer and George D. Hamor, assignee of a half interest, both in New Kensington. Pennsylvani, U.S.A., 20th November. \(1906 ; 6\) years. Filed 27 th October, 1906. Receipt No. 140,678 .
Claim.-1. The combination with the axle, the drive wheels mounted thereon, and the main frame in which the axle is journalled, of a pinion mounted on the axle. a transverse shaft journalled in the frame on a plane brlow the axle and having a crank on each end, a pinion on said transverse shaft meshing with the pinion on the axle hangers mounted on sald transverse shaft. hangers secured to the frame near its forward end, a platform suspended from sald hangers, a pitman lever pivotally mounted on said platform near its forward end, pitmen connecting said pitman lever with the ranks of the transverse shaft, and a ball and socket joint connecting sald pitman lever with a sickle, substantially as described.
2. Sickle actuating mechanism for mowing machines comprising in combination with a drive axle, drive whecls secured thereon, a main frame in which the axle is journalles and a sickle, a pinion mounted on the axle, a transversw shaft journalled in the main frame, a pinion carried by sald shaft and meshing with the pinion on the axle. a platform. hangers connected to the platform and to said shaft for supporting the platform at its rear end, hangers connected to said platform and to the frame for supporting the platform at its forward end, a pitman lever connected to the sickle and pivotally mounted on the platform, a pitman connecting said pitman lever with the transverse shaft, substantially as described.
No. 102,106. Joint. Joint.

Nexandre Arthur Charles Chenu, 71 rue St. Jacques. Etampes Seine et Oise, France. 20th November. 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,320.
Claim.-1. Rail and other like joints comprising a chair Cshaped in section, wedging jars adapted to contact with the rails or bars at several distinct points, and engaging between the chair and the adjacent ends of the bars or rails. substantially as described.
2. Rail and other like joints comprisingg a single chair C-shaped in section, wedging jaws adapted to contact with the rails or bars at several distinct points and engaging between the chair and the adjacent ends of the bars or ralls, and securing means such as pins or spikes between the. chair and the jaws, substantially as described.
3. Rail and other like joints comprising a single chair Cshaped in section, ribs or projections formed on said chair. wedging jaws adapted to engage with the under surface o! the overturned edge of the chair and with the rails at two points on the base when tightening forces are set up and \(a\) : one point in loose contact with the web of the rail, substantially as described.
4. Rail and other like foints comprising a single chair \(C\). shaped in section, wedging jaws adapted to contact with the rails or bars at several distinct points and engagin: between the chair and the adjacent ends of the bars or nails, and expansion limiting plates located on either side of the rails or bars and gydgeons or parts adapted to pas: through openings in the adjacent rail and engage with the opposing plate, substantially as described.

No. 102,107. Fire Escape. Sauveteur d'incendic.

Sargent Z. Moore, Dallas, Texas, U.S.A., 20th November 1906 : 6 years. Filed 27th September. 1906. Reccip: No. 139,814.
Claim.-1. In a fire escape the combination with an endless cable operatively mounted alongside of a building, of means

Cor braking said cable comprising a movable platform, located at the base of said cable and a braking member mounted on said platform adapted to be brought into engagement with the operating cable upon the descent and alighting upon the platform of each person carried by the cable.
2. In a fire escape the combination with an endless cable operatively mounted alongside of a building, of a support adjacent the lower end of said operating cable and provided with a transverse plate having a cutaway portion and a pivoted platform provided with braking member having a prong-shaped upper portion adapted to co-operate with the cut-away portion of said transverse plate and to receive the operating cable therebetween.

No. 102,108. Gas Cut-Off. Détente pour le gaz.

Campleell's Automatic Safety Gas Burner Co., assignee of Victor E. Campbell, both of Portland, Oregon, U.S.A. 20th November, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,538.
Claim.-1. The combination with a gas burner, a valve therein and a tension device for holding the valve normally closed, of a brake wheel operativaly connected to and adapted to be actuated by the closing of the valve, a brake lever and a thermostat for applying the lever to the wheel.
2. The combination with a gas tube, a valve therein and a spring for holding the valve normally closed, of a brake wheel adapted to be actuated by the valve when closed, a resilient brake lever and a thermostat for applying the lever to the wheel, said thermostat comprising a support and an actuating rod connected thereto, said rod and support being affected to different extents by heat.
3. The combination with a gas tube, a valve therein and a spring for holding the valve normally closed, of a toothed sector movable with a valve, a train of gears, a pawl and ratchet connection between the sector and train of gears, a brake wheel actuated by the gears, a resilient brake lever and a thermostat for applying the lever to the brake wheel to hold the gears and valve against movement.
4. The combination with a gas tube, a valve therein and a spring for holding the valve normally closed, of a brake wheel adapted to be actuated by the valve when closed, a resilient brake lever, a thermostat comprising a readily expansible support and a rod connected thereto, a flnger upon the rod and a lever supported and actuated by the finger, said lever bearing upon and adapted to actuate the brake lever.
5. In a device of the character described the combination with a valve, means operated therewith and a brake for said means, of a thermostat for actuating the brake and comprising a tubular support and a rod secured at one end within and extending through the tube. said rod and tube being capable of expanding to different degrees when heated.
6. In a device of the character described the combination with a valve, means operated therewith and a brake for said means, of a thermostat for actuating the brake and comprising a tubular support, readily expanded by heat and a rod less affected by heat, said rod secured at one end to and extending through the tube
7. In a device of the character described, a thermostat comprising a support, a tube extending therefrom and a rod secured at one end to one end of the tube and extending through the tube, said rod and tube being affected to different degrees by heat applied thereto.
8. In a device of the character described, a thormostat comprising a support, a tube mounted thereon and readily susceptible to the expansive action of heat. and a rod secured to one end of and extending through the tube, said rod being less affected by heat than the tube.

No. 102,109. Electrically Controlled Optical Appliances.
A"nareil optique actionné par l'électricité.

John C. Fredell, Potacello, Idaho, U.S.A., 20th November, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137,709. Claim.-1. In an electrically controlled optical appllance, the combination of a lens tube, a shutter for controlling the opening of the lens tube, and instrumentalities including momentarily energized solenoids, one of which effects the opening of the shutter an dthe other of which releases the shutter at the end of a predetermined period, and means for automatically locking the shutter in open position during such period.
2. In an electrical optical appliances of the class described, a lens tube, a shutter for controlling the opening through the lens tube, means for opening the shutter, means operating automatically to engage the shutter opening means for locking the shutter in open position for a predetermined period, means operating upon said automatic locking means for releasing the shutter opening means at the end of said period, and means for closing the shutter.
3. In an electrically controlled optical appliance, the lens tube, a shutter for controlling the opening through the lens tube, a lever connected with the shutter for moving it out of the lens tube, a second lever disposed within the path of the first-mentioned lever and adapted to engage the latter and hold it with the shutter for a predetermined period in the position to which it has been moved, means to operate upon the second lever to release it from engagement with the first-mentioned lever, and means for restoring the first-mentioned lever to its normal position in the lens tube.
4. In an electrically controlled optical appliance, a lens tube, a shutter for controlling the opening through the lens tube, a solenold having an armature, a lever secured to said armature and engaged with the shutter, whereby the shutter is opened when the solenoid is energized, a second lever disposed within the path of the first-mentioned lever and adapted to lock the later against movement when the shutter is opened and a solenoid for operating upon the said second lever to release the shutter operating lever.
5. In an electrically controlled optical appliance, a barrel, a lens tube, an adjusting rod for the lens tube, a shutter fulcrumed upon said rod, a lever having one end engaged with the shutter and having an armature on its other end, a solenoid for operating said armature to open the shutter a locking lever normally held within the path of the shutter operating lever and adapted to be engaged by the latter to hold the shutter in an open position, an armature on one end of the locking lever. a solenoid for operating upon said armature to release the locking lever from engagement with the shutter operating lever, and a spring secured to the armature of the shutter operating lever for restoring the shutter to closed position, substantially as specified.

No. 102,110. Paint. Pcinture.
Handolph Harryson Goddin, Newport News, Virginia, U.S.A.. 20th Novemebr, 1906; 6 years. Filed 17th Jily. 1906. Receint No. 137,919
claim.-1. The process which consists in mixing gas tar with red lead, the adding paris green, then linseed oil, sulphur, a desiccating compound, and black asphaltum, suba drier, and finally adding a gloss giving compound, substantially in the proportions specifled.
2. The within described composition of matter, consisting of gas tar, red lead, paris green, linseed oil, sugar of lead. sulphur, a desiccating compound. and black asphaltum, substantially in the proportions specifled.

No. 102,111. Method of Rectifying Alcohol, Etc.
Méthode pour rectifler l'alcool, etc.

Emile Guillaume, Paris. France. 20th November. 1906: 6 years. Filed 12th July, 1906. Receipt No. 137,788.
Claim.-1. An improved process for rectifying alcohol or other product which is similarly treated. the said process ccosisting in combining the processes for the final purifcation of alcohol witn the process of pasteurizing alcohol discharged from the final purifying column through the circumstances that the extraction of pasteurized alcohol effected on the shelves of the rectifying column diminishes the quantity of tail products which it contains on its entrance into the final purifying column, the said process being advantageously completed by regulating the discharge of the head products by a means which consists in effecting, at the bottom of the condenser which surmounts the final purifying column and below the retrogradation connection which returns the condenser liquid into the latter, a withdrawal of the said liquid, in effecting a withdrawal of the condensed liquid at the bottom of the refrigerator which succeeds the condenser aforesaid, in connecting these two connections with a plpe running to the exit testing device of the head products, and in regulating the total discharge arising from these two connections by means of a tap placed on the pipe aforesaid.
2. An improved process for rectifying alcohol or other product which is similarly heated, the said process consisting in effecting a first withdrawal of pasteurized alcohol from one or the upper shelves of the rectifying column, and in sending this alcohol by means of a pipe provided with a regulating tap to the exlt testing device corresponding to the least pure alcohol, in effecting a second withdrawal of alcohol at the condenser outlet which comes after the rectifying column, and in sending this alcohol by means of a pipe provided with a regulating tap into the final purifying column, at the bottom of which the purest finished alcohol is discharged to pass to the corresponding testing device, in effecting at the bottom of the condenser which surmounts the inal
purifying column and below the retrogradation connection which returns the condensed liquid into the latter, a withdrawal of the said liquid, in effecting a withdrawal of condensed liquid at the bottom of the refrigerator which comes afler the said condenser, in connecting these two connections with the pipe running to the exit testing device of the head products, and in regulating the total discharge arising from these two connections by means of a tap placed on the sald piper
3. An improved process for rectifying alcohol or other product which is similarly treated, the said process consisting in combining the procrss of final purification of the alcohol, with the process of pasteurization of the alcohol and with a peculiar purifying process, from the point of view of the most volatile tail products carrled off in the rectified alcohol, which passes to the final purlifying column, by means which consists in arranging an intermediate cclumn between the discharge of alcohol made at the top of the rectifying column and the column of final purification.
4. An improved process cor rectifying alcohol or other product which is simflarly treated, the sald process consisting ing in effecting a withdrawal of alcohol at the exit of the condenser of the rectifying column and in sending this alcohol by means of a pipe provided with a regulating tap to the lower part of an intermediate column serving for the separation of the tall products and arranged between iar condenser and the final purifying column, in sending to the exit testing device corresponding to the least pure alcohol. the liquid alcohol arising from the lower part of the intermediate column, in sending the alcohol emerging from the condenser of the said intermediate column, by means of a nipe provided with a regulating tap, to the final purifying column, from the bottom of which the purest finished alcohol emerges, to go to the corresponding testing device, In effecting at the bottom of the condenser which surmounts the final purifying column, and below the place where the retrogra dation is withdrawn which returns into the latter the condensed liquid, a withdrawal of the same liquid, in effecting a withdrawal of condensed liquid at the bottom of the refrigerator which succeeds the aforesald condenser. In connecting these two withdrawals with the pipe passing to the exit condensing device for head products, and in regulating the total discharge arising from these two consertious by means of a tap placed on the said pipe.
5. An improved process for rectifying alcohol or other product which is similarly treated, the said process consisting in effecting a withdrawal of alcohol at the exit of the condenser of the rectifying column and in sending this alcohol by means of a pipe provided with a regulating tap to the lower part of an intermediate column serving for the separation of a tail products, and arranged between th. condenser and the final purifying cloumn in causing the liquid alcohol arising from the lower part of this intermediate column to pass into a distilling column suitably heated and actuated beneath the intermediate column, an in sending to the exit testing device corresponding to the least pure alcohol, the alcohol arising from the lower part of the distilling column in sending the alcohol discharged from the condenser of the said intermediate column by means of a pipe provided with a regulating tap to the final purifying column from the bottom of which the purest finished alcohol emerges to pass to the corresponding testing device in affecting at the bottom of the condenser which surmounts the final purifying column, and below the place where the retrogradation is withdrawn which returns into the latter the condensed liquid, a withdrawal of the same liquid, in effecting a withdrawal of the condensed liquid from the bottom of the refrigerator which succeceds the aforesald condenser, in connecting these two withdrawals with the pipe going to the exit testing device of the head products, and in regulating the total discharge arising from these two withdrawals by means of tap placed on the said pipe.
6. An improvement in the process of rectifying alcohol or other product which is similarly treated, the said improvement applying to any apparatus comprising a condenser and a refrigerator from which a withdrawal of liquid arising from the condensation which withdrawal is variable at will has to be effected, commencing with the liquid resulting from the condensation made in the last place in the refrigerator by means which consists in effecting at the bot tom of the condenser which surmounts the purifying column and below the place at which the retrogradation is withdrawn which returns into the latter the condensed liquid, a withdrawal of the same liquid, in effecting a withdrawal of condensed liquid at the bottom of the refrigerator which succeeds the said condenser, in connecting these two withdrawals with the plpe going to the exist testing device of the head products and in regulating the total discharge from these two withdrawals by means of a tap placed on the said plpe.

No. 102,112. Fruit Pioleer. Jaffet.

Andrew Murdock, Montreal, Quebec. Canada, 20th November, 1906; 6 years. Filed 12th September, 1906. Receipt No. 139,446.
Claim.-1. A fruit picker comprising an extensible handle, a pair of diverging fingers mounted on one end thereof and a basket below said ningers.
2. A fruit picker comprising an extensible handle, a pair of diverging fingers mounted on one end thereof, a cutter mounted between said fingers and a basket below sald fingers.
3. A fruit picker comprising a telescoping handl? a pair of diverging ingers mounted on one end thereof, a revoluble cutter mounted between sald fingers and a basket located immediately below said fingers.
4. A fruit picker comprising a telescoping handle, a pair of diverging fingers mounted on one end thereof, slots in said fingers, a cutter passing through said slots and a basket below said fingers.
5. A fruit picker comprising a telescoping handle, a pair of diverging fingers mounted on one end thereof, slots in said fingers, a cutter passing through said slots, means for rotating said cutter and a basket below said fingers.
6. A fruit picker comprising a telescoping handle, means for maintaining said handle in extended position, a pair of diverging fingers mounted on one end of said handle, a revoluble cutter mounted between said fingers, a housing for said cutter and a padded basket located below sald fingers.
7. A fruit picker comprising a telescoping handle, means for maintaining said handle in extended position, a pair of diverging fingers mounted on one end of said handle, a cutter mounted between said fingers, a housing for said cutter. means for rotating said cutter and a padded basket located below said fingers.

\section*{No. 102,113. Berpy Picker.}

Appareil à cueillir des bleuets.
Harry Allan Peters, Winnipeg. Manitoba, Canada, 20th November, 1906; 6 years. Filed 14th September, 1906. Receipt No. 139,498.
Claim.-1. In a device of the class described, the combination with a body of channel bar cross section having fingers extending forwardly therewithin, of a screened receptacle to the rear and attached to the body portion, and a handle attached to the side pieces of the body portion, as and for the purpose specified.
2. In a device of the class described, the combination with a body portion, having a longitudinal cavity therein, of a series of fingers extending forwardly within the body portion. a screened recentacle to the rear of the body portion and continuous with the inner face thereof. and a handle gecured to the body gortion, as and for the purpose specified.
3. In a device of the class described, the combination with the body portion, having a substantially channel bar rorm, of a series of fingers or teeth extending forwardly 11-15
within the body portion, a detachable receptacle to the rear of the body dortion, a screen top to the receptacle,

the said screen being substantially in a plane with the upper face of the body portion when in the closed position, and handles secured to the body portion, as and for the purpose specifled.
4. In a device of the class described, in combination, a body forming a runway for the berries, forwardly extending fingers intricate with the body, a screened receptacle forming a receiver for the berries, and a handle attached to the body portion, as and for the purpose specified.
5. In a device of the class described, the combination with the body of substantially channel bar-shaped cross section, and having a series of forwardly extending fingers, of a detachable receptacle secured to and extending across the body portion, a screen top to the receptacle, sald top being substantially in a plane with the inner upper face of the body, a set of carriage wheels secured to the body, and a handle secured to the body adaptable for use by the operator in a standing posture, as and for the purpose specified.
6. In a device of the class described, the combination with a body portion, of substantially channel bar cross section, and having a series of fingers arranged in the forward portion thereof, of a shaft extending across the body portion and bearing within the upright sides, a set of carriage wheels on the shaft, a gear wheel on the shaft, a set of rollers extending across the body portion parallel with the shaft, and bearing respectively in the upright arms, a pinion intricate with the rear rollers, and in mesh with the aforesaid gear, a set of arms secured forwardly to the sides of the body and extending upwardly and rearwardly, a set of supports reinforcing the said arms, a handle secured between the extending ends of the arms, a roller, bearing in the arms in proximity to the handles, an endless carrier belt passing over all of said rollers, and a receptacle or basket dependent from the arms adapted to act as a received from the carriers, as and for the purpose specified.
7. In a device of the class described, the combination with a body portion of channel bar section, having a series of fingers projecting within the body portion, of a set of carriage wheels supporting the body, and toward the rear, a gear wheel revolvable with one of the carriage wheels, a large and a small roller extending across the body portion, and bearing within its upright arms, the rear roller of the said rollers being of larger diameter than the forward, a pinion intricate with the shaft of the rear roller and in mesh with the gear, a set of reinforced upright arms supporting a handle in convenient position for an operator, standing, a roller extending between the arms and in proximity to the handle, an endless canvas belt extending over and around all of the said rollers, sets of pockets or carriers secured on the outer face of the belt and adapted to lift and carry the berries from the body portion, and a receptacle dependent from the arms adapted to receive the berries when deposited from the carriers, as and for the purpose specified.
8. In a device of thec lass described, the combination with the body portion of channel bar cross section, having fingers extending thereacross, the said receptacle being of an arcuate cross section, a sercen top adapted to close the top of the receptacle, and having the mesh of the screen varying from small at the outside to large at the inside next the body, and means for controlling the operation of the body portion, as and for the purpose specified.
9. A berry nicker comprising a body portion of channel bar cross section, having fingers extending forwardly therewithin, a set of detachable carriage wheels, a detachable screened receptacle to the rear of the body, a set of rollers bearing within the upright sides of the body, and extending
transversely thereacross, a set of gear wheels actuating one of the said rollers, and interchangeable means for controlling the operation of the body portion, said means being adapted for sitting and standing positions respectively, of the operator.
10. A berry picker comprising a receptacle having forwardly projecting fingers and means for supporting and manipulating the receptacle, as and for the purpose specifled.
11. A berry picker comprising a receptacle having forwardly projecting fingers, means for supporting and manipulating the receptacle and a screen for the top of the receptacle, as and for the purpose specified.

No. 102,114. Horseshoe Pad.
Bourrclet pour fer à checal.

August C. Tappe, Cincinnati, Ohio, U.S.A., 20th November, 1906; 6 yaars. Filed 25th October, 1906. Receipt No. 140,608.
Claim.-1. A horseshoe pad having a thickened heel portion, a thin flange so constructed as to receive a horseshoe, a raised hollow bead and partitions dividing said hollow bead.
2. A horseshoe pad having a thickened heel portion, a thin flange so constructed as to receive a horseshoe, a raised hollow bead, partitions dividing said hollow bead and a leather backing for the top of said pad.
3. A horseshoe pad having a thickened heel portion, a thin flange so constructed as to receive a horseshoc, a ralsed hollow bead, partitions dividing said hollow bead, a leather backing for said pad, said leather having air apertures over each chamber into which said hollow bead is divided.

No. 102,115. Cement Fence Post.
Potcau de clôture en ciment.

\(n\)
\(i\)
\(i\)

John Francis McElroy and Joseph M. Denning, assignee of a half interest, both of Cedar Rapids, Iowa, U.S.A., 20th November. \(1906 ; 6\) years. Filed 3rd October, 1906. Receipt No. 140,011 .
Claim.-1. A fence post of substantially trianglar formation having front attaching flanges and an intermediate rar reinforcing flange, the attaching flanges having plerced
therethrough holes arranged in converging relation to each other from rear to front for the passage of attaching brackets, substantially as described.
2. A fence post of substantially triangular formation havIng front attaching flanges and an intermedate rear reinforcing flange, the attaching flanges having alternately pierced therethrough holes arranged in onverging relation to each other from rear to front for the passage of attaching brackets, substantially as described.
3. A fence post of substantially triangular formation having front attaching flanges and an intermediate rear reinforcing flange, the attaching flanges having alternately pierced therethrough holes arranged in staggered relation with respect to one another, said holes extending in a diagonally upward direction through the flanges and in a conrerging relation from rear to front with respect to one another for the passage of attaching brackets therethrough, substantially as described.
4. A fence post consisting of metallic framework and a cement body having front attaching flanges and a rear reinforcing flange all arranged in radial relation with respect to the center of the post the front flanges having extending therethrough a plurality of holes extending diagonally upward through the flanges and in converging relation from rear to front with respect to one another for the passage therethrough of attaching brackets, substantially as described.
5. A fence post consisting of metallic framework and a cement body having front attaching flanges and a rear reinforcing flange all arranged in radial relation with respect to the center of the post, the front flanges having extending therethrough a plurality of holes extending diagonally upward through the flanges and in converging relation from rear to front with respect to one another and attaching brackets hooked at their forwardly projecting attaching ends and turned down at thteir rear ends, substanially as described.
6. A fence post consisting of a metallic framework comprising three upright bars in triangular relation with respret to one another and a cement body within which the bars are imbedded. said body having front attaching flanges and an intermodiate reinforcing flange radially arranged with respect to the center of the post. the attaching flanges being separated by an intermediate channel or depression and being provided with a plurality of staggered holes extending diagonally upward through the flanges and in converging relation fron rear to front with respect to one another and attaching brackets provided at their forwardly projecting ends with hooks and turned down at their rear ends to prevent withdrawal, substantially as described.

No. 102,116. Telegraphy. Télégraphie.

Isidor Kitsee, Philadelphia, Pennsylvania, U.S.A., 12th November, 1906; 6 years. Filed 19th July, 1906. Recelpt No. 137,988.
Claim.-1. Means to transmit over a cable of comparatively great capacity simultaneously two mesages in one direction. said means embracing means adapted to transmit charactors of one message, each character comprising one impulse o! one polarity followed by a space impulse of opposite polarity, the difference in time between the two impulses symbolizing the character. and means adanted to transmit characters of a second message, a variable resistance for sntl means, each character comprising a series of impulses irduced in the line through the variation of said variable resistance, the number of said impulses symbolizing the character.
2. In combination with a transmitting line, two transinitting devices, one of said transmitting devices embracing a transmitting key and source of current. a. variable resistance, a source of current, and an inductorium for the second of sald transmitting devices, the primary connected to the sources of current, the secondary connected to the source of current, the secondary connected to the line, and means to change the value of said variable resistance in accordance with the impulses to be transmitted.
3. Means to transmit simultaneously two messages over a line, said means embracing two transmitters. a key adapted to be manually operated and source of current for one transmitter, a variable resistance, means to automatically vary sald resistance, a manually operated key, and a source of current for the second transmitter, both transmitters in operative relation to the line of transmission.
4. Means to transmit simultaneously two messages over a cable and receive the same at a second station. said means embracing at the transmitting station a key adapted to be manually operated and to transmit over the line of impulses of comparatively slow succession, a variable resistance, a second key adapted to be manually operated and to vary through said operation the value of a variable resistance, and adapted to transmit impulses in quick successlon over.the line, and embracing at the recelving station a device such as a polarized relay for the first-named impulse, and a second device such as a telephone recelver for the second-named impulse.
5. In combination with a transmitting line a telegraphic transmitting device embracing a variable resistance, automatic means to alter said resistance, and means to make operative said automatic means, in accordance with the characters to be transmitted, and means to induce in said line impulses in accordance with the variation of said resistance.
6. In combination with a transmitting line means to transmit two messages simultaneously over said line, said means embracing two sets of batteries inserted in the line in opposition to each other, a shunt around one of said sets and a transmitting key adapted to open and close said shunt in accordance with the characters to be transmitted, for one message, and embracing a secondary of an inductorium inserted in the line and localized means to induce impulses in said secondary in accordance with the characters to be transmitted, for the second message.

No. 102,117. Wire Strotcher. Tendeur dc fl.

John B. Adams, Jr., Malden, New York, U.S.A., 20th November, 1906; 6 years. Filed 23rd October, 1906. Receipt No. 140,509.
Claim.-1. A device of the character described comprising an S-shaped dog effective to be engaged with a bearing, and a manually actuated lever having a right angled terminal pivoted to one terminal of said dog and equipped with a clasp, said lever being adapted for movement toward said dog and means for limiting its movement in that direction.
2. A device of the character described comprising an \(S\) shaped dog effective for engagement with a bearing and having intermediately of its terminals an outstanding lug provided with a lateral stop, and a manually actuated lever having a right angled terminal pivoted to one terminal of said dog and equipped with a wire engaging clasp.
3. A device of the character described comprising an Sshaped dog equipped with a curved blade and a manually actuated lever having a right angled terminal and armed at its angle with a curved blade and having its right angled terminal pivoted to one terminal of said dog, said blades having their convexed and concaved cutting edges respectively to form a cutter as said lever is actuated.
4. A device of the character described comprising an \(\mathbf{S}\) shaped dog having intermediately of its terminals an outstanding lug provided with an adjustable lateral stop, and a lever having a right angled terminal pivoted to one terminal of said dog and equipped with a wire securing clasp. said lever being movable toward the dog and controlled in that direction by said stop.
5. A device of the character described comprising a dog effective for engaging with a bearing and a manually actuated lever having pivotal connection with said dog, said dog and lever having opposed terminals adapted to form pincers or pllers as shown.

No. 102,118. Wire Stretcher. Tendeur de 12.

Francis W. Bost and James W. Bolen, co-inventors, both of China Grove. North Carolina, U.S.A., 20th November, 1906: 6 years. Filed 1st October, 1906. Receipt No. 139,946.
Claim.-1. A wire stretcher comprising a frame, upper and lower inclined legs, said legs adapted to be driven into the post of a fence and braces adapted to engage opposite sides of said post, substantially as described.
2. In a wire stretcher the combination of a frame, a drum mounted on said frame and provided with ratchet teeth. a pawl adapted to engage said teeth, legs formed integral with said frame and adapted to be driven into a frame post. chain and hook devices adapted to engage opposite sides of said fence post, substantially as described.
3. A wire stretcher comprising a horizontally disposed frame, upper and lower inclined legs, said legs adapted to be driven into a vertical support, braces adapted to engage opposite sides of said support, a drum mounted on a rotating shaft, latches adapted to lock or release said shaft. a clinching device having a flexible connection connected with sald drum and means for rotating sald drum, substantially as described.
4. A wire stretcher comprising a frame, legs adapted to be driven into a suitable support and braces adapted to engage opposite sides of said support, substantially as described.

\section*{No. 102,119. Wire Fence Etretcher. \\ Tendcur de fl pour clôtures.}

Washington M. Dillon, Sterling, Illinols, U.S.A., 20th Novtmber, \(1906 ; 6\) years. Filed 6th October, 1906. Recelpt No. 140,096 .
Claim.-1. A device of the class named, comprising a frame adapted to be attached to the clamp bar of the fencing, a pair of similar ratchet wheels rotatably mounted in said frame a chain drum fixed between said ratchet wheels so as to rotate therewith, a chain engaged at one end by said drum and adapted to be secured to a ixture at tho
other end. a pair of ratchet arms engaging said pair of ratchet wheels, and means for actuating said ratchet arms

to alternately rotate the wheels engaged thereby, substantially as described.
2. In a wire fence stretcher the combination of a frame adapted to be attached to the clamp bar of the fencing, a pair of similar ratchet wheels rotatably mounted in said frame, a chain drum fixed between said wheels so as to rotate therewith, a chain actuated by said drum, a lever head pivoted on said frame centrally of such head, means for suitably oscillating such head, and means for imparting the movement thereof to said wheels to alternately rotate the same, substantially as shown and set forth.
3. In a device of the class named the combination of thte frame 1 , provided with the recess 10 , the pair of wheels 2,2 , rotatably mounted in said frame, the chain drum 3. fixed between the wheels 2 , the chain 8 , engaging the drum 3 , the head 5, provided with the recess 6 , and pivoted on the upper face of the frame 1, a pair of ratchet arms 7. 7, pivoted at one end in the recess 6 , on opposite sides of the pivotal point of the head 5 , and engaging the wheels 2 at their other conds to rotate such wheels, and means for sultably oscillating the head 5 , substantially as and for the purpose shown.
4. In a wire fence stretcher the combination of the frame 1 , adapted to be attached to the clamp bar of the wire fencing, a pair of ratchet whecls 2, rotatably mounted in said frame, a chain drum 3 , located between the wheels 2 , and rotating therewith, a chain 8 engaging the drum 3 , the head 5 pivoted on the frame 1 , and provided with recess 6 , a pair of ratchet arms 7 , pivoted in the recess 6 , and provided at their free ends with flanges 14 , engaging the wheels 2 , a block 13 fixed on the frame 1 , and limiting the movement of the head 5, and means for suitably oscllating such head, substantially as set forth.

No. 102,120. Wire Stretcher and Clamp.
Tendeur de fll de fer et crampon.

John W. Hardesty, Mount Eden, Kentucky, U.S.A., 20th November, 1906; 6 years. Filed 9th October, 1906. Receipt No. 140,161 .
Claitn.-In combination with a plate having an angled flange, a plurality of obliquely disposed slots in said plate, a gripping jaw positioned over said angled flange and having
serrations on the edge thereof, pins secured to sald jaw. one positioned in each of said slots, an apertured bar through which said pins pass. said bar being held upon the pins by the heads of the latter, a lever pivotally mounted upon said plate, a link pivotally connecting one of said pins with said lever whereby said jaw may be made to co-operate with the flange of said plate to securely hold a wire, as set forth.

\section*{No. 102.121. Lubricating Compound.}

Composé à lubrifler.
Edwin Ard Emery, Cripple Creek, Colorado, U.S.A., 20th November, 1906; 6 years. Filed 9th July, 1906. Receipt No. 137,654.
Claim-1. A solid lubricant for pneumatic machinery having lubricating ingredients incorporated one with the other at a consistency which secures disintegration under the erosive effects of an air current under pressure.
2. A solid lubricant for pneumatic machinery having lubricating agents and a solvent incorporated one with the other possessing an affinity for moisture in an air current under pressure and disintegrated by the erosive action of such current, and dissolved by the moisture contained therein.
3. A moulded solid lubricant for pneumatic machinery having lubricating ingredients, and an anti-refrigerating agent incorporated one with the other at a consistency which secures disintegration under the erosive effect of an air current, the ingredients of the solid charge having an affinity for the moisture present in the air current, and the lubricant as a whole resisting the freezing action of an air current thereon.
4. A substantially neutral lubricant for pneumatic machinery comprising a saponaceous substance, plumbago and mucilaginous extract of slippery elm bark incorporated with a neutral salt and a solvent.
5. \(\Lambda\) solid lubricant for pneumatic machinery having a saponaceous substance. plumbago and fluid extract of slippery elm bark as lubricating ingredients. salt as a nonrefrigerant, and water as a solvent, the whole being combined in substantially the proportions specified.
6. A lubricant consisting of soap. plumbago. mucilaginous extract of slippery elm bark. a neutral salt, and water in about the proportions specifled.
7. A substantially neutral lubricating composition. comprising lubricating ingredients, and an anti-refrigerating agent incorporated therewith.
8. A substantially neutral solid lubricant adapted for disintegration by air current. comprising soap, elm bark solution, plumbago, and an anti-refrigerating agent combined and incorporated one with the other.

\section*{No. 102,122. Protector for Telegraph Poles. Protection pour potcaux de télégraphe.}

Benjamin W. Hyder, Rutherforton, North Carolina, U.S.A.20th November, 1906; 6 years. Filed 24th October. 1906. Receipt No. 140,575.
Claim.-A device of the class described comprising a tubular metal casing designed to inclose the lower end of a pole. a shield fitted on the latter to house the upper end of the casing. said shield having a tubular portion, and a flexible. impervious guard fitted on the tubular portion of the shield and arranged to tightly embrace the pole at 2 point above the sama.

No. 102,123. Ewvolope Soelteg Machine.
Machine à sceller les enocloppes.

John A. Markoe, White Bear, Minnesota, U.S.A., 12th November, 1906; 6 years. Filed 10th May, 1906. Receipt No. 135,766.
Claim-1. The combination with a moistening device and co-operating movable upper and lower and intermediate feed devices, of means for directing the gummed flaps of the onvelopes to the said molstening device while subject to one of said feed devices, and yielding flap pressing rod or arm arranged to press the envelope flaps against the moistening device, substantially as described.
2. The combination with a moistening device including a water distributing roller, of a yielding flap pressing rod overlying said roller, upper and lower and intermediate feed rollers, and a deflecting device, said upper and intermediate rollers being arranged to feed the envelopes and to carry their gummed flaps over the water distributing roller, and said deflecting device being arranged to feed the inverted envelopes between said intermediate and lower feed rollers, to seal the same, substantially as described.
3. In an envelope sealing machine the combination with means for moistening the gummed flaps thereof. of upper and lower and intermediate feed rollers, a deflecting device arranged to receive the envelopes fed from between the upper and intermediate rollers, and to direct the same between the intermediate and lower roller, and a yielding stop rod overlying said feed rollers and arranged to assist in imparting an initial movement of the inverted envelope between said intermediate and lower feed rollers, substantially as described.
4. In an envelope sealing machine the combination with means for moistening the flaps thereof, of upper and lower and ylelding feed rollers, a deflecting plate arranged to receive the envelopes delivered from between the said upper and intermediate feed rollrs, and to deliver the same between sid intermediate and lower feed rollers, and a pivoted gravity actuated stop rod overlying sald feed rollers, and arranged to assist in imparting an initial movement of the inverted anvelope between said intermediate and lower feed rollers, substantially as described.
5. In an envelope sealing machine the combination with means for molstening the gummed flaps thereof, of upper and lower and intermediate feed rollers, a deflecting plate arranged to recelve the envelopes fed from between the upper and intermediate rollers and to direct the same between the intermediate and lower rollers, a stop plate rigidly but adjustably secured with respect to sald deffecting plate, and a y:elding stop rod loosely resting upon said stop plate, and adiustable therewith, substantially as described.
6. In an envelope sealing machine the combination with a moistening device, of upper and lower and intermediate feed devices extending parallel with and below said moistening device, of a yielding stop arranged to act upon the envelopes and to assist in directing the same between the intermediate and lower feed devices, substantially as described.
7. In an envelope sealing machine the combination with a ccrrugated intermediate feed roller, of a co-operating upper ffed roller corrugated ai its central portion only, a lower ffed device co-operating with said intermediate feed roller. means for directing the ellvelopes between said upper and intermediate feed rollers. and means for moistening the flaps of the envelopes while they are being thus fed to the said intermediate and upper feed rollers, substantially as described.
8. In an envelope sealing machine the combination of upper and lower and intermediate feed rollers, said intermediate feed roller being corrugated, and said upper feed roller being corrugated at its central portion only, and the said upper and intermediate rollers having smooth engaging end portions, substantially as and for the purposes set forth.
.9. In an envelope sealing machine the combination with upper and lower and intermediate feed rollers, of a deflecting device arranged to receive the envelopes from between said intermediate and upper feed rollers, and to deliver the same between said intermediate and lower feed rollers, a vertically adjustable receiving deck below said feed rollers, and a pair of clamping members for holding the envelopes upon said receiving deck, one of which clamping members is movable with respect to the other, to permit the accumulation of envelopes, substantially as described.

No. 102,124. Zarm. Fil.

Henry Ryder, New York City.• New York, U.S.A.. 20th Norember, 1906; 6 years. Filed 22nd October, 1906. Receipt No. 140.508 .
Claim.-1. A yarn comprising a core of wire and parallel Abres spun directly on, lengthwise of and spirally around said wire core.
2. A yarn comprising a core of wire and parallel flbres spun directly on, lengthwise of and spirally around said wire core, in such manner that the settlement of the flbres when the yarn is put under longitudinal strain is substantially equal to the elasticity of the wire core.
3. A yarn comprising a cole of wire, and fibres supplied lengthwise of and enveloping said wire and then spun collectively in parallel position about said wire core, in such manner that each fibre has substantially the same tension with respect to the others, and the fibres collectively have the same tension as the wire core, when the wire is put under lengitudinal strain.
4. The method of producing yarn which consists in supplying fibres to a core of wire lengthwise of and enveloping said core of wire. and then spinning said tibres collectively in parallel position about said core of wire in such a manner that when the yarn is put under longitudinal strains the individual fibres shall have substantially the same tension with respect to each other and the fibres collectively shall have the same tension as the core of wire.

No. 102,125. Tranamitter for Wireless Telegraphy.
Transmetleur pour télégraphic same Als.

Harry Shoemaker, Jersey City. New Jersey, U.S.A., 20th November. 1906; 6 years. Filed 9th March, 1906. Receipt No. 133,694 .
Olaim.-1. In a wireless telegraph transmitter, a rack, a plurality of Leyden jars mounted therein, a drum member mounted upon said rack, spark gap terminals within said
drum and mounted upon the heads thereof, and an inductance winding surrounding said spark gap terminals and supported by sald drum.
2. In a wireless telegraph transmitter, a rack, a plurality of Leyden jars mounted therein. spark gap terminals mounted uron said rack, and an inductance winding suronuding said terminals and rotatable with respect thereto and mounted uron sald rack.
3. In a wireless telegraph transmitter, rack, a plurality of Leyden jars mounted thereln. spark gad terminals mounted within a drum, sald drum bring mounted upon said rack, and ar inductance winding rotatable upon said drum.
4. In a wireless telegraph transmitter, a drum, spark gap terminals within said drum and mounted upon the heads thereof. an inductance winding intermediate said drum heads and rotatable with respect thereto.
5. In a wireless telegraph transmltter. a drum. spark gap terminals therein and supported by the heads thereof, a mufflor within said drum and inclosing said spark gap terminals, an inductance winding surrounding said spark gap terminals, a frame supporting sald winding. and means permitting the rotation of said trame with respect to sald drum.
6. In a wireless telegraph transmitter. a drum. spark gap treminals mountod therein and supported by the heads thereof. an inductance winding surrounding sald snark gap torminals. and rotatable upon said drum and means for maintaining elertrical communication between said winding and a spark gap terminal.
7. In a wireless telegraph transmitter a condenser. a container therefor, an inductaner winding supported upon said container and spark gap terminals surrounded by said winding.
8. In a wireless telegraph transmitter, a condenser, a container therefor, spark gap terminals supported upon said containcr, and an inductance winding surrounding said spark gap terminals and rotatable with respect thereto.
?. In a wireless telegraph transmitter, a condenser, a contalner therffor, an inductance supported upon said container. and means for rotating said inductance whereby the amount of inductance co-operating with said condenser may be varled.
10. In a wireless telegraph transmitter. a condenser, a container therefor. spark gap terminals supported upon said contained, an inductance winding surrounding said spark gap terminals and connections for the radiating conductor and earth at terminals of said condenser.
11. In a wircless telegraph transmitter, a plurality of condrnsers, a container therefor, spark gap terminals supported upon said container, an inductance winding. surrounding said spark gap terminals, said spark gap, inductance winding, and condensers being serially connected, and connections for the radiating conductor and earth at the terminals of a condenser.
12. In a wireless transmitter, a plurality of Leyden jars in series parallel grouping, a container therefor, spark gap terminals supported upon said contalner, an inductance winding surrounding said spark gap terminals, and connections for radiating conductor and earth at the terminals of a group of said Leyden Jars.
13. In a wireless telegraph transmitter, a plurality of Ieyden jars, a container therefor, an inductance winding supported upon said container, and spark gap terminals surrounded by said winding.
14. In a wireless telegraph transmitter, a plurality of Leyden jars, a contalner therefor, an inductance winding supported upon said container, spark gap terminals surrounded by said winding, and Leyden Jars, inductance winding and spark gap being serially connected.
15. In a wireless telegraph transmitter, a frame, an Inductance winding supported thereon, spark gap terminals supported by and surrounded by said inductance winding.
16. In a wireless telegraph transmitter, a frame, an inductance winding supported tereon, spark gap terminals supported thereby and surrounded by said inductance winding. and means permitting rotation of said inductance winding.
17. In a wireless telegraph transmitter, a condenser, a container therefor, an inductance supported upon said contalner, and means for rotating said inductance, said inductance and condenser being frequency determining elements of an oscillating circuit.
18. In a wireless telegraph transmitter. a condenser, a containes therefor. an inductance supported upon said container, spark gap terminals supported upon said container and surrounded by said inductance, said spark gap, inductance and condenser being arrially connected.
14. In a wireless telegraph transmitter, a condenser, a container therefor, an inductance supported upon said container, spark gap terminals surrounded by said inductance, and a muffler surrounding said spark gap terminals.
20. In a wireless telegraph transmitter, a condenser, a contalner therefor, an inductance supported upon sald con-
tainer, spark gap terminals supported on said container. and a muffier enclosing said spark gap terminals.
21. In a wireless telegraph tranimitter, a condenser. container therefor, an inductance supported upon said container, spark gap terminals surrounded by said inductance and a muffler enclosing said spark gap terminals
22. In a wireless telegraph transmitter, an inductance winding, and spark gap terminals co-operating therewith and surrounded thereby.
23. In a wireless telegraph transmitter, a condenser, a container therefor. an inductance winding supported thereon. spark gap terminals supported thereon, and means for con necting said condenser, spark gap, and inductance winding in series with each other.
24. A portable oscillator, comprising a condenser, an adjustable inductance and a spark gap.
25. In combination, spark gap terminals, a muming chamber enclosing the same, the walls of said chamber being composed of micanite.
26. In combination, an inductance winding. a support therefor. spark gap terminals mounted on sald support and surrounded by sald winding, and a mufling chamber enclosing said spark gap terminals.
27. In combination, spark gap terminals, a frame supporting the same, an inductance winding, a support therefor said support and frame being rotatable with respect to each other.

\section*{No. 102,126. Shock Loader.}

Machine de charger les gcrbes.

Thomas Robson and Walter George Fisher, co-iuventors both of Alliston. Ontario, Canada, 20th November. 16 in 6 years. Filed 29th August, 1906. Recelpt No. 13s.07:
Claim.-1. Io a shock loader the combination with ib. main frame and main wheel and end supporting wheel. \(s\) : the inclined picker elevator, located in front of the ma:s frame at one side, and comprising side boards, endles: chains carrying the bars and prongs, and the longitusibal shields extending from top to bottom of the elevator asd between which the prongs travel, as and for the purpose speciffed.
2. In a shock loader the combination with the main fram: and main wheel and end supporting wheel, of the inclines picker elevator located in front of the main frame at oz: side, and an extension bar at the opposite side and the leading wheels and draft tongue suitably connected to the fron: end of the extension bar, as and for the purpose speciar.
3. In a shock loader the combination with the main iramand main wheel and end supporting wheel, of an incline: picker elevator located in front of the main frame at nse side, an extension bar at the opposite side, a fore carriagpivotally connected to the extension bar, and compris!ne a crossbar pivotally connected to the end of the extens: bar. crank levers pivotally connected to the and of th. crossbar, co-acting toothed quadrants secured io tbu da: supporting wheels journalled on the ends of the crant levers and a tongue secured centrally to the croasbar \(s\) : the carrlage, as and for the purpose specifed.
4. In a shock loader the combination with the main frame and supporting wheels, of the inclined picker elevator located in front of the main frame at one side and comprising side boards, upper and lower cross spindles journalled in the side boards, sprocket wheels secured thereon to each side of the elevator, connecting spocket chains therefor. arc-shaped projections on the upper pair of sprocket wheels, crossbars provided with prongs and pivotally secured to the links of the endless sprocket chain, rearwardly extending arms designed to ride up onto the arc-shaped projections of the sprocket as the chain revolves, as and for the purpose specified.
5. In a shock loader, the combination with the main frame and supporting wheels, of the inclined picker elevator comprising side boards provided with upper and lower longitudinal guiding strips, upper and lower journalled shafts in the side boards, sprocket wheels secured to the spindles, arc-shaped projecting plates secured to the upper wheels and having laterally extending lugs, connecting sprocket chains between the upper and lower wheels, crossbars provided with prongs and extending between the sprocket chains in which they are journalled at their ends, arms extending from the crossbars in the direction of movement of the bars, rollers journalled on the ends of the bars and on the arms and designed to travel in the sald guiding strip, as and for the purpose specified
6. In a shock loader, the combination with the main frame and supporting wheels and inclined picker elevator, of a cross conveyer, and elevating conveyer, a supporting strut for the elevating conveyer pivoted at its lower end on the main frame, a roller journalled in proximity to the end of the strut, a bracket forming a guideway secured to the elevating conveyer and designed to receive the roller of the strut, an axle journalled in the side boards of the elevating conveyer, a crank handle for the axle and a flexible connection between the upper end of the strut and the axle, \(2 s\) and for the purpose specified.
7. In a shock loader the combination with the main frame and supporting wheels and inclined picker elevator, of a cross conveyer, an elevating conveyer provided with side boards having longitudinal slots therein, a supporting strut for the elevating conveyer pivotally supported at its lower end and designed to engage and have movement in the slotted side board at its upper end to support the elevating conveyer and means for swinging the strut on its pivot, as and for the purpose specified.
8. In a shock loader, the combination with the main frame and main wheel and end supparting wheel, picker elevator, cross conveyer and elevating conveyer, of a gear secured o the main wheel, a main shaft journalled on the frame, a pinion secured at one end and meshing with the main gear, a sprocket, a clutch connection between the sprocket and main shaft, a connecting sprocket chain between the sprocket on the main shaft and the driving sprocket of the picker elevator, a bevel gear on the main shaft, a counter shaft, a bevel pinion thereon meshing with the main bevel gear on the main shaft, a sprocket on the counter shaft connected thereto by a slidable clutch connection. a sprocket chain connecting the countershaft and the driving gear of the elevating and picker carriers, as and for the purpose specified.

\section*{No. 102,127. Boiler Cleaning Compound.}

\section*{Composé à nettoyer les chaudières.}

The John Callahan Co., assignee of John Callahan, both of Seattle, Washington, U.S.A.. 20th November, 1906; 6 years. Filed 5th February, 1906. Receipt No. 132.574.
Claim.-1. A cleaning compound having incorporated therein silicate of soda, cutch and glucose.
2. A cleaning compound having incorporated therein a sllicate, and an astringent extract and glucose.
3. A cleaning compound having incorporated therein an alkaline silicate, and an astringent.
4. A cleaning compound having incorporated therein a silica silicate and an astringent extract.
5. A cleaning compound composed of 75 per cent alkali, 10 per cent cutch, 10 per cent glucose and one per cent carmine.

No. 102,128. Method of Manufacturing MaltoDiastasted Milk. Méthode de fabrication de lait malto-diasté.
La Société Le Lait, assignee of Eugéne Terrien, both of Paris, France, 20th November; 1906. Filed 15th May, 1906. Receint No. 135,935 .

Claim.-1.-A malto-diastased milk for feeding infants. or convalescent adults, produced by mixing with an infusion of crushed malt, made at \(60^{\circ} \mathrm{C}\), a boiled food obtained by heating while cold, into a mixture of 3 , \(\frac{1}{3}\) of a litre of milk, according to circumstances, and of \(\frac{1}{2}\), or of water,
about 70 grammes of meal, cream, or flour of cereals, then cooking it at \(100^{\circ} \mathrm{C}\) for one quarter of an hour, and then allowing it to cool down to \(80^{\circ}\), at which temperature the mixture with the infusion of malt is effected, the said mixture being sweetened, and heated again to \(100^{\circ}\), then cooled.
2. The application to the malto-diastased milk characterized by a mixture of crushed malt, milk, water and meal as described, of known processes for the preservation and concentration of milk, and in particular the process of preservation under pressure of oxygen, which consists in enclosing the milk to be. preserved in hermetically closed receptacles in which it is subjected to a pressure of oxygen at the same time as it is agitated and slightly heated. or else to known processes of sterilization at a high temperature. care being taken in this case to avoid deterioration and coagulation of the milk, by previously alkalizing it after maltosing.

\section*{No. 102,129. Rubber Composition.}

Composition de caoutchouc.

James P. Crane, Chicago, Illinois, U.S.A.. 20th November
1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,150 Claim.-1. A new composition of matter consisting of elastic vulcanized rubber as a base and elongated, crumpled and interlocking metallic flbres incorporated therewith throughout the mass.
2. A new composition of matter consisting of a mass composed of vulcanized rubber in an elastic and flexible condition substantially throughout which is distributed metallic wool in proportions by which elasticity and pliability of the mass is due to the rubber and at the same time producing a resisting wearing surface therefor, substantially as described
3. A new composition of matter consisting of vulcanized rubber, having steel wool uniformly distributed therethrough in such proportions as to produce a resisting wearing surface for a mass of rubber the elasticity and pliability of which is due to the rubber, substantially as described.
4. A new composition of matter consisting of a vulcanizable gum as a base, and a resilient metallic fibre incorporated therewith.

\section*{No. 102,130. Rubber Compound.}

\section*{Composé de caoutchouc.}

Lucien Roland, Paris, France, 12th November, 1906, 6 years. Filed 29th May, 1906. Receipt No. 136,378.
Claim.-An elastic substance analogous to rubber, obtained by combining a mixture of gelatine and glycerine taken in a liquid state, with an aqueous solution of chromates or chromic acids, the quantity of glycerine employed surpassing by one-tenth in weight that of the gelatine, while the quantity of chromates is equal to about five hundredths of such quantity of gelatine, the weight of water employed to dissolve the chromates being equal to about twice the weight of such chromates, a little more or a little less according as the proportion of glycerine in the mixture is more or less strong, such water remaining enclosed in the substances under the form of water of constitution.
No. 102,131. Check Valver Soupape d'arrêt.
George W. Rich, Memphis, Tennessec, U.S.A., 20th November. 1906; 6 years. Filed 24th October, 1906. Receipt No. 140,574.
Claim.-1. A check valve for the purposes set forth embodying in its construction a casing provided with a screwthreaded stem, two connections, each provided with a valve seat, one connection being adapted to be screwed into the casing and the other adapted to be attached to the firstnamed by screw-threaded means, a wing valve seated in
cach connection, a stuffing box in the casing over the center of the upper valve, a seem extended through said stufing

box and a handle on the outer end of the said stem to enable it to be turned down on the upper valve and press it down to the steam tight degree upon its seat.
2. A check valve for the purposes set forth embodying. in its construction a casing provided with a screw-threaded stem, two connections, each provided with a valve seat, one connection being adapted to be screwed into the casing and the other adapted to be attached to the first-named by screw-threaded means, a wing valve seated in each connection, a stuffing box in the casing over the center of the upper valve, and means extended through said stuffing box and adapted to act upon the valve therebelow to press it down and hold it upon its seat.
3. A check valve comprising a casing, means for securing the casing to a steam boiler, two connections each provided with a valve seat, and a wing valve seated in each connection, in combination with means for securing one valve rigidly upon its seat.
4. A cheok valve comprising a casing. moans for securing the casing to a steam boller, two connections each provided with a valve seat, and a wing valve seated in each connection one above the other, in combination with means for securing the upper valve rigidly upon its seat and permitting the lower valve and its connection to be removed.

\section*{}

John H. Chandler, Indian Orchard. Massachusetts, U.S.A.. 20th November. 1906: 6 years. Filed :1th October, 1906. Recoint No. 140,16 :
Claim.-1. The combination in a plug valve of a body havInz a spirally dis!osed projection theruin, a plug, a stem confircted with the plug and arranged to impart a rotary and a lifting movement thereto, and means of engagement between
the plug and said projection to effect the rotation of the plug by the downward movement of the latter.
2. A plug valve comprising a body, a tapered plug. a stem ccnsisting of two parts, one of which extends outalde of the body and is revoluble in a subatantially fixed plane, a atem on a plug having a screw engagement with the first-named stem to raise the plug to a seating position agalnst the under side of the cap, and to rotate it in one direction.
3. A plug valve comprising a body, a tapered plug, a stem consisting of two parts, one of which extends outside of the body and is revoluble in a substantially fixed plane, a stom on the plug having a screw engagement with the first-damed stem whereby the latter, when turned in one direction will raise the plug to a seat against the under side of the cap. In the body, the plug rotating with the stem, the rotation of the latter in the opposite direction imparting vertical movements only to said plug together with a device to effect the rotation of the plug during the said vertical movement.

No. 102,133. Chatix Irom. Chaise de fer.

Juhn Gilson, Jr., Port Washington, Wisconsin, U.S.A.. soth November, 1906: 6 years. Filed 20th August. 1906 Rccelpt No. 138,869 .
('laim.-1. The combination in a chair spider, of a traasverse spreader plate terminating in ears, a yoke for conneciion with the adjusting post and provided with a central standard and at opposite sides thereof with rocker arms. a pintle between the yoke and ears, a \(U\)-shaped plate arranged under the spreader plate at opposite sides of the rocker arma. said U-shaped plate being provided at its rear with one member of a spring support and having its opposite branohes recessed to recelve the upper ends of the rocker arms, an adjusting rod extending beyond the rear spring support of sald U-shaped plate and the central standard of the yoke, an adjusting wheel at the front end of said rod, a yoke plece at the rear end thereof, and colled springs interposed between the yoke plece and the spring support at the rear end of the U-shaped plate.
2. The combination in a chair spider, of a transverse spreader plate having depending ears. spider arms arranged or the plate, a yoke having an eye for receiving the adjusting post and provided with a central standard and opposite rocker arms, a transverse pintle passing through the yoke and the ears of the spreader plate, a spring supportine plate arranged under the spreader plate to reinforce the same. said spring supporting plate being of \(U\)-shape and having its opposite arms or branches recessed to reocive and form stops for the rocker arms and at its rear end providod with a tiansverse spring support extending above its arzis or bianches and having the shoulder 9 against which the spreader plate abuts, a tension rod mounted in the central standers and spring support of said \(U\)-shaped plate, a yoke plece as the rear ond of the rod, springs interposed between the yoke piece and the spring support of said U-shaped plate, an atjusting wheel at the front end of said rod, and rivels paned through the spider arms, spring plate and arms or branche of the \(U\)-shaped plate.
3. The combination in a chair spider, of a transvers spreader plate having depending bearing ears, spider arms arranged on the plate, a yoke having an eye for recelving the adjusting post and provided with a contral standard and opposite rocker arms, a transverse pintle passing through thr yoke and the ears of the spreader plate, a spring supportion plate arranged under the spreader plate to relnforce tar same. said spring supporting plate being of \(\mathbb{C}\)-shape and havirg its opposite arms or branches recessed to receive asd fcrm stops for the rocker arms, and at lts rear end provided with a transvirse spring support extending above tis arm or branches and having the shouliar 9 agminst which the spreader plate abuts, a tension rod mounted in the retital
standard and spring support of said \(U\)-shaped plate, a yoke plece at the rear end of the rod, springs interposed between the yoke piece and the spring support of said \(\mathbb{U}\)-shaped plate, and an adjusting wheel at the frint end of said rod.

No. 102,134. Chair Iron. Chaise de fer.

Harry W. Bolens, Port Washington, U.S.A., 12th November. 1906; 6 years. Filed 20th September, 1906. Recelpt No. 139,663.
Claim.-1. The combination in a chair iron, of a spreader plate, a pivotal supporting meaus therefor, a substantially U-shaped spider arm frame formed of angle iron baving its central portion shaped to form a point of contact and perforated to receive attaching scraws, and its opposite terminals constituting spider arms secured upon the spreader plate, and a rear transverse spider arm mounted on the terminals of the \(U\)-shaped spider arm frame and the spreader plate and having its ends shaped to form opposite contacts and perforated to receive attaching screws.
2. The combination in a chair iron, of a spreader plate, a plvotal support therefor, a substantially \(U\)-shaped spider arm frame formed of angle iron having its central portion upwardly disposed to form a contact point and perforated and its opposite terminals forming spider arms and embracing the opposite edges of the spreader plate, a rear transverse spider arm formed of angle iron and mounted upon the terminals of the spider arm frame and the rear end of the spreader plate, and rivets passing through the arms and plates.
3. The combination in a chair iron, of a spreader plate, opposite spider arms formed of angle iron embracing the opposite side edges of sald spreader plate, a rear transverse spider arm formed of angle iron and embracing the rear edge ot the spreader plate and surmounting the rear terminals of the spider arms, and rivets passed through the two sets of spider arms and the spreader plate.
4. The combination in a chair iron, of a yoke having opposite stop shoulders, a spreader plate pivotally mounted on the yoke, and spider arms formed of angle iron mounted on the spreader plate and embracing the same, whereby the lower edges of the spider arms are adapted to contact with said stop shoulders and limit the pivotal movement of the spreader plate.
5. The combination in a chair iron, of a yoke, a spreader plate pivotally supported therein, a bridge plece engagin: the front of the spreader plate and extending between the yoke terminals and out of contact therewith, and a tension device carried by the bridge piece.
6. The combination in a chair iron, of a yoke, a spreader plate pivotally mounted therein, a bridge piece depending from the front edge of the spreader plate and having an extension passed under and braced against the spreader plate, and a tension device carried by the bridge piece.
7. The combination in a chair iron, of a yoke. a sheet metal spreader plate pivotally supported in the upper end thereof, a bridge piece formed indegendent of the spreader plate and comprising an upper widened engaging end taking over the edge of the spreader plate, a depending apron out of contact with the yoke, a brace extending rearwardly and contacting with the spreader plate, and a tension device carried by the apron.
8. The combination in a chair iron, of a yoke, a spreader plate pivotally mounted therein, a bridge piece comprising a widened bifurcated upper end terminating in spreader plate engaging fingers, a depending apron, a rearwardly disposed plate passing under the spreader plate. a bracing web between the apron and plate, and a tension device carried by the apron.

11-16
9. The combination in a chair iron, of a yoke, a spreader plate pivotally mounted therein, a bridge plece comprising a widened bifurcated upper end terminating in spreader plate engaging fingers, a depending apron, a rearwardly disposed plate passing under and braced against the spreader plate, and a tension device carried by the apron.
10. The combination in a chair iron, of a spreader plate means for supporting same, a spider arm frame formed of an angle Iron. said frame having a V-notch formed in its upper horizontal flange and its edges brought substantially in contact to form a point of contact, the terminals of sald frame being secured to the spreader plate.
11. In a chair iron the combination with a spreader plate and a yoke for supporting the same, of an apron bearing at its front end against the front endge of the spreader plate and having its rear portion extended under and bearing against the spreader plate, and a tension device carried by said apron.
12. In a chair iron, the combination with a spreader plate and a yoke for supporting the same, of an apron connected at its front end to the front of the spreader plate and having its rear portion extending under and bearing against the under side of the spreader plate, and a tension device carried by said amron.

No. 102,135. Folding Eeat and 8tep.
Sieges et marches pliants.

Charles N. Hazelton, Morrison, Illinois, U.S.A., 20th November, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,485 .
Claim.-1. In a combined folding seat and step, the combination of an inner pair of legs, a step rigidly uniting such legs at their central points, an outer pair of legs spaced apart from said inner pair, and pivotally secured thereto at their central points, the upper parts of said outer pair of legs being hingeably secured to the lower parts, above the pivotal points thereof, so as to fold over into proximity with the inner pair of legs, means for holding the upper parts of each adjacent pair of legs from accidental closing. means for limiting the separation of the lower parts of said legs, when in use, and a folding back, pivotally secured to the outer pair of said legs, and adapted to fold downwardly to form a support, when said device is in use as a step, substantially as shown and set forth.
2. The combination with a pair of spaced apart legs 1 and 4, pivotally attached at their central points, of a brace 11, pivotally secured at each of its ends to one of said legs, and comprising two plates 12 and 13 , pivotally united centrally of said brace, so as to fold downwardly into the space between said legs, the inner ends of sald plates being projected beyond the givotal point. the inner end of the plate 12 coming in contact with a stud 15 fixed on the plate 13 , and the inner end of the plate 13 engaging a boss 16 on the plate 12, so as to lock said brace from accidental closing, substantially as shown and described.
3. In a folding seat and step the combination of a pair of legs 1, provided with a cross piece 2, the pair of legs 4 plvotally attached to the legs 1 at their central points, and provided with the cross piece 6 , a pair of supports 18 . pivoted on the legs 4 , and united by the back 17 , and the buttons 23 pivoted on the strips 18, and adapted to be turned inwardly into engagement with the ends of the cross piece 2, to support the back thercon, substantially as and for the purpose named.

Ne. 102,136. Apparatus for Manufacturing Uphelatery.
Appareil pour la fabrication de tapisserie.

Edwin M. Hulse, Columbus, Ohio, U.S.A., 20th November, 1906; 6 years. Filed 4th August, 1906. Receipt No. 138,410.
Claim.-1. In apparatus for the manufacture of upholstery, a table comprising two parts each having its edges provided with button holders and means for moving the parts of the table asunder.
2. In apparatus for the manufacture of upholstery, a table upon which the upholstery can be supported having its opposite edges provided with grooved botton holders and means whereby said button holders can be moved asunder.
3. In apparatus for the manufacture of upholstery, a table upon which the upholstery can be supported having its edg. provided with a grooved button holder into which the buttons can be slid and from which button holder the said buttons can be slid after the application of the upholstery covering material thereto.
4. In apparatus for the manufacture of upholstery, a table upon which the upholstery can be supported having its opposite edges provided with grooved button holders into which the buttons can be. slid and from which button holders the said buttons can be slid after the application of the upholstery covering material thereto and means for moving said button holders asunder.
5. In apparatus for the manufacture of upholstery. a table upon which the upholstery can be supported, said table having near its edge a grooved button holder into which buttons can be slid and from which they can be removed after application to the upholstery. said button holder being movable with respect to the supported upholstery.
6. In apparatus for the manufacture of upholstery, a table upon which the upholstery can be supported, sald table having near its edge a grooved button holder into which buttons can be slid and from which they can be removed after application to the upholstery, said button holder being movable with respect to the supported upholstery, combined with means whereby sald button holder may be moved with respect to the supported upholstery and for retaining the same in the position to which it is to be moved.
7. In apparatus for the manufacture of upholstery. the combination of a table for supporting the upholstery, a holder for a pronged fastening device at the cdge of said table, said holder adapted to support said fastening device with its prong lying in a plane substantially parallel to the plane of the top of the table, and means tending to provent the removal of the rastening device from said holder in a direction colnciding with the direction of the prong.
8. In apparatus for the manufacture of upholstery, the combination of a table for supporting the upholstery, a holder for a pronged fastening device at the edge of sald table, said bolder adapted to support sald fastening device with its prong lying in a plane substantially parallel to but below the plane of ho top of the table, and means tending to provent the removal of the fastening device from said
holder in an outward direction coinciding with the direction of the prong.
9. In apparatus for the manufacture of upholstery, the combination of a table for supporting the upholstery. a holder for a pronged fastening device at the edge of sald table adapted to support said fastening device with its prong lying in a plane substantially paralled to the plane of the top of the table, said holder being movavble with respect to the supported upholstery and means tending to prevent the removal of the fastening device from said holder in an outward direction coinciding with the direction of the prong.

No. 102,137. Biscuit Machine and Baldig Devico. Apparcil d faire et cuire les biscuits.

Yasuke Kawasaki, Vancouver, British Columbia, Canada, 20th November, 1906; 6 years. Filed 18th June. \(1900^{\circ}\). Heceipt No. 137,007.
Claim.--1. As a means for forming and baking wafer bis. cuits of the class described. the combination with upper and lower plane surfaced plates hinged together so that the plates may be laid open and their adjacent surfaces exposed. means for maintaining both plates at a constan: temperature whether open apart, or closed one on the other. stops to regulate the distance apart of the plates when closed one on the other, means for securing the plates tightly together in the closed position, an open batter containing box mounted on wheels and a track so as to be movable over one of the plates, the bottom of such box having a series of apertures through it. and means for simultantously opening and closing said apertures.
2. As a means for forming and baking water biscuits. the combination with plane surfaced plates hinged together no that one may be folded on the other, means for uniformir and uninterruptedly heating said plates, a batter holding riceptacle movable over one of said plates, said receptacle. having a series of apertures through its bottom and mean: for opening and closing said apertures.
3. As a means for forming and baking wafer blscults, th. combination with plane surfaced plates hinged that th. plane surfaces may be exposed upward or closed one on the other, means for uniformly and uninterruptedly beatink said plates, a batter holding receptacle having a series " apertures through its bottom, said receptacle being morabl-. on a carriare which itself is movable over one or other othe plates and has a plane surface provided with apertures corresponding with those in the bottom of the aforementioned recuptacle, and means for moving the recoptacle in relation to its carriage so as to open or close the apertures in the botiom of the receptacle.
4. As a means for forming and baking wafer biscuits, the combination with plane surfaced plates hinged that the plane surfaces may be exposed upward or closed one on the other. means for uniformly and uninterruptedly heating said plates, a batter holding receptacle movable over one or other of the plates having a series of apertures in the bottom which may be opened or closed, bridge bars across the receptacle having a series of screws threaded therethrough corresponding to the apertures in the bottom of the receptacle. said screws having conical lower ends which may be inserted in the apertures to regulate the flow of the batter through them.

No. 102,138. Umbrella Frame. Cadre de parapluie.

Alphonse Lenoir, administrator of the estate of Patil SergeKisslow, deceased, Portland, Oregon, U.S.A., 20 th November, 1906; 6 years. Filed 11th September, 1905. Receipt No. 128,369.
Claim.-1. A runner comprising in combination a stem a, and a longitudinally movable spring controlled sleeve on said stem, the said stem and said sleeve each being made with a flaring lower end, provided with an inwari taper or chamfer and adapted to depress the detaining spring on the umbrella stick, so that the runner may be drawn over the same, substantially as described.
2. A runner comprising a stem and a longitudinally movable spring controlled sleeve on said stem, said stem and said sleeve each being made with a flaring lower end provided with an inward taper or chamfer, and adapted to depress the detaining spring on the umbrella stick, so that the runner may be drawn over the same, and the lower end of said sleeve being further made with an integral socket head \(e\). adapted to be slipped over and hold the free ends of the ribs, when arranged together. substantially as described.
3. A runner comprising a stem \(n\) and a longitudinally movable sleeve \(r\), on said stem, which sleeve comprises a contracted upper end sliding on said stem, and a body of greater diameter than said stem. a coil spring within the sleeve holding the latter in its normal position, the lower and of said stem a being made with a bearing for the lower end of the sleeve \(r\) to slide on, said stem and said sleeve each being made with a flaring lower end provided with an inward taper or chamfer, and adapted to depress the detaining spring on the umbrella stick. so that the runner may be drawn over the same, and the lower end of said sleeve being further made with an integral socket head \(e\), adapted to be slipped over and hold the free ends of the ribs, when arranged together, substantially as described.

No. 102,139. Wigwam. Futte indicnnr.

John Albert Lynn. Charlevois. Michigan, U.S.A., 20th November, 1906; 6 years. Filed 24th July, 1906. Receipt No. 138,134.
Claim.-1. In a sectional knock-down pyramidal wigwam, a triangular section consisting of side bars bevelled on their outer faces and upper ends, inner transverse braces, outer transverse tie rods, and bark layers attached to said side bars and clamped between said braces and tie rods, substantially as speciffed.
2. A knock-down pyramidal wigwam, consisting of detachable sections having bevelled frame bars, transverse braces and tie rods, lining layers and outer overlapping layers og bark. connecting bolts, and a detachable knocklown top binder, substantially as specified.
3. A sectional nyramidal wigwam having long angular detachable sections, a short triangular detachable section, their connecting bolts, and a detachable pyramidal top binler. substantially as specified.

No. 102,140. Cock for Water Supply Apparatus. Robinet \(\dot{\text { à eau. }}\)

Joseph Mouhlen, Dusseldorf. Germany, 20th November, 1906;
6 years. Filed 6th September, 1906. Receipt No. 139,307. Claim.-1. Controlling the supply of water to domestic and similar service pipes and taps by the insertion in the water pipe immediately behind the service tap of a three-way cock, the plug \(e\) of which is so constructed that the supply of water to the service tap \(a\) or to the service pipe \(h\) or to both simultaneously can be shut off, in which latter case the service pipe \(h\) is put in communication with the service tap \(a\).
2. A service tap with a shut-off cock for water supply pipes an dthe like distinguished by a device for preventing the unscrewing of the service tap and of its upper part whilst the supply pipe is open, said device comprising a ring which is mounted to rotate and move axially on the service tap engaging by means of an extension in a recess in the upper part of the service tap and also engaging by means of a second extension which is furnished with a circular recess, a suitably formed part \(e\) of the plug circular recess, a suitably formed part \(e^{1}\) of the plug this clip being furnished with a recess which in the position of the plug \(e\) in which the liquid is shut off from the service tan allows the ring to be moved to release the servier tap to allow it to be unscrewed.

No. 102,141. Machine for Making Bale Ties.
Machine à faire des liens de ballots.

Charles B. Post, New London, Ohio, U.S.A., 20th November, 1906; 6 years. Filed 26th March 1906. Receipt No. 134,301.
Claim.-1. In a bale tie machine, means for stretching the wire, means for relieving the tension on the wire after it has been stretched, and cutting means for severing the wire after it has been released, substantially as described.
2. In a bale tie machine the combination with loop forming mechanism of a stretching device arranged to engage the loop and stretch the wire before it is cut. means for relieving the tension on the stretched wire, and a cutter arranged to sever the wire after its tension has been relieved, substantially as described.
3. In a bale tie machine, an endless carrier having means for engaging the loop of the tie before the latter has been severed from the wire, a wheel over which said carrier passes, a holding device for gripping the wire while engaged by the carrier, cutting means for severing the wire, and mechanism arranged to operate the cutting means after that point of the carrier which is engaged with the loop of the wire has passed beyond the center of the whecl, substantially as described.
4. In a bale tie machine, an endless carrier having a laterally projecting loop engaging hook. a wheel over whirh the carrier passes, means for gripping the wire, a cutter, and means for operating the cutter after the loop engaging hook has passed beyond the center of the wheel, substantially as described.
5. In a bale tie machine, devices for bending or looping the wire and for twisting the loop, a cutting device, a wire gripping device. an endless carrier having a loop engaging hook, a wheel over which the carrier passes. and means for operating the cutting device after the loop engaging hook has passed beyond the center of the wheel, substantially as described.
6. In a bale tie machine, an endless carrier having a loop engaging hook, a tension device for the wire, a loop forming device, a twisting device, means for holding the wire while the loop is being twisted. a stretcher arranged to stretch the wire before it is cut, and means for relleving the tension on the wire before cutting. substantially as described.
7. In a machine for the purpose described, instrumentalitles for looping the wire, a stretcher device comprising \(\Omega\) carrier, adapted to engage the loop of the wire. a wheel over which said carrier passes, a gripping device adapted to angage and hold said wire and to operate slightly before
the carrier reaches its extreme point of travel beyond the gripping device, and instrumentalities adapted to operate to release the loop and cut off the wire, substantially as described.
8. In a machine for making a bale tin having a loop in one end, in combination, a device for bending the wire, a twisting device, a device for holding the free end and body of the wire while the loop is being twisted, a carrier adapted to engage the loop and draw the wire forward to the required length, a gripping devior arranged to engage and hold the wire, just before it has reached the limit of travel, whereby the wire is stretehed and straightened. and devices for reloasing the loop from the carrier and for cutting off the wirc. subsiantially as described.
9. In a machine for making a bale tie. having a loop in one end, in combination, a device for bending the wire to form a loop. a twisting drvice, an endless carrier adanted to engage the loop and to draw the wire forward to the required longth. wherls upon which the carrier is mounted, and a vis. ada!otel to congage the wire as its forward and arrives at a point near the vertical center of the said outer wheel, whereby the movement of this part of the wheel to the horizontal position will stretch the wire, substantially as desrribed.
10. In a machine for making a bale tie having a loop in one and, in combination, a device for bending the wire to form loop, a twisted device, an endless carrier adapted to engage the loop and to draw the wire forward to the required length, outer and inner sprocket wheels upon which the carrier is mounted, a vice adapted to engage the wire as its forward end arrives substantially at the vertical center of the said outer snrorket wheel. whereby the movenent of this part of the wheel to the horizontal position will stretch the wire, a releasing device for the loop located below the conter of the saidoutcr sprocket wheel. whereby the strain upon the wire will be relaxed as the wheel continues to rotate, and a cutting device for the other end of the wire organized to operate as soon as the strain is removed from the wire substantially as described.
11. In a bale tie machine the combination with loop forming means. of stretching means comprising \(u\) carrier arranged to engage the loop, a gripping device, and means for releasing the gripping device after the carriage has brought the loop to a position below the center of the wheel, substantially as described.
12. In a bale tie machine, a tension roll, a tipping bearing therefor, and a belt shifter operated by the tipping bearing, substantíally as described.
13. In a bale tic machine, a twisting pin, a looping device, a link and lever mechanism for actuating said device to carry the wire around the twisting pin, and a cam for actuating link and lever mechanism, substantially as described.
14. In a bale tie machine, a pin, a looping device, lever mechanism arranged to carry the looping device around the pin, a cam for actuating the lever device, and an intermittently operating twisting device, substantially as described.
15. In a balc tie machine, a pin, a looping device, an arm to which said device is attached, a plvoted link carrying said arm, a bell crank lever connected to the link, a cam for artuating the bell crank lever. and guiding means for the link, substantially as described.
16. In a bale tic machine, an endless caprier having a loop rngaging hook. a wheel over which said hook passes, and a loop disengaging device located beyond the center of said wheel, substantially as described.
17. In a bale tie machine, loop forming and twisting devices, an endless carrier arranged to engage the formed loop and to draw the wire forward to the required length, wheels upon which the carrier is mounted, a gripping device arranged to engage the wire as its forward end arrives at a point near the vertical center of the outer wheel, whereby the movement of this part of the wheel will stretch the wire and its movement beyond this point will releasc and relax the tension of the wire, a cutting device arranged to operate after the tension is thus relaxed. and means for disengaging the loop from the carrier, substantially as described.
18. In a machine for forming a wir, bale tie having a looped end, in combination. a guide for the wire, a wire bending and loop twisting device. a roller vise member and die, adapted to hold the wire while the loop is being twisted. an endless chain and loon engaging device thereon, sprocket wheels over which said rhain passes. said loop engaging device being arranged to engage the inop when in the horizontal position, and raise said loop to the top of one whel and carry it to the other wheel, and the said roller vise momber serving as a gulde over which the wire is drawn. substantially as described.
19. In a machine for the purpose described, a device for stretching the wire, and for giving one end thereof a swing ing motion, and a counting device having a rotating member arranged in the path of the swinging end of the wire, and adapted to be rotated thereby. substantially as described.

No. 102,142. Malt House. Germoir.

William P. Rice, Chicago, Illinois, U.S.A., 20th November,
1906; 6 years. Filed 6th July, 1906. Receipt No. 137,577.
Claim.-1. In a malting apparatus, a plurality of malting units located side by side, each comprising a plurality of closely spaced shelves located one above the other, for supporting the grain or malt in separate thin layers, a frame common to and supporting all said shelves, means for turning the grain or malt comprising means for discharging the same from a unit, and depositing it on the shelves of another or the same unit, and means for separately admitting air to the contents of the several shelves in a manner to limit the passage of the same air through a single layer.
2. A malting device comprising a plurality of shelves located one above the other for supporting the grain or malt in separate layers, a frame common to and supporting all of said shelves, and a plurality of air openings in the side walls of said frame opening separately to the exterior of the device through which air is directed horizontally to said layers, said shelves being movable in the frame to discharge the contents or the shelves.
3. A malting device comprising a plurality of perforated shelves arranged one above the other for supporting thereon malt or grain in layers, a frame common to and supporting all of said shelves, and side and end plates of said frame constituting the side and end walls of compartments, of which the shelves constitute the bottoms, each of the compartments being provided in one wall with an air admission opening, and being closed at its opposite wall, the air openings of arjacent compartments being located alternately on opposite sides of the device or unit.
4. A malting device comprising a plurality of perforated shelves arranged one above the other for supporting thereon malt or grain in layers, a frame common to and supporting all of said shelves, means for discharging the contents of sai slelves therefrom, and side and end plates on said frame constituting the side and end walls of compartments, of which the shelves constitute the bottoms, the upper pait of one vertical wall of each compartment terminating short of the bottom or shelf of the superjacent compartment, the compartments being otherwise closed and the openings of the adjacent compartments being located alternately on opposite sides of the device or unit, each compartment being adapted to be filled to the level of its opening, whereby there is provided above said layer a space constituting an air passage through which air is distributed to the malt below.
5. A malting device comprising a plurality of superposed compartments having perforated bottoms and upon which the grain or malt is supported in layers, each compartment being open at one side at the top thereof and the openings of adjacent compartments being arranged alternately on opposite sides of the compartments.
6. An improved system or apparatus for producing malt comprising a single story room or apartment, a plurality of malting units located side by side on the floor of said room and separated by aisles constituting air passages, said units filing the principal part of the space between the floor and ceiling of the room, and means for directing air through certain of said aisles, horizontally through the units, and dis charging it through other adjacent aisles.
7. An improved system or apparatus for producing malt comprising a room or apartment, a plurality of malting units lucated side by side on the floor of said room, each embracing a plurality of shelves located one above the other, and upon which the grain or malt is arranged in layers, and sup ported upon a frame common to all, said units being sepa-
rated by spaces arranged to constitute defined aisles or air passages, and means for directing air through said aisles and over the layers of malt or grain on said shelves.
8. An improved system or apparatus for producing malt, comprising a room or apartment, a plurality of malting units located side by side on the floor of said room and separated by aisles constituting air passages, said units filling substantially the space between the floor and celling of the room, means for directing air through certain of said aisles and korizontally through the units and discharging it through other adjacent aisles, and independently operable doors or valves, one at the end of each aisle, whereby the aisles may tr: changed from high to low pressure aisles, and the direction of the air through the units reversed.
9. An improved system or apparatus for producing malt comprising a suitable room or apartment, a plurality of units lecated side by side on the floor of said room, each comprising a plurality of compartments located one over the other is which the malt or grain is supported in layers, said units slibstantially filling the vertical space between the floor and ceiling of the said room, said units being separated by spaces constituting aisles or air passages, and the compartments being provided in their vertical walls with openings through which air enters for contact with the layers of grain or malt in the compartments, and means for directing air through said aisles or passages to the units.
10. An improved system for producing malt comprising a suitable room or apartment, a plurality of units on the floor of said room, and substantially filling the space between the floor and ceiling of the room, and means for turning the grain or malt comprising means for discharging the same from the units and redepositing it therein.
11. The improved malt house and apparatus described comprising a germinating room, a drying room, a plurality of steep tubs, a plurality of malting units located side by side in said germinating and drying rooms and substantially filling the vertical spaces between the floors and ceilings of the germinating and drying rooms, said units each comprising a plurality of shelves located one above the other, upon which the malt or grain is arranged in layers, means for directing steeped grain from the steep tubs to the units in the germinating room, means for directing the green malt to the units in the drying room, and means for directing air through said usits in contact with said layers of grain or malt on said sbelves.
12. The improved malt house and apparatus described comprising a germinating room, a drying room, a plurality of steep tubs, a plurality of malting units located side by side ir. said germinating room, and substantially filling the vertical space between the floor and ceiling of the germinating rom, said units each comprising a plurality of shelves located one above the other, upon which the malt or grain is arranged in layers, means for directing steep grain from the steep tubs to the units in the germinating room, means for directing the green malt to the drying room, and means for directing air to the germinating and drying malt.
13. The improved malt house and apparatus described comprising a germinating room, a drying room, a plurality of steep tubs, a plurality of malting units located side by side in said germinating and drying rooms, and substantially filling the vertical spaces between the floors and ceilings of the germinating and drying rooms, said units each comprising a plurality of shelves located one above the other upon which the malt or grain is arranged in layers, means for directing steeped grain from the steep tubs to the units in the germinating room, means for directing the green malt to the units in the drying room, means for directing air through said units in contact with said layers of grain or malt on said shelves and means for discharging the malt or grain from said units and re-depositing thereon for the purpose of turning the grain or malt.
14. An improved system or apparatus for producing mal comprising a room or apartment, a plurality of malting units located side by side on the floor of said room and separated by aisles constituting air passages, said units each comprising a plurality of vertically separated, closely spaced shelves on which the malt is supported in thin layers and units filling substantially the space between the floor and ceiling of the room, means for directing air through certain of the aisles and through the units and discharging it through other adjacent aisles, and means for reversing the direction of the air currents through said units whereby either of two aisles at the sides of a unit may be a plenum or vacuum aisle.
15. The improved system or apparatus for producing malt comprising a single story room or apartment, a plurality of malting units located side by side on the floor of the room, each comprising a plurality of vertically separated. closely spaced shelves on which the malt is supported in thin layers, said units substantially filling the space between the floor and ceiling of the room, and means afford ing prescribed air passages located on opposite sides of
each unit whereby air is directed from one passage, through the unit and to the other passage.
16. The improved system or apparatus for producing malt comprising a single story room or apartment, a plurality of malting units located side by side on the floor of the room, each comprising a plurality of vertically separated closely spaced shelves on which the malt is supported in thin layers, said units substantially filling the space between the floor and ceiling of the room, means affording prescribed air passages located on opposite sides of each unit whereby air is directed from one passage, through the unit and to the other passage and means whereby the direction of air through sald passages and through the units may be changed.
17. An improved system or apparatus for producing malt comprising a single story room or apartment, a plurality of malting units located side by side on the floor of said room and separated by aisles constituting air passages, said units filling the principal part of the space between the ceiling and floor of the room and nach comprising a plurality of closely spaced shelves constituting the bottom of superposed compartments upon and in which the malt is supported in thin layers, and means for directing air through certain of said aisles and through the units and discharging it through other adjacent aisles.
18. An improved system or apparatus for producing malt comprising a single story room or apartment, a plurality of malting units side by side therein each comprising a single vertical series of closely spaced superposed shelves, said shelves being movable to permit the layers of malt supnorted thereon to be dumped therefrom. the units substantially filling the space between the reiling and fioor of the room, and means affording prescribed air passages located on opposing sides of each unit, the air directed from one passage, through the unit and into the other passage.
19. In a malting unit, a plurality of closely spaced, verti cally separated shelves and a frame common to and supmorting all said shelves, said shelves being made of a pluraliy of dumping sections and means for moving the shelves severally towards and out of one end of the unit to dump the contents of each of said shelves from the unit.
20. In a malting unit, a plurality of vertically separated, closely spaced shelves each comprising a plurality of dumping sections joined nexibly together, a frame provided with a series of tracks on which said shelves are severally supported, and means for advancing said shelves severally to ward and out of one end of the unit for dumping the contents of each shelf from the unit.
21. A malting unit comprising a plurality of vertically separated, closely spaced shelves, a frame therefor, walls enclosing sald shelves, means for directing air to the contents of said shelves, said shelves comprising a plurality of short sections joined flexibly together, and means for severally advancing the shelves towards and out of one end of the unit for dumping the contents thereof.
22. In a malting unit, a plurality of closely spaced vertically separated shelves, and a frame therefor embracing side and end enclosing walls. said shelves each embracing a plurality of short sections joined flexibly together tracks on the frame for supporting said shelves means for moving said shelves severally toward and out of one end of the unit to dump the contents of the same at the end of the unit, and means for directing said shelves backwardly and into the unit.
23. In a malting unit, a plurality of closely spaced vertioally separated shelves, and a frame therefor including side ad enclosing walls, said shelves each embracing a plurality of dumping sections joined flexibly together, tracks on the frame for supporting said shelves, means for moving said shelves severally toward one end of the unit to dump the contents thereof. means for again directing said shelves into he unit, and means for loading each shelf as it passes into place in the unit.
24. A malting unit comprising a plurality of vertically separated closely.spaced shelves, a frame therefor including enclosing side and end walls. means for admitting air to said shelves, tracks in the frame for supporting said whelves, said shelves each comprising a plurality of tray sections foined flexibly to each other and provided at their ends with rollers which rest and roll on said tracks. and means for advancing said slecves severally to and through one end of the unit for dumping the contents thereof
25. An improved system or apparatus for producing malt comprising a room or apartment, a plurality of malting units located side by side on the floor of said room, each embracing a plurality of shelves located one above the other, and upon which the grain or malt is arranged in layers, and the shelves substantially filling the space between the ceiling and floor of the room, means for directing air through defined air passages to the several shelves of said units, said shelves each embracing a plurality of flexibly connected short dumping sections, means for advancing
each shelf towards and through one end of its unit for dumping the same and for redirecting the shelf into the unit.
26. An improved system or apparatus for producing malt comprising a single story room or apartment, a plurality of malting units, each including a series of closely spaced. separated shelves constituting the bottoms of compartments for the grain or malt. the compartments of the units substantlally filling the space between the ceiling and floor of the room, means affording prescribed air passages located on opposing sides of each unit, the air being directed from one passage through the unit and into the other passage. and each shelf constituting a plurality of short flexibly connected sections, and means for advancing the shelves toward and through one end of the unit to dump the contents thereof.
27. In a malting unit, a plurality of closely spaced vertically separated shelves, a frame common to and supporting said shelves, means for moving th:- shelves severally toward and out of one end of the unit to dump the contents thereof from the unit. and a conveying mechanism located in receiving proximity to the dumping contents of each shelf and constructed to redeposit such contents upon the shelf from which it was dumped, as well as upon either of the other shelves of the units.
28. A malling unit comprising a frame provided with a plurality of horizontal tracks. a plurality of closely spaced vertically separated shelves having rollers which rest on said tracks whereby the weight of the shelves and their contents are supported on said tracks, means for withdrawing the shelves from the unit to discharge the contents thercof outside the unit and means for directing air from the space outside the unit in prescribed paths over and through the contents of the shelves.
29. In a malting apparatus, two malting units arranged end to end and separated by a space, each embracing a plurality of closely spaced, vertically separated shelves to receive the malt, the shelves of each unit being movable into spaces in the other unit, and arranged to dump the contents there of while passing through the spare separating said units.
30. In a malting apparatus, two malting units arranged end to end and separated by a space. each embracing a plurality of closely spaced vertically separated shelves to re ceive the malt, the shelves of each unit being movable into spaces in the other unit, and arranged to dump the contents thereof while passing through the space separating said units, and conveying mechanism for redepositing said mal into the same or other shelves while passing through the spare separating said units.
31. In a malting apparatus, two malting units arranged ndd to end and separated by a space, each embracing a plurality of closely spaced vertically separated shelves to re ecive the malt, the shelves of each unit being movabl into spaces in the other unit, and arranged to dump th contents thrreof while passing through the space separating said units, a conveyer at the bottom of said spare arparating the units and a conveyer at the top of said space receiving malt from the lower conveyor, said shelves being cach ada!ted to be redirected to its unit and to be loaded from said overhead conveyer.
32. In a malting apparatus, two malting units arranged end to end and separated by a space, shelves to receive the malt and a track spanning said space, each shelf being mad of a plurality of dumping sections and the track being arranged to permit the sections of the shelves to dump the contents thereof while passing over said track
33. In a malting apparatus, two malting units arranged end to end and separated by a space, shelves to receive the malt and a track spanning said space, each shelf being made of a plurality of dumping sections and the track being ar ranged to permit the sections of the shelven to dump the contents thereof while passing over sald track, said shelves each passing backwardly into its unit over sald track, and means for loading each shelf as it passes into its unit.
34. In a malting apparatus, two malting units arranged nd to end and separated by a space, shelves to receive sail malt and a track spanning sald space and provided with depressed guides, each half consisting of a plurality of flexibly joined sections, arranged to drop at one end int contart with said guides when the shelf passes over said track and thereby dump the contents of the same.
35. In a malting apparatus, a malting unit provided with a shelf which is movable toward and out of one end of the unit for dumping the contents thereof. means for returning the shelf to the unit through he same and from which it emerged and means for loading said self as it passes backwardly into the unit.
36. In a malting apparatus, a malting unit provided with a shelf movable out of one end of the unit and backwardly into the same end thereof for the purposes of dumping th contents thereof, and reloading the shelf, said shelf com
prising a plurality of sections joined flexibly together by cables or bars.
37. In a malting apparatus, a malting unit provided with a shelf movable out of one end of the unit and backwardly into the same end thereof for the purposes of dumping thi contents thereof and reloading the shelf, said shelf comprising a plurality of sections joined flexibly together by cables or bars, said sections being provided with rollers which rest and roll on tracks on the frame of said unit.

No. 102,143. Spark Arrester. Arrête-ćtincelles.

Herbert L. Lapham, Wllmington, Minnesota, U.S.A., 20th November, 1906; 6 years. Filed 7th July, 1906. Receipt No. 137,605.
Claim.-1. In a spark arrester the combination with a smoke stack, of an outer shell engaged with the stack, a screen cone disposed within the smoke stack, an exhaust plpe communicating with the lower end of the cone, and a deflecting hood secured to the upper end of the cone and extending outwardly and downwardly around the smoke stack and with the outer shell.
2. In a spark arrester the combination with a shell, of a smoke stack disposed within the shell, a foraminous pipe located within the smoke stack, a deflecting hood secured to the foraminous pipe and arranged to deflect sparks from the upper end of the stack downwardly within the outer shell, said foraminous pipe being adapted for connection with an exhaust at its lower end.
3. In a spark arrester the combination with a shell, of a smoke stack inside of the shell, a screen cone inside of the smoke stack, a deflecting hood connected to the top of the screen cone below the top of the smoke stack and extending outwardly and downwardly over the outer surface of the stack in spaced relation thereto and terminating at a point lower than the top of the screen cone.
4. In a spark arrester the combination with a smoke stack, of an inverted screen cone located within the stack, an outer shell surounding the stack in spaced relation thereto, a denecting hood secured to the upper end of the screen cnin within the stack and extending outwardly and downwardly around the stack in spaced relation thereto, and a removable roceptacle located within the lower portion of the shell exteriorly of the stack.

\section*{No. 102,144. Flne Cleaner. Netloyeur de tubes.}

Christ C. Schrank. Batesville. Indiana. U.S.A.. 20th November. 1906; 6 years. Filed 14th March, 1906. Receipt No. 133,891.
Claim.-A flue cleaner comprising in combination a body portion having a longitudinal opening formed centrally therethrough, and provided with an annular groove, broomstraw cut in even lengths doubled at the middle into bights, wires arranged to draw and hold the said bights in said
grooves, bringing the other portions of the said straw together, and causing them to stand out radiately from the

body, and a spindle having a stem extending through said opening and provided with an integral flange adapted to bear against the corersponding end of said body, said spindle having its flange end threaded and adapted to be turned in the end of a handle, and having its opposite end threaded and carryinfg a washer and nut to hold sald body against said flange.

No. 102,145. Fan or Ventilator. E'vantail ou ventilateur.

Sergius Timokhovitch, Moscow, Russia, 20th November, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,416.
Claim.-1. A motor fan comprising the motor with its shaft, the fan mounted to rotate on a shaft separate from the motor shaft though attached to the motor frame or stand and driving connection between the two shafts, substantially as described.
2. A motor fan comprising the motor with its shaft, the fan mounted to rotate on a shaft separate from the motor shaft, though attached to the motor frame or stand and a frictional driving connection between the two shafts, substantially as described and shown.
3. A motor fan comprising the motor with its shaft the fan mounted to rotate on a shatt separate from the motor shaft, though attached to the motor frame or stand, and a helicoidal or toothed wheel driving connection between the two shafts, substantially as described and shown.

No. 102,146. Non-Refllable Bottle.
Boutcille non-ricmplissuble.

Michael Loftus, Chicago, Illinois, U.S.A., 20th November, 1906; 6 years. Filed 17th January, 1906. Receipt No 131,939.
Olaim.-A bottle having a guide socket in the bottom and a valve seat in the neck, a valve ball fitting the seat and having a stem extending into the socket and movable theren to guide the ball to its seat, and a weight comprising a loose movable piece of material partially filling the space in the neck above the ball

No. 102,147. Non-Refillable Bottle.
Boutcille non-rćcmplissable.

Emile C. Ricard, Verner, Ontario, Canada, 20th November, 1906; 6 years. Filed 19th January, 1906. Receipt No 132,014.
claim.-1. In combination with a bottle having a bulged neck, a pair of insertible members, one of which is provided with openings, springs disposed in the openings, rods disprised in the openings and adapted to be forced outward by the springs, and means adapted to prevent the inward flow of a liquid.
2. In combination with a bottle having a bulged neck, an insertible member provided with openings and provided with a central tubular body, means for locking the insertible member within the neck of the bottle, a second insertible member locked in position by the first insertible member, a valve disposed within the second insertible member, a rod conneeted to the valve, a spring disyosed around the rod, and a ccating disposed around the valve, said rod being adapted to extend into said tubular body.
3. In combination with a bottle having a bulged neck, an insertible member provided with a recess and provided with openings therein, means for locking the insortible member within the neek of the bottle. a web disposed beneath the irsertible member and provided with a flange adapted to interlock with said recess. standards connected to said web and provided with a flange, a valve seated on said flange and provided with an annular channel, a resilient coating for the valve, and means adapted to normally maintain the valve seated.

No. 102,148. Non-Refllable Bottle.
Bouteille non-réemplissable.

Fic.II

fig:

Fic 10

/: ?!!!

The Universal Patent Bottle Company, Tighes Hill, assignee of Alexander Houseman and Louis Weichert, Charlestown, New South Wales, Australia, 20th November, 1906; 6 years. Filed 3rd November, 1905. Recelpt No. 129,785.
Claim.-1. In an anti-fraudulent bottle, a neck formed with an annular internal groove forming a line of weakness therein a stopper of impenetrable material such as porcelain adapted to pass within the neck of the bottle and extend below the annular groove, said stopper having an aperture thereacross, and in such aperture a resilient member the euds of which are downwardly turned toward the lower end of the stopper and upwardly turned to engage and secure a hold in the annular groove.
2. In an anti-fraudulent bottle, a neck having an internal alnular groove forming a line of weakness therein, the bore of such neck being plainly cylindrical from the mouth to the an nular groove and about an equal distance beyond it and thereafter restricted in a gradual convex curvature, an impcnetrable stopper loosely fitting the cylindrical portion and an outwardly expansible resilient catch engaging the stopper and the annular groove.
3. In an anti-fraudulent bottle, a neck formed with an icternal annular groove forming a line of weakness therein, the bore o fthe neck being plainly cylindrical from the mouth to beyond the annular groove and thereafter restricted in a gradual convex curvature, an impenetrable stopper loosely fitting the cylindrical portion, said stopper having an aperture across and a resilient member inserted in such aperture, the ends of which member are downwardly and then upwardly turned to enter and engage the upper edge of the annular groove.
No. 102,149. Fiberizer for Reducing Wood.
Appareil à réduive le bois.
The Wood Distillates and Fibre Company, Chicago, Illinois, assignce of Arthur William Hanford, Evanston, Illinois, U.S.A., 20 th November, 1906; 6 years. Filed 9 th November, 1906. Receipt No. 141.052.
Claim.-1. In a fiberizing apparatus in combination with a pair of rolls and a frame in which they are journalled. throlls having circumferential intermeshing V-shaped grooves and ribs, means for rotating the rolls while thus intermeshed, means for delivering to the rolls the materials to be operated upon, and a steam discharge pipe directed for cischarge of steam jet through the material at the entering side of the rolls.
2. In a fiberizing apparatus in combination with a pair of rolls, a frame in which they are jourualled and a housul? which encloses the frame and rolls, a condult whose cavity is continuous with that of the housing and which communicates therewith at the top, a conveyer in such conduit and a hopper mouth into which such conveyer discharges, said hop-
per mouth being located for directing the material to the inwardly revolving side of the rolls, a conveyer at the lower

part of the housing and an outleading condult in which such conveyer operates and a steam pipe leading into the housing and terminating for discharge of the steam jet through the material at the entering side of the rolls.
3. In a fiberizing apparatus in combination with a housing, a conduit having its cavity continuous with that of the housing and communicating therewith at the top of the latter, a second conduit having its cavity continuous with the housing and communicating therewith at the bottom of the latter, a conveyer in each conduit, fiberizing rolls and the frame in which they are mounted enclosed by the housing, means for receiving material from the conveyer in the first-mentioned conduit and guiding the same to the entering side of the rolls, means for conducting the material from the discharge side of the rolls to the second conveyer, means for heating the rolls and for discharging steam through the material at the entering side thereof.
4. In a fiberizing apparatus in combination with a housing, a plurality of pairs of flberizing rolls and a frame in which they are mounted enclosed by the housing, said pairs of rolls bein: arranged successively one pair above another in positlon for discharging the material operated upon from each upper to the next lower pair, a conduit leading into the upper part of the housing and a conveyer therein discharging irto the housing and onto the upper pair of rolls, means for heating the rolls and for discharging steam through the material supplied thereto at the entering side of the pairs of rolls respectively.
5. In a flberizing apparatus in combination with a housing, a plurality of pairs of flberizing rolls and a frame in which they are mounted enclosed by the housing, said pairs of rolls being arranged successively for delivering from cach preceding pair to the next succeeding pair. the final pair of rolls in the series being hollow and having hollow trunions, and steam pipes extending into the hollow trunfons for discharging steam thereinto at one end, drainage pipes extending through the hollow trunions at the other end and having within the rolls respectively downwardly extending terminals terminating near the lower side of the roll cavity, and stuffing boxes on the trunnions through Which the pipes respectively extend thereinto.

\section*{No. 102,150. Boat Launching and Stowing Apparatus.}

\section*{Appareil d̀ lancer et arrimer un vaisseau.}

William J. Kivel and Stephen B. Dawson, Toronto, assignees of Fred. Ellsworth Martin, Oakville, Ontario, Canada, 20th November, 1906; 6 years. Filed 5th March, 1906. Receipts No. 133,521.
Claim.-1. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, davit cranes movable an said trackways, a releasable bolt fo: securely holding the davit cranes in their inboard position, means for arresting the davit cranes at the limit of their outboard position and other releasable means to resist the return of the davit cranes to thelr inboard position.
2. A boat Iaunching and stowing apparatus comprising fixed trackways leading to the ship's side, davit cranes movable on the trackways, releasable means for securely holding the davit cranes at their inboard position, means for arresting the davit cranes at their outboard position, means for resisting the return of the davit cranes to their inboard position and means for releasing the resisting means comprising a rock shaft engaging therewith.

11-17
3. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, two davit cranes

rigidly coupled together, a carriage for each davit crane movable on its respective trackway, a winding shaft journalled in bearings connected with the davit cranes comprising two shaft sections coupled together by an universal coupling, winding drums mounted on the winding shaft, guide pulleys connected with the davit cranes, davit falls passing over the guide pulleys and wound on the winding drums, and means for causing the revolution of the winding shaft.
4. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, two davit cranes rigidly coupled together, a carriage for each davit crane movable on its respective trackway, a winding shaft journalled in bearings connected with the davit cranes comprising two shaft sections coupled together, winding drums mounted on he winding shaft, gulde pulleys connected with the davit cranes, davit falls passing over the guide pulleys and wound on the winding drums, means for causing the revolution of the winding shaft consisting of a pinion shaft journalled in a bearing connected with one of the davit cranes, a pinion mounted on the pinion shaft, means for causing the revolution of the pinion shaft and pinion, and a spur wheel mounted on the winding shaft meshing with the pinion.
5. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, two davit cranes rigidly coupled together, a carriage for each davit crane movable on its respective trackway, a winding shaft journalled in bearings connected with the davit cranes, comprising two shaft sections coupled together, winding drums mounted on the winding shaft, guide pulleys connected with the davit cranes, davit falls passing over the guide pulleys and wound on the winding drums, means for causing the revolution of the winding shaft consisting of a pinion shaft journalled in a bearing connected with one of the davit cranes, a pinion mounted on the pinion shaft, means for causing the revolution of the pinion shaft and pinion, a spur wheel loosely mounted on the winding shaft meshing with the pinion, and a removable locking means for causing the united revolution of the spur wheel and winding shaft.
6. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, two davit cranes rigidly coupled together, a carriage fo each davit crane movable on its respective trackway, a winding shaft journalled in bearings connected with the davit cranes, comprising two shaft sections coupled together, winding drums mounted on the winding shaft, guide pulleys connected with the davit cranes, davit falls passing over the guide pulleys and wound on the winding drums, means for causing the revolution of the winding shaft consisting of a pinion shaft journalled in a bearing connected with one of the davit cranes, a pinion mounted on the pinion shaft, means for causing the revolution of the pinion shaft and pinion, and a spur wheel mounted on the winding shaft meshing with the pinion, a brake wheel fixed on the winding shaft, a movable
brake lever and a band passing partly around the brake wheel and connected at one end with one of the davit cranes and at the other end with the movable brake lever.

A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, two davit cranes rigidly coupled together, a carriage for each davit crane movable on its respective trackway, a winding shaft jour nalled in bearings connected with the davit cranes comprising two shaft sections coupled together, winding drums mounted on the winding shaft, guide pulleys connected with the davit cranes, davit falls passing over the guide pulleys and wound on the winding drums, means for causing the revolution of the winding shaft consisting of a pinion shaft journalled in a bearing connected with one of the davit cranes, a pinion mounted on the pinion shaft, means for causing the revolution of the pinion, shaft and pinion, a spur wheel mounted on the winding shaft meshing with the pinion, a brake wheel fixed on the winding shaft a movable brake lever, a brake band passing partly around the brake wheel and connected at one end with one of the davit cranes and at the other end with movable brake lever, a detent dog for the brake lever, a link connected with the detent dog and having a hand grip whereby it can be actuated, and a toothed segment connected with the davit crane to be engaged by the detent dog.
8. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, guards at the sides of the fixed trackways and extending above the same with inturned flanges at their upper ends and an unoccupied interval between the flanges, two davit cranes rigidly coupled together and movable above the guards, a carriage for each davit crane movable between the guards, antifriction rollers for the carriages movable upon the trackways, other anti-friction rollers connected with the carriages movable between the guards to engage the top flanges thereof and a boat raising and lowering means carried by the davit cranes.
9. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, guards at the sides of the fixed trackways and extending above the same with inturned flanges at their upper ends and an unoccupied interval between the flanges, two davit cranes rigidly coupled together and movable above the guards, a carriage for each davit crane movable between the guards, antifriction rollers for the carriages movable upon the trackways, other anti-friction rollers connected with the carriages movable between the guards to engage the top flanges thereof, a boat raising and lowering means carried by the davit cranes releasable means for securely holding the davit cranes at their inboard position, and means to arrest the movement of the davit cranes at their outboard position.
10. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side guards at the sides of the fixed trackways and extending above the same with inturned flanges at their upper ends and an unoccupied interval between the flanges, two davit cranes rigidly coupled together and movable above the guards, a carriage for each davit crane movable between the guards, a carriage for each davit crane movable between the guards, antifriction rollers for the carriages movable upon the trackways, other anti-friction rollers connected with the carriages movable between the guards to engage the top flanges thereof, a boat raising and lowering means carried by the davit cranes, releasable means for securely holding the davit cranes at their inboard position, means to arrest the movement of the davit cranes at their outboard position, and a releasable resisting means to prevent the inboard movement of the davit cranes when the latter are at their outboard position.
11. A boat launching and stowing apparatus comprising fixed trackways leading to the ship's side, guards at the sides of the fixed trackways and extending above the same with inturned flanges at their upper ends, and an unoccupied interval between the flanges, two davit cranes rigidly coupled together and movable above the guards, a carriage for each davit crane movable between the guards, antifriction rollers for the carriages movable upon the trackways to support the davit cranes therefrom, other antifriction rollers connected with the carriages movable between the guards to engage the top flanges thereof, a boat raising and lowering means carried by the davit cranes, releasable means for serurely holding the davit cranes at their inboard position, means to arrest the movement of the davit cranes at their outboard position, releasable resisting means to prevent the inboard movement of the davit cranes when the latter are at their outboard position, and means for releasing the resisting means.
12. A boat launching and stowing apparatus comprising two davit cranes rigidly coupled together, a carriage for each davit crane, a winding shaft consisting of two shaft sections journalled in bearings connected with the davit cranes, an universal coupling uniting the inner ends of the winding shaft, winding drums mounted on the winding shaft,
suide pulleys connected with the davit cranes, davit falls passing over the guide pulleys and wound on the winding drums, and means for causing the revolution of the winding shaft and winding drums.
13. A boat launching and stowing apparatus comprising two davit cranes rigidly coupled together, a carriage for each davit crane, a winding shaft consisting of two shaft sections journalled in bearings connected with the davit cranes, an universal coupling uniting the inner ends of the winding shaft, a winding drum mounted on the winding shaft, davit falls passing over the guide pulleys and wound on the winding drums, means for causing the revolution of the winding shaft and winding drums, consisting of a pinion shaft journalled in a bearing connected with one of the Cavit cranes, a pinion mounted on the pinion shaft, a spur wheel mounted on the winding shaft and meshing with the teeth of the pinion and means for causing the revolution of the pinion shaft.
14. A boat launching and stowing apparatus comprising two davit cranes rigidly coupled together, a carriage for each davit crane, a winding shaft consisting of two shaft sections journalled in bearings connected with the davit cranes, a universal coupling uniting the inner ends of the winding shaft, a winding drum mounted on the winding shaft, a winding drum mounted on the winding shaft, guide pulleys connected with the davit cranes, davit falls passing over the guide pulleys and wound on the winding drums, means for causing the revolution of the winding shaft and winding drums, consisting of a pinion shaft journalled in a bearing connected with one of the davit cranes, a pinion mounted on the pinion shaft, a spur wheel mounted on the winding shaft and meshing with the teeth of the pinion, means for causing the revolution of the pinion shaft, and a braking mechanism for the winding shaft consisting of a brake wheel mounted thereon, a toothed segment, a movable Sever having a releasable detent dos to engage with the toothed segment and a brake band to engage the brake wheel connected at one end with the davit crane and at the other end with the brake lever.
15. A boat launching and stowing apparatus comprising two davit cranes rigidly coupled together, a carriage for each davit crane, an arm connected with the davit cranes having a bolt aperture therein, bolt guides at the inboard position of the davit cranes, a locking bolt movable in the bolt guides to enter the bolt aperture in the arm, a lever to actuate the bolt, stops to arrest the movement of the davit cranes at their outboard position, racks and gravity dogs carried by the davit cranes adapted to engage with the racks to resist the return of the davit cranes from their outboard position.
16. A boat launching and stowing apparatus comprising two davit cranes rigidly coupled together, a carriage for each davit crane, an arm connected with the davit cranes having a bolt aperture therein, bolt guides at the inboard position of the davit cranes, a locking bolt movable in the bolt guides to enter the bolt aperture in the arm, a lever to actuate the bolt. stops to arrest the movement of the davit cranes at their outboard position, racks, gravity dogs carried by the davit cranes to engage with the racks to resist the return of the davit cranes from their outboard position, and a rock shaft carried by the davit cranes having cranks to engage with the gravity dogs and raise them out of engagement with the racks.
17. A boat launching and stowing apparatus comprising two davit cranes rigidly coupled ogether, a carriage for each davit crane an arm connected with the davit crane having a bolt aperture therein, bolt guides at the inboard position of the davit cranes, a locking bolt movable in the bolt guides to enter the bolt aperture in the arm, a lever to actuate the bolt, stops to arrest the davit cranes at their outboard position, racks, gravity dogs carried by the davit cranes to engage with the racks to resist the return of the davit cranes from their outboard position, a rock shaft carried by the davit cranes having rock shaft cranks to engage with the gravity dogs and rise them out of engagement with the racks in combination with boat supporting saddles to engage the boat at its inboard position, an actuating lever and links connected with the actuating lever to cause the saddles to fall outwards when operated.
18. A boat launching and stowing apparatus comprising two davit cranes rigidly coupled together a carriage for each davit crane, fixed trackways, an arm connected with the Javit cranes having a bolt aperture therein. bolt guides at the inboard position of the davit cranes, a locking bolt movable in the bolt guides to enter the bolt aperture in the arm, a lever to actuate the bolt, stops to arrest the davit cranes at their inboard position, racks, gravity dogs carried by the davit cranes adapted to engage with the racks to resist the return of the davit cranes from their nutboard position, a rock shaft carried by the davit cranes having cranks to engage with the gravity dogs and raise them out of en gagement with the racks. in combination with boat supporting saddles to engage the boat at its inboard position an
actuating lever, links connected with the actuating lever to cause the saddles to fall outwards when operated, and lashing arms pivotally connected with the deck to engage the gunwales of the boat when seated upon the saddles and automatically disengage themselves therefrom by gravity when the saddles have been lowered by the saddle actuating means.

\section*{No. 102,151. Grain Weighing Device.}

Appareil d peser le grain.

Elling O. Berg, Madison, Minnesota, U.S.A., 20th November, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,959. Claim.-1. The combination with a weighing hopper yieldingly supported for vertical movements, means for delivering grain into the upper end of said hopper, a partition plate pivotally mounted within said hopper and provided at its upper portion with a wheel, and a fixed cam plate with which said wheel engages, the said wheel and cam plate tending te hold said partition plate in either of its two extreme positions when the said hopper is held in its uppermost position and a tally arranged to register the number of vibratory movements of said partition plate, substantially as described.
2. The combination with an elevator leg having and an endless conveyer working therein. of a weighte
hood S pivoted to said hood, a hopper 6 supported by said lever, a partition plate 17 intermediately pivoted within said hoppcrand provided at its upper portion with a wheel 19. a cam plate 20 fixed on said hood and co-operating with said roller to hold said partition plate in either of its extreme positions when said hopper is raised, an arm mounted to vibrate with said partition plate, and a tally arranged to be actuated by said arm under movements therof in both directions, substantially as described.
3. The combination with a weighing hopper yieldingly supported for limited vertical movements and provided within with a vibratory partition plate, of means for supplying grain to the upper end of said hopper, and reversely acting pivoted lock dogs arranged to act upon said vibratory partition plate to lock the same against vibratory movements when the hopper is in its uppermost position, substantially as described.

\section*{Yo. 102,152. Machine for Surfacing Paper.}

Machine pour faire une surface all papier.
Chauncey W. Gay, West Springfield, Massachusetts, U.S.A., 20th November. 1906; 6 years. Filed 31st July, 1906. Receipt No. 138,311 .
claim.-1. In a surface finishing machine for paper, the combination with a pair of sidewis adjacent rotary cylinders. peripherally covered with cloth. of a further pair of rotary cylinders having metallic peripheries, and means for carrying sheets of paper, to be subjected to pressure, between said two pairs of rolls.
2. In a surface finishing machine for paper, the combination with a pair of sidewise adjacent rotary cylinders peripherially covered with cloth, of a further pair of rotary cylinders having metallic peripherial surfaces with inequalities therein like those in the surface of cloth, and means for carrying sheets of paper, to be subjected to pressure, between said two pairs of rolls.
3 In a surface finishing machine for paper the combination with a pair of sidewise adjacent cylinders peripherally covered with cloth, a further pair of cylinders having peripherial coverings of cloth, and thin sheet metal overlying the cloth and formed with a multiplicity of indentations and
prominent portions conforming to the inequalities in the surface of the cloth next thereunder, and means for carry-

ing sheets of paper, to be subjected to pressure between said two pairs of cylinders.
4. In a surface finishing machine for paper the combination with a pair of sidewise adjacent rotary cylinders having metallic peripheral surfaces formed with inequalities like those in the surface of cloth, and means for carrying sheets of paper, to be subjected to pressure, between said pair of rolls.
5. In a surface finishing machine for paper, a pair of sidewise adjacent rotary cylinders having peripherally continuous end portions, having paper surfacing ptripheral portions between said end portions, and having longitudinal niches endwise terminating within said continuous peripheral end portions of the cylinders, and means for feeding sheets of paper between, and subject to the surfacing action of said cylinders.
6. In a surface filinishing machine for paper, a pair of sidewise adjacent rotary cylinders having coverings of cloth therearound, and having further coverings of thin sheet metal, overlying the cloth covering which are conformed to the inequalities of the cloth.
7. In a surface finishing machine for paper the combination with a supporting frame, of two pairs of rotary cylinIfrs. each peripherially adjacent the next and having paralipl end journals, one of the intermediate cylinders having its journals in fixed bearings. means for adjusting the other of the intermediate cylinders transversely of its axis in opnosite dircetions, and adjustable means for resisting the journal bearings for the outer cylinders of the two pairs against transversely outward displacements, cloth surfacing on one or more of the cylinders, and means for carrying shects of paper between the cylinders of both said pairs.
8. In a surface finishing machine for paper, a pair of peripherially adjacent rotary cylinders having longitudinally extending niches, clamping plates provided at opposite walls of said niches having rib and groove engagements with said walls. surface filnishing sheet material covering the peripheries of the said cylinders and marginally extending within said niches and engaged between the ribbed and grooved surfaces of the niche walls and said clamping plates, means for maintaining said plates in their clamping confinements. and means for carrying paper sheets between said paired cylinders.
9. In a surface finishing machine for paper, a pair of peripherially adjacent rotary cylinders having longitudinally extending niches clamping plates provided at opposite walls of said niches having rib and groove engagements with said walls, surface finishing sheet material covering the peripheries of the said cylinders and marginally extending within said niches and engaged between the ribbed and grooved surfaces of the niche walls and said clamping plates, means for maintaining said plates in their clamping confinements, rock shafts carried by the cylinders and located in said niches, grippers carried by said rock shafts and co-acting with peripheral portions of the cylinders at the margins of the niches, levers on the ends of the rock shafts, and statinnary cams with which said levers in their revolutions co-act for alternately opening and closing said grippers.
10. In a surface finishing machinc for paper, the axially wrallel cylinders \(1,2,3\) and 4. having peripheral paper finishing surfaces, the cylinder 2 having fixed journal bearings therefor, and the cylinder 3 having an adjustable journal bearing provided with an inclined side, a block having an inclined side and in sliding engagement with the in-
clined side of the fournal bearing for the third cylinder, oppositely arranged screws engaging through the machine frame and against the upper and lower portions of said block, and the adjusting screws horizontally engaged through the machine frame and forming adjustable abutments for the movable journals of the first and forth cylinders.
11. In a surface finishing machine for paper, the combination with a plurality of sidewise adjacent rotary cylinders having paper surfacing peripheral portions and having longitudinal niches, grippers therein, and means for operatIng the grippers, a rotary cylindrical part located above one of the surfacing cylinders, carrying a series of grippers and having gripper operating means therefor, a horizontally journalled shaft having tape solls thereon and deivery tapes around said rotary cylindrical part and saia tape rolls.
12. In a surface finishing machine for paper, the combination with a plurality of sidewise adjacent rotary cylinders having paper surfacing peripheral portions and having longitudinal niches, grippers therein, and means for operating the grippers, a rotary cylindrical fart located above one of the surfacing cylinders, carrying a series of grippers and having grippar operating means therefor, a horizontally journalled shaft having rolls thereon forwardly beyond said tary cylindrical part and said tape rolls, and a recelver for around said rotary parts and said tape rolls, and series of guide rolls above and in rolling contact with said rotary cylindrical part and said tape rolls, and a receiver for the sheets of surface finished paper in advance of snid tape rolls.
13. In a surface finishing machine for paper, the combination with a plurality of sidewise adjacent rotary cylinders having paper surfacing peripheral portions, and having longitudinal niches, grippers therein, and means for operating the grippers, a rotary cylindrical part located above one of the surfacing cylinders, carrying a series of grippers and having gripper operating means therefor, a horizontally journalled tape shaft, delivery tapes running around sald rotary cylindrical part and sald tape shaft, and means adjacent the forwardly located portions of the tapes for imparting a movecment to the sheets in delivery faster than the travel of the tapes.
14. In a surface finishing machine for paper, the combination with a plurality of sidewise adjacent rotary cylinders having paper surfacing peripheral portions, and having longitudinal niches, grippers therein, and means for operating the grippers, a rotary cylindrical part located above one of the surfacing cylinders, carrying a serles of grippers and having gripper operating means therefor, a horimontally journalled tapt shaft, delivery tapes running around said rotary cylindrical part and said tape shaft, rolls on said tape shaft of greater diameter than said shaft, and friction rolls running peripherally on said rolls.

No. 102,153. Euotion Boz. Boite d'aspiration.

William F. Harbrecht and Frederlc Boarger, Delphos, Ohio, U.S.A., co-inventors, 20 th November, 1906 ; 6 years. Filed 24th September, 1906. Recelpt No. 139,746.
Claim.-1. A perforated rotating cylinder, combined with axtd end castings having flanges at thelr margins against which the ends of the cylinders abut, radially disposed rollers within the castings for supporting the cylinder and a suction box.
2. A perforated rotating cylinder, combined with fixed end castings, each having an obliquely disposed hollow bracket, screws threaded upwardly througb the upper porlions of said brackets, and a suction box within the cylinder and adjustably supported on sald screws.
3. A perforated rotating cylinder having open ends. combined with fixed end castings each of which has at its ton a recess having a flat bottom, parallel guiding faces. and above the latter diverging side faces, a suction box of an exterior conflguration corresponding to the shape of the recesses within which its extremities rest, and means for adjusting the box vertically therein.
4. A perforated rotating cylinder having open ends. combined with fixed end castings each of which has at its top a recess having a flat bottom, parallel guiding faces, and above the latter diverging side faces, a suction box of an exterior conflguration corresponding to the shape of the recesses within which its extremities rest, hollow brackets on the end castings, and screws threaded upwardly through said brackets against the bottom of the suction box. for the purpose set forth.
5. A rotating hollow cylinder, and a stationary suction box therein, combined with fixed end castings at the ends of the cylinder, means on the castings for adjustably supporting the box, a block in each recess carrying a roller contacting with the inner face of the cylinder, and an adjusting screw between the inner side of the block and the inner wall of the recess.

No. 102,154. Carbureter. Carburatcur.

Ozro Haden Hinds, Le Mars, Iowa, U.S.A., 20th November. 1906; 6 years. Filed 29th October, 1906. Receipt No. 140,717.
Claim.-The combination of the tank, an air supply pipe. a coupling \(J\) on said pipe, couplings \(J^{1}\) connected with the coupling \(J\), branch pipes leading from the couplings \(J^{2}\) and provided with devices for discharging air into a body of gasolene and also with air discharge openings or outlets. independent of those which discharge to the gasolene, and valves controlling said independent air discharge openings of the several branch pipes, substantially as set forth.

No. 102,155. Pulp Screen. Tamis d pulpe.
Orville H. Moore, Fort Edward, New York, U.S.A., 20th November, 1906; 6 years. Filed 3rd July, 1906. Recelpt No. 137,485.
Claim.-1. A machine of the character described the combination with a horizontal revoluble hollow shaft carrying fan blades and having openings theroin between said blades. of a screen enclosing said fan, and means to feed material to said hollow shaft.
2. In a machine of the character defcribed the combination with a horizontal revoluble hollow shaft carrying fan bladts and having openings therein between said blades. of a screen enclosing said fan, and an inlet pipo registeriag with the end of the hollow shaft and adapted to feed material thereto.
3. In a machine of the character described the combination with a revoluble shaft carryinf fan blades and hariag openings therein between sald blades, of a screen enclosing said fan, a pipe arranged above sald screen and adapted to
direct a shower thereon, and means to feed material to sald bollow shaft.

4. In a machine of the character described the combination with a horizontal revoluble shaft comprising a hollow portion and a solid portion of blades mounted on said hollow portion, the latter being provided with openings between said blades, a screen enclosing said fan, and means to feed material to the hollow portion of said shaft.
5. In a machine of the character described the combinaportion and a solid portion, of fan blades mounted on said hollow portion, the latter being provided with openings between said blades, a screen enclosing said fan, and an inlet pipe registering with the end of the hollow portion of said shaft ad adapted to feed material thereto.
6. In a machine of the character described the combination with a horizontal shaft comprising a hollow portion and a solid portion, of fan blades mounted on sald hollow portion, the latter being provided with openings therein between said blades, a screen enclosing said fan, means on the solld portion of the shaft for rotating the same, and means to feed the material to said hollow portion of said shaft.
7. In a machine of the character described, a revoluble screen, a fan adapted to be revolved in the same direction but at a different speed from said screen, a casing enclosing said screen, provided with separate compartments for the refined material and the sllver, said compartments being separated from each other by a double flange on the screen adapted to move in juxtaposition to the opposition sides of a single flange on the casing.
8. In a machine of the character described the combination with a revoluble shaft comprising a hollow portion and a solid portion of fan blades mounted on said hollow portion, the latter having openings between said blades, an independently revoluble screen enclosing said pan, a casing enclosing the screen, said screen having a supporting disc at one end bearing on the solid portion of the shaft. an inwardly extending flange arranged on the other end of the screen and bearing on a projection from the casing, and means to feed material to the hollow portion of the shaft.
9. In a machine of the character described the combination with a revoluble shaft comprising a hollow dortion and a solid portion of fan blades mounted on said hollow portion, the latter having openings between said hlades. an independently revoluble screen enclosing said fan. a casing enclosing the screen. said screen having a sumporting dise at one end provided with an extending flange having bearings in the casing and provided with gear teeth on its interior surface, and a system of gearing between the shaft and said toothed flange for rotating the screen.
10. In a machine of the character described the combination with a revoluble shaft comprising a hollow portion and a solid portion, fan blades mounted on said hollow portion, the latter having openings between caid blades, of a revoluble screen enclosing said tan, ai casing enclosing the ncreen having slots for the escape of the sliver and means to one end bearing on a flange on the casing, said flange on the scree having slots for the escape of the sliver, and means to feed material to the hollow portion of the shait.
11. In a machine of the character described the combination with a revoluble shaft comprising a hollow portion and a solid portion, fan blades, mounted on said hollow portion, the latter having openings between said blades, of a revoluble screen enclosing said fan, a casing enclosing the screen, said screen having an inwardly extending flange on one end bearing a flange on the casing, sald flange on the screen having slots for the escape of the silver. said screen having an outwardly extending double flange embracing a single flange on the casing thereby separating the compartment for the screened stock from that of the silver, the inwardly extending flange on the screen having slots for the escape of the silver, and means to feeed material to the hollow portion of the shaft.
12. In a machine of the character described the combination with a revoluble shaft comprising a hollow portion and a solid portion, of fan blades mounted on said hollow portion, the latter having openings between said blades, an independently revoluble screen enclosing said fan, a casing enclosing the screen, said screen having a supporting disc at one end provided with an extending flange having bearings in the casing and provided with gear teeth on its interior surface, a gear wheel on the solid portion of said shaft, an auxiliary shaft carrying gears meshing with said toothed flange and said gear, and means for rotating the main shaft.

No. 102,156. Churn. Baratte.

Frank D. Merrill, Seattle, Washington, U.S.A., 20th November, 1906; 6 years Filed 22nd October, 1906. Receipt No. 140,532.
Note.-Frank D. Merrill is an assignee of the patent No. 96,966 issued to Thomas J. Cheney, Lodi, Ohio, bearing date the sixteenth day of January, 1906, of which the present patent is a reissue.

Claim.-1. In a churn the combination of a reception for the liquid, a combined agitation and aerator comprising a body portion and a stem provided with an air inlet, the walls of which agitator present a smooth and unbroken surface displacing the liquid, and inducing a downward current of air into the liquid, and means for actuating sald agitator substantially as described.
2. In a churn the combination of a receptacle for the liquid, a combined agitator and aerator comprising an outwardly extending end portion, a tubular stem provided with an air inlet, the walls of which agitator present a smooth and unbroken surface displacing the liquid and inducing a downward current of air into the liquid, and means for actuating said agitator, substantially as described.
3. In a churn the combination of a receptacle for the liquid, a combined agitator and aerator comprising an outwardly extending hollow end portion, and a tubular stem provided with an air inlet, the walls of which agitator present a smooth and unbroken surface displacing the liquid inducing a downward current of air into the liquid and means for actuating said agitator, substantially as described.
4. In a churn the combination of a receptacle for the liquid, a combined agitator and aerator comprising a hollow bell-shaped body provided in its upper end with air inlets, the inner and outer walls of which bell-shaped body present a smooth and unbroken surface displacing the liquid and inducing a downward current of air into the liquid, and means for actuating said agitator, substantially as described.
5. In a churn the combination of a receptacle for the liquid. a combined agltator and aerator comprising a hollow bell-shaped end portion, and a tubular stem opening therein. and provided with air inlets, the inner and outer walls of which stem and agitator present a smooth and unbroken surface displacing the liquid by centrifugal force, and inducing a downward current of air into the llquid, and means for actuating said agitator, substantiallv as described.
6. An improved dasher for aerating churns comprising a tubular portion adapted to extend above the surface of the linuid and provided with a gradually enlargel lower end.
7. An improved dasher for aerating churns comprising a tubular portion adapted to extend above the surface. of the liquid and a gradually enlarged smooth lower end portion integral therewith.
8. An improved dasher for aerating churns comprising a tubular portion adapted to extend above the surface of the liquid and a bell-shaped smooth lower end portion integral therewith.
9. In a churn a smooth bell-shaped dasher and means for Introducing air centrally thereto.

No. 102,157. Power Hammer. Marteau mécanique.

Fiュ. 1

Fig. 3
Fig. 2

The Climax Patents Limited assignee of Harry Benwell Stocks, Stanton, Barlow Moor Road, Chorlton-ComHardy, Manchester. Lancaster, 20th November, 1906; 6 years. Filed 7th September, 1905. Receipt No. 128,244.
Claim.-1. In power hammers and like percussive tools in which each tool is worked in conjunction with a separate air compressor, building up the air pressure within two conducting tubes until normal predetermined pressures are attained within such tubes the sald normal predetermined pressures acting on a valve or valves in the tool holding it or them in equilibrium, such equilibrium being destroyed by excess of the predetermined pressures the valve or valves being actuated by such excess pressure to admit air from the tubes to one side or the other alternately of a piston of the tool to drive such piston back and forth, substantially as described.
2. In power hammers and like percussive tools the combination of an air compressor and a power hammer, two air tubes connecting such compressor with the hammer, back pressure valves in the compressor and a valve or valves in the tool held in equilibrium by predetermined pressure in the tubes, the air pressure in the tubes when such predetermined gressure is exceeded overcoming the valve or valves in the tool on each impulse of the air compressor. whereby the pressure within the tubes is admitted to the piston of the tool, substantially as described.
3. In power hammers and like percussive tools. a slidable valve within a valve box. air tubes conducting air pressure, which is greferably high and low pressure. from an air compressor to the valve box at each side of the valve whereby the valve is held in equilibrium, ports leading from the valve box to a distributing valve which is actuated when the equilibrium of the valve is destroyed to conduct air pressure from the tubes to one side or other of the hammer of the tool and exhaust air of the previous stroke, subsantially as described.
4. In a power hammer a valve box, a valve slidable in such valve box, ports formed in the valve box, an inner and an outer shell a distributing valve slidable between such shells, ports formed in such shells and the distributing valve, a cylinder formed with ports and a hammer or piston sldable within such cylinder, substantially as described.
5. In a power hammer consisting of a cyllnder, a hammer or piston slidable within such cylinder, means for carrying a chisel or tool in the mouth of the cylinder, a handle securcd to such cylinder, a valve box, a slidable valve contained in such valve box, ports leading to each end of the slldable valve, air tubes connected to stuch ports and an alr enmpressor wheruby on a predet.rmined pressure of air being obtained with the tubes and valve box the value is
held in equilibrium, an annular distributing valve, ports governed by the slidable valve for acturating the distributing valve to conduct air pressure on one impulse of the alr compressor to the front of the piston of the tool to return the piston to starting point and for exhausting alr behind the piston, ports governed by the valve to actuate the annular distributing valve to conduct air pressure on the next impulse of the air compressor to the back of the piston of the tool to effect the blow stroke, and for exhaust ing alr of the previous stroke in front of the piston, substantially as described.
6. A power hammer consisting of a cylinder, a hammer or piston slidable within such cylinder, means for carrying a chisel or tool in the cylinder end, a handle secured to the cylinder, a valve box in such handle. a slidable valve contained within such valve box formed with heads or valves of unequal area and an annular groove, ports leading to each head of the slidable valve, air tubes connected to such ports and to an air compressor whereby on a predetermined pressure of air being obtained within the tubes and valve box the valve is held in equllibrlum, rings or shells arranged between the cylinder end and the valve box, an annular distributing valve arranged to slide between such shells, ports governed by the equilibrium valve for actuating the distributing valve to conduct air on one impulse of the alr compressor along ports to the front of the piston of the tool to return the piston to its starting point and for exhausting the air behind the piston, ports governed by the equilibrium valve to actuate the annular distributing valve conducting air pressure on the next impulse of the air compressor to the back of the piston of the tool to effect the blow stroke and for exhausting air of the previous stroke in front of the piston, means for assisting the opening of the equilibrum valve to admit air pressure to the back of the piston of the tool and for reversing the movement of the equilibrum valve to cut off pressure behind he piston of the tool when the plston has completed a portion only of its stroke. a bye-pass for the low pressure air, and means for starting and stopping the tool gonsisting of an exhaust governed by a valve whereby pressure in the conducting tubes can be relieved, substantially as described.
7. In combination in a power hammer air ports conducting air pressure to the actuating valve of thehammer. an exhaust port communicating with such air ports a valve governing such exhaust port and a lever to actuate the valve for starting and stopping the hammer, substantially as described.
8. In power hammer and like percussive tools the combination of a separate air compressor to each tool and back pressure valves in the compressor and loaded valres in the tool for holding up the air pressure generated at each stroke of the compressor until a predetermined pressure is attained in two tubes conducting the air pressure to the tool the excess of such pressure on each stroke of the alr compressor being conducted to the piston or hammer of the tool, substantially as desribed.
9. In power hammers like percussive tools the provisinn of spring loaded valves permitting the admission of air to the ports leading to the front and rear of the reciprocating hammer when the presure in the air conducting tubes exceeds the load of the valves, a piston or plstons actuated by the air pressure to admit air pressure from the tubes aiternately to one port, and open the port not under alr pressure to exhaust at each stroke of the compressor, substantially as described.
10. The power hammer consisting of a cylinder containing a reciprocating hammer or piston, an exhaust port or ports arranged in the cylinder to exhaust the pressures at the end of each stroke of the hammer, ports provided in the cylinder to conduct the pressure to the front and back of the hammer, spring loaded valves governing such ports. a double piston actuated by the air pressure to alternately open one port to pressure and the other to exhaust, and means for conductingethe exhaust to atmosphere from the port not under pressurc. an exhaust port governed by a valre actuated by the operator to start and stop the tool, all arranged and acting in the manner substantially as described.
11. An air compressor having back pressure valves and conducting air in impulses alternately to two tubes, in combilation with a hammer connectid to the two tubes having valves to assist with the back pressure valves in the compressor in rutaining the air in the tubes until a predeter. mined pressure is attalned, substantially as described.
12. The combination of a power hammer having valves loaded to control the admission of air to the front and rear of the piston, with an air compressor provided with back pressure valves and two tubes to conduct the pressure to the hammer the cubic capacity of the hammer crlinder boing greater that the volume of air displaced at each stroke of the compressor when the preditermined pressure has b.wn attathed in the tibhes to enable the atr to be wortond caransively. substantially as described.

No. 102,158. Metal Axle. E'ssien de métal.

The Bettendorf Metal Wheel Company, assignee of Emil Einfeldt, all of Davenport. Iowa, U.S.A.. 20th November, 1906; 6 years. Filed 27th September, 1906. Recelpt No. 139,860.
Claim.-1. A metal axle comprising a body portion and integral bearing spindles, the body portion being composed of a web and flat longitudinal flanges, and the bearing spindles being composed of a web of greater thickness and of less height than that of the body portion, and forming an integral continuation of the latter, and curved flanges forming integral continuations of the flat fianges of the body portion.
2. A metal axle consisting of a single section of commercial I-beam, comprising a main body portion and integral bearing spindles, the body portion having flat flanges and a longitudinal connecting web, and the bcaring spindles having a thickened web and inwardly curved flanges with longitudinal spaces between the flanges and the web, and two bearing shoulders at opposite sides of the bearing spindle at its inner end, said shoulders being formed wholly of the metal of the flanges and presenting projections at two sides only of the spindles.
3. An axle embodying a section of I-beam having the web at the end of the section thickened, condensed and reduced in height, and the flanges at the end curved inward toward each other to present a rounded bearing surface with longitudinal spaces between the curved flanges and the web.
4. An axle embodying a section of flanged bar having the flanges at the end curved to form a bearing spindle, and integral shoulders at the inner end of the bearing spindle. said shoulders being formed of the upset metal of the flanges.
5. A metal axle comprising a section of I-beam, with the web at the end condensed and thickened, and the ends of the flanges curved inward to form a bearing spindle, and shoulders at the inner end of the spindle, consisting of the upset metal of the flanges.

No. 102,159. Telephone Repeater.
Répétiteur de téléphone.

George Washington Kretzinger, assignee of David H. Wilson both of Chicago, Illinois, 20th November, 1906; 6 years. Filed 5th July, 1905. Receipt No. 126,643.
Claim.-1. A telephone repeater comprising a core having two coils thereon adapted to be connected in the talking circuit, a telephone recelver associated with said core, a telephone transmitter associated with said receiver so as to be actuated therefrom, a coil on said core in circuit with said transmitter, and a source of electric supply in circuit with said coil and transmitter whereby the impulses from one station are reinforced so as to be transmitted to the next.
2. A telephone apparatus which consists of a continuous circuit connecting two telephone stations with two separated coils in said circuit between said stations and wound upon the same core, a telephone receiver having its diaphragm in proximity to said core so as to be actuated thereby, a transmitter associated with said receiver, another coil on said core in circuit with said transmitter and a source of electric supply in the transmitter circuit.

No. 102,160. Repair Band for Pneumatic Tires Bande à réparer les bandagrs pnetmatiques.

Frederick William Hoare and Charles Wainman Cole, assignee of a half interest, both of Collingwood, Ontario, Canada, 20th November, 1906; 6 years. Filed 17th August, 1906. Receipt No. 138,756.
Claim.-1. A repair band for tires comprising a partial band shaped to fit the distended cover of the tire and provided with a retaining edge designed to be inserted between the edges of the cover and the sides of the groove in which it fits, as and for the purpose specifled.
2. A repair basd for tires comprising a ptartial band shaped to lt the distended cover of the tire and provided with a retaining edge having a bead formed thereon designed to be inserted between the edges of the cover and the sides of the groove in which it its, as and for the purpose specifled.
3. The combination with the rim having the peripheral groove, of the cover fitting the edge therein at each side of the groove, the air tube fitting within the cover and the repair band fitting outside of the cover and having the retaining edges fitting between the edges of the cover and the sides of he groove, as and for the purpose specifled.

No. 102,161. Bioycle Pump. Pompe de bicycle.

Frank Bruckner Murray and Bradford Merry, assignee of a half interest, all of Augusta, Georgia, U.S.A., 20th November, 1906 ; 6 years. Filed 1st August, 1906. Receipt No. \(138,317\).
Claim.-1. The combination with a vehicle wheel including a hub and an inflatable tire, of a pump cylinder fixed for rotation with the wheel, a duct connecting the cylinder and tire for communication, a piston arranged for reciprocation within the cylinder and having its rod extended beyond one end of the latter, a pivoted cam member adapted to swing to an inclined position for action upon the rod to reciprocato the piston, an operating rod under control of the operator and having an annular portion adapted when the rod is ro-
tated to move the cam member to active position, supporting bearings for said rod, one of said bearings being provided with a notch, a head fixed upon the rod and having a tooth for engagement with the notch to lock the rod against rotation and a spring acting upon the rod for maintaining the notch and tooth normally in locking engagement.
2. The combination with a vehicle wheel including a hub ed an inflatable tire, of a pump cylinder fixed for rotation with the whiel \(a\) duct communicating with the cylinder and tire, a guide rod mounted in the cylinder a piston arranged for reciprocation in the latter and having a tubular piston rod in telescopic engagement with the guide rod, a spring arranged on the guide rod between the piston head and adjacent end of the cylinder and adapted for moving the piston in one direction, the piston rod being extended beyond the other end of the cylinder and equipped with a bearing roller, a pivotetd bearing disc adapted to be moved to an inclined position and act upon the bearing roller for reciprocating the piston against the action of the spring, and means under control of the operator for swinging the bearing disc to active position.

No. 102,162. Whoel Making Machine.
Machine d faire des roues.

The International Harvester Company, Chicago, Illinois, U.S.A., assignee of Charles Walrath Robinson, Hamilton, Ontario, Canada, 20th November, 1906; 6 years. Filed 6th August, 1906. Receipt No. 138,449.
Claim.-1. In a machine of the class described in combination, a base sultably mounted, driving gears, two reciprocating crossheads slidably mounted on said base and opersted by sald driving gears, said crossheads moving as a single plece, means fixed to the adjacent sides of said crossheads for actuating the spoke gripping jaws and for upsetting the spoke ends and spoke gripping jaws mounted on said base.
2. In a machine of the class described in combination a base suitably mounted, driving gears journalled on one end thereof, two reciprocating crossheads slidably mounted on sald base and operated by said driving gears, side bars for adjustably connecting the two crossheads with each other, rams flxed to the adjacent sides of said crossheads, spoke heading tools fixed to said rams and two pairs of spoke gripping jaws actuated by the rams.
3. In a machine of the class described in combination a base suitably mounted, driving gears journalled one one end thereof, two reciprocating crossheads slidably mounted on sald base and operated by said driving gears, side bars for adjustably connecting the two crossheads with each other, two pairs of spoke gripping jaws mounted on sald
base, a ram mounted on each of said crossheads, one of said rams arranged to actuate one pair of said spoke sripping jaws on the forward movement of the crossheads, and the other ram to actuate the other pair on the return movement of same and spoke heading tools carried by said rams.
4. In a machine of the class described in combination a base, driving gears journalled on one end thereof. two pairs of spoke gripping jaws mounted on said base, opposing spoke heading tools and single reciprocating means operated by said driving gears for actuating said spoke sripping jaws and for carrying said heading tools.
5. In a machine of the class described. in combination a base, driving gears journalled on one end thereof. two palrs of spoke gripping jaws mounted on said base, opposing spoke heading tools operated by said driving gears and single reciprocating means for actuating said spoke gripplag jaws and for carrying said heading tools. said means in its forward movement operating to secure the hub end of the spoke and in its return movement to secure the rim end of same.
6. In a machine of the class described, in combination a base, driving gears journalled at one end thereof, two pairs of spoke gripping jaws mounted on said base, a vertically movable wheel member support, opposing spoke headins tools and single reciprocating means actuated by said driving gears for operating said spoke gripping jaws for ralaing and lowering said wheel member support and for carring said heading tools.
7. In a machine of the class described, in combination a base, driving gears journalled on one end thereof, two pairs of spoke gripping jaws mounted on said base, a vertically movable longitudinally yielding wheel member support, opposing spoke heading tools and single reciprocating means actuated by said driving gears dropping the said wheel member support in its forward movement and raising it in its return movement for operating the said jaws and for carrying the spoke heading tools.
o. In a machine or the classs described, in combination a base, driving gears journalled on one end thereof, two bed pieces fixed to and longitudinally adjustable upon said base, a pair of spoke gripping jaws mounted upon each bed plece, crossheads operated by the driving gears and located outside the bed pieces and slidably mounted thereon, jaw actuating rams and spoke heading tools carried by said crossheads and a wheel member support.
y. In a machine of the class described, in combination a base, driving gears journalled on one end thereof, two pairs of spoke gripping jaws mounted on sald base, a vertically movable, longitudinally yielding wheel member eupport clastically held normally in a central position by opposiag springs, and single reciprocating means actuated by said driving gears for controlling the movement of the spoke gripping jaws and the said wheel member support.
10. In a machine of the class described, in combination with the spoke fastening devices, a wheel member support adapted to yield longitudinally independently of said spoke lastening devices as the spokes are being secured to the hub.
11. In a machine of the class described in combination fixed spoke gripping jaws, spoke heading tools co-operating with said jaws and movable with each other, and a vertically movable longitudinally yielding platen for supporting the wheel members, said platen being actuated in its longitudinal movement by the upsetting of the apoke.
12. In a machine of the cass described in combination. spoke fastening devices, a vertically movable longitudinally yielding wheel member support, and a yielding presser head inounted on said wheel member support and adapted to bear against the inside of the wheel rim.
13. In a machine of the class described, in combination with the vertically movable and longitudinally yielding wheel member support, a yielding inside presser head adapted to bear against and spring outwardly a segment of the wheel rim during the initial upsetting of the rim ond of the spoke, sald presser head being mounted on the wheel member support.
14. In a machine of the class described in combination 2 hub end and rim end spoke fastening mechanism, each comprising a pair of fixed spoke gripping jaws and a longitudinally movable heading device, a wheel member support, a yielding independently actuated inside presser head mounted on said support, and an outside presser head actuated by the rim end heading device.
15. In a machine of the class described in combinatio: a hub end and a rim end spoke lastening mechanism. each comprising a pair of fixed spoke gripping jaws and a longitudinally movable heading device, a wheel member support. a yielding independently actuated inside presser head mount. ed on said support, and an outside presser head operatirely connected to said heading device and actuated only during the initial forward movement thereof.
16. In a machine of the class described. In comblnatioa with a vertically movable longitudinally ylelding wheel
member support, an independently actuated ylelding presser head mounted on said support and arranged to bear against and spring a segment of the rim outwardly, hub and rim end spoke fastening devices, each comprising fixed jaws and a heading tool, and an outside presser head adapted to bear against and move the wheel member support inwardly and bring the rim to position at a predetermined distance from the fixed jaws of the rim end spoke fastening device.
17. In a machine of the class described, in combination with a vertically movable longitudinally yielding wheel member support, an independently actuated yielding presser head mounted on said support and arranged to bear against and spring a segment of the rim outwardly, hub and rim end spoke fastening devices, each comprising fixed jaws and a heading tool, an outside presser head adapted to bear against and move the wheel member support inwardly and bring the rim to position at a predetermined distance from the fixed jaws of the rim end spoke fastening device, and both positive and elactic means for returning the said outside presser head.
18. In a machine of the class described in combination, spoke fastening devices, a vertically movable longitudinally yielding wheel member support, counterbalancing springs interposed between said wheel member support and the machine frame, and a yielding presser head mounted on said support and adapted to bear against the inside of the wheel im.
19. In a machine of the class described in combination, spoke fastening devices, a vertically movable longitudinally ylelding wheel member support, an adjustable stop for controlling the lower position of sald support, counterbalancing springs interposed between the wheel member support and the machine frame, and a yielding presser head mounted on said support and adapted to bear against the inside of the wheel rim.
20. In a machine of the class described in combination a hub and a rim and spoke fastening device, a vertically movable hub and rim support arranged to yield longitudinally as the hub end of the spoke is being secured, means for positively raising the said hub and rim support after a spoke has been secured in place, an inside presser head mounted on said support and constructed to bear against and spring a segment of the rim outwardly and yield inwardly as the rim end spoke fastening device secures the rim end of the spoke in place, and an outside presser head actuated by the rim end spoke fastening device and operating to move the hub and rim support to a gauge position with respect to the rim end jaws.
21. In a machine of the class described in combination with the heading tool and spoke gripping jaws, a vertically movable longitudinally yielding hub and rim support, an inside presser head mounted on said support, an outside presser head comprising a sliding plunger arranged to press against the hub and rim support, a lever pivotally mounted on the machine frame, a link connecting said plunger and lever, and a spring operating to hold the plunger in its rearward position, and means in connection with said heading tool for actuating the said outside presser head.
22. In a machine of the class described in combination a reciprocating crosshead, a jaw actuating ram and a heading tool fixed to said crosshead, spoke gripping jaws, a cam block mounted on said ram, a vertically movable longitudinally yielding hub and rim support, an inside presser head mounted on said support an outside presser head comprising a siding plunger arranged to press against the hub and rim support, a lever pivotally mounted on the machine frame, a link pivotally connecting said plunger and lever, a roller fournalled at the pivotal connection thereof and adapted to be engaged by the cam on said ram, thereby positively moving said presser head forwardly and a spring operating normally to hold the plunger in its rearward position, and means for positively returning said presser head consisting of a downwardly projecting arm, or hook integral with the said lever of the presser head and a stop on sald ram adfacent to the cam block, the said stop lying in the path of said arm or hook, when the said presser head occupies its forward position.
23. In a machine of the class described in combination with the spoke fastening devices, a vertically movable longitudinally yielding wheel member support comprising a circular rim holding platen having longitudinally extending guideways on its under side and a large central opening, a bridge secured to said platen and extending across said opening, a hub mandrel mounted on said bridge, vertically extending guides secured to the machine frame, slides provided with transversely extending guides at their upper ends which engage the longitudinally extending ways on the other side of said platen, horizontally arranged springs for holding the platen yieldingly in a central position, a vertically adjustable block placed at the lower end of said vertically extending guides for limiting the drop of said platen, springs for counterbalancing the weight of said pla-

11-18
ten, and means in connection with said spoke fastening de vice for positively raising the platen
24. In a machine of the class described in combination with the reciprocating crossheads and the side bars for connecting same, a platen provided with suitable guides for permitting both a horizontal and a vertical movement, springs acting to hold said platen in its central position horizontally, cam blocks fixed to said side bars and depending arms movable in one direction pivotally secured to said platen and arranged to engage said cam blocks and lift the platen as the bars are reciprocated.
25. In a machine of the class described in combination, a vertically movable longitudinally yieding wheel member support and an inside presser head mounted thereon, said presser head comprising a frame, a plunger longitudinally movable therein, a cylinder and platen pivotally mounted at the lower end of the frame, a vertically arranged lever pivoted on the frame and connecting above with sald plunger and below with said piston, and means for controlling the admission and release of air to said cylinder.
26. In a machine of the class described in combination, a vertically movable longitudinally yielding wheel member suport and an inside presser head mounted thereon, said presser head comprising a frame, a plunger longitudinally movable therein, a cylinder and piston pivotally mounted at the lower end of the frame, a vertically arranged lever pivoted on the frame and connecting above with said plunger and below with said piston, manually operated valve for controlling the admission of air to said cylinder, and automatically actuated mechaniom for releasing the air pressure at a predetermined time.

No. 102,163. Smoke Consumer. Foyer fumivore.

Charles Stewart Ferry and Malcolm Gregory, assignee of a
fourth interest, both of Montreal, Quebec, Canada,
20th November, 1906; 6 years. Filed 7th December, 1906 Receipt No. 130,779.
Claim.-1. The combination with a fire chmaber contalning a fire grate, a tubular member extending transversely to such chamber at the front thereof above the level of the fire grate, a series of tuyeres extending from such tubular member, a steam pipe within and extending longitudinally through the said tubular member, a series of nozzles also within the tubular member and extending from the steam pipe and each being located in line with one of the tuyeres, means whereby heated air is supplied to the tubular member consisting of a single pipe extending from one end of the tubular member to a point in the furnace room above the furnace, and means whereby steam is supplied to the steam plpe, substantially as described.
2. The combination with a fire chamber containing a fire grate, a tubular member extending transversely to such chamber at the front thereof above the level of the fire grate, a series of tuyeres extending from such tubular member, a steam pipe within and extending longitudinally through the said tubular member, a series of nozzles also within the tubular member and extending from the steam pipe and each being located in line with one of the tuyeres, means whereby heated air and the products of combustion from the furnace are supplied to the tubular member consisting of a pair of pipes extending from one end of the tubular member, one of such pipes leading to a point in the furnace room above the furance and the other to a point with in the upper portion of the furnace, the upper end of the first-mentioned air conducting pipe being flared and the upper end of the second-mentioned pipe terminating in a hood, and means whereby steam is supplied to the steam pipe. substantially as described.
3. In a furnace the combination with a fire chamber containing a fire grate and the fire door, of a tubular member extending transversely to such chamber at the front thereof above the fire grate, one end of such tubular member being losed and the other open, a series of tuyeres extending from such tubular member. a stram conductor in close relathon with and adapted to transmit heat to the tubular member, a series of nozzles within the tubular member and receiving steam from the stram conductor, such tuyeres being located one in line with each of the tuyeres, an air conducting pipe connected at one end to the open end of the tubular member and having is opposite end flared and located above the furnace, a second pipe connected at one end of said tubular member and having its opposite end located within the furnace, a pair of valves controlling such conducting pipes a steam supply pipe connteted to the steam conductor a valve controlling such steam supply pipe, a spring controlled lever operatively connected to the stem of the steam valve means detachable operatively connecting the fire door to the lever, a cylinder containing a piston with a piston rod extending therefrom the sald piston also having a port therein and a flexible disc secured to the side thereof. means pivotally connecting the lever to the piston rod infans operatively connecting the lever to the valves of the conducting plpes, a conductor extending from one end to the other of the cylinder, and a valve for controlling the lastmentioned cylinder, substantially as described.
4. In a furnace the combination with a fire chamber containing a fire grate, and the fire door, of a tubular member extending transversely to such chamber at the front thereof above the fire grate, one end of such tubular member being -losed and the other open, a sorics of tuyres extending from such tubular member, a steam conductor in close relation with and adapted to transmit heat to the tubular member, a series of nozzles within the tubular member and reeiving steam from the steam conductor, such tuyeres being located one in line with each of the tuyeres, an air conducting pipe connected at one end to the open end of the tubular member and having its opposite end flared and located above the furnace. a second pipe connected at one of the sald tubular member and having its opposite end located within the furnace, a palr of valves controlling such conducting pipes, a lever fulcrumed between the said pair of valves. means connecting the said valves to the lever at opposite sides of the fulcrum point, a steam supply pipe connected to the steam conductor, a valve controlling such steam supply pipe, a spring controlled lever operatively connected to the stem of the steam valve, means detachably operatively connecting the fire door to the spring controlled lever. means operatively connecting the spring controlled lever to the first-mentioned lever, a cylinder containing a piston with a piston rod extending therefrom. the said piston also having a port therein and a flexible valvulal disc secured to the side thercof, means pivotally connecting the lever to the piston rod, a conductor extending from one end to the other of the cylinder a valve for controlling the last-mentioned conductor, a crank shaft, means effecting a detachable connection between the crank and spring controlled levr, a bevel gear mounted rigidly upon such crank shaft and a bevel gear notatable with the door and intermeshing with the bevel gear just mentioned, substantially as described.

\section*{No. 102,164. Electric Muscle Exercising Apparatus.}

Appareil d'exercice pour les muscles.
Robert O'Connor, Hammond and Charles William Humphrey. assignee of a fourth interest, 20th November, 1906; 6 years. Filed 20th June, 1905. Receipt No. 126.216.
Claim.-1. The combination with a suitable frame, of a magneto-electric generator movable on said frame, and electric conducting and operating cords arranged in circuit and connected to convey the current through the operator when moving the generator on the frame.
2. The combination with a suitable frame, of a weight guided on said frame, an electric generator in said weight. and electric conducting and operating cords arranged in circuit and connected to convey the current through the operator when actuating the device.
3. The combination with a sultable trame, of a pair of movable weights guided on said frame, an electric generator movable with one of sald weights, and combined electric conducting and operating corils for said weights In suitable electric connection with the generator to convey the current through the body of the operator.
4. The combination with a suitable frame, of a magneto-- ectric generator movable one sald frame and having a bulley on the armature thercof, and elrctric conducting and oprerating cords in circuit, one of said cords pasistig ovor sald pulley to simultaneously catise the generator to move on the frame and revolve the armature of sald generator.
0. The combination with a sultable frame having guldes. of a pair of weights movable on said guldes, a magneto-

electric generator within one of said weights and having a pulley on the armature thereof, a pulley within the other weight, suitable pulleys on the frame, electric conduc:ing and operating cords passing over said pulleys and provided with handles, and an electric conducting cord Letween the generator and the last-mentioned weight, salid cords being arranged in circuit to conveg the current through the operator
6. The combination of a frame having non-conducting side guide rods and a center conducting guide rod, weighe guided on said rods with the conducting guide rod between them, an electric generator within one of said weights and having electric connection therewith, and combined conducting and operating cords, one of sald cords being connected to said generator and adapted to actuate the same and the other cord having electric connection with the other of said weights.

No. 102,165. Bicyole Seat Eprins.
Ressort de sidge de bicycle.

Clysses G. Sweeney, and Melvin L. Mayes, Orosi, Callforna l.S.A., 20th November, 1906; 6 years. Flled 2ith Aus. ust, 1906. Receipt No. 139,003.
C'laim.-A saddle supporting spring comprising a pair of horizontally disposed arms the ends of which are ben: in form colncident coils, sald coils being provided with offsets defining upwardly curved arms for attachment to a bicycle saddle post, and a tubular clamping slenve engaging sald horizontal arms and adapted to support the saddle.

No. 102,166. Tandem Bicyole. Bicycle double.

Joseph Delanchamp, Jr., Marieville, Quebec, Canada, 20th November, 1906; 6 years. Filed 16th August, 1906. Receipt No. 138,732.
Olaim.-1. In combination with two bicycles, connecting rods secured to the bicycles, steering means operable from both blcycles, and means for supporting a seat and a receptacle on said rods intermediate of the bicycles.
2. In combination with two bicycles, connecting rods secured to the bicycles, steering means operable from both bicycles, means for supporting a seat and a receptacle on said rods intermediate of the bicycles, and a canopy support carried by the connecting rods.
3. In combination with two bicycles, connecting rods removably secured to the bicycles, steering means operable from either bicycles, and means for supporting a seat and a receptacle on said rods intermediate of the bicycles.
4. In combination with two bicycles, connecting rods secured to the bicycles, steering means onerable from either bicycle, means for supporting a seat and a receptacle intermediate of the bicycles, and means for bracing the bicycles against lateral stress.
5. In combination with two bicycles, a front connecting rod secured to the heads of the bicycles, a rear connecting rod secured to the rear of the frames of the bicycles, a seat and a receptacle carmed by the rods, and means for steering the bicycles synchronously.
6. In combination with two bicycles, a front connecting rod provided with bifurcated ends adapted to engage the heads of the bicycles, means for maintaining the rods in position, a rear rod secured to the rear of the frames of the bicycles, a seat and a receptacle carried by the rods, and means for steering the bicycles synchronously.
7. In combination with two bicycles, a front connecting rod brovided with screw-threaded bifurcated ends, shoes disposed in the bifurcations and adapted to engage the heads of the bicycles, wing nuts on the screw-threaded portion of the bifurcations adapted to secure sald shoes, a rear connecting rod secured to the rear of the frames of the blcycles, a seat and a receptacle carried by the rods, and means for steering the bicycles synchronously.
8. In combination with two bicycles. a front rod secured to the heads of the bicycles, a rear rod provided with recesses disposed around the rear forks of the bicycles. plates disposed on the opposite sides of the rear forks. bolts disposed through the plates and the ends of the rear rod, a seat and a receptacle carried by the rods, and means for steering the bicycles synchronously.
9. In combination with two bicycles, a front connecting rod, a rear connecting rod, intersecting horizontal rods carried by the front and rear rods, a seat and a receptacle carried by the intersecting horizontal rods, and means for steering the bicycles synchronously.
10. In combination with two bicycles, connecting rods removably secured to the bicycles, means for supporting a seat and a receptacle intermediate of the blcycles, means for steering the bicycles synchronously, and a canopy supporting the framework disposed on the connecting rods,
11. In combination with two bicycles, rods having their ends removably connected to the bicycles, Inclined braces connecting the rods and the bicycles, yokes connected to the handle bar stems of the bicycles, links pivotally connected to the yokes, and a rod pivotally connecting the links.

No. 102,167. Rotary Machine. Machine rotatoire.

Daniel Appel, Cleveland, Ohio, U.S.A., 20th November, 1906; Filed 22nd January, 1906. Receipt No. 132,092.
Claim.-1. In a rotary machine, a casing having inlet and exhaust ports and a rotatable power transmitting abutment wall sub-dividing said casing, a piston extending centrally through the said wall to opposite sides thereof and adapted to oscillate and thereby impart a rotary motion to said wall, said piston having its entire active surface exposed to the power fuid from inlet to exhaust.
2. In a rotary machine, a spherical casing, power transmitting wall rotatably mounted in said casing, and an oscillating power piston hinged across the center of said wall and equally exposed on opposite sides thereof, said piston and wall having uniform and unchanging active surfaces and rotatable together.
3. In rotary machines, a casing having inlet and exhaust ports and \(\begin{gathered}\text { atatable wall centrally thereof adapted to }\end{gathered}\) transmit power in combination with a piston intersecting said wall at right angles across its center, and means to cause said piston to oscillate obliquely to the axis of said wall and thereby impart a rotary motion to sald wall and piston.
4. In a rotary machine, a chamber and a rotatable power transmitting wall sub-dividing said chamber, a piston pivoted across the center of said wall at right angles to its axis and adapted to swing from side to side in respect to said wall and means to cause said piston to assume an oblique angle to the plane of said wall and thereby convert the power into a rotary motion for said piston and wall together.
5. A rotary machine having a rotatable shaft and an abutment wall fixed on said shaft and axially in the same plane and a piston-like disc hinged at its center and adapted to oscillate on said hinge in respect to sald abutment wall.
6. In a notary machine, a spherical casing, a rotatable abutment wall therein and a piston disc centraily across the same and in hinged relation therewith, a guide having an orbit in said casing at an oblique angle to the axis of said abutment wall and provided with pivots on which the said piston disc is adapted to osi:illate across the plane of the orbit of said gulde.
7. In rotary machines, \(\varepsilon\). casing and a rotptable sub-dividing wall therein and a piston hinged at its middle in said wall and having a portion of its edge pivotally confined to an orbit at an angle to the axis of sald wall.
8. In rotary machines, a spherical chamber, a rotatable abutment wall therein having fixed bearings, a piston disc having its axis centrally across said wall, and means engaged with the edge of said disc to cause the disc to oscillate obliquely as it rotates.
9. In rotary machines, a spherical chamber, a rotatable abutment wall therein having fixed bearinga, a piston hinged centrally at right angles to said wall and rotatable therewith, and rotatable means in the wall of said chamber adapted to travel at an angle of inclination to the axis of said abutment wall and having sald piston pivotally engaged therewith whereby said disc is caused to oscillate as it rotates.
10. In a rotary machine. a rotatable abutment disc and a piston disc extending through said abutment disc and a travelling pivot point for said piston disc at its edge on which it is adapted to oscillate.
11. A rotary machine having an abutment disc rotatable about a fixed axis and a piston disc hinged at its middle midway across said abutment disc and rotatable therewith. and a rotatable gulde outside both sald discs with which the piston disc has pivoted connection.
12. In a rotary machine, a rotatable abutment wall having a fixed axis and a piston disc hinged at right angles to the said axis across the middle of sald abutment wall and a guide provided with pivots for said piston disc and adapted to travel in a fixed orblt at an inclined angle to the place of sald abutment wall.
13. In rotary machines. a spherical casing comprising base and cover sections dividing at the center of the nower shaft and supply and exhaust connections on the said base section therebr leaving the cover section free to be detached without disturbing the sald connections, In combination with an abutment and a niston miotahin with aqid abutmont adanted to traverse the sald supply and exhaust connection.
14. A snherical casing having its line of division central and lengthwise to the Dower shaft and provided with a guide channel centrally at right angles to said division line, and supply and exhaust connections on said base section whereby the working parts may be readly inspected and removed by taking off the cover section and without disturbing the permanent supply and exhaust connections.
15. In a rotatable machine having a nower shaft. a rotatable ahutment disc havine said shaft extending diametrically through its center and provided with port controlling enlargements on oddosite sides of said shaft, and a casing having ports controlled in the nath of said enlargements.
16. In a spherical rotary machine. a casing comprising a hase section and a nower shaft on which said sections divide. suoply and exhaust connertions secured to sain base section and an endless guide rhannel acrose both said sections at an inclination to the axis nf said shaft. Whereby the rover section mav he convenientlv taken off and the working memhers inanected or remnved from the casing withoit disturbing anv nermanent connections.
17. In a rotary machine. an ahutment dise.. a piston dise engaged at its center acrose the center of the abutment diac and at right angles to the aris thersof and a travelling circular pulde with which said plston disc is pivotally engaged at its periphery.
18. In a rotary machine. a rotatable abutment disc. ian oacillating piston disc hinged rentrally arross the middle of said abutment dise. and a quide ring operativelv connected with arid piston disc and encomnassing both said discs.
19. In a rotary machine. a anitahle rasing. a rotatable abutment disc therein having fixed bearings, a piston disc hinged across the renter of sald abutment disc. 'a ring adapted to travel rotarilv in said rasing and onnosite pivot connertions between said ring and the sald piston disc.
20. In a rotary machine. a casing having a apherical chamher nrovided with a channel extending aroind the wall theroof a gulde ring slidahly mounted in said channel. a nistnn disc oivntallv encaged with said ring at its:edge and an abutment disc traversed by said piston disc.
21. In a rotary machine. a casing having a spherical chamber and a ring-shaned channel extending around the same. a quife ring mounted in said channel. an abutment dise rotatably sunoorted in said chamber and having its axis extendine centrally through the same at an angle to the said ring. and a piston disc hinged at its center and engaged at opnosite points at its edge with the said guide ring.
22. The casing having a chamber with a channel about the same, an abutment disc rotatably mounted in said chamber at an angle to said channel, a guide ring rotatably mounted in said channel and a piston disc hinged at its center across the center of said abutment disc, and having opposite pivot connections with said guide ring.
23. The casing having a spherial chamber and a guide channel about the same, a main shaft and an abutment disc mounted thereon at an angle to said channel, a piston disc hinged at an angle across sald abutment disc, and a guide ring in said channel operatively engaged with the edge of saidiabutment disc and flush with the wall of sald chamber.
24. The casing having a spherical chamber and a ringshaped guide channel about said chamber, a guide ring occupying said channel and having its inner surface flush. with the surface of the said chamber, a piston disc and pivots connecting the edge thereof with sald. ring, an abutment disc in said chamber at an angle to the said ring and a shaft on which said abutment disc is fixed.
25. The casing having inlet and exhaust ports, and abutment disc constructed to control said ports, a piston disc mounted at an angle across said abutment disc, and a rotatable guide with which the said piston disc is operatively engaged at its elge.
26. The casing having a spherical chamber and inlet and exhaust ports. a shaft centrally through said chaniber and an abutment disc fixed thereon and constructed to control the said porte, a piston disc hinged across sald abutment
disc and means to caure said disc to oscillate to and fro in respect to the said abufment disc.
27. A rotary machine having an inlet and an outlet for fluid pressure and comprising rotating and oscillating members, in combination with an automatic relief valve for the fluid inlet of cald machine.
28. In a rotary machine, a set of rotatable power members having opposed working surfaces, of a fixed area during an entire cycle of rotation, and one of said members adapted to oscillate obliquely in respect to the axis of rotation of both members.
29. In a rotary machine, a get of power membere comprising a rotatable abutment and an oscillating piston adapted to rotate with sald abutment, said abutment and said piston having opposed working surfaces of a given area adapted to operate with an unvarying exposure during their entire travel.

No. 102,168. Windmill. Moulin d oent.

\section*{5}

Robert S. Bartlett, Nocona, Texas, U.S.A., 20th November, 1906. 6 years Filed 25th September, 1906. Recelpt No 139,767.
Claim.-1. A wind wheel comprising spaced apart hoads, a circular series of transversely curved blades secured to said heads and held therebetween. the outer edges of sald blades being arranged in a circle and the inner edges of said blades belng also arranged in an inner circle which forms a wind chamber at the center of the wheel, the inner edge of each curved blade being located at a point where a line drawn tharethrough and through the center of the wheel will intersect the outer edge of the next blade in advance, and each of said blades being concaro-convex in cross section, the cross section thereof lying in an arc struck from the outer circle of the wheel to the inner circle forming the wind chamber. the radius of said are being equal to one-quarter the diameter of the wheel.

No. 102,169. Display Cabinet. Cabinet de montre.

Martin T. Brennan, Montreal, Quebec, Canada, 20th Norember, 1906; 6 years. Filled 29th September, 1906. Recelpt No. 139,895 .
Claim.-1. A display cablnet comprising the comblation of a glass cylinder, casings arranged at the top and bot-
tom of the cylinder, a locking rod disposed through the casings and means for displaying collars in the cylinder on the rod.
2. A display cabinet comprising the combination of a glass cylinder, casings arranged at the top and bottom of the cylinder, a locking rod disposed through the caslngs, a reflector disposed in each of the casings, and means for displaying collars on the rod in the cylinder.
3. A display cabinet comprising the combination of a glass cylinder, casings arranged at the top and bottom of the cylinder, a rod disposed through the casings, bracket arms provided with collars adapted to engage the casings, screw-threaded caps adapted to lock the collars on the casings, brackets adapted to support the arms, and means for displaying collars on the rod in the cylinder.
4. A transparent display cabinet having a rod therein disposed centrally and longitudinally thereof and adapted to maintain the parts of the cabinet together, in combination witli a collar on the rod provided with radial arms, some of which arms are provided with hooks adapted to support a collar, and one of which arms is provided with a button adayted to be inserted through the front button holes of the supported collar, and set screws adapted to secure sald collars on the rod.
5. A display cabinet comprising the combination of a transparent cylinder, a lower casing having an interiorly and exteriorly screw-threaded projection, an upper casing having a projection with a screw-threaded bore and having external screw threads, bracket arms having collars disposed around the projections, screw-threaded caps on the projections adapted to lock the collars against the casings. a screw-threaded rod disposed with one end in the screw-threaded recess and the other end in the bore of the other casing, an interiorly and exteriorly screwthreaded nut on the rod and in engagement with the bore of the casing, reflectors in the casing, and display racks on the rod.
6. In combination with a supporting roa, a collar disposed on the rod and provided with a plurality of radial arms, some of which are provided with hooks adapted to support a collar, and one of which is provided with a button adapted to be inserted through the button holes in the collar, and a set screw adapted to lock the collar on the rod.

No. 102,170. Metallic Bar Bender.
Apparell pour plier les barres de metal.

Alvin C. Busby, Ellenburg, Washington, U.S.A., 20th November, 1906; 6 years. Filed 20th October, 1906. Receldt No. 140,465.
Claim.-1. An apparatus for bending metallic bars comprising a frame, rollers journalled therein, standards which are connected together, one of said standards being hinged to the frame, a corrugated roller adjustably mounted upon said standards, a longitudinally movably key mounted upon the frame, a pivotal lever for operating said key whereby the same may be moved into and out of a recess in one of said standards, as set forth.
2. An apparatus for bending metallic bars comprising a frame, rollers journalled therein, standards which are connected together, one of said standards being hinged to the frame, a corrugated roller adjustably mounted upon said standards, a longitudinally movable key mounted upon the frame, a pivotal lever for operating said key whereby the same may be moved into and out of a recess in one of said standards, and a stop to limit the movement of said key in one direction, as set forth.
3. An apparatus for bending metallic bars comprising a frame with rollers mounted therein, standards, connections between the same, an adjustable roller carried by said
standards, one of said standards hinged to the frame, and the other having a recess in the face thereof adapted to register with a recess in the face of said trame, a longitudinally movable key adapted to move in said recesses which in registration with each other, and an angle lever mounted upon the frame and having sliding pivotal connection with said key, as set forth.
4. An apparatus for bending metallic bars comprising a frame with rollers mounted therein, standards, connections between the same, an adjustable roller carried by said standards, one of sald standards hinged to the frame, one of the faces of the frame having a longitudinal recess with an off-set therein, which latter is adapted to recelve the lower end of one of said standards, a key adapted to work in registering recesses in said frame and one of said standards, and a pivotal lever having sliding connection with said key and adapted to move the same longitudinally, as set forth.

No. 102,171. Relay for Reinfording Sound.
Relaf pour renforcir le son.

Jens Herman Christensen, Sovejen, Sollerod, Denmark, 20th November, 1906; 6 years. Filed 5th April, 1905. Receipt No. 123,981.
Claim.-1. A telephone relay comprising a diaphragm, a pendulum freely adacent said diaphragm and bearing lightly thereagainst, and. a repeating circuit including a receiver and arranged in series with contacts formed by said pendulum and the diaphragm respectively.
2. A telephone relay, comprising a diaphragm. a pendulum depending freely adjacent thereto and having a carbon block at its exremity, said diaphragm and carbon block being lightly in contact, and a repeating circuit including a receiver and arranged in series with the contacts formed by said diaphragm and carbon block.
3. A telephone relay. comprising a diaphragm having a carbon plate forming a part thereof, a plurality of pendulums each depending freely adjacent said diaphragm and having a carbon block bearing lightly against said plate, and a repeating circuit arranged in series with the contacts formed by the engagement of said carbon blocks with said plate.
No. 102,172. Means for Inflating Pneumatic Tires.
Moyen. de soufler les bandages pncumatiques.
Roger Connell, Westport, Westland. New Zealand, 20 th November, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137,698.
Claim.-1. Apparatus for the purpose indicated, comprising in combination with a pneumatic tire, a pump barrel, means for connecting the barrel to the tire, a plunger within the barrel having a cupped leather washer, a rod extending from the plunger to the tire, means for attaching the rod to the inside of the outer periphery of the air tube of the tire, a perforated screw cap attached to one end of the rod and screwed upon the plunger, a valve within the plunger, a spiral in compression between the valve and the screw cap, a cap screwed upon the upper end of the pump
barrel, a neck integral with the screwed can and a nonreturn valve within the neck, substantially as set forth.

2. Apparatus for the purpose indicated, comprising in combination with a peumatic tire, a pump barrel, means for connecting the pump barrel to the tire, a plunger within the barrel, having a cupped leather washer, a rod extending from the plunger to the tire, means for attaching the rod to the inside of the outer periphery of the air tube of the tire, a perforated screw caf attached to one end of the rod and screwed upon the plunger, a valve within the plunger, a spiral spring in compression between the valve and the screw cap, a cap screwed upon the upper end of the pump barrel, a neck integral with the screwed cap. a nipple having a hole throughout its length and fitting the neek, a spindle having one end flattened and entering the hole of the nipple. a pin passed through the nipple and through a slot in the spindle, a rubber tube provided with a slit and fitting upon the spindle and the end of the nipple. a screw cap upon the neck, and means for excluding dirt from the interior of the pump, substantially as set forth.
3. Apparatus for the purpose indicated comprising in combination with a pneumatic tire, a pump barrel, means for connecting the pump barrel to the tire, a plunger with in the barrel having a cupped leather washer, a rod extending from the plunger to the tire and having a screwed end, a flanged nipple screwed to receive the screwed end of the rod, washers and a nut upon the nipple for making an air tight joint between the nipple and the tire, a perforated screw cap attached to the other end of the rod and screwed upon he plunger, a valve within the plunger a spiral spring in compression between the valve and the sorew cap. a cay screwed upon the upper end of the pump barrel, a neck integral with the screwed cap and a non-return valve within the neck, substantially as set forth.

No. 102,173. Writing Guide. Guide pour écrire.
Joseph Castle Dana, Boise. Idaho. U.S.A., 20th November. 1906: 6 years. Filed 16th August, 1906. Receipt No. 138,737.
Claim.-1. A device of the class described, comprising a bed or platen, line guides associated therewith, and a line indicator carried by the bed or platen.
2. A device of the class described, comprising a bed or platen, line guides associated therewith, and a line indicator permanently and movably mounted upon the bed or platen.
3. A device of the class described, comprising a bed or platen. line guides associated therewith, a gulde member mounted upon the bed or platen, and a line indicator movably mounted upon the guide member.
4. A devlce of the class described. comprising a bed or platen, line guides associated therewith, a guide member secured to the platen, and a line indicator movably mount-
ed upon the guide member, said line indicator being provided with a turn down engaging portion.

5. A bed of the class described comprising a bed or platen, line guides associated therewith, and a line indicator movably mounted unon the bed or platen, said line indicator being provided with a turn down engaging portion.
6. A device of the class described, comprising a bed or platen provided with flanges, a frame provided with guide elements, said frame being hingedly secured to one of the flanges of the bed or platen, and a line indicator movably mounted upon the bid or platen.

No. 102,174. Calculating Machine.
Machine d calculer.

William Robert Gaither, Chicago, Illinois, U.S.A., 20th Novvember, 1906; 6 years. Filed 20th August, 1906. Receipt No. 135.815.
- Ulaim.-1. In a calculating machine of the character described employing a printing attachment containing a laterally shiftable carriage and a platen and paper feeding means, the combination with the carirage of a web guide thereon, a roller carrier rigidly connected with said carriage to move with it, and lower and upper web carrying rollers journalled on said carrier and adanted for winding and unwinding a web extending from one to the other of said rollers between said platen and feeding means, for the purnose set forth.
2. In a calculating machine of the character described employing a printing attaclment containing a laterally shiftable carriage and a platen and pader feeding means.
a frame for said carriage extending across the back of the machine casing and projecting beyond the sides thereof, a track extending between the ends of said frame and on which the carriage is movably supported, a web guide secured on the carriage to move with it, a roller carrier rigidly connected with said carriage to move with it, and lower and upper web carrying rollers journalled on said carrier and adapted for winding and unwinding a web extending from one to the other of said rollers betwoen said platen and reeding means, for the purpose set forth.
3. In a calculating machine of the character described employing a printing attachment containing a laterally shiftable carriage, and a platen and paper feeding means a frame for said carriage extending across the back of the machine casing and projecting beyond the sidis thereof, a track extending between the ends of said frame and on which the carriage is movably supported, a web guide secured on the carriage to move with it, a supplemental frame rigidly connected with said carriage to move with it, and lower and upper web carrying rollers journalled on said supplemental frame and adapted for winding and unwinding a web extending from one to the other of said rollers between said platen and feeding means, for the purpose set forth.
4. In a calculating machine of the character described employing a printing attachment containing a latterly shiftable carriage and a platen and paper feeding means, a frame for sald carriage extending across the back of the machine casing and projecting beyond the sides thereof, a track extending between the ends of said frame and on which the carriage is movably supported, a web guide secured on the carriage to move with it, a supplemental frame rigidly connected with said carriage to move with it, a bearing on said casing on which the supplemental frame travels and lower and upper web carrying rollers journalled on said supplemental frame and adapted for winding and unwinding, a web extending from one to the other of sald rollers betweed said platen and feeding means, for the purpose set forth.
5. In a calculating machine of the character described, employing a printing attachment containing a laterally shiftable carriage and a platen and paper feeding means, a frame for said carriage consisting of a bar extending across the back of the machine casing and projecting beyond the ends thereof, and brackets projecting upward from the ends of said bar, a track supported at its ends on said brackets and on which the carriage is movably supported, a bearing bar connecting said brackets below the track, arms extendrearward from the carriage and carrying vertical bars provided at their lower ends with rollers riding on said bearing bar and having lower and upper foller bearings, and web carrying rollers journalled in said roller bearings and adapted for winding and unwinding a web extending from one to the other of said rollers between said platen and feeding means, for the purpose set forth.

\section*{No. 102,175. Feed. Water Feater, Separator and Purifier.}

Chauffeur d'eau d'alimentation, séparateur et purificateur.
William Asa Gibson, Muscatine, Iowa, U.S.A., 20th November, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,199.
Claim.-1. In a heater and purifier the combination with an inlet pipe and means for forcing the fluld to be heated therethrough, of a restricted nozzle continuous with the inlet pipe, a baffle plate opposite the end of the nozzle, means for heating the baffle plate to a high temperature, a separating chamber, an annular spiral passage concentric with said nozzle and having one hot and one cold wall and leading from said baffle plate into the separating chamber and delivering the heated water thereinto under rapid gyratory motion, a discharge pipe in the bottom of the mud drum through which the heavier solids in suspension escape, superheating pipes through which the water flows from the mud drum, a separating chamber adapted to receive the heated water from said superheating pipes and means thereing the lighter precipitate therefrom.
2. In a feed water heater and purifier the combination with an inlet pipe, of a restricted nozzle thereon, means for spraying and heating to a high temperature the water ejected therefrom, a spiral restricted passage through which the heated water is passed letween an inner cold wall and an outer hot wall, a centriiugal separating chamber into which said water is delivered with rotary motion. a waste pipe connected peripherally in the wall of the chamber and from which the heavier solids in suspension escape, a centripetal separating chamber, superheating pipes leading from the centrifugal chamber into the centripetal separating chamber, means for directing the water therefrom obliquely against the walls of said chamber, and means located centrally of said chamber acting to divert the lighter solids in suspension into a discharge passage.
3. A water heater and purifler provided with means for admitting cold water under pressure thereinto, and first

spraying and highly heating the same, then partly cooling and delivering the same with rotary motion into a centrifugal separating chamber provided with means permitting the separation of the heavier solids in suspension therefrom, means for again highly heating the water, a centripetally operating separating chamber into which the heated water is delivered with a gyratory movement, a deflector located centrally of sald chamber and acting to remove the lighter solids in suspension, said chamber having peripherally disposed apertures through which the heated and purified water escapes to the boiler under pressure.
4. The combination in a water heater and purifier, of means for removing the heavier solids therefrom, a separating chamber, means for superheating the water thereafter and delivering the same with great force obliquely against the sides of said separating chamber, a spiral deflector located axially of said chamber and having its edges presented to the whirling mass of water and acting to direct the lighter impurities therefrom into a passage opening axially from said chamber, said separating chamber having peripherally disposed exit passages leading to the boiler feed pipe.
5. The combination in a boiler feed heater and purifier, of means for highly heating the water and directing the same alternately against a hot and a cold surface, precipitating the solids in suspension thereby, a separating chamber into which the water is delivered under high rotary motion, a blow-off pipe leading therefrom and from whence the heavier solids are delivered, an auxiliary centripetally operating separating chamber and a pipe leading therefrom to the boiler or the like, superheating pipes from whence the water is conducted into said auxiliary separating chamber.
6. The combination with means acting to precipitate the solids from feed water, of a centripetally operating separating chamber connected therewith and into which the water is delivered therefrom, immovable means located centrally therein and acting to separate from said water the solids in suspension and to deliver the same from the heater and a passage communicating with said chamber and the boiler.
7. The combination in a water heater and purifier, of means acting to precipitate the solids therein, a mud drum in which a part of the solids are separated and removed, superheating pipes leading therefrom, a separating chamber into which said pipes open obliquely, and a deflector located therein acting to remove the remaining solids therefrom.
8. The combination with a water heater and purifier acting to precipitate the solids contained in solution in the water and to remove the heavier solids therefrom. of a separating chamber, superheating pipes acting to deliver the partly purified water obliquely into said separating chamber under pressure and producing a centrifugally flowing current of high velocity, a rigid deflector in said chamber
acting to draw the impurities inwardly to a centrally located exit passage, and an outlet pipe leading to the boller or the like.
9. The combination with a water heater and separator, of reheater pipes leading therefrom, a separator chamber into which said pipes open obliquely and outwardly acting to produce rotary motion in the water therein, of a deflector located axially of sald chamber and having its edges directed against the current on the inner side and acting to engage the precipitated solids in the current and direct the same to an exit aperture at the axis of said chamber and discharge passages near the periphery of the chamber communlcating with the boiler or the like.
10. The combination with a water heater and purifier acting to highly heat the water and precipitate the solids therein and to eliminate the heavier solids centrifugally of a separating chamber, superheating pipes acting to dellver the heated and partly purified water thereinto, axially disposed separating means in said chamber acting to draw the remaining solids inwardly to a point of discharge located axially of the chamber, and a pipe communicating with sald chamber and the boiler or the like.
11. In a device of the class described a separating chamber comprising a cylindrical shell, inlet passages opening thereinto and directed obliquely against the side wall thereof, a spiral deflector in said chamber, a deflecting plate at the end of the chamber having a central exit aperture therein and registering with the end of sald deflector and a delivery pipe opening from said chamber
12. In a device of the class described the combination with a centrifugal separating chamber, of means for delivering water thereinto with a gyratory motion, a centripetal chamber, superheating pipes connecting said chambers, a steam chest enclosing said pipes, a laterally directed nozzle on said pipes, within the centripetal chamber, a deflector in said chamber and means for carrying off the separated solids.
13. The combination in a water heater and purifier, of a centrifugal separating chamber, means for delivering water thereinto with a gyratory motion, a centripetal separating chamber, a plurality of superheating pipes connecting said chambers and extending into the centripetal chamber, a laterally directed nozzle on each pipe, an axially disposed spiral deflector in said centripetal chamber, a radially ribbed disc and means thereon for collecting and discharging the senarated solids.
14. The combination in a water heater and purifier, of a centrifugal separating chamber, a casing having an outer chamber therein and an inner centripetal separating chamber a plurality of superheating pipes connecting said centrifugal chamber with said centripetal separating chamber, means for separating and forcing solid matter from the water to the center of said chamber through a discharge exit and forcing the purified water to the outer side of said chamber and into said outer chamber.

No. 102,176. Compler for Whifiletrees.
Joint pour palonniers.

Andrew W. Gilchrist, Manchester, Iowa, U.S.A., 20th November, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137.235.
Claim.-1. In a device of the character described the combination with a pivoted base having a headed extension at one end. of a retaining strap having an aperture for the reciption of the head, and means for securing the stran to the base.
2. In a device of the character described the combination with a base having a headed extension at one end and a
whiffletree engaging projection upon the extension, of a retaining strap having an aperture therein for engagement by the head, and means for securing the strap to the base.
3. In a device of the character described the combination with a supporting plate and an ear integral and parallel therewith, of a base mounted between the supporting plate and ear, a headed extension at one end of the base, a projection upon the extension and an apertured retaining strap adapted to be engagec by the head, and means for securing the strap and base to the ear and plate respectively.
4. The combination with a supporting plate and a strap integral therewith for holding the plate upon a support, of an ear integral with the supporting plate and parallel therewith, a base mounted between the plate and ear, a headed extension at one end of the base, a projection upon the extension an apertured retaining strap for engagement by the head and means for pivotally connecting the strap and base to the ear aud supporting plate.

\section*{No. 102,177. Non-Refllable Bottle.}

Boutcille non-ríemplissable.

Angelo Feraro, Brooklyn, New York, U.S.A., 20th Norember, 1906; 6 years. Filed 23rd February, 1906. Recelpt No. 133,215.
Claim.-1. In a device of the class described, a bottle having a neck provided with a valve seat, a valve designed to rest upon the seat and comprising a pair of discs and an interposed tubular weight, and a shield arranged above the valve.
2. In a derice of the class described a bottle having a neck provided at its inner end with a shoulder, a tubular section affixed above said shoulder, and constituting a valve seat, a valve arranged to close on said seat, a second tubular section fixed in the neck above and remote from the valve, a guard member designed to seat on said section.* and a shield arranged above the guard member.
3. In a device of the class described, bottle having a neck provided with a valve seat, a valve desigaed to rest upon the seat and comprising a pair of discs and an interposed weight, and a shield arranged above the valve.
4. In a device of the class described, bottle having a neck provided with a valve seat, a valve designed to rest upon the seat and comprising a pair of discs and an interposed weight, one of suid discs being composed of buoyant material, and a shield arranged above the valve.

\section*{No. 102,178. Closure for Bottlea.}

\section*{Fermeture de bouteilles.}

Carl Lohmann, No. 4 Newmarket Gelsenkirchen, Germany 20th November, 1906; 6 years. Filed 23rd May, 1906. Receipt No. 136,173.
Claim.-1. A closing device for bottles, comprising a ring of resilient material introduced into the neck of the bottle and suitably supported and having a passage therethrough. a tap inscrted in said ring and having its passage therethrough arranged to register with said ring passage, and means for retaining said tap in said ring, as and for the purpose specified.
2. A closing device for bottles, comprising an india rub ber ring introduced into the neck of the bottle in an annular recess formed in a collar surrounding sald neck fotermediate of its length, said ring having passage leading from the inner wall of the ring opening through to the lower side. a tap having a stopper portion closing sald ring opening and a passage therethrough adapted to register with said pas sage in the ring on the turning of sald stopper portion, eatd tap having suitable shoulders intermediate of its lensth,
and a cap encircling the shank of said tap above said stopper portion and having inturned outer edges adapted to

\(\pi g .2\)

grip a bead at the top of the neck of the bottle, as and for the purpose specided.
3. A closing device for the bottles. comprising an india rubber ring having a passage through the wall thereof and introduced into the neck of the bottle, a tap having a stopper portion adapted to close the opening in said ring and shoulders formed in the shank portion above said stopper portion and a passage therethrough registering at its lower end with said passage in said ring portion, and a gripping device encircling the said stopper at said shoulders and engaging the neck of the bottle, as and for the purpose specified.

No. 102,179. Wire Drawing Machine.
Laminoir pour fils de fer.

William John Herald, Hamilton, Ontario. Canada, 20th November, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,402 .
Claim.-1. The combination with the dies, of a drum located between the same supported on a suitable shaft and provided with slits extending radially in the face of the drum and longitudinal in the periphery, and a friction wheel secured on the chaft and with which the interior periphery of the drum is caused to contact as the drum is contracted upon the call of the wire, as and for the purpose specified. 11-19
2. The combination with the dies, of a drum located between the same supported on a suitable shaft and provided with slits extending radially in the face of the drum and longitudinal in the periphery, the said drum fiaring internally outwardly and a friction wheel having a taper substantlally corresponding to the internal flare of the drum and adjustably secured on the shaft and with which the interior perlphery of the drum is caused to contact as the drum is contracted upon the call of the wire, as and for the purpose specified.

No. 102,180. Shelf Bracket.
Console de tablettes.

John Henry Morgan, The Grange, Harlow Oval, Harrogate,
York, England, 20th November, 1906; 6 years. Filed 29th September, 1906. Receipt No. 139,907.
Claim.-1. As an improved article of manufacture, the herein described sheet metal braceless bracket, consisting essentially of the wall and shelf plates, each plate being provided with tapering flanges and each having a tapering strengthening web formed by folding a portion of the blank on a longtitudinal line, and having a sllt cut in the web for dividing it into two portions, and a portion of its folding part removed, and the web afterwards opened out to enable one of its portions to overlap and enclose the upper and widest part of the remaining portion of the web, and to abut against the inner surface of the flanges wall plate bracket at the point of juncture.
2. A sheet metal bracket formed from a single elongated diamond-shaped blank of which a tapering strengthening web is formed by a longitudinal fold of the metal, the tapering portions of the web being arranged to terminate at a transverse slit and a recess formed in one portion of the upper surface of the said web by removing a portion thereof, a tapering flange formed out of a blank on each side of the web and made to taper from each of its ends towards the point of meeting at the said slit, and afterwards bending a portion of each of the sald flanges over at a right angle to the other portion for enabling the web connected to the bent over flanges to overlap the top of the web on the other portion, and its ends so impinge upon the outer surfaces of the vertical flanges, and the means comprising two rivets passing transversely through the widest portions of the web for preventing any movement of the horizontal arm when a plate is placed upon its upper surface, as set forth.
3. A bracket in which the wall and shelt plates are provided with a strengthening tapering web is first formed by a longitudinal fold of the blank, and having a slit cut therein for dividing the web into two portions, and a recess formed in the upper surface of one of the portions of the web, a tapering flange formed out of a blank on each side of the
 comprising two rivets for securing the broad ends of the web together at the points of juncture where they overlap each other, substantially as set forth.

No. 102,181. Grindstone Mill. Moulin à broyer.
Ol:ver J. Mousette, New York City, New York, U.S.A., 20th November, 1906; 6 years. Flled 6th March, 1906. Receipt No. 133,602.
Clain-1. A grinding mill comprising a rotary case tapering from the center towarls each end, and a crusher arranged within the case and composed of flexibly connected sections of a conicity different from that of the case and
adapted to grind or comminute material between their adjacent faces, each of said crusher sections tapering from

the inner toward the other end thereof and conforming in contour to the shape of the casing so as to nest therein, and prevent displacement of the crusher during rotation of the casing, the taper of the crusher being of somewhat different degree to the taper of the case so as to cause the meeting edges of the crusher sections to gape or stand at an angle to one another.
2. A grinding mill comprising a rotary case tapering from the center towards each end, and a crusher arranged within the case and composed of sections of a conicity different from that of the case linked together and adapted to grind or comminute material between their adjacent faces, each of said crusher sections tapering from the inner toward the outer end thereof and conforming in contour to the shape of the casing so as to nest thereis and prevent displacement of the crusher during rotation of the casing, the taper of the crusher being of somewhat different degree to the taper of the case so as to cause the meeting edges of the crusher sections to gape or stand at an angle to one another.
3. In a grinding mill a rotary case and tubular or open crusher sections each having a web in its interior clear of the edges, and link bolts respectively secured to the webs and connected to one another.
4. In a grinding mill, a tapered rotary case and crusher sections of different taper than the case and having their opposing end faces indented.
5. In a grinding mill, a rotary case tapering from the center towards each end and having openings along the axis of rotation and crusher sections of tubular shape placed end to end and extended in like direction so as to allow flow during the operation through the crusher and both ends of the case.
6. In a grinding mill a rotary case tapered from its center portion in each direction in the axis of rotation, tubular or hollow crusher sections of different taper from the case, and a connection between the sections, sald case having openings for the passage of fluid during the operation and a withdrawing opening with cover therefor, said crusher sections being placed end to end and being detached from the case so as to roll freely therein.

\section*{No. 102,182. Compring Cheese Criter. \\ Couteau d fromage calculateur.}

John H. Osborne, Anderson, Indiana, U.S.A., 20th November, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,818 .
Claim.-1. In a computing cheese cutter the combination of a cheese table, an operating lever therefor bearing a cheese total scale, a radial arm having a clutch connection with said table, a movable connection device between said lever and arm, an indicator for said scale, and means carried by said lever for changing the. position of said connection device in accordance with the adjustment of said indicator, substantlally as specifled.
2. In a computing cheese cutter the combination of a cheere table, an operating lever for the fame bearing a cheese total scale. a radial arm plvoted centrally of said table and having a clutch connection therewith, a connection device between said lever and arm, an indicator for said scale, and means carried by sald lever for simultaneously adjusting sald connection device and indicator, substantially as specified.
3. In a computing cheese cutter the combination of a checse table, an operating lever for the same bearing a
cheese total scale, an indicator for said scale, a radial arm having a clutch connection with said table, a connection

device between said lever and arm, and means for simultaneously adjusting said indicator and connection device, substantially as specifled.
4. In a computing cheese cutter the combination with a rotary cheese table, of an operating lever therefor bearing a cheese total scale, an indicator for said scale, a radial arm having a clutch connection with said table, a connec tion device between said arm and lever, and a longitudinal adjusting rod engaging said connection device and indicator, substantially as specified.
5. A computing cheese cutter, having in combination a rotary cheese table, an operating lever therefor having a fulcrum at its rear end and bearing a cheese total ecale, a radial pivoted arm having a clutch connection with sald table, a connection device between said arm and lever, and means for simultaneously adjusting said connection device and indicator, substantially as specified.
6. A computing cheese cutter, having in combination a rotary cheese table, an operating lever therefor having a fulcrum at its rear end and bearing a cheese total scale, a radial pivoted arm having a clutch connection with said table and having a longitudinal slot, an indicator for eaid scale, a connection device engaging said slot, and a longitudinal rod carried by said lever and having threaded end portions engaging said indicator and connection device, substantially as specified.
7. In a cheese cutter the combination of a base frame, a cheese table mounted rotatably thereon, an actuating part carrying a clutch, said clutch carrylng a pair of plas adapted to grip annular part of the table and belng piroted 10 the actuating part and having a longitudinal movement thereon, a spring for normally actuating the clutch, and means for operating said actuating part.
8. In a cheese cutter the combination of a base frame and a rotatable table mounted thereon and provided with in annular rim, means for actuating the table embodying a clutch consisting of a radially movable plate provided with gripping means adapted to grip the opposite sides of said annular rim of the table, and a spring for normally keeplas said gripping means against said annular rim.
9. In combination with a base and a table rotatably mounted thereon and having an annular gripping rim, and means for rotating the table, said means embodying a radially morable plvoted plate carrying pins which normally grip aaid rim, said pins being so disposed that they grip the rim while moving in one direction and release it when moving in the opposite direction.
10. In a cheese cutter the combination of a base frame and a rotary table mounted thereon, a vibrating lever an 1 means for actuating the table therefrom, a spring retracted stop pin carried on the handle of said lever, and a serles of stops mounted on the base fame, these stops marking of fractions of a pound, for the purposes set forth.
11. In a cheese cutter the combination of a base frame and a rotary table mounted thereon, a vibrating lever and means actuated thereby for rotating the table, a scale adjacent to said lever, and a slide on said scale carrying a movable stop pin adapted to be projected into the path of said lever, for the purpose set forth.
12. In a cheese cutter the combination of a base frame and a rotary table mounted thereon, a vibrating lever and means actuated thereby for rotating the table, a pair of maximum throw stops carried by the base, intermediate stops, for measuring off fractions of a pound, a part on the lever adapted to co-act with sald intermediate stops, a price anit scale extending between said maximum throw stops, and an adjustable stop on said price unit scale.
13. In a cheese sutter the combination of a base frame and a rotary table mounted thereon, a vibrating lever and means actuated thereby for rotating the table, maximum throw stops on the base, a price unit scale bar extending between these stops and along which the lever works, and an adjustable slide on the scale bar carrying a movable stop adapted to be projected into the path of the lever and arrest in at points intermediate of the maximum throw stops, for the purpose set fonth.
14. In a cheese cutter the combination of a base frame, and a rotary table journalled thereon, an arm pivoted concentrically with respent to the table and lying thereunder and carrying at its outer end means for aripping an annular part of the table. said arm being longitudinally slot ted, a fulcrum pin engaging said slot. and means for adjusting said fulcrum pin in said slot. means for vibrating said fulcrum pin, and means for limiting the movement of said vibrating means. for the purpose set forth.
15. In a cheese cutter the combination of a base frame and a rotary table mounted thereon, a vibrating lever, and means actuated thereby for rotating the table. stops on the base for determining the maximum throw of the lever, a price unit scale bar extending between sald stops and across the lever, an adjustable stop on the scale bar, and means whereby the lever may be permitted to vibrate between the maximum throw stops or confined in its vibrations between one of said stops and the adjustable stop, for the purpose set forth
16. The method herein described for measuring off cheeses either by weight or by money value, consisting in the omployment of two co-operating and juxtaposed scales for governing the actuating mechanism, one of said scales being a weight scale and the other a price scale, whereby pieces of cheese may be measured off by a single actuating means according to weight or according to price alternately and without disturbing the adjustment of either scale.
17. In a commuting cheese cutter. the combination of a rotary table and means for actuating the same, two scales for controlling the action of the actuating means, one of said scales being a weight scale and the other a price scale and the two scales being co-operatively related so as to control the single table actuating means, being provided whereby elther scale may be brought into requisition without disturbing the adjustment of the other scale.
18. In a cheese cutter, the combination of a base frame and a rotary table mounted thereon. a lever and means actuated thereby for rotating the table, fixed maximum throw stops for the lever, and a weight scale for regulating the influence of the lever upon the table, a price scale and an adjustable stop thereon. and means whereby the lever may be permitted to vibrate between the maximum throw stops or be confined in its vibrations between one of said stops and the adjustable stop, for the purpose set forth.

\section*{No. 102,183. Fire Extinguishing Construction of Buildings.}

\section*{Apparedl d'extincteur d'incendie dans la construction des batisses.}

John Rogers, Perry, Iowa, U.S.A... 20th November. 1906: 6 years. Filed 20th June, 1906. Receipt No. 137,099.
Claim.-1. In construction of buildings or the like, cellings or wall structure embodying inner and outer plates spaced from each other centrally thereof to form a water chamber, lugs projected from the outer plate and engaging the inner plate to attach same together. water inlet pipes communicating with the space between the plates, the outer plate being apertured for egress of the water from the water chamber aforesaid.
2. In construction of buldings or the like, wall structure embodying inner and outer plates spaced centrally from one another and also spaced at the edges, supporting beams having portions recelved between the spaced edges of the plates aforesald. the inner plate belng provided with elongated opening, lugs projected from the outer plate and
passing through the elongated openings of the inner plate, engaging extensions projected from the lugs, and water

supply pipes communicating with the space between the central portions of the plates.

No. 102,184. Resilient Bearing for Wheels. Coussinct élastique pour roues.

Albert Simpson, Chehalis, Washington, U.S.A., 20th November, 1906; 6 years. Filed 8th October, 1906. Receipt No. 140,150.
Claim.-1. In a resilient support for vehicles, the combination of a pair of vertically slotted plates provided at their lower ends with lateral offset portions vertically apertured, an axle mounted in the vertical slots of said plates. a pair of springs each having a threaded stem at its lower end to pass through the vertical aperture of a lateral extension and provided at its upper end with a hook to engage over an end of the axle, and a set nut mounted upon the threaded extension of each stem below the lateral offset through which the threaded stem passes.
2. In a resilient support for vehicles, the combination of a pair of vertically slotted plates provided at their lower ends with lateral offset portions vertically apertured, and having rearwardly extended arms at their upper ends and rear extensions between their ends, means co-operat.

Ing with the said rear arms and extensions to secure the plates to the frame of the vehicle, an axle mounted in the vertical slots of said plates, a pair of springs each having a threaded stem at its lower end to pass through the vertical aperture of a lateral extension and provided at its upper end with a hook to engage over an end of the axle, and a set nut mounted upon the threaded extension of each stem below the lateral offset through which the sald threaded stem passes.

No. 102,185. Draft Equaliser. Eyalisoir dc tirage.

William L. Vicbrock, Lime Spring, Iowa, U.S.A., 20th November, 1906: 6 years. Filed 14th July, 1y06. Receipt No. 137,816 .
Claim.-1. The combination with an evener, of a substantially horizontal clevis, means for connecting the clevis to an implement, a link connecting the evencr and clevis and disposed in angular relation to the line of draft, another link conected to the evencr and disposed diagonally of the line of draft and in angular relation to the first-mentioned link, said link extending diagonally across the clevis and in rear of the same, and means for connecting the link to an implement in rear of and at one side of the clevis.
2. The combination with an evener, of a substantially horizontal clevis, means for securing the clevis to one side of an implement, link connecting the evener and clevis and disposed in angular relation to the line of draft. an extensible link connected to the evener and disposed diagonally of the line of draft and in angular relation to the firstmentioned link, said extensible link being disposed diagonally across the clevis and in rear of the same, a guide device adjustably mounted on the clevis and engaging the extensible link, and means for connerting said extensible link to an implement in rear of the clevis.
3. The combination with an evener including a yoke, of a clevis. a link pivoted to the yoke and to the clevis. another link pivoted to the yoke and extending diagonally across the clevis, and means for pivotally securing the rear end of the latter link to an implement.
4. The combination with an evener, of a clevis, means for attaching the clevis to an implement. a swinging connection between the clevis and the evener, and means connected to the evener and to the implement independently of the clevis for holding said swinging connection in different angular relations.
5. The comb!nation with an pvener, of a clevis, means for attaching the clevis to an implement, a swinging connection between the clevis and the evener, and an extensible link connected to the evener and having means for attachmirnt to the implement independently of the clevis for holdsaid swinging connection in different angular relations to the clevis.
6. The combination with an evener, of a clevis. means for attaching the clevis to the front portion of an implement, a swinging connection between the rlivis and evener, and means connected to the evener and having a device arranked to be attached to an intermediate portion of the implement, said means holding the swinging connection in
different angular relations and being slidably associated with the clevis.
7. The combination with a clevis, of means for connecting the same to an implement, an evener. a link conne.i...o between the clevis and evener, and means for holding the link connection in different angular relations with respect to the clevis, said means belng slidably associated with the clevis.
8. The combination with a clevis, of means for connecting the same to an implement, an evener, a link connection between the clevis and evener, and means for holding the link connection in different angular relaclons with respect to the clevis. said means including a stirrus that embraces the clevis.
9. The combination with a clevis, of means for connecting the same to an implement, an evener, a link connection between the clevis and evener, and an extensible link for holding the said link connection in different angular relations with respect to the clevis. said link comprising a sectional rod having means at its rear end for attachment to an implement, and a stirrup secured to the front end of the rod. said stirrup slldably embracing the clevis and being pivoted to the link connection.
10. The combination with a plurality of plough beams. of a rod connecting and projecting heyond one side of th. same. a clevis pivoted to the projecting and of the rod. an evener, a link connecting the evencr and clevis, and means connecting the cvener and beams independently of said clevis.
11. The combination with a plurality of spaced plough beams, of a tie rod connecting the same and profecting beyond one side thercof, a clevis journalled upon the projecting portion of the tie rod. an evener having a rearwardly extending yoke, a link pivotally connecting the yokand clevis, a stirrup pivotally connected to the yoke and slidably embracing the clevis, an extensible rod connected to the stirrup and to one of the plough beams.

No. 102,186. Rock Drill. Fôrct à roche.

Governor D. Warren, Denver, Colorado ,U.S.A., 80th Nuvember, 1906; 6 years. Filed 18th January, 1906. Receipt No. 131,990.
Claim.-1. A rock drill comprising a cylinder having an enlarged central opening, a drill operating piston within the cylinder and having a reduced central portion. means for admitting pressure at each end of the piston and within the reduced central portion of the platon, and means carried by the reduced portion of the piston for exerting pressure on the piston on its forward stroke.
2. A rock drill comprising a cylinder having an enlarged central opening, a drill operating piston within sald cylinder and having a reduced central portion. two rings loosely mounted upon said reduced portion of the piston, and means for admitting steam between said rings, whereby on. bears against the piston and the opposite onn agalust as cylinder, substantially as described.
3. A rock drill comprising a cyllnder having an enlarged central opening, a drill operating piston within sald cylin-
der and having a reduced central portion two rings loosely mounted in said reduced portion of the piston, a spring normally forcing the rings apart, means for admitting steam between sald rings, substantially as described.
4. A rock drill comprising a cylinder having an enlarged central opening, a valve above sald opening, a valve arm extending within said cylinder, a drill operating piston within the cylinder and having a reduced central portion, and a ring carried by said reduced portion of the piston on each side of the valve arm, substantially as described.
5. A rock drill comprising a cylinder having as enlarged central opening. a valve above said opening, a valve arm extending within the cylinder, a drill operating piston within the cylinder and having a reduced central portion. a ring carried by the reduced portion of the piston on each side of the valve arm. and a coil spring between said rings. substantlally as described.
6. A rock drill comprising a cylinder having an enlarged central opening, a valve above said opening, a valve arm extending within the cvlinder, a drill operating piston within the cylinder and having a reduced central portion, a ring carried by the reduced portion of the piston on each side of the valve arm. and means carried by the valve for admitting pressure between the rings.
7. A rock drill comprising a cylinder having an enlarged montral odening. a valve above sald opening, a valve arm extending within the cylinder, a drill operating piston within the cylinder and having a reduced central portion, a ring carried by the reduced portion of the piston on each side of the valve arm, a coil spring between said rings, a means operated by the valve for admitting pressure between the rings.
8. A rock drill comprising a cylinder having an enlarged central opening, a drill operating piston within said cylinder and having a reduced central portion, and means for utilizing the steam in said central and esd openings simultaneously on its forward stroke.
9. A rock drill comprising a cylinder, a drill operating piston therein, and means for applying a central and end pressure simultaneously on the forward stroke.
10. A rock drill comprising a cylinder having an enlarged central onening. a valve above said opening, a valve arm extending within the culinder. a drill operating diston within the cylinder and having a reduced central portion, a ring rarried by the reduced nortion of the piston on each side of the valve arm, and a coil spring between said rings.
11. A rock drill comprisine a cylinder having an enlarged central opening, a valve ahove said opening, a.valve arm extending within the cylinder, a drill operating piston within the cylinder and having a reduced central portion. a ring carried by the reduced portion of the piston on each slde of the valve arm. and means between said rings for holding the same apart.
12. A rock drill comprising a cylinder having an enlarged central opening. a valve above sald opening, a valve arm extending within the cylinder. a drill operating piston within the colinder and having a reduced central portion, a ring carried by the reduced portion of the piston on each side of the valve arm. and said valve arm having a passageway, whereby the fluid pressure is admitted between the rings.
13. A rock drill comprising a cvlinder having an enlarged central opening, a valve above said opening, a valve arm extending within the cylinder, a drill operating piston within the eylinder and having a reduced central portion, a ring carried by the reduced portion of the piston on each side of the valve arm, a coil spring between said rings and said valve arm having a passageway whereby fluid pressure is admitted between the rings.
14. A rock drill comprising a cylinder having an enlarged central opening. a valve above said opening a valve arm extending within the cylinder, a drill operating piston within the cylinder and having a reduced central portion, a ring loosely mounted upon the reduced portion of the piston on each side of the valve arm, means for admitting fluid pressure between the rings.
15. A rock drill comprising a cylinder having an enlarged central opening, a drill operating piston within the cylinder and having a reduced central portion, and means for utilizing the fluid pressure in said central and end openings simultaneously on the forward stroke.
16. A rock drill comprising a cylinder having an enlarged central opening, a drill operating piston within the said cylinder and having a reduced central portion, a ring mounted on said reduced portion, and means whereby a central and end fluid pressure is simultaneously obtained on the forward stroke of said piston.
17. A rock drill comprising a cylinder, a drill operating piston within said cylinder and having a reduced central portion, means for admitting steam at each end of the piston and within the central reduced portion of the piston. and means carried by the reduced portion of the piston for exerting steam pressure on the piston on its forward stroke.
18. A rock drill comprising a cylinder having an enlarged central opening, a valve above said opening \(L_{2}\) a valve arm extending within said enlarged opening, a piston within the cylinder and having a reduced central portion, rings carried by said reduced portion on the piston of each side of said valve arm.
19. A rock drill comprising a cylinder having an enlarged central opening, a valve arm extending within said opening. a piston within said cylinder and having a reduced central portion, rings carried by said reduced portion of the piston and a spring normally holding said rings apart.
20. A rock drill comprising a cylinder having an enlarged central opening, a valve arm extending within said opening. a piston within the cylinder and having a reduced central portion, rings loosely mounted upon said reduced portion of the piston on each side of said valve arm and extending within the enlarged opening in the cylinder, a coll spring between said rings and one of said rings having steam passages therethrough and adapted to be closed by the shoulder formed by the reduced portion of the cylinder.
21. A rock drill comprising a cylinder having an enlarged central opening, a valve above said opening, a drill operating piston within the cylinder and having a reduced central portion, means operated by the valve for admitting pressure into the end and enlarged central portion of the said cylinder, and means carried by the reduced portion of the piston for exerting pressure on the piston on its forward stroke. 22. A rock drill comprising a cylinder having an enlarged central opening therein, a piston within the cylinder and having a reduecd central portion, a valve above the enlarged portion of the cylinder and adapted to allow pressure to enter at the end and central portion of the piston, a valve arm carried by the valve and adapted to enter said enlarged and reduced portion of the cylinder and piston, a ring carried by the reduced portion of the piston on each side of the valve arm entering the enlarged opening in the cylinder, a coil spring between said rings, one of said rings having steam passages through the same and adapted to be closed by the shoulder formed by the reducing of the piston.
23. A rock drill comprising a cylinder, a piston within the cylinder, a valve above said piston, a valve arm carried by the valve and extending into the cylinder adjacent the piston, and rings loosely mounted upon the piston on each side of the valve arm.
24. A rock drill comprising a cylinder, a piston within the cylinder and having a reduced central portion, a valve above the plston, a valve arm carried by the valve and extending within the reduced portion of the piston, and rings loosely mounted upon said reduced portion of the piston on each side of the valve arm.
25. A rock drill comprising a cylinder having an enlarged central opening, a valve above said opening, a valve arm extending within said enlarged opening, a piston within the cylinder and having a reduced central portion, and rings loosely mounted upon said reduced portion of the piston on each side of said valve arm.
26. A rock drill comprising a cylinder, having an enlarged central opening a valve above said opening, a valve arm extending within said enlarged opening within the cylinder, said valve arm having a steam passageway therethrough, and rings loosely mounted upon the reduced portion of the piston on each side of said valve arm.
27. A rock drill comprising a cylinder having an enlarged central opening, a valve above said opening, a valve arm extending within said enlarged opening, a piston within the cylinder, said valve arm having a steam passageway therethrough, rings loogely mounted upon the reduced portion of the piston on each side of said valve, the forward ring having a steam passageway adapted to allow the steam to pass therethrough on the rearward stroke of the piston.
28. A rock drill comprising a cylinder, a piston therein, a ratchet disc rotatably mounted in the cylinder, means carried by the said disc for rotating the piston, a sleeve surrounding said disc, a pawl carrying member mounted in the cylinder and spring held against sald sleeve and spring pressed pawls carried by said member.
29. A rock drill comprising a cylinder, a piston therein, a ratchet disc rotatably mounted in the cylinder, means carried by the said disc for rotating the said piston, a readwardly extending stud carried by the disc, a spring pressed pawl carrying member adapted to receive said stud and spring pressed pawls carried by said member.
30. A rock drill comprising a cylinder, a rotatable ratchet disc within the cylinder, a stationary disc between said ratchet disc and the piston, a forwardly extending rod carried by the ratchet disc and passing through the otationary disc, means carried by sald rod for rotating the piston, a sleeve surrounding the said ratchet disc, a stud carried by said ratchet disc, a pawl carrying member mounted on the cylinder and adapted to receive said stud. longitudinally extending spring pawls carried by sald member, and a spring bearing against the outer end of said member.
31. A rock drill comprising a cylinder, a drill operating reciprocating and turning piston within the cylinder, a rotatable ratchet disc within the cylinder. a stationary dise between the ratchet disc and the plston, a forwardly extending member carried by the ratchet disc and having spirally arranged grooves, the end of the piston having an oprning adapted to receive said member, sald opening having correspondingly spirally arranged projections, a sleeve surrounding the ratchet disc, a rearwardly extending stud carried by said ratchet disc, a pawl carrying member mounted in the cylinder and adapted to recelve sald stud, and longitudinally extending spring pawls carrled by said member and engaging said ratchet disc
32. A rock drill comprising a cylinder, a drill operating reciprocating and turning piston within the cylinder, a rotatable ratchet disc within the cylinder, a stationary disc between the ratchet disc and the piston, a forwardly exlending member carried by the disc and having spirally arsanged grooves, the end of the piston having an openins adapted to receive said member, said opening having correspondingly spirally arranged projections, a sleeve surrounding the ratchet disc, a rearwardly extending stud carried by said ratchet disc, a pawl carying member mounted In the cylinder and adapted to recelve said stud. and longitudinally extending spring pawls carried by said member and engaging said ratehet disc, and a spring bearing against the outer end of the spring pawl carrying member
33. A rock drill comprising a cylinder, a drill operating reciprocating and turning piston within the cylinder, means carried by the ratchet dise for rotating the piston. and a slenve surrounding the said ratchet disc and fractionally preventing the ratchet dise from rotating too freely.
34. A rock drill comprising a cylinder, a drili operating reriprocating and turning piston therein. a rotatable ratchet dise within the cylinder, means carried by the ratchet dise for rotating the piston. a disc between the ratchet dise and the cylinder. a sleeve surrounding the ratehet dise and a pawl carrying member within the cylinder and rngaging sald slenve
35. A rock drill comprising a cylinder, a drill operating reciprocating and turning piston therein, a rotatsble ratchet disc within the cylinder, means carried by the ratchet disc for rotating the piston, a sleeve surrounding the ratchet disc and frictionally engaging the same. a pawl carrying member within the cylinder and engaging said sleeve. pawls within said member and engaging the ratehet disc. and means for holding sald pawl carrying member within the cylinder.
36. A rock drill comprising a cylinder. a drill operating reciprocaling and turning piston therein. a rotatable ratchet disc within the cylinder, means carried by said dise for rotating the piston, a slecve surrounding the ratchet dise and erictionally engaging the outer deriphery thereof, a pawl carrying member engaging said sleevr. pawls carried by said member and engaging the ratchet disc, and a spring pressed block carried by the cylinder and engaging the pawl carrying member.
37. A rock drill comprising a cylinder, a drill operating reciprocating and turning piston therein, a rotatable ratchet disc within the cylinder, means carried by said disc for rotating the piston, a sleeve surrounding the ratchet disc and irictionally engaging the same, a pawl carrying member engaging said sleeve, horizontal inwardly spring presser pawls extending through sald pawl carrying member and a block within the cylinder and having an inwardly extending flange engaging the pawl carrying member adjacent its outer periphery.
38. A rock drill comprising a cylinder. a drill operating reciprorating and turning piston terein, a rotatable ratchet disc within the cylinder means carried by the ratchet disc for rotating the piston, a disc on the inside of said ratchet disc and bearing against a projection within the cylinder, a sleeve surrounding the ratchet and bearing against the second-mentioned disc, a pawl carrying member engaging said sleve, horizontally extending inwardly spring pressed pawls extendnig through the said member, a block within the cylinder and having an inwardly extending flange engaging the pawl carrying member adjacent its outer periphery. and a spring for holding said block against said pawl carrylug member.
39. A rock drill comprising a cylinder, a piston therein. a ratchet disc rotatably mounted in the cylinder, means carrled by the said disc for rotating the piston, a sleeve surrounding said disc, a pawl carrying member within the cylinder and spring pressed pawis carried by said member.
40. A rock drill comprising a cylinder, a piston thereln. a rotalable ratchet disc within the cylinder means carried by the ratchet disc for rotating the piston, a sleeve surrounding said ratchet disc and frictionally preventing the ratchet disc from rotating too freely, a pawl carrying member in engagement with the said sleeve and pawls carried by said member and engaging said ratchet disc.
41. A rock drill comprising a cylinder, a drill operating piston within the cylinder, a rotatable ratchet disc within the cylinder, means carried by the ratchet disc for rotatiog the piston, a sleeve surrounding said ratchet disc and frictionally preventing the ratchet disc from rotating too freely and of a greater width than the thickneas of the ratchet dise. a pawl carrying member in engagement with said sleeve and pawls carrled by sald member.
42. A rock drill comprising a cylinder, a plston therein. a rotatable ratchet disc for rotating the piston, a sleeve surrounding the disc and of a width greater than the thickness of the disc and frictionally preventing the disc from rotating too freely a pawl carrying member engaging sald sleeve. horizontally inwardly spring pressed pawls carried by sall member and engaging sald disc. a block within sald cylinder and having an inwardly extending flange engaging the pawl carrying member adjacent its outer periphery and a epring extending across the end of the cylinder and engaging sald block.
43. A rock drill comprising a cylinder, a drill operating piston therein a rotatable ratchet dise within the cylinder. a forwardly extending bar carried by the disc for rotating the piston, a disc surrounding the said bar and resting against a shoulder within the cylinder, a sleeve surrounding the ratchet disc and in engagement with said disc and adapted to frictionally prevent the ratchet disc from rotating too far, and a pawl carrying member in engagement with sald sleeve.
44. A rock drill comprising a cylinder having a piston carrying a bore and an enlarged bore adjacent its rear and. a dise within sald enlarged bore of the cylinder and resting upon the shoulder formed by the two bores. a ratchet disc within said enlarged bore. a forwardly extending drill operating bar passing through said disc, a sleeve surrounding said ratchet disc and frictionally preventing the same from rotating too freely. a pawl carrying member in engageent with said slecve, pawls carried by sald member and engaging the ratchet disc and a block holding the pawl carrying member within the cylinder.
45. A rock drill comprising a cylinder. a piston therein. a ratchet disc rotatably mounted in the cylinder, means carried by the disc for rotafing the piston. sleeve surrounding said disc. a pawl carrying member mounted in the cylinder and pawls carried by said member.
46. A rock drill comprising a cylinder a piston therein. a ratchet disc rotatably mounted in the cylinder, means carried by the disc for rotating the piston a ring surrounding the ratchet disc and a pawl carrying member within the cylinder and held against rotation and pawls carried by said member and engaging the ratehet disc.
47. A rock drill comprising a cylinder. a piston therein. a ratchet dise rotatably mounted in the cylinder, means carried by the disc for rotating the piston, a ring surrounding the ratchet dise, a pawl carrying member within the cylinder and abutting said ring. and a head within the cylinder and clamping the pawl carrying member betwern the same and the ring surrounding the ratchet dise.
48. A rock drill comprising a cylinder, a piston therein. a ratchet disc within the cyllnder, means carried by th. disc for rotating the piston, a ring between the ratchet disc and the piston and abutting a shoulder carried by the cylinder and a pawl carrying member within the cylinder and held against rotation and pawls carried by said member and engaging the ratohet disc
49. A rock drill comprising a cylinder, a piston therein. a ratchet within the cylinder, means carried by the disc for rotating the piston, a ring between the cylinder and abutting a shoulder within the cylinder, and a pawl carrying member within the cylinder and held against rotation and pawls carried by sald members and engaging sald ratchet discs.

\section*{No. 102,187. Method of Asclomerating Partioles} of Oxide of Iron for Furnaces.
Míthode d'agglomérer les parcelles d'oxyde de fer pour les fournaises.

Utley Wedge, Ardmore, Pennsylvania, U.S.A., 20th November.
1906 ; 6 years. Filed 23rd May, 1906. Receipt No. 136 186.

Claim.-1. The mode herein described of agglomeratlag tane partleles of iron oxide for use in furnaces, said mode consisting in combining sald particles with sulphate of Iron and subjecting the mixture to heat sumfient to drive of the aulwhur, substantially as specified.
2. The mode herein described of agglomerating fine particles of iron oxid, for use in furnaces, sald mode consistlag in combining sald particles with sulphate of iron in plasile form and subjecting the mixture to heat sumcient to drive off the sulphur, substantially as specifed.
3. The mode herein described of agglomerating ine particles of iron oxide for use in furnaces, sald mode coasist-
ing in combining said particles with sulphata of iron and subjecting the mixture to agitation and to heat sufficient to drive off the sulphur, substantially as specifled.
4. The mode herein described of agglomerating fine particles of iron oxide for use in furnaces, said mode consisting in combining said particles with sulphate of iron in plastic form and subjecting the mixture to agitation and to heat si:fficient to drlve off the sulphur, substantially as specified.
5. The mode herein described of preparing fine particles of Iron oxide for use in furnaces, said mode consisting in noistening said particles with sulphuric acid, subjecting them to the action of said acid and of heat until sulphate of iron is formed, and then subjecting them to heat sufficient to drive off the sulphur, substantially as specified.
6. The mode herein described of preparing fine particles of iron oxide for use in furnaces, said mode consisting in moistening said particles with sulphuric acid, subjecting them to the action of said acid and of heat untll eulphate of iron is formed, and then subjecting the compound to agitation and heat sufficient to drive off the sulphur. substantially as specifled.

No. 102,188. Hook and Fye. Crochet dexilet.

anna H. E. Wuner, Philadelphia, Pennsylvania, U.S.A., 20th November, 1906 ; 6 years. Filed 7th September, 1905. Receipt No. 128,268 .
Claim.-In a hook and eye a hook formed of one piece of wire, the wire after being bent so as to form the hook and body portion of the hook is bent so as to form a spring jin pointed at the end, a retainer formed in the body portion of the hook for retaining the point of the pin, an eye also formed of one plece of wire, said wire after being bent to form the eye then bent so as to form a spring pin pointed at the end, and a retainer for the point of the pin formed with the body portion of the eye, as specified.

No. 102,189. Hormenhoe. Fer d cheval.
August Anderson, Birmingham, Alabama, U.S.A., 27th November, 1906 ; 6 years. Filed 31st October, 1906 . Receipt No. 140,776 .
Claim. -The herein described horseshoe comprising a body of channel form in cross section, having nail holes in its top wall, a pad arranged in and extending throughout the length of the channel of said body, and held against lateral movement by the body, a wear plate resting in the channel of the body, below the pad, whereby it is also held against lateral movement, and depending from the body and having
caulks. and nails extending through and connecting the wear plate, pad and body arranged to attach the horseshoe as a

whole to a horse's hoof in such manner as to permit of movement of the wear plate with respect to the body.
No. 102,190. Potato Digger. Arrache-patates.

Frederick W. Benjamin, Jefferson, Ohio, U.S.A., 27th November, 1906; 6 years. Filed 6th November, 1906. Recelpt No. 140,965.
Claim.-1. In a machine of the class described, the combination of a frame mounted on transporting wheels, a gear carried by one of the wheels, a series of transverse shafts carrying resilient overlapping agitating teeth, guard plates, a plough scoop in front of said series of agitating teeth, and means for raising and lowering the plough scoon.
2. In combination with a frame mounted on wheels, guard boards or plates, a series of transverse shafts extending across the space between said guard boards and each being provided with a series of wheels having radial teeth whose rear faces are convexed, means whereby these wheels have a. limited rotary motion forwardly on their respective shafts, gearing for routing said shafts backwardly, and a vertically adjustable scoop arranged in front of said shafts. substantially as set forth.

No. 102,191. Sawing Apparatug. Scic portative.
Evangelice Brisebois, St. Jovite, Quebec, Canada, 27th November, 1906; 6 years. Filed 31st October, 1906. Receipt No. 140,787 .
Claim.-1. In a portable saw, the combination comprising balance wheel on the main shaft, means for driving the bolance wheel on the main shaft, means for driving the balance wheel, a connecting rod secured to the balance wheel, a slidable head connected to the opyosite end of the connecting rod, a reciprocable saw adapted to be actuated by the slidable head, and a circular saw adapted to be driven by the main shaft.
2. In a portable saw, the combination comprising a supporting framework, a main shaft on the supporting frame-

work, a balance wheel, means for driving the balance wheel, a vertically adjustable guideway on the frame, a head slidable in the guideway, a removable rod adapted to connect the balance wheel and the slidable head, a reciprocable saw adapted to be driven by the slidable head, and a circular saw adapted to be driven from the main shaft.
3. In a portable saw, the combination comprising a supporting framework, a main shaft on the framework, a balance wheel on the main shaft, means for driving the balance wheel, a vertically adjustable guideway carried by the frame, a flexible member secured to the guideway, a roller adapted to recelve the flexible member, a drum on the frame to which is secured the opposite end of the flexible member, a slidable head disposed in the guideway, means connecting the slidable head and the balance wheel, a saw driven by the slidable head, a circular saw carried on the frame, and means for driving the circular saw from the main shaft.
4. In a portable saw, the combination comprising a supporting frame, a main shaft carried by the frame, a reciprocable saw, means for driving the reciprocable saw from the main shaft, a pinion on the main shaft, a gear normally in mesh with the pinion, a shaft adapted to support the gear, means for throwing the pinion out of mesh with the gear, a circular saw, and means for driving the circular saw from sald latter shaft.
5. In a portable saw, the combination comprising a supporting frame, a main shaft, a reciprocable saw, means for driving the reciprocable saw from the main shaft, a pinion slidably disposed on the main shaft, a lever pivoted adjacent the pinion and adapted to slide the same on the main shaft, a gear normally in mesh with the pinion, a shaft adapted to support the gear and provided with double cranked portions, rods connected to said double cranked portions, a shaft supported by the framework and provided with double cranked portions to which are connected the opposite ends of said rods, and a circular saw on said latter shaft.
6. In a portable saw, the combination comprising a supporting iramework, a main shaft, vertical guideways carried by the framework. a horizontal guideway adjustably disposed in the vertical guideways, means for adjusting the horizontal guideway, a slidable head disposed in the horizontal guideway, removable means for connecting the slidable head with the balance wheel, a saw connected to the slidable head, a cranked shaft driven from the main shaft, a second crank shaft driven from said cranked shaft, and a circular saw on said second cranked shaft.

\section*{No. 102,192. Conveying Apparatus.}

Robert Allison Chambers, New Glasgow, Nova Seotia, Canada, 27th November, 1906 ; 6 years. Filed 3rd November, 1904. Receipt No. 140,881.
Claim.-1. In a conveyer a suspension cable, a carriage thereon, a traction rope passing over a pulley on said carriage, a fall block, a fall rope running over said block and suspending it from said carriage, and means for maintaining said traction and fall ropes always in tension.
2. In a conveyer, a suspension cable, a carriage thereon. a traction rope passing over a pulley on said carriage, a fall block; a fall rope running over said block and suispending it from said carriage, an engine having two independent
drums operating said traction and fall ropes, means for keeping said traction and fall ropes always in tension, and

means for unwinding either of said ropes simultaneously with the winding of the other.
3. In a conveyer a suspension cable carriage thereon, a fall block, a bucket suspended from said fall block, an engine having two independent drums, one of said drums operating a traction rope to move the carriage in one direction and the other said drum operating a fall rope to move the carriage in the opposite direction and simultaneously raise the bucket.
4. In a conveyer, a suspension table, a carriage thereon. a pair of supporting wheels on the upper side of said carriage, a pair of operating sheaves on the lower side of sald carriage, a traction rope passing over one of sald sheaves, a fall rope fixed to the carriage and passing over the other sheaf, a fall block in the loop of sa!d fall rope, a bucket suspended from said fall block, and means whereby the carriage wil be held by one rope against the tension of the other rope.
5. In a conveyer a supporting cable, a carriage thereon. a traction rope pasing over a sheaf on said carriage, a fall rope fixed to the carriage and passing over a second sheal thereon, a fall block in the loop of said fall rope, a bucket suspended from sald fall block, an engine having two separate drums, one of said drums adapted to move the carriage in one direction through the medium of the traction rope, and the other of said drums adapted to move the carriage in the reverse direction through the medium of the fall rope.
6. In a conveyer, a suspension cable, a traction rope, a fall rope, a carriage on said suspension cable movable in one direction by said traction rope and movable in a reverse direction by said fall rope, a fall block suspended from said carriage by said fall rope, a bucket suspended from said fall block means for locking the traction rope to allow the bucket to be raised vertically, means for locking the fall rope to alow the bucket to be raised diagonally and means for keeping both ropes constantly in tension.
7. In a conveyer, a suspension cable and carriage thereon, a pair of pulleys mounted on said carriage, a block at one end of the span, an engine having two independent drums at the opposite end of said span, a traction rope fixed to said block and passing over one of the pulleys of said carriage and over the sheaf of said block to one of the drums of gaid engine, a fall rope fixed to the carriage and passing over the other of said pulleys mounted on the carriage to the other drum of said engine, a fall block in the loop of the fall rope and a bucket suspended from said fall block.

\section*{No. 102,193. Dumping Platform.}

Plateforme d bascule.
Fred W. Cooley. Minneapolis, Minnesota, U.S.A.. 7th November, \(1906^{\prime}: 6\) years. Filed 5th November, 1906. Receipt No. 140,931.
Claim.-1. The combination with a dumping platform of mears for imparting pivotal movements thereto comprising an oscillatory support, a screw rod connected to sald dump-
ing platiorm at one end. a nut member swivelled on and carried by said oscillatory support and working on the said

screw rod, and means for transmitting rotary motion to said nut member from a distant point, substantially as described.
2. The combination with a dumping platform comprising a pair of pivoted beams, of an oscillatory support mounted below one end of said dumping platform, a pair of screw rods attached at their upper ends to said dumping platform a pair of nut members swivelled on and carried by said oscillatory support and working on each of said screw rods and power transmission mechanism extending from a distant point to the said two nut members and operative to simultaneously rotate the same, substantially as described.
3. The combination with a scale platiorm, of a dumping platform applied thereto and comprising a pair of pivoted beams, a transverse support connected to one end portion of said scale platform nd supported thereby for oscillatory movements, a pair of screw rods attached at their upper ends to said dumping platform and depending throngh said transverse oscillatory support, a pair of nut members swivelled on said oscillatory support and working one on each of said screw rods, of an upright operating rod mounted in berings carried by said oscillatory support, and connections between said operating rod and the said nut members for simultaneously rotating the latter, substantially as describtd.
4. In combination with a fixed platform 1 and scale platform 2, of a dumping pltform comprising a pair of beams 3 pivotally connected to said scale platform, of a plank or support 7 extending transversely below one end portion of said scale platform, interlocked eye bolts 9 , loosely suspending said plank or support 7 from said scale platform, screw rods 13 pivotally connected to said platform beams 3 and working loosely through said plank or support 7, sprocket wheels 12 journalled in bearings on said plank or support 7 and working as nuts on said screw bolts. an idle sprocket 16 also journalled on said plank or support 7 and working through an opening in said platform 1, a wheel or hand piece 20 on the upper end of said supporting rod, a sprocket wheel 15 on the lower end of said operating rod 18 , and a sprocket chain 17 running over said sprockets 12,15 and 16 , substantially as described.

No. 102,194. Rotary Harrow. IIcrse rotatice.

Charles J. Davis, Lansing, Michigan, U.S.A., 27th November. 1906; 6 years. Filed 31st October, 1906. Receipt No. 140,789.
Claim.-1. In a rotary harrow the combination with a triangular frame composed of frame bars and the ends of two 11-20
of said bars being arranged to project beyond the angles of the triangular frame, of rotary elements, center pins passing through the angles of said triangular frame and through the center of the said rotary elements, circular tracks borne by the said rotary elements, and wheels secured to the said frame and arranged to escape the said circular tracks, each of the said projecting ends of the irame bars having secured thereto outside of the triangular frame one of the said wheels, and pivoted teeth attached to said rotary elements and adapted to drag upon one side and to catch the ground upon the other side of the said rotary clements whereby they are rotated, substantially as described.
2. In a rotary harrow the combination with a triangilar frame composed of frame bars and the ends of two of said bars being arranged to project beyond the angles of the triangular frame, of a rotary elements, enter pins passing through the angles of said triangular frame and through the center of the said rotary element, circular tracks having loo:izontal flanges borne by the said rotary elements, and spool wheels secured to the said frame and arranged to enEdge the said circular tracks, each of the said projecting ends of the frame bars having secured thereto outside of the triangular frame one of the said spool wheels, and pivoted teeth attached to said rotary elements and adapted to drag upon one side and to catch the ground upon the other side of the said rotary elements whereby they are rotated, substantally as described.

No. 102,195. Fly Shield for Forsen.
Appareil moustiquaire pour chevaux.

William F. Elliott, De Kalb, Illinois, U.S.A., 27th November. 1906 ; 6 years. Filed 5th November, 1906. Receipt No. 140,915.
Claim.-An insect shield comprising a body portion having ifngthwise adjustable sections which are shaped to fit lengthwise adjustable sections which are shaped to fit under the jaw of the animal, and one of said sections having a cupshaped end fitting over the lips of the animal.

\section*{No. 102,196. Train Pipe Coupling.}

Joint de tuyau pour convois de chemin de fer.
Grorge Adelbert Elwell, Toledo, Ohlo, U.S.A., 27th Novem-
ber, 1906; 6 years. Filed 3rd November, 1906. Recelpt No. 140,884 .
Claim.-1. In a train pipe coupling, an outer bumper body, and a coupling member movable within the body and having coupling ends normally retracted therein, substantially as described.
:. In a train pipe coupling, an outer bumper body having end openings, and a coupling member having coupling ends normally retracted in sald openings, substantially as described.
3. In a train pipe coupling, an outer bumper body having ar. elongated slot in its side, and a coupling member having coupling ends normally retracted in the body, said coupling member also having a laterally extending portion adapted for connection with the train pipe and disposed to operate along the slot in the body. substantially as described.
4. In a train pipe coupling, an outer bumper body having end couplings, a coupling member slidable in the body and having coupling ends normally retracted within said end cpenings, and means for projecting said coupling ends

Digitized by
through the end openings when the body is in coupling contact, substantially as described.

5. In a train pipe coupling, an outer bumper body having end openings, a coupling member slidable within the body and having coupling ends normally retracted within sald end openings, means for projecting said coupling ends through the end openings, and means for subjecting the coupling member to yielding pressure when the coupling ends thereof are projected in the openings in the body, substantially as at scribed.
6. In a train pipe coupling, an outer bumper body having end openings, a coupling member slidably disposed within the body and having male and female coupling ends, means for normally maintaining the coupling ends retracted within the openings in the body, and means for projecting said coupling ends through said openings when the body is in coupling engagement, substantially as described.
7. In a train pipe coupling, a body suspended from a car (1) permit universal movement, a bar slidably connected with the inner end of the body, a spring engaging the bar and normally holding the body in outward position, a coupling member slidably disposed in the body and normally maintained is retracted position therein, and a spring interposed between said bar and the coupling member to cause the latter to be projected in the body under yielding pressure when the body is in coupled engagement, substantially as described.
8. In a train pipe coupling, a body having end openings arranged side by side and having the projection 10 and the recess 11 adapted to align the same when in coupled engagement with the opposite coupling device, a bar adapted to slidably support the rear end of the body, said bar having a swinging connection with a rigid support, an enlargement upon the bar adapted to contact with the body and limit lis outward movement, a spring disposed between the enlargement and the body and forcing the latter in outward position. a hollow coupling member slidable longitudinally w!thin the body and having branches provided with male and female coupling ends respectively adapted to be projected through the end openings in the body, a spring supported by tho body and pressing against the coupling member to normally hold the same in retracted position in the body, and a colled spring interposed between the aforesaid bar and the ccupling member adapted to yieldingly hold the latter projocted in the body when the body is in coupling engagement with the opposite coupling device, substantially as described.

\section*{No. 102,197. Printed Dreas Pattern.}

Patron de robes imprimé.
William Freeman, New York City, New York, U.S.A., 27th November, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,936.
Claim.-1. A base having printed thereon a set of patterns of graduated sizes for a sleeve, said patterns being nested in such a manner that the distinguishing lines of each smaller size lie wholly between the lines of the next larger size, and so that the lines extending along one side of the nest continue and form converging shoulder lines, which merge into a single armpit line.
2. A base having printed thereon a set of patterns of graduated sizes for the front of a dress walst, said patcern being nested in such a manner that the side. top and bottom lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at both the armpit and the neck.
3. As an article of manufacture a set of patterns of graduated sizes for a dress waist comprising patterns for the front of the waist, and patterns for the back of the
waist, the front patterns being nested in such a manner that the side, tod and bottom lines of each smaller size

are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at the armpit, and the patterns for the back being nested in such a manner that the side lines, the armpit lines and the shoulder and arik lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coinclde or form a single line at the bottom of the waist.
4. As an articlt of manufacture, a set of patterns of graduated sizes for a dress waist, comprising patterns for the front of the waist, patterns for the back of the waist, and patterns for the sleeve, the front patterns being nested in such a manner that the side, top and bottom lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns colncide or form a single line at the armpit, the patterns for the back being nested in such a manner that the side lines, the armpit lines and the shoulder and neck lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at the bottom of the waist, and the sleeve patterns belng nested in such a manner that both side lines of each smaller size are distinct from and lie wholly between the side lines of the next larger size, and so that the side lines in one set continue and form converging shoulder lines, which merge into a single armpit line, all of the patterns coinciding or corming a single line at the bottom end of the sleeve.
5. A pattern comprising a base and unsymmetrical demarking outlines printed thereon, said outlines being broken and spaced to form sections of a complete pattern outline, whereby sald base may be folded or cut in the spaces between the broken lines, and said outlines jolned to make a complete pattern outline, corresponding sets of equally spaced marks occupying the spaces between the broken sections, for guiding the user in joining the sections.

\section*{No. 102,198. Baling Press. Presse d batot.}

Arthur Castonguay, St. Andre de Restigouche, Quebec, Canada. 27th November, 1906; 6 years. Filed 2nd November. 1906. Receipt No. 140,854 .

Claim.-1. In a baling press, the combination comprising a baling chamber, a plunger head, means for actuating the plunger head in one direction, means for retracting the plunger head when the actuating means are in operative position, channelled binding blocks adapted to enter the baling chamber, and means for locking the blocks in Dosition.
2. In a baling press, the combination comprising a baling chamber, a plunger head, a top hinged to the plunger head, means for actuating the plunger head in one direction, means for retracting the plunger bead when the actuating means are in operative position channelled binding blocks adapted to enter the baling chamber, and means for locking the blocks in position.
3. In a baling press, the combination comprising a balIng chamber, a plunger head, a top hinged to the plunger hind, means for normally maintalning the hinged top in clevated position, means for actuating the plunger bead in one direction, means for retracting the plunger bead when the actuating means are in operative position. channelltd binding blocks adapted to enter the baling chamber. and means for locking the blocks in yosition.
4. In a baling press, the combination comprising a baling chamber, a plunger head, a top hinged to the planger
head. means for locking the top in depressed position, means for actuating the plunger head in one direction,

means for retracting the plunger head when the actuating means are in operative position, channelled binding blocks adapted to enter the baling chamber, and means for locking the blocks in yosition.
5. In a baling press, the combination comprising a balIng chamber, a plunger head, a top hinged to the plunger head and provided with an opening, a spring catch disposed through the opening, a spring disposed beneath the hinged top, means for actuating the plunger head in one direction, means for retracting the plunger head when the actuating means are in operative position, channelled binding blocks adapted to enter the baling chamber, and means for locking the blocks in position.
6. In a baling press, the combination comprising a chamber, a plunger adapted to work into the chamber, projectIng shoulders on the plunger head. means'for retracting the plunger head, a link plvoted between the shoulders. a second link pivoted to the first link and having its opposite end plvoted, and a sweep pivoted adjacent the second link and provided with a recess adapted to receive said second link.
7. In a baling press, the combination comprising a baling chamber, a plunger, means for forcing the plunger into the chamber, means for retracting the plunger, spring fingers projecting into the chamber, and wiring blocks adapted to enter the chamber.
8. In a baling press, the combination comprising rectangular frame members, side members carried by the frame members, plates carried by the side members, a pin disposed through the plates, a sweep pivoted on the pin and provided with a recess, a plunger adapted to enter the chamber. links connected to the plunger and said pin, one of which sald links is adapted to lle within said recess in the sweep, and means for retracting the plunger.
9. In a baling press, the combination comprising rectangular frame members, side members connected to some of said frame members and having their rear ends free and resilient, means for clamping said free ends, binding blocks adapted to be clamped by said side members, a plunger adapted to pass between satd side members, means for actuating said plunger, and means for retracting the plunger.

No. 102,199. Winker Brace. Tirant d aillère.
William W. Gleckner, Canton, Pennsylvania, U.S.A., 27th November, 1906; 6 years. Filed 5th November, 1906. Receipt No. 140,929.
Claim.-1. A winker brace comprising a doubled billet strap having openings in its folds, and a brace having its divided portions passed through the said openings and provided with a tongue portion between the doubled portions of the billet strap, substantially as described.
2. A winker brace comprising a doubled billet strap having openings in its fold, a brace having its divided portions passed through the sald openings and provided with a tongue fortion between the doubled portions of the billet strap, and
a core strap having divided portions in the brace and a tongue portion bearing against the tongue portion of the

brace, sald tongue portions of the brace and core strap belug secured between the doubled portions of the blllet strap.

No. 102,200. Screen Por Coal. Tamis d charbon.

Jacob H. Gmelin, Bay City, Michigan, U.S.A., 27th November, 1906 ; 6 years. Filed 2nd November, 1906. Recelpt No. 140,848
Claim.-1. A separator comprising a supporting irame, oppositely inclined stationary chutes mounted on the frame, a thliting frame pivotally secured to the supporting frame, an adjustable chute, the upper end of which rests loosely upon and is sustained by the rocking frame, the lower end of the adjustable chute being pivotally secured to a statlonary chute, the adjustable chute forming a continuation of one of the stationary chutes, arms pivotally secured to the rocking frame and releasably connected to the supporting frame to retain the adjustable chute at its inclination, screens carried by one of the stationary chutes and the adjustable chute and an apron beneath the screen in the adjustable chute, the apron adapted to discharge onto the screen carried by the stationary chute.
2. A separator comprising a supporting frame, a rocking frame pivotally mounted thereon, a stationary chute carried by the main frame, a tilting chute pivotally secured to the stationary chute and forming a continuation thereof, the upper end of the tilting chute resting upon the rocking frame, a screen carried by the tilting chute and means carried by one frame and releasably engaging the other frame for adjustably retaining the tilting chute at different inclinations.
3. A portable separator comprising a bow-shaped main frame, wheels journalled to one end of the frame, the opposite end of the frame adapted to be ralsed from the ground. a pair of oppositely inclined chutes carried by the main
frame, a screen in one of the chutes, a rocking frame pivoially mounted on the main frame, a tilting chute pivotally secured at its lower end to one of the statlonary chutes and forming a continuation thereof, a screcn in sald tilting chute, the rocking frame adapted to support the tilting chute and means for adjustably retaining the frame at different Inclinations.
4. A separator comprising a supporting frame, oppositcly inclined chutes mounted thereon, a screen in one of said chutes, an apron beneath the screen terminating short of ihe mouth of the chute, to leave an opening, a spout inclined beneath the opening. combined gates and bag holders located a! 'h : mouths of the respective chutes, a main chute constituting a continuation of the unscreened chut and located above the first-named screened chute, a screen in the main chute and an apron beneath the last-named screen, sald apron terminating short of the lower end of the main chute to leave a discharge opening above the lower screened chute.
5. A separator comprising a frame, a chute mounted therenis, a screen located intermediate the ends of the chute and an unperforated distributor plate locattd at the upper end of the chute, the plate provided with diverging ribs leading to the screen.
6. A separator comprising a frame, a chute mounted threr cr, a screen located in the chute, and a removable head piece located at the upper end of the chute.
7. A separator comprising a supporting frame, a sectional chute, one section of which is stationarily secured to the frame, the remaining section being pivotally supported. a screen carried by the pivotally supported section and means for adjusting the inclination of the section.
8. A separator comprising a supporting frame, a sectional chute, one section of which is stationarily secured to the frame, the remaining section being pivotally supported, a screen carried by the pivotally supported section. an upperforated distributor plate located above the screen to recfive the material, divergent riffles on the distribution plate. and means for adjusting the inclination of the pivotally sup1 orted section.
9. A separator comprising a supporting frame. oppositely frelined chutes carricd thereby, a main chute located above one of the oppositely inclined chutes and forming, a continuation of the remaining oppositely inclined chute, thr aprx of the last named chute having a groove formed therein, the main chute and the chute beneath it, each having ledges on their side walls, screens removably received on the ledges, unperforated aprons located beneath each screen. the aprons being of less length than the chutes whereby chenings are left at their upper and lower ends, the lower end of the screen in the main chute recrived in the groove, a spout bencath the opening in the lower screened chute and a distributor plate in the main chute above the screen.

No. 102,201. Collar Support. support de collet.

Agnes Haviland, New Orleans, Loulsiana, 27th November, 1906; 6 years. Filed ith November. 1906. Receipt No. 140.931.

Claim.-1. A support of the class described provided at opposite ends with apertures therethrough, a guard disposed intermediate of the ends of the support. a securing device co-operating with one of said apertures. and a scouring advice alapted to engage material at the other aperture and enter natid guard.
2. A support of the class deseribed provided at opposit, ands with apertures through which thi material to be supported is projacted, securing pins passed through the pro-
jucted portions of the material, and a guard carried by the support intermediate of its ends through which the points of said pins are adapted to extend.
3. A support of the class described formed of a slagle: strand provided with coils at its opposite ends, one of the fron ends of said strand being twisted about the body thernof to engage the opposite free end and form a guard nortion.
4. A sunport of the class described provided with aprrtures at its opposite ends, a projecting device having a shank adapted to force the material to which the forion is appliad through sald apertures, and a securing d.vite adanted to pass through the shank of said projecting device.
5. A support of the class described provided with coil \(\cdot\) d portions at its opposite ends and an intermediate guard portion, securing nins having enlarged heads adapted to lin within said coiled portions and have their polnts exlivided through the guard portion.

No. 102.202. Shaking Grate. Grillc bianlantc.

Frank Carponter Heath, Reverc, Massachusetts. IU.A. 27th November, 1906: 6 ycars. Flled 6th November. 1906. Receint No. 140.956.

Claim.-1. A shaking grate comprising a serios of duplicale bars placed slde by side and movable freely endwise. their fuel supporting surfaces being always in one plane. cach bar consisting of a longitudinal verically corrugatid web and lateral separated fingers extending from opposit. sides thereof, the corrugations of the web permitting expansion and contraction of the bar without injury to th. wob, duplicate headers at the ends, and two pairs of duplicate movable supports for the end portions of the bars whereby the latter are permitted to elongate and shorten frecly.
2. A shaking grate comprising a header bar at each rad. the headers buing duplicates and each being formed of a vertically corrugated wel) and transverse fuel holding flngers entirely separato from each other. the spaces brtween the fingers and the corrugated webs permitting fris longitudinal expansion and contraction of the headers. duplicate longitudinal grate bars having lateral fuel supporting fingers in the same plane with pach other and with the surfaces of the headers and longitudinal fingers at their ends projecting between the fingers of the h.asers. and duplicate rockers and rollers supporting the lonkttudinal bars adjacent their ends, the bars having longitudinal ribs vertically corrugated to permit elongation and contraction without fracture thereof, and the rollers pirmitting such elongation and contraction to take pla, freely.
3. A grate comprising a plurality of longitudinally reciprocable bars, each having a longitudinal stifening wibl on its under side, the web being of uniform thickness un and down and tapered in depth from center to ends. and transversely corrugated uniformly from top to bottom wi the web to provide alternate rounded projections and d... pressions, the depresslons on one side being oppostt, the projections on the other. whereby longitudinal expansio: and contraction is permitted, and the bars having latoral fingers oppositely and alternately arranged to axtend outward from the projections.
4. A grate comprising a series of bars having fluel supporting surfaces movable longitudinally and oppositily in ond !lane and adanted to support fuel over their entir. lengihs. rock shafts adjacent the ends of the grate. each having projecting segmental surfaces adapted to support
one end of every other bar, the bars having sockets in their under sides covered above by the fuel supporting surfaces and enclosed by the sides of the bars, said rock shafts having tongues projecting from the segmental surfaces lying within the sockets, whereby oscillation of the rock shafts is adapted to reciprocate the bars.
5. A grate comprising a series of bars having fuel supporting surfaces movable longitudinally and oppositely in one plane and adapted to support fuel over their entire lengths, rock shafts adjacent the ends of the grate and having projections extending therefrom, each consisting of a tongue and segmental surfaces close to and on opposite sides of the tongue, one end of each alternate grate bar resting on a segmental surface, and the bars having downwardly opening sockets covered above by the fuel supporting surfaces and enclosed on all sides, receiving the tongues, whereby oscillation of the rock shafts is adapted to reciprocate the bars.
6. A grate comprising a frame, rock shafts supported thereon arms extending upwardly and downwardly from each rock shaft, each arm provided with a stud having a shank and an elongated head, a connecting rod having slots corresponding in outline to the heads and engaged with the studs of the upwardly extending arm of one rock shaft and the downwardly extending arm of the other said connecting rod being also adapted to be engaged with the studs on the downward arm of the first rock shaft and the upward arm of the second, and a plurality of endwise movable grate bars each engaged with one of said rock shafts for movement thereby in opposite directions.
7. A grate comprising a frame, a rocker and a roller mounted adjacent each end of the frame, said rockers having projections each consisting of a tongue and segmental flanges on opposite sides thereof, said projections being spaced apart and those of one rocker situated opposite the spaces of the other rocker, grate bars each resting near one end on the segmental flanges of one of said projections and near the other end passing between the projections of the othtr rocker and resting on the adjacent roller, the bars having downwardly opening, but otherwise entirely enclosed sockets receiving the tongues, one tongue belng thus engaged with each bar and connections for casing the rockers to be oscillated simultaneously in opposite directions, whereby adjacent bars are reciprocated oppositely.
8. A grate comprising parallel movable fuel supporting bars, mechanism for oppositely reciprocating alternate bars in the direction of their lengths, said bars having fingers projecting laterally towards the adjacent bars and also spacing projections extending laterally beyond the ends of the fingers, the said projections of each bar being substantially equal in length or area and located beside those of the adjacent bars and extending longitudinally of the bars a greater distance than the amplitude of vibration therenf. said projections being also grooved or corrugated vertically on their outer sides.
9. A grate comprising supports a plurality of bars each mounted on said supports with their fuel supporting surfaces in one plane so as to be movable longitudinally in said plane, each bar consisting of a central web of substantially equal thickness from top to bottom and vertically corrugated o form alernate rounded protuberances on each side thereof and fingers projecting laterally on opposite sides of the bar from said protuberances, spaces being left between the fingers opposite the depressions, the bars being longitudinally and centrally grooved and the fingers being grooved on their upper surfaces.
10. A grate comprising a plurality of duplicate longitudinally reciprocable bars. each consisting of a central web having vertical corrugations forming alternate rounded projections and depressions on opposite sides thereof, each depression on one side being opposite a projection on the other side, detachable fuel supporting sections mounted on said web and having laterally projecting fingers on opposite sides out of alignment, and lugs depending from the said sections and arranged to slide in the depressions in opposite sides of the web and being wholly clear of the project tions, the said fingers being directly above the alternate projections of the web.

\section*{No. 102,203. Grain Cleaning and Picking Machinc.} Machine a nettoyer et trier le grain.
Halvor T. Helgeson, Regina, Saskatchewan, Canada. 27th November, \(1906 ; 6\) years. Filed 31st October 1906. Receipt No. 140,781.
Claim.-1. A device of the class described comprising a feed hopper, an endless carrier. a tank, a cross partition forming a funnel-shaped channel within the tank, a chute leading from the hopper and above the carriers and adapted to direct the grain upon the funnel-shaped cross partition, as and for the purpose specified.
2. A device of the class discribed comprising a feed hopper.
a tank, a funnel-shaped cross partition within the tank, an
endless carrier extending into the channel formed by the funnel-shaped partition. and a chute leading from the hop-

per and extending into the tank and above the carrier. and adapted to direct the grain into the funnel-shaped channel, as and for the purpose specified.
3. A device of the class described comprising a tank having a cross partition forming a funnel-shaped channel with the sides an endless conveyer having its lower end within the channel, a cross partition extending obliquely downwardly above the ascending side of the conveyer an adjustable gate makini an angle with the latter cross partition and forming with the latter cross partition a hopper, as and for the purpose specified.
4. In a device of the class described the combination with the supporting frame of a tank in the lower portion of the frame, an endless carrier extending obliquely from the tank and within the fraework, side enclosures at the ends or the carriers and continuous with the sides of the tank, a cross partition in the tank forming a basin with the side of the tank, an endless carrier extending obliquely upwardly from the basin, out of the tank and within the framework, a cross partition above the ascending side of the carrier and extending into the tank, an adjustable gate forming with the latter cross partition and the side enclosures a hopper, as and for the purpose specified.
5. In a device of the class described the combination with the tank. the hopper and an endless carrier, of a chute to receive the grain from the carrier, and an endless conveyer within the chute and free of the bottom, as and for the purpose specified.
6. In a device of the class described the combination with the tank, the hopper, and the endless conveyer, of an inclined projecting chute, adapted to receive the grain from the carriers, an endless conveyer longitudinally within the chute, and having the blades clear of the bottom of tho chute, as and for the purpore specifled.
7. In a device of the class described the combination with the tank. the hopper, and the endless carriers, of an inclined chute adapted to receive the grain from the carriers, a perforated drain board extending over the upper face of the bottom of the chute, and an endless conveyer longitudinally within the chute, and adapted to operate clear of the drain board, as and for the purpose specifled.
8. In a device of the class described the combination an inclined chute, a perforated drain board suspended above the inner face of the base of the chute, and an endless conveyer within the chute, as specified.
9. In a device of the class described the combination comprising an inclined chute, an endless chain conveyer within the chute, having cross blades thereon, and a removable perforated drain board, below the tips of the blades. and above the entire face of the bottom of the chute, as and for the purpose specified.
10. In a device of the class described the combination with the tank. and a pan extending obliquely into the tank. from its rear end, of a skimmer adapted to adjust itself to the height of the liquid in the tank, as and for the purpose specifled.
11. In a device of the class described the combination with the tank, of a pan extending within the tank from the rear end, a sieve above the inner face of the pan, and a skimmer adapted to be self adjustable to the height of the liquid in the tank, as and for the purpose specified.
12. In a device of the class described the cimbination with the tank, the hopper and the endless carriers, of an inclined chute, an endless chain conveyer longitudinally within the chute and having blades thereon, extending across the chute, a drain board below the tips of the blades on the lower side of the conveyer, and a cross partition adajacent to the inner end of the conveyer, as and for the purrose specified.
13. In a device of the class described the combination with the tank, and the endless carrier, of a chute inclined towards the tank, and adapted to receive the grain from thn carriers, a set of gears supported on a shaft bearing ith the sides of the inner end of the chute, a set of gear wheels secured on a shaft, supported in adjustable bearings at the sides of the outer end of the chute, endless gear chains encircling the opposing gears in the sets, a series of cross blades secured to the chains, and extending to the edges of the chute, a cross partition at the inner end of the chute, in juxtaposition to the conveyer, a perforated drain board extending across the chute, and considerably below the tips of the blades, as and for the purpose specified.
14. In a device of the class described, a chintn to rerpive the grain from the carriers, a drain board within the chute, and an endless conveyer adapted to operate ahnve the drain board, as and for the purgose specifled.
15. In a device of the class described the combination with the tank, of a part extending obliquely within the tank. a skimmer adapted to co-operate with the pan in removing floating impurities from the solution in the tank, as and for the purpose specified.
16. In a device of the class described the combination with the tank, of a pan extending obliquely into the liquid. within the tank, a sieve above the inner face of the pan, a skimmer. and means whereby the skimmer is automatically adjustable to the height of the solution within the tank, as and for the purpose specified.
17. In a device of the class described, a skimmer, comprising a set of esdless chain carriers, and a flap secured to the links in the opposing chains. as and for the purpose specified.
18. In a device of the class described, a skimmer consisting of a set of endless chain carriers, a flap formed from a resiliest material, and secured to an opposing pair of links within the chain, and means for operating the chains, as and for the purpose specified.
19. In a device of the class described, a skimmer consisting of a framework. transverse shafts, supported in adjustable bearings at the extremities of the framework. a supporting shaft passing through the framework and between the aforementioned shafts, chain gears at the extremities of the chafts, endless chains passing around the gears, a flap secured to opposing links in the chains, and means for operating the chains, as and for the purpose specified.
20. In a device of the class described the combination with the supporting frame, of a tank in the lower portion of the frame. side enclosures at the upper portion of the frame, bars supported by the enclosures and extending obliquely into the tank, a transverse shaft pivotally supported in the lower end of the bars, a transverse shaft pivotally supported in adjustable bearings at the upper end of the bars. sets of similar gear wheels on the shafts, endless link chains encircling the gears, a series of suitably disposed perforated cups secured to the chains, a cross partition passing downwardly into the tank. and above the tips of the cups on the ascending sides of the chains, a cross partition forming a basin with the sides of the tank, and adapted to direct the grain to the carriers, an adjustable gate supported by the side enclosures, and making an angle with the former partition, an inclined chute projecting from the framework and adapted to recelve the grain from the cups, a drain board in the chute, and a longitudinal conveyer above the drain board, as and for the purpose specifled.

No. 102,204. Car Coupler. Attelagc de chars.

Thomas D. Jones, Cleveland, Ohio, U.S.A., 27th November, 1906; 6 years. Filed 2nd November, 1906. Receipt No. 140,815 .
Claim.-The combination with a drawhead of the Janney type having a cavity in its face, of an emergency knuckle
comprising a casting having a front hook portion adapted to engage within the opposite knuckle and a rear portion adapted to bind against the outer side of the said knuckle, the casting being pivoted to the head at its rear onter cor\(r \in r\), and the rear portion of the casting being shaped to fit within said cavity, and against the drawhead, so as to transmit the impact against said rear portion directly to the drawhead.

No. 102,205. Heating Apparatus for Railway Cars. Appareil à challfage pour chars de chemin de fer.

Fritz Kaeferle, Hanover, Germany, 27th November, 1906 ; 6 years. Filed 15th October, 1906. Receipt No. 140.310.
Ciaim.-1. In heating apparatus for low pressure steam reating in rallroad cars in combination a self acting steam pressure regulator, a second regulator regulating the quantity of steam necessary for the low pressure steam heating and a heating body, substantially as set forth.
2. In heating apparatus for low pressure steam heating in railroad cars in combination a steam inlet opening \(i\), a lever valve \(b\), two communicating chambers \(Q\) and \(Q^{1}\), partly filled with mercury, a weight \(P\) swimming in the chamber \(Q\), a conuection rod between the free end of the lever valve \(b\) and the weight, two safety valves placed on the bottoms of the two communicating chambers, a second regulator regulating the quantity of steam necessary for the low pressure steam heating and a heating body, substantiglly as set forth.
3. In heating apparatus for low pressure steam heating in railroad cars in combination a steam inlet opening \(i\), a lever valve \(b\), two communicating chambers, \(Q\) and \(Q^{1}\), partly fill ed with mercury, a weight \(P\) swimming in the chamber \(Q\). a connection rod between the free end of the lever valve \(b\) and the eight, two safety valves placed on the bottoms of the two communicating chambers, a hand regulator for regulating the quantity of steam necessary for the low pressure steam heating, and a heating body, substantially as set forth.
4. In heating apparatus for low pressure steam heating in railroad cars in combination a steam inlet opening \(i\), a lever valve \(b\), two communicating chambers, \(Q\) and \(Q^{1}\), partly filled with mercury, a weight \(P\) swimming in the chamber \(Q\), a con nection rod between the free end of the lever valve \(b\) and the weight, two safety valves placed on the bottoms of the two communicating chambers, a self-acting electric magnetically operated regulator regulating the quantity of steam necessary for the low pressure steam heating and a heating body, substantially as set forth.
5. In heating apparatus for low pressure steam heating in rallroad cars in combination a steam inlet opening \(f\), a lever valve \(b\), two communicating chambers, \(Q\) and \(Q^{1}\), partly fllad with mercury, a weight \(P\) swimming in the chamber \(Q\), a connection rod between the free end of the lever valve \(b\) and the weight, two safety valves placed on the bottoms of the two communicating chambers, a second regulator regulating the quantity of steam necessary for the low pressure steam heating, a heating body \(k\), a canal s leading from the regulators to the heating body, a second canal \(c\) for the exit of the condensing water placed right below the canal for the instreaming steam, a very fine passage between the two canals, and a partition separating the two canals. substantially as set ferth.
6. In heating apparatus for low pressure stcam heating in rallroad cars in combination a self-acting steam pressure
regulator, a second regulator regulating the quantity of steam necessary for the low pressure steam heating, one or more heating bodies in each car compartment, a special condensing water exit for each heating body and means to keep these exits open for a quick ventilation, substantially as set forth.
7. In heating apparatus for low pressure steam heating in ra!lroad cars in combination a self-acting steam pressure \(r \in g u l a t o r\), a second regulator regulating the quantity of steam necessary for the low pressure steam heating, one or more heating bodies in each car compartment, a special condensing water exit for each heating body, and heat protectors for pach exit, substantially as set forth.
8. In heating apparatus for low pressure steam heating in railroad cars in combination a self-acting steam pressure regulator, a second regulator regulating the quantity of steam necessary for the low pressure steam heating, one or more heating bodies in each car department. condensing water exit pipes for the heating bodies, heat protectors, and means to screw the exit pipes into the condensing water exit canal \(c\) from the outside of the car through the car bottom, substantially as set forth.

No. 102,206. Oil Can. Bidon à huile.

Henry J. Klusmire, Holton, Kansas, U.S.A., 27th November, 1906; 6 years. Filed 31st October, 1906. Receipt No. 140, 778 .
Claim.-An oil can having a threaded orifice, a spout threaded at one end for detachably engaging said orifice and provided with a lateral disc having a notched periphery for bearing unon said orifice, a resilient member formed from a single piece of wire bent into a lateral loop at one end for encircling said thieaded orifice and secured rigidly thereto as by soldering, and with a vertical portion extended for yieldably engaging said notches and terminating in a lateral loop yieldably encircling said spout.

No. 102,207. Instep Enpport. Support du coup-du-picd.

Leon Theophilus Jules Lubin, Boston, Massachusetts, U.S.A., 27th November, 1906; 6 years. Filed 30th October, 1906. Recelpt No. 140,764.
Claim.-1. An instep support comprising a top piece, an arch piece and a support for one end of the arch plece, both of said pleces being permanently attached to said top piece and the end of the arch piece overlapping the free end of the support.
2. An instep support comprising a top piece, an underlying metallic arch piece, and a metallic support, both said arch piece and support being permanently attached to the under side of the top piece, the end of the arch piece turnin? on the upper side of said support.
3. An instep support comprising a top piece, an underlying metallic arch piece, and a metallic supporting plate, both attached permanently at separate points to the underside of said top plece, the end of the arch piece overlapping the end of the supporting plate and turning thereover.

No. 102,208. Potato Planter. Plantoir à patates.

Julin Petermann, Jr., Ontonagon, Michigan, U.S.A., 27 th November, 1906; 6 years. Filed 31st October, 1906. Receipts No. 140,784 .
Claim.-1. In a planter the combination with a frame provided with wheels and draft devices, of a tilting seed box on the frame, having seed lropping and covering devices supportod thereby, means to tilt the box to lift said devices from the land, and driving connections between the dropping devices and the wheels, sald connections being disengageable by tilting the box.
2. In a planter the combination with a frame mounted on Wheels and having draft devices, a seed box hinged to the irame and having dropping and covering devices supported thereon, and a hand lever mounted on the frame and connected to the seed box and arranged to tilt the same to lift said devices from the land.
3. In a planter the combination with a seed box, of a spout connected thereto, a shaft extending across the head of the spout and having curved fingers which lift the seed and drop the same into the spout, and means to drive the shaft.
4. In a planter the combination with a seed box having a feed opening in the bottom, of an inclined chute leading from said opening, a spout extending downwardly from the lower end of the chute and forming an angle therewith, the spout and chute having slots at said angle, a shaft extending across the spout at the angle and having curved fingers which pass through sald slots and lift seed from the chute and drop same into the spout, and means to drive the shaft.

No. 102,209. Elevator for Clothes Lines.
Ascenseur pour cordes à linge.

Richard Pike, Montreal, Quebec, Canada, 27th November, 1906; \(\boldsymbol{f}\) years. Filed 6th November, 1906. Receipt No. 140,956.
Olaim.-1. In a clothes line elevator, a vertical rod, a pair of brackets, and a pulley slidably mounted on sald rod.
2. In a clothes line elevator, a vertical rod, a pair of fixed brackets engaging the extremities of said rod, and a pulley slidably mounted on said rod.
3. In a clothes line elevator, a vertical rod, a pair of fixed brackets engaging the extremities of said rod, a block slidably mounted on said rod, and a pulley journalled in said block.
4. In a clothes line elevator, a vertical rod, upper and lower brackets supporting said rod, a roller bearing block mounted on said rod, and a pulley journalled in said block.
5. In a clothes line elevator, a vertical rod. upper and lower brackets supporting said rod, a pulley mounted in said upper bracket, a pair of integral fingers on said lower bracket, a roller bearing block mounted on said rod, and a pulley journalled in said block.
6. In a clothes line elevator, a vertical rod, upper and lower brackets supporting said rod, a pulley mounted in said upper hracket, a pair of integral fingers on said lower bracket. a roller bearing block mounted on said rod, a pulley journalled in satd block, and a cord fixed to said block and passing over the pulley in said upper bracket and engaging the flngers of said lower bracket.

No. 102,210. Cultivator. Culticilcur.

Henry Smith, Wallace, Perth, Ontario. Canada, 27th November. 1906; 6 years. Filed 31st October, 1906. Receipt No. 140.782.

Claim.-1. In a riding cultivator the combination with the side bars of the frame and the cross bars a dijustably connected to the side bars, so as to alow of lateral movement of the side bars, and a cultivator located substantially on a line with the side bars and to the rear of the same, as and for the purpose specified.
2. In a riding cultivator the combination with the side bars of the frame and the cross bars adjustably connected to the side bars, so as to allow of lateral movement of the side bars. of a cultivator located intermediately between the side bars and a cultivator located substantially on a line with the side bars and to the rear of the same, and runners adjustably connected to the front of the side bars and extending rearwardly and suitably connected to the slde bars at the rear ends, as and for the purpose spectfied.
3. In a riding cultivator the combination with the side bars of the frame and the cross bars adjustably connected to the side bars. so as to allow of lateral movement of the side bars. of a cultivator located intermediately between the side bars. and a cultivator located substantially on a line with the side bars and to the rear of the same, and runners adjustably contected to the front if the side bars and extending rearwardly and suitably connected to the side bars at the rear ends. and supporting wheels, bearings for the same secured to the side bars and means for adjusting such wherls vertically in relation to the runners. as and for the purpose specified.
4. In a riding cultivator the combination with the side bars of the frame and the cross bars adjustably connerted to the side bars. so as to allow of lateral movement of the side bars, of a cultivator located intermediately between the side bars. and a cultivator located substantialle on a line with the side hars and to the rear of the same, and runners aljustably connected to the front of the side bars and extending rearWardly and suitably connected to the side bars at the rear ands, and supporting wheels, bearings for the sam. secured to the sic!, bars. a crank axle support for the smporting wheels journalled in the bearings and means for turning such rimit avie so as to raise and lower the wheels in relation to the runners, as and for the purpose specificd.
5. In a riding cultivator the combination with the side bars of the frame and the cross bars adjustably connected to the side bars, so as to allow of lateral movement of the s:ce bars, of a cultivator located intermediately between the sid. bars and a cultivator located substantially on a line with the side bars and to the rear of the same and runners adjustably connected to the front of the slde bars and extending rearwardly and suitably connected to the side bars at the rear ends, and supporting wheels, bearings for the same secured to the side bars a crank axle support for the supporting Wheels journalled in the bearings, arms on the end of the crank axles and levers connected by llaks to the arms aod quadrants on the frame with which the levers co-act, as and for the purpose specified.
6. In a riding cultivator the combination with the frame comprising the side bars and cross bars, of the Z-shaped extending betwean the cross bars, the straight teeth on the front bars and the rotating dise cultivators provided wita stems secured on the rear Z-bars, as and for the purpose specifled.
7. In a riding cultivator, cultivator teeth comprising a double mould board and wings secured to the sides of the mould board and means for adjusting the same in relation to the mould board, as and for the purpose specified.
s In a riding cultivator. cultivator teeth comprising a double mould board and wings secured to the sides of the mould board and rods connected to the outside of the wings and to the back of the stem of the teeth and provided with a plurality of bolt holes adjacent to the stem, as and for the purpose specified.

No. 102,211. Method of Incompletely Coling Peat. Mithode de ruire la tourbe dune manirive incomplete.

Oberbayerische Kokwerke and Fabrick Chemscher. Produkte Akt. G sel!schaft. Munich, assignee of Marlij Ziezler, Beuerberg, Bavarla, Germany, 27th November. 1906: 6 years. Filed 2nd March, 1906. Receipt No. 133.174.
Claim.-1. Improved method of incompletely coking fuel as peat or the like in a shaft, according to which the furl is first treated in the upper half of the shaft with bot incombustible gases, then is passed Into the lower half of the shaft and treated there with hotter incombustible gases.
2. Improved method of incompletely coking fuel as peat or the like in a shaft according to which the fuel is tirst treated in the upper half of the shaft with hot steam and then is passed into the lower part of the shaft and treated there with hotter combustion gases.
3. Improved method of incompletely roking fuel as peat or the like in a shaft according to which the incombustible gases led into the upper half of the shaft are heated to a temperature of approximately \(480^{\circ} \mathrm{F}\) before they enter the upper part of the shaft.
4. Improved method of incompletely coking fuel as peat or the like in a shaft, according to which the steam betore its rntering the upper half of the shaft is superbeated to a temperature of approximately \(480^{\circ} \mathrm{F}\).
6. Improved method of incompletely coking fuel as peat or the like in a shaft according to which the the gases of approximately \(40^{\circ}\) F from vertical coking retort ovens are led into the upper half of the shaft for treating the fuel before it enters the lower half of the shaft in which the fuel thus tratiod as further treated with flue gases having been sup plied from vertical retort ovens and heated to a temperature of approximately \(660^{\circ}\) F these gases and the gasers and vapours delivered from the fuel being senarately removed namely the gases and vapours from the lower half leave the shaft before enterlng the upper half of the shaft.

No. 102,212. Shanling Ont Machine.
Machine d couper les renforts.

The United Shoe Machinery Company of Canada, Montreal, assignee of John Benjamin Hadaway, Brocton, Massachusetts, U.S.A., 27th November, 1906; 6 years. Filed 7th November, 1904. Receipt No. 119,779.
('laim.-1. A shanking out machine having in combination a welt support, a sole support and two skiving cutters located between the supports arranged to act upon the lower outer edge of the welt and upon the upper outer edge of the sole respectively, substantially as described.
2. A shanking out machine having in combination, means for skiving the lower outer edge of the welt and means for skiving the upper outer edge of the sole, substantially as described.
3. A shanking out machine having in combination a rotary shaft and two cutters mounted thereon side by side arranged to enter between the welt and outsole of a shoe and to skive the lower outer edge of the welt and the upper outer edge of the sole respectively, substantially as described.
4 A shanking out machine having in combination a welt support arranged to enter the crease between the upper and welt of a shoe and a rotary cutter arranged to skive the lower outer edge of the welt, substantially as described.
5. A shanking out machine having in combination a welt support arranged to enter the crease between the upper and welt of a shoe, a rotary cutter arranged to skive the lower outer edge of the welt and a guard for preventing the cutter from cutting the switches of the inseam, substantially as described.
6. A shanking out machine having in combination a welt support arranged to enter the crease between the upper and welt of a shoe, a rotary cutter arranged to skive the lower outer edge of the welt, and a guard surrounding the cutter provided with a shoulder to bear against the stitches of the inseam and hold the cutter out of contact therewith, substantially as described.
7. A shanking out machine having is combination, a welt support, a sole support, a skiving cutter located between said supports, and means for separating said supports to allow the cutter to enter between the welt and outsole of a shoe, substantially as described.
8. A shanking out machine having in combination, a welt support, a sole support, a skiving cutter located between sald supports, and means for yieldingly pressing the supports towards the cutter, substantially as described.
9. A shanking out machine having in combluation, a welt support arranged to enter the crease between the upper and welt of a shoe, a skiving, cutter arranged to act upon the lower outer edge of the welt, and a spring for pressing the support towards the cutter, substantially as described.
10. A shanking out machine having in combination, a welt support, a sole support, two skiving cutters located between said supports and arranged to act upon the lower outer edge of the welt and upon the upper outer edge of the sole respectively, a spring for pressing the sole support towards the cutters, and means for locking the welt support in fixed position, substantially as described.

11-21
11. A shanking out machine having in combination, two rotary skiving cutters arranged to enter between the welt and outsole of a shoe and to skive the lower outer edge of the welt and the upper outer edge of the sole respectively. and a disc located between said cutters forming a guard for both cutters, substantially as described.
12. A shanking out machine having in combination, a welt support arrasged to enter the crease between the upper and welt of a shoe, an edge guide arranged to engage the edge of the outsole and a skiving cutter arranged to enter between the welt and outsole, substantially as described.
13. A shanking out machine having in combination, a rotary cutter arranged to enter between the welt and outsole of a shoe, a guide arranged to enter the crease between the upper and welt and a guide arranged to bear against the inseam below the welt, substantially as described.
14. A shanking out machine having in combination, a cutter arranged to enter between the welt and outsole of a shoe, a guide arranged to bear against the inseam below the welt and a guide arranged to bear against the edge of the outsole, substantially as described.
15. A shanking out machine having in combination, a rotary shaft, a skiving cutter secured thereto arranged to enter between the welt and outsole of a shoe, and a sole support arranged to support the sole upon both sides of the shaft, substantially as described.
16. A shanking out machine having in combination, a rotary shaft and a cutter mounted thereon arranged to enter between the welt and outsole of a shoe and to skive the lower outer edge of the welt and the upper outer edge of the sole, substantially as described.

\section*{No. 102,213. Welting for Welt Shoes.}

Bordure de chaussures.

-

Big. 5
102213

The United Shoe Machinery Company of Canada, Montreal, Quebec, Canada, assignee of John Benjamin Hadaway, Brockton, Massachusetts, U.S.A., 27th November, 1906;
6 years. Filed 7th November, 1904. Receipt No. 119.780.
Claim.-1. As an article of manufacture, a strip of welting for use in the manufacture of welt shoes consisting of a strip of welt material cut away on its under side on a broken line from its inner edge to a point beyond the Inseam sitch receiving portions, substantially as described.
2. As an article of manufacture, a strip of welting for use in the manufacture of welt shoes consisting of a strip of welt material cut away on its under side on a broken line from its inner edge to beyond the inseam stitch receiving portion, and having a bevelled shoulder beyond the inseam stitch receiving portion, substantially as described.
3. As an article of manufacture, a strip of welting for use in the manufacture of welt shoes consisting of a strip of welt material cut away from its inner upper edge diagonally downward through abou half the thickness of the welt, thence substantially parallel with the sides of the welt to a point beyond the inseam stitch receiving portion of the welt and thence downward through the remainder of the thickness of the welt, substantially as described.
4. The method of making welts which consists in dividing a strip of well material into two parts, the combined width
of which is greater than the width of the strip of material brot extending from one surface to the other in a tions of and forming overlapping stitch receiving porportions of the samess than the strip of material and body upper surface of one welt being formed by of material, the the strip and the upper burfag formed by one surface of formed by the other surface of of the other welt being described.
5. The \(m\)
a strip of welt of making welts which consists in dividing line which intersects one by a cut extending along a broken from the edge of the one surface of the strip at a distance of a welt and intersects the equal to the width of the body of a welt and intersects the other surface of the strip at a
distance from the opposite edge of the strip equal to the width of the body of a welt, so as to produce two welts the combined width of which is greater than the width of the strip. having overlapping stitch receiving portions of less thickness than the strip of. material, and body portions of the same thickness as the strip of material, the upper surface of one welt being formed by one surface of the strip and the upper surface of the other welt being formed by the other surface of the strip. substantially as described.
No. 102,214. Grinding Mill. Moulin ì broyer.

John Wheeler Fuller, Jr., Catasauqua, Pennsylvania, U.S.A. 27th November, 1906: 18 years. Filed 21st March, 6,06 Receipt No. 134,107.
Claim.-1. A metal ring or annulus for pulverizing or grinding mills having the wearing surface composed of chilled and linchilled portions, the chilled portion being arranged between the unchilled portions and differing in outline.
2. A metal ring or annulus for pulverizing or grinding mills having the inner wearing surface composed of chilled and unchilled portions, the chilled portion being arranged between and merging into the unchilled portions thereof.

\section*{No. 102,215. Process of Evaporating and Concentrating Liquors.}

Procédé pour évaporer et concentrer les liquides.
Charles Louis Prache and Charles G. V. Bouillion, co-inventors, both of Paris, France, 27th November, 1906; 6 years. Filed 11th December, 1905. Receipt No. 130,879.
Claim.-1. A single acting process for the evapouration or concentration of liquids, broadly characterized by the systematic circulation of the liquids to be concentrated in a series of assemblages of tubes arranged in a single vessel, these liquids, during their circulation and for the purpose of concentrating them, being raised ta ebullition by the vapours emitted by them in the apparatus, these vapours being sucked continuously by an appropriate apparatus and after compression forced continuously into a single heating chamber around the assemblage of tubes through which the liquids pass in their systematic circulation.
2. The herein described process of concentrating liquids in apparatus, of known kinds having chests, which consists in operating all the chests in quantity or multiple, as regards the vapours, instead of causing them to act in series, and circulating the liquids in series, that is to say systematically from one chest to another, in proportion as they are concentrated.
3. A single acting liquid evapourating and concentrating apparatus, broadly characterized by a heating chamber formed within the apparatus by two tubular plates united one to the other by vertical tubes placing in communication the upper and lower chambers of the apparatus, the vertical tubes ex-
tending slightly beyond the upper tubular plate, the space comprised between the two tubular plates being supplied

with the vapours emitted by the liquids to be concentrated which circulate systematically in the assemblages of tubes, by means of any appropriate compressor and in particular by means of a rotary compressor or a jet compressor.
4. For the purpose of producing the systematic circulation of the liquids to be concentrated in the various assemblages of tubes of the apparatus, the division of the ebullition chamber into compartments which do not reach the top of the apparatus and which are united in series, each compartment communicating with the lower part of the next compartment in the series through a tube opening in the interior of a tube of larger diameter and traversing the heating chamber parallel with the assemblages of tubes, the lower part of each ebullition chamber being provided, around the tube placing one compartment in communication with the other, with a baffle plate facilitating the repeated circulation of the liquid in the same assemblage of tubes, the first compartment being connected with an automatic feed apparatus for the IIquid to be concentrated and the last with an outlet for the concentrated liquid.

\section*{No. 102,216. Process of Electrolytically Coating Metals.}

I'rocélle électrique pour enduire les métaux.
Alexander Classen, Aachen, Prussia, Germany. 2ith November, 1906: 6 years. Filed 30th October, 1905. Receipt No. 129,667.
Claim.-1. The process for the production of lustrous metallic coatings on metals by electrolysis, which consists in adding to the electrolytic bath in which the metal articles are to be treated one or more glucosides.
2. The process for the production of lustrous metallic coatings on metals by electrolysis. which consists in adding to the electrolytic bath in which the metal articles are to be treated, extract of plants, or parts of plants, containing a glucoside.
3. The process for the production of lustrous metallic coatIngs upon metals, which consists in placing the metal to be treated in an electrolytic bath containing a glucoside, allowing the metal to remain in such bath until a lustrous metallic coating is produced thereon, and then removing the coated metal from the bath.
4. The process for the production of lustrous metallic coatings upon metals, which consists in placing the metal to be treated together with the metal which is to form a coating in an electrolytic bath contajning extract of licarice root. allowing the metal to remain in such bath until a lustrous metallic coating is produced thereon, and then removing the coated metal from the bath.
5. The process for the production of lustrous metallic coatings upon metals, which consists in providing an electrolytic bath composed of zinc sulphate, sodium sulphate, zinc chloride, bonic acid, water and licrice root embraced within an electric circuit, placing the metal in such bath, allowing the metal to remain in the bath until a lustrous metallie
coating is produced thereon, and then removing the coated metal from the bath.
6. The process for the production of lustrous metallic coatings upon metals, which consists in providing an electrolytic bath embraced within an electric circuit and composed of a solution of twenty kilos crystallized zinc sulphate. four kilos crystallized sodium sulphate, one kilo zinc chlorid and 0.5 kilo boric acid in one hundred liters water. adding the extract of flive kilos licorice root, placing the metal in such bath. allowing the metal to remain in the bath untll a lustrous metallic coating is produced thereon. and then removing the coated metal from the bath.

No. 102,217. Electrode. Elentrode.

Fig.2"

Adolf Gallia, Vienna, Austria, administrator of the estate of Carl Kellner, deceased, 27th November, 1906; 6 years. Filed 5th March, 1906. Recelpt No. 133,542.
Claim.-1. In electrodes for electrolytic cells comprising substantially Z-shaped electrodes.
2. Electrodes for electrolytic cells. comprising two substantially horizontal portions, at different levels connected by a suitable shaped middle portion to form electrodes, substantially as described.
3. Bi-polar electrodes for electrolytic cells substantially Z-shaped and having two substantially horizontal portions at different levels and a connecting portion between them adapted to take over a partition wall, substantially as described

\section*{No. 102,218. Electric Smelting Furnace.}

\section*{Fonderie électrique.}

Eugen Assar Alexis Grönvall, Ludvika. Sweden, 27th November, 1906; 6 years. Filed 9th, June, 1906. Receipt No. 136,736.
Claim.-1. Improvements in transformator furnaces of the class described characterized thereby that one or more short circuited conductors are placed in such a manner that they are intersected by the leaking lines of force but not by the effective lines of force of the transformer.
2. Improvements in transformator furnaces of the class described, characterized thereby, that a part or parts of the transformer or the whole transfomer core is surrounded by one or more mantels of conducting material, cut open at one or several places and arranged in such a way that the effective lines of force of the transformer do not act inductively on the same while the leaking lines of force do so.
3. Improvements in transformator furnaces of the class described characterized thereby, that a part or parts of the transformer core or the whole of the transformer core is surrounded by one or more mantels formed of two or more turns of a conducting material wound around each other spirally and insulated from each other, the said mantel being so arranged that the effective lines of force of the transformer do not act inductively on the same, while the leaking lines of force do so.
4. Improvements in transformator furnaces of the class described, characterized thereby, that one or several short

circuted conductors enclosing a part or parts of the transformer core are so located that they are intersected by the leaking lines of force but not by the active lines of force of the transformer.
5. Improvements in transformator furnaces of the class described, characterized thereby, that one or more annular discs of conductive material. cut open at one or several places are so located that they are intersected by the leaking lines of force but not by the active lines of force of the transformer.

\section*{No. 102,219. Isolation of Metals.} Isolation des métaur.

Karl August Kuhne, Dresden, Germany, 27th November. 1906: 6 years. Filed 22nd May, 1906. Receipt No. 136,150.
claim.-1. The process for the production or isolation of metals, metalloids or alloys thereof either amongst themselves or with aluminium which consists in mixing oxygen containing compounds of such elements as cannot be produced or isolated separately in reguline form by what is known as the Goldschmidt or the Thermite process, with al uminium and chlorate or potash or other similar combinations, and in then igniting the mixture, substantially as described.
2. The employment of a chlorate. such as chlorate of potash or the like, for isloating metals, metallo!ds and their alloys from their compounds or salts by aluminium in the process, known as the Goldschmidt or Thermite process, in such cases, in which metals, metalloids or their alloys cannot be produced or isolated by sald process, substantially as described.

\section*{No. 102,220. Method of Recovering Copper.}

Méthode d'obtenir du cuivre.
Thomas Jefferson Lovett, Chicago, Illinois, U.S.A., 27 th No vember, 1906; 6 years. Filed 14th February. 1906. Receipt No. 132,903.
Claim.-1. The herein described combined dry and wet process of concentrating and collecting the non-magnetic sulphide and contained values in low grade chalcopyrite ores carrying a material percentage of magnetic iron, which con sists of the steps of coarse crushing the ore in a dry state to reduce the sulphide and iron and allow of the dislodgment of adhering sulphide powder, magnetically separating from the dry reduced mass the disunited iron particles, dislodging from said dry iron particles and collecting the adhering sulphide powder, comminuting the remaining attracted material in a wet state to a degree of fineness which disunites the re-
maining iron particles from the other constituents, magnetically separating the disunited remaining iron particles from

the wet mass, and finally collecting and saving the sulphide concentrates from the recrushed mass.

No. 102,221. Show Case. Vitrinc.

James Arthur Walters, Sydney, Cape Breton, Nova Scotia, Canada, 27th November, 1906; 6 years. Filed 15th August, 1905. Receipt No. 127,705.

Claim.-1. In a device of the character described, the combination of a stationary case having a plurality of shelves, stops on one edge of sald shelves, which stops project above and below the shelves, a receptacle exterior of sald case, and insertible receptacles adapted to be inserted in said case, said receptacles having channeled end members. a removable cover portion, a transparent and removable face portion, and slidable rear portions adapted to serve as a closure therefor.

\section*{No. 102,222. Manufacture of Pulverized Mica. Fabrication de mica pulverisé.}

Frederich Richard Tiller, Hamburg, and Heinrich Duelfer, Cassel, each an assignee of a half of the interest, assignees of Philipp Dobler, Munich. all in Germany, 27th November, 1906; 6 years. Flled 25ith July, 1906. Receipt No. 138,163 .
Claim.-The herein described method of reducing mica to a powder which consists in subjecting mica to a high degree of dry heat, then steaming the mica, and finally pulverizing the same, substantially as set forth.

\section*{No. 102,223. Cement Blook Mould.}

Moule pour blocs de ciment.
Charles N. Choate, Samuel Taggart, assignee of three-eights, and John Cronk, assignee of one-eighth interest. all of Woodstock, Ontario, Canada, 27th November, 1906: 6 years. Filod 20th April, 1906. Receipt No. 135.078.
Haim.-1. In a block moulding machine the comblation with a support, of a mould thereon, a flanged core support
having a recess therein, a core, and clips thereon arranged to pass through sald recess for the engagement of sald core with sald support.

2. In a block moulding machine the combination with the bed, of a mould thereon, a reclprocating core support beneath the mould and one or more cores mounted upon the support for longitudinal adjustment, cllps on the cores and a recess in said support through which said clips are arranged to pass.
3. In a block moulding machine the combination with a supporting frame, of the mould thereon, a laterally flanged supporting bar mounted upon the frame for vertical reciprocation beneath the mould, and one or more cores upon said bar provided with clips engaging the bar flanges.
4. In a block moulding machine the combination with the bed plate, of the mould having movable end and side sections, mechanism for operating the sections, and means acting automatically upon the closing of the mould for locking the ends against movement.
5. In a block moulding machine the combination with the bed plate, of the mould having laterally movable end and side sections, mechanism for laterally shifting the sections to open and close the mould, and locking devices carried by the sides acting automatically upon the closing of the mould to hold the ends against movement.
6. In a block moulding machine the combination with a bed, of a mould thereon having movable end and side sections to open and close the mould, and automatically operating locking means independent of the section operations mechanism for locking the ends after the closing of the mould has been effected.
7. In a block moulding machine the combination with the bed, of a mould thereon having movable end and side sections, mechanism for operating the sections to open and close the mould, and means for varying the extent of morement of the sides.
8. In a block moulding machine the combination with the supporting frame, of the mould thereon having movable sides, a reciprocating member, levers having their ends pivotally connected to the sides and frame and having operative connections with the reciprocating member, actuatiog mechanism for sald member, a lever controlling the operation of said mechanism and a lock for the lever.
9. In a block moulding machine the comblnation with a supporting frame, of a mould thereon having side and end sections mounted for lateral movement, and a lever controlled operating mechanism for shifting said sections simultaneously in a horizontal plane.
10. In a block moulding machine the combination with a supporting frame, of a mould thereon having movable sides, a reciprocating member levers connected to the sides and frame, sleeves slidably mounted on said levers, bars connecting said sleeves with sald reciprocating member, sctuating mechanism for sald member, and a lever controlling the operation of said mechanism.
11. In a block moulding machine the combination with a supporting frame, of a mould thereon having movablo sides. a reciprocating member, levers connected to the sides and frame, sleeves slidably mounted on sald levers, bars piroted on said sleeves and adjustably connected to sald mam.
ber, and a lever operatively connected to said member, for the reciprocation thereof.
12. In a block moulding machine the combination with a supporting frame, of a mould thereon having movable sides, a reciprocating member, angled levers connecting the sides and frame, connections between said member and levers slidable longitudinally of said levers whereby the reciprocation of said member will reciprocate said levers and sides, and means for actuating said member.
13. In a block moulding machine the mould proper including a side section, a support therefor, and levers pivoted on the support and pivotally connected to the ends of the side, permitting relative rotary adjustment of the side.
14. In a block moulding machine the combination with the mould comprising side and end sections, of removable partitions for the mould carrying pins at their ends adapted to engage openings formed in the mould sides.

No. 102,224. Formaldehyde Manufacture.
Fabrioation de formaldehyde.
Henry Spencer Blackmore, Mount Vernon, New York, U.S. A.. 27th November, 1906; 6 years. Filed 25th July, 1906. Receipt No. 138,164.
Claim.-1. A new antiseptic powder comprising powdered talcum and formic aldehyde.
2. A new antiseptic powder comprising powdered talcum, formic aldehyde, and a substance capatle of masking the odor of aldehyde.
3. A new antiseptic powder comprising powdered talcum, formic aldehyde, a substance capable of masking the odor of formic aldehyde, and a bibulous substance.
4. A new composition of matter consisting of powdered talcum containing formic aldehyde, a substance capable of masking the odor of the formic aldehyde, and powdered alumina.
5. A new antiseptic powder consisting of powdered talcum containing formic aldehyde, a fragrant ketone, and alumina.
6. The process of making a solld composition containing formic aldehyde, which consists in generating the formic aldehyde in the presence of a porous absorbent substance under sub-atmospheric pressure.
7. The process of making a solid composition containing formic aldehyde, which consists in exposing a porous mineral substance to reduced pressure and then introducing formic aldehyde into the pores thereof
8. The process of making a porous composition containing formic aldehyde, which consists in mixing the porous substance with a formic aldehyde generating material, exhausting the air therefrom, and exposing the mixture to the action of heat, whereby the formic aldehyde produced is absorbed by the porous substance.
9. The process of making a porous composition containing formic aldehyde. which consists in mixing a porous substance with paraformaldehyde, exhausting the air thereirom, and exposing the mixture to the action of heat.
10. The process of making a porous composition containing formic aldehyde, which consists in mixing powdered talcum with formic aldehyde, exhausting the air therefrom, and exposing the mixture to the action of heat.

No. 102,225. Dental Crown and Bridge. Couronne et pont dentaire.
Arthur H. Brown, Hamilton, Missouri, U.S.A., 27th November, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,017.
Claim.-1. A denture embodying a retainer provided in one edge with sockets disposed wholly within it, and a tooth having a shoulder to engage the retainer and close the sockets and headed pins to engage the sockets.
2. A denture embodying a tooth provided with a flat pressure receiving shoulder disposed approximately at right angles to its length and extending throughout the width of the tooth and with headed anchoring pins extending parallel with the shoulder, and a retainer to be engaged by the shoulder and provided with sockets to be engaged by the headed ends of the pins.
3. A denture comprising a tooth having its lingual surface provided with two flat shoulders arranged in step order, one of which is disposed at right angles to the length of the tooth and the other obliquely thercto, a headed retainer engaging one of the shoulders, and means for assembling the tooth and retainer.
4. A denture comprising a tooth having its lingual surface provided with two flat shoulders arranged in step order, one
of which is disposed at right angles to the length of the tooth and the other obliquely thereto, a headed retainer en-

gaging the first-named shoulder, and means for assembling the tooth and the retainer.

No. 102,226. Process of Extraoting Turpentine and Renin from Wood.
Procédé pour extraire de la térébenthine et résine du bois.

George B. Frankforter, Minneapolis, Minnesota. U.S.A., 27th November, 1906; 6 years. Filed 23rd July, 1906. Recelpt No. 138,102 .
Claim.-1. The process of extracting turpentine and resinous matter from resinous wood, which consists in subjecting the wood to the action of one of the carbon compounds (such as ether, petroleum ether, or carbon disulphide) in vapour form, having the property of dissolving the turpentine and resinous matter.
2. The process of extracting turpentine and jesonous matter from wood which consists in repeatedly vapourizing and condensing a carbon compound (such as ether, petroleum ether or carbon disulphide and in subjecting the wood to the solvent while in vapour form, substantially as described.
3. The process of extracting turpentine and resinous matter from resinous wood, which consists in subjecting the wood to the action of a carbon compound (such as ether. petroleum ether, or carbon disulphide) in vapour form, in permitting the said vapour to condense and run from the wood charged with turpentine and resinous matter dissolved and held in solution thereby, in revapourizing said solvent fluid to frce the same from the turpentine and resinous matter carried thereby from the wood, and in returning the revapourized solvent fluid to the wood for further action thereon.
4. The process of extracting turpentine and resinous matter from resinous wood by means of a solvent fluid and in reclaiming the solvent fluid in the extraction chamber after the extraction has been completed, which consists in subjecting the wood to a solvent fluid and in thereafter applying thereto a reclaiming fluid whose density differs from that of the solvent fluid, wherehy sald solvent fluid is or may be removed from the extraction chamber.
5. The process of extracting turpentinc and resinous matter from resinous wood by means of a solvent fluid, and in reclaiming the solvent fluid left in the extraction chamber after the extraction is completed. which consists in subjecting the wood to a solvont fluid and in therepfer applying thereto a reclaiming fluid whose density. at the temperature at which reclamation takes place. is greater than that of said solvent fluid, whereby the latter is removed from the extraction chamber.
6. The process of extracting turnentine and resinous mat. ter from resinous wood and in reducing the wood to a pulp. which consists in subjecting the wood to one of the rarbon compounds isuch as ether, petroleum ether. or carbon disulphide) in fluid form, whereby the turnentine and resinous matter are dissolved and removed therefrom. and in thereafter subjecting the wood to a fluid caustic compound. such as caustic soda, whereby the wood is converted to a pulp.
7. The process of extracting turpentinc and resinous matter from resinous wood bv means of a solvent fluif and in reclaiming the solvent fluid and converting the wood into a pulp, which consists in subjecting the wood to one of the carbon compounds (such as ether. petroleum ether. or carbon disulphide) in fluid form. whereby the turpentine and resinous matter are dissolved and removed therefrom. and in thereafter subjecting the wood to a fluid caustic compound. such as caustic soda. whereby the solvent fluid is removed from the wood, and whereby the wood is converted to a pulp.

No. 102,227. Apparatus for Extracting Turpentine and Resinous Matter from \(\mathbf{V}\)
Apparcil pour cxtraire de la térébenthine et matiores résincuses. du bois.

George B. Frankforter, Minncapolis, Minnesota. U.S.A., 27th ㅇovember. 1!06; 6 years. Filed 23rd July, 1:066. Receipt No. 138.103.
rlaim.-1. In an apparatus of the kind described the combination with an extraction chamber and boiler, of a conduit leading from the upper portion of said boiler to the upper portion of said extraction chamber, and a return pipe leading from the lower portion of said extraction chamber back to said boiler. substantially as described.

2 . In an apparatus of the kind described the combination with an extraction chamber and a boiler. the former being located above the latter, of a conduit leading from the upper portion of said boiler to the upper portion of said extraction chamber, and a return conduit leading from the lower portion of said extraction chamber hack to said boiler, substantially as deseribed.
3. In an apparatus of the kind described the combination with an extraction chamber and a boiler. the former being lowated above the latter. of a conduit leading from the upper portion of said boller to the upper portion of said extraction chamber, a return conduit lading from the lower portion of satid attaction chamber back to satd boller. and a closed stram plpe extending into the lower portion of sald
boiler. for heating the contents thereof. substantially as deseribed.
4. In an apparatus of the kind described the combination with a boiler and a plurality of extraction chambers located above the same, of condults leading from the upper portion of said boiler to the upper portions of said extraction chamhers. and return cunduits leading from the lower portions of said extraction chambers back to said boller, said ronduits having valves for opening and closing the same, at will whereby the said extraction chambers may be used suc"essively. substantially as described.

5 . In an apparatus of the kind described the combination with a boiler. of a plurality of extraction chambers located above the same. conduits leading from the upper portion of said boiler to the upber portions of said extraction chambers, return conduits leading from the lower portions of said extraction chambers back to sald boiler, a condult connecting the upper portions of the several extraction chambers and other conduits opening into said extraction chambers for delivering thereto a reclaiming fluid, and valves in the several conduits. whereby the several extraction chambers may be used successively, substantialiv as described.
6. In an apparatus of the kind described the coubination with a boiler. of an extraction chamber located above the same and provided with a removable cap and a removabir bot om. of a conduit leading from the upper dortion of said boiler to the unper portion of said extraction chamber. and a return conduit leading from the lower portion of said extraction chambers back to said boller. substantially as described.

No. 102,228. Gas Generator. Générateur à gas.

©arence L. Gerrard. Columbus, Nebraska. C.S.A.. ETh November, 1906: 6 years. Flled 21st July. 1:06. Rrceipt XV. 138,057.
Claim.-1. The combination of a generator head having an opening extending from its bottom to one side of the bead. a case having an opening in its top registering with the ope:ing in the gencrator head, the side of the case having an cpering therein, a closure for said opening, a solution receptacle having a neck adapted to fit in the opening in :he generator head, and a perforate tube projecting through the neck of the receptacle and having an open upper and communicating with the head.
2. A gas generator comprising a solution recentacle, a \(\quad\) - . fractory tube located in the receptacle and having an wir. upper end and also having an opening in its lower portio., and a generator head enclosing the upper end of the tube
3. A gas gencrator comprising a solution receptacle, a ro. fractory tube having an open upper end, the tub: being projected downward into the receptacle and having a closed lna er extremity. and a plurality of openings in its side. and a generator head enclosing the open upper end of the tube
4. A gas generator having a solution receptacle, a tube opion at its upper end. the tube being projected downward into th. receptacle. said lubr being capable of holding a meiallir rod and having below its upper end a number of openinge in is side at rifferent elevations, and means for withdrawing th. gas from the open upper end of the tube.
5. A gas generator having a solution receptacle. a inb. having an open upper end. the tube being projecied downward into the remeptacle and having a closed Inwer end. and a number of nofentiges in its side at different elevations. and mrans for carrying off the gas from the upper end of the tube.

No. 102,229. Concrete Construction.
Construction de béton.

Albert A. Pauly, Youngstown, Ohio, U.S.A., 27th November, 1906 ; 6 years. Filed 13th October, 1906. Receipt No 140,270.
Claim.-1. A composite wall composed of composite building blocks of channel bar form disposed in two parallel rows each row of blocks being two blocks high and cemented together, tie rods having their ends embedded in the cement between the blocks of each row and connecting the rows together, and a solid filling of concrete between the rows of composite blocks.

No. 102,230. Camera. Camera.

Willis E. Phillips, Collbran, Colorado, U.S.A., 27th November 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,018
Claim.-1. A camara attachment comprising a frame pro vided at one end with an exposure opening and having its other end formed for connection with the lens tube of a camera, front and rear prisms mounted within the frame, and means to tiltably adjust the prisms.
2. A camera attachment comprising a tube which is provided at its front end with an exposure opening and has its rear end provided with a coupling to embrace the lens tube of a camera, front and rear prisms within the frame, and means to adjustably tilt the prisms.
3. A camera attachment comprising a tube which is provided at its front end with an exposure opening and has its rear end reduced and open to form a coupling for embracing the lens tube of a camera, front and rear prisms within the tube, and means for tiltably adjusting the prisms.
4. A camera attachment comprising a frame provided at one end with an exposure opening and at its opposite end with means for engagement with a lens tube, front and rear prisms pivotally supported within the frame, and means to tiltably adjust the prisms upon their pivotal supports.
5. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a canera front and rear prisms pivoted within the tube and means carried by one side of the tube for adjustably turning the prisms upon their pivots.
6. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera front and rear prisms pivoted within the tube, and a threaded adjusting stem carried by the tube and associated with the prisms to pivotally adjust the same
7. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera front and rear prisms pivoted within the tube, crank arms carried by the pivots of the prisms, and an adjusting device carried by the tube and associated with the crank arms.
8. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera, front and rear prisms pivoted within the tube, crank arms carried by the pivots of the prisms, and a threaded adjust ing stem carried by the tube and provided at its inner end with a circular head, the crank arms being provided with seats receiving the head of the adjusting stem.
9. A camera attachment comprising a tube which is provided at its front end with an exposure opening and has its rear end formed for engagement with the lens tube of \(a\) camera, front and rear prisms within the tube and means to adjust the prisms, said tube being rotatable upon its longitudinal axis when associated with the lens tube.
10. The combination with the lens tube of a camera, of a light refracting device rotatably associated with the lens tube and including front and rear prisms.
11. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of \(\approx\) camera, front and rear prisms pivoted within the tube and having trunnions projecting upon the exterior of the tube, crank arms carried by the projected portions of the trunnions and provided with bifurcated free ends, and a threaded adjusting stem carried by the case and having a circular head working in the bifurcation of the crank arms.
12. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera, front and rear prisms pivoted within the tube, and means to simultaneously tilt the prisms to corresponding angular adjustments and to permit individual adjustments of the prisms.
13. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera, front and rear prisms pivoted within the tube, and means to simultaneously adjust the prisms to corresponding angles, each prism capable of being disconnected from the adjusting means to permit individual adjustment thereof.
14. A camera attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera, front and rear prisms pivoted within the tube, crank arms carried by the prisms, and adjusting means associated with the crank arms, each crank arm capable of being disassociated with the adjusting means to permit individual adjustment of the corresponding prism.
15. A camera attachment comprising a tube provided at is forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera front and reaf prisms pivoted within the tube, elastic crank arms for the prisms, and an adjusting element associated with the crank arms, each crank arm capable of being sprung out of engagement with the adjusting devices to permit individual adjustment of the corresponding prism, the tube being provided with friction surfaces against which the crank arms bear to hold the same agalnst looseness when disengaged from the adjusting devices.
16. A camara attachment comprising a tube provided at its forward end with an exposure opening and having its rear end formed for engagement with the lens tube of a camera, front and rear prisms pivoted within the tube, trunnions for the prisms piercing the tube, spring crank arms carried by the projected portions of the trunnions and having their free ends bifurcated, and a threaded adjusting stem mounted upon the tube and provided with a circular head recelved within the bifurcations of the crank arms, each crank arm capable of being sprung out of engagement with the head to permit individual adjustment of the cor
responding prism, the tube being provided with flat extraal bosses beneath the crank arms and the crank arms having bowed portions to erictionally bear upon the bosses for holding the crank arms against looseness when disengag'd from the adjusting stem.

No. 102,231. Horse Drench.
Apparcil d administrer des médecincs aux chevaux.

Ned Stanley Price, Erie, Pennsylvania, U.S.A., 27th November, 1906 ; 6 years. Filed 19 th July, 1906. Recelpt No. 137,985.
Claim.-1. In a drenching device the combination of a recoptacle, a part \(b\) extending laterally from the receptacle and a rearwardly extending part \(b^{1}\), said parts forming a nozzle unobstructed from the end of the part \(b^{1}\) to beyond the turn between the parts to permit of the nozzle being insertr! in the side of the mouth with the jaws closed, and turaed to bring the gart 1 through the side of the mouth, and the part \(b^{1}\) extending into or toward the throat. and a valve controlling the flow of liquid from the receptacle
2. In a drenching device the combination of a receptacle, a part \({ }^{\prime}\) extending laterally from the receptacle, and a rearwardly extending part \(b^{1}\), said parts forming a nozzle unobstructed from the end of the part \(b^{1}\) to beyond the turn between the parts to permit of the nozzle being inserted in the side of the mouth with the jaws closed, and turned to bring the part " through the side of the mouth. and the part brextending into or toward the throat, and a valve controlling the flow of liquid from sald valve through the top of the roceptacle, and means within the reach of the operator's hand rasping the receptacle for tripping the valve.
3. In a dreuching device the combination of the receptacle A, the lateral part \(b\), and the rearwardly extending part \(b^{\prime}\) forming the nozzle \(B\) unobstructed from the end of the part \(b^{1}\) to beyond the turn between the parts, the valve \(C\) controlling the connection between the receptacle and the nozzle. and the stem \(c\) extending from the valve through the top of the receptacle, a lever \(c^{2}\) extending from the stem over the side of the receptacle, a lug \(a^{3}\) forming the fulcrum for the lever \(c^{x}\), a chain \(c^{d}\) secured to the lever, and the thumb ring \(c^{*}\), secured to the chain.
4. In a drenching device the combination of a receptacte for the liquid, said receptacle being provided with a vrint, a nozzle extending from said receptacle, a valve controlling the flow of liquid from the receptacle to the nozole, meqne for closing the vent, and means for opening the rent and valve simultaneously.
5. In a drenching device the combination with a receptac!e. a. nozzle extending therefrom, and a funnel top arranged or sald receptacle having an opening through which material may pass from the top into the receptacle, said opening also forming a vent for the receptacle, means for closing sa: rent and means for opening said vent.
6. In a drenching device the combination with a receptac'r, a nozzle extending therefrom, and a funnel top arranged or said receptacle, having an opening through which matorial may pass from the top into the receptacle, said opening also forming a vent, a valve controlling the flow of liquid from the recoptacle to the nozzle, and means for simultaneously opening the va!ve and the vent.
7. In a drenching device the combination of a receptacle for the liquid a nozzin extending therefrom, a funnel-shapetop \(a^{1}\) on the receptacle, having an opening therefrom for the passage of the material, a cover at for sald opening, a hinge for securing sad cover to the top, a spring \(a^{1}\) for holding said rever in rlised position.
8. In a drenching device the combination of the receptacle A having the passage \(a\) through the bottom thereof, the la-
teral part \(b\) and rearwardly extending part \(b^{\prime}\) forming a nozzle \(B\) unobstructed from the end of the part \(b^{1}\) to beyond the turn between the parts, the valve \(C\) controlling the opening. a stem extending from the valve through the top. the fun-nel-shaped top \(a^{1}\) having an opening for the introduction of the material, said opening also forming a vent, a cover \(a^{4}\) for said opening, and means on the stem ofor opening said cover.
9. In a drenching device the combination of a receptacle. 1 part b extending laterally from the receptacle, and a rearwardly extending part \(b^{1}\), sald part forming a nozzle unobstructed from the end of the part \(b^{1}\) to beyond the turn between the parts to-permit of the nozzle belng inserted in the side of the mouth with the jaws closed, and turned to bring the part \(b\) through the side of the mouth, and the part \(b^{-}\) extending into or toward the throat, and a valve controlling the flow of liquid from the receptacle, the float \(D\) having the graduated stem \(d\) extending upwardly therefrom through the top of the receptacle.

No. 102,232. Storm Window. Contrevent.

Davidson Todd, Toronto, Ontario, Canada, 27th November, 1906 ; 6 years. Filed 9th July. 1906. Receipt No. 137. 630」
Claim.-1. In storm sashes for windows the combination with the ordinary lower sash. of a storm sash provided with top and bottom and side weather strips, and means for securing it in fixed relation to the ordinary sash, as and for the purpose specifled.
2. In storm sashes for windows. the combination with the ordinary lower sash, of a storm sash provided with top and bottom and side weather strips, a top plate bridging the tops of the ordinary bottom sash and storm sash and secured to the same, as and for the purpose syecified.
3. In storm sashes for windows the combination with the ordinary lower sash, of a storm sash provided with top and bottom and side weather strips, a top plate bridging the tops of the ordinary bottom sash and storm sash and secured to the same, and a pin extending through the bottom ralls of the storm and ordinary sashes, as and for the purpose specified
4. In storm sashes for windows, the combination with the upper sash, of a detachable storm sash located to the Inside of the lower sash, and detachable means for connecting it to the upper sash, whereby thek may be more in unison, as and for the purpose specified.
5. In storm sashes for windows, the combination with the upper sash, of a detachable storm sash located to the inside of the lower sash, and hooks screwed into the ordinary upper sash, and eyes extending through the storm sash through which the hooks extend, and detachable means for connecting the bottom of the storm sash to the bottom of the ordinary lower sash, as and tor the purpose specifled
6. In storm sashes for windows, the combination with the upper sash, of a detachable storm sash located to the inside of the lower sash, and hooks secured into the ordinary upper sash and eyes extending through the storm saeh through which the hooks extend, the lower storm sash s.i. cured to the lower ordinary sash and provided with suitable weather strips, and the L-shaped bars held in sultable
brackets and extending into slots in the upper storm sash and lower storm sash, as and for the purpose specifled.
7. In storm sashes for windows, the combination with the ordinary upper and lower sashes, of the upper and lower storm sashes, the lower one being securely affixed to the ordinary lower sash and the upper one being detachably connected at the top to the upper sash, so that it will swing on the connection, and L-shaped bars extending into slots in the upper and lower sashes, the lower slot in the lower storm sash being under-cut and provided with , a lateral enlargement at the top, as and for the purpose specifled.

No. 102,233. Thread Washing and Drying Method. Méthode à laver et sécher le fll.

Fig. 1.

Fig. 2.

Ernst Willy Frederick, Blaton, Hainaut, Belgium, 27th Novvember, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,934 .
Claim.-A method of washing an drying artificial threads on spools which consists in slowly rotating the spool on a substantially horizontal axis while it is only partly immersed in the washing liquid and again while the thread is drying on it, substantially as and for the purpose set forth.

No. 102,234. Scafiold. Echafaud.

Henry R. Laird, Millersburg, Kentucky, U.S.A., 27th November, 1906; 6 years. Filed 19th October, 1906. Receipt No. 140,430.
Olaim.-1. In a combined scaffold and step ladder, frames movably connected at one end, a platform swinging inter-11-22
mediate its length from one of said frames, means for adjustably connecting one portion of said platform to the other frame, rails swinging from the other portion of sald platform, spaced bars coupling said rails to the adjacent frame, and ladder steps connected to said bars.
2. In a combined scaffold and step ladder frames movably connected, a platform swinging intermediate its length from one of said frames and provided with spaced stops, stop pins carried by the ohter frame for engaging said spaced stops, rails swinging from the other portion of the platform, spaced bars coupling said rails to the adjacent frame and ladder steps connecting the bars.
3. In a combined scaffold and step ladder, frames movably connected, a platform swinging intermediate its length from one of said frames, means for adjustably connecting one portion of said platform to the other frame, a brace swinging from one of said frames, and means for adjustably connecting said brace to the other frame.
4. In a combined scaffold and step ladder, frames movably connected, a platform swinging intermediate its length from one of said trames means for adjustably connecting one portion of said platform to the other frame, rails swinging irom the other portion of said platform, spaced bars coupling sald ralls to the adjacent frame, ladder steps connecting sald bars, a brace swinging from one of said frames, and means for adjustably and detachably coupling said brace to the other frame.

No. 102,235. Method of Extracting Eydrated Oxides from Ores.
Méthode d'extraire de l'oxyde hydraté des minerais.

Denis Lance, Paris, France, 27th November, 1906; 6 years. Filed 15th August, 1905. Receipt No 127,703.
Claim.-1. The herein described process of extracting and concentrating metals from ores with conjointly re-acting nitro sulphuric acid, decomposable metallic chlorides, nitrochlorides, oxides or nitrogen fumes, oxide of sulphur fumes and water vapours, in effecting hydration of the herefrom resulting salts of the metals contained in said ores, in separating said hydrated material and saturating with calcareous reagents, in separating the metalliferous calcareous precipitate and lixiviating with ammonia solutions, in removing the calcareous precipitate. in distilling the lixiviation fluid, and in separating the precipitated metallic oxides.
2. The herein described process of extracting metals from ores consisting and concentrating in treating ores with nitro-sulphuric acid and decomposable metallic chlorides, in causing nitro-sulphuric acid to re-act upon descomposable metallic chlorides to form nitro-chlorides, in causing the said chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore.
3. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric
acid to re-act upon the said metal chlorides to form the sulphate of the metal contained in said ore, in heating to 110 to 120 degrees centrigrade to effect distillation of the aforementioned nitro-chlorides and in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid.
4. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed reaction chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitrochlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating it to 100 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides. in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitro-stalphuric acid, decomposable metallic chlorides. nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride of the said metal, in causing the cyclic formation of nitro-sulphuric acid, nitro-chlorides and the metal chloride, and in causing the formation of permanent sulphate of the metal contained in the said ore.
5. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore. in heating to 110 to 120 degrees rentigrade to effect distillation of the aforementloned nitro-chlorides. in injecting oxide of sulphur fumes and water vapours to form new quantitins of sulphuric acid, in causing a continuous ronjoint re-action between nitro-sulphuric acid. decomposable metallic chlorides, nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chlorlde of said metal. in causing the ryclic formation of nitro-sulphuric acid, nitro-chlorides and the metal chloride. ifr causing the formation of permanent subhate of the metal contained in the said ore, in partially hydrating at 40 to 50 degrees Beaume density and in completing the hydration with a metallic bisulphate.
6. The herein described process of extraction and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers. in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore. in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous re-action between nitro-sulphuric acid, decomposable metallic chlorides, nitrochlorides, oxides of nitrogen fumes, oxide of sulphur fumes. water vapours, the metal contained in the ore and the chloride of the said metal. in causing the cvelic formation of nitro-sulphuric acid. nitro-chlorides and the metal chloride. in causing the formation of permanent sulphate of the metal contained in the said orc. in partially hydrating at 40 to 50 degrees Beaume density and in completing the hydration with sodium bi-sulphate solution.
7. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to react upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitrosulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid. in causing a continucus conjolnt re-action between nitro-sulphuric acid, dccomposable metallic chlorides, nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride of the said metal. in causing the cyclic formation of nitro-sulphuric acid. nitro-chlorides and the metal chloride, in causing the formation of permanent
sulphate of the metal contained in the said ore, in partially hydrating at 40 to 50 degrees Beaume density, in completing the hydration with a metallic bl-sulphate, in removing the non-metalliferous residuum from the hydrated re-action mixture and in saturating the remaining liquid with calcareous re-agents.
\(S\). The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to react upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid, to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitro-sulphuric acid, decomposable metallic chlorides, nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes. water vapours, the metal contained in the ore and the chloride of the said metal, in causing the cyclic formation of nitro-sulphuric acid nitro-chlorides and the metal chloride, in causing the formation of permanent sulphate of the metal contained in the said ore, in partially hydrating at 40 to 50 degrees Beaume density, in completing the hydration with a metallic bi-sulphate in removing the nonmetalliferous residuum from the hydrated re-action mixture and in saturating the remaining liquid with calcium carbonate and lime.
9. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitrosulphuric acid to re-act upon decomposable metalic chlorides to form nitrochlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating to 110 to 120 dugrees centigrade to effect distillation of the afore-mentioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitrosulphuric acid, decomposable metallic chlorides, nitro-chlorides oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride of the said metal, in causing the cyclic formation of nitrosulphuric acid, nitro-chlorides and the metal chloride, in causing the formation of permanent sulphate of the metal contained in said ore, in partially hydrating at 40 to 50 degrees Beaume density, in completing the hydration with a metallic bi-sulphate, in removing the non-metalliferous residuum from the hyhrated re-action mixture, in saturating the remaining liquid with calcareous re-agents, in separating the metalliferous calcic precipitate and in lixiviating the same with ammoniac solutions.
10. The herein described process of extracting and concenirating metals from the ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in slosed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitrochlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating to 110 to 12C degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitro-sulphuric acid, decomposable metallic chlorides. nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride of the said metal, in causing the cyclic formation of nitro-sulphuric acid, nitro-chlorides and the metal chloride in causing the formation of a permanent sulphate of the metal contained in the said ore, in partially hydrating at 40 to 50 degrees Beaume density, in completing the hydration with a metallic bi-sulphate, in removing the non-metalliferous residuum from the hydrated re-action mixture, in saturating the remaining liquid with calcareous re-agents, in separating the metalliferous calcis precipitate and in lixiviating the same with ammonia solution.
11. The hercin described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in clo:ed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride
of such metal, in causing the previously added nitro-sul phuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides. in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitro-sulphuric acid, decomposable metallic chlorides, nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride of the said metal, in causing the cyclic formation of nitro- sulphuric acid, nitro-chlorides and the metal chloride, in causing the formation of permanent sulphate of the metal contained in the said ore, in partially hydrating at 40 to 50 degrees Beaume density. in completing the hydration with a metallic bisulphate, in removing the non-metalliferous residuum from the hydrated re-action mixture, in saturating the remaining liquid with calcareous re-agents. in sedarating the metalliferous calcic, precipitate, in lixiviating the same with ammonia solutions, in removing the calnareous sediment and in distilling the lixiviation fluids intil freed from hydrogen nitride.
12. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitro-sulphuric acid, decomposable metallic chlorides, nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride' of said metal, in causing the cyclic formation of nitro-sulphuric acid, nitro-chlorides and the metal chloride, in causing the formation of permanent sulphate of the metal contained in the said ore, in partially hydrating at 40 to 50 degrees Beaume density, in completing the hydration with a metallic bisulphate, in removing the non-metalliferous residuum from the hydrated re-action mixture, in saturating the remaining liquid with calcareous re-agents, in separating the metalliferous calcic precipitate. in lixiviating the same with ammonia solutions, in removing the calcareous sediment, in distilling the lixiviation fluid until freed from the ammonia, and in seyarating the inydrated metallic oxide precipitated thereby.
13. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitro-chlorides, in causing the said nitro-chlorides to re-act upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore. in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitro-sulphuric acid, decomposable metallic chlorides, nitro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes. water vapours, the metal contained in the ore and the chloride of the said metal, in causing the cyclic formation of nitro-sulphuric acid, nitro-chlorides and the metal chloride, in causing the formation of permanent sulphate of the metal contained in the said ore. in recovering the aforesaid nitro-chlorides by distillation and in using the same in subsequent decompositions of ores in place of new charges thereof.
14. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act upon decomposable metallic chlorides to form nitrochlorides, in causing the said nitro-chlorides to re-act upon the metal contained in sald ore to form the chlorides of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantitles of sulphuric acid, in causing a continuous conjoint re-action between nitro-sulphuric acid, decomposable metallic chlo-
rides, nitro-chlorides, oxides of nitrogen fumes oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride of the said metal, in causing the cyclic formation of nitro-sulphuric acid, nitro-chlorides and the metal chloride, in causing the formation of permanent sulphate of the metal contained in the said are, in partially hydrating at 40 to 50 degrees Beaume density, in completing the hydration with a metallic bi-sulphate, in re moving the non-metalliferous residuum from the hydrated re-action mixture, in saturating the remaining liquid with calcareous re-agents, in separating the metalliferous calcic precipitate, in lixiviating the same with ammonia solutlons, in removing the calcareous sediment, in recovering the residual ammonia from the said calcareous sediment and in using the recovered ammonia in subsequent lixiviations in place of new charges thereof.
15. The herein described process of extracting and concentrating metals from ores consisting in treating ores with nitro-sulphuric acid and decomposable metallic chlorides in closed re-action chambers, in causing nitro-sulphuric acid to re-act unon deconposable metallic chlorides to form nitrochlorides, in causing the said nitro-chlorides upon the metal contained in said ore to form the chloride of such metal, in causing the previously added nitro-sulphuric acid to re-act upon the said metal chloride to form the sulphate of the metal contained in said ore, in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitrochlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous conjoint re-action between nitro-sulphuric acid. decomposable metallic chlorides, nitro-chlorides, oxides of fitrogen fumes, oxide of sulphur fumes, water vapours, the metal contained in the ore and the chloride of the said metal centigrade to effect distillation of the aforementioned nitrochinrides and the metal chloride, in causing the form tion of permanent sulphate of the metal contained ir. the suid ure, in partially hydrating at 40 to 50 degrees Beaumo depsity, in completing the hydration with a metallic bisulphate, in removing the non-metalliferous residuum from the hydraled re-action mixture, in saturating the remaining liquid with calcareous re-agents, in separating the metalliferous calcic precipitate, in lixiviating the same with ammonia solutions, in removing the calcareous sediment, in distilling the lixiviation fluid until freed from ammonia, in recovering the said distilled ammonia and in using the same in subgequent lixiviation in place of new charges thereof
16. The herein described process of extracting and concentrating nickel from silicious nickel ore, consisting in treating said ore with nitro-sulphuric acid and sodium chloride inclosed re-action chambers, in causing nitro-sulphuric acid to re-act upon sodium chloride to form nitro-chlorides. in causing the said nitro-chlorides to re-act upon the nickel contained in said ore to form chloride of nickel, in causing the previously added nitro-sulphuric acid to re-act upon the said nickel chloride to form sulphate of the nickel contained in said ore, in heating to 110 to 120 degrees centigrade to effect distillation of the aforementioned nitro-chlorides, in injecting oxide of sulphur fumes and water vapours to form new quantities of sulphuric acid, in causing a continuous con joint re-action between nitro-sulphuric acid, sodium chloride ultro-chlorides, oxides of nitrogen fumes, oxide of sulphur fumes, water vapours, the nickel of said ore and the chloride of nickel, in causing the cyclic formation of nitro-sulphuric acid, nitro-chlorides and nickel chloride, in causing forma tion of permanent sulphate of the nickel contained in said cre, in partially hydrating at 40 to 50 degrees Beaume den sity, in completing the hydration with sodium bisulphate solution, in removing the non-metalliferous residuum of the silicious ore from the hydrated re-action mixture, in saturat ing the remaining liquid with calcium and lime, in separat ing the metalliferous calcic precipltate, in lixiviating the same with ammonia solutions, in removing the calcareous sediment, in distilling the lixiviating solution until freed from ammonia and in separating the hydrated nickel oxide preciptated thereby.

No. 102,236. Nut Lock. Arrête-écrous.
Harry Bostock and John Angell Peck, assignees of Henry James Swain, all in Sydney, New South Wales, Austra lia, 27th November, 1906; 6 years. Filed 2nd November 1906. Receint No. 140,817 .

Claim.-1. A nut lock consisting of a saucer-shaped washer having radial ribs upon its convex side and corresponding grooves upon its concave side, in combination with corresponding radial grooves in the under side of the nut, or of the head, such grooves being adapted to receive the radial ribs on the washer, as specified.
2. A lock nut consisting of a nut having radial grooves on its under side, a saucer-shaped washer having radial ribs upon its convex side, corresponding grooves upon its
concave side and a helical spring washer with a terminal tooth or \(\operatorname{cog}\) adapted to enter any one of the grooves in

the concave side of the saucer washer, as herein set forth.

No. 102,237. Potato Plough. Charrue d patates.

James M. Drake, and Frank Dengle, assignee of two-thiris of the interest, both of Shawano. Wisconsin, U.S.A.. 27th November, 1906: 6 years. Filed 2nd November, 1906. Recelpt No. 140,821 .
Claim.-1. A potato digger comprising a vertically swinging frame, bars carried by the frame, a shovel at the forward end of the frame, a beam arranged at one side of the frame, and substantially rectangular whecls arranged at the rear portion of the frame.
2. A potato digger comprising a frame, shaker bars extended lengthwise of the frame, a shovel with which the frame has swinging connections, a beam arranged at the side of the frame, agitating wheels mounted on the side members of the frame, the sald wheels being substantially rectangular in contour, and a curved plate secured on the frame at the opposite side to that of the beam.
3. A potato plough comprising a frame, a shovel with which sald irame has swinging connection, and rectangular agitating wheels mounted on the frame.

\section*{No. 102,238. Potato Digger. Arrache-patatcs.}

The Champion Potato Machinery Company, assigner of Otto Knoerzer, all of Hammond. Indiana, U.S.A., 27th November, 1906; 6 years. Filed 3rd November, 1906. Receipt No. 140,891.
Claim.-1. In a notato digger, side plates for the throat which taner downward toward the front, bow outward along their upper edges, and along their extreme top arr rolled outward in a curve to provide a smooth rounded surface or bead for the vines.
2. In a gotato digger, the combination with flat vertical side walls, of draught beams which form unbroken continuations of the side walls and bow outward from their lower edges and form the vortical side walls. side plates for the throat which taper down toward the front and bow
outward, the adjacent portions of the draught beams fol. lowing the same general bowed contour, a short shovel

connecting the front ends of the side plates, and an elevator running between the side plates to the shovel.
3. In a potato digger, the combination with side walls and reinforcing angle irons secured to the lower edges of the side walls and extending beyond the front edges thereof to form supports for the throat, of a palr of draught beams secured to the angle irons and to the side walls, the rear vertical edges of said draught beams being approximately parallel at their points of junction with the side walls, and being bowed outwardly along the lower portions of their front edges, side plates for the throat secured to the angle irons and draught beams, which side plates bow outward and taper downward toward their front edges, and a short shovel blade connecting the front ends of said side plates.
4. In a potato digger, the combination with the side walls, of side plates for the throat which taper downwardly toward the front and bow outward along their upper edgrs and have their extreme upper edges rolled outward to present smooth surfaces, draught beams having portions lying between the side walls and side plates, the planes of which portions merge into the curved planes of the side plates and into the vertical planes of the side walls anit have a comparativel \(\bar{y}\) wide and curved front edges which merge into the upper edges of the side plates, and a short shovel blade connecting the front ends of the side plates.

No. 102,239. Body Bolster. Coussin.

The Pressed Steel Car Company, Pittsburg, assignee of Charles August Lindstrom, Allegheny, both in Peansylvania, U.S.A., 27th November, 1906; 6 years. Filed ftb November, 1906. Receipt No. 140,962.
Claim.-1. A body bolster comprising a cast compressios 1:. hiter cast iu cellular form and formed wit:- interme.liat, supports for a tension member, and a horizontal tensios member having its end portions bent around and secured is the end portions of the compression member, substantially as described.
2. A body bolster comprising a cast compression member. cast in cellular form, with a plurallty of horizontal sup-
ports for a tension member, and having its lower surface inclined upwardly and outwardly from the center, and a horizontal tension member resting upon said supports and secured to the compression member at its ends, substantially as described
3. A body bolster arranged below the car sill, said bolster being cast in cellular form in cross section with a plurality of upwardly extending intermediate supports for a tension member, and having holes to receive draft sills, substantially as described.
4. A body bolster having a cast compression member of substantially U-shaped cross section provided with intermediate supports, and a wrought tension member secured to the compression member and resting upon sald supports. substantially as described.
5. A body bolster having a cast compression member of substantially U-shaped cross section provided with intermediate flanged supports. ard a wrought tension member secured to the compression member and resting upon said supports, substantially as described.

No. 102,240. Paving Mixture. Mćlange pour pavage.
The International Pavement Company. Hartford. Connecticut, assignee of Walter Scott Wilkinson, Wytheville. Virginia, U.S.A., 27th November, 1906: 6 years. Filed 24th October, 1906. Receipt No. 140,598 .
claim.-1. The improvement in the manufacture of bituminous pavement mixture which consists in rendering a flux oil non-absorbable through the action of a converting agent, preparing a bitiminous cement by mixing asphalt therewith, adding fines thereto and thoroughly surface coating the said fines with the non-absorbable flux oil cement and then addIng the resultant mixture to a quantity of dry mixed remaining body material.
2. The improvement in the manufacture of bituminous paving or pavement mixture or composition which consists in producing a fines-impregnated bituminous cement by subfecting flux oil to the action of a converting agent and thereby forming an elastic substance. mixing the resultant product with asphalt to form an asphaltic cement, and Impregnating the same with fines, dry mixing the remaining body material, and then, while the latter is in agitation, mixing therewith said fines-impregnated cement.
3. The improvement in the manufacture of bituminous paving or pavement mixture or composition which consists in forming a fines-impregnated bituminous cement containing a negligible quantity, if any, of oll, impregnating said cement with such of the fines as many be added thereto while still preserving the necessary liquidity of the cement, agitating the remaining body material and while the latter is in agitation mixing therewith said fines-impregnated cement.
4. That improvement in the manufacture of bituminous paving or pavement mixture or composition which consists in producing a fines-impregnated cement by converting the flux oll to an elastic substance, mixing the resultant product with asphalt, to form an asphaltic cement, and impregnating the same with fines, agitating the remaining body material, and, while in agitation. mixing therewith the finesimpregnated cement, subjecting the resultant mixture to heavy compression in a mould, and subjecting the compressed body to the action of a cooling agent to set it to preserve its shape.

\section*{No. 102,241. Basket Making Machine.}

Machine d faire des panicrs.
Androw Dev!ne, New York City, assignee of Emmet Horten, Elmira, both in New York, U.S.A., 27th November, 1906 ; 6 years. Filed 5th July, 1906. Receipt No. 137.559.
Claim.-1. In a basket making machine the combination with a revoluble form, of a die movable toward anc frow the form in line with the axis thereof, and also laterally relatively thereto in a straight path.
2. In a basket making machine the combination with a revolvable form, of a die movable toward and from the form vertically and also laterally relatively thereto in a stra!ght path and which is adapted at times to rotate with tres form.
3. In a basket making machine the combination with a re volvable form, of a reciprocating bar, a revolvable dis carried thercby, a rock shaft, connections between the ruck shaft and the die by which it is moved towa:cis end froct the form, and moans for reciprocating the carrier bar io move the die laterally towards and from the form.
4. In a basket making machine the combina!ion with a form, of a die cup having raised vertical corners for centering the blanks as the form enters the din, and mians \(t\) or raising and lowering the cup.
5. In a basket making machine the combination with a form, of a die cup having its corners raised and bevelled to a point for centering the blanks as the forin enters the die.
6. In a basket making machine the combination of a form, a die plate having means for centering the boily bleplis. and
a die movable towards and from the form and having iudependent means for centering the blank:.

7. In a basket making machine the combination with a form, of a die plate having centering posts, and a dic cup having raised projections at its corners for contering the blanks.
8. The combination of the die cup, the supporting arm to which it is pivoted, means for raising and lowering said supporting arm, a locking bolt carried by the arm sinc adapted to engage the die, a bevelled crossbar engaging the bolt when the die is ralsed end which causes the bolt to be withdrawn from the die and a bevelled block engaging tbe bolt when the die is lowered and which causes thn bolt to engage the die.
9. In a basket making the combination with a form, of a blank carrier, means for reciprocating it to an? from the form, and means for crossing blanks thereon whi!e it i : nooving away from the form.
10. In a basket making machine the combination with a form of a blank carrier, a rotatable die carried thereby, means for moving the hising carrier to and from the form, anil means for crossing blanks on the b:ank :anrier, wh:le it is noving away from the ?or.n.
11. In a basket making machine the corbiaition with a form, of two blank carriers one of which places a blank crosswise of the blank on the other carrier which delivers to the form, and which are operated to reciprocate in opposite directions, the one moving towards the form, while the other moves away from it, substantially as described.
12. In a basket making machine the combination with a form, of a blank carrier, means for moving it away from the form, another blank carrier which deposits a blank on the carrier first-mentioned while it is moving away from the form, means for supplying another blank to said first-mentioned carrier and means for moving said first-mentioned carrler with its two blanks towards the form
13. In a basket making machine the combination with a form, of a blank carrier, means for moving it from the form and means for crossing blanks thercon on its outward movement away from the form and before it commences its backward movement towards the form.
14. In a basket making machine the combination of a form pickers for rajsing the blanks, a die carrier, means for moving it towards and from the form, a blank carrier, means for moving it towards the form while the die carrier is moving away therefrom, devices for causing a blank to be deposited by said blank carrier on the die carrier, and devices for depositing another blank on sald carrier, substantially as described.
15. In a basket making machine the combination of a form, two boxes for holding body blanks having their longer axis arranged at right angles to each other, a carrier for conveying blanks from the boxes to the form, means for crossing the blanks by passing one blank under the other while it is suspended, and means for depositing the blanks crosswise on the carrier. substantially as set forth.
16. In a basket making machine the combination with a form, of a reciprocating blank carrier for carrying the body blanks of the hasket to the form, a gripping levice for conveying a bedy blank, and means for operating the gripping device to deposit a blank on the carrier whlle said carrier is moving away from the form.
17. In a basket making machine the combination with a form, of a carrier for conveying the body blanks, a rotatable die carrier thereby, a gripping device for conveying a boily blank and means for operating the gripping device to deposit a blank on the carrier during its movement away from the form.
18. In a basket making machine the combination of a car rier bar, a die carrier attached thereto, a gripping device engaging a body blank, gearing between this gripping device and the carricr bar for causing the gripping device to move in the contrary direction to that of the carrier bar and means for supplying blanks to the gripping device.
19. In a basket making machine, the combination of a carrier bar, a die carrier attached thereto, a gripping device consisting of upper and lower jaws. gearing connecting the carrier bar with the gripging device, and means for operating the lower jaw to cause it to engage a blank and to withdraw therefrom, substantlally as described.
20. In a basket making machine, the combination of a picker for raising a body blank out of its receptacle, a device pollowed un under the blank when it is raised by the nleker to conflne it for transportation, and means for operating said device.
21. In a basket making machinc. the combination with muans for separating a blank from the top of a pile of blanks. of a nlate adanted to follow under the separated blank as it denarts from the pile, and means for operating said :late.
\(2 \because\). In a basket making machine, the combination with \(a\) iick+r for sevarating and lifting blanks from a pile of blanks. gripner jaws for engaging the blank ralsed by the nicker, and tripoing devices operated by the picker for causing the gripping jaws to close on a separated blank and take it from the nicker.
23. In a basket making machine, the combination of a box for containing body blanks, plates pivotally connected thrrewith at its unper end, levers for operating said plates. a nicker for raising blanks above the plates and which operates the levers to turn the glates under the raised blank, and means for removing the raised blank from between the glates and the picker.
24. In a basket making machine, a picker comprising a pivoted needle holding levers, a spring connecting the levers and means for moving the levers to cause the connertions between the ends of the spring and sald levers to gass beyond the pivotal centers of the levers whereby hir suring acts to cause pressure to be exerted on the blanks before the needles can enter and to draw the needles inwardly into engagement with the blanks, substanlially as described.
25. The combination of the needle carrying levers, the pressure block with which they are pivotally connected, the links connected with the needle carrying levers, a spring connecting the pivotal connections of sald links with the needle carrying levers, and means for operating the parts whereby as the needle carrying levers are wung on their pivots the spring is caused to elther draw the needles inwards towards each other or tends to draw them in an opposite direction, substantially as described.
26. In a basket making machine, the comblnation of a vertically moving pieker bar, a presser head carried thereby, links and levers pivotally connected with the picker bar and with the presser head, a vertically sliding rod carried by the presser head, needles carried by the levers. a pivoted lever adapted to engage said vertically sliding rod, and means for operating said lever to cause sald rod to slide.
27. In a band separating device for a basket making machine, a rock shaft having fixed blades swinging alternately under a nile of bands, one blade serving to separate from the pile the lowermost band and the other blade pushing the separated band from under the plle.
28. Band senarating devices for basket making machines, in which two blades move back and forth in opposite dircetions to seyarate and deliver the bottom band from a pile of bands, one of said blades moving outwardly while the other moves inwardly and one blade having the band below the path of the other blade
29. Blank senarating devices for basket making machines. comprising \(a\) senarating blade and a picker which enkages the side of a blank and moves it beyond the path of the senarating blade
30. Band fecding devices for baskret making machin.. omprising a picker which engages the under side iv: t e lowermost band in a nile of bands. a blade which enters lontween the senarated band and the others and means for dellvering the senarated band from beneath the pile.
31. In a basket making marhine the combination of a pieker engaging the under side of a band in a pile of binds and segarating said band from the pile, a separator which enters between the pile of the bands and the band ernarated by the nicker and an ejector which delivers srparated
the separated band from beneath the pilfe
32. Band separating devices for basket making machises comprising a separating blade adapted to enter between the blanks in a pile and a picker arranged to engaze a blank move it in the plane of the plie and separate it from the plle previous to the entrance of the separating blade.
33. Blank separating devices for basket making machine comprising a separating blade, a picker which engages a blank and moves it in the plane of the plle away from the pile, and means for actuating the separating blade to cause it to enter between the separated blank and the plle and to further move said separated blank away from the pile.
34. Blank separating devices for basket making machines comprising two reciprocating blades, one of which moves outward!y while the other moves inwardy and one of which blades causes the blank to move beyond the path of the other blade, substantially as described.
35. The combination of a revolvable form, of a band holding arm normally held away from the form and out of en gagement with the band being wrapped, and means for actuating sald arm to move it towards the form and hold the outer end of the band close to the form at the time the last end of the band is being nalled
36. In a basket making machine the combination of a revolvable form, band holding arms normally held away from he form and out of engagement with the band being wrapped and movable simultaneousiy towards opposite sides of the form and which engage the last ends of the bands and hold them close to the form at the time the ends of the bands are being nailed.
37. In a basket making machine the combination with a revolvable form, of devices for supporting the bands as they are being wrapped around the form and a supplomental band wrapping arm normally held away from the form and out of engagement with the band being wrapped which takes hold of and guides the band after it leaves the sald band supporting device, substantially as described.
38. In a basket making machine the combination with a form mounted to revolve about a vertical axis, band wranping arms projecting to each side of the form and movable towards and from each other and towards the form, and means for operating the arms to hold the bands on the form while being nailed.
39. In a basket making machine the combination with a form having band holding hooks on opposite sides, of pinfors connected with the hooks.. a bevelled gear meshing with the pintons, a reciprocating plunger engaging the bevelled gear a lever for moving the plunger, and means for operating the lever.
40. In a basket making machine the combination of the pickers, the vertically reclprocating picker rod, the levir with which it is connected and which is formed with a long1tudinal slot. a roller traversing said slot. a wheel on which it is eccentrically pivoted, a differential pinion connected with said wheel and a segmental gear for operating sal.i pinion whercby the picker bar is moved rapidly downward and more slowly upward.
41. In a basket forming machine adapted to construct ino baskets during each revolution of the main shaft, the conubination of a rotatable form, a gear driven pinion connecter therewith having a shoe formed with four fiat faces and four intermediate teeth and a gear provided with teeth engaging the pinion and imparting to the form two half and four quarter revolutions during the construction of two baskets.

\section*{No. 102,242. Bibben Shifting Machime.}

\section*{Machine à changer le ruban de pooition.}

The Dey Time Register Company, assignee of John Dey and Alexander Dey, all of Syracuee, New York, U.S.A.. Sith November, 1906; 6 years. Filed 10th Juiy, 1906. Re. ceipt No. 126,724 .
Claim.-1. In combination a platen, printing mechanism. a ribbon interposed between sald platen and said printing mechanism, and time controlled means for shifting said ribbon laterally with respect to its direction of travel
2. In combination a platen, printing mechanism, a multicoloured ribbon interposed between said platen and sati printing mechanism, and time controlled means for shifi. ing said ribbon laterally with respect to its direction or travel in such manner as to change the colour of the postlon of the ribbon in operative relation to said printing mechanism.
3. In combination a type bearing member, a printing ric bon, and time controlled means adapted to control mechad ism for shifting sald ribbon laterally with respect to said type bearing member.

In combination a type bearing member, a multi-coloured printing ribbon, and time controlled means adapted to control mechanism for shifting said ribbon laterally so as ic change the colour of the portion thereof opposite said type beraring mrmber
6. In combination a type bearing member, ribbon spools. a slidably mounted ribbon har to which aald spools are rotat.
ably secured, a printing ribbon upon said spools opposite said type bearing member, and automatic means adapted to

control mechanism for sliding said ribbon bar and changing the portion of said printing ribbon opposite said type bearing member.
6. In combination a type bearing member, a printing ribbon opposite thereto, spools upon which sald printing ribbon is mounted, a slidably mounted bar having parts secured thereto upon which said spools are mounted, a lever connected with said ribbon bar, automatically actuated means for setting said lever, and means adapted to throw said lever to one extreme of its path of travel and shift said printing ribbon laterally with respect to said type bearing member.
7. In combination, a type bearing member, a multicoloured printing ribbon in operative relation thereto, spools upon which said printing ribbon is mounted, a slidably mounted ribbon bar having parts secured thereto upon which said spools are mounted, a lever having a connection with said ribbon bar, automatically controlled means for setting said lever in operative condition, and means adapted to throw sald lever to one extreme of its path of travel and shift said ribbon laterally with relation to said type bearing member so as to bring a portion thereof of different colour into operative relation thereto.
8. In apparatus of the class described, in combination printing mechanism comprising a minute type wheel and mechanism for operating the same, a printing ribbon in operative relation to said type wheel, and means automatically controlled by sald minute wheel and adapted to shift laterally said printing ribbon with respect thereto.
9. In apparatus of the class described, in combination. printing mechanism comprising a minute type wheel and mtchanism for operating the same, a multi-coloured printing ribbon in operative relation to sald type wheel, and means automatically controlled by said wheel adapted to shift laterally said printing ribbon with relation thereto so as to bring a portion thereof of different colour into operative position.
10. In apparatus of the class described, in combination printing mechanism comprising a minute type wheel and mechanism for operating the same, a slidably mounted multi-coloured printing ribbon in operative relation to sald type wheel, asd means automatically controlled by parts fixed upon said wheel adapted to shift laterally said printing ribbon and bring a portion thereof of different colour into operative position.
11. In apparatus of the class described, in combination, printing mechanism comprising a minute type wheel and mechanism for operating the same, a slidably mounted multi-coloured printing ribbon in operative relation to said wheel, a lever connected with the part upon which said ribbon is mounted, a pivotally mounted member connected with said lever, parts flxed upon said minute wheel adapted to engagt and swing pivotally mounted member and throw the same to one extreme of its path of travel and shift said ribbon laterally so as to bring a portion thereof of different colour into operative relation to sald minute wheel.
12. In an apparatus of the class described, in combination, printing mechanism comprising a minute type wheel and mechanism for operating the same, a slldably mounted multi-coloured printing ribbon in operative relation to said type wheel, a ribbon bar affixed to the mounting of said ribbon, a pivotally mounted lever connected with said ribbon bar, a pivotally mounted member having a connection with said lever, parts fixed upon said minute wheel adapted to engage and swing said pivotally mounted member and throw said lever into operative condition, means adapted to engage said lever when in operative condition and throw the same to one extreme of its path of travel and slide said ribbon laterally with respect to sald minute type whecl in such manner as to bring a portion thereof of different colour into operative position, and means automatically controlling the engagement of said parts upon said minute wheel with said pivotally mounted member.
13. In an apparatus of the class described, in combination. printing mechanism comprising a minute type wheel and mechanism for operating the same, a slidably mounted multi-coloured printing ribbon in operative relation to said type wheel, a ribbon bar affixed to the mounting of said ribbon, a pivotally mounted lever connected with said ribbon bar, a pivotally mounted member having a connection with said lever, parts fixed upon said minute wheel adapted to engage and swing said pivotally mounted member and throw said lever into operative condition, means adapted to engage said lever when in operative condition and throw the same to one extreme of its path of travel and slide said ribbon laterally with respect to said minute type wheel in such manner as to bring a portion thereof of different colour into operative position, a disc driven by said minute wheel operating mechanism having a recessed outer surface, a member adapted to rest against said outer surface, and a connection between said last-mentioned member and said pivotally mounted member whereby the engagement of said parts upon said minute wheel with said pivotally mounted member is determined by the contour of said disc.
14. In combination a type bearing member, a platen, manually actuated means adapted to bring said type bearing member and said platen into operative condition with relation one to another, a printing ribbon between said type bearing member and said platen, ribbon shifting mechanism, a connection between said ribbon shifting mechanism and said manually actuated means whereby the latter is adapted to shift laterally said printing ribbon, and time controlled means controlling said connection.
15. In combination a type bearing member, a platen, manually actuated means adapted to bring said type bearing member and said platen into operative relation one to another, a multi-coloured slidably mounted printing ribbon between sald type bearing member and said platen, shifting mechanism adapted to shift laterally said slidably mounted printing ribbon with respect to sald type bearing member, and a connection between said shifting mechanism and said manually actuated means whereby the latter is adapted to operate said shifting mechanism and bring a portion of ribbon of different colour into operative position.
16. In combination a type bearing member, a platen, manually actuated means adapted to bring said type bearing member and said platen into operative condition with relation one to another, a multi-coloured slidably mounted printing ribbon between said platen and said printing mechanism, shifting mechanism adapted upon operation to slide said ribbon laterally with respect to said type bearing member and bring a portion thereof of different colour into operative position, and means whereby said manually actuated means is adapted to operate said shifting means upon the latter being set in operative condition.
17. In combination a type bearing member, a platen, manu ally actuated means adapted to bring said type bearing member and said platen into operative position with relation one to another, a multi-coloured slidably mounted printing ribbon between said platen and said type bearing member, shifting mechanism adapted to slide said printing ribbon laterally with relation to said type bearing momber and bring a portion thereof of different colour into operative position, means automatically controlled by said type bearing member adapted to set said shifting mechanism in operative condition, and means whereby said manually actuated means is adapted to operate said shifting mechanism upon the same being set in operative condition.
18. In combination a type bearing member, a printing ribbon on operative relation thereto, manually actuated means adapted to cause said type bearing member to make an impression for shifting said printing ribbon laterally with respect to said type bearing member, automatic means for setting said shifting means in operative condition, and means whereby said manually actuated means is adapted to oper ate said shifting mechanism upon the same being set in operative condition.
19. In combination printing mechanism, a printing ribbon, means adapted to shift said printing rlbbon with respect to said printing mechanism, automatic means for controlling said shifting means, and means adapted to lock said controlling means in each of its extreme positions.
20. In combination printing mechanism, a multi-coloured printing ribbon, means adapted to shift said printing ribbon laterally with respect to said printing mechanism so as to bring a portion thereof of different colour into operative position, automatic means for controlling said shifting mechatilism, and means adapted to lock said controlling means in \({ }^{\prime} \cdot \mathrm{n}\) of its extreme positions.
21. In combination a type bearing member, a printigg ribbon in operative relation thereto, means adapted to shift laterally said printing ribbon with relation to said type bearing member, means actuated by parts upon sald type bearing member controlling said shifting mechanism, and means adapted to lock said controlling means in each of its extreme positions.
\(\because 2\). In combination a type bearing member, a printing ribbon in operative relation thereto. means adapted to shift laterally said printing ribbon with relation to sald typc bearing member, means actuated by parts upon said type bearing members controlling said shifting mechanism, and means adapted to lock said controlling means in each of its extreme positions and to lock the same against movement in one direction when in an intermediate position.
23. In combination printing mechanism, a multi-coloured slidably mounted printing ribbon in operative relation to said printing mechanism, a lever adapted to shift the same laterally with respect to said printing mechanism, a pivotally mounted member connected with said lever and adapted to set the same in operative condition, automatic means for controlling the movement of said pivotally mounted member: and means adapted to lock the same in each of its extreme positions against movement in either direction and in an intermediate position against movement in one direction.
24. In combination printing mechanism, a multi-coloured slidably mounted printing ribbon in operative relation thereto, a lever adapted to shift said printing ribbon laterally with respect to sald printing mechanism so as to bring a portion thereof different colour into operative position, a pivotally mounted member connected with said lever and adapted toi set the same in operative condition, automatic means adapted to actuate said pivotally mounted member, a plurality of locking levers adapted to control the position thereof, one of said levers being proviled with teeth adapted to prevent the movement of said pivotally mounted member in one direction and the other of said levers being provided with oppositely directed teeth adapted to lock said pivotally mounted member against movement in the opposite direction, and means for releasing said levers.
25. In combination printing mechanism, a multi-coloured slidably mounted printing ribbon in operative relation thereto, a lever adapted to shift said printing ribbon laterally with respect to said printing mechanism so as to bring a portion thereof of different colour into operative position, a pivotally mounted member connected with said lever and adapted to set the same in operative condition, automatic means adapted to actuate said pivotally mounted member, a plurality of locking levers adapted to control the position thereof, one of say levers being provided with tecth adapted to prevent the movement of said pivotally mounted member in one direction and the other of said levers being provided With oppositely directed terth adapied to lock said pivotally mounted member against movement in the opposite direction, and means for releasing said levers, said automatic means comprising parts upon said printing mechanism adapted to engage and swing said pivotally mounted member.
26. In combination a type bearing member, a multi-coloured printing rlbbon, mechanism adapted to shift said printing ribbon laterally with respect to said type bearing member so as to bring a portion thereof of different colour into operative position, automatic means adapted to control sald shifting means, and a visual indicator connected with said shifting mechanism and adapted to change from one to another of two alternative positions when said ribbon is shitted.
27. In combination a type bearing member, a multi-coloured printing ribbon, means adapted to shift said printing ribhon laterally with respect to sald type bearing member so as to bring a portion thereof of different colour into operative condition, and a visual indicator connected with said shifting mechanism adapted to move from one to another of two alternative positions when sald ribbon is shfted and display a surfaccof colour substanilally identical with that of the portion of the printing ribbon which is in operative position.
29. In combination a type bearing minute wheel, a platen. means adapted to bring said wheel and said platen into operative relation one to another, a multi-colourcd slidably mounted printing ribbon between said platen and said type bearing minute wheel, a lever connected with a part upon which sald ribbon is mounted and adapted to shift the same
laterally with respect to sald type bearing minute wheel so as to bring a portion thereof of different colour into opera live position, a pivotally mounted member connected with said lever, parts upon said minute wheel adapted to engas. and swing said pivotally mounted member and set the samin operative condition, and a part upon said manually actuated means adavted to strike and actuate said lever and shift said ribbon upon said lever being set in operative condition.
29. In apparatus of the class described in combination. printing mechanism comprising a minute type wheel and mechanism for operating the same, a slidably mounted multicoloured printing ribbon in operative relation to sald type wheel, means automatically controlled by sald minute wheel adapted to shift laterally said printing ribbon and bring a portion thereof of different color into operative position. and means adapted to lock said controlling mechanism in each of its two alternative positions.
30. In apparatus of the class described in combination. printing mechanism for operating the same, a slidably mounted multi-coloured printing ribbon in operative rela tion to said type wheel, means automatically controlled by said minute wheel adapted to shift laterally said printing ribbon and bring a portion thereof of different colour into operative position, and positive means adapted to lock said controlling mechanism in each of its two alternative positions and to lock the same against movement in one direction when in an intermediate position.
31. In combination a type bearing member, a platen, manu ally actuated means adapted to bring said type bearing member and said platen into operative relation one to another. a slidably mounted multi-coloured printing ribbon between said platen and said type bearing member, means adapted to shift said printing ribbon with relation to sald type bearifg member in surh manner as to bring a portion thereof of differcnt colour into operative position, automatic means adapted to set said shifting means in operative condition means adapted to lock said automatic means in its two ex treme positions, and a connection whereby said manually actuated means is adapted to cause the operation of said shifting means when the latter is in operative condition.
32. In apparatus of the class described, in combination, printing mechanism comprising a minute wheel and mechanism for operating the same, manually actuated means adapted to cause the operation of said printing mechanics. a multi-coloured slidably mounted ribbon in operative relation to said printing mechanism, means adapted lateraly to shift. said ribbon and bring a portion thereot of different colour into operative position, automatic means adapted to set said shifting mechanism in operative condition, means adapted to lock said setting means in each of its two exreme positions, and a member upon said manually actuated means adapted to engage and operate sald shifting mechanism upon the latter being set in operative condition.
33. A time recorder including, in combination, time controlled marking means, means for producing records therefrom, and automatic means whereby records of different classes are made by marks having distinguishing characteristics.
34. A time recorder including, in combination. time controlled marking devices, means for producing recards therefrom, and time controlled means whereby records of regular and irregular character are made by marks having distinguishing characteristics.
35. A time recorder including, in combination, time controlled marking means, means for producing records therefrom, and automatic means whereby records of regular and irregular character are made by marks having distinguishing characteristics.
36. A time recorder, in combination, a type bearing mem lirr, a multi-coloured printing ribbon in operative relation thereto, means adapted to shift said ribbon to bring a portion thereof of difierent colour into operative position with respect to said type bearing member, and a power actuated disc adapted automatically to control said ribbon shifting mechanism.
37. In a time recorder, in combination, a type bearing member, a multi-coloured printing ribbon in operative relation thercto, means adapted laterally to shift satd printing ribbon to bring a portion thereof of different colour into onerative position with respect to said type benring member, and a power actuated disc hâving Irregularitics in the outer surface thereof adapted to control sala ribbon shifting mechanism in accordance with the form and position of said irregularities.
38. In a time recorder, a type bearing member. a multscoloured printing ribbon in operative relation thereto means adapted laterally to shift said printing ribbon to bring a portion thereof of different colour into operaltie position with respect to said tyDe bearing member, a dise having Irregularities in the outer surface thercof. and a wiper arm resting upon said disc adapted to concrol
said ribbon shifting mechanism in accordance with the position and form of said irregularities.
39. In a time recorder. in combination. a type bear:ing minute wheel, a power transmitting member adapted rin drive the same, a multi-coloured printing ribbon in operative relation to said wheel, a lever adapted to shift said printing ribbon laterally to bring a portion of said printing ribbon of different colour in operative relation to said wheel, a disc driven from said power transmitting member and having irregularities in its surface, and a wiper arm resting upon said disc and adapted to control the position of said lever in accordance with the form and position of said irregularities upon said disc.
40. In combination, a platen, printing mechanism,a vertical multi-coloured printing ribbon interposed between said platen and said printing mechanism, and automatic means for shifting said ribbon laterally with respect to its direction of travel in such a manner as to change the colour of the portion of the ribbon in operative relation to said printing mechanism.
41. In a time recorder, in combination, a type bearing r.iember, a card receiver having a closed back, a multi. coloured printing ribbon in operative relation to said type bearing member and positioned between the same and said closed card receiver, and automatic means adapted to control mechanism for shifting said ribbon laterally so as to change the colour of the portion thereof opposite said type bearing member
42. In a time recorder, in combination, a type bearing member, a card receiver having a closed back, a multicoloured vertical printing ribbon positioned between the back of said card receiver and said type bearing member. and automatic means adapted to control mechanism for shifting said ribbon laterally so as to change the colour of the portion thereof opposite said type bearing member.
43. In a time recorder, printing mechanism, a multi-coloured printing ribbon adapted to travel in operative relation thereto, said ribbon being mounted movable in a lateral direction with respect to its direction of travel, and means adapted to actuate said printing mechanism and to move said printing ribbon laterally so as to bring a portion thereof of diferent colour into operative position.
44. In a time recorder, printing mechanism, a multi-colour ed printing ribbon adapted to travel in operative relation thereto. said ribbon being mounted movable in a lateral direction with respect to its direction of travel, means adapted to move said ribbon laterally, automatic means adapted to set the said in operative condition, and manually actuated means adapted to actuate said printing mechanism and to move said printing ribbon laterally so as to bring a portion thereof of different color into operative position upon said frst-mentioned means being set in operative condition.
45. In a time recorder, printing mechanism, a multi-coloured printing ribbon adapted to travel in operative relation thereto, said ribbon being mounted movable in a lateral direction with respect to its direction of travel, means adapt ed to actuate said printing mechanism and to move said printing ribbon laterally so as to bring a portion thereof or different colour into operative position, and an automatically actuated visual indicator adapted to indicate the colour which the recorder is in condition to print.
46. In a time recorder, printing mechanism, a multi-coloured printing ribbon adapted to travel in operative relation thereto, said ribbon being mounted movable in a lateral direction with respect to its direction of travel, means; adapted to move said printing ribbon laterally, automati cally actuated means adapted to set said frst-mentioned means in operative condition, manually actuated means adapted to actuate said printing mechanism and to actuate said ribbon moving mechanism so as to bring a portion of said ribbon of different colour into operative position upon said ribbon moving mechanism being set in operative condiion, and an automatically actuated visual indicator adapted to indicate the colour which the recorder is in condition to print
47. In a time recorder in combination, a platen, printing mechanism, a multi-coloured ribbon interposed between said platen and printing mechanism, and automatic clock con.. trolled means for shifting said ribbon laterally with respect to its direction of travel in such manner as to change the colour of the portion of the ribbon in operative relation to said printing mechanism.
48. In a time recorder in combination a type bearing member, a multi-coloured printing ribbon, and automatic clock actuated means adapted to control mechanism for shifting sald ribbon laterally so as to change the colour of the portion thereof in operative relation to said type bearing member.
49. In a time recorder, a printing mechanism. a multicoloured printing ribbon adapted to travel in operative relation thereto, said ribbon being mounted movably in a lateral direction with respect to its direction of travel. means adapted to move sald printing ribbon laterally, auto-
matically actuated means adapted to set said first-mentioned means in operative condition, and manually actuated means adapted to actuate said printing mechanism and to actuate said ribbon moving mechanism so as to bring a portion of said ribbon of different color into operative relation to said printing mechanism upon said ribbon moving mechanism beprinting mechanism upon said
ing set in operative condition.
50. In a time recorder in combination, a type bearing mem. ber, a multi-coloured printing ribbon in operative relation thereto, means adapted to shift said ribbon in such manner as to bring a portion thereof of different colour in operative relation to said type bearing member, a clock actuated member, a lever controlled by said clock actuated member, a manually actuated lever, and means automatically con; trolled by said first-mentioned lever whereby, upon actuation thereof, a subsequent actuation of said manually controlled lever will shift said ribbon.
51. In a time recorder in combination, a type bearing mem. ber, a movable printing ribbon adapted to travel adjacent thereto, means adapted to shift said printing ribbon laterally with respect to its normal direction of travel, clockwork. a rotary member driven from said clockwork, a pivotally mounted lever adapted to be contracted and actuated by parts upon said rotary member, a hand lever, and means adapted to be set in operative condition by said first-men. tioned lever, said means being adapted, upon being set in operative condition, operatively to connect said hand lever and said shifting mechanism.
52. A time recorder including in combination time con. trolled printing mechanism, means for taking impressions from said printing mechanism upon a record surface, and means whereby the impressions made by said printing mechanism during different predetermined Intervals are made in different colours.
53. In a time recorder in combination, time controlled printing mechanism, means for taking impressions from said printing mechanism upon a record surface, and automatic means whereby irregular records formed by said impressions are made in a certain colour and regular records in a certain other colour.

No. 102,243. Shade Hanger. Porle abat-jour.

Oliver Linebarger, Charles A. Linebarger and John Freese, each an assignee of a third interest, all of Council Bluffs, Iowa, U.S.A., 27th November, 1906; 6 years. Flled 29th August, 1906. Receipt No. 139,066.
Claim.-In comblnation with a sultable hanger for sup. porting a shade roller and operating cords therefor, of a spring wire clamping device comprising outwardly projecting horizontal arms and an inwardly extending clamping yoke for holding the operating cords between the arms and yoke, and loops at the outer extremities of the arms and yoke to receive the cords when released from the clamping yoke, substantially as and for the purpose set forth.

\section*{No. 102,244. Receiving Device for Flectric Transmission. \\ Réceptcur pour transmission élcctrique.}

Isidor Kitsee, Philadelphia, Pennsylvania, U.S.A., 27th
November, 1906; 12 years. Filed 17th September, 1906. Receipt No. 139,587
Claim.-1. In combination with a receiving device connected to the line of transmission, a local circuit embracing air gap, a high tension current transforming said local circuit and air gap, a translating device in said local circuit, and means operatively connected to the movable
part of said recelving device to vary the fow of said high tension current through said air gap, in accordance with the impulses received.

2. In electric transmission, a device adapted to make record of the incoming impulses and adapted to disturb through its movement the balance of two air paths made conducting through the flow of a high tension current, in combination with a direct source of current and electromagnetic translating device operatively connected to said air paths.
3. In electric transmission means to receive the incoming impulses, means to translate sald impulses, said second means comprising a circuit including air gaps and a source of high tension current adapted to overbridge said air gaps, and a second circuit including a source of direct current and translating device, said direct current adapted to make circuit through aaid air gaps only when said air gaps are made conducting through the flow of the firstnamed source of current, the means to receive adapted to vary the resistance of said alr gaps.
4. In electric transmission, a receiving device in com. bination with means to translate the received impulses. said means embracing a circult comprising a source of interrupted or alternating current and two air gaps, a second circuit comprising a direct source of current and electromagnetic device, said second circuit operatively related to sald first circuit and said air gaps.
5. In telegraphy, means to translate the incoming inpulses, said means embracing a direct source of current, a circult including electro-magnetic device for said source, the circult conductively broken through resistance paths, sald resistance paths made conductive through the flow of a high tension current, in combination with a receiving device connected to the line of transmission and adapted through its movement to vary the resistance of said paths.
6. In electric transmission an electro-magnetic device provided with two coils connected to a source of unidirective current in a manner so as to oppose their respective magnetizing influence, two pairs of contacts, each pair included in a circuit comprising the source of current and one of said colls, the contacts of each pair adjusted so as to present an air gap between them, a source of alternating or interrupted current connected with one terminal to one contact of each of said pairs, and with the othor terminal to the other contact of each of said pairs, and means to vary the resistance of one or the other of the air gaps as to the flow of the alternating or interrupted current in accordance with the received impulses.
7. In telegraphy, two pairs of adjustable contacts, a support for each of said pairs, one contact of each palr connected in multiple arc to one side of a source of high I口nsion current and the other contact of each pair conlorcted in multiple arc to the other side of sald source of hish tonsion current, a source of direct current, an electromisnotir device provided with two colls connected to said
direct source so as to oppose their respective magnetizing influence, the source of current connected with one pole to one contact of each of said pair and connected with the other pole to the junction of said two colls, the free torminal of one of said coils connected to one contact of one of said pairs, and the free terminal of the second of said colls connected to one contact of the second of said pairs. each pair of contacts adjusted in a manner so as to form a path, non-conducting for a straight current, between same, in combination with means actuated by the incoming current to increase the resistance of one or the other of said paths to the flow of the high tension current in accordance with the received impulses.
8. In telegraphy, a siphon recorder provided with means to record the incoming messages, a local circuit including a uni-directive source of comparative low potential and an alternating or induced current of comparatively high potential, a translating device, circuits in operative rilation to both of said sources including paths non-conducting for said uni-directive current but made conducting for said current through the passage of the high tension current, and means operatively connected to the siphon re: corder to vary the resistance of one or the other af said naths.
9. In a device of the class described, means to actuate a localized electro-magnet, said means embracing a unidirective source of current, an electro-magnet and electrically interrupted circuit for same, a high tension current producing a conducting path between the interrupted parts of said circuit, and means co-acting with a receiving device to vary the resistance of the interrupted circuit.
10. Means to actuate a local electro-magnet with the aid of a receiving device connected to the line of transmission without direct contact with the circuit of said local mag. net, said means embracing two circuits, one including a source of high tension current and one including a source of uni-directive low tension current, the terminals of both circuits connected to conducting means presenting between them a path non-conducting for the uni-directive source but conducting for the high tension source, on electsomagnet, and means co-acting with the receiving instrument to vary the resistance of said path.
11. Means to alter the resistance of a local circuit in accordance with the incoming telegraphic impulses. aald means embracing a source of current of comparatively low potential, a circuit for same, parts of said circuit nonconductive to said source, a source of carrent of comparatively high notential reducing the resistance of said non-conductive parts and means responding to the incomink impulses to vary the flow of the high potential curreot through the non-conductive parts in accordance with the incoming imgulses.

No. 102,245. Pipe Coupling. Joint de tuyas.

William Pitt Frye Ayer, Winchester, Massachusetts, U.S.I. 27th November, 1907; 6 years. Filed 26th October. 1.... Reccipt No. 140,642.
Claim.-In a pipe coupling the combination with ith member a. provided with the forwardly projecting rounded surface \(a^{3}\), of the member b having an inner rounded surface to fit the surface \(a^{2}\), the tubular non-corrosive surface portion \(b^{\circ}\), and the annular channel \(b^{3}\), the tubular. non-corrosive. surface \(b^{+}\)being spun into contact with said laner roundia surface and said annular channel \(b^{\circ}\), substantially as des. cribed.

No. 102,246. Telegraph Cut-Ont.
Détente de télégraphe.

Fred A. Clogston, Reed, Montana, U.S.A., 27th November, 1906; 6 years. Flled 26th October, 1906. Receipt No. 140,652.
Claim.-1. In a cut-out of the character described, the combination with a series of pivoted devices each adapted to be electrically connected to a sounder, of a common return device movably mounted above and normally contacting with all of the pivoted devices, and means for actuating any one of sald pivoted devices to ralse the return device out of contact with the remaining pivoted devices
2. In a cut-out of the character described, the combination with a series of pivoted devices each adapted to be electrically connected to a sounder, of a spring pressed, electrically supported return device mounted above and normally contacting with all of the pivoted devices, and means for separately actuating any one of the pivoted devices to raise the return device out of contact with the remaining pivoted devices.
3. In a cut-out of the character described, the combination with a series of levers, each adapted to be connected to a sounder, of a return device normally supported by and elec:rically connected to all of the levers, and means for separately actuating any one of the levers to remove the return device from electrical connection with the remaining levers.
4. In a cut-out of the character described, the combination with a series of levers adapted to be electrically connected to a series of sounders, of a spring pressed return plate movably monnted adjacent to and normally electrically connected with all of the levers, and means for separately actuating any one of the levers to break the electrical connection between the return blade and the remaining levers.
5. A cut-out of th character described comprising a series of levers adapted to be electrically connected to a series of sounders and springs mounted upon the levers, a spring pressed return plate adapted to be electrically connected to a common return wire, sald plate normally contacting with all of the springs of the levers, and means for separately actuating any one of the levers to move the plate out of contact with the springs of the remaining levers.
6. A cut-out of the character described comprising a series of levers adapted to be electrically connected to a series of sounders and springs mounted upon the levers, a spring pressed return plate adapted to be electrically connected to a common return wire, sald plate normally contacting with all of the springs of the levers. eranks mounted within the casing, rods connecting each crank with one of the levers, and means for separately rotating the cranks to actuate any one of the levers to move the plate out of contact with the springs of the remaining levers.

\section*{No. 102,247. Floating Wier Head Gate.}

\section*{Barrière pour sc̀cherics flottantes.}

Harry K. Fairall, Howard L. Fairall and Jacob Kunzmann, co-inventors, all of Highland. California, U.S.A., 27th November, 1906; 6 years. Filed 13th September, 1906. Receipt No. 139,470.
Claim.-1. In a device of the class described, a vertically movable wier gate formed with an opening and a floating frame connected therewith.
2. In a device of the class described, a stationary spillway member, a vertically movable wier gate formed with an opening connected with said spillway and a floating frame connected with the wier gate.
3. In a device of the class described, a vertically movable wier gate formed with an opening and a floating frame adjustably connected therewith.

4. In a device of the class described, a stationary splliway member, a vertically movable wier gate formed with an opening, adjustably connected with said spillway and a floating trame connected with the wier gate.
5. In a device of the class described, a vertically movable wler gate formed with an opening, a floating frame connected therewith, a scale connected with the wier gate and a floatIng indicator adjacent to the scale.
6. In a device of the class described, a stationary spillway member, a vertically movable wier gate formed with an opening connected with said spillway, a floating frame connected with the wier gate, a scale connected with the wier gate and a floating indicator adjacent to the scale.
7. In a device of the class described, the combination of a vertically adjustable wier gate having an opening therein, a floating frame for supporting the wler gate, a tubular scale fixed to the wier gate, a float within the tubular scale and an indicator carried by the float.
8. In a device of the class described, a stationary spillway member, a spillway member hinged thereto for vertical movement and a floating wier gate frame connected with the hinged member of the spillway.
9. In a device of the class described, a stationary spillway member, a spillway member hinged thereto for vertical movement, a floating wier gate frame connected with the hinged member of the spillway and an adjustable wier gate in sald frame.
10. In a device of the class described, the combination of a stationary spillway member, a spillway member pivotally connected thereto, a spring tending to normally elevate the free ends of the movable spillway member and a floating wier gate device connected with the movable spillway member.
11. In a device of the class described, the combination of a stationary spiliway member, a spillway member pivotally connected thereto, a spring tending to normally eleyate the free ends of the movable spillway member. a floating wier gate device connected with the movable spillway member and stationary guides for preventing lateral movement of the movable spillway section.
12. In a device of the closso described, the combination of a stationary spillway member, a spillway member pivotally connected thereto, a floating wier gate device connected with the movable spillway member and stationary guldes for preventing lateral movement of the movable spillway section.
12. In a device of the class described, the combination nf a movable splliway, a wier gate frame connected therewith a wier gate adjustably mounted in the frame, a floating deVice adjacent to the rear gate frame, and means for vertically adjusting the wier gate frame relatively to the floating device.
14. In a device of the class described, the combination of a movable spillway, a wier gate frame connected therewith, a wier gate adjustably mounted in the frame. a floating device adjacent to the rear gate frame, means for vertically adjusting the wier gate irame, means for vertically adjusting the wier gate frame relative to the floating device and
means for automatically releasing the wier gate to parmit it to droy in the wier gate frame upon the submersion of the floating device.
15. In a device of the class rescribed, the comblnation of a spillway, capable of vertical movement. a wier gate frame pivotally connected therewith, a wier gate slidably mounted in the wier gate frame, a floating frame, means for vertically adjusting the wler gate frame relative to the floating frame, an auxiliary float carriod by the floating frame, a switch connected with sald float and arranged to detach the wier gate from the floating frame so that it may drop by gravity when the float frame is submerged.

No. 102,248. Spark Gap and Mrifiler.
Trou détincelles et appareil d'échappement silencicus.

Aaron E. Harrison, New York City, and Crowell M. Haslett. Jersey City, New Jersey. U.S.A., 27th November. 1906; 6 years. Filed 17th October, 1906. Recelpt No. 140,381.
Claim.-1. In a muffier, the combination of a member provided with inner and outer sholls, and further provided with means whereby a spark gap may be maintained within said inner shell, and a lid engaging said inner and outer shells and provided with portion for breaking joints betwet. sald lid and said inner and outer shells.
2. In a muffier, the combination of an inner shell of porous material, an outer shell encircling the same, and means for mounting spark terminals within said inner shell.
3. In an apparatus of the character described, the combination of a base portion provided with inner and outer shells integral therewith and concentric to each other, a lid provided with annular members for fitting sald inner and outer shells so as to break joints therebetween, and spark terminals for maintaining a static discharge within said inner shell.
4. In an apparatus of the character described, the combination of a hollow member for containing a snark gap, an outlet pipe connected with said hollow member, a mufflinp drum connected with said outlet pipe, and means for supplying air into said hollow member.
5. In an apparatus of the character described the combination of a hollow for containing a spark gap, means for admitting air thereinto, and a muffling drum connected with said member and receiving therefrom the air heated by the spark gap, said muffing drum being provided with means for discharging said heated air while preventing the sounds from escaping.
6. In an apparatus of the character described the combination of a hollow member, an outlet pipe connected therewith, a disc mounted upon said outlet pipe, a plurality of concentric cylinders connected with said disc and provided with holes staggered in relation to each other, another disc mounted upon said concentric cylinders, and means for admitting air to said hollow member.
. In an apparatus of the character described, the combination of a hollow member, a spark gap mounted therein, and drum separate from said receptacle and connected therewith. 8. In an apparatus of the character described, the combination of a hollow member, a spark gap mounted therein, and
a muffier drum connected with said hollow member, said muffler drum being provided with a plurality of outlets staggered relatively to each other.
9. In an apparatus of the character described, the comblnation of a hollow member, a spark gap mounted therein, a muffier drum communicating with said hollow member, said muffler drum having a plurality of walls provided with apertures, and fillings mounted intermediate of sald walls for the purpose of suppressing sounds.
10. In a muffler for spark gaps, the combination of a sound proof receptacle for contalning a spark gap, a muffler drum connected with said receptacle and provided with a plurality of outlets, and means for forcing a cooling medium through said receptacle and into said muffler drum.
11. In an apparatus of the character described, the combination of a hollow, means for conducting an air current therefrom, a spark gap mounted within said hollow member, and a muffler drum connected with said hollow member and provided with concentric walls, said walls having apertures staggered relatively to each other for the purpose of depressing sounds from said hollow member.

\section*{No. 102,249. Chicken Coop. Poulailler.}

Cicero Hoskins, Quincy, Illinols, U.S.A., 27th November, 1906; 6 years. Filed 6th October, 1906. Receipt No. 140,094.
Claim.-1. A knockdown coop formed of sheet metal sections, the end, front and rear sections formed with co-oderating hook flanges whereby said sections may be slidably connected, and having upturned base flanges, the bottom formed with downwardly extending flanges adapted to fit over the base flanges of said sections, a top section and means for locking the top section in place, substantially as described.
2. A knockdown coop formed of metallic sections, the end. front and rear sections formed with co-oderating hooked flanges along their vertical edges, whereby said sections may be slidably connected and formed with upturned flanges at their lower edges and the bottom section formed with a downwardly extending flange adapted to fit over the flanges on the lower edges of the end and front and rear sections. and the top section, substantially as described.
3. A knockdown coop formed of sheet metal sections, the end, front and rear sections formed with co-operating hook flanges whereby said sections may be slidably connected. and having upturned base flanges, the bottom formed with a downwardly extending flange adapted to fit over the basc flanges of said sections, a top section and the spring hooks carried by the end sections adapted to take over the edge of the top section when in place, whereby said top will be locked in place, substantially as described.
4. In a knockdown coop the combination of the end. front and rear sections and top and bottom sections removably secured together, said front section having an opening therein. guideways on said section, closures for the opening sliding in said guideways, and a pin or bar adapted to be passed through the guideways, to the rear of the closure in front of the opening, whereby said closure will be held from movement, substantially as described.

No. 102,250. Stall for Calves. Stalles pour caux.
Allen A. Lewis, Hazleton, Iowa, U.S.A., 27th November, 1906; 6 years. Filed 6th October, 1906 . Receipt No. \(140,097\). Claim.-1. In a device of the class described. a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining bar at the rear of the partitions, a rope attached to said retaining bar for raising the retaining bar from its lower limit of movement, and a second
rope secured to the retaining bar and designed to draw the bar to its lower inner limit of movement.

2. In a devic of the class described, a series of partitions forming stalls, weans for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining bar at the rear of the partitions, a rope attached to said retaining bar for raising the retaining bar from its lower limit of movement, and a retaining device at the forward end of one of the partitions for securing the rope in various positions.
3. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining bar at the rear of the partitions. a rope attached to said retaining bar for raising the retaining bar from its lower limit of movement, and a retaining device in front of one of said partitions for securing the second rope in position for retaining the retaining bar at its lower inner limit of movement.
4. In a device of the class described, a series of partitions formine stalls. means for securing the partitions in onsition relative to each other, a manger at the forward portion of the stalls. a retaining bar at the rear of the partitions. a rope attached to said retaining bar for raising the retaining bar from its lower limit of movement, a second rope secured to the retaining bar and designed to draw the bar to its lower inner limit of movement, and a retaining device at the forward and of no of the partitions for securing the rope in various positions.
5. In a device of the class described. a series of partitions forming stalls, means for securing the partitions in position relative to each other, a manger at the forward portion of the stalls, a retaining bar at the rear of the partitions a rope attached to said retaining bar for raising the retaining bar from its lower limit of movement, a second rope secured to the retaining bar and designed to draw the bar to its lower inner limit of movement. a retaining device at the forward end of one of the partitions for securing the rope in various positions, and a retaining device in front of one of said partitions for securing the second rope in position for retaining the retaining bar at its lower inner limit of movement.
6. In a device of the class described, a series of partitions forming stalls, means for securing the partitions in position relative to each other, a series of pivotally mounted supporting rods, attached to the rear of said partitions, a retaining device secured to the lower ends of said rods, a rope secured to said retaining device, passing over one of said partitions to the forward end of it, a retaining device for maintaining the rope in various positions, a second rope rope secured to said retaining device passing through one of sald partitions to a point in front of the partition, a retaining device for maintaining the rope in various positions, sald ropes and retaining devices being designed to support and secure said retaining bar in any position in its limit of movement.

\section*{No. 102,251. Photographing Telegraph.}

T'́légraphe à photographie.
Paul Ribbe, Berlin, Germany, 27th November, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,344.
Claim.-1. In a telautograph the combination with two moving screens at the sending and recelving stations respectively and each provided with a plurality of differently arranged apertures, of a radiophone at the sending station, means at the sending station for projecting rays of light
from an original through the path of the several apertures in the moving screen to said radiophone, so that only a

single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in concentric strips of the original, a telephone at the recelving station, means controlled by said telephone for projecting rays of light from a source of light through the path of the several apertures in the moving screen to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light act upon points in concentric strips of the sensitive plate or the like, a line of transmission between the sending and recelving stations and controlled by said radiophone for sending electrical impulses through said telephone, and means for synchroniding said two moving screens by means of sald line of transmission.
2. In a telautograph the combination with two rotatable discs at the sending and recelving stations respectively, and each provided with a plurallty of differently arranged apertures, of two clockworks adapted to drive said two rotatable discs, a radiophone at the sending station. means at the sending station for projecting rays of light from an original through the path of the several apertures in the rotatable disc to said radiophone, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in concentric strips of the original, a telephone at the receiving station. means controlled by said telephone for projecting rays of light from a source of light through the path of the several apertures in the rotatable disc to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light act upon points in concentric strips of the sensitive plate or the like, a line of transmission between the sending and receiving stations and controlled by said radiophone for sending electrical impulses through said telephone, and means tor synchronizing sald two rotatable discs by means of said line of transmission.
3. In a telautograph the combination with two rotatable discs at the sending and receiving stations respectively and each provided with a plurality of radial slits within two concentric circles, a plurality of differently arranged apertures within two other concentric circles and a plurallty of armatures on the periphery. two clockworks driving said two rotatable discs, a first and a second selenium cells at the sending station, means at the sending station for projecting rays of light from a source of light through the path of the several radial slits in the rotatable disc to said first selenium cell, two pairs of electro-magnets at the sending and recelving stations respectively and the two opposite electro-magnets of each pair disposed on both sides of the rotatable disc and adjacent to the path of its armatures. circuits at the sending station and comprising sald first anil second selenium cells and the pair of electro-magnets. means at the sending station for projecting rays of light from an original through the path of the several apertures in the rotatable disc to said second selenium cell, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in concentric strips of the original, the radial slips in the rotatable disc being so disposed that the rays of light emanating from the source of light can pass through either of them only if no ray of light passes through either of the aper-
tures, a telephone at the recelving station, means controlled by sald telephone for projecting rays of light from a source of light through the path of the several apertures in the rotatable disc to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shiftling rays of light act upon points in consecutive strips of the sensitive plate or the like, circults at the receiving station and comprising said telephone and the pair of electro-magnets, and a line of transmission connecting together said circuits at the sending and receiving stations respectively.
4. In a telautograph the combination with two rotatable discs at two different stations respectively and each provided with a plurality of radial slits within two concentric circles, a plurality of differently arranged apertures within two other concentric circles and a plurality of armatures on the periphery, two clockworks driving said two rotatable discs, two pairs of selenium cells at a distance from said two rotatable discs, means at each station for projecting rays of light from a source of light through the path of the several radial slits in the rotatable disc to one of the two selenium cells, two pairs of opposite electro-magnets on both sides of said two rotatable discs and adjacent to the paths of their armatures, means at each station for projecting rays of light from an original through the path of the several apertures in the rotatable disc to the other of the two selenium cells, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rajs of light correspond to points in concentric strips of the orisinal, two telephones at both stations. means at each station controlled by the telephone to projecting rays of light from a source of light through the path of the several apertures in the rotatable disc to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the concentric consecutive apertures and the several shifting rays of light act upon points in consecutive strips of the sensitive plate or the like, circuits at each station and comprising the tclephone, the two selenium cells and the pair of electromagnets, a line of transmission connecting together said circuits at both stations, and means for turning either station into a sending station and the other one into a recelving station, the radial slits in said two rotatable discs being so disposed that the rays of light sent from a source of light to one selenfum cell can pass through either of them only if no ray of light passes through either of the apertures.
5. In a synchronizing system the combination with a rotatable disc disposed at one station and provided with a radial slit and on its periphery with a sheet iron armature, of means for driving said rotatable disc. two opposite electromagnets on both sides of said rotatable disc and adjacent to the path of its armature, an adjustable tube on one side of said rotatable disc and closed at the end adjacent to the path of the radial slit with a bottom provided with a slit. a source of light and a reflector at the other end of sald tube. a lens and a cylinder lens in said tube and adapted to send a broad beam of light through the slits in the bottom and in the rotatable disc, a tubular casing on the other side of said rotatable disc opposite to said tube, a selenium cell in said tubular casing. a conductor connecting said selenium cell with the ground, lines connecting in serles said selpnium cell and said two electro-magnets, a second rotatable disc at another station and provided on its periphery with a sheet iron armature, means for driving said second rotatable disc. two further opposite electro-magnets on both sides of said second rotatable disc and adjacent to the path of its armature, a second conductor connecting in series said two further opposite electro-magnets with the ground. a line of transmission connecting said electro-magnets at both stations. and a battery for energizing said conductors and said line of transmission.
6. In a synchronizing system the combination with a rotatable disc disposed at one station and provided with a plurallty of radial slits and on tts periphery with a plurality of sheet iron armatures, of means for driving sald rotatable disc, two opposite electro-magnets on both sides of sald rotatable disc and adjacent to the path of Its armatures, a tube on one side of said rotatable disc and closed at the end adjacent to the path of the radial slits with a bottom provided with a slit, a source of light and a reffector at the other end of said tube, a lens and a cylinder lens in said tube and adapted to send a broad beam of light through the slits in the bottom and in the rotatable disc, a tubular casing on the other side of said rotatable disc ppposite in said tube, a selenium celi in said tubular casing. a conductor connecting said selenium cell with the ground. lines connecting in series said selenium cell and said two electro-magnets, a second rotatable disc at another station and provided on its periphery with a plurality of showt iron armatures, means for driving said second rotatable dise, two further opposite eloctro-magnets on both sides of said second rotatable disc and adjacent to the path
of its armatures, a second conductor connecting in series said two further opposite electro-magnets with the ground, a lise of transmission connecting said electro-magnets at both stations, and a battery for energizing said conductors and said line of transmission.

No. 102,252. Photographing Telegraph. Télégraphe d photographie.

Paul Ribbe, Berlin, Germany, 2ith November, 1906 :
years. Filed 2nd August. 1906. Recelpt No. 138.364.
Claim.-1. In a telautograph, the combination with two endless bands at the sending and receiving stations respectively and each provided with a plurality of differently arranged apertures, of two clockworks adapted to drive said two endless bands, a radiophone at the sending station. means at the sending station for projecting rays of light from an original through the path of the several apertures in the endless band to said radiophone, so that only a siagle shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in parallel adjoining strips of the original, a telephone at the recelving station, means controlled by said telephone for projecting rays of light from a source of light through the path of the several apertures in the endless band to a sensitive plate or the like, so that onlv a single shifting part of the rays of light is permitted to pass through each of the conorcutive apertures and the several shifting rays of light act upon points in parallel adjoil!ng strips of the sensitive plate or the like, a linc of transinission between the sending and recelving stations and controlled by sald radiophone for sending electrical impulses through said telephone, and means for synchronizing said two endless bands by means of said line of transmission.
2. In a telautograph, the combination with two rotatable discs at the sending and receiving stations respectively and each provided with a plurality of armatures on the periphery, and the disc at the sending station being moreover provided with a jlurality of radial slits, of two endless band at the sending and recelving stations respectively and each provided with a plurality of differently arranged apertures, two clock works driving said two rotatable dises and said two endless bands, a first and a second selenium cells at the sending station, means at the sending station for projecting rays of light from a source of light througt the path of the radial slits in the rotatable disc to sald first selenium cell, two electro-magnets at the sending and recelving stations respectively and adjacent to the patha of the armatures on said two rotatable discs, clreutts at the sending station and comprising said first and seooad selenlum cells and the electro-magnet, means at the sedding station for projecting rays of light from an origisal through the path of the several apertures in the endiess band to said second selenium cell, so that only a masle shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in parallel adfoining strips of the original, the apertures in the eniless band being 80 disposed that only if no ray of light passes through either of them, the rays of light emanatiag from the respective source of light are permitted to pass through either of the radial slits in the rotatable disc. a telephonc at the recelving station, means controlled by said telephone for profecting rays of light from a source of light through the path of the several apertures in the eadless bard to a sensitive plate or the like. so that only a single shifting part of the rays of light is pernitied to
pass through each of the consecutive apertures and the several shifting rays of light act upon points in consecutive strips of the sensitive plate or the like, circuits at the receiving station and comprising said telephone and the elec-tro-magnet, and a line of transmission connecting together said circuits at the sending and recelving stations respectively.
3. In a telautograph, the combination with two rotatable discs, two driving pulleys and two pluralities of guiding pulleys at the sending and recelving stations respectively. the two rotatable discs being each provided with a plurality of armatures on the periphery and the disc at the sending station being moreover provided with a plurality of radial slits, of two endless bands passing over said two driving pulleys and said two pluralities of guiding pulleys and each provided with holes along the edges and with a plurality of diferently arranged apertures, said two driving pulleys and sald two pluralities of guiding pulleys having each series of pins along the periphery for engaging in the holes of sald two endless bands, two clockworks driving said two rotatable discs and said two dríving pulleys, a first and a second selenium cells at the sending station, means at the sending station for projecting rays nf light from a source of light through the path of the radial slits in the rotatable disc through the path of the radial slits in the rotatable disc to said first selenium cell, two electro-magnets at the sending and receiving stations respectively and adjacent to the paths of the armatures on said two rotatable discs, circuits at the sending station and comprising said first and second selenium cells and the electro-magnet, means at the sending station for projecting rays of light from an original through the path of the several apertures in the endless band to said second selenium cell, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in parallel adjoining strips of the original, the apertures in the endless band being so disposed, that only if no ray of light passes through either of them, the rays of light emanating from the respective source of light are permitted to pass through either of the radial slits in the rotatable disc, a telephone at the recelving station. means controlled by said telephone for projecting rays of light from a source of light through the path of the several apertures in the endless band to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light act upon points in consecutive strips of the sensitive plate or the like, circuit at the receiving station and comprising said telephone and the electro-magnet, and a line of transmission connecting together said circuits at the sending and receiving stations respectively.
4. In a telautograph the combination with two rotatable discs at two different stations respectively and each provided with a plurality of radial slits and with a plurality of armatures on the periphery, of two driving pulleys and two pluralities of guiding pulleys at both stations respectively and each pulley provided with pins along the periphery, two endless bands passing over said two driving pulleys and said two pluralities of guiding pulleys and each provided with holes to co-operate with the pins of the pulleys and each provided with a plurality of differently arranged apertures, two clockworks driving sald two rotatable discs and said two driving pulleys, two selenium cells at a distance from sald two rotatable discs, two further selenium cells at a distance from said two endless bands, means at each station for projecting rays of light from a source of light through the path of the several radial slits in the rotatable disc to the respective selenium cell. two electro-magnets at both stations and adjacent to the paths of the armatures on said two rotatable discs, means at each station for projecting rays of light from an original through the path of the several apertures in the endless band to the respective selenium cell, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in parallel adjoining strips of the original, two telephones at both stations, means at each station controlled by the telephore for projecting rays of light from a source of light through the path of the several apertures in the endless band to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light act upon points in consecutive strips of the sensitive plate or the like, circuits at each station and comprising the telephone, the two selenium cells and the electro-magnet, a line of trans, mission connecting together said circuits at both stations, and means for turning either station into a sending station and the other one into a recelving station, the apertures in the two endless bands being so disposed that only if no ray of light passes through either of them, the rays of light emanating from the respective source of light are permitted to pass through either of the radial slits in the rotatable diec.
5. In a telautograph the combination with two rotatable discs at the sending and recelving stations respectively and each provided with a plunality of armatures on the periphery and the disc at the sending station being moreover provided with a plurality of radial slits, of two endless bands at the sending and receiving stations respectively and each provided with a plurality of differently arranged epertures. two clockworks driving said two rotatable discs and said two ondless bands, a first and a second selenium cells at the sending station, means at the sending station for projecting rays of light from a source of light through the path of the radial slits in the rotatable disc to sald first selenium cell, two pairs of electro-magnets at the sending and recelving stations respectively and the two opposite electro-magnets of each pair disposed on both sides of the rotatable disc and adjacent to the path of its armatures, circuits at the sending station and comprising said first and second selenium cells and the pair of electro-magnets, means at the sending station for projecting rays of light from an original through the path of the several apertures in the endless band to said second selenium cell, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in parallel adjoining strips of the original. the aper tures in the endless band being so disposed that only if no ray of light passes through either of them, the rays of light emanating from the respective source of light are permitted to pass through either of the radial slits in the rotatable disc, a telephone at the receiving station, means controlled by said telephone for projecting rays of light from a source of light through the path of the several apertures in the endless band to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light act upon points in consecutive strips of the sensitive plate or the like, circuits at the recelving station and comprising said telephone and the pair of electromagnets, and a line of transmission connecting together said circuits at the sending and receiving stations respectively.
6. In a telautograph the combination with two rotatable discs, two driving pulleys and two pluralities of guiding pulleys at the sending and receiving stations respectively, the two rotatable discs being each provided with a plurality of armatures on the periphery and the disc at the sending station being moreover provided with a plurality of radial slits, of two endless bands passing over said two driving pulleys and said two pluralities of guiding pulleys and each provided with holes along the edges and with a plurality of differently arranged apertures, said two driving pulleys and said two pluralities of guiding pulleys having each series of pins along the periphery for engaging in the holes of said two endless bands, two clockworks driving said two rotatable discs and said two driving pulleys, a first and a second selenium cells at the sending station, means at the sending station for projecting rays of light from a source of light through the path of the radial slits in the rotatable disc to said first selenium cell, two pairs of electro-magnets at the sending and recelving stations respectively and the two opposite electro-magnets of each pair disposed on both sides of the rotatable disc and adjacent to the path of its armatures, circuits at the sending station and comprising said first and second selenium cells and the pair of electro-magnets, means at the sending station for projecting rays of light from an original through the path of the several apertures in the endless band to said second selenium cell, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light corespond to points in parallel adjoining strips of the original, the apertures in the endless band being so disposed that only if no ray of light passes through either of them, the rays of light emanating from the respective source of light are permitted to pass through either of the radial slits in the rotatable disc, a telephone at the receiving station, means controlled by said telephone for projecting rays of light from a source of light through the path of the geveral apertures in the endless band to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light act upon points in consecutive strips of the sensitive plate or the like, circuits at the receiving station and comprising said telephone and the pair of electro-magnets, and a line of transmission connecting together sald circuits at the sending and receiving stations respectively.
7. In a telautograph the combination with two rotatable discs at two different stations respectively and each provided with a plurally of radial slits and with a plurality of armatures on the periphery, of two driving pulleys and two pluralities of guiding pulleys at both stations respectively. and each pulley provided with pins along the periphery, two endless bands passing over said two driving pulleys and said two pluralities of guiding pulleys and each provided with holes to co-operate with the pins of the pulleys and each provided with a plurality of differently arranged apertures,
two clockworks driving said two rotatable discs and said two driving pulleys. two selenium cells at a distance from said two rotatable dises. two further selenium cells at a distance from said two endless bands, means at each station for projrcting rays of light from a source of light through the path of the several radial slits in the rotatable disc to the respective selenium cell, two pairs of electro-magnets on both sides of said two rotatable discs and adjacent to the paths of their armatures, means at each station for projecting rays of light from an original through the path of the several apertures in the endless band to the respective sclenium cell, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light correspond to points in parallel adjoining strips of the original, two telephones at both stations, means at each station controlled by the telephone for projecting rays of light from a source of light through the path of the several apertures in the endless band to a sensitive plate or the like, so that only a single shifting part of the rays of light is permitted to pass through each of the consecutive apertures and the several shifting rays of light act upon points in consecutive strips of the sensitive plate or the like, cicults at each station and comprising the telephone, the two selenium cells and the pair of electromagnets, a line of transmission connecting together said circuits at both stations, and means for turning either station into a sending station and the other one into a recelving station, the apertures in the two endless bands being so disposed, that only if no ray of light passes through either of them, the rays of light emanating from the respective source of light are permitted to pass through either of the radial slits in the rotatable disc.

No. 102,253. Spinning Machine. Métier à fler.

Henry Ryder. New York City. New York. U.S.A., 2ith November. 1906; 6 years. Flled 22nd October, 1906. Receipt No. 140,507.
Claim.-1. A spinning machine comprising means for feeding fibre in straight fibres, means for fceding a wire and means for spinning said fibres parallel to each other spirally around said wire.
2. A spinning machine comprising a spindle, means for freding a wire to said spindle, means for feeding straight fibres to said spindle and means for spinning said flbres spirally parallel to each other around said wire.
3. A spinning machine comprising a spindle, means for feeding a wire to said spindle, means for feriing straight fibres to said spindle, means for keeping said wire and sald fibres separate until they reach said spindle and means for spinning said fibres parallel to each other spirally around said wire.
4. A spinning machine comprising a wire spool. a fler, a spindle. a driving shaft. a main shaft and means for rotating said wire spool, said filer and sald spindle with the same speed of rotation.
5. A spinning machine comprising a spindle, means for reeding separately to said spindle. a wire and parallel fibris. means for spinning said fibres parallel to each other spirally a round said wire, and means for giving to the yarn thus spun any desired amount of tension.
f. A spinning marhine comprising a spindle. means for freding separately to said spindle a wire and parallel fibres. means for spinning said flbres parallel to each other spirally around said untwisted wire, and means for winding the yarn thiss spun onto a yarn spool.
7. A spinning machine comprising a spindle. means for fonding separately to sald spindle a wire and parallel fibres, means for spimming sad fibres parallel to cach of ner splally around said wire, means for giving any desired tension to the yarn thus spun and means for winding said yarn cevenly on a yarn spool.

No. 102,254. Method of Maldigs Fillers Rer
Méthode de fuire les remplissures pour cigares.

Peter August Ediard Scheer, Hamburg, Germany, 27th No vember, 1906; 6 years. Filed 2nd October, 1906. Recelpt No. 139,897 .
Claim.-1. In a device for producing fillers for cigars the combination of a rolling plate and an apron attached thereto, with a ledge hollowed out at one edge to suit the shape of a clgar and serving to guide the filler when rolled on the rolling plate.
2. In a device for producing fllers for cigars the combination of a rolling plate and an apron attached thereto, with a ledge hollowed out at one edge to suit the shape of a cigar and means to pavallel guide the ledge across the rolling plate.
3. In a device for producing fllers for clgars the combination of a rolling plate and an apron attached thereto, with a ledge hollowed out at one edge to suit the shape of a cigar and a frame carrying such ledge and guided on parallel edges of the rolling plate, to secure parallel motion of the ledge when moved across the rolling plate.
4. In a device for producing fillers for cigars the combination of a rolling plate constructed as a sliding frame and an apron attached thereto at one end, with a second frame carrying a ledge hollowed out to suit the shape of a cigar. a clamping ledge rotatabiy attached to the rolling plate and adapted to clamp the other end of the apron against the and adapted to clamp rolling plate.
5. In a device for producing fillers for cigars the combination of a rolling plate constructed as a sliding frame an. an apron attached thereto at one end, with a second irame carrying a ledge hollowed out to suit the shape of a cigar and a trough arranged on the rolling plate and adapted to be filled with tobacco, when lined with the apron.

\section*{No. 102,255. Chair Seat. Siègc de fautcuil.}

Henry Harrison Schrop, Detroit, Michigan, U.S.A., 27th November 1906; 6 years. Filed 4th Scptember, 1906. Receipt No. 139,225 .
Claim.-1. A material for chair seats having in conbination a sheet of metal with a covering of texoderm over the face and lapping over the edges, substantially as describel.

2. A material for seats having in combination a plate o: metal having its surface covered with a paint and a rovering of texaderm cemented to the painted plate, substautially as described.

No. 102,256. Cattle Stanchion. Etançon pour bćtail.

Pearl B. Trewer and John T. Trewer, co-inventors, both of Mt. Morris, New York, U.S.A., 27th November, 1906; 6 years. Filed 3rd October. 1906. Receipt No. 140.006.
Claim.-A cattle stanchion, comprising a securing frame pivotally mounted in a supporting frame, said securing frame comprising upper and lower cross heads, a fixed standard connected to one end of each of said crossheads, a movable standard pivotally connected at its lower end to said lower crosshead, a latch bar pivotally mounted to said upper crosshead whereby when the stanchion is open said latch bar will engage the supporting frame and hold said stanchion in position, and a spring projected locking bolt arranged in said movable stanchion to engage said latch bar and thereby lock said stanchion in closed or operative position, substantially as described.

No. 102,257. Curtain Pole Bracket.
Console pour poteaux de rideaux.
Fig. 1

Isaac H. Webb, Emlenton, Pennsylvania. U.S.A.. 27th November. 1906; 6 years. Filed 4th September, 19\%. Receipt No. 139,230
Claim.-A new article of manufacture comprising a curtain pole bracket and pole and ornament formed of a single plece of turned wood, the connected ends of the bracket and ornament being partly separated by a well defined groove formed during the turning operation and leaving a relatively small connection between the two which may be readily severed to permit separation of the parts. the onposite ends of said article having flattened faces from which project securing members, and the bracket being shaped to form a support for the pole and ornament and pole, substantially as described.

No. 102,258. Curtain Fixture. Attache de rideak.

Burroughs Agin and George B. Thompson, co-inventors both of Kansas City, Missouri, U.S.A., 27 th November, 1906; 6 years. Filed 6th October, 1906. Receipt No. 140,095.
Claim.-1. A curtain fixture consisting of a pair of supporting plates adapted to engage the sides of a window casing, a telescopic rod having its outer ends bearing against said plates. a section forming part of said rod provided at its inner end with an integral flange, a second section having its inner end arranged within the first-mentioned section, an expansion spring encircling the second section and bearing at one end against the flange, a collar adjustably mounted upon the second section for adjusting the length of the rod and regulating the tension of the spring, and brackets adjustably secured to the supporting plates.
2. A curtain fixture consisting of a pair of supporting plates adapted to engage the sides of a window casing, a telescopic rod having its outer ends bearing against the supporting plates, a section forming part of said rod provided at its inner end with a flange, a second section having its inner end adjustably arranged within the first-mentioned section, an expansion spring encircling the second section and bearing at one end against the flange, means carried by the second section for adjusting the length of the rod and regulating the tension of the spring, and brackets secured to the supporting plates.

No. 102,259. Curtain Fastener. Attache de rideau.

Nana A. Ferres, Johnstown, New York, U.S.A., 27th November, 1906; 6 years. Filed 11th October, 1906. Recelpt No. 140,208 .
Claim.-1. The combination with a metallic ring having portions bent to form aligning loops, of a pin having an eyt at one end disposed with its eye between the loops, a pivot pin engaged in the loops and in the eye for pivotal movement of the first-named pin with respect to the ring. and a retainer carried by the ring and arranged for the reception of the first-named Din to hold the latter against pivotal movement.

Digitized by
2. A device of the class described comprising a ring formed of metal and having a longitudinal slot therein, the metal on opposite sides of the slot being bent outwardly to form loops, a pin having an eye at one end disposed with its eye between the loops, a plvot pin engaged in the loops and in the eye for pivotal movement of the firstnamed pin with respect to the ring, and a retainer slidably engaged with the ring and having a portion bent to form a rib and resultant passage, said passage being arranged for the reception of the free end portion of the first-named pin, to hold the latter against movement.

No. 102,260. Curtain Fixture. Attache de rideau.

Edwin F. Henderson, West Allis, Wisconsin, U.S.A., 27th November, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,868 .
Cluim.-The combination with a window shade secured at one end to the top of a window and provided at its other end with a spring roller located at the bottom of the shade, of a bottom curtain fixture located beneath the shade and spaced from and arranged entirely out of contact with the same, and composed of side rods provided at their outer euds with bearings receiving the journals of the roller, a central tubular member adjustably recelving the rods to vary the length of the curtain fixture, adjusting means \(10-\) cated at the ends of the tubular member and engaging the rods for rigidly securing the latter in their adjustment, and a central handle also connceted with the tubular member and located between the said adjusting means.

No. 102,261. Window Screen. Ecran de fenêtre.

Edwin A. Reitz, Reynoldsville, Penngylvania, U.S.A.. 27th November, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,831 .
Claim.-A window screen formed in laterally adjustable serctions, the frames of said sections having recessed over-
lapping inner ends, overlapping sections of netting secured to said frame sections, longitudinally slotted locking plates arranged over the overlapping ends of the frame sections, clamping screws arranged in the slots of said locking plates to lock said sections in their laterally adjusted positions, and means to hold said sections in sliding engagement with the sides of the window frame, sald means comprising sheet metal guide strips, one of which is bent to form a longitudinally grooved strip or section secured to the screen, and the other of which is bent to form a tongue strip or section adapted to be secured to the window frame and to receive tho grooved strip or section of the screen, whereby the latter is slidably connected and supported in the window frame.

No. 102,262. Window Screen Fastener. Atlache ecran iffentere.

Byrd C. Rockwell, Malvern, Arkansas, U.S.A., 27th November, 1906; 6 years. Filed 10th October, 1906. Receipt No. 140.185.
Claim.-1. In an adjustable screen, a pair of longitudinaliy adjustable rails having oppositely divergent kerfs, the kurfs of each rail terminating in a pair of slots extending through the rail and separated by a Qongue, and a clip siated in said slots in engagement with the tongue and having divergent portions for engagement with the corresponding kerfs of the adjacent rail.
2. In an adjustable screen, a pair of longitudinally adjustable rails having opposing faces adapted to contact with each other, said rails being provided with oppositely diverging kerfs and with slots extending through the rails at the ends of said kerfs, in combination with clips bodily seated in said slots, secured against rocking movement, and provided each with diverging portions engaging the kerfs of the adjacent rail.
3. In an adjustable screen, a rail having divergent keris in the face thereof, an engaging rail having a clip seat "xtending therethrough and a clip engaging said seat, secur"d against rocking movement, and having divergent portions engaging the kerfs of the opposite rail.
4. In an adjustable screen, a pair of relatively movable screen sections each comprising a frame and a sheet of reticulated material, and sheet metal binding members for the inner edges of the reticled material, said binding members having transverse incisions adjacent to their ands and the latter attached to the screen frame, the body portions of the members between the incisions being angularly extended to lie in the path of each other to form stops and having their outer edges overriding the surface of the material of the adjacent screen section.
5. In a screen, a frame and a shect of reticulated malerial carried thereby, a binding member for one edge of the material, longitudinal kerfs formed in a pair of the frame bars and constituting seats for the adjacent edzes of the material. said kerfs terminating in saats fo: thi ends of the binding member,, and means for securing the latter in place.
6. In an adjustable screen, a pair of relatively and longitudinally adjustable rails, one of sald rails having a pair of divergent longitudinal keris and the other a longitudinal clip seat extending through the body of the rall, a clip having a.body portion engaging said seat and projecting divergent portions for engagement with the kerts. and means for securing said clip against rocking movement.
7. In an adjustable screen, a pair of relatively and longitudinally adjustable rails, one of said rails having a pair of divergent longitudinal kerfs and the other a pair of slots producing an intermediate tongue, and a cllp having a body portion engaging. said tongue and divergent portions for engagement with the kerfs.
8. In an adjustable screen, a rail having a pair of divergent keris terminating in a clip seat extending through the body of the rail, a clip having a body portion engaging the seat and divergent portions projecting beyond one face of the rail, and means for securing said clip against rocking movement.

No. 102,263. Metal Screen. Ecran en métal.

Henry W. Watson and Wllliam w. Watson, co-inventors, both of Jamestown, New York, U.S.A.. 27th November, 1906; 6 years. Filed 17th October, 1906. Receipt No 140,400.
Claim.-1. In a metal screen, a frame, the side and end pieces of said frame each consisting of a solid tube, a channel along said tube, screen wire and a locking means to hold said wire in said channel.
2. In a metal screen, a erame, the side and end pieces of said frame each composed of strigs of bendable sheet metal formed in a brazed tube. a channel along said tube, screen wire, and a locking strip to hold said wire in said channel.
3. In a metal screen, a frame, the side and end pieces of the irame each consisting of a strip of sheet metal formed in a tube, a lengthwise flange beside said tube formed by the lapped edges of the said strip, screen wire, and a retaining strip to fit said channel.
4. In a metal screen, a frame, the side and end picces of said frame each consisting of a tube formed from strips of sheet metal, the lengthwise edges of said strip lapped and formed in a continuous channel around the inner edge of said frame, screen wire, and retaining strips to fit said channel and hold said screen wire.
5. In a metal screen, a frame, the side and end pieces of said frame each composed of strips of metal formed in a tube with lapped edges, said lapped cdges brazed together and formed in a channel along said tube, screen wire. and a locking strip to hold said wire in said channel.
6. In a metal screen, a frame, each side of said frame formed by a strip of sheet metal having the central portion formed in a tube and the edge portions of said sheet metal united by solder and shaped in a lengthwise angular flange to form a channel with one side of said tube, screen wire, and a retaining strip to fit said channel.
7. In a metal screen, a frame consisting of side and end pieces having a channel therein, screen wire, and metallic tube locking strips for holding said wire in said channel.
8. In a screen window, a frame, consisting of side and end pieces having a lengthwise recess along the same, screen wire, and a tubular spring locking said strip for holding sald wire in said recess.
9. In a window screen, the combination of the frame. with a groove enlarging inwardly, wire fabrlc, and slotted
tubes forming a filling piece adapted to hold said wire in said groove
lo. In a window screen, a frame consisting of sheet metal strips bent in rectangular form, the edges of said strips formed in a channel, screen wire, a cleft tube to fit said channel and secure said screen wire, and locking projections on the walls of said channel for said retaining tube.
11. In a window screen, a frame consisting of sheet metal strips bent in rectangular form, the edges of said strips formed in a lengthwise recess, one end of said strips at each irame corner cut away at a mitral angle and the other uncut end inserted and soldered within said mitered end to form the correr, screen wire, and a retaining strip for said wire \(\mathrm{in}_{\mathrm{n}}\) said recess.
12. In a window screen, a frame consisting of sheet metal strips bent in tubular form, the lengthwise edges of sald strips formed in a recess, a sheet metal channel strip enclosed between said edges to reinforce and brace said recess. projections on the outer and inner walls of said recess. a screen wire, and a locking strip to fit said recess and hold said wire within said locking projections.
13 In a window screen, a frame, the slde and end pieces of said frame consisting of strips of sheet metal formed in a tube, a channel formed along the inner side of said tube, the lateral tubular pieces of the frame also formed in a channel along their outer edges, screen wire, and retaining strips to fit said inner recess and hold the wire.
14 In a window screen, a frame, the side and end pieces of said frame consisting of sheet metal formed in a tube, a continuous channel along the inner edges of said tube and also channels formed in the outer edges of the lateral pieces of the frame, said outer channel parts extending at each corner of the frame within the opposing end, said cpposing ends cut away to form channels the full length of the screen, screen wire and retaining strips to fit sald inner channel and hold said wirc.
15. In combination with a hollow metallic frame having siaced slots therein, bowed springs of uniform width throughout having their ends bent at substantially right a gles and engaging said frame adjacent said slots and sl ding in and out of the same, to prevent the disengageanent of said springs when in a normal bowed state and to a!low of removal thereof when the springs are in a flat state.

No. 102,264. Guide for Sliding Screens.
Guide pour glisser les écrans.

Henry W. Watson and William W. Watson, co-inventors, both of Jamestown, New York, U.S.A., 27th November, 1906; 6 years Filed 17th October, 1906. Receipt No. 140,401.
(iaim.-1. In sllding ways for screens and the like, a woolen strip, a metal covering for one edge of said strip and attached to the same, and a portion of said strip left lincovered by said metal for fitting to a support.
2. In a guide strip for sliding screens and the like, a wooden strip having a round beaded edge and a supporting base, and a close sheet metal covering pressed onto said b ading, substantially as and for the purpose set forth.
3. A gulde strip for sliding screens comprising a wooden strip 10, a bead 11 on one edge of sald strip, and a base portion 17, a sheet metal covering 12 for sald bead having holes 13 therein for attaching said guide strip to a support

No. 102,265. Alloy of Iron and Hydrogen. Alliage de fer et hydranènc.

Harleston Corbett Gesner, Brooklyn, assignee of Augusto Bontempl, New York City, both in New York, U.S.A 27th November. 1906; 6 years. Filed 9th August, 1906. Receipt No. 138,546.
Claim.-1. An article consisting of an alloy of iron and hydogen impregnated with a metalliferous, material, as set farth.
2. An article conslsting of an alloy of iron and hydrogen impregnated with a relatively volatile metalliferous material, as set forth.
3. An article consisting of particles of an alloy of iron and hydrogen compressed and agglomerated into a strong coherent body, said body impregnated with a metalliferous material, as set forth.
4. An article consisting of a body of agglomerated particles of an alloy of Iron and hydrogen. Impregnated with a metalliferous material of sultable electrical conductivity, as set forth.
5. An article consisting of an alloy of iron and hydrogen impregnated with a metalliferous material and permeated with an inert fller, as set forth.
6. The process of producing coherent bodies of an iron hydrogen alloy, which consists in incorporatiog a metalliferous material with a mass of particles of the alloy, as set forth.
7. The process of producing coherent bodies of an fron hydrogen alloy, which consists in heating a mass of particles of the alloy and impregnating the mass with the vapours of a relatively volatile metalliferous material, as set forth.
8. The process of producing coherent bodies of an iron hydrogen alloy, which consists in mixing particles of the alloy with a relatively volatile metalliferous material, shaping the mixture, and heating it to a temperature sufficient to volatilize the added material, as set forth.
9. The process of producing non-porous coherent bodies of an iron hydrogen alloy. which consists in impregnating the alloy with a metalliferous material, and saturating-the product with an inert fller, as set forth.
10. The process of impregnating an alloy of iron and hydrogen with a volatile metalliferous material. which consists in placing the materials in a tightly closed vessel of iron or other non-porous material, and heating them to a temperature sufficient to volatilize the added material, as set forth.

No. 102,266. Filament for Lighting and Feating. Filament pour éclairer et chauffer.

George Michaud and Eugene Delasson, Paris, France, 27th November, 1906; 6 years. Filed 18th August, 1905. Recelpt No. 127,793.
Claim.-1. A process of producing filaments from suitable material, which consists in feeding the same in a fine stream in the form of a powder and arresting its move ment in a zone of intense heat to agglomerate the same whereby a flament of the agglomerated material is produced.
2. A process of producing filaments from suitable material by means of heat, which consists in feeding the material in powdered form to the heat zone in a fine stream. arrestlag the movement of said stream in said heat zone to produce a flament therefrom and gradually removing the newly formed flament from said point of arrest. whereby the end thereof which is growing will remain in approximately the same position in the heat zonc.
3. The process of producing flaments from relatively hightly refractory material which consists in fusing the same in a powdered state in a fine stream. in an oxyhydrogen flame and forming the fused material into a flament, substantially as described.
4. The process of producing flaments which consists in miving together alumina and a compound or salt of thor-
ium, cerium and chromium, reducing this material to the form of a fine powder fusing the same in a fine stream and finally forming the fused mass into a flament, substantially as described.

\section*{No. 102,267. Cigaretto Malding Machino.} Machine d faire des cigarettes.

Louis Bernhard Baron, London, England, 27th November. 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,089.
Claim.-1. In cigarette machines and in combination tobacco feeding devices, means for carrying an endless feed belt and paper wrapper beneath same and to the compression wrapping and pasting devices, a vertical flat faced compression wheel, two horizontal compression wheels, an adjustable scraper plate for the vertical compression wheel adapted to act as a cover plate for the space between the horizontal compression wheels and wrapping, pasting and cut-off devices, substantlally as described.
2. In cigarette machines and in combination tobacro feeding devices, means for carrying an endless feed belt and paper wrapper beneath same and to the compression wrapping and pasting devices. a vertical flat faced compression wheel, two horizontal compression wheels, an adjustable scraper plate for the vertical compression wheel adapted also to act as a cover plate tor the space between the horizontal compression wheels, adjustable corered scrapers therefor, an adjustable tapered tongue with outwardly flared ends for receiving the compressed tobacco. and wrapping, pasting and cut-off devices, substantially as described.
3. In cigarette machines and in combination inbacco feeding devices, means for carrying an endless feed bilt and paper wrapper bencath same and to the compression wrapping and pasting devices, a vertical flat faced compression wheel, two horizontal compression wheels, an adjustable scraper plate for the vertical compression wheel adapted also to act as a cover plate for the space between the horizontal compression wheels, wrapping devices. an adjustable pasting device delivering the gum or paste directly to the paper and cut-off devices, substantially as described.
4. In cigarette machines and in combination tobaceo feeding devices, means for carrying an endless feed boll and paper wrapper beneath same and to the compression wrapping and pasting devices, a vertical fat faced com pression whecl, two horizontal compression wheels, an ais Justable scraped plato for the vertical compression wheel adapted also to act as a cover plate for the spacr between the horizontal compression whecls, adjustabli cover scrapers therefor, an adjustable tapered tongue with outwardly flared ends for ecelving the compressed tobacco, devices, an adjustable pasting device delivering the gum or paste directly to the paper, and cut-off device, substantially as described.
5. In cigarette machines and in combination tobacco feeding device, means for carrying an endless feed belt and paper wrapper beneath same and to the compression wrapping and pasting devices, a vertical flat faced compression wheel, two horizontal compression wheels, an adjustable scraper plate for the vertical compression wheel adapted also to act as a cover plate for the space between the horizontal compression wheels, wrapping and pasting devices, and an adjustably mounted cut-oft mechanism by which the length of the cigarette cut can be varled, substanlially as described.
6. In cigarette machines and in combination tobacco feeding devices, means for carrying an endless feed belt and paper wrapper beneath same and to the compression wrapping and pasting devices, a verisal for faced compression wheel, two horizontal compression wheels, an adjustable scraper plate for the vertical compression wheel adapted also to act as a cover plate for the space between the horizontal compression wheels, adjustable covered scrapers therefor, an adjustable tapered tongue with outwardly flared ends for receiving the compressed tobacco, wropping and pasting devices, and an adjustably mounted cut-off mechanism by which the length of the cigarette cut be varied, substantially as described.
7. In cigarette machines and in combination tobacco feeding devices, means for carrying an endless feed belt and paper wrapper beneath same and to the compression wrapping and pasting devices, a vertical flat faced compression wheel, two horizontal compression wheels, an adjustable scrap ed plate for the vertical compression pheel adapted also to act as a cover plate for the space between the horizontal compression wheels, adjustable cover sciapers therefor, an adjustable tapered tongue with outwardly flared ends for receiving the compressed tobacco, wrapping devices, an adjustable pasting device delivering the gum or paste diractly to the paper and an adjustably mounted cut-off mechanism by which the length of the cigarette cut can be varied, substantially as described.

No. 102,268. Thill Coupling. Joint de limonidres.

McKendree F. Bishop, Alameda, California, U. S. A., 27th November, 1906; 6 years. Filed 26th March, 1903. Receipt No. 104,111 .
Claim.-1. A thill coupling consisting of a movable anil a stationary member, a spring adapted to hold said members in close contact, and a clevis surrounding one of the said members and contracted to prevent accidental displacement of the other, substantially as described.
2. A thill coupling provided with a stationary member having an open mouthed cavity, a rocking member adapted to enter said cavity, a clevis secured to said rocking member and surrounding said stationary member, said clevis being formed with a contracted portion and a spring engaging said clevis and causing a close contact between said members, substantially as described.
3. A thill coupling having.a rocking and a stationary member and means for locking said members together and preventing movement of said rocking member said means being arranged for automatic releasement substantially as described.
4. In the thill coupling described, the combination of the clip, the plate receiving the arms of the clip and having its upper side rabbetted at its rear end and also having the concave convex portion at its forward end forming a seat and the north in its forward extremity. the spring having its upper rear end seated in the rabbet of the clip plate and receiving one arm of the clip and also having a forward extending arm terminating in a hook, the thill iron having the rounded end resting in the seat of the clip plate, and the clevis pivotally connected to said end of thlll iron and having a contracted lower portion, substantially as described.
5. In a thill coupling, the combination of the body or plate, a thill iron bearing therein, a clevis pivotally connected to and depending from the thill iron and having a lower contracted portion and a spring connected with the body or plate and having an arm engaging the bight of the clevis, substantially as described.

No. 102,269. Window Shade Eupport.
Support d'abat-jour de fenêtre.

Charles Corrill Brown, Revelstoke, British Columbia, Canada, 27th November, 1906; 6 years. Filed 16th October, 1905. Recelpt No. 129,293.

Claim.-1. In a device of the character described, a pair of brackets, each provided with serrations, and a hanger rockably and slidably disposed on each bracket and provided with integral means adapted to engaga said serrations.
2. In a device of the character described, a pair of brackets, each provided with serrations, hangers slidably and rockably disposed on the brackets, and each provided with a lug adapted to engage in sald serrations, when the hangers are rocked downward.
3. In a device of the character described, a pair of trackets, each provided with a flange having serrations thereon, hangers slidably and rockably disposed on each bracket, provided with lugs adapted to engage said serrations when the hangers are rocked downward, and each provided with integral means for supporting a window shade roller.
4. In a device of the character described, a pair of vertically disposed brackets, each provided with serrations, and a hanger slidably disposed on each bracket and provided with a lug adapted to engage said serrations, and each hanger comprising a metallic strip bent to conform to the shape of the bracket on which it is disposed.
5. In a device of the character described, a pair of brackets, each provided with serrations, a hanger disposed on each bracket and from a single strip bent to conform to the shape of the bracket on which it is disposed, and provided on one side with a lug adapted to engage said serrations, and a rivet adapted to fasten together the ends of the hanger.
6. In a device of the character described, a pair of brackets, each provided at opposite ends with an integral lug having a hole therein, and each provided with a flange having serrations thereon, and a hanger disposed on each bracket, provided with a lug adapted to engage the serrations, and provided with means for supporting a shade roller.
7. In a device of the character described, the combination comprising a pair of supporting brackets provided with offset flanges having serrations thereon, and hangers, each formed of a single strip bent to a shape to conform to the shape of the brackets and slidably and rockably disposed thereon, and each of the hangers being provided with an integral lug adapted to engage the serrations when the hangers are rocked downward.

\section*{No. 102,270. Method of Obtaining Ammoninm Chloride.}

\section*{Méthode d'obtenir du chlorate d'ammoniaquc.}

Andrew Gordon French. Williamson Avenue, Grey Lynn, New Zealand, 27th November, 1906; 6 years. Filed 31st August, 1905. Receipt No. 128,082.
Claim.-A process of manufacturing ammonium chloride which consists in drenching carbonized coal containing sulphur and nitrogen in the proportion of one and one-seventh pounds of sulphur to one pound of nitrogen with a strong brine, and then burning said drenched carbonized coal by subjecting it to a current of air containing at least ten per cent of steam.

No. 102,271. Process of Making Bearing Fangers for Beams.
Procédé pour faire des attaches pour ponties.

\(\approx\)

Johann Georgo Hänsler, Munich, Germany, 27th November, 1906; 6 years. Filed 2nd.June, 1906. Receipt No. 136,505. Claim.-1. Process for the manufacture of bearing hangers or stands from I-beams or channels, its characteristic being that the I-beam or channel is slit longitudinally in its lower part, after which the two legs thus formed are bent outward and then, after cutting off the projecting parts of the web, their lower parts connected to a base plate and preferably also to reinforcing plates, by riveting or other means, while the upper part of the I-beam or channel is recessed for the reception of the bearing base.
2. Process for the manufacture of bearing hangers or stands from I-beams or channols, its characteristics being that the I-beam or channel is slit longitudinally in its lower part, after which the two legs thus formed are bent outward and then, after cutting off the projecting parts of the web, the webs of the legs are riveted to the base plate, by means of projections \(e\).
3. Process for the manufacture of bearing hangers or stands from I-beams or channcls, its characteristics being that the I-beam or channel is slit longitudinally in its lower nart, after which the two legs thus formed are bent outward and then, after cutting off the projecting parts of the wrb, their lower parts connected to a base plate and preferably also to reinforcing plates, by riveting or other means. while the upper part of the I-beam or channel is recessed for the reception of the bearing base. and the upper free ends of the flanges of the I-beam or channel are bent inward.

No. 102,272. Fire Escape. Sauvctcur d'incendie.
Martin Herbert Kennedy and George A. Kennedy, assignee of a half interest, both of Denver, Colorado, U.S.A., 27th November, 1906; 6 years. Filed 10th October, 1906. Recelpt No. 140,182.
claim.-1. In a device of the character described, the combination with a casing having a movable portion and a spool revolubly mounted within the casing, of grip members pivoted upon the casing and separated from, but adapted to press, the movable portion of the casing upon the spool.
2. In a device of the character described, the combination with a casing having a movable portion and a spool revolubly mounted within the casing, of grip members pivoted upon the casing and separated from, but contacting with, the movable portion of the casing and a guide within one of said members.
3. In a device of the character described, the combination with a casing, a movable portion, an outlet in said novable portion and a spool revolubly mounted within the casing, of oppositely disposed grip members movably mounted upon the casing and separated from, but contacting with, the movable portion of the casing, and a guide within one of said members.
4. A device of the character described, comprising a casing having an outlet, and movable casing portion adjacent the outlet, a cable carrying device mounted within the casing. oppositely disposed grip members movably connected to the casing adjacent the outlet and separated from but adapted to bear upon the movable portion of the casing to retard the movement of the cable therein.
5. A device of the character described, comprising a casing having an outlet, said casing having movable portions adjoining the outlet, a cable carrying device mounted within
the casing, oppositely disposed grip members movably connected to the casing, said members being separated from

but adapted to bear upon the movable portion of the casing to force it into contact with the cable carrying device.
6. In a device of the character described, the combination with a casing having an outlet, a movable portion adjacent tho outlet, and a cable carrying device movably mounted with the casing, of oppositely disposed overlapping grip members movably connected to the casing adjacent the outlet and bearing upon but separated from the movable portion of the casing.
7. In a device of the character described, the combination with a casing having an outlet and depressible casing por tions, of oppositely disposed overlapping grip members movably connected to the casing and bearing upon but separated from the depressible portion of the casing.
8. In a device of the character described, the combination with a casing having an outlet, and a depressible portion. of a spool mounted within the casing and adapted to be contracted by the depressible portion, oppositely disposed overlapping grip members pivoted to the casing and sepa rated from but normally bearing upon the depressible portion of the casing.
9. In a device of the character described, the combination with a casing having an outlet and a depressible casing portion adjacent the outlet, of a spool rotatably mounted within the casing and adapted to be contacted by the depressible portion, a grip member pivoted to the casing adjacent the outlet and separated from but bearing upon the depressible zortion.
10. In a device of the character described, the combination with a casing having a depressible portion and a ro tatable device within the said casing adanted to be contacted by the depressible portion, of oppositely disposed pivoted grip members having overlapping toes normall bearing on the depressible portion but detached therefrom and guiding means on one of the grip members.
11. In a device of the character described, the combination with a casing comprising a front and rear plate, means for depressing the same and a depressible band interpose between the plates and forming an aperture between the ends thereof, of a reel revolubly mounted with the casing, oppositely disposed grip members connected to the casing adjacent the aperture and having integral projecting por tions contacting with the depressible portions of the band, and a cable guide within one of said members.

\section*{No. 102,273. Building Block. Bloc de construction.}

Andrew Klay, Bluffton, Ohio, U.S.A., 27th November, 1906; 6 years. Filed i7th September, 1906 . Receipt No. 139.556.

Claim.-1. A building block provided in one face with a longitudinal channel and upon its opnosite face with a longitudinal rib corresponding in size and shape to the channel, the channel exceeding the rib in depth, there being an intermediate extension of the block flush with the channel and rib faces thereof, said extension being provided
in one face with a channel sulstantially parallel to the first mentioned channel and upon its opposite face with a rib

substantially parallel with the first-mentioned rib, the rib of the extension corresponding substantially in size and shape to the channel thereof with the channel exceeding the rib in depth.
2. A wall including sections separated by a vertical interspace, each section being made up of superimposed blocks having intermediate lateral extensions flush with the tops and bottoms of the blocks and resting upon the extensions of he respective next below blocks of the other wall section, each extension being shorter than the width of the space between the wall sections.
3. A wall including sections separated by a vertically interspace, each section being made up of superimposed blocks having intermediate lateral extensions flush with the tops and bottoms of the blocks and resting upon the extensions of the respective next below blocks of the other wall section, each extension being shorter than the width of the space between the wall sections, and a socket and profection interlocking connection between the adjacent extensions.
4. A wall formed of a plurality of superposed blocks each provided with a longitudinal rib adapted to engage a corresponding channel in the longitudinal edge of an adjacent block, said blocks having their upright ends abutted in mutual contact and provided with registering grooves which are closed by the contacting ends of the blocks, and mortar flling the grooves only.
5. A building block provided with an intermediate extension which is flush with the top and bottom of the block and is provided in one horizontal face with a channel disposed longitudinally of the block and upon its other horizontal face with a rib corresponding to the channel.
6. A building block having an intermediate lateral. extension flush with its top and bottom faces, said extension being provided with an air chamber opening outwardly through the outer end of the extension.
7. A bullding block provided with one horizontal face with a longitudinal channel open at opposite ends, the other horizontal face being provided with a longitudinal rib corresponding to the channel, the ends of the blocks being provided with upright grooves, and an intermediate lateral extension flush with the top and bottom of the block, one horizontal face of the extension being provided with a channel substantially parallel with the first-mentioned channel, the opposite face of the extension being provided with a rib substantially parallel with the first-mentioned rib, and the extension being provided with an air chamber opening through the outer end of the extension.

\section*{No. 102,274. Roof Carline. Carlingues pour totitures.}

George B. Maltby, Cleveland, Ohio, U.S.A., 27th November, 1906; 6 years. Filed 19th October, 1906. Receipt No. 140,452.
Claim.-1. A sheet or plate metal roof carline having an integral body comprising a web of \(U\) or channel section, lateral flanges projecting from the side members thereof, and downwardly turned flanges at the ends of the web and lateral flanges.
2. A sheet or plate metal roof carline having an open topped integral body comprising a web of \(U\) or channel section, lateral flange projecting from the side members thereof, recessed or channel section seats formed in the web and lateral flanges, and downwardly turned flanges on the ends of the web and lateral flanges.
3. In a car frame, the combination of side plates, plate metal roof carlines pressed into channel section with la-

teral flanges projecting from their side members and downwardly turned end flanges, and supported on and having their end flarges abutting against the side plates, connections securing the carlines to the side plates, and a ridge pole and purlins fitting in recessed seats in the side members and lateral flanges of the carlines.

No. 102,275. Traction Wheel. Roue de traction.

Isaac McHenary, Toronto, Ontario, Canada, 27th November, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,646. Claim.-1. As a new article of manufacture, a wheel provided with a plurality of radiating sectiors spaced apart, the perimeter of each section being a segment of the circle or perimeter of the wheel, and caulks for said sections extending beyond the perimeter thereof.
2. As a new article of manufacture, wheel provided with a plurality of integrally farmed radiating sections spaced apart, the perimeter of each section being a segment of the circle or perimeter of the wheel, and one or more caulks for said sections comprising a shank provided. with transversely formed holes and a brcadened head, the said shank resting in longitudinal pockets in said sections. and pins passing through holes transverely formed in said sections and through the holes in the shank of said caulks.
3. As a new article of manufacture, a wheel provided with a plurality of integrally formed radiating sections spaced apart, the perimeter of each section being a segment of the circle or perimeter of the wheel, and being preferably constructed \(\mathbf{V}\)-shaped, and one or more caulks for sald sections comprising a shank provided with transversely formed holes and a broadened head, the sald shank resting in longitudinal pockets in said sections, and pins passing through holes transversely formed in said section and through the holes in the shank of said caulks.
4. As a new article of manufacture, a wheel provided with a plurality of radiating sections, the perimeter of each being a segment of the circle or perimeter of the wheel, the sald sections being spaced sufficiently apart to prevent any unevenness in movement or pounding of the wheel as it passes over the roadway.

\section*{No. 102,276. Viscose Manufacture.} Fabrication de viscose.
Sergius Peessarev, St. Petersburg, Russia, U.S.A., 27th November, 1906; 6 years. Filed 6th September, 1905. Receipt No. 128,223 .
Claim.-1. The herein described step in the process of producing viscose threads, and other bodies of viscose, which consists in treating the bodies of viscose with salts of organic bases such as aniline. naphtnylamin and pyridin.
2. The herein described step in the process of producing viscose threads, and other bodies of viscose, which consists in treating the bodies of viscose with a solution of chloride of aniline.
3. The herein described step in the process of producing viscose threads, and other bodies of viscose, which consists in relating the bodies of viscoe with salts of organic
bases such as aniline, naphthylamin, and pyridin, treating the body operated on in a bath containing an excess of mieral acid and chloride of sodium, and subjecting the body to the action of heated water.
4. The herein described process of producing bodies of viscose, which consists in forming the bodies with the desirf 1 shape, treating the formed bodies in a solution of sal of organic bases, and washing and drying the bodies 5 The herein described process of producing bodies of viscose, which consists in forming the bodies with the desired shape, treating the formed bodies in a solution of salts of organic bases, heating the bodies in a bath containing mineral acid and chloride of sodium, passing the bodies through heated water or steam, washing the bodies in water containing lime and drying the bodies.

No. 102,277. Tunnel. Tunnel.

Richard W. Raftus, Chicago, Illinols, U.S.A., 27th November, 1906; 6 years. Filed 29th October, 1906. Receipt No. 140,702 .
Claim.-1. A tunnel or subway having its walls formed of an outer layer of concrete and an internal lining of tile, said tile being formed of a main body portion having openings therein, securing arms projected from one of the side faces of the said body portion, said arms being provide with inwardly extending shoulders, said shoulders being formed by an angle of \(45^{\circ}\) extending from a point upon the arm slightly beyond the side face of the body portion, for the purpose set forth, substantially as described.
2. A tunnel or subway whose walls consists of the combination of concrete having a plurality of binding members located therein with an internal lining of tiles, said tiles consisting of a main body portion having an opening therethrough and a plurality of securing arms projected from one of the side faces of the said body portion, said arms being provided with inwardly extending shoulders for the purpose set forth. substantially as described.
3. \(\Lambda\) tunnel or subway having its side walls and arch formed by the combination of concrete with an inner lining of tiles, the said tiles cosisting of a body portion having openings therethrough and securing arms projected from one of the side faces of the sald body portion, said arms being provided with inwardly extending shoulders, said shoulders being formed by an angle of \(45^{\circ}\) extending from a point upon the arm slightly beyond the side face of the body portion, for the purpose set forth, substantially as described
4. A tunnel or subway having its side walls and arch formed by the combination of concrete with an inner lining of tiles, the said tiles consisting of a body portion having openings therethrough and securing arms projected from one of the side faces of the said body portion, said arms bcing provided with inwardly extending shoulders, said shoulders being formed by an angle of \(45^{\circ}\) extending from a point upon the arm slightly beyond the side face of the body portion, the bottom or floor wall being formed of two layers of concrete, having a layer of hollow tile located between the two layers, all combined and arranged substantially as set forth.
5. A tunnel or subway having its side walls and arch formed of the combination of concrete having a plurality of binding members located therein with an inner lining of tiles, the said tiles consisting of a body portion having openings therethrough and securing arms projected from one of the side faces of the sald body portion, said arms being provided with inwardly extended shoulders, said shoulders being formed by an angle of \(45^{\circ}\) extending from a point upon the arm slightly beyond the side face of the body portion, the bottom or floor wall being formed of two layers of concrete having a layer of hollow tile located between the two layers, all combined and arranged substantially as set forth.

\section*{No. 102,278. Fastener for Plate Glamy.}

Attache pour la vitre.

Henry R. Ranson, Pittsburg, Kansas, U.S.A., 27th November, 1906; 6 years. Filed 11th October, 1906. Receipt No. 140,209.
Clain.-1. The combination with recessed plates contacting at their adjoinlng edges, of a plate disposed in rear of and overlapping the abutting edges of the recessed plates, parallel metallic strips secured upon opposite faces of the inwardly extending plate, hooks upon said plates and within the recesses. said hooks contacting and overlapping the outer faces of the recessed plates and means secured to the inwardly extending plate for holding the recessed plates within the hooks.
2. The combination with plates having abutting edges, said edges having registering recesses therein of a mullion plate abutting against and overlapping the edges of the rocesses plates, metallic strips secured to opposite faces of the mullion plate and hooks integral with said strips and disposed within the recesses, said hooks engaging the recessed plates.
3. The combination with plates having abutting edges, said edges having registering recesses therein, of a mullion plate in rear of and overlapping the abutting edges of the recessed plates, metallic strips secured to opposite faces of the mullion plate and overlapping that edge of the mullion plate contacting with the recessed plates, said strips contacting and seated within the recesses, each strip having an integral hook overlapping the outer face of the recessed plates.

No. 102,279. Window Tent. Fenêtre de tente.

William E. Walsh, Morris, Illinois, U.S.A., 27th November, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,864.
Claim.-1. A device of the class described in the form of a box adapted to be projected through a window and open to the outer atmosphere, and adapted to have the head of a patient inserted thereinto, leaving the body of the patient outside of the box and within the room, substantially as described.
2. In a device of the class described, a framswork and a covering for the framework constituting a box adapted to be projected through a window and provided with an opening in its outer or projected portion for the admission of air and provided with an opening in its inner portion for the projection of the head of a patient therethrough, leavino the body of the patient outside of the box and within the room, substantially as described.
3. In a device of the class described, the combination of a frame and a covering of fabric therefor constituting a box adapted to be projected through a window and provided with an opening in the inner portion of the box for the projection therethrough of the patient's head, leaving the patient's body outside of the box and within the room, substantially as described.
4. In a device of the class described, the combination of a framework, a covering therefor providing a substantially rectangular box having an opening in the bottom or the outer end portion, a hinged bracket to which the fabric surrounding the opening is secured, means for raising and lowering the hinged bracket, and an opening for the insertion of a patient's head, substantially as described.
5. A device of the class described, in the form of a box adapted to be inserted into a window frame and open to the outer atmosphere, and adapted to have the head of a patiented inserted thereinto, leaving the body of the patient outside of the box and within the room, and a lateral extension adapted to close the surplus space in the window substantially as described.
6. In a device of the class described, a framework and a covering for the framework constituting a box adapted to be inserted into a window and provided with an opening in its outer portion for the admission of air and provided with an opening in its inner portion for the insertion of the head of a patient therethrough, leaving the body of the patient outside of the box and within the room, and a lateral extension adapted to close the surplus space in the window, substantially as described.
7. In a device of the class described, the combination of a frame and a covering of fabric therefor constituting a box adapted to be inserted in a window casing and provided with an opening in the lower side of the outwardly projecting portion for the admission of air, and provided with an opening in the inner portion of the box for the insertion therethrough of a patient's head, leaving the patient's body outside of the box and within the room, and a lateral extension adapted to close the surplus space in the window, substantially as described.
8. In a device of the class described, the combination of a frame work, a covering provided therefor, a substantially rectangular box having an opening in the bottom of the outer end portion, a hinged bracket to which the fabric surrounding the opening is secured, means for raisting and lowering the hinged bracket, an opening for the insertion of a patient's head, and a later extension adapted to close the surplus space in the window, substanially as des cribed.
9. A device of the class described, in the form of a box adapted to be inserted in a window casing and open to the outer atmosphere, and adanted for the head of a patient to be inserted thereinto, leaving the body of the patient outside of the box and within the room, and an extensible framework having secured thereto a flexible covering adaptcd to provide a closure for the surplus window space, substantially as described.
10. In a device of the class described a framework and a covering for the framework constituting a box adapted to be inserted into the window casing and provided with an opening in its outer portion for the admission of outside air and provided with a sack or pocket in its inner portion for the insertion of the head of a patient therethrough, whereby the body of the patient is outside of the box and within the room, substantially as described.
11. Is a device of the class described, a framework and a covering for the framework constituting a box adapted to be inserted into the window casing and provided with an opening in its outer portion for the admission of outside alr and provided with a sack or pocket in its inner portion for the insertion of the head of a patient therethrough, whereby the body of the patient is outside of the box and within the room, and an extensible framework having secured thereto a flexible covering adapted to provide a closure for the surplus window space, substantially as described.
12. In a device of the class described, the combination of a frame consisting of a stiff wire and a covering of fabric therefor constituting a box adapted to be inserted into a window casing, and provided with a downwardly opening hood at its outer end for the admission of air, provided with a sack or pocket which is puckered at its mouth for the insertion therethrough of the patient's head, whereby the patient's body is left outside of the box and within the room, and an extensible framework having secured thereto a flexible covering adapted to provide a closure for the surplus window space, substantially as described.
13. In a device of the class described the combination of a frame consisting of stiff wire and a covering of fabric constituting a box adapted to be inserted into a window casing and provided with a downwardly opening hood at its outer end for the admission of air, provided with a sack or pocket which is pucked at its mouth for the insertion therethrough of the patient's head, whereby the patient's body is left outside of the box and within the room, and a lateral extension consisting of a stralght upper crossbar and a lower L-shaped crossbar adapted to position extensible side curtains to provide a closure for the surplus window space, substantially as described.
14. In a device of the class described, a box adapted to be inserted into a window frame and provided with an opening adapted to hare the head of a patient inserted therethrough into the box and an outwardly projecting downwardly opening hood having a sloping roof and having its lower edge secured to a hinged bracket, substantially as described.
15. In a device of the class described, a box adapted to be inserted into a window frame and provided with an opening adapted to have the head of a patient inserted therethrough into the box, and an outwardly projecting downwardly opening hood having a sloping roof and having its lower edge secured to a bracket, substantially as described.

\section*{No. 102,280. Threadless Bolt and Nut. Boulon et nois sans fil.}

Jacob J. Souder, Washington, District of Columbia, U.S.A.
27th November, 1906; 6 years. Filed 17th February, 1906. Recelpt No. 132,995.
Claim.-1. An improved article of manufacture, a bolt provided with a solid head integral therewith and having separated unwelded members extending from the head in parallel planes normally in engagement with each other, and in which the longitudinal fibers of the metal are separated in the transverse center of the bolt from the head to the end of the bolt.
2. A threadless bolt having a solid head and members extending therefrom in parallel planes normally in engagement with each other and separable at their outer ends, a threadless nut surrounding said members and a wedge between the members extending into the nut and covered by said members.
3. A threadless bolt having a solid head and separate members extending therefrom in parallel planes normally in engagement with each other and separable from their outer ends up to the head, a threadless nut surrounding said members and a wedge between the members extending into the nut and covered by said members.
4. A threadless bolt having a solld head and members extending therefrom in parallel planes normally in engagement with each other and separable at their outer ends, a
nut having a threadless conical opening therein, and surrounding the bolt, a wedge between the outer ends of the

bolt extending into the nut and enclosed by said outer ends of the bolt engaging the wedge.

No. 102,281. Hot Air Engine. Machine à air chaud.

Frank W. Moore, Frank B. Hubbard and Casius M. Pierce, each an assignee of a third interest, Warren, Ohio, C.S.A., 27 th November, \(1904 ;\); 6 years. Filed 24th September, 1906. Receipt No. 139,756.
Claim.-1. In a hot air engine, the comblination of a working cylinder with an air heating cylinder, and open passage connecting said cylinders, a plunger in sald airheating cylinder and a piston in said working cylinder and crank connections for the same, a heater for said airheating cylinder and an auxiliary air pump connected with sail piston. air connections between said pump and airpressure heating cylinder, a check-valve for said air heating cylinder.
2. In a hot air engine, a casting with a working cylinder and a portion of an air-heating cylinder embodied thereln. separate upper and lower extensions to complete said air heating cylinder, a water jacket for the upper extension and a heater casing for the lower extension, a heater bencath said air heating cylinder, a piston for said working cylinder and a plunger for said air heating cylinder, a rrank shaft and balance wheel thereon and crank conneclions between said crank shaft and said piston and said plunger, an auxillary air pump for said engine and air connowtions between said auxiliary alr pump, and the lower end of sall air heating cylinder. and means to control the flow of air to said heating cylindor from said auxiliary pamp. allil an automatic air relief valve for the upper end of said air bratlag cylinder.

No. 102,282. Tool Holder for Lathes.
Mandrin pour tours.

The John Bertram and Sons Company, Dundas, assignee of George Theodore Reiss, Hamilton, both in Ontario. Canada, 27th November, 1906; 6 years. Filed 27th October, 1906. Receipt No. 140,688 .
Claim.-In a tool holder for lathes, a base portion on which the tool may rest, ears projecting upwardly there. from and horizontally mortised above the tool top level. a nut bar engaging and horizontally shiftable in the mortises, and a set screw vertically threaded into the nut bar

No. 102,283. Telpher. Ascenseur.

Henry McL. Harding, New York City, New York, and Charies M. Clark, Summit, New Jersey, both in the U.S.A., \(\infty\) inventors, 27 th November, 1906 ; 6 years. Filed soch November, 1905. Receipt No. 130,507.
Claim.-1. In a telpher system, a telpher, a hosiding apparatus carried by the telpher, means for putting the hoisting apparatus in operation, means for cutting ont the holst ing apparatus and for cutting in the telpher, and means for stopping the telpher at a predetermined point.
2. In a telpher system, a telpher, a hoisting apparatus. means for putting the hoisting apparatus in operation. means for automatically stopping the hoisting apparatus. means for automatically starting the telpher apparatus, and means for automatically stopping the telpher at a predetermined point.
3. In a telpher system, a telpher, a holsting apparatus carried thereby, means for putting the holsting apparales in operation, means for stopping the holsting apparatus. means ior starting the telpher, means for stopplag the telpher at a predetermined point, and means for lowering the hoist at said point.
4. In a telpher system, a telpher, a hoisting apparatus. means for starting the hoisting apparatus, means for automatically stopping the hoisting apparatus and for starting the telpher, means for automatically stopping the telpher at a predetermined point and for causing the holst to lowe: at said point.
5. In a telpher system, a telpher, a holstiag apparatue. means for putting the hoisting apparatus in operation. moans for stopping the hoisting apparatus, means for starting the felpher. means for stopping the telpher at a predetermined point, means for causing the hoisting apparatus to lower at said point. and means for reversing the bolsting apparatus at said point.
6. In a telpher system, a telpher, a hoisting apparatus, means for putting the hoisting apparatus in operation, means for automatically stopping the holsting apparatus and for putting the telpher in motion, means for automatically stopping the telpher at a predetermined point and for causing the hoisting apparatus to lower at said point, and means for automatically reversing the hoisting apparatus to cause it to hoist at sald point.
7. In a telpher system, a telpher, a hoisting apparatus connected to and carried by the telpher, means for putting the hoisting apparatus in operation, means for automatically stopping the hoisting apparatus and for throwing the telpher in operation, means for stopping the telpher at a predetermined point to cause the hoisting apparatus to reverse at said point, means for automatically stopping the hoist and causing it to reverse at said point, and means for automatically stopping the hoist and causing the telpher to operate.
8. In a telpher system, a telpher, a hoisting apparatus carried by said telpher, means for putting the hoisting apparatus in operation, means for automatically stopping the telpher at a predetermined point. means for automatically changing the direction in which the telpher will move from sald point, means for automatically causing the hoisting apparatus to lower at eald point, means for automatically dumping the load. means for automatically reversing the hoist, and means for automatically stopping the hoist, and causing the telpher to operate.
9. In a telpher system, a telpher a holsting apparatus connected to and carried by the telpher, means for putting the hoisting apparatus in operation, means for automatically stopping the hoisting apparatus and for putting the telpher in operation, means for automatically stopping the telpher at a predetermined point, means for automatically switching the telpher so that it may be caused to travel in the opposite direction, means for automatically causing the hoisting apparatus to lower at said predetermined point, means for automatically dumping the load at said point, means for automatically reversing the holst while the telpher is at said point and for causing the telpher to operate, and means for automatically stopping the telpher when it reaches the starting point.
10. In a telpher system, a telpher, a hcisting apparatus connected to and carried by the telpher, means for causing the hoisting apparatus to operate to raise a load, means for automatically stopping the hoisting apparatus and for causing the telpher to travel to a distant point, automatic means for stopping the telpher at said point, means for automatically swtching the telpher so that it will travel in a reverse direction, means for automatically causing the holsting apparatus to lower a load, means for automatically dumping the load, means for automatically reversing the hoisting apparatus, means for automatically stopping the hoist and starting the telpher so that the telpher will travel to its frst postion, and means for automatically stopping the telpher at said first position and to automatically start the hoisting apparatus to lower.
11. In a telpher system, a telpher, a hoisting apparatus connected to and carried by the telpher, means for causing the hoisting apparatus to operate to raise a load, means for automatically stopping the hoisting apparatus and for causing the telpher to travel to a distant point, automatic means for stopping the telpher at said point, means for automatically switching the telpher so that it will travel in a reverse direction, means for automatically causing the hoisting apparatus to lower a load, means for automatically dumping the load, means for automatically reversing the hoisting apparatus, means for automatically stopping the hoist and starting the telpher so that the telpher will travel to its first position, means for automatically stopping the telpher at said first position and to automatically start the hoisting apparatus to lower, and means for automatically stopping the hoist when it is lowered to a predetermined point.
12. In a telpher system, a telpher, a hoisting apparatus connected to and carrled by the telpher, means for putting the hoisting apparatus in operation, means for automatically stopping the hoisting apparatus and causing the telpher to operate, means for automatically stopping the telpher at a distant point, means for automatically changing or switching the telpher so that it will travel in an opposite direction, means for automatically causing the hoist to operate at said distant point to lower a load, means for automatically dumping the load, means for automatically reversing the hoist after the load has been dumped, means for automatically stopping the holst and to throw the telpher in operation so that it will travel to its first position, means for automatically stopping the telpher at said first position so that it will travel in an opposite direction, means for automatically putting the holst in operation to lower, and means for automatically stopping the holst when it has lowered to a predetermined point.

No. 102,284. Wrench. Clé décrou.

Cuthbert B. Lowry, Lexington, Kentucky, and Richard Bernhard, Cudahy. Wisconsin, U.S.A., 27th November, 1906; 6 years. Filed 7 th November, 1906. Receipt No. 141,001.
Claim.-1. The combination with two parts or members, each movable relatively to the other, and having an intervening space, the opposite walls whereof are approximately convergent at a plurality of points, rollers located in pairs within such space, means for holding the rollers of each pair in fixed relation to each other, and means tending to normally hold the rollers in engagement with the opposite walls at said points of convergence.
2. The combination with two parts or members, each movable relatively to the other, with a series of separate chambers between the two members, the walls of each chamber being approximately convergent at a plurality of points, a plurality of rollers located within each chamber and designed to engage the opposite walls therect, means for holding the rollers in each chamber in fixed alignment with each other. and means tending to normally hold the rollers toward the reduced portions of each chamber.
3. A wrench comprising a casing having an annular opening, a socket head within said opening, a serles of separate chambers being formed between the socket head and the wall of said opening, each chamber having eccentrically arranged walls, rollers located within said chambers, and carriers for bolding the rollers of each chamber in fixed relation to each other.
4. A wrench comprising a casing having an annular opening, a socket head fitted within said opening, a series of separate chambers being formed between the socket head and the wall of said opening, each chamber having eccentrically arranged walls, rollers located within sald chambers, carriers for holding the rollers of each chamber in fixed reation to each other, and springs acting on sald carriers.
5. The combination with the casing haring an annular opening, of the socket head fitted in said opening and havIng at its periphery a series of spaced apart chambers, the periphery of said head within each chamber being eccentric, at two different points, to the axis of the wrench, a roller for co-operating with each eccentric portion of each chamber, a carrier for holding the rollers of each chamber in fixed relation to each other, and means acting on said carrier for holding the rollers toward one end of each chamber.
6. The combination with the casing having an annular opening, of the socket head fitted in said opening having a series of peripheral projections and intermediate chambers, each chamber having separate bearing surfaces eccentric to the axis of the wrench, rollers within said chambers, carriers for said rollers, and springs mounted in said peripheral projections and acting on said carriers.
7. The combination with the casing having an annular opening, of the socket head having a series of peripheral projections forming separate chambers having bearing surfaces eccentric to the axis of the wrench, rollers located in said chambers, carriers for holding each pair of rollers in fixed relation to each other, said carriers comprising connected side bars having oien ended slots to accomodate the journals of said rollers, and springs mounted in said projections and acting on said carrlers

No. 102,285. Drill. Fûrct.

Silvio Casparis, Columbus, Ohio, U.S.A., 27 th November, 1906; 6 years. Filed 19th Octeber, 1906. Receipt No. 140,432.
Claim.-1. A tool comprising a bidy, a bit carrying device therein, a rifle bar, means separate from the rifle bar and under constant pressure of notive fluid for holding the rifle bar normally against rotation, and means for intermittently directing motive fluid upon the holding means to equalize the pressure thereon and permit its rotation.
2. A tool of the character described comprising a body. a tool carrying device movably mounted within the body, a rifle bar, means separate from the rifle bar for holding it against rotation, means for constantly directing fluid under pressure against sald holding means, and means for intermittently equalizing the pressure upon the holding means to alternately hold and release the rifle bar.
3. A tool of the character described comprising a body, a tool carrying piston movably mounted therein, a rifle bar, means for clamping the bar to hold it against rotation, means for constantly directing motive fiuid against one face of the holding means and means for intermittently directing motive fluid between the piston and the holding means whereby the pressure on said holding means is equalized during the alternate strokes of the piston.
4. A tool of the character described comprising a body, a tool carrying piston movably mounted therein, a rifle bar, clamping means for holding the bar against rotation, said body having a port for constantly directing fluid against one face of the clamping means, and having ports for directing motive fluid against opposite ends of the piston alternately and against the other face of the clamping means intermittently.
5. In a tool of the character described the combination with a body having a tool carrying piston movably mounted therein, of a rifle bar having a head, an interior projection in the body and overlapped by the head, a holding piston bearing upon said head, means for constantly directing motive fluid under pressure against said holding piston to clamp the head when pressure upon said head is not equalized, and means for directing motive fluid between one end of the tool carrying piston and the head intermittently to equalize pressure on the head.
6. A tool of the character described comprising a body having an interior shoulder, a tool carrying piston mounted therein, means for conveying motive fluid to opposite ends of the piston, a rifle bar having a head disposed beyond the path of the piston, a washer interposed between said head and the shoulder, a holding piston movably mounted within the body and contacting with the head, and means for constantly directing motive fluid against said piston.
7. A tool of the character described comprising a body having an interlar shoulder, a tool carrying piston movably mounted within the body between the shoulder and one end of the body, sald body having ports for directing motive fluid against the ends of the piston, a washer loosely bear ing upon the shoulder, a rifie bar having a head bearing on the washer, and a piston loosely mounted within the body and bearing upon the head, said body having a port for constantly directing motive fluid between the holding piston and the adjoining head of the body.

\section*{No. 102,286. Explosive Gas Engine.} Machine explosive d gas.

Edward G. Shortt. Carthage, New York, U.S.A., 27th November, 1906; 6 years. Flled 16th June, 1906. Receipt No. 136,971.
Clatm.-1. An explosive gas engine having a cylinder with - combustion chamber and a piston working therein, an exhaust chamber, a fuel duct, an air and fuel combining rhamber having free and unobstructed communication with said combustion chamber, an air compression compartment, and a varuum spaci intermediate the combustion chamber and the compression compartment, a valved passageway

Irading from the vacuum space to said exhaust chamber, valve mechanism for allowing air under pressure from sald

rompression compartment together with fuel to simultaneously enter the combining chamber. and means for actuating said mechanism exposed on one side to the atmospbere and on the other side to the vacuum space, as set forth.
2. An explosive gas engine having a cylinder with a combustion chamber and a piston working therein, an exhaust chamber a fuel duct, an air and fuel combining chamber. having free and unobstructed communications with said combustion chamber, an air compression compartment. and a vacuum space intermediate the combustion chamber and the compression compartment, a valved passageway lead. ing from the vacuum space to said exhaust chamber, valre mechanism for allowing air under pressure from said compression compartment together with fue!, to simultanenusly enter the combining chamber, a pneumatic cylinder positioned in a pasageway communicating with said vacuum space. a piston in said pncumatic cylinder and adapted to actuate said valve mechanism, nd means for regulating the supply of air to said pneumatic cylinder, as set fortb.
3. An explosive gas engine having a cyllnder with a combustion chamber and a piston working therein, an exhaust chamber with ports leading theretn from the lower porllon of the combustion chamber, a fuel duct, an air and fu-l combining chamber, having free and unobstructed commun:cation with the combustion chamber, an air compressind compartment, the lower end of sald piston belng enlargod and adapted to form with the adjacent wall of the crlinder in which it works a vacuum space which communicates through a valve regulated passageway with sald exhaust chamber, valve mechanism for allowing the alr under pr. ssure from sald compression compartment and iuel to simultaneously enter the combining chamber. and means fir actuating said mechanism exposed on the one side to the atmosphere and on the other side to the vacuum space. as set forth.
4. An explosive gas engine having a cylinder with a combustion chamber and a plston working therein. an exhaus: chamber, a fuel duct, an alr and fuel combining chamber. having free and unobstructed communication with said combustion chamber. an alr compression compartment. a vacuum space being formed intermediate the combustion chamber and the compression compartment. a pneumatic cylinder with a duct leading thercfrom and communica:ing with said vacuum space, and valve mechanism for regulatiog the supply of air from the compression compartment and fuel to the combining chamber, simultaneously with the closing of the exhaust to the atmosphere, as set forth.
5. In an explosive gas engine, a combination chamber. ar air compression compartment, a piston working in sa:1 chamber and having an enlarged end to compress air in:o said compartment, a vacuum space being formed intermediate the circumference of said piston and the wall of the compression compartment, a combining chamber haring free communication with the combustion chamber. at exhaust chamber with norts leading to the combustion chamber and to the atmosphere, an induction ralve costrolling the feeding of air and fucl to the combinlag chamber, a stem upon which said valve is mounted, a preumatic cylinder, a piston mounted in said chamber and exposid on one side to the atmosphere and on the other slde to the vacuum space, said piston having a contracted portion for controlling the port leading from the exhaust chamber, as set forth.
6. In an explosive gas engine, a combustion chamber, ad air compression compartment and vacuum epace, a flatoo
working in said chamber, and having an enlarged end adapted to compress air within said compartment, an exhaust chamber of measured capacity communicating with the combustion chamber and with the atmosphere, a combining chamber communicating with the combustion chamber, a duct leading from sald air compression compartment to convey air from the latter to the combining chamber, a pneumatic cylinder and piston working therein, a duct leadIng from sald cylinder to said vacuum space an inductive valve and stem secured thereto, which is also fastened to said piston in said cylinder, and valve mechanism in connection with said piston in the cylinder, and means for actuating said mechanism exposed on the one side to the atmosphere and on the other side to the vacuum space, and means for allowing a given quantity of alr to enter the pneumatic cylinder to break the vacuum, as set forth.
7. In an explosive gas engine, a combustion chamber, an air compression compartment and a vacuum space, a piston working in said chamber, and having an enlarged end adapted to compress air within sald compartment, an exhaust chamber of measured capacity communicating with the lower portion of the chamber and with the atmosphere, an inductive valve for regulating the supply of air and fuel to the combustion chamber, a pneumatic cylinder, a piston having an enlarged head working in said cylinder and provided with a contracted portion regulating the exit passageway between said exhaust chamber and the atmosphere, a valve regulating the ingress of air to said cylinder, said induction valve actuated by said piston in said cylinder, the latter having communication wih sald vacuum space, as set forth.
8. An explosive gas engine comprising a combustion chamher, a working piston therein, an annular chamber for receiving the residue of the products of combustion, an induction valve, a pneumatic cylinder, a piston working therein having a contracted portion regulating the exit passageway from said annular chamber to the atmosphere, a valve regulated air inlet duct leading to the pneumatic cylinder, a stem on which the piston of said cylinder is mounted, an induction valve mounted on said stem, and opening into a combining chamber, a shell in which an enlarged portion of the working piston travels forming a vacuum space, a port leading from said space to the pneumatic cylinder, an air compression chamber, a crank shaft mounted therein, and a pitman between said working piston and shaft, and a duct formed in the casing of the engine and leading from the air compression chamber to said induction valve, whereby air under pressure may be fed to the combining chamber as the induction valve is unseated, as set forth.
9. An explosive gas engine comprising a combustion chamber, a working piston mounted therein, a shell extending below the combination chamber, an enlarged portion of said piston working therein. an air compression compartment, an annular chamber for receiving the residue of the products of combustion, a pneumatic cylinder, a piston having an enlarged headed portion working in said cylinder and a contracted portion regulating communication between the exhaust chamber and the atmosphere, a stem fitted to said piston in said cylinder, and an induction valve secured to said stem and regulating the flow of air and fuel to the combining chamber, as set forth.
10. An explosive gas engine having a combustion chamber. a receiving chamber communicating therewith into which the residue of the products of combustion is forced, a working piston mounted in the combustion chamber, a shell below the combustion chamber forming a space in which an enlarged portion of the working piston reciprocates, an air compression compartment, a mixing chamber into which air is conducted from said air compression compartment, an :nduction valve and stem on which the same is mounted, a oneumatic cylinder, a passageway leading therefrom to said space, a portion of the piston in said cylinder controlling communication between the recelving chamber and the atmosphere, a guide piece through which said stem passes, and a spring for normally holding the induction valve closed. as set forth.
11. In an explosive gas engine, a combustion chamber and an air compression compartment, a piston in sald chamber, a recelving chamber communicating with the combustion chamber and into which the residue of the products of combustion is forced, an induction valve, a stem on which the same is mounted, a shell extending below the combustion chamber, an enlarged portion of said piston working within said shell, a vacuum space formed between the enlarged portion of said piston and shell, a pneumatic cylinder, a duct leading therefrom to said vacuum space, a piston mounted in said cylinder and connected to the induction valve, and a valve regulated air inlet duct leading to said cylinder, a duct leading from the air compression chamber to the combining chamber, a valve regulated fuel aperture opening to the seat of the induction valve, and a spring actuated valve regulating the passageway between said air compression chamber and said receiving chamber, as set forth.

No. 102,287. Pneamatic Tire for Wheels.
Bandage pncumatique pour roues.

Clara Annette Smith. 399 London Road, Thornton Heath, Surrey, England. 27th November, 1906; 6 years. Filed 18th October, 1905. Receipt No. 129.104.
Claim.-1. The herein described process of producing leather tire casing, which consists in subjecting rawhide to the usual depilation and liming processes, moulding the strips of rawhide to the desired shape on a form while in a flaccid condition produced by the soaking of the liming process, and subjecting the strips to a tanning process while moulded on such form.
2. The hercin described process of producing leather tire casings, which consist in soaking strips of rawhide to render them flaccid. moulding such strips to the desired shape on a form, and subjecting the strips to a tanning process while moulded on such form.
3. The herein described process of producing leather tirc casings, which consist in soaking strips of rawhlde to render them flaccid, moulding such strips to the desired shape on a form, and subjecting the strips to the chrome process of tanning while moulded on such form.

No. 102,288. Mop Wringer. Essoreuse.

David Whitehurst and Albert J. Ean, assignee of a half interest, both of New York City, New York, U.S.A., 27th November, 1906 ; 6 years. Filed 25th April, 1906. Receipt No. 135,253.
Claim.-A pail having a guard across the upper edge thereof and partly covering said pail, said guard having an inverted cone projecting downwardly therefrom into the interior of said pail and having openings therein through which the water may drain.

No. 102,289. Slap Fook. Crochet d ressort.

Arno Macdler, Valentin Hartung, Wilhelm Griesing and Emil Welsshaar, all in Germany, 27th November, 1906 ;
6 ycars. Filed 20th November, 1905. Receipt No. 130,237.
Claim.-1. The combination of a hook, a mousing piroted thereto and having a locking recess, a catch which comprises members on opposite sides of the hook and which congages in said recess when the mousing is closed and means for holding the catch in engagement with the reciss. substantially as set forth.
2. The combination of a hook. a mousing pivoted thereto. and a spring catch which is rigidly secured to the side of the hook and projects therefrom toward the mousing. said catch yielding laterally from the hook in closing the mousing. substantially as set forth.
3. The combination of a hook, a mousing pivoted thereto and having a locking recess in its side, and a spring catch which is rigidly secured to the side of the hook and proierls toward the mousing and which iz ornvidnt with a locking lug which engages in the recess of the mousing when the latter is closed, substantlally as set forth.
4. The combination of a hook having a curver bill end which is provided in its concave side with a longitudinal romes. and a mousing plvoted to the hill ond of tha hook and having a curved bearing piece adapted to bear with ils ennvex side against the concave side of the hook and provided on its convex alin with a longitudinal rib which is seated in said recess when the mousing is closed. subsiantially as sct forth.

\section*{No. 102,280. Steam Boiler. Chaudiere d rapeur.}

Leon Brewster Lent and Robert William Semple. assignee of a half interest, both of New York City. New York, C.S.A., 27th November, 1906; 6 years. Filed 9th October, \(1!\mathrm{M}_{5}\) Receipt No. 129.061 .
Claim.-1. The combination of a vertical tubular boller, a casing surrounding same, and a furnace communicating langentially with sald chamber near the upper end thereof, whireby the furnace gases are caused to take a brlical course about the boller and through said chamber before passing through the boiler tubes, substantially as described.
i. The combination of a vertical tubular boller. a chambir surrounding same, a furnace communicating tangentially with the upper end of said chamber. whereby the furnare gases are caused to take a downward helical course about th. boller and through said chamber before taking an upward course through the tubes of the boller, substantlally ats deseribed.
: The combination of a vertical tubular boller, a casing currounding same and forming a chamber. a furnace communfoating tangentially with the upper end of sald chamber and a hilical suptum in said chamber wheriby the gases are furced to take a belical downward courae about the
boiler and then pass upward throush the tubes of the boiler to the smoke stack, substantially as deacribed.

4. The combination of a vertical boller, a chamber about the same, a furnace connected with said chamber near its upper end, tubes in said boller whereby the furnace gases pass downward about the boiler and then upward through the tubes, a superheater located below the boiler in the chamber, and in the path of the gases after they have surrounded the boiler, and a steam plpe leading from the upper part of the boiler to the superheated, abstantially as described.
5. The combination of a vertical tubular boller. a chamber surrounding the same, a furnace so connected with the upper part of the chamber as to cause the gases to pass about the boller in a helical whirl and then through the boilfr tubes, a superheater located in the chamber below the boiler and in the path of the gases and a steam pipe connecting the guperheater with the upper part of the boiler, substantlally as described.
6. The combination of a boiler. a chamber surrounding the same, a furnace connected with one end of sald chamber and to one side of the longitudinal axis of the boller. whereby the furnace gases are caused to pass in a helical path about the boiler to its other end, a auperbeater at this end located in the chamber, and a pipe connecting the upper or steam space of the boiler with sald superheater. substantially as described.
7 The combination of a boller, a chamber surrounding the same, a furnace connected with one end of said chamber. and to one side of the axis of the boiler, a bellcal septum in eald chamter, whereby the gases are forced to pass in a tangential helical whirl about the boller to its other end: a superheater located at this ond and a steam plpe connecting the boller steam space with sall superheater, substantlally as described.
8. The comblnation of a vertical boller provided with tubes. a chamber surrounding the boller, a furnace connected tangentially with eald chamber near its upper end. a hellical septum in sald chamber surrounding the boller. a superheater located below the boiler in said chamber and a pipe connecting the steam space with said superheater whereby the furnace gases pass in a tangential helfcal whirl about the boller. down through the chamber. about the superheater, and then through the boller tobec. substantially as described.

\section*{No. 102,291. Imbsicator. Graisacur.}

Darius Gilead Pickett, asalgnoe of Lester D. Pickett. both of Fredonia. New York. U.8.A., 27th November, 1908: 6 ycars. Filed 18th August, 1908. Recelpt No. 138,is3.
Claim.-1. The combination with an internal combuation engine, of a lubricator connected thereto, meana for regolating the speed of the engine, and mechantam conaecter to the pered regulating means for goveraing the quancley of lubricant fed from the lubricant at each nirote of cio ea. gine.
2. The combination with an internal combustion engine. of a speed regulating means for the engine, and a lubri-

cator connected to the speed regulator means and adjustable therewith to increase the quantity of the lubricant fed at each stroke of the piston as the speed of the engine increases, and to reduce the quantity of lubricant fed at each stroke as the speed of the engine decreases
3. The combination with an internal combustion engine, of means for regulating the speed of the engine, a lubricant reservoir, a feed chamber in communication therewith, a valve connected to the feed regulating means and adjustable in accordance with the speed of the engine to govern.
4. The combination with an internal combustion engine, of a lubricator connected thereto, means for regulating the speed of the engine, and mechanism connected to the speed regulating means for governing the quantity of lubricant fed from the lubricator.
5. In a lubricator, a pair of superposed chambers, the upper forming a reservoir, and the lower a feed chamber, a pair of valved ports through which sald chambers may be placed in communication with each other, and adjusting mechanism connected to one of the valves, the second valve being manually adjustable to open or closed position, and a suction opened discharge valve for permitting the flow of lubricant from the feed chamber.
6. In a lubricator, a hollow spindle having an annular flange arranged intermediate its ends, upper and lower cap members mounted on the spindle, tubular casings extending between the flange and the cap members and forming superposed chambers, one constituting an of reservoir and the other a feed chamber, thers being a valved port extending through the flange, and a port extending from the lower chamber to the interior of the hollow spindle, the lower end of said spindle being arranged to form a valve seat, a valve adapted to said seat. a rod extending through the spindle, a spring acting on said rod, aud tending to close the valve, and means for connecting the uppar chamber to a main lubricant reservoir.
7. In a lubricator, a hollow spindle having an annular flange about midway of its ends. cap members fitted on the end portions of the spindle, tubular casings held between the flange and cap members, packing rings arranged at the end of the casinge to form fluid proof joints, the upper of the casings constituting an oil reservoir and the lower. a feed chamber, there being a port extending through the wall of the lower portion of the chamber for the outflow of oil from the lower chamber and a pair of ports extending through the flange, a valve arranged in one of said ports, an adjusting device connected to said valve, a second manually operable valve arranged in the second port, there being an air port leading from the onter edge of the flange to the lower chamber, a valve in said port, a coupling collar screwed to the lower end of the spindle, the lower end of said spindle being shaped to form a valve seat, a suction opened valve adapted to said seat, a valve rod extending through the spindle, a spring arranged at the upper end of the spindle and tending to hold the valve closed, a lock nut at the upper threaded end of the spindle, a cap covering the end of the spindle and concealing the spring, a ramovable plug screwed in the upper cap and a coupling nipple extending from the upper cap for connection to a main supply reservoir.

No. 102,292. Locomotive. Locomotive.

John Edward Robertson and Robert Carnahan, Jr., assignee of a half interest, both of Onedia, Kentucky, U.S.A., 27th November, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,080.
Claim.-1. In a locomotive engine the combination with the front and rear driving wheels thereof, of two cylinders arranged upon each side of the locomotive, one above the other, a piston working in each cylinder, pitmen connected at their forward ends, one to each piston rod, the rearward end of the lower pitmen being plvoted eccentrically to the forward driving wheel, a connecting rod connecting the forward driving wheel with the rearward driving wheel. gears secured to and adapted to revolve with the driving wheels, gears arranged above the first-named gears and meshing with the same and journalled to the framework of the locomotive. the upper pitmen being pivoted eccentrically to the forward upper gears, connecting rods connecting all of the upper gears together, the wrist pins of the driving wheels and the wrist pins of the upper gears being so disposed relative to one another as to be one-quarter revolution removed relatively, as and for the purpose specified.
2. In a locomotive engine the combination with the front and rear driving wheels thereof, of two cylinders upon each s!de of the locomotive, said cylinders being arranged one above the other, piston rods extending from said cylinders, two pitmen upon each side of the locomotive connected one to each piston rod, the lower pitmen being connected at their rearward ends eccentrically to the forward driving wheels, wheels arranged above the driving wheels and adapted to mesh therewith, the upper pitmen connected at their rearward ends to the forward one of these wheels, connecting rods connecting the driving wheels together and also the wheels in mesh with the driving wheel, the wrist pins upon the driving wheels being so disposed that the pistons in each pair of cylinders will always be at a distance apart equal to half of a complete stroke in either direction to cause the pistons at one end of the engine to move in the same direction for half of the stroke of any one piston, while during the next half stroke the piston will move in opposite directions.

\section*{No. 102,293. Gas Engine. Machine d oaz}

Robert P. Moodie and Charles W. Ball, assignee of a half interest, both of Ottawa, Ontario, Canada, 27 th November, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,096.
Claim.-1. An engine comprising the combination with a cylinder and piston, of a valve casing communjoating with the cylinder, an inwardly opening valve commanding opening in the valve casing, an outwardly opening valve commanding a second opening in the valve casing, a pressure reservoir communlcating with the second valve, means establishing communication between the pressure reservoir and a third opening in the valve casing at a point removed from the two valves first-named, a third valve operating in the valve casing, and means for operating the third valve, said valve being shiftable to establish communication between the two first-named valves and the cylinder, or to close the said communication and establislı communication between the third opening in the valve casing and the cylinder.
2. The combination with two cylinders and plstons thereIn, of a valve casing communicating with said cylinders, a prissure reservoir, means establishing communication between the pressure reservoir and an intermediately situated opening in the valve casing, two valves commanding openings in one end of the valve casing, one valve opening inwardly and the other opening outwardly, means establishing communiaation between the outwardly openting valve and the presure reservoir, a third valve operating
within the valve casing. and mrans for actuating the third valve, said third valve being shiftable so as to distribute

the pressure from said intermediately situated opening in the valve casing to the two cylinders or to close communiration between said cylinders and sald intermediately situated opening an do open comunication between the two first-named valves and one of the cylinders.
3. The combination with two cylinders and pistons operating therein, of a valve casing communicating with the cylinders. a pressure reservoir communicating with the valve casing intermediate its ends, inlet and outlet valves commanding oriftees in one end portion of the valve casing, means establishing communication botween the outlet valve and the pressure reservoir, and a valve operating in the casing and rapable of connecting the pressure riservoir with the cylinders to distribute the pressure therein and operato the pistons, or of moving to disconnert one of the cylinders and connect the other cylinder with the end of the valve casing having the said infet and outhe valves, whereb; to permit the operation of the last. nimed eylnder os : cenepressor.
4. The combination with two cylinders and pistons work. ing therein, of a valve casing communicating with the cylinder, a pressure reservoir, means establishing communication between the pressure reservoir and an intermedi ately situated oriflee in the vaive casing. inlet and out. let valves commanding orifices in one end of the valve rasing means establishing communication between the outlot valve and the pressure reservoir, and a valve arranged to rock and slide within the valve casing. said valve being slidable to one position to distribute pressure to the cylinders from said intermediately situated orifice, and to another position to cut off the cylinders from one orlfice and connect one of the cylinders with said inlet and outlet valves.

No. 102,294. Valve for Explosive Engines.
Soupapc pour machincs cxplosites.

The Winton Motor Carriage Company, assignee of Alexamber Winton and Harold B. Anderson, all of Cleveland, ohin. l.s.A., 27th Nowmber. 1:0f; 6 years. Filed 4th O-tober. 1906. Receipt No. 140,037 .
Claim.-1. The combination of two reciprocaling valves having projecting stoms, of a member loosely connected
with both of said valve stems, and a spring acting upon the yoke at an intermediate point to actuate both valves ind.pendently in the same direction.
2. The combination of two valves having stems projecting in the same direction, a tilting member having its ends looscly connected with said valve stems and a spring acting on the said tilting member at an intermediate point to move the valves independently in the same direction.
3. The combination of two valves having stems projecting in the same direction, a yoke having its respective ends swivelled to said stems and a spring acting on the yoke at an intermediate point to move said valves in the same dirction.
4. The combination of two valves having stems projecting in the same direction and a rigid yoke spanning the space between said stems and having its respective ends fulcrumed upon said valve stems and a spring acting on the yoke at an intermediate point and thereby serve to holl said valves in the same direction and permit independen: movement thereof.
5. The combination of two valves having their stems projecting in the same direction, a valve stem yoke having its respective ends fulcrumed on said stems, a spring yoke fulcrumed on said yoke and a spring acting on said spring yoke, the parts operating substantially as described.
6. The combination of two valves having stems projecting in the same direction, a valve stem yoke having its respective ends fulcrumed on said valve stems, a spring yoke fulcrumed at an intermediate point on said stem yoke, a spring holding member carried by the sald spring yoke, and a spring having one end in said holder and its opposite end engaging an independent member, the parts co-operating substantially as described.
7. The combination of two valves, and a single sprin; connected with said valves to move them in the same direction and to permit them to have an independent movemen: in the opposite direction.
8. The combination of two valves means for moving them alternately in the same direction, and a spring connected with the valves to alternately exert a tension on the ralves and permitting them to be alternately moved against said tension.
9. The combination of the two valves, means for moving the valves alternately in the same direction, and a spring connected with the valves to simultaneously exert a tension on both values in the same direction and at the same time permit either valve to be moved against said tension.
10. The combination of two valves, means for alternately moving the valves in the same direction, a spring connected with the valves to move them in the same direction and to exert an increased tension on one valve when the other is moved against the tension thereof.
11. The combination of two reciprocating valves having valve stems projecting in the same direction, remorable pins passing through said stems, a spring yoke having 1 e ends projecting at each side of said valve stems and ingaging said pins, the yokr constructed to hold the pins ir. place, and a spring holding the yoke in engagement with the pins.
12. The combination of two valves having stems projeciing in the same direction, removable pins passing through the stems, a spring yoke having its ends extending at each side of the stems and provided with recesses constructed to hold the pins against endwise removal, and a spring holding the yoke in engagement with the pins.
13. The combination of a reciprocating valve having a stom, a removable pin passing through its stem, and a spring yoke having a recess constructed to receive and prevent the endwise movement of the pin while in engaf.ment therewith.
14. The combination of a reciprocating valve having a projocting stom. a spring holding the valve closed, a ricinrocalling piston having an adjustable head adapted to cm とaLe sad valw stem. and means for moving the plston. th. parts constructed for the purpose described.
15. In an explosive engine reciprocating valves therefor a cam shaft rasing. a shaft carrying cams for operatio. \(=\) said valves, and removable cam shaft bearings carried by the casing of a size when removed to permit the shaft \(w: t h\) the rams thereon to be removed.

\section*{No. 102,295. Internal Combustion Bngine.}

Machine a combustion interne.
Arthur B. Goodsperd. Roseville, New Jerseg. C.S.A., a: Nowember, 1:06; 6 years. Flied 9th June, 1906. Receis: No. \(136 . \pi 56\).
Claim.-1. In an internal combustion engine the combin. ation of a working cyllader and plston, a primary com. pressor, an auxiliary compressor recelving air from the primary compressor and dellvering alr to the working cylinder, and means whereby air may be dellvered from
the auxiliary compressor to the primary compressor, substantially as described.

2. In an internal combustion engine the combination of a working cylinder and piston, a primary compressor, an auxiliary compressor recelving air from the primary compressor and delivering air to the worling cylinder, and a connection including a relief valve, fr'm the head end of the auxiliary compressor to the head end of the primary compressor, substantially as described.
3. In an internal combustion engine the combination of a working cylinder and piston, a primary compressor, an auxillary compressor, a connection, including a reservoir between the primary compressor and the auxiliary compressor, a connection between the auxiliary compressor and the working cylinder, and a connection including a rellef valve between the auxiliary compressor and the primary compressor, substantially as described.
4. In an internal combustion engine the combination of a working cylinder and piston, a primary compressor, an auxiliary compressor, a connection, including a check valve between the primary compressor and the auxiliary comsompressor, a connection including an inlet valve between the auxiliary compressor and the working cylinder, and a connection, including a relief valve between the auxiliary compressor and the primary compressor, substantially as described.

5 In an internal combustion engine the combination of a working cylinder and a primary compression cylinder in tandem, pistons for sald cylinders connected to move together, an auxiliary compressor, a connection, including a check valve, between the primary compression cylinder and the auxiliary compressor, a connection between the auxiliary compressor and the working cylinder and a connection, including a relief valve, between the auxiliary compressor and the primary compressor, substantially as described.
6. In an internal combustion engine the combination of a working cylinder and piston, a compression cylinder and piston, a reservoir, a connection from said reservoir to said working cylinder, a connection from said compression cylinder to said reservoir, a valve in sald connection normally opening under presstre from the compression cylinder, and means to open said valve to admit air under pressure from the reservoir to the compression cylinder in starting the engine, substantially as described.
7. In an internal combustion engine the combination of a working cylinder having a valve for the admission of fuel. oil and air, a piston, a compression cylinder and piston, a reservoir, a connection from said reservoir to said working cylinder valve, a connection from said compression cylinder to said reservoir, and a valve in said connection normally opening under pressure from the compression cylinder, substantially as described.

11-26

\section*{No. 102,296. Internal Combustion Brgine.}

Machine d combustion interne.

Arthur B. Goodspeed, Roseville, New Jersey, U.S.A., 27th
November, 1906; 6 years. Filed 9th June, 1906. Receipt
No. 136,757.
Claim.-1. In an internal combustion engine, the combination with an inlet port, of a two-part valve to co-operate therewith and comprising a central part and an outer annular part seated upon the said central part and movable independently thereof, and said central part co-operating directly with said port to close the same, and means to supply alr and fuel for admission by said parts respectively, substantially as described.
2. In an internal combustion engine, the combination with an inlet port, of a two-part valve to co-operate with said port and comprising a central part and an outer annular part seated upon said central part and movable independently thereof, said outer part being chambered internally and provided with a port, and said central part co-operating directly with said inlet porf to close the same, substantially as described.
3. In an internal combustion engine, the combination with an jnlet port having a conical valve seat, of a two-part valve to co-operate with said valve seat and comprising a central part and an outer annular part seated upon said central part and movable independently thereof, substantially as described.
4. In an internal combustion engine, the combination with an inlet chamber having an inlet port, of a two-part valve to co-operate with said port and comprising a central part and an outer annular part having a chambered sleeve surrounding the stem of the first-named part and provided with a port, and means to supply the elements of the combustible mixture separately to said valve chamber and said last-named port, substantially as described.
5. In an internal combustion engine, the combination with an inlet port valve, of a two-part valve to co-operate with said port and comprising a central part having a stem and an outer annular part seated upon the first-named part and having a chambered sleeve surrounding said stem valve operating devices operatively connected with said stem, and means to supply the elements of the combustible mixture separately to said valve port and to sald chambered sleeve, substantially as described.
6. In an internal combustion engine, the combination with an inlet valve port and a valve chamber, of a two-part inlet valve to co-operate with said valve port and comprising a central part having a stem and an outer annular part seated upon the first-named part and having a chambered sleeve surrounding said stem, means co-operating with said stem to lift the valve, and means to supply the elements of the combustible mixture separately to said valve chamber and to said chambered sleeve, substantially as described.

\section*{No. 102,297. Hydro-Carbon Engine. \\ Machine a hydro-carbone.}

Friedrich August Haselwander, Rastall, Germany, 27th November, 1906; 6 years. Filed 29th August, 1905. Recelpt No. \(128,019\).
Claim.-1. In a hydro-carbon engine having a projection at the rear of its piston, and another projection in the rear of its cylinder, the two projections being adapted near to the end of the back stroke of the piston to co-operate with each other so as to form two spaces of unequal capacity, the combination with the piston and the cylinder, of two projections of the kind stated, but so shaped that they form ledges extending across the cylinder space and are adapted to co-operate like a slide valve, as set forth.
2. In a hyro-carbon engine having a projection at the rear of its piston and another projection in the rear of its

cylinder, the two projections being adapted, near to the end of the back stroke of the piston, to co-operate with each other so as to form two spaces of unequal capacity, the combination with the piston and the cylinder, of two projections of the kind stated, and a third extending parallel to that in the rear of the cylinder and forming with the same a recess adapted to receive the projection of the piston, all said projections extending across the cylinder, as set forth.
3. In a hydo-carbon engine having a projection at the rear of its piston and another projection in the rear of its cylinder, the two projections being adapted near to the end of the back stroke of the piston, to co-operate with each other so as to form two spaces of unequal capacity, the combination with the piston and the cylinder, of two projections of the kind stated and a third extending parallel to that in the rear of the cylinder and forming with the same a groove adapted to receive the projection of the piston, said latter projection being shaped as a rib extending across the piston and being adapted to operate like a slide valve, as set forth.
4. In a hydro-carbon engine having a projection at the rear of its piston and another projection in the rear of its cylinder, the two projections being adapted, near to the end of the back stroke of the piston, to co-operate with each other so as to form two spaces of unequal capacity, the combination with the piston and the cylinder, of two projections of the kind stated, but the projection of the piston forming a rib extending across the whole diameter of the piston, and the other projection forming a ledge extending across the whole diameter of the cylinder space, parallel to sald rib, as set forth.
5. In a hydro-carbon engine having, first, a projection at the rear of its piston and another projection in the rear of its cylinder, the two projections being adapted, near to the end of the back stroke of the piston, to co-operat: with each other so as to form two spaces of unequal capacity, and second, a channel between said two spaces. the combination with the piston, the cylinder and said channel, of two projections of the kind stated, but so shaped that they form ledges extending across the cylinder space and are adapted to operate like a slide valve, and means for introducing the hydro-carbon into said channel, as set forth.
6. In a hydro-carbon engine having, first, a projection at the rear of its piston and another projection in the rear of its cylinder, the two projections being adapted, noar to the end of the back stroke of the piston, to co-operate with each other so as to form two spaces of unיqual capacity. and second, a channel betwern sald two spaces. the combination with the piston, the cylinder and said channel, of two projections of the kind stated, a third extending parallel to that in the rear of the cylinder and forming with the same a recess adapted to receive thi projaction of the plston, all said projections extending across the cylinder, and means for heating said channel, as set forth.
7. In a hydro-carbon engine having, first, a projection at the rear of its piston and another projection in the rear of its cylinder, the two projections being adapted near to the end of the back stroke of the piston, to co-operate with each other so as to form two spaces of unequal capacity. and second, a channel between said two spaces, the combination with the piston, the cylinder, and said channel. of two projections of the kind stated, a third extending parallel to that in the rear of the cylinder and forming with the same a groove adapted to receive the projection of th. piston. said latter projection being shaped as a rib extending across the piston and being adapted to operate like a slide valve, means for heating said channel, and means for introducing the hydro-carbon into the same.
8. In a hydro-carbon engine having, first, a projection at the rear of its piston and another projection in the rear of its cylinder, the two projections being adapted, near to the end of the back stroke of the piston, to co-operate with each other so as to form two spaces of unequal capacity. and second, an air inlet adapted to be opened by the piston at the end of its fore-stroke, the combination with the piston, the cylinder and the air inlet, of projections of the piston forming a rib extending across the whole diameter of the piston and being moreover so shaped that it is adapted to act as a deflector for the air allowed to pass into the cylinder through said inlet, the other projection fomring a ledge extending across the whole diameter of the cylinder space, parallel to said rib, as set lorth.
9. In a hydro-carbon engine having, first, a projection at the rear end of its piston and another projection in ithe rear of its cylinder, the two projections being adapted, near to the end of the back stroke of the piston, to cooperate with each other so as to form two spaces of unequal capacity, second, a channel betweeen sald two spaces, and third, an air inlet adapted to be opened by the piston at the end of its fore-stroke, the combination with the piston, the cylinder, the said channel and the said air inlet of two projections of the kind stated, but so shaped that they form ledges extending across the cylinder space and are adapted to operate like a slide valve, the ledge of the piston being moreover so shaped that it is adapted to act as a deflector for the air allowed to pass into the cylinder through said inlet, means for heating said channel, and means for introducing the hydro-carbon into the same, as set forth.

\section*{No. 102,298. Driving and Reversing Mechanism.} Mécunisme de mise en marche et renversement.

Robert Falkland Carey, 19 Ash Grove, Cricklewood. Misdlesex. England, 27th November, 1906; 6 years. Filed 30th January, 1906. Recelpt No. 132,422.
Claim.-1. In power transmitting, regulating and rerirsing mechanism, the combination with a rocker. of drivize mechanism connected to the rocker, a shifting fulcrum for said rocker, and means co-operative with the driving mechanism for adjusting sald fulcrum.
2. In a power transmitting, regulating and reversing mechanism, the combination with a rocker, of driving mechanism connected to the rocker, a shifting fulcrum for sald rocker, and means co-operative with the driving mechanism for automatically adjusting said fulcrum.
3. In Dower transmitting, regulating and reversing mechanism, the combination with driving mechanism, of a rccker connected therewith and carrying a cam, a driven member having a disc adapted to be engaged by sald cam, reversing mechanism for said driven member, a shifting fulcrum for said rocker, and means for simultancously applying the brake mechanism and adjusting the fulcrum.
4. In a power transmitting, regulating and reversing mechanism, the combination with driving mechanism of a rocker connected therewith and carrying a cam, a driven member having a disc adapted to be engaged by said cam, reversing mechanism for said drivon member, a shifting fulcrum for said rocker. and means dependent upon said fulcrum for actuating the reversing mechanism.
5. In a power transmitting, regulating and reversing mechanism, the combination with a rocker, driving mechanism connected to the rocker, a shifting fulcrum for said rocker in operative relation with the driving mechanism, and means actuated by the fulcrum for connecting or disconnecting the driving mechanism.
6. In power transmitting, regulating and reversing mechanism, the combination with a rocker, of driving mechanism connected to the rocker, a reciprocating fulcrum for sald rocker in operative relation to the driving mechanism, and means for limiting the travel of said fulcrum in either direction.
7. In power transmitting, regulating and reversing mechanism, the combination with a rocker, driving mechanism connected to the rocker, a shifting fulcrum for said rocker, brake mechanism, a frame carrying a screw spindle upon which the said fulcrum travels, gearing connecting the spindle with the driving mechanism, clutches controlling said gearing, and a plurality of regulating tappets for actuating the clutches and break mechanism.

No. 102,299. Ore Treatment. Traitement de minerais

Paul Gredt, Luxembourg, Germany, 27th November, 1906 ; 6 years. Filed 21st October, 1906. Receipt No. 129.444. Claim.-1. The herein described process of producing iron or steel which process consists in refining a bath of pig iron in an electric induction furnace by means of the convulsive movement caused by the pulsations of the inducing currents, said movement causing suitable additions to react rapldly upon pig iron or pig iron more or less refined.
2. The herein described process of producing iron or steel which process consists in refining a bath of pig iron by introducing suitable additions into the molten metal contained in an electric induction furnace, producing a convulsive movement of the bath by means of the pulsations of the electrc currents and thus causing the said additions to re-act rapidly upon the said bath of pig iron and to convert it into iron or steel.
3. The herein described process of producing iron or steel which process consists in introducing iron oxide compounds in a molten bath of pig iron contained in an clectric induction furnace, producing a convulsive movement of the bath by means of the pulsations of the electric currents and thus causing the said additions to re-act rapidly upon the said bath of pig iron and to convert it to iron or steel.
4.The herein described process of producing iron or steel which process consists in introducing iron oxide compounds mixed with reducing agents into a molten bath of pig iron contained in an electric induction furnace, producing a convulsive movement of the bath by means of the pulsations of the electric current and thus causing the sald additions to re-
act rapidly upon the said bath of pig iron and to convert it to iron or steel.
5. The herein described process of producing iron or steel which process consists in introducing suitable additions into a molten batff of pig iron freed to a convenient degree from phosphorus, contained in an electric induction furnace producing a convulsive movement of the bath by means of the pulsations of the electric currents and thus causing the said additions o re-act rapidly on said bath of pig Iron and to convert it to iron or steel. .
6. The herein described process of producing iron or steel which process consists in introducing iron oxide compounds into a molten bath of pig iron freed to a certain degneo from phosphorus, said bath being contained in an electric induction furnace, then producing a convulsive movement of the bath by means of the pulsations of the electric currents, and thus causing the said oxide compounds to re-act rapidly on the said bath of pig fron and to convert it to iron or steel.
7. The herein described process of producing iron or steel which consists in introducing iron oxide compounds mixed with reducing agents into a bath of pig iron freed from phosphorus to a certain degree and contained in electric induction furnace, producing a convulsive movement of the bath by means of the pulsations of the electric currents and thus causing the said oxide compounds to re-act rapidly upon the said bath of molten pig iron and to convert it to iron or steel.
8. The herein described process of producing iron or steel which process consists in introducing liquid pig iron into an electrical induction furnace adding suitable additions to the bath, blowing air into the bath for oxidizing the greater part of the phosphorus present producing a convulsive movement of the bath by means of the pulsations of the electric currents, then adding other suitable additions and thus converting the said pig iron to iron or steel.
9. The heretofore described electric induction furnace for carrying out the heretofore described process having an annular hearth provided with sumps or compartmetns for introducing the necessary additions and provided with restricted or widened portions for the purpose of forming an operating hearth for the re-action taking place, said sumps or compartments being so arranged as to direct said additions to come within the sphere or area of the pulsations of the bath.
10. The heretofore described electric induction furnace for carrying out the heretofore described process having an annular hearth provided with sumps and restricted to widened portions, taping holes provided at different levels for drawing off the slag or the molten bath and a tipping mechanism for the purpose of permitting of running off the metal or the slag.

No. 102,300. Flectric THme Switoh.
Aiguille horaire électrique.

John Gunning, 100 Holdenhurst Road, Bournemouth, Hants, England, 27th November, 1906; 6 years. FHled 9th December, 1905. Receipt No. 130,830 .
Claim-1.In electric time switches, a timing dial having adjustable releasing and closing tappets, a pivoted switch arm adapted to be displaced by the closing tappet, a detent co-operating with said switch arm and adapted to be displaced by the releasing tappet, a second pivoted switch arm, a spring urging said second arm to close on the first switch arm, a stop limiting the movement of the second arm and an insulating piece moved by the first switch arm to displace the second arm against its spring when the first arm is displaced by the closing tappet, substantially as described.
2. In electric time switches, a timing dial having adjustable releasing and closing tappets, a pivoted switch arm adapted to be displaced by the closing tappet, a detent cooperating with said switch arm and adapted to be displaced
by the releasing tappet, a second pivoted switch arm, a spring urging said second arm to close on the first switch arm, a stop limiting the movement of the second switch arm and a third arm pivoted on the first arm and arranged to encounter and displace the second arm when the first arm is displaced by the closing tappet, substantially as described.

No. 102,301. Holder for Paper Covers on Head Rests of Chairs.

Porte-papier à envelopper attaché au dos de fauteuil. Heinrich Mayr, Kulmbach, Bavaria, Germany, 27th November, 1906 ; 6 years. Filed 28th March 1905. ceipt No. 123.781.
Claim.-A holder with a supply roll of paper for covering the head rests of chairs having two supporting arms \(f\) pivoted at one end to the holder and adjustably held apari towards the opposite end by a crossbar o, substantially as set forth.

No. 102,302. Mrititubular Steam Generator. Générateur à vapcur.

P! \({ }^{\prime \prime}\)

Andrew Erskine, Muirhead, Cart Forge, Catheart, Glasgow, Ccotland, 27th November, 1906; 6 years. Filed 9th August, 1906. Receipt No. 138,550.
Claim.-In a multitubular steam generator the combination with the boiler tubes and the smoke box, of a spirally bent stirrer rod arranged in each of said tubes and having one of its ends extending outside of the smoke box, a motion plate arranged within the smoke box, and having a plurality of arms engaging the lateral ends of the stirrer rods and a driving shaft having one end connected to the motion plate and having its other end extending outside of the smoke box.

No. 102,303. Trolley Pole. Perche de trollé.

Hiliary Quertier, Dunedin, Otago, New Zealand, 27th November 1906 ; 6 years. Filed 12th October, 1906. Receipt No. 129,174.
Claim.- Apparatus for the purpose indicated, comprising in combination, a bracket fixed to the top of the vehicle. a lug integral with the bracket, a vertical stem having a jaw at its lower end, spring horns extending in opposite directions from the bracket, a tubular rod telescoping upon the stem, lock nuts screwed upon the stem, a spring threaded upon the stem between the lock nuts and the tubular rod, a trolley wheel mounted on the top of the tubular rod, a bracket fixed to the tubular rod and having opposing jaws, stay rods pivoted in the jaws of the said bracket and having their ends passed through the spring horns, nuts screwed upon the ends of the stay bars, springs threaded upon the stay bars and nuts above the springs screwed upon the stay bars, substantially as set forth.

No. 102,304. Cash Tray. Plateau àmonnaie.

Michael Holroyd Smith, Westminister, London, England, 27th November, 1906; 6 years. Filed 27th February. 1906. Recelpt No. 133 ès78.

Claim. - Cash trays made of glass or other transparent material characterized by the upper surfaces being surrounded by a concaved sloping rim thus forming a well or dish, the well being crossed by a rib or ridge also having concaved sloping sides, the rib dividing the well into two compartments into either of which coins can be placed, the slope and a curvature of the rib and rim being such that a coin can be easily drawn up the slope by the fingers until part thereaf projects above the rib or rim and picked up between the fingers and thumb and the underside of the said tray being recessed for the reception of pictures, marks, letters or designs for advertising or decorative purposes, and visible through the transparent material.

No. 102,305. Machine for Measuring and Cutting Cloth.
Machine a mesurer et couper le drap.
F/6.1.

Peter Smith Swan, 12 Clive Row, Calcutta, India, and Norman Fraser, Westburn Foundry, Arbroath, Forfar, Scotland, 27th November, 1906; 6 years. Filed 8th May, 1906. Receipt No. 136,049.

Claim.-1. In a machine for measuring and cutting cloth, and the like, in combination, a main shaft driven continuously, measuring and horizontally reciprocating cutting mechanism, and gearing for intermittently and alternately actuating such mechanism for the continuously running shaft.
2. In a machine for measuring and cutting cloth, and the like, a main shaft, a spur wheel thereon, and through which it is continuously driven, two partially toothed wheels carried by the syur wheel, measuring and cutting shafts. pinions thereon gearing with the partially toothed wheels, grooves in the spur whecl and studs on the pinions capable of sliding in the grooves, measuring rollers. changeable gear driving such rollers from the measpring shaft, a table, a knife running in a slot therein, gearing operating the knife from the cutting shaft and a cam operated slotted presser bar working above the table.
3. In a machine for measuring and cutting cloth, and the like, a disc knife and mechanism for intermittently riving a reciprocating and also a rotary motion thereto in combination with means for alternately and intermittently drawing out and measuring off the length of cloth to be cut and for holding the cloth whilst being cut.
4. In a machine for measuring and cutting cloth, and the like, a knife and mechanism for intermittently giving a reciprocating motion thereto, in combination with means for alternately and intermittently drawing out and measuring off the length of the cloth to be cut, and for holding the cloth whilst being cut.
5. In a machine for measuring and cutting cloth, and the like, a table over which the material to be cut is passed, a saddle slidable in a rail on the table, a disc knife on a spindle carried by the saddle, a slot in the table through which the knife protrudes, a rack on the under side of the table, a pinion on the disc knife spindle gearing therewith, a drum shaft, chains connecting the opposite ends of the saddle therewith, an intermittently driven cutting shaft, gearing connecting the two shafts to give a reciprocating motion to the knife, and means for holding the cloth whilst being cut.
6. In a machine for measuring and cutting cloth, and the like, a table over which the material to be cut is passed, a saddle slidable in a rail on the table, a knife carried by the saddle, a slot in the table through which the knife protrudes, means for giving a rotary motion to the knife, a drum shaft, chains connecting the opposite ends of the saddle therewith, and intermittently driven cutting shaft. gearing connecting the two shafts and consisting of bevel gear actuating a crank pin disc connected to a lever carrying a toothed sector gearing with a pinion on the drum shaft, and means for holding the cloth whilst being cut.
7. In a machine for measuring and cutting cloth, and the like, a table over Which the material to be cut is passed, a saddle slidable in the table, a knife carried by the saddle, a slot in the table through the knife protrudes, a drum shaft, chains connecting the opposite ends of the saddle therewith, means for rotating the drum shaft intermittently and alternatively in opposite directions so as to give an intermittent reciprocatory motion to the knife, and means for holding the cloth whilst being cut.
8. In a machine for measuring and cutting cloth, and the like, cloth measuring gear comprising measuring rollera. intermittently driven changeable gear including an epicyclic train, one member of which is connected to the measuring rollers, the second member of which is actuated by
the changeable gear, and the third member of which is also intermittently driven through changeable gear in combination with means for cutting the cloth.
9. In a machine for measuring and cutting cloth and the like, a measuring roller, a changeable gearing device for driving the same, an epicyclic train in said gearing device and comprising a shaft geared to the measuring roller, a dise pinion loose unon the shaft, changeable gearing for driving the disc, orbital pinions carried in the disc, a bevel pinion loose unon the shaft and gearing with the orbital pinions, a pinion fixed to the bevel pinion, changeable gearing driving that pinion, a second bevel pinion fast upon the shaft and also gearing with the orbital pinions, and means for intermittently driving the changeable gear device, in combination with means for cutting the cloth, as described.

No. 102,306. Fish Net Stake.
Potcau pour filets d poisson.

Edward J. Hopkins, Bay City, Michigan, U.S.A. 27th November, 1906; 6 years. Filed 7th September, 1906. Receipt No. 139,334 .
Claim.-1. A fish net stake comprising a lower section, an upper section removable relative to the lower section, means for retaining the upper and lower sections in alignment and a loose connection between the upper and lower sections.
2. A fish net stake comprising a stationary lower section, an upper section adapted to be aligned with the lower section and to move vertically relative thereto and a flexible connection between the sections.
3. A fish net stake comprising a lower section, a socket carried thereby and an upper section, the lower end of which is removably stopped in the socket, the upper section movable vertically relative to the lower section and a positive connection between the upper and the lower sections to prevent their separation.
4. A fish net stake comprising a lower section, a socket mounted thereon, the periphery of the socket being flush with the periphery of the lower section, an upper section removably seated in the socket and a positive connection between the upper and the lower section to prevent their entire separation.
5. A plurality of fish net stakes, each comprising a lower section, a socket carried thereby, an upper section removably seated in the socket the upper section capable of vertical movement relative to the lowef section, means for connecting the upper sections of the stakes and means for positively connecting the upper section with its corresponding lower section to prevent entlre separation.
6. A fish net stake comprising a lower section, a socket carried thereby and outwardly flared at its open end, an upper section removably seated in the socket and means for positively connecting the upper and lower sectlons to prevent their entire separation.
7. A fish net stake comprising a lower section. a socket carried thereby, a seat formed in the socket above the upper end of the lower section whereby to leave a chamber between the seat and upper end of the lower section, an upper section one end of which is removably received in the socket and a flexible connection between the upper and lower sections, the connection received in the chamber when the upper section is received in the socket.
8. A fish net stake comprising a lower section, a socket carried thereby, a pair of collars located interiorly of the socket and spaced apart from each other, the upper collar
being apertured the lower collar forming a seat for the upper end of the lower section, an upper section removably seated upon the upper collar and a flexible connection between the upper and lower sections and passing through the aperture in the upper collar, the connection recelved in the space between the collars when the upper section is seated in the socket.
9 A fish net stake comprising a lower section, a socket carried thereby. a pair of collars located interiorly of the sockrt and spaced apart from each other, the upper collar being apertured. the lower collar forming a seat for the upper end of the lower section, an upper section removably seated upon the upper collar, strengthening ribs located interiorly of the socket between the collars and a flexible connection between the upper and lower sections and passing through the aperture in the upper collar, the connection received in the space between the collars when the upper section is seated in the socket.

10 A fish net stake comprising a lower section, a socket carried thereby, an apertured seat formed in the socket and spaced above the upper end of the lower section, a pin held in the socket beneath the seat, an upper section removably receivable in the socket and a flexible connection between the upper section and the pin.
11. \(\Lambda\) fish net stake comprising a lower section, a socket carried thereby, the socket provided with intersecting bayonet grooves, an upper section removably seated in the socket and studs carried by the upper section, the studs received and travelling in the grooves.
12. A fish net stake comprising a lower section, a socket carried thereby, an upper section removably seated in the socket, studs carried by the upper section, the socket provided with intersecting grooves adapted to recelve the studs to releasably lock the upper and lower seculons together, one of the intersecting grooves being of such length that the upper section is seated before the stud reaches the bottom of the groove.
13. A fish net. stake comprising a lower section, an upper section removably seated relative thereto, and means for connecting the upper and lower sections at all tlmes to prevent an entire separation thereof, the upper section capable of a vertical movement relative to the lower section.
14. A fish net stake comprising a lower section, an upper section removably supported thereby and means for flexibly connecting the sections to permit the unseating of the upper section relative to the lower section and to permit the upper section to swing horizontally relative to the lower section.
15. A fish net stake comprising a lower section an upper section removably seated thereon, means for preventing an entire separation of the sections and a weight for submerging the upper section subsequent to its unseating.
16. A fish net stake comprising a fixed lower section, a socket carried thereby, an upper section loosely and removably received in the socket and a flexible connection, the opposite ends of which are respectively connected to the upper and lower sections.

\section*{No. 102,307. Wator Gas Prodncer.}

Productcur de gas d cau.

Dellwik-Firischer Gesellschaft, M. b. H., Frankfort on the Main, Germany, 27th November, 1906; 6 years. Filed 15th September, 1906. Recelpt No. 139.515.
claim.-1. A water gas producer, comprising a furnace, means for blowing the same hot by means of a suction
blast, a steam pipe opening into the upper part of the furnace, a scrubber, a water gas main leading from the lower part of the furnace, and opening into the bottom of the scrubber below the level of the bottom of the furnace. and a water seal in the bottom of the scrubber for the lower end of the gas main, substantially as specifed.
2. A water gas producer, comprising a furnace, a blast pipe provided with a slide valve and opening into the bottom of the furnace, a steam pipe opening into the upper part of the furnace, a scrubber, a water gas maln between the furnace and scrubber, and a water seal in the scrubber for sealing the lower end of the gas main. a coal feed hopper opening into the top of the furnace. a cone-shaped bottom for the hopper and means for depressing the bottom. a pipe communicating between the upper part of the hopper and fan casing, and provided with a slide valve, substantially as snecifled.
3. A water gas producer, comprising a furnace, means for blowing the same hot by means of a suction blast, a steam pipe opening into the upper part of the furnace, a scrubber. a water gas main between the lower parts of the furnace and scrubber, a water scal in the scrubber, a by pass for the suction blast, and a slide valve formed with a small opening and a full opening for three positions of the slide valve, substantially as specifed.

No. 102,308. Time Recorder. Registre horaire

The Canadian Time Recording Company, assignee of Alfonso L. Jaynes, Toronto, Ontario, Canada, 27th November, 1906; 6 years. Filed 8th January, 1906. Receipt No. 131,637.
Claim.-1. In a time recorder the combination of a card holder laterally movable, means for automacically moving said card holder in one direction at pre-determined intervals, means for automatically returning the card holder to its original position at a predetermined time, means for locking said card holder in each position, said means permitting a limited backward movement of the card holder from each position other than the first, substantially as described.
2. In a time recorder the combination of a card holder laterally movable, an arm connected therewith and longiludinally slotted, a projection on gald arm, a shaft transverse to the arm and passing through the slot therein. means controlled by a time clock for partially rotating the shaft at pre-determined intervals, a snall connected to the shaft, and adapted to engage the projection on the arm. and yielding means tending to hold the projection in contact with the snall, substantially as described.
3. In a time recorder the combination of a card holder laterally movable, an arm connected therewith, a projection on said arm, a shaft transverse to the arm, means controlled by the time clock for partially rotating the shaf: at pre-determined intervals, a snall connected to the shaft, and adapted to engage the projection on the arm. a pin on the arm for engagement by the snall, spaced from the projection a distance substantially equal to the greatest diameter of the snall, and arms secured to the snall substantially at right angles to its greatest diameter. and adapted to engage the pin to prevent forward movement of the arm when the snall is in intermediate positions, substantially as described.
4. In a time recorder the combination of a card boitlaterally movable, an arm connected therewith, a projectur. دa said arm, a shaft transverse to the arm, means crrtrolled by a time clock for partially rotating the shaft at prodetermined intervals, a snall connected to the shar:. and adanted to engage the projection on the arm, and a pin on the arm for cngagement by the snall, spaced from
the projection a distance substantially equal to the greatest diameter of the snail, substantially as described.
5. In a time recorder the combination of a card holder laterally movable, an arm connected to the card holder by a pin and slot connection, means engaging the arm for yieldingly pressing forward the card holder, means for automatically moving forward the arm at pre-determined intervals, and means for returning it to its original position at a predetermined time, substantially as described.
6. In a time recorder the combination of a card holder laterally movable, an arm connected therewith, a projection on said arm, a shaft transverse to the arm, a ratchet wheel on the shaft, a spring held ratchet rack engaging the ratchet wheel, clock controlled means for operating said rack, a detent carried by the rack, a notched wheel secured to the shaft and adapted to be engaged by the detent when the rack is at the forward end of its stroke, and means preventing backward movement of the shaft, substantially as described.
7. In a time recorder the combination of an abutment for a card, an operating lever for registering mechanism, a detent normally preventing the movement of the operating lever, a lever pivoted on the abutment in position for engagement by a card, and connections between the lever and the detent whereby the latter is disengaged from the operating lever when the abutment lever is pressed down by a card, substantially as described.
8. In a time recorder the combination of a clock driven vertically reciprocating abutment for a card, a bell crank lever pivoted on the abutment with one arm in position for engagement by a card, a vertical bar in position for engagement by the other arm of the bell crank lever, parallel equal pivoted links connecting the bar with a stationary part, a lever having one end in operative engagement with the bar, a detent engaged by the other end of the lever, an operating lever for registering mechanism normally engaged by the detent, and yielding means retaining the parts in the normal positions, substantially as described.
9. In a time recorder the combination of an abutment for a card, an operating lever for registering mechanism, a detent for engagement with the operating lever at two different positions of the latter and normally engaging the lever when the latter is in its normal position, a lever pivoted on the abutment in position for engagement by a card, and connections between the lever and the detent whereby the latter is disengaged from the operating lever when the abutment lever is pressed down by a card, substantially as described.
10. In a time recorder the combination of a clock driven vertically reciprocating abutment for a card, a laterally movable vertical rack with which the abutment is adapted to engage, yielding means normally maintaining the rack out of engagement with the abutment, means carried by the abutment adapted, when pressed by a card, to move the rack into engagement with the abutment, substantially as described.
11. In a time recorder the combination of a clock driven vertically reciprocating abutment for a card, a vertical rack, means for engaging the abutment and the rack, means carried by the abutment adapted, when pressed by a card, to effect an engagement between the rack and the abutment, and ylelding means normally maintaining the rack and abutment out of engagement, substantially as described.
12. In a time recorder the combination of a clock driven vertically reciprocating abutment for a card, a bell crank lever pivoted on the abutment with one arm in position for engagement by a card, a vertical bar in position for engagement by the other arm of the bell crank lever, parallel equal pivoted links connecting the bar with a stationary part, a lever having one end in operative engagement with the bar, a detent engaged by the other end of the lever, an operating lever for registering mechanism normally engaged by the detent, a laterally movable vertical rack with which the abutment is adapted to engage, an arm extending from the rack and engaging the vertical bar, and ylelding means normally maintaining all the parts in their normal positions, substantially as described.

\section*{No. 102,309. Nogative Pole Plate.}

\section*{Plaque de póle négatif.}

The Electric Storage Battery Company, Philadelphia, Pennsylvania, assignee of Paul Seeliger, Hagen, Germany, 27th November, 1906; 6 years. Filed 23rd March, 1905. Receint No. 123,639.
Claim.-1. Negative pole plate active material possessed of loose structure and being the product derived from expansion and disintegration induced by reducing and discharging a mixture of active and inert materials, substantially as described.
2. A negative pole plate consisting of a mixture of active and inert materials adapted upon reduction and discharge

to expand and disintegrate and produce a product being active material of loose structure and a support or grid having retaining means for holding said active material of loose structure upon its production in proper relation to the support, substantially as described.
3. A negative pole plate comprising a support operatively combined with active material of loose structure being the product derived from disintegration and expansion induced by reducing and discharging a mixture of active and inert materials, substantially as described.
4. A negative pole plate consisting of a support having spaces partially filled with a mixture of active material or material adapted to become active and an inert substance which upon reduction and discharge disintegrates and expands and constitutes a product being active material of loose structure which is retained in such spaces, substantially as described.

\section*{No. 102,310. Organ. Orgue.}

Louis Stacey Lockwood and James Stewart Collins, co-inventors, both of Woodstock, Ontario, Canada, 27th November, 1906; 6 years. Filed 29th August, 1906. Receipt No. 139,073.
Claim.-1. In a pneumatic organ the combination with the main action supporting rail, the pipes, pneumatics and valves for the pipes operated by the pneumatics of the valve chambers, connecting passages between the valve chambers and pneumatics and the main key action and a flexible diaphragm located in the valve chambers and designed to be forced against the end of the passages leading to the pneumatics by pneumatic pressure, as and for the purpose specified.
2. In a pneumatic organ the combination with the main action supporting rail the pipes, pneumatics and valves for the pipes operated by the pneumatics, of valve chambers. connecting passages between the valve chambers and the pneumatics and the main key action and having projecting beaded inner edges and flexible dlaphragms locate in thie valve chamber and designed to be forced against the beaded ends of the passage by the pneumatic pressure, as and for the purpose specified.
3. In a pneumatic organ the combination with the main action supporting rails, the pipes, pneumatics and valves for the pipes operated by the pneumatics, of valve chambers connecting passages between the valve chambers and the pneumatics, flexible diaphragms located in the chambers, a passageway extending to the back of the chambers behind the diaphragms and a partition having an orifice therein and located between the passage and the valve chambers. as and for the purpose specifled.
4. In a pneumatic organ the combination with the main action supporting rail, the pipes, pneumatics and valves for the plpes operated by the pneumatics, of valve chambers connecting passages between the chambers and the pneumatics, projecting beaded edges extending around the inner
ends thereof flexible diaphragms located in the chambers, a passageway extending to the back of the chambers be-

hind the diaphragms and a partition having orifices therein and a projecting beaded edge extending around the orifices and opposing the aforesaid beaded edges, as and for the purpose specified.
5. In a pueumatic organ the combination with the main action supporting rails, the pipes. pneumatics and valves for the pipes operated by the pneumatics, of valve chambers connecting passages between the chambers and the pneumatics. flexible diaphragms located in the chambers, a passageway extending to the back of the chambers behind the diaphragms and a partition having orifices therein and eyelets secured in the orifices and in opposing ends of the passage leading to the pneumatics, as and for the purpose speciffed.
6. In a pneumatic organ the combination with the plpes and the main action supporting rail having a bevelled lower surface and passages therein leading to the pipes, of pneumatic bellows secured in an oblique position to the bevelled portion of the rail and provided with an arm and valve head designed to cover the open ends of the passage leading to the pipes and a weight secured to the lower member of the valve bellows, as and for the purpose specified.
7. In a pneumatic organ the combination with the pipes. the pneumatics, the suppoiting rail having valve chambers therein and passages conrecting the valve chambers with the outside atmosphere and with the pneumatics, flexible diaphragms located in the valve chambers, a passageway located to the rear of the valve chambers, a partition located between the valve chambers and the passage and having orifice therein and reinforcing pieces secured to the diaphragm and designed alternately to cover the orifice in the partition and the end of the passage leading to the pneumatic, as and for the purpose specified.
8. In a pneumatic organ the combination with the pipes, the pneumatics, the supporting rail having valve chambers therein and passages connecting the valve chambers with the pneumatics and with the outside atmosphere a passageway located to the rear of the valve chambers, a partition located botween the passageway and the valve chambers and having orifices thicrein, eyelets held within the orifice and within the inner end of the passage leading to the pneumatic, a flexible diaphragm secured within the valve chamber and having a reinforced center portion designed to seat itself against the eyelets, as and for the purpose specified.

No. 102,311. Smelting Process and Apparatus.
Procédé et appareil de fonte.

Alfred Stansfield and Leo Bowlby Reynolds, co-inventor: both of Montreal, Quebec, Canada, 27th November, 1906: 6 years Filed 2nd June, 1904 Receipt No. 115,853.
Claim.-1. The process of recovering metal from an oxidized lead zinc ore, which consists in adding sufficient carbon to such oxidized ore, then subjecting such mixtures while excluding the air to heat produced electro-thermally. thereby reducing and melting the lead and simultaneously reducing and volatilizing the zinc, and finally separately collecting said melted lead and said volatilizing zinc, substantially as described and for the purpose set forth.
2. The process of recovering metal from a lead zinc ore, which consists in adding a reducing agent to the ore, then subjecting such mixture while excluding the air to heat produced electro-thermally, thereby reducing and melting the lead and simultaneously reducing and volatilizing the zinc and finally separately collecting said melted lead and said volatilized zinc, substantially as described and for the purpose set forth.
3. The process of recovering metal from lead zinc ore, which consists in adding to the ore a sufficient quantity of a substance or substances adapted when heated with the said ore to reduce the metal to the metallic state from the state of chemical combination with the other substances in which state they exist in the ore, then subjecting such mixture while excluding the air to heat produced electro-thermally, thereby reducing and melting the lead and simultaneously reducing and volatilizing the zinc and finally separately collecting said melted lead and said volatilized zinc, substantially as described and for the purpose set forth.
4. The process of recovering metal from an oxidized lead zinc ore, which consists in adding a reducing agent to the ore, then subjecting such mixture while excluding the air to heat produced electro-thermally, thereby reducing and melting the lead and simultaneously reducing and volatilizing the zinc and finally separately collecting said melted lead and said volatilized zinc, substantially as described and for the purpose set forth
5. The process of recovering metal from lead ore, which consists in subjecting such ore to an oxidizing roast, adding sufficient carbon to such oxidized ore, then subjecting such mixture while excluding air to heat produced electrothermally, thereby reducing and melting the lead and finally collecting said lead, substantially as described and for the purpose set forth.
6. The process of recovering metal from an oxidised lead ore, which consists in adding sufficient carbon to mach ont. dized ore, then subjecting such mixture while exalylang of
to heat produced electro-thermally, thereby reducing and melting the lead, finally collecting said lead, substantially as described and for the purpose set forth.
7. The process of recovering metal from an oxidized lead zinc ore which consists in adding sufficient carbon to such oxidized ore, then subjecting a continuous supply of such mixture while excluding the air to heat produced electrothermally thereby reducing and melting the lead, simultaneously reducing and volatilizing the zinc, and also simultaneously, fusing the remainder of the ore, and finally separately collecting said melted lead and said volatilized zinc, substantially as described and for the purpose set forth.
8. The process of recovering meta: from a lead-zinc ore, which consists in subjecting said ore to an oxidizing roast, adding sufficient carbon to such oxidized ore, then subjecting such mixture while excluding the air to heat produced electro-thermally, thereby reducing and melting the lead and simultaneously reducing and volatilizing the zinc, and finally separately collecting sald melted lead and said volatilized zinc, substantially as described and for the purpose set forth.
9. The process of recovering lead and zinc from an ore in which the said two metals occur which consists in first roasting the ore, then mixing the said ore with carbonaceous material, then submitting the said mixture to an elec-tro-thermic action in an air tight chamber thereby simultaneously reducing and melting the lead and reducing and volatilizing the zinc, and finally collecting in one smelting process the reduced and melted lead and the reduced and volatilized zinc, substantially as described and for the purpose set forth.
10. The process of recovering lead and zinc from an oxidized ore in which the said two metals occur which consists in charging the furnace with a substance adapted to become heated by the passage of an electric current therethrough, mixing the ore with carbonaceous material, adding the mixture to the substance, causing a current of electricity to pass through the mass thereby reducing and melting the lead and reducing and volatilizing the zinc, and finally collecting in one smelting process the reduced and melted lead and the reduced and volatilized zinc, substantially as described and for the purpose set forth.
11. The process of recovering lead and zinc from an ore in which the said two metals occur which consists in roasting the ore, charging the furnace with a substance adapted to become heated and melted by the passage of an electric current therethrough, mixing the roasted ore with carbonaceous mixture adding the mixture to the substance. causing a current of electricity to pass through the mass thereby reducing and melting the lead and reducing and volatilizing the zinc, and collecting in one smelting process the reduced and melted lead and the reduced and volatilized zinc, substantially as described and for the purpose set forth.
12. The process of recovering lead and zinc from an ore in which the said two metals orcur which consists in charging the furnace with a slag and a substance adapted to become heated by the passage of a current of electricity therethrough, causing a current of electricity to pass through said substance and melt the slag, roasting the ore, mixing the said ore with carbonaceous material, adding the mixture to the slag while the current of electricity is passing therethrough thereby reducing and melting the lead and redueing and volatilizing the zinc, and finally collecting in one smelting process the reduced and melted lead and the reduced and volatilized zinc, substantially as described and for the purpose set forth.
13. The process of recovering lead and zinc from an ore in which the said two metals occur which consists in roasting the ore, charging a furnace with a molten slag, causing a current of electricity to pass through said slag, mixing the said roasted ore with carbonaceous material, adding the mixture to the slag while the current of electricity is passing therethrough thereby reducing and melting the lead and reducing and volatilizing the zinc, and finally collecting in one smelting process the reduced and melted lead and the reduced and volatilized zinc, substantially as described and for the purpose set forth.
14. A smelting furnace wherein lead and zinc are recovered simultaneously from an ore in which they occur, such furnace consisting of a smelting chamber, a pair of electrodes arranged a distance apart within sald chamber, means whereby an ore in which the said metals occur is fed to the space between the sald electrodes, means whereby the reduced lead and the slag are removed, and means whereby the reduced and volatilized zinc is allowed to escrape from said chamber, substantially as described and for the purpose set forth.
16. A smelting furnace wherein lead and zinc are recovered simultaneously from an ore in which they occur, such furaace consisting of a smelting chamber, a pair of electrodes arranged a distance apart within said chamber, a
vertical shaft extending downwardly into said chamber and whereby an ore in which the sald metals occur is fed to the space between the sald electrodes, means whereby the reduced lead and the slag are removed, and means whereby the reduced and volatilized zinc is allowed to escape from sald chamber, substantially as described and for the purpose set forth.
16. A smelting furnace furnace whercin lead and zinc are recovered simultaneously from an ore in which they occur such furnace consisting of a smelting chamber, a pair of vertical electrodes arranged a distance apart within said chamber, means whereby an ore in which the said metals occur is fed to the space between the sald electrodes, means whereby the reduced leall and the slag are removed and means whereby the reduced and volatilized zinc is allowed to escape from said chamber, substantially as de. scribed and for the purpose set forth.
17. Smelting furnace wherein lead aud zinc are recovered simultaneously from an ore in which they occur, such furnace consisting of a smelting chamber, a pair of vertical electrodes arranged a distance apart within sald chamber, a vertical shaft extending downwardly into said chamber and whereby an ore in which the sald metals occur is fed to the space between the said electrodes, means whereby the reduced lead and the slag are removed, and means whereby the redisced and volatilized zinc is allowed to escape from sald chamber. substantially as described and for the gurpose set forth.
18. A smelting furnace wherein lead and zinc are recovered simultaneously from an ore in which they occur, such furnace consisting of a smelting chamber having an exit flue in the upper portion thereof, a pair of electrodes arranged a distance apart within said chamber, means whereby an ore in which the said metals occur is fod to the space between the said electrodes, means whereby the reduced lead and the slag are removed, substantially as described and for the purpose set forth.
19. A smelting furnace wherein lead and zinc are recovered simultaneously from an ore in which they occur, such furnace consisting of a smelting chamber having an exit flue in the upper end of one of its walls, a zinc condensing chamber adjacent to said smelting chamber and with which the said flue communicates, a pair of electrodes arranged a distance apart within said smelting chamber, means whereby an ore in which the said metals occur is fed to the space between the sald electrodes, means whereby the reduced lead and the slag are removed, substantially as described and for the purpose set forth.
20. A smelting furnace wherein lead and zinc are recovered simultaneously from an ore ir which they occur such furnace consisting of a smelting chamber having an exit flue in the upper end of one of its walls, a zinc condensing chamber adjacent to said smelting chamber and with which the said flue communicates and a secondary chamber adjacent to said condensing chamber, a communicating duct leading from said condensing to said secondary chamber, a pair of electrodes arranged a distance apart within said smelting chamber, means whereby an ore in which ths said metals occur is fed to the space between the said electrodes, means whereby the reduced lead and the slag are removed, substantially as described and for the purpose set forth.
21. A smelting furnace wherein lead and zinc are recovered simultaneously from an ore in which they occur such furnace consisting of a smelting chamber having an exit flue in the upper end of one of its walls, a zinc condensing chamber adjacent to said smelting chamber and with which the said flue communicates and a secondary chamber adfacent to said condensing chamber, a communicating port leading from said condensing to said secondary chamber, and a baffler wall extending downwardly from the top of said condensing chamber and adajacent to the last-mentoined port, a pair of electrodes arranged a distance apart within said smelting chamber, means when an ore in which the said metals occur is fed to the space between the said electrodes, means wherebj the reduced lead and the slag are removed, substantially as described and for the purpose set forth.

No. 102,312. Track Gange and Tevel. Jauge et niveau pour voies de chemin de fer.
Louis Barceloux, St. Guillaume Station, Quebec, Canada. 27th November 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,233.
Claim.-1. In a device of the character described, the combination comprising a frame, an axle carried by the frame, a pair of discs disposed on each end of the axle and arranged to lie on opposite sides of the rails of a railway track, rotatable members on the axle between each pair of discs, and means for fixing the discs at a plurality of points on the axle.
2. In a device of the cbaracter described the combination comprising a irame, an axle carried by the frame, discs

disposed on the axle, movable collars disposed on each side of the discs, and washers disposed intermediate of the dises.
3. In a device of the character described the combination comprising a frame, arms carried by the frame, an axle, means for securing the axle to the frame, gruge discs carried by the axle means for spacing the discs apart so as to lie on each side of the ralls of a rallway wack, and means carried by said arms adapted to indicate the level of a track.
4. In a device of the character described the combination comprising a frame, arms carried by the frame, an axle, a yoke disposed beneath the axle and extending through the frame and said arms. nuts on the yoke adapted to secure the arms to the frame, and the frame to the axle, a spirit level carried by the arms, and gauge indicating means carried by the axle.
5. In a device of the character described in combination with a wheeled car, a yoke carried by the car, a V-shaped frame disposed adjacent the yoke, a removable pin disposed through a portion of the car, the V-shaped frame and the yoke and adapted to form a pivctal connection between the frame and he car, an axle carried by the frame, gauges carried by the axle, and a level supported by the frame.

\section*{No. 102,313. Punching Machine. Machine d emporte-pièce.}

John L. Brower, Montreal, Quebec, Canada, 27th November, 1906; 6 years. Filed 7th November, 1906. Receipt No. 140,989.
Claim.-1. A multiple punch comprising a supporting frame or head having a plurality of openings each of which is adapted to recelve and guide a punch stock, a movable punch stock in each of said openings, a punch on the outer end of each stock, a plurality of superposed and adjustable gags supported in said frame or head and adapted to cover or uncover any one of the openings and control the movement of the punch stocks through the supporting frame or head.
2. A multiple punch comprising a supporting frame or head having a plurality of openings each of which is adapted to receive and guide a punch stock, a movable punch stock in each of said openings, punch on the outer end of each stock, a plurality of superposed and adjustable gags of different lengths supported in said frame or head and adapted to cover or uncover any one of the openings and control the movement of the punch stocks through the supporting frame or head.
3. A multiple punch comprising a supporting frame or head having a plurality of opening eash of which is adapted to receive and guide a punch stosk, a movable punch stock in each of said openings, a punch on the outer end of each stock, a plurality of superpos \(>d\) and adjustable gags supported in said frame or head and adapted to control any combination of the openings and movement of the punch stocks through the supporting frame or head.
4. A multiple punch comprising a supporting frame or head having a plurality of openings each of which is adapted to receive and guide a punch stock, a movable punch stock in each of said openings, a punch on the outer end of
each stock, a plurality of superposed gags supported in said frame or head and movable in the same direction and oper-

able from the same point, said gags adapted to control amy combination of the openings and movement of the punch stocks through the supporting frame or head.
5. A multiple punch comprising a supporting frame or head having a plurality of vertical openings each of which is adapted to receive and guide a punch stock, a movable punch stock in each of said openings, a punch on the outer end of each stock, a plurality of adjustable gags horisontally supported and arranged in tiers in said frame or head and adapted to control any combination of the openings and movement of the punch stocks through the supporting frame or head.
6. A multiple punch comprising a supporting frame or head having a plurality of openings each of which is adapted to receive and guide a punch stock, a movable punch stock in each gf said openings, a punch on the outer end of each stock, a plurality of superposed and adjustable gags supported in said frame or head and adapted to control any combination of the openings and movement of the punch stocks through the supporting frame or head, and stops for controlling the movement of the gags.
7. A multiple punch comprising a supporting frame or head having a plurality of openinge each of which is adapted to receive and guide a punch stock, a movable punch stock in each of said openings. a punch on the outer ond of each stock, a plurality of superposed and adjustable gags supported in said frame or head and adapted to control any combination of the openings and movements of the punch stocks through the supporting frame or head, and a bolt passing loosely through a slot in the end of the gags and acting as a stop for the adjusted positions of the gags. 8. A multiple punch comprising a supporting frame or head having a plurality of vertical openings arranged in rows at a right angle to each other, each of which openings is adapted to receive and guide a punch stock, a movable punch stock in each of said openings, a punch on the outer end of each stock, a plurality of superposed and adjustable gags of different lengths supported in said frame or hesd and adapted to cover or uncover any one of the openings and control the movement of the punch gtocks through the supporting frame or head.
9. A multiple punch comprising a supporting frame or head having a plurality of vertical openings arranged in rows at right angles to each other each of which openings is adapted to receive and guide a punch stock, a movable punch stock in each of said openings, a punch on the outer end of each stock, a plurality of superposed gags of different lengths supported in said frame or head and adjustabls In one direction and adapted to control any combination of the openings and movement of the punch stocks through the supporting frame or head.
10. A multiple punch comprising a supporting frame or head having a plurality of vertical openings arranged in rows at right angles to each other, each of which openings is adapted to receive and guide a punch stock, a movable punch stock in each of said openings, a punch on the outer
end of each stock, a plurality of superposed gags of different lengths supported in said frame or head and movable in the same direction and operable from the same point, said gags adapted to control any combination of the openIngs and movement of the punch stocks through the supporting frame or head.

Ne. IOF,314. Celour Printing Device Hor Cash Regiaters.
Apparell d imprimer en couleur pour registre àmonnaie.

Jules Frydmane and Louls Chambon, co-inventors, both of Paris, France, 27th November, 1906; 6 years. Filed 4th Auguet, 1906 Receipt No. 138,416.
Claim.-1. A colour printing for cash registers, characterized by an inking ribbon, similar to that used in typewriting machines, arranged in such a manner that it is automatically brought across the printing members of the said apparatus each time it is desired to register an operation other than that of a predetermined kind, with the object of producing by its intermediary, upon the registering or checking band, an impression of the corresponding indications, which will be clearly differentiated by its colour from the ordinary impression produced directly by the printing members inked in the ordinary manner, although the indications in opposite colours follow each other in one and the same column.
2. The arrangement of the inking ribbon upon a rocking support in relation to the printing member comprising characters sorving for the varions kinds of operations, the said rocking taking place only when the characters of this part reserved for operations other than those consisting of a predetermined kind become operative, for the purpose of placing the said ribbon across the printing members at this moment.
3. The arrangement upon the printing member, comprising characters adapted for the various. kinds of operations of a cam presenting a recess of an amplitude equal to that formed by the characters reserved for the operations other than those of a predetermined kind and keyed in such a poaition thet at the proper moment it releases the inking ribbon mpport so as to render the ribbon opera'ive relatively to the printing parts.
4. The combination of the printing parts, the ordinary inking parts, and the printing table of cash registers with an inking ribbon, a support for this latter, a cam acting upon the said support, and which permits of bringing the inking ribbon across the printing parts under predetermined conditions and when the ordinary inking members move aside, in such a manner that these printing parts instead of pronting directly print indirectly and in a different coleur.

No. 102,315. Teaching Apparatus.
Appareil d'enseignement.

Henry Thomas Fox-Esmond, 14 Margaret street, Rozelle, Sydney, New South Wales, Australia, 27th November, 1906; 6 years. Filed 11th September, 1906. Receipt No. 139,422.
Claim.-1. A demonstrating apparatus consisting of a polygonal frame of box shape, having mare than two sides, so as to admit of different demonstrations being exhibited thereon, or upon paper or fabric attached to rollers fixed at the top of each side, such polygonal frame being in combination with and suspended on a central pillar and being movable vertically up and down by means of sheaves, supporting cords, and a balance weight, such sheaves and the frame carrying the same being fixed at the top of the central pillar, and pivoted upon a ball bearing or other suitable pivot in order to rotate such polygonal frame.
2. A demonstrating apparatus consisting of a polygonal frame of box shaye, formed with more than two sides, whereon different demonstrations may be exhibited, in combination with a central pillar, and with appliances for suspending the said polygonal frame to such pillar moving vertically and rotating the same.
3. A demonstrating apparatus consisting of a polygonal frame of box shape, formed with more than two sides, having rollers fixed at the top of each side bearing thereon rolls of paper or other fabric whereon different demonstrations may be exhibited, in combination with a central pillar, and with appliances for suspending the said polygonal frame to such pillar moving vertically and rotating the same.
4. A demonstrating board suspended on a central pillar so as to admit of different demonstrations being exhibited thereon or upon paper or fabric attached to rollers fixed at the top of each side, such demonstrating board being in combination with and suspended on a central pillar and being movable vertically up and down by means of sheaves supporting cords and a balance weight, such sheaves and the the frame carrying the same being fixed at the top of the central pillar, and nivoted upon a ball bearing or other suitable pivot in order to rotate such demonstrating board, substantially as described.
5. A demonstration board suspended on a central pillar, having rollers with paper or fabric attached thereto fixed at the top of one side, such demonstration board being in combination with and suspended on a central pillar, and being movable vertically up and down by means of sheaves supporting cords and a balance weight, such sheaves and the frame carrying the same being fixed at the top of the central pillar.
6. A demonstrating apparatus consisting of a frame having two or more sides, so as to admit of different demonstrations being exhibited thereon, or upon paper or fabric attached to rollers fixed at the top of each side, such frame being in combination with and suspended upon a cen
tral plllar, and being moved vertically up and down by means of sheaves supporting cords and a balance weight such sheaves and the frame carrying the same being fixed at the top of the central pillar and pivoted upon a ball bearing or other suitable pivot in order to rotate such frame, said frame having eyelets or pintles on the edges thereof, and in combination therewith separate demonstrating boards, having on one edge of the frames thereof pinlles or eyelets to fix into the eyelets or pintles of the frame suspended on the central pillar, or into the eyelets or pintles of a board attached thereto, a board or series of boards so attached being supported if required by a standard having thereon a sliding part to which is fixed eyelets or pintles to fit into the pintles or eyelets of the board or last board to be supported.
7. A demonstrating apparatus consisting of a frame having two or more sides, so as to admit of different demonstrations being exhibited thereon, or upon paper or fabric attached to rollers fixed at the top of each side, in combination with a central pillar, and with appliances for suspending the said frame to such pillar moving vertically and rotating the same, said frame having eyelets or pintles on the edges thereof, and in combination therewith separate demonstrating boards, having on one edge of the frame thercof pintles or eyelets to fix into the eyelets or pintles of the frame suspended on the central pillar, or into the eyelets or pintles of a board attached chereto, a board or series of boards so attached being supported, if required, by a standard having thereon a sliding part to which is fixed eyelets or pintles to fit into the pintles or eyelets of the board or last board to be supported.

No. 102,316. Magazine Firearm.
Arme à feu à magasin.

Alfred Milroy Nolf, Salt Lake City, Utah, U.S.A., 27th November, 1906; 6 years. Filed 24th July, 1906. Receipt No, 138,111.
Claim.-1. In a magazine firearm the combination of a stock, guides extending forwardly from the stock, a barrel slidably mounted upon said guides, a guide bar rigidly supported beneath said barrel and attached to the stock, a rib on said guide bar near the forward end thereof, ad metal stnap secured to said barrel on the under surface thereof and having an opening, a guide loop slidable on said strap and on said guide bar, a spring pressed pawl in said guide loop adapted to engage the opening in said strap and to be forced out of engagement therewith by the rib upon said guide bar, and a fore end rigidly associated with said guide loop.
2. In a magazine firearm the combination of a hammer, a trigger, a latch for said trigger, a sliding fore end, and connections between said fore end and said hammer and between said fore end, and said trigger latch, whereby the forward movement of said fore end cocks said hammer and locks said trigger.
3. In a magazine firearm the combination of a hammer, a trigger, a latch for said trigger, a lock to hold sald trigger latch positively in operative position, and a sliding fore end operatively connected with the said latch and said hammer whereby the foreward movment of the fore end cocks the hammer, sets and latches the trigger and locks the trigger latch positively in operative position.
4. In a magazine firearm, the combination with a barrel, of a pair of cartridge chambers one on either side of the barrel near the breech end. means in said chambers for raising the cartridge therein, and means for alternately removing the uppermost cartridge in each chamber and introducing it into the barrel.
5. In a magazine firearm, the combination with a barrel, of a pair of cartridge chambers located one on each side of the barrel near the breech end thereof, a pivoted cartridge shifter for each of said chambers, and means for operating said shifters alternately.
6. In a magazine firearm, the combination of a barrel, a pair of cartridge chambers located one on either side of said barrel near the breech end thereof. a plvotal mounted fork lying in each of said chambers and forming means for shifting cartridges from said chamber into position beneath the barrel, means for raising the cartridges in each of sald chambers, and means for alternately actuating sald fork to remove the uppermost cartridge in each of said chambers. 7. In a magazine firearm, the combination. of a sliding barrel, a pair of cartridge chambers located one on elther side of the breech end of said barrel, a pivoted cartridge shifting fork located in each of said chambers, means associated with said barrel for operating said forks alternately to shift the cartridge from the magazine chamber into position beneath said barrel, and means for holding the fork in position under the barrel until the cartridge has been disengaged from the fork.
8. In a magazine firearm, the combination of a sliding barrel, a pair of cartridge chambers located one on either side of said barrel near the breech end thereof, a pair of pivoted cartridge shifting forks, means associated with the barrel whereby the rearward movement of the barrel actuates one of said cartridge forks and causes it to shift a cartridge into position beneath the barrel, and means for locking said fork in position beneath the barrel until the forward movement of the barrel.

In a magazine firearm, the combination of a stationary guide bar, a barrel slidably mounted above said guide bar, a pair of cartridge chambers located adjacent to the breech end of said barrel one upon either side thereof and below the level of the barrel, a pair of pivotal cartridge shifting forks adapted to shift the cartridges alternately from said chambers into position under said barrel. a pair of spring fingers attached to said guide bar and provided with locking lug adapted to lock said forks alternately in position under said barrel when they have been shifted into position thereunder. and means associated with said barrel for disengaging said locking lugs and said forks.
10. In a magazine firearm, the combination of a sliding barrel, a pair of cartridge chambers located one on either side of said barrel near the breech end. a stationary member beneath said barrel, a pair of cartridge shifting forks pivotally mounted on said stationary member and adapted to shift cartridges from said chambers into position beneath said barrel, a pair of snring fingers provided on said stationary member, each of said spring fingers having a pair of upwardly projecting lugs nne of which is adanted to lock the cartridge shifting fork in position under the barrel after a cartridge has been shifted into position beneath the barrel, and means provided beneath the barrel for engaging with the other lug upon each of said spring fingers to depress either of the fingers and release the cartridge fork locked by either of said fingers.
11. In a magazine firearm the combination of a sliding barrel a pair of cartridge chambers located one on either side of said barrel near the breech end, a stationary member beneath said barrel, a pair of forks pivotally mounted on said stationary member and adapted to shift cartridges from said chambers into position beneath said barrel, a pair of spring fingers attached to said stationary member and each having a pair of upwardly projecting lugs the rear one of which is adapted to lock the fork in position beneath the barrel, and a pivoted cam mounted beneath the barrel and adapted to contact with the forward lugs on said spring fincers and to denress said spring fingers sufficiently to release said cartridge shifting forks.
12. In a magazine firearm the combination of a sllaing barrel, a plvoted cam secured in position beneath said bar-
rel, a stop lug for limiting the pivotal movement of said cam, a spring adapted to hold said cam always in contact with the stop lug, a pair of cartridge chambers, a pair of cartridge shifting forks located in said chambers, and ribs upon said forks adapted to be engaged by said cam to operate sald forks.
13. In a magazine firearm the combination of a sliding barrel, a pivoted spring actuated cam secured beneath said barrel and movable therewith, a stationary member beneath said barrel, a pair of cartridge chambers located one on either side of said barrel near the breech end, a pair of cantridge forks pivotally mounted on said stationary member and adapted to shift cartridges from sald chambers into position beneath sald barrel, a rib provided on the upper surface of each of said forks and adapted to be engaged by said cam to operate the fork to which the rib is attached, latch mechanism provided on said stationary member and adapted to engage said forks to hold elther in position beneath the barrel after shifting a cartridge, said latch mechanism being adapted to engage by said cam and thrown into operative position.
14. In a magazine firearm the combination of a sliding barrel, a magazine adjacent to the breech end of said barrel at one side thereof and below the level of the barrel, means for shifting a cartridge from the magazine to a position beneath the harrel, an elevator adapted to ralse a cartridge from position beneath the barrel into alignment with the bore of the barrel, a rod having a cam groove associated with the barrel and reciprocated thereby, a pivoted lever having one end connected with the elevator and the other end engaging the cam groove in sald rod, whereby the reciprocation of sald rod raises and lowers said ehevator:
15. In a magazine firearm, a cartridge elevator comprising a member mounted for vertical reciprocation and a pair of soring actuated cartridge gripping jaws projecting forward from said member and each having the forward portion curved to conform to the contour of the cartridge and at the rear vertically disposed groove immediately in front of said member to permit the upward passage of the head of a cartridge.
16. In a magazine firearm, a stationary member having laterally projecting studs, a cartridge elevator comprising a vertically sliding plate having guide loops engaged by said studs and a pair of spring actuated cartridge clamping jaws projecting forwand from said slidable plate.
17. In a magazine firearm, the combination of a sliding barrel, a magazine adjacent to the breech end of said barrel, means for shifting a cartridge from said magazine to a position beneath said barrel, a downwardly projecting lug at the breech end of said barrel, said lug being curved to correspond to the curvature of the cartridge and serving by engagement with sald cartridge to hold the same in position beneath the breech of said barrel into which a cartridge will be forced by the rearward movement of said sliding barrel.
18. In a magazine firearm having a barrel, a magazine below the level of sald barrel, said magazine being open at the bottom for charging, a pivoted closure plate for said magazine. a pair of lugs provided on said closure plate, spring actuated follower fingers pivotally mounted on said lugs. said follower fingers having slots intermediate of their onds, equalizer fingers pivotally mounted on said closure plate in the rear of said lugs and studs provided on said rqualizer fingers and adapted to engage the slots in the follower fingers, the cartridge engaging end of such pivot members maintaining the same positions relatively to each other during the entire upward movement within the magazine.
19. In a magazine firearm the combination with a slidable barrel, a breech plece provided on its opposite sides and bottom with mibs and grooves, those on the sides being arranged on lines oblique to the axis of the bore and a slidably mounted locking bolt having similarly disposed ribs and grooves for engagement with those of the breech piece and exercising a cam like action in forcing the breeah piece in the direction of the breech block of the firearm.
20 In a magazine frearm, a slidable barrel, a breech plece rigidly secured thereto. a slidable locking bolt disposed at right angles to said barrel for engaging with said breech piece, cams provided on sald locking bolt and a reciprocating member having grooves for engagement with sald cams to throw sald locking bolt into and out of operative position.
21. In a magazine firearm, a frame having forwardly extending portions forming guides, a barrel slidably mounted on said guides, a breech plece rigidly secured to said barrel, a locking bolt slidablv mounted in said frame and engaging positively with said breech piece, a spring interposed between said locking bolt and said frame to cause
frictional engagement between said locking bolt and said frame, and means for operating sald locking bolt.
22. In a magazine firearm the combination of a pivoted hammer, an eccentric lever for cocking said hammer, a gear, a trigger, a trigger latch, a lever for throwing said trigger latch into operative position and a reciprocating member engaging sald eccentric lever and the lever for locking the trigger latch and throwing them into operative position.
23. In a firearm the combination of a hammer, a gear, a trigger having a recess formed therein, a trigger latch entering said recess, an automatic lock engaging said trigger latch and serving to lock it in operative position and a reciprocating member for cocking sald hammer and throwing said trigger latch into operative position.
24. In a firearm the combination of a hammer, a trigger having a recess, a trigger latch entering said recess, an automatic lock engaging sald trigger latch and holding it securely in operative position and a reciprocating member operating on one movement to cock said hammer and throw said trigger latch into operative dosition and serving upon the reverse movement to partially disengage the lock for sald trigger latch
25. In a firearm the combination of a sliding barrel, a locking bolt for said barrel, a cartridge elevator, a sliding fore end, and a rod having cam grooves adapted to be engaged by portions of said elevator and said locking bolt and attached to said sliding fore end.
26. In a magazine firearm the combination of a magazine, means for shifting cartridges from sald magazine to said barrel, a sliding fore end for imparting movement to said cartridge shifting means,and a latch pin upon said fore end by means of which said cartridge shifting means may be rendered operative or inoperative at will.
27. In a magazine firearm the combination of a magazine, means for shifting cartridges from sald magazine to the barrel, a lock, a sliding fore end, connections between said fore end and said shifting means whereby the movement of said fore end operates said cartridge shifting means and said lock, and a catch upon said fore end by means of which the movement of the fore end may be limited 80 as to prevent the operation of the cartridge shifting means without binding the operation of the lock.

\section*{No. 102,317. Apparatus for Raising Sunken Vonsels.}

Appareil pour monter à la surface les vaisseauv submergés.

Fernando Staud y Ximinez, Chicago, Illinois. U.S.A., 27th November, 1906; 6 years. Filed 15th September, 1906. Receipt No. 139,537.
Claim.-1. A submergible pontoon for the purpose set forth, comprising a shell equipped with air pressure and water inlet and outlet valves, and a guide tube extending through the shell for a lifting cable to direct the shell toward the point of attachment of said cable to a sunken vessel to be ralsed.
2. Apparatus for raising sunken vessels, comprising in combination, a pontoon formed of a shell equipped with air pressure and water inlet and outlet valves and having a guide tube extending through it, and a lifting cable passing through said tube, and having one end secured to the vessel to be raised at the side thereof to which the submerged pontoon on said cable is immediately adjacent.
3. A submerged pontoon for the purpose set forth, comprising a shell equipped with air pressure and water inlet and outlet valves, a guide tube through the shell, and a lifting cable passing through said tube and provided at one end with anchoring means adapted for fastening sald cable
to a vessel to be raised at the side thereof to which the submerged pontoon on said cable is immediately adjacent.
4. A submergible pontoon for the purpose set forth, comprising a shell equipped with air pressure and water inlet valve and water outlet valve, soid valves being connected together to adapt them to work simultaneously, and a guide tube through the shell for a lifting cable to direct the shell, by filling it with water for sinking it, toward the point of attachment of sald cable to a sunken vessel to be raised.
5. A submergible pontoon comprising a shell having a guide tube extending extending through it for a lifting cable attachable to a sunken vessel to be raised, an air-and-water inlet valve, a water outlet valve and an air vent, a rod carried by the water outlet valve, and means for releasably connecting said inlet valve to said rod, whereby said inlet valve may be operated independently of or simultaneously with said outlet valve.
6. A submergible pontoon comprising a shelt, having a guide extending through it for a lifting cable attachable to a sunken vessel to be raised, an air-and-water inlet valve carrying a sleeve, a water outlet valve and an air vent, a rod carried by the water outlet valve extending into sald sleeve and provided with a stop below the same, and means for releasably fastening said sleeve to said rod, whereby the alr and water valve may be operated independently of or simultaneously with said water outlet valve.
7. A submergible pontoon for the purpose set forth, comprising a shell equipped with alr preseure and water inlet and outlet valves, a guide tube extending through the shell for a lifting cable to direct the shell toward the point of attachment of said cable to a sunken vessel to be raised, and a gripping device for the cable having ylelding teeth adapted to engage the cable in said tube to lock the shell against rising on sald cable.
8. A submergible pontoon for the purposes set forth, comprising a shell equipped with air pressure and water inket and outlet valves, a guide table extending through the
shell lor a lifting cable to direct the chell toward the point of attachment of sald cable to a sunken reasel to be raised, and fielding toeth previded at different potats along the interior of aald tube for eacasing and cable to prevent movement thereon of the shell th ons direction.
9. A submergible pontoon comprising a valre equipped shell and a tube extending through the shell and adapted to receive a iffting cable for directing the shell toward the point of attachment of said cable to a suriten ressel to be raised, and clutch mechantsm in said tube for engigtins seid cable, comprising epring pressed teeth pivoted to the Inver wall of gald tube, and edaptod to mepmality entead laterally into the path the cable, to permbt the pontoon to be lowered but prevent it from rising thereon.
10. A submergible pontoon comprisitas a vaive equipped shell, a tube eartending through the shetl and admpeed to receive a listing cable for directiag the shes coward the polnt of attackment of said cabbe to a sumiton reasel to be ralsed, longitudinal tubes on the inaer wah of cald tabe. end cluten mechaniom counpriaing sectes of opring peresed teeth pivoted to said ribe and admpted to mormaify extend laterally into the path of the cable to permil the pontoon to be lowered and perevent it srom rinting thereon.
11. A submergible pontoos compritias a mineh prowited with an air inlet valve and a water outlet valze, and means for attaching the shell to a sanken vessel to be rateed, a lube extending into the shell, through which a pertion of its water centents is expelled, a conduit leadios form sak tube, and a valved seat on the ent of cald coeduit, fer the purpose set forth.
12. A submergible pontcon comprising a blell, meazs for attaching the shell to 2 surisen rossel to te raized, as atr and water iniet valve and a water curthet valvo ac the shell, a valved air outlet tube and a valved mater catiot tube extending into said ahall and haming a dipe comeection and a condult leadinc from said comenea plpe and cermianting in a valved loat, for the murpoee eet fermh.

\title{
TRADE-MARKS
}

\section*{Registered during the month of November, 1906, at the Department of AgricultureCopyright and Trade-Mart Branch.}
11378. KINAHAN \& COMPANY, LIMITED, Carlisle Building, Dublin, Ireland : Guildford Street, York Road, Lambeth, London, England : and 16 Bothwell Street, Glasgow, Scotland. Gin. Oblong label with representation of a cat in belt and top boots sitting on the ground and holding a glass, surmounted by the words: "Cordial Old Tom Gin. Snowdrap " and name and addresses of Registrants below. 5th November, 1906.
11879. KTNAHAN \& COMPANY, LIMTTED, Carlisle Building, DubIln, Ireland: Guildford Street. York Road, Lambeth, London. England : and 16 Bothwell Street, Glasgow, Scotland. Whisky. Oblong label with words : "Kinahan's 'Glintry' Finest Liqueur Scotch Whisky,' and name and addresses of Registrants. 5th November, 1906.
11380. FOLEY, LOCK \& LARSON, Winnipeg, Manitoba. Biscuits. Label with wonds : "Milk Toast" and representation of a child seated at a table eating, a dog and a cat on chairs near. 5th November, 1906.
11381. JOSEPH ADELARD BEAUREGARD, La Presentation, Que. Remedies. Representation d'un Ours debout, tenant dans sa patte droite un api de ble d'Inde et mots: "Baume Merveilleux," etc., 5 novembre 1906.
11382. AMERICAN LEAD PENCIL COMPANY, New York, N.Y., U.S.A. Lead Pencils. Word : "Venus." 5th November, 1906.
11383. THE GENESEE PURE FOOD OOMPANY, Le Roy, New York, U.S.A. Ice Cream Powder. Word : "Jell-o." 6th November. 1906.
11384. J. A. FARCUEAR e COMAPANY, MaHfax, Nova Scotla. Flour. Label re "The Skipper." 6th November, 1906.
11385. F. CORBY DIETHLLERT COMPANY, LIMITED, Belleville, Ont. All Epirituous Liquors. Word : "Majestic." 6th November, 1906.
11386. THE UNITED GTATES GYP\&UM OOMPANY, Chicago, Illinois, U.B.A. Plaster. Word: "Fint" and representation of a fint arrowhead. 6th November, 1906.
11387. THE UNITED STATES GYPSUM COMPANY. Chicago, Illinois, U.S.A Plaster. Representation of the heavens with word : "Eenth" thereon, and pyramid of bags of plaster. 6th November, 1906.
11388. WILLIAM AUGUSTUG GREENE, Waterloo, Ont. General Trade Mark. Word : "Greene." 7th November, 1906.
11389. THE NEW YGRK HAMBURGRR GUMMI-WAREN COMPAGNIE, (The New York Hamburg India Rubber Company), Hamburg, German Empire. Combs for Tollet purposes and certain named goods of India Rubber and Sulphurized India Rubber. Words: "Hercules Club" and representation of Hercules breaking his club on the teeth of a comb. 7th November, 1906.
11390. THE NEW YORK HAMBURGER GUMMI-WAREN COMPAGNIE, (The New York Hamburg India Rubber Company), Hamburg, German Empire. Combs for Tollet purposes and certain named goods of India Rubber and Sulphurized India Rubber. Word : "Hercules." 7th November, 1906.
11391. PHCENIX GUNDRY COMPANY, LIMITED, Montreal, Que. Toilet Articles and Preparations. Representation of a Phœnix with open claws and wings, initials: "P.S.C.L." In sun's rays above. 7th November. 1906.
11392. FRANK W. MERRILL, Toronto, Ont. Tollet Preparations. Words : "The Royal" ""English." 8th November, 1906. (Assigned to The Merrill Medical Company.)
11393. ALEXANDER FERGUBON \& COMPANY, Glasgow, Scotland. Whisky. Red label bearing letters : "K.T." and circular shield with thistle. 8th November, 1906.
11394. THE M. S. BROWN COMPANY, LIMITED, Montreal, Que. Watches and Jewellery. Word : "Perfection." 8th November, 1906.
11395. THE BLOOMFIELD PACKING COMPANY, LIMITED, PIcton, Ont. Canned Vegetables and Fruits. Words : "Llttle Gem." 9th November, 1906.
11396. PERCY HOWARD BENNETT, Kenora, Ont. Clothing, Underwear, Boots and Shoes, Trunks and Valises. Words: "The Big Four Clothing gtore." 9th November, 1906.
11397. THE 2 MACS, LIMITED, Ottawa, Ont. General Trade Mark. Words : "The 2 Macs." 9th November, 1906.
11398. BADISCHE ANILIN \& SODA FABRIK, Ludwigshafen-on-the-Rhine, German Empire. Chemicals, including colouring matters. Representation two Shields, one bearing a Rampant Horse and the other a Rampant Lion. 9th November, 1906.
11399. BADISCHE ANILIN \& SODA FABRIK, Ludwigshafen-on-the-Rhine, German Empire. Chemicals, including colouring matters. Label and words: "Badische Anllin \& Soda FabrikMoskau Ludwigshafen A/Rh. Neuville s/s," on scrolls, representations winged figure and two shields, one bearing Horse Rampant and the other Lion Rampant. 9th November, 1906.
11400. HERBERT JACKSON, 49 Lansdowne Road, Notting Hill, London, England. General Trade Mark. Word: " MYXYM." 10th November, 1906.
11401. ROYAL WORCESTER CORSET COMPANY. Worcester, Massachusetts, U.S.A. Women's and Children's Underwear, particularly Corsets and Corset Waists. Word : "Adjusto." 10th November, 1906.
11402. THOMAS MCAVITY STEWART, St. John, New Brunswick. Antifriction Metals, Valves, Cocks, Hardware, Mill. Factory, Engineers' and Plumbers' Supplies, Belting, Hose, etc., etc. Word : "Mayflower." 10th November, 1906.
11403. THOMAS McAVITY STEWART, St. John, New Brunswick. Closets, Tanks, Baths, Basins, etc., etc. Word : " Hygienico." 10th November, 1906.
11404. THE BRITISH LYSOFORM COMPANY. LIMITED, 34 Old Broad Street, London, England. Chemical Substances, particularly Disinfectants. Word : "Lusoforme." 12th November, 1906.
11405. CHARLES FOX TODD, Victoria, British Columbia. Canned Salmon. Representation of a Globe showing Western Hemisphere with words: "Prince Rupert" across same. 12th November, 1906.
11406. SOCIETY OF CHEMICAL INDUSTRY IN BASLE, Klybeckstrasse 151. Basle, Switzerland. Pharmaceutical Products. Representation of a Peasant Woman gathering Herbs or Simples. 12th November, 1906.
11407. SOCIETY OF CHEMICAL INDUSTRY IN BASLE, Klybeckstrasse 151, Basle, Switzerland. Pharmaceutical Products. Word: "Fortossan." 12th November, 1906.
11408. SOCIETY OF CHEMICAL INDUSTRY IN BASLE, Klybeckstrasse 151. Basle, Switzerland. Pharmaceutical Products. Word: "Phytin." 12th November, 1906.
11409. SOCIETY OF CHEMICAL INDUSTRY IN BASLE, Klybeckstrasse 151. Basle, Switzerland. Pharmaceutical Products. Word : "Quinine-Phytin." 12th November, 1906.
11410. SOCIETY OF CHEMICAL INDUSTRY IN BASLE. Klybeckstrasse 151. Basle, Switzerland. Pharmaceutical Products. Word: "Salen." 12th November, 1906.
11411. THE STANDARD TOOL COMPANY. Cleveland, Ohio, U.S.A. Small Machinlsts' Tools. Outline of a Shield enclosing words : "Standard Tool Co." 13th November, 1906.
11412. ACME WHITE LEAD \& COLOUR WORKS, Detroit, Michigan. U.S.A. Paints, Enamels, Varnishes, etc., etc. Words: "Acme Quality " on a flag-shaped field within a circular border. 13th November, 1906.
11413. JOHN A. BRUCE \& COMPANY, Hamilton. Ont. Vegetable, Flower and Farm Seeds. Representation of a Crowned Lion Rampant and words: "Regal Seeds" on a four-leaved clover enclosed in a Garter bearing name and address of Registrants. 13th November, 1906.
11414. THE LAPRAIRIE BRICK COMPANY. LIMITED, Montreal, Que. Bricks, Blocks, Slabs, etc., for Building, Paving and other purposes. Words: "Shale Plastic." 14th November, 1906.
11415. GEDEON MILLER, Winnipeg, Manitoba. Suits made to order. Name: "The Scotland Woolen Mills Company." 14th November, 1906.
11416. THOMAS RICHARDSON ELLIN, Footprint Works, Hollis Croft, Sheffield, England. Steel and Iron in bars, sheets or rods, Wire, Machinery, Cutlery, Tools and Silver and Plated goods. Representation of, and word : "Domino." 14th November, 1906
11417. THOMAS RICHARDSON ELLIN, Footprint Works, Hollis Croft, Sheffeld, England. Steel and Iron in bars, sheets or rods, Wire, Machinery, Cutlery, Tools and Silver and Plated Goods. Representation of, and word : "Footprint." 14th November, 1906.
11418. THE PARIS PLOW COMPANY, LIMITED, Paris, Ont. Various kinds of Plows. Word : "Success." 15th November, 1906.
11419. HARRY R. McLELLAN, St. John, New Brunswick. Automatic Fasteners. Word: "Security " spelled : "C-curity.". 15th November, 1906.
11420. THE T. W. CAPP COMPANY, Toronto, Ont. Gold and Silver Jewellery. Representation of a Jockey's Cap. 15th November. 1906.
11421. CLAIRE STOKES, Petrolea, Ont. Drug for the cure of the Liquor Habit. Word : "No-Jag." 15th November, 1906.
11422. JOHN MACKINTOSH, Halifax, England. Confectionery, particularly Toffee. Words: "I am John Mackintosh, the Toffee King, and photograph of John Mackintosh. 15th November, 1906.
11423. CHARLES PETERSON, Dublin, Ireland. Pipes, Cigar Holders, Cigarette Holders and Smokers' articles. Words: " Peterson's Patent." 16th November, 1906.
11424. MANCHESTER, ROBERTSON, ALLISON, LIMITED, St. John, New Brunswick. Serges for Men's wear. Words : "Briny Deep 'Serges." 16 th November, 1906.
11425. THE J. C. AYER COMPANY, Lowell, Massachusetts, U.S.A. Tollet Preparations. Label re "Ayer's Hair Vigor" and representation of a woman displaying long flowing hair. 16th November, 1906.
11426. THE J. C. AYER COMPANY, Lowell, Massachusetts, U.S.A. Medical Compounds. Label re "Ayer's Compound Concentrated Extract of Sarsaparilla (Non-Alcoholic.'") 16th November, 1906.
11427. THE J. C. AYER COMPANY, Lowell, Massachusetts, U.S.A. Medical Compounds. Label re "Ayer's Cherry Pectoral." 16th November, 1906.
11428. WILLIAM HOLLINS \& COMPANY, LIMITED, Pleasley Works, near Mansfield and Warser Gate, Nottingham, and 25-26 Newgate Street, London, England. General Trade Mark. Word : "Viyella." 17th November, 1906.
11429. THE COLUMBIA FLOURING MILLS COMPANY, LIMITED, Enderby, British Columbla. Flour. Representation of Two Stars. 17th November, 1906.
11430. THE COLUMBIA FLOURING MILLS COMPANY, LIMITED, Enderby, British Columbia. Flour. Words : " Moflet's Best." 17th November, 1906.
11431. SHARP SONNENTHAL \& COMPANY, LIMITED, Bradford, England. General Trade Mark. Word : "Esescho." 17th November, 1906.
11432. THE AMERICAN TOBACCO COMPANY OF CANADA, LIMITED, Montreal, Que. Tobacco. Word: "Hochfeiner" and representation of the Arms of Canada. 17th November, 1906.
11433. FRANCIS G. GALE, Waterville, Que., Trading as GFO. GALE \& SONS. Bedsteads. Words : "Lawson Tait Hospital Spring Bedstead." and representation of a bedstead. 19th November, 1906.
11434. FRANCIS G. GALE, Waterville, Que., Trading as GEO. GALE \& SONS. Wire Mattresses. Words: "Dominion Wire Mattress. and representation of a wire mattress and of a bed packed for shipping. 19th November, 1906.
11435. FRANCIS G. GALE, Waterville, Que., Trading as GEO. GALE \& SONS. Wire Mattresses. Words : "Old Dominion Wire Mattress" and representation of a wire mattress. 19th November, 1906.
11436. WALTER E. GUNN, Winnipeg, Manitoba. Magazine. Words: "Canada West, A Magazine of the Sunset Provinces." 19th November, 1906.
11437. MALLEABLE IRON RANGE COMPANY, Beaver Dam, Dodge County, Wisconsin, U.S.A. Ranges. Word : "Monarch." 19th November, 1906.
11438. ANTOINE SOLARI, Smyrna, Turkey-in-Asia. Figs. Oval goldbordered label bearing words: "Tonee Figs" etc., and landscape showing fig trees. 20th November, 1906.
11439. THE DEISEL-WEMMER COMPANY, Lima, Ohio, U.S.A. Cigars. Worts: "San Felice." 20 th November, 1906.
11440. REGAL SHOE COMPANY, INCORPORATED, Boston, Massachusetts, U.S.A. Leather Boots and Shoes. Words : "Window of the Sole." 20th November, 1906.
11441. THE GOLDIE MILLING COMPANY, LIMITED, Ayr. Ont. Flour. Word: "Housekeeper." 20 th November, 1906.
11442. J. G. GROSCH FELT SHOE COMPANY. Milverton, Ont. Boots, Shoes and Slippers. Name : "J. G. Grosch" on a band cross. ing a shield diagonally. 20th November, 1906.
11443. SHINKICHI TAMURA, Vancouver, British Columbia. Flour, Wheat and Rice. Representation of a Ball. 21st November, 1906.
11444. SHINKICHI TAMURA, Vancouver, British Columbia. Flour, Wheat and Rice. Representation of a square including four smaller squares. 21st November, 1906.
1145. GLENCOE WOOLLENS, LIMITED, Glencoe, Ont. Knitted Goods and Textiles. Words: "Glencoes, Glencoe Woollens, Limited." 21st November, 1906.
11446. THE MONTKEAL COTION COMPANY, Valleyfield, Que. Woven Cotton and wool Mercerized Cotton. words: "Sea Lsland Wool.' 21st November, 1906.
1144. JOHN HERCHMEK POINTZ, Toronto, Ont. A Toilet Washing ronuer. wurd: "Mık-Amun-vat." zind Novemper, 1906.
11448. ONTARIO S'IEEL WARE, LIMITED, Toronto, Ont. All articles of sinamelled ware. Kepresentation of a disn nearing words: " ware ior Wear." 22 nd November, 1906.
11449. HORACE BAXTER PEABODY and WITTER JOHNSTON PEABODY, winasor, Unt. rants, Uveralis and Jackets. Representation ot a square nut for a machine bolt bearing words : " Leather Label," etc. 22nd November, 1906.
11450. THE LISK MANUFACTURING COMPANY, LIMITED, Canandaigua, New York, U.S.A. Tin Ware (inciuding anti-rusling tin ware), Aluminum Gaivanized ware, elc., etc. Name: "Lisk" with name and address of kegistrants and descriptive matter on oval label with ornamental blue and gold border. 22nd November, 1906.
11451. THE IRVING UMBRELLA COMPANY, LIMITED, Toronto, Ont., Umbrellas, Parasols and Sunshades. Word : "Reliance." 23rd November, 1906.
11452. THE IRVING UMBRELLA COMPANY, LIMITED, Toronto, Ont. Umbrelllas, farasols and Sunshades. Word: "Broadway." 23 rd November, 1906.
11453. THE IRVING UMBRELLA COMPANY, LIMITED, Toronto, Ont. Umbrellas, Parasols and Sunshades. Word: "Duke." 23rd November, 1906.
11454. THE IRVING UMBRELLA COMPANY LIMITED, Toronto, Ont. Umbrellas, Yarasols and Sunshades. Word : "Broad23rd November, 1906.
11455. THE IRVING UMBRELLA COMPANY, LIMITED, Toronto, Ont. Umbrellas, Parasols and Sunshades. Word: "Gem." 23rd November, 1906.
11456. THE IRVING UMBRELLAA COMPANY, LIMITED, Toronto, Ont. Umbrellas, Parasols and Sunshades. Word: "Perfection." 23rd November, 1906.
11457. THE IRVING UMBRELLA COMPANY, LIMITED, Toronto. Ont, Umbrellas, Parasols and Sunshades. Word : "Peerless." 23rd November, 1906.
11458. THE IRVING UMBRELLA COMPANY, LIMITED, Toronto, Ont, Umbrellas, Parasols and Sunshades. Word: "Queen." 23rd November, 1906.

\section*{No. 102,318. Disc Furrow Opener. Disque d ouvrir les sillons.}

The American Seeding Machine Company. Springfield, Ohio, assignee of Edward Christman, Louisville. Kentucky, U.S.A., 4th December, 1906: 6 years. Filed 9th November, 1906. Receipt No. 141,053.
Claim.-1. In a furrow opener, a main supporting frame formed in two parts, a furrow opening disc mounted on one of said parts, a conduit mounted on the other part, a shietil or scraper carried by said conduit. means for varying the inclination of the conduit in its relation with the vertical, whereby the shield or scraper will be adjusted in its relation with the furrow opening disc.
2. In a furrow opening device, a frame or support formed In two parts, a disc mountedaon one of said parts and a shield or scraper for said disc connected to the other part, means for varying the relative inclination of the said frame parts whereby the shields or scraper will be laterally adjusted in its relation to the disc, substantially as and for the purpose specified.
3. In a furrow opener, a supporting frame formed in two parts, a disc mounted on one of said parts and a shield or scraper for said disc on the other part, a fulcrum on one of said parts, an adjustable fastener on cach side of sain fulrrum whereby the position of one of the parts may be varied in its relation to the vertical to nermit a relative adjustment of the shield and dise. substantially as specified.
4. In a flurrow opener, a supporting frame in two parts, 12-1
a disc mounted on one part and a conduit on the other part, a rulcrum or projection on one or said parts adapted to contact with the other part, and adjustable fastening means on each side of said fulcrum whereby the position of the conduit may be adjusted with reference to the disc, substantially as described.
5. In a furrow opener, a supporting frame formed in two parts, one of said parts being provided with a recess and the other with an arm to fit in sald recess, a transverse bearing between said parts, adjustable fastening means on each side of said transverse bearing, a disc mounted on one of said parts and a conduit carrying a shield or scraper on the other part, for the purpose specifled.
6. In a furrow opening device, a two-part supporting frame, a disc mounted on one of said parts, a conduit carrying a shield or scraper on the other part, one of said parts being formed with a recess and the other with an arm fitted into said recess, a transverse bearing between the respective parts, adjustable fastening devices on each side of said transverse bearing, whereby the conduit may be adjusted with reference to the disc.
7. In a furrow opening device, a two-part supporting frame, a disc mounted on one of said parts, a shield or scraper for said disc mounted on the other part, a transverse bearing having a fulcrum between the respective parts of said two-part frame, and adjustable fastening means on cach side of said transverse bearing whereby said shield or scraper may be adjusted to or from said disc and held in proper relation thereto, substantially as specified.
8. The combination with a main supporting frame, a disc journalled thereon, a conduit carrying a shield or scraper, an arm on said condult and a recess in said frame into which said arm is fitted. a rib on one of said parts and a groove in the other part, fastening devices on each side of said rib and groove, and means for adjusting said fastening devices to produce adjustment of said conduit with reference to said disc. substantially as specified.

\section*{No. 102,319. Vestibule for Railway Cars. \\ Vestibule pour chars de chemin de fer.}

The Gould Coupler Company, New York City, New York, assignee of Willard F. Richards, Buffalo, New York, U.S.A., 4th December. \(1906 ; 6\) years. Filed 10th November, 1906. Receipt No. 141,079.
claim.-1. The combination with a car vestibule, of an extension hood therefor, and means for extending said hood comprising a swinging link which connects the other jr \(r\) tion of said hood to the vestibule and is pivoted at one end to one of said parts and has a sliding connection at the other end with the other part. and means exerting force on said link in a vertical direction to swing the link away from the part to which it is pivoted, substantially as set forth.
2. The combination with a car vestibule, of a face plate which is conncted to the vestibule by an extensible wall and is movable toward and from the vestibule, and means for pressing said face plate outwardly away from the vestibule comprising links each pivoted at one end to said vestibule and having sliding and pivotal connection at the other end with said face plate, and means exerting force on said links in a vertical direction to swing them away from the vestibule, substantially as set forth.
3. The combination with a car vestibule, of a face plate which is connected to the vestibule by an extensible wall
and is movable toward and from the vestibule, and means for pressing said face plate outwardly away from the ves-

tibule, comprising links pivoted at their lower ends to the sides of the vestibule and having pivotal and sliding connections at their upper ends with the upper side portions of said face plate and springs carried on said face plate for exerting a downward pressure on the upper ends of said links, substantially as set forth.
4. The combination with a car vestibule, of a face plate which is cionnected to the vestibule by an extensible wall and is movable toward and from the vestibule but is held from vertical movement, ad means for pressing said face plate outwardly away from the vestibule, comprising links piroted at one end to the vestibule, slides pivoted to the other ends of said links, hollow spring pockets on said face plate in which sald slides are movable vertically, and vertically disposed coil springs in said pockets for opposing the movement of said slides in one direction, substantially as set forth.
5. The combination with a car vestibule, and a horizontally movable vestibule buffer, of a face plate which is rigidly attached at its lower end to said buffer and is connected to the vestibule by an extensible wall and is movable horizontally toward and from the vestibule, and means for pressing said face plate outwardly away from the vestibule, comprising links pivoted at opposite ends to the side portions of said face plate and vestibule and also having sliding connections with said face plate, and means for yieldingly resisting the movement of said links toward the vestibule, substantially as set forth.

No. 102,320. Truck Bolster. Traversin de châssis.
The Gould Coupler Company, New York City, assignce of Willaard F. Richards, Buffalo, both in New York, U.S.A., 4th December, 1906 ; 6 years. Filed 10th November, 1906. Receipt No. 141,080.
Claim.-1. A bolster or the like consisting of an integral casting of substantially M-shape in cross section, substantially as set forth.
2. A bolster or the like comprising substantially vertical spaced webs connected at their lower edges, and substantially vertical flanges arranged outside of said webs and connected to the upper edges of said webs, substantially as set inrth.
3. A bolster or the like comprising substantially vertical spaced webs, a tension member arranged between and joining said webs and compression members located outside of and spaced from but joined to said webs, substantially as set forth.
4. A bolster or the like comprising substantially vertical spaced webs which decreases in depth from the center toward the ends of the bolster, a tension member arranged between and joining said webs and compression members of substantially uniform depth throughout, located outside of and spaced from but joined to said webs, substantially as set forth.
5. A bolster or the like consisting of an integral casting having substantially vertical spaced webs which decrease in

depth from the center toward the ends of the bolster, a bottom joining said webs, substantially vertical side flanges of approximately the depth of the end portions of said webs located outside of and joined to said webs and a central strut between said bottom and the upper portions of said webs, substantially as set forth.
6. A bolster or the like consisting of an integral casting having substantially vertical spaced webs which decrease in depth from the center toward the ends of the bolster, a transversely curved bottom joining said webs, substantially vertical side flanges of approximately the depth of the end portions of said webs located outside of and joined to said webs by transtersely curved top portions and a central strut between said bottom and the upper portions of said webs, substantially as set forth.
7. A cast metal bolster or the like having integral substantially vertical spaced webs, a bottom connecting the lower portions of said webs and flanges substantially parallel with said webs and joined to the upper portions thereof, substantially as set forth.
8. A cast metal bolster or the like having integral substantially vertical spaced webs connected by a transversely curved bottom and flanges substantially paralell with said webs and joined to the upper portions thereof by transversely curved portions, substantially as set forth.
9. A cast metal bolster or the like of substantially troughshape having webs connected by a bottom. and flanges spaced from said webs and connected to the upper portions thereof, substantially as set forth.
10. A cast metal truck bolster having integral substantially vertical spaced webs, a bottom connecting the lower portions of said webs, flanges substantiallv'parallel with said webs and joined to the upper portions thereof and center and side bearings, substantially as set forth.
11. A cast metal truck bolster or the like of substantially trough-shape having webs connected by a bottom. and flanges spaced from said webs and connected to the upper portions thereof, said bolster having hollow box-like end portions. substantially as set forth.
12. A cast metal truck bolster or the like of substantially trough-shape having wobs connected by a bottom. and flanges spaced from said webs and connected to the upper portions thereof. said bolster having hollow box-like end portions with upward extensions forming side bearings, substantially as set forth.

\section*{No. 102,321. Rail Joint. Joint de rails.}

William M. Douglass, Bloomfield, New Jersey, U.S.A., 4th I)ecember, \(1906 ; 6\) years. Filed 12 th November. 1906. Receipt No. 141,119.
Claim.-1. A device for reinforcing rail joints comprising in combination with the meeting ends of ralls, a bridge plate having a depending portion adapted to space the tles, fish plates secured to the rails and having nortions of their liength turned into hooked shaped flanges adapted to engage flanges upon the opposite edge of said bridge plate, as set forh.
2. A device for reinforcing rail joints comprising in combination with the meeting ends of rails, a bridge plate having a depending portion adapted to space the cles, fish plates secured to the rails and having portions of their length turned into hook shaped flanges adapted to engage flanges upon the opposite edge of said bridge plate, portions of the edges of the fish plates beyond said hook-shaped fiangi adapted to extend over the ledges of the flange of the rall and said bridge plate, as set forth.
3. A device for reinforcing rail joints comprising in combination with the meeting ends of rails, a bridge plate hav-

ing a depending portion adapted to space the ties, fish plates secured to the rails and having portions of their length turned into hook shaped flanges adapted to engage flanges upon the opposite edge of said bridge plate, and means for fastening the lower ends of the fish plates together, as set forth.

No. 103,322. Railway Tie Plate.
Plaque de tirant de chemin de fer.

Frederic Adrian Delano, Chicago, Illinios, U.S.A., 4th December, 1906 ; 6 years. Filed 9 th November, 1906. Receipt No. 141,056 .
Claim.-1. In mechanisms of the class described, a tie plate composed of a plurality of pieces having rail base receiving portions provided with base embracing and stop lugs oppositely rdisposed and perforated lever-like portions extending outwardly and oppositely therefrom, the perforations being arranged at points relatively remote from the base receiving portion of the plate, substantially as described.
2. In mechanisms of the class described, a tie plate formed of a pluraity of portions, one portion having a bifurcated base receiving portion provided with base embracing lugs at its free edges and base stop lugs oppositely disponed and with a laterally extending lever-like portion for securing the same to a railway tie at a point relatively remote from the base of a railway rail, and a second portion provided with a base recelving portion arranged between the bifurcation of the first-named plate portion and having a rail embracing lug at its free end and a basee stop lug oppositely disposed and with a laterally extending leverlike portion perforated relatively remote from the rall base for securing the same to the railway tie, substantially as described.
3. In mechanisms of the class described, a tie plate formed of two portions, one having a bifurcated rail base supporting portion provided with base embracing lugs at its free edges and base stop lugs oppositely disposed and with a laterally lever-like perforated extension for securing the same to the railway the at a point remote from the rail base and a second plate portion provided with a base receiving portion arranged between the free ends of the bifurcated plate having a base embracing lug at its iree end and a base stop lug oppositely disposed and with a laterally extending lever-like perforated portion adapted to overlap a similar lever-like extension of a similar plate on the opposite track rail to preserve the gauge of the track, substantially as described.
4. The combination of a rail support, a rail, rail holding plates having means for engaging the rail at opposite sides and also having different centers of movement and spikes
connecting the plates and the rail support, the sald rail holding plates and the spikes bring so relatively arranged that the spikes serve as the centers upon which the plates are movable.
5. In mechanisms of the class described, the combination of a railway rail having a height greater than the width of its base, a tie plate portion engaging the base of the rail and provided with lever-like extensions extending outwardly and oppositely from the rail base, and means for securing the same in position at points relatively remote from the rail base, substantially as described.

No. 102,323. Railway Tfe.
Dormant de chemin de fer.

John Howell, Houston, Arkansas, U.S.A., 4th December, 1906; 6 years. Filed 7th November, 1906. Receipt No. \(140,996\).
Claim.-1. A metallic rallway tie comprising a bed piece in the form of a trough having an imperforate bottom and upstanding longitudinal flanges, and a sectional top or cover for said bed piece consisting of a plurality of cap pieces having downwardly extending flanges which embrace the flanges of the bed piece and are secured thereto, the said can pieces embodying braces which engage the rail flanges and secure the rails to the tie.
2. A metallic railway tie comprising an imperforate bed piece with upstanding longitudinal flanges, fiber blocks inserted between said flanges and forming rall seats, and a sectional top or cover for the bed piece of the tie composed of a plurality of cap pieces fitting over the top of the bed piece and provided with flanges which extend downwarad outside of the flanges of the bed piece and also provided with projecting braces which extend over the flanges of the rails, and bolts passing through the flanges of the bed piece and cap pieces at opposite sides of the seat blocks. 3. A metallic railway tie comprising an imperforate bed piece with upstanding longitudinal flanges, a sectional top or cover composed of a plurality of cap pleces extending over the top of the tie and provided with depending flanges which embrace the flanges of the bed plece, seat blocks located within the body of the tie immediately beneath the rails, and bolts connecting the cap pleces and bed plece, said cap pieces being provided with a hollow and a movable cover for said hole, substantially as and for the jurgose described.
4. A metallic rallway tie comprising an imperforate bed piece having upstanding longitudinal flanges, a sectional top or cover composed of cap pieces extending over the top of the bed piece and having depending flanges which embrace the flanges of the bed piece, means for securing the cap pieces to the bed piece, the end cap pleces being provided with openings in the top thereof and covers for said openings, guard rails extending across the end cap pleces, and fastening bolts passing vertically through the tie and guard ralls, substantially as described.

\section*{No. 102,324. Rail Joint. Joint de rails.}

James Leith, Sherbrooke, Quebec, Canada, 4th December, 1906; 6 years. Filed 7th November, 1906. Receipt No. 140,993.
Claim.-1. In a rail joint, a pair of rail sections having longitudinal terminal extensions adapted to overlap when the sections are assembled, said extensions having on their inner faces transversely projecting lugs designed to enter corresponding recesses also provided in the said faces, fish plates applied to the rail, and fastening members for securIng the plates in place.
2. A rail section having a longitudinally projecting terminal extension having a diagonally inclined inner face

provided with a recess and with a transversely projecting ing disposed in alignment with said recess and shaped for entrance thereinto.

No. 102,325. Signal for Air Brake System. Signal pour systeme de frein à air.

Richard Peter Nolan, Havelock, Ontario. Canada, 4th De-
cember, 1906 ; 6 years. Filed 7th November, 1906. Receipt No. 141,013.
Claim.-1. In a device for the purpose specifled the combination with the air brake system of a valve therefor, automatically opening when the pressure drops below a given point and a signal operated by the air escaping through said valve, as and for the purpose specified.
2. In a device for the purpose specified the combination with the air brake system, of a valve therefor automatically opening when the pressure drops below a given point and a sound producing signal operated by the air escaping through said valve, as and for the purpose specified.
3. In a device of the class described the combination with the air pipe of a valve communicating therewith, a valve seat therein, a valve disc held thereon by the pressure of the air, and means for exerting a predetermined pressure upwardly against the valve to move the same off the seat when the air pressure drops below a given point and a signal operated by the air escaping through said valve, as and for the purpose specified.
4. In a device of the class described the combination with the alr brake pipe of a valve therefor comprising a valve seat, a valve disc held thereon by the pressure of the air, means for limiting and adjusting the movement of the valve, means for exerting a predetermined pressure against the valve disc to move the same off the seat when the nressure drops below a given point and a signal oderated by the passage of air through said valve, as and for the purpose specified.
5. In a device for the purpose specified the combination with the air brake pipe of a valve connected thereto having a valve seat, a valve disc held thereon bv the pressure of the air in the air brake pipe, a spring tending to press the valve off gaid seat and a signal adanted to be operater by the air passing through the valve when the dien thereof is moved off its seat. as and for the purpose snecified.
6. In a device of the class described the combination with the air brake pipe of a valve connected thereto and means acting automatically to open the valve when the pressure drops below a predetermined point and a signal connected to the valve and operated by the air passing therethrough, as and for the purpose specified.
7. In a device of the class described the combination with the air brake pipe of a valve connected thereto normally kept closed by the pressure of the air, a spring normally tending to open the valve and a signal adapted to be operated by the air passing through said valve, as and for the purpose specifled.
8. In a device of the class described the combination with the air brake pipe of a valve connected thereto, normally kept closed by the pressure of the air in sald pipe, a spring normally tending to open said valve and a noise producing signal adapted to be operated by the air passing through said valve, as and for the purpose specifled. '

No. 102,326. Railway Signal.
Signal de chemin de for.

John P. Egan, Milford, Massachusetts, U.S.A., 4th December, 1906 ; 6 years. Filed 8th November, 1906. Receipt No. 141,025.
Claim.-1. In a device of the class described the combination with a railway car having an air eonveying pipe thereon and an extension on said pipe, of a plunger disposed in said extension and adapted to close said pipe, a head pivotally secured to said car and having a cam slot therein, a wheel carried by said plunger and disposed in said slot, an arm extending from said head, and means to engage said arm and rotate the head whereby the plunger will be removed from the air conveying pipe.
2. A device of the class described comprising the combination with a car having an air conveying pipe and an extension on said pipe, of a plunger disposed in sald extension adapted to normally extend into the air conveying pipe, and means to dispose said plunger into or out of said air conveying pipe.
3. The combination with a rallway car. of an air conveying pipe, an extension on said pipe, a plunger in said extension, a head pivotally arranged on said car and having a cam slot, means carried by the plunger engaging sald slot, an arm extending from sald head, means to cngage said arm to rotate the head and additional means to hold sald head in its rotated nosition.
4. The combination with a railway car. of an air conveying pipe, a plunger disposed in said pine. a head having a cam slot therein, means to rotate said head whereby said plunger will be removed from the air conveying pipe, means to engage said head and hold said nlunger out of said nipe and additional means to return said head to its normal position when released.
5. The combination with a rallway car having brake operating mechanism secured thereto, of means to operate sald mechanism comprising a plate, an arm integral with said nlate, said nlate beine substantially V-shaped, supporting means for sald arm and nlate and additional means to raise or lower said arm and nlate.

\section*{No. 102,327. Shoe and Last. Chaussure et forme.}

Henry Franklin Browne. Swampscott, Massachusetts, U.S.A.. 4th December. 1906: 6 years. Filed 12th November, 1906. Recript No. 141,128.
Claim.-1. A shoe having a pocket in the interior of its heel portion. said pocket being lower than the shank portion of the sole, and a permanently attached inner sole having a loose heel portion forming a cover for sald pocket, said cover being movable and adapted to prevent forward and upward, displacement of a cushion inserted in the pocket.
2. A shoe comprising an outer sole having its heel porthon offset or depressed below the highest part of the

Ahank, an inner sole, the heel portion of which has a lower part which is seated on and affixed to the depressed portion of the outer sole, and constituting the bottom and front end of a cushion pocket, and an upper part which is flexibly connected with the fore part of the inner sole, and constitutes a movable cover for a cushion inserted in said Docket.
3. A shoe comprising an outer sole having an offset heel portion, and an inner sole having a two-part heel portion, the lower part of which is affixed to the offset portion of the outer sole, the upper part forming a cushion covering and retaining member.
4. That improvement in the method of making pocketed shoes which consists in dividing the heel portion of the inner sole, separating the division of said heel portion, offsetting the heel portion of the outer sole, and attaching the lower division of the heel portion of the inner sole to the offset portion of the outer sole while said divisions are separated, the upper division being left free to form a pocket cover.
5. A last having means for holding a transverse portion of an inner sole above the bottom face of a portion of the last.
6. A last having means for holding the heel portion of an inner sole above the bottom face of the heel portion of the last.
7. A last having a transverse opening in its bottom face, extending from side to side of the last for the reception of a portion of an inner sole.
8. A last having in its body portion a pocket located above the bottom face of the last, said pocket having a mouth extending across the bottom face of the last. between the heel and toc portions.
9. A last having the bottom face of its heel portion offset to form on an inner sole the bottom and forward end wall of a heel receiving pocket, and provided above said bottom face with means for holding a portion of the inner sole above the said offset bottom face.
10. A last and a heel seat extension therefor separable from the body of the last.
11. A last and a detachable heel seat extension therefor, the last and extension having complemental means for preventing relative movement.
12. A last and a detachable heel seat extension therefor, said parts having complemental interlocking members.
13. A last and a detachable heel seat extension therefor having a flange adapted to engage the margin of the heel seat portion of the last body, the latter having a seat for said flange.
14. A heel scat extension having an inner face adapted to bear on the heel seat portion of the last body, and an outer face presenting a heel seat which is offset from said gortion.
15. A heel seat extension having an inner face adapted to bear on the heel seat portion of a last body, and an outer face presenting a heel seat which is offset from said portion, said outer face being inclined or bevelled at the forward end of the extension.
16. A heel seat extension having an inner face adapted to bear on the heel seat portion of a last body, an outer face presenting a heel seat which is offset from said portion, and means for engaging said body to prevent displacement of the extension.
17. A heel seat extension having an inner face adapted to bear on the heel seat portion of a last body, an outer face presenting an offset heel seat and a marginal flange adapted to engage said body.

No. 102,328. Shoe and Last. Chaussure et forme.

Henry Franklin Browne, Swampscott, Massachusetts, U.S. A., 4th ecember, 1906; 6 years. Filed 8th November, 1906. Receipt No. 141,033 .

Claim.-1. In a shoe, a shoe, an upper, and a moisture proof lining partially enclosing the edge portion of the sole and enclosing the edge of the upper, the same lining covering, also one surface on the sole.
2. In a shoe, a channelled sole, an upper, a moisture proof lining covering the channelled surface of the sole. said lining being attached to the edges thereof to the upper and said sole.
3. In a shoe, a channelled sole, an upper and a moisture proof covering attached with the upper to the channelled edge of the sole, said covering being folded over the row of stitching and upon the channelled surface of said sole.
4. In a shoe, a channelled sole, an upper, and lengths of moisture proof material overlapping the channelled surface of the sole, the said moisture proof material being attached at the edges thereof to the upper and the sole.
5. In a shoe, a channelled sole, an upper and lengths of moisture proof material atached with the upper to the sole at the edges thereof, said lengths of material overlapping each other and the channelled surface of the sole.
6. In a shoe, a channelled sole, an upper and lengths of moisture proof material attached with the upper to the sole a.t the edges thereof, said lengths of material being iolded up on the sole and enclosing the row of stitching between said upper and the sole.
7. In a shoe, a channelled sole, an upper and a moisture proof lining enclosing the joint between the upper and the sole and fastened upon the channelled surface of the sole.
8. In a shoe, a channelled sile, an upper and a plurality of moisture proof layers fastened to the channelled surface of the sole and enclosing the stitches between the upper and the sole.
9. In a shoe, an upper, a sole and lengths of moisture proof material attached to the edge portion of the sole and upper and folded upon said sole to enclose the stitches which unite the several parts.
10. In a shoe, an upper, a sole and lengths of moisture proof material attached to the edge portion of the sole and upper folded upon said sole to enclose the stitches which unite the several parts, said lengths of material being united to the sole and to each other.

No. 102,329. Felt Boot. Chaussure de fcutre.

William Henry Shultz, Grand Rapids, Michigan, U.S.A.. 4th December, 1906; 6 years. Filed 7th November. 1906. Receipt No. 140,010.
Claim.-1. The method of forming a felt boot having a bellows front consisting of preparing a batt to form the
boot, and a smaller batt to form the bellows or gussett placing non-felting material between portions of the batts, joining the batts integrally where they are in contact by felting the same, and serving the same vertically on a line through the portions so jolned.
2. The method of forming a felt boot having a bellows front consisting of preparing a batt to form the boot pooper. and a smaller and thinner batt to form the bellows or gusset, folding the latter around a piece of non-folting material with the edges of the batt adiacent to each other. placing the batts one upon the other and placing betwern the same strips of non-felting material spaced apart to permit portions only to the batts to rome in contact. ioining the batts integrally where they come in contact by felting the same. forming and treeing the boot and severing the leg of the boot on a line through the integrally joined portions of the leg and hellows portions.
3. A felt boot comprising a lece nowion sorrat vertically. and a bellows nortion foldad at itc resnoctive vertical adges and integrally folned at its fni i...irmz to the soyered edges of the leg portion by felting the same.
4. A pelt boot comprising a leg nortion sovered vertically at the front. and a bollows nortion foldod at itc vortical cilges and intcerally joined to the enver力d edges of the leg nortion by felting the said les and bellows nortions while in the hatt form. said severed niges of the leg nenaronting opposing thickened and reinforend proiecting edges.

No. 102,330. Stove Draft Apparatus.
Apparefl de tirage de poêle.

Silas McClure, Beaver Dam, Wisconsin, U.S.A.. 4th December, 1906; 6 years. Filed 9th November, 1906. Receipt No. 141,054 .
Claim.-1. In a stove or analogous device having a fuel grate and an air draft chamber across under the grate, a plurality of swinging draft controlling doors on a wall or walls of the draft chamber adapted to eoncurrent!y open and close and thereby to coincidently admit or shut off the flow of air to the draft chamber under the grate at distant points, a lever pivoted medially on the inside of the draft chamber between and substantially in a line with said doors, and rods severally connecting the opposite arms respectlvely of said lever to said doors respectively and so that the swinging of one of said doors outwardly or inwardly will compel movement of the rods in revers, directions and the swinging of the doors reversely concurrently outwardly or inwardly.
2. A stove draft apparatus. comprising hinged draft doors at distant localities on the walls of the stove, a lever pivoted medially on the stove in the line between the doors, a yielding elastic device bearing on and holding the lever yieldingly against rotating, and rods connccting the arms of the lever respectively to the doors.
3. A stove draft apparatus, comprising a pair of doors hinged at their lower edges respectively to walls of a stove, an intermediate lever pivoted medially on a stud pivot fixed on the stove the stud having a shoulder at the inner end of the pivot, means on the pivot holding the lever against the houlder frictionally, and rods connecting the arms of the lever respectively to the doors adapted to control them to swing coincidently.
4. In stove draft apparatus, duplicate door frames secured respectively to the wall or walls of a stove, said frames each having a door seat around and opening and inclined inwardly upwarly, and pintle sockets in the lower member of the frame, doors having pintles that enter the sockets and hinge the door on the frame. the door being adapted to rest when closed on the inclined seat of the frame, and means on the inside of the stove connecting the doors so that they must swing or remain closed coincidentlly.
5. In a stove draft apparatus, two oppositely located swinging doors, an intermediate medially pivoted swinging lever having laterally extended pivot apertures in its arms, and rods connecting the doors to sald lever, said rods having wrist pins with radially projecting rigid keys thereon adapted to pass through the apertures in the lever arms and by a quarter turn to be held therein against escape by endwise movement of the wrist pins.
6. In combination with a stove or range, two draft doors located in opposite walls of the stove, a medially pivoted swinging lever and rods connecting the doors at the inside thereof to the arms of the lever, the lever the rods and the connection of the rods to the doors being all on the inside of the stove and between the doors.

\section*{No. 102,331. Stove. Pocile.}

Melvin Decker, Vicksburg, Michigan, U.S.A., 4th December, 1906; 6 years. Filed 10th November, 1906. Receipt No. 141,066.
C'laim.-In a stove, in combination a magazine in the body thereof, and fitting at its lower end against the back of the stove, an exit flue at the back of the stove adjacont the top of the magazine, whereby the products of combustion are forced to rise at the front part of the stove, and to pass around the jacket hercinafter mentioned to the exit flue, an air feeding pipe which extends downwardly from the top of the stove between the magazine and the front of the stove through the path of the profucts of eambustion and entering the magazine near the lower end thereof. whereby the air is heated before being delivered to the magazinc, and a jacket around the magazine above the entrance of the aforesaid air ferding pipe.

No. 102,332. Trousers. I'antalon.

Charles William Bartrum, Newburg, New York, U.S.A., fth December. 1906; 6 years. Filed 12th November, 1306. Receipt No. 141,109.
Claim.-1. A buttonhole-fly for trousers, composed of a piece of cloth containing the buttonholes and a facing connected thereto back of the buttonholes, said fly attached to the edge of the trousers by means of the outer edge only of the facing, and said piece of cloth extending to and stitched in the side seam of theh trousers, whereby exposed lines of stitching adjacent to the trousers opening are avold.d.
2. A buttonhole fly for trousers, composed of a single pief of cloth extending from the edge of the trousers opening to the side seam of the trousers and containing the buttonholes, and a facing connected therewith back of the button-
holes, said fly being attached to the trousers by having the outer edge conly of the facing stitched to the edge of the trousers opening, and the edges of the cloth stitched in at the waist and side seam of the trousers, whereby exposed lines of stitching at the trousers opening are avoided.

No. 102,333. Grain Picker.
Machine pour marincr le grain.

Herbert F. Boyce, Abernethy, Saskatchewan, Canada, 4th December, 1906; 6 years. Filed 10th November, 1906 Receipt No. 141,069.
Claim.-1. A grain pickler comprising the combination of a bath receptacle, a separate grain hopper, means for feeding the grain into the bath receptacle, and means for elevating the grain from the bath receptacle.
2. A grain pickler comprising the combination of a bath receptacle, a separate grain hopper, means for feeding the grain into the bath receptacle, means for controlling the feed of the grain and means for elevating the grain from the bath receptacle.
3. A grain pickler comprising the combination of a bath receptacle, a separate grain hopper, provided with an opening therein, a closure for the opening, spring hinges on the closure and secured to the grain hopper, a rod carried transverse to the closure and provided with a thum nut, cams on the rod adapted to contact with the closure, and means for elevating the grain from the bath receptacle.
4. A grain pickler comprising the combination of a bath receptacle provided with an inclined bottom, a separate grain hopper provided with an inclined bottom, means for feeding the grain into the bath receptacle, and means for clevating the grain from the bath receptacle.
5. A grain pickler comprising the com'ination of a bath receptacle, a separate grain hopper provided with a depending flange extending within the bath receptacle, means for feeding the grain into the bath roonotarle from the grain hopper, and means for elevating the grain from the bath receptacle.
6. A grain pickler comprising the combination of a bath receptacle provided with an inwardly proiecting flange. a separate grain hopper. means for feeding the grain into the bath receptacle, and elevating means extending beneath the inwardly projecting flange.
7. A grain pickler comprising the combination of a bath receptacle, a separate grain hopper, means for feedin;: the grain into the bath receptacle, means for elevating the grain from the bath receptacle, and means for preventing the passage of grain under the elcvating means and for maintaining the elevating means in position.
8. A grain pickler comprising the combination of a bath receptacle, removable conveyer supporting menbers inclined upwards from the receptacle, drums on the supporting members, a crank on one of the drums. o flexible belt on the drums and a removable grain hopper on the receptacle.
9. A grain pickler comprising the combination of a bath receptacle, removable conveyer supporting niembers inclined upwards from the receptacle. drums on the supporting members, a crank on one of the drums, a flexible screening belt on the drums, and a removable grain hopper on the receptacle.

\section*{No. 102,334. Ash Sifter. Tamis à cendre.}

Joseph J. Domek, Jr., Chicago, Illinois. U.S.A., 4th December, 1906; 6 years. Filed 10th Novomber, 1906. Receipt No. 141,140.
Claim.-In an ash sifter the combination with a cylin drical vessel having a horizontal slot at a suitable distance below its upper end, of a series of serew-threaded and headed stub shafts located in said vessel on a horizontal plane near the said slot, a roller on each of said shafts, a
pair of nuts located on each of said shafts, one on the inner and the other on the outer side of said vessel, a cylindrical

sifter having a sieve horizontally located in its bottom and resting on said rollers. a screw-threaded apertured lug on the sifter, and a handle having a threaded portion to engage said lug and extending through the slot in the outer vessel, substantially as described.

No. 102,335. Miter Box. Boite ì onglet.

Peter Dosch, Bridgeport, Connecticut, U.S.A., 4th December, 1906; 6 years. Filed 7th November, 1906. Receipt No. 140,999.
Claim.-1. The combnation in a mitering apparatus, of a stationary table, a frame pivoted to the stationary table, an A-frame pivotally connected to the pivoted frame at its separated ends, a device pivotally supporied upon the other end of the A-frame provided with means which engage the back and sides of the saw at a distance from its teeth, means connected with said pivoted device and with the pivoted frame for maintaining the saw in a horizontal position at all positions of the \(\Lambda\)-frame and counterbalance springs which co-act with the A-frame.
2. In a mitering apparatus, a saw supporting and guiding device provided on its interior with resilient bearing plates adapted to immediate engagement with the sides of the saw at a distance from its teeth, the opposite ends whereof are independently adjustable toward and from the saw.
3. In a mitering apparatus a frame pivotally supported at one end in the axis or center of the apparatus, another swinging frame pivoted to the first-named frame at two points to the right and left of its axial line, a saw supporting and guiding davice pivotally supported at the other end of the last-named frame in substantially the axial line of the device, and saw centering and controlling bearing plates within the saw supporting and guiding devices the opposite ends whereof are independently adjustable toward and from the saw blades at a distance from its teeth.

\section*{No. 102,336. Pipe Cleaner. Nettoyeur de tuyau.}

Edgar T. Gilbert, Rochester. New York, U.S.A., 4th December, 1906; 6 years. Filed 9th November, 1906. Receipt No. 141,048 .
Clnim.-1. A pipe cleaner or analogous device embodying a stiff central core provided with fibres extending radially therefrom, the lengths of said fibres being increased at intervals to form a succession of tufts or brushes.
2. A pipe cleaner or analogous device embodying a stiff central core provided with groups of fibres extending radi-
ally therefrom at intervals and forming a succession of tufts or brushes.

3. A pipe cleaner or analogous device embodying a stiff central core provided with groups of fibres of graded lengths extending radially therefrom at intervals and forming a succession of conical tufts or brushes.
4. A pipe cleaner or analogous device embodying a stiff central core provided with groups of fibres of graded lengths extending radially therefrom at intervals and forming a succession of conical tufts or brushes varying in maximum diameter.

No. 102,337. Nnt Lock. Arrête écrou.

Harry H. Hawley, Malone, New York, U.S.A., 4th December, 1906; 6 years. Filed 12th November, 1906. Receipt No. 141,100.
Claim.-1. In combination, a nut having a transversely extending recess formed in its inner face and extending across the plane of the threaded opening, said recess having an obliquely disposed wall that extends from the juncture of the inner face of the nut and one of its wrench engaging faces, and a pivoted bolt engaging tongue housed within the recess and having a face shaped to engage the obliquely disposed wall, he free end of said tongue being arranged to be engaged by an adjusting tool.
2. In combination, a nut having a transversely extending recess formed in its inner face, said recess having an obliquely disposed wall that extends from the juncture of the inner face of the nut with one of its wrench engaging faces, and a pivoted tongue housed within the recess and having its free end shaped for engagement by an adjusting tool, such tongue having a depending lug or fingeer for engaging a grooved bolt, the tongue having a face shaped to engage the obliquely disposed wall.
3. In a nut lock, a grooved bolt, a nut having a transversely extending recess across its inner face, one wall of the recess being oblique with respect to the face of the nut, a locking tongue housed by the recess and having one end pivoted, the free end of the tongue having a recessed upper edge, and a curved lower face to permit engagment by an adjusting tool.

\section*{No. 102,338. Milk Pail Support.}

\section*{Support de seau d lait.}

Jacob Kuhn, Iola, Kansas, U.S.A.. 4th December, 1906; 6 years. Filed 12th November, 1906. Receipt No. 141,111. Claim.-1. A pail support comprising a pair of substantially semi-circular plates having their ends overlapping and fit-
ting slidably together, devices extending through their overlapping ends to secure them against accidental movement,

and segmental arms projecting outwardly from said plates and bearing a rigid relation therewith.
2. A pail support, comprising a pair of seml-circular plates one provided with longltudinal grooves at its upper and lower edges and the other having its corresponding edges fitting in said grooves, fastening devices extending through said overlapping ends of the plates to secure them at the desired adjustment, and segmental arms secured to said plates at diametrically opposite points and curving upwardly and outwardly therefrom.
3. A milk pail support, comprising a pair of substantially semi-circular plaes, one having grooves at its upper end lower margins and the other having its corresponding edges fitting in said grooves, bolts extending through the overlapped end of said plates, nuts engaging the bolts, and a pair of arms consisting of doubled plates bent to form loops tightly engaging the first-named plates at diametrically oppasite points and curving upwardly and outwardly therefrom.

No. 102,339. Hat Shape Making Machine. Machine pour faire des formes de chapeaux.

Arthur Conrad Lederer, London, England, 4th December, 1906; 6 years. Filed 8th November, 1906 . Receipt No. 141.021.
Claim.-1. A shape forming machine, comprising a stand, a vertical spindle turning in said stand, a crown rigid with said spindle and a plurality of arms pivotally secured in said crown, and slidable means vertically arranged on said spindle for throwing said arms inwardly or outwardly, substantially as described.
2. A shape forming machine, comprising a stand having a vertical orifice through the upper portion thereof, a vertical sbindle inserted and suitably supported in said orifice and rotating freely therein, a plurality of arms extending from the upper end of said spindle and pivotally supported therefrom, slidable means on said spindle for operating said arms, and means for operating said slldable means, substantially as described.
3. A shape forming machine, comprising a stand having a solid portion at its upper end and a central vertical orifice through said solid portion, said orifice having a reduced lower end, a spindle having a reduced lower end inserted and turning in said orifice, a plurality of arms radially and pivotally arranged at the upper end of said spindle, a collar encircling said spindle and sliding vertically and connected with sald arms, and means for moving said collar upwardly and downwardly, substantially as described.
4. A shape forming machine, comprising a stand having a solid portion at the upper end thereof and a centra
vertical orifice through said solld portion, said orifice having a reduced lower end, a spindle corresponding at the lower end thereof with said orifice and extending therethrough and having larger dimensions thereabove, a nonrotating sleeve encircling said spindie intermediate of its length, a collar encircling said sleeve and suitably supported thereon, spiral springs encircling said spindle above and below said sleeve respectively, a plurality of arms radially and pivotally arranged at the top of said spindle, a corresponding number of supporting links radially and pivotally secured in said collar and adjustably secured to said arms, and means for carrying said sleeve upwardly and downwardly against the spring pressure, substantially as described.
5. In a shape forming machine the combination with the stand having a solid portion supported on suitable legs, of a spindle having a squared upper end and turning in said solid portion, a crown having a corresponding squared orifice mounted on said spindle and having radial slots therein, elbowed arms pivotally secured in said radial slots, a collar encircling said spindle and sliding vertically thereon, supporting links connecting said collar with said elbowed arms, means for raising and lowering said collar and returning it to its mid-position, substantially as described.
6. In a shape forming machine the combination with the stand supported on suitable legs and having a central opening therethrough, of a spindle having a reduced lower end inserted in said opening and suitably supported. a sleeve encircling said spindle and spring-heln to its mid-position, a collar turning on said sleeve and supported thereby, a crown rigid with said spindle at the upper end thereof and having radial slots therein from the outer edge. elbowed arms pivotally secured in said radial slots extending upwardly and having longitudinal slots therein, supporting links connecting said collar and said arms, forming fingers having forked ends, clamps securing said fingers through their forked ends to said arms through the longitudinal slots, and pedal operated means connected to said sleeve for raising and lowering the same against its spring pressure, substantially as described.
7. In a shape forming machine the combination with the stand having a central vertical orifice throcish the upper and solid portion thereof and side orifices and hollow legs arranged in alignment with said side orifices, of a spindle inserted in said central orifice and turning therein and suitably supported, a sleeve encircling said spindle. spring-held to its mid-position and having side slots therethrough at different elevations, latches pivoted in said slots at the upper and lower end thereof, connecting rods extending through said side vertical orifices in the stand and through said hollow legs, pivoted spring-held pedals pivotally jointed to said connecting rods, one at the extremity thereof and one intermediate of its length, said pedals pulling and pushing on said rods respectively and moving said sleeve against the spring pressure, arms radially arranged and pivotally secured at the upper end of said spindle, a collar encircling said sleeve, supporting links radially inserted and pivotally secured to said collar and adjustably secured to said arms, and forming fingers adjustably arranged on said arms. substantially as described.
8. In a shape forming machine the combination with the stand and a plurality of radially arranged elbowed arms extending therefrom having longitudinal slots in their vertical sections, means for altering the vertical position of said arms and fingers forked at their inner ends and extending from said forked ends in various directions and having substantially \(S\)-shaped hooks therein arranged and clamps securing said fingers to said arins through the forked ends of the fingers and the slots of said vertical portions of the arms, substantially as described.
9. A shape forming machine comprising a stand baving central and side vertical orifices therethrough and suitable legs, said central orifice having a reduced lower end. a spindle having a reduced lower end extending through the lower portion of said central orifice and an enlarged central portion and an annular groove in said central portion, a sleeve having side slots therethrough at different elevations. a collar encircling said sleeve. suitaby supported on the shoulder thereof, a spiral spring encircling said spindle below said central portion, a washer encircling said spindle over said spring and under the lower shoulder formed by said central portion, a spiral spring encircling said spindle above said central portion, a washer encircling said upper spindle immediately beneath said spring and above the upper shoulder formed by said central portion. a crown ripidly secured at the upper end of said spindle. arms radially arranged in said crown and pivotally secured thereto. supporting links radially arranged and pivolally secured in said collar and adjustably secured to said urms, latches pivoted in the upper and lower ends of the walls in said slots in said sleeve respectively and engaging the shoulders formed by said annular groove, connecting rods pivotally secured to said latches and extending downwardly through the side
vertical openings in the solid portion of said frame, a pedal pivotally secured at its extremity to the lower end of one of the legs of said stand and having an orifice intermediate of its length in which one of said connecting rods is secured, a pedal pivoted intermediate of its length at the lower end of another of said legs and having an orifice at the extremity thereof on which is secured the other of said connecting rods, springs secured to said legs and said pedals respectively retaining said pedals in their upper position, and forming fingers adjustably secured to the aforesaid arms, substantially as described.

No. 102,340. Box Hook. Crorhet de boîtes.

Albert Max Maretzek, Hoboken, New Jersey, U.S.A., 4th December, 1906: 6, years. Filed 10th November, 1906. Receipt No. 141,087.
Claim.-A device of the character described comprising a shank, a transversely extending handle web having enlarged end portions forming hammer faces and having its intermediate portion formed with flat faces lying substantially parallel with the axis of the shank, and handle scales secured to the said faces of the web.

\section*{No. 102,341. Dump Car. Char ì bascule.}

Otto William Meissner, Montreal, Quebec, Canada, 4th December, 1906; 6 years. Filed 9th November, 1906. Receipt No. 141,055.
Claim.-1. In a car of the class described, the combination of a supporting frame portion, a drop bottom therefor formed of swinging doors pivotally secured to the frame portion at their inner edges, and movable end portion on the free edges of the bottom doors adapted to extend at an incline beyond the sides of the car when the doors are in oden nosition.
2. In a car of the class described, the combination of a supporting frame portion, a drod bottom therefor formed of swinging doors pivotally secured to the frame portion at their inner edges, and movable end portions on the free edges of the bottom doors adapted to extend at an incline beyond the sides of the car when the doors are in open position and to be moved into an inoperative position when the dron doors are closed.
3. In a car of the class described, the combination of a supporting frame portion, a drop bottom portion therefor composed of swinging doors hinged at their inner edges, and downwardly swinging extensions hinged to the outer edges of the swinging doors.
4. In a car of the class described, the comblnation of a supporting frame portion, a drop bottom therefor composed of swinging doors hinged at their inner edges, downwardly swinging extensions hinged to the outer edges of the swinging doors, and means for raising the extensions to operative position when the swinging doors are lowered. substantially as described.
No. 102,342. Feed Water Heater for Locomotives. Chauffeur d'eau d'alimentation pour locomotives.

Walter Andrew Moffat, Denver, Colorado. U.S.A., 4th December, 1906 ; 6 years. Filed 7th November, 1906 . Receipt No. 140,997.
Claim.-1. In a device of the class described. a boiler provided with a combustion chamber, a feed water receptacle, a supply tank, an auxiliary heating tank communicating therewith, a duct leading from the auxiliary tank to the receptacle, a pipe connected with the latter and leading through the combustion chamber for heating the water, and a pipe leading from the receptacle to the boiler.
2. In a device of the class described, a boiler having a combustion chamber, a feed water receptacle, a tank communicrating with said receptacle, means for supply steam to the tank, a pipe connected with the receptacle and leading through the combustion chamber, and means between the receptacle and boiler for supplying water to the latter.
3. In a device of the class described, a boiler having a combustion chamber and an exhaust, a receptacle, means for supplying water thereto, a duct, connected with the exhaust and leading into the receptacle, a duct connectes with the latter and leading through the combustion cham. ber, and connections between the receptacle and boiler for supplying water to the latter.
4. In a device of the character described, a boiler having a combustion chamber and an exhaust, a water jacket for sald boiler, a duct connected with the exhaust and leading into said water jacket, a duct connected with the latter and leading into the boiler, a supply tank having connection with said water jacket, and a steam pipe connecting said boiler and the steam space of the supply tank, the same having a valve thercin controlled by the steam pressure of the boller, substantially as and for the purpose sel forth.

No. 102,343. Washing Machine. Machinc ì laver.

Philip Vollmar, Chatham, Ontario, Canada, 4th December, 1906; 6 years. Filed 12th November, 1906. Receipt No. 141.112.

Claim.-1. The combination witt. the tub \(A\) of an oscillatory rubber B, a movable bumper \(F\) and an operaing handle engaged to simultaneously operate the rubber and bumpers, substantially as specified.
2. The combination with the tub \(A\) of an oscillatory rubber \(B\) having the slotted engagement with the bumper \(F\). substantially as specified.
3. The combination with a tub of an oscillating rubber having a slotted engagement with the arms \(G\) of the bumper \(F\). and the coiled compression springs \(H\) exerting their tension on the ends of the arms \(G\) at \(g\), and the lateral flanges \(h\) of the rubber \(B\), substantially as and for the purposes specified.
4. In combination with the tub \(A\), an oscillatory rubber \(B\). having a slotted engagement with the bumper \(F\), the colled springs \(B\) exerting their tension upon the ends of the sald arms \(G\) and the rubber \(B\) when the tension of the coiled springs \(H\) is overcome, the rubber \(B\) may oscillate independent of the bumper \(F\), substantially as described and for the purpose specifled.
5. In a washing machine the combination of the semicircular oscillating rubber \(B\) having metal ends \(B^{1}\), the inside corner being extended and having elongated slots or slides \(b^{2}\). for the pivotal engagement of the studs \(g\), at the outer ends of the arm \(G\) of the bumper \(F\), for the purpose specified.
6. In a washing machine the combination of a semi-circular oscillating rubber \(B\) having extended ends with slides and lateral flanges for the engagement of one end of the colled compression springs \(H\), the opposite ends engaging with the pivot on the arm of the bumper F, substantially as and for the purpose specified.
7. In a washing machine the combination of the semicircular rubber \(B\) having a rigid engagement with the axle \(C\) the arms \(C^{1}\), the connecting rods \(E\) haviag a plvoted engagement with the handles \(D\), the bumper \(F\) the supporting rods \(N\) engaging with the sides of the tub \(A\) at \(N\). substantially as and for the purpose specified.
8. In a washing machine the combination of the oscillating rubber \(B\) having the metal heads \(B^{1}\). which are constructed with flanges and perforations for receiving the transverse slats \(b\), the cross braces \(B^{2}\), having the hub \(B^{x}\) eccentric to the ends of said brace, the said rubber having a rigid engagement with the axle \(r\) the rigid arms \(C^{\prime}\), the connecting rods \(E\), the levers \(D\) and the handle \(D^{\prime}\). the compression spring \(H\), the bumper \(F\), the supporting rods \(N\), all subsintially as and for the purpose specified.

No. 102,344. Ironing Board. Planche demaner.

John O. Ward, Santa Maria, Californla, U.S.A., 4th Derember, 1906; 6 years. Filed 12th November, 1916. Receipt No. 141,099.
Clain.-An ironing board comprising a table formed with a longitudinal slot at one end, engaging spurs projecting upward from the upper surface of the table at opposite sides of the slot, a leg member formed with an engaging shoulder said leg member projecting edgewise through the slot in the table, a hinge having its upper leaf secured 10 the under surface of the table adjacent the slot, and having its lower leaf extending downward along the upper edge of the leg member and formed with a longitudinal slot. and a bolt extending through the slot and endwise through the lea member, said bolt being provided with a tightening nut, substatially as described.

\section*{No. 102,345. Perpetual Calendar. \\ Calendrier perpétuel.}

James M. Crawford, Bentonville, Indiana, U.S.A., 4th December, 1906; 6 cuars. Filed 16th November, 1905. Receipt No 130,171.
Claim.-A perpetual calendar consisting of a card. a table printed on the lower central dortion of the card and comprising numbers indicating the days of the month and an aperture formed through the card adjoining the table. a diac pivoted in its center to the back of the card and haviak printed thereon abbreviations for the dags of the week occuring seven times which appear through the aperture as the

through an aperture in said card and means for indicating
the year numerically, substantially as shown and described

\section*{fear numerically, substantially as shown and described.}

No. 102,346. Metallic Packing.
Garniture métallique.

Edward J. Fuller, Elyria, Ohio, U.S.A., 4th December, 1906; 6 years. FIlled 25 th October, 1905. Receipt No. 129,562.
Claim.-1. In a metallic packing, the combination with the packing rings, of a cage composed of separable members, means interposed between the meeting faces of said members and wholly enclosed within the edges of said meeting faces for insuring \(t\) true and perfect alignment of sald members, and means for securing said members together.
2. In a metallic packing the combination with the packing rings, of a cage composed of separable members, centering devices projecting into the meeting faces of said members and wholly enclosed within the odges of said faces for insuring a true and perfect alignment of said members, and means for securing all of said members togethar.
3. In a metallic packing, the combination with the packing rings, of a cage composed of separable members, centering rings projecting into the meeting faces of sald members and wholly enclosed within the edges of said faces for insuring a true and perfect allgnment of said members, and means for securing the members together.
4. In a metallic packing, the combination with the packing rings, of a cage composed of separable members, provided with annular recesses in their meeting faces, centering rings adapted to engage in said recesses for insuring a true and perfect alignment of said members, and means for securing said members together.
5. In a metallic packing the combination with the packing rings, of a cage composed of separable members,

suitable
means surroundin securing said members together, and perfect alignment of said bolts for insuring a true and 6. In a metalic of said members.
ing rings, of a cage comg, the combination with the packable bolts for securing said of separable members, suiting rings surrounding said members together, and centerperfect alignment of said members for insuring a true and 7. In a metallic of said members.
ing rings, of a cage cong, the combination with the packvided with suitable composed of separable members proindependent of but surrounding and with annular recesses arranged in said recesses for said holes, centering rings alignment of said members, insuring a true and perfect said bolt holes and members, and suitable bolts occupying
8. In a metallic packined to hold said members together. ing rings, of a cage composed combination with the packvided with suitable bolt posed of separable members proindependent of but wolt holes and with annular recesses ing rings arranged in said recic with said bolt holes, centera true and perfect alignm recesses and adapted to insure occupying perfect alignment of said members, and bolts together.
No. 102,347. Postmarker.
Apparcil id maculer les lettres, etc.

Donald Robertson, Wellington, New Zealand, 4th December, 1906; 6 years. Filed 24th November, 1905. Receipt No. 130.384 .
Claim.-1. The combination in a postmarking machine of a feed wheel and an index finger on one side of the mall path, with, on the opposite side of the mail path, an adjustable sensitive mail separator at right angles to the mail path and a time stop projecting across the mail path, substantially as and for the purpose set forth.
2. In a postmarking machine the combination with a positive rotary feed wheel having a continuous rubber face of an adjustable spring controlled mail separator at right angle to the mail path, substantially as herein described.
3. In a postmarking machine the combination, of an index finger, means for adjusting the space between said index finger and guide plate or mail fence, a spring for automatic adjustment of index fliger to passing mail matter, and means for regulating the pressure of said spring, substantially as herein described.
4. The combination in a postmarking machine of a rotary printing wheel having gripping and marking surfaces, part of marking periphery being recessed, the lower part being of continuous periphery, and inking device engaged with marking die, and a pressure roller adapted to engage with gripping surface and marking die, substantially as herein described.
5. The combination in a postmarking machine of a mall fence a time stop profecting across mall path set in advance of marking and pressure wheels, and pivoted to recede from mail path, a cam adapted to actuate said time stop and means to restore same to normal position after actuation.
6. In postmarking machines the combination with the marking wheel, having the printing dies thereon, and the pressure roller having a rubber sleeve thereon adapted to engage with the printing dies of the maraking wheel, sald sleeve having grooves therein, substantially as describeed.
7. In postmarking machines the combination of a stacking wheel, an adjustable fence, a travelling tray beneath sald fence, and rollers to carry said tray, substantially as described.

No. 102,348. Shock Loader. Charge-gerbes.
Arthur L. Walker, Pincher Creek, Alberta. Canada, 4th December, 1906; years. Filed 4th September, 1906. Receipt No. 139,216.
Claim.-1. A machine of the class described comprising a supporting frame having a depending bracket mounted on its under face adjacent each of its side edges, a main drive shaft
journalled in bearings slidable in said brackets, traction wheels carried by said drive shaft, a bracket mounted on the

upper face of said frame adjacent its side edges, a lever pivotally secured to each of said upper brackets, and connected at one end to the corresponding drive shaft bearing, means for onerating said levers to elevate or lower said frame, a hoisting carrier mounted at one end of said frame, an inclined discharge elevator disposed in the rear of said hoisting carrier, and means for operating said carrier and elevator.
2. A machine of the class described comprising a supporting frame having a depending bracket mounted on its under face adjacent each of its side edges, a main drive shaft journalled in bearings slidable in said brackets. traction wheels carried by said drive shaft. a bracket mounted in the upper face of said frame adjacent each of its side edges, a lever pivotally mounted in each of said upper brackets, and connected at one end to the corresponding shaft bearing, means connected to the opposite end of said levers for simultaneously operating the same, to raise or lower said frame, a hoisting carrier mounted at the front end of said frame, means connected with said drive shaft for operating said carriage, an inclined discharge elevator arranged at the rear of said carrier, and connections between said carrier and elevator for operating the latter.
3. A machine of the class described comprising in combination a supporting frame. a depending bracket mounted on the under face of said frame adjacent wach of its side edges. a lever pivotally mounted in each of said unver brarkets, a main drive shaft journalled in bearings slidable in sald lower brackets traction wheels carried by said shaft, a rod connecting the front end of each lever with the corresponding shaft bearing. means connected to the opposite end of said levers for simultaneously operating the samp. to raise or lower said frame with respect to said shaft. a pair of spaced uprights mounted unon said frame, at itc front end. shafts connecting said uprights. sprocket whecls mounted on said shafts at onnosite ends thereof. a hoisting carrier disposed between said uprights. and commrising a nair of snrocket chains adanted to travel unon said anrocket wheels, rod= connecting said sprocket chains and a series of nicker fingers mounted on each rod. an inclined dischargo plevator arranged at the rear of said carrier. means for driving said carrier from said traction whecl. and means for driving said clavator from said carrier.
4. A machine of the class deacribed comnrisine a sumporting frame provided with a nair of denonding braclecta. earh mounted on the under face of said prame ailacent the side edges thereof. a main drive shaft inurnalled in hearings elinable in caid brarkets. tractinn whela married by said ohaft. a nair of bracknts mounted on the unnor fare of eafid Prame at onnosite ends thrrofi, a inver nivotallv mnunted in each of sald upper bracketa. a rod connecting the lower end of each lever with the correanonaing shaft hearing. a tongue connecter at its front ond with said shaft and extending bevond the rear eden of saif frame. meanc mounted upon the rear end of the tongue and connectad with the onposite end of said levers for simultanfouslv onerating the same to lower or raise said frame, means likewise mounted at the rear end of said tongue for effecting an independent tilting movement of said frame upon said shaft, a hoisting carrier mounted at the front end of said frame an inclined discharge elevator arranged at the rear of said carrier, means for driving said elevator from said carrier.
5. A machine of the class described comprising a supporting frame provided with a pair of brackets. each mounted on the under face of said frame adjacent the side edges thereof, a main drive shaft journalled in bearings slidable in said brackets, traction wheels carried by said shaft, means mounted on said frame for raising or lowering the same with respect to said shaft. means for effecting an independent tilting movement of said frame upon said shaft, a second shaft mounted at the rear end of said frame pro-
vided at opposite ends with sprocket wheel mounted thereon, a sprocket wheel mounted on each end of said main drive shaft, chains connecting the corresponding sprocket dive shaft, chains connectig a holsting carrier mounted at the wheels of said shaft, a hoisting connecting said second
front end of said frames, means con front end of said irames, means connectics, an inclined discharge elevator arranged at the rear of said hoisting carrier to receive therefrom, and means connecting said carrier and elevator for driving the latter.
6. A machine of the class described comprising a supporting frame provided with a pair of depending brackets mounted on its under face, a main drive shaft journalled in said brackets. means connected with said frame for raising or lowering the same with respect to said main drive shaft. a second shaft mounted on said frame in the rear of sald main drive shaft, a holsting carrier mounted at the front of said frame, a sprocket wheel secured to each end of sald main drive shaft. a sprocket wheel loosely mounted on each end of said second shaft and provided with an integral toothed sleeve forming one member of a clutch, a clutch member fixed at each end of said second shaft, means for normally holding the members of each clutch in contact with each other, means mounted at the rear end of said frame for simultaneously separating the members of each clutch against the action of said holding means. sprocket chains connecting the corresponding sprocket wheels, connections between said second shaft and said hoisting carrier for driving the latter na, incllned elevator mounted in the rear of said hoisting carrier and adapted to receive therefrom, and means for driving said clevator from said hoisting carrier.

\section*{No. 102,349. Range Boiler Heater.}

Chauffcur de chaudic̀res.

Thomas B. Watt, Chatham. Ontario. Canada. 4th December. 1906: 6 years. Filed 3rd November, 1906. Receipt No. 140,889 .
Claim.-1. A metallic steam pipe or body in combination with a metallic inner water pipe having the ends of both the outer body and the inner water pipe threaded for their engagement into the ties serving to fasten the said outer body and the inner water pipe together, substantially as set forth.
2. A metallic steam pipe for use in heating in combination with an inner water pipe secured on the inside of the outer body by means of ties, the outer body having a threaded engagement at both ends into the ties, the inner water pipe passing through the said ties and being secured by means of the jamb nuts and washers, substantially as specified and set forth.
3. A metallic stem pipe in combination with a water pipe, and means of securing he said water pipe inside the said steam pipe forming a chamber for the reception of the steam, substantially as set forth.
No. 102,350. File and Binder for Newspapers, Etc. Fil et relicure pour journaux.
Joseph Wilson Christchurcr, New Zealand, 4th December.
1906 : 6 years. Filed 22nd December, 1904. Receipt No. 120,972.
Claim.-1. In a file for newspapers and the like in combination, a narrow oblong shaped frame, upwardly projecting ation, a narrow oblong shaped frame, upwardy proce shects of paper may be impaled, a flap that is hinged to the frame that has openings through which the hooks come when the flap is brought over the hooks in order to hold or lock the papers on the file, a guard piece likewise hinged to the frame that is adapted to come over the points of the hooks and spring catches on the guard piece supports adapted to engage with the stems of the hooks, substantially as specified.
2. In a flle for newspapers, letters and such like, a narrow oblong shaped frame, upwardly projecting sharpened hooks
on the frame having eyes near the points thereof through which a cord may be passed, a flap that is hinged to the frame having openings through which the hooks come when the flap is brought over the hooks in order to lock the papers on the file, a guard piece likewise hinged to the frame that is adapted to come over the points of the hooks and spring catches upon the guard piece supports adapted to engage with the stems of the hooks, substantially as described and as illustrated.

No. 102,351. Bufing Machine. Machine d bouvier.

Sidney Wilmot Winslow, assignee of Andrew Wilson Rogers, both of Beverly, Massachusetts, U.S.A., 4th December, 1906; 6 years. Filed 16th December. 1904. Receipt No. 120,806
Claim.-1. The combination with a holder formed with a plurality of holes, of an abrading device comprising a plurality of pleces of abrasive material arranged in layers and having corresponding holes, and means extending through the holes for securing the device in position on the holder.
2. The combination with a holder and an abrading device comprising a plurality of pieces of abrasive material arranged in layers, of means for securing said device to the holder, and additional securing means for entering the abrasive material.
3. The combination with a support of non-abrasive material, of an abrading device comprising a plurality of pieces of abrasive material of varying diameters arranged in layers with the smallest layer next to the support, sald support being of a diameter slightly less than the said smallest layer whereby to support said layer from its center to within a short distance of its edge.
4. The combination with a holder and an abrading device. of a securing device comprising a stem extending centrally through the abrading device and into the holder and provided with arms having prongs to engage the abrading device and holder at two or more points to prevent relative rotative movement of said parts.
5. The combination with a rotary holder and an abrading device, of a securing device comprising a stem extending through the abrading device and provided with an arm arranged to engage said deyice eccentrically, and means for securing the stem in position in the holder.
6. A device of the class described comprising a plurality of pieces of material, each having an abrasive surface, sald pleces being of circular form and of varying diameters and being placed in layers with their abrasive surfaces on the same side.
7. In a machine of the class described, the combination of an abrasing device comprising a plurality of circular layers of abrasive material of diameters varying from the largest in the outer layer to the smallest in the inner layer with means for supporting and actuating sald device, the combination being arranged to permit continuous use of said abrading device while successive layers of the abrasive material are being worn out.
8. As a new article of manufacture, an abrading device comprising a plurality of pleces of material, each having an abrasive surface, said pieces being of circular form and being placed in layers with their abrasive surfaces on the same side and also being secured together.
9. As a new article of manufacture, an abrading device comprising a plurality of pieces of material, each having an abrasive surface, said pieces being of circular form and being arranged in concentric layers with their abrasive surfaces all on the same side, said device having provision for securing the pleces together at two or more points to prevent relative rotative movement thereof.
10. As a new article of manufacture, an abrading device comprising a plurality of circular pieces of abrasive material, said pieces being of varying diameters and being placed in concentric layers and also being secured together at two or more points.
11. As a new article of manufacture, an abrading device comprising a plurality of layers of flexible abrasive material secured together, the marginal portions of said layers of material being free to move relatively.
12. A device of the class described comprising a plurality of superposed pieces of abrasive material arranged in layers of diminishing size with their abrasive surface on the same side.
13. An abrading device comprising a plurality of superposed layers of flexible abrasive material, the marginal portions of the layers of material being disconnected to permit sald portions to move relatively, said superposed layers being of diminishing size whereby the upper layers will not project beyond the periphery of the lowest one when the device is bent upwardly.
17. The combination with a holder and an abrading device, comprising a plurality of pieces of abrasive material of circular form and of varying diameters, said device presenting a convex abrasive surface near its edge.
15. As a new article of manufacture, an abrading device comprising a plurality of pieces of abrasive matorial of circular form and of varying diameters and a backing of non-abrasive material secured thereto.
16. As a new article of manufacture, an abrading device comprising a plurality of circular pieces of abrasive material arranged in concentrlc layers secured together at a plurality of points.
17. The combination with a holder and an abradingdevice, of means for securing the abrading device to the holder, said securing means comprising a headed stem extending through the abrading device and holder and provided with a roughened surface, and latches arranged to engage said roughened surface for securing the stem in the holder.
18. The combination with a holder and an abrading device, of means for securing the abrading device to the holder, said securing means comprising a headed stem extending through the abrading device and holder and provided with a roughened surface and radially movable latches arranged to engage said roughened surface, means for yieldingly pressing the latches normally toward position for engaging the stem and bevelled faces formed on the inner ends of the latches whereby they may be forced outwardly by the stem in inserting the latter.
19. The combination with a holder and an abrading device, of means for securing the abrading device to the holder, said securing means comprising a headed stem extending through the abrading device and holder and provided with a roughened surface, a plurality of latches arranged to engage said roughened surface and operating means for simultaneously withdrawing said latches.
20. The combination with a holder and an abrading device, of means for securing the abrading device to the holder. said securing means comprising a stem provided with an arm having a prong to engage the abrading device eccentrically. said securing means having provision for preventing rotative movement, radially movable latches mounted in said holder for securing the stem therein, aeans for normally pressing the latches toward position for engaging the stem, and means for simultaneously withdrawing the latches to release the same.

No. 102,352. Machine for Distributing Material. Machine de distribution de matières.

Wagner and Brand, assignee of Otto G. C. Schmitt, both of Frankfort on the Main, Germany, 4th December, 1906; 6 years. Filed 30th May, 1905. Receipt No. 125,602.
Clain.-1. An electro-magnetic selection device for use in mechanically operated distributing apparatus consisting of an electro-magnet which is continuously caused by mechanical means to move to and fro upon a slide, and a distributing part which is likewise movable to and fro along a slide, and is provided with a spring pressed armature, being attracted or suddenly released by the core of the electromagnet when this latter is energized or the magnetizing current is interrupted.
2. In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination with the electro-magnet movable to and fro upon a slide, and the distributing part which is likewise movable to and fro along a slide, of movable contact pieces placed at intervals along the path of the electro-magnet, a current collector fixed to the electro-magnet carriage and adapted to make sliding contact with said contact pieces and keys connected to the respective contact pieces. 3. In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination with the electro-magnet movable to and fro upon a slide, and the distributing part which is likewise movable to and fro along a slide, of a galley containing the matter to be distributed and having mounted on it the armature of the electro-magnet.
4. In the electro-magnetic selection device for use in mechanically operated distrlbuting apparatus, the combination with the electro-magnet movable to and fro upon a slide, a distributing part which is likewise movable to and fro along a slide, and a galley for containing a line of type to be distributed, a key controlled electro-magnetically operated devices for effecting the transfer of a line of type to the galley, said devices comprising a slide which normally closes a delivery aperture in the locking frame containing the matter to be distributed and is adapted to be opened by the action of an electro-magnet, and of a pusher adapted to be operated by another electro-magnet so as to cause the line of type to be distributed to pass through said anerture into the galley.
5. In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination with the electro-magnet movable to and fro upon a slide, a distributing part which is likewise movable to and fro along a slide, with a set of keys adapted to effect the delivery of individual types from the distributing galley to the respective type chutes comprised in a range approprlated to one alphabet of a shift key common to all the keys of the set and adapted to cause the actuation of said keys to effect the delivery of types to the respective type chutes comprised in a range appropriated to another alghabet.
6. In the electro-magnetic selection device for use in mechanically operated distributing apparatus the combination of typc holders, key operated ejecting mechanism, a composing galley, means for feeding said galley a distance equal to the width of a type at each operation of a key, and means for feeding the galley in a direction transverse to that of the first-named feeding movement.
7. In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination of type holders, key operated effecting mechanism, a composing galley, means for feeding said galley a distance ecual to the width of the type at each operation of a key, means for feeding the galley in a direction transverse to that of the first-named fecding movement, and adjustable mechanism for bringing about the operation of a secondnamed feeding means after a predetermined, variable number of operations of the first-named feeding means.
8. In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination of type holders, key operated ejecting mechanism, a composing galley, means for feeding sald galley a distance equal to the width of a type at each operation of a key, and means controlled by the movement of the galley, for returning it the distance it has been fed.
9. In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination of type holders, key operated ejecting mechanism, a composing galley, means for feeding said galley a distance equal to the width of a type at each operation of a key, means, controlled by the movement of the galley, for returning it the distance it has been fed in the aforesaid manner, means for feeding the galley, after a number of feeding operations of sald kind, in a direction transverse to that of the first-named feeding movement, and mechanism controlled by the second movement of the galley, for returning it the distance it has been fed in such transverse direction.
10.In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination with a key actuated mechanism, of separate series of type chutes for canital and for small letters of the alphabet respectively, a single set of type keys for controlling the delivery of types from both series of type chutes, and a shift key adapted to co-act with all the type keys in common, substantially as described.
11. In the electro-magnetic selection device for use in mechanically operated distributing apparatus, the combination with a key actuated mechanism, of type chutes, a composing galley and means whereby the composing galley is caused to advance through a distance equal to the width of a type for each actuation of a type key, said means comprising a screw spindle supporting the composing galley, a rotated wheel for producing the rotation of the screw spindle and a bar adapted to be actuated by means of any one of the type keys, substantially as described.
No. 102,353. Comb. Pcigne.

Charles Schmidt and Joseph C. Hoffman, assignee of a halt interest, both of Brooklyn, New York, U.S.A., 4th De'cember, 1906; 6 years. Flled 30th July, 1906. Receipt No. \(138,285\).
Claim.-1. The combination of a comb, a locking plate having prongs to engage the hair, and means for securing said blate to the comb.
2. A means for fastening a comb upon the hair, comprising a locking plate having prongs adapted to engage the hair in the reverse direction from that of the comb teeth.
3. The combination of a comb, a locking plate having prongs adapted to fit between the teeth of the comb for gripping the hair, and means for securing said plate to the comb.
4. The combination of a comb for ladies' hair, a lock ing plate having a pair of ears thereon and having prongs, and means upon the comb for engaging said ears whereby the prongs enter the spaces between the comb teeth.
5. The combination of a comb for ladies' hair, having extensions at each end, a locking plate having ears to engage said extensions and having prongs formed to enter between the teeth of the comb and engage the hair.
6 The combination of a comb for ladies' hair, a locking plate having prongs adapted to fit between the teeth of the comb, interlocking projections and said recesses on said comb and plate, and means for retaining the same in cooberative relation.
7. The combination of a comb for ladies' hair, having a pair of extensions thereon, the lower edges of said extensions being bevelled. and a locking plate baving ears adapted to engage said bevelled extensions and having prongs adapted to enter between the teeth of the comb.
8. The combination of \(a\) comb for ladies' hair, having a pair of extensions thereon, the lower edges of said extensions being bevelled, and a locking plate having bent over ears to engage said extensions and having prongs to enter between the tepth of said comb, said locking plate having projections thereon adapted to be received in corresponding recesses in the comb.

No. 102,354. Gas Burner. Brâleur à gaz.

The National Gas Light Company, assignee of John Doorenbos, both of Kalamazoo, Michigan, U.S.A., 4th December, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138.259.
Claim.-1. The combination with a Welsbach burner having a gas orifice and a mixer tube into which said orifice opens, a self adjusting valve containing said orifice, pressure actuated means for actuating said valve, a passage for the gas around said means, and means for varying the amount of gas passing through said passage arcording to the variation in the gas pressure.
2. The combination with a Welsbach burner having a gas orifice and a mixer tube into which said orifice opens, a ralve controlling said orifice and equipped with a piston, a cylinder in which said piston moves, a passage leading to the cylinder beneath the piston, a passage extending around the cylinder to said first-named orifice and a valve controlling said last-named passage.
3. The combination of a nipple having a chamber therein, and a vertical passage from said chamber and a lateral passage from said chamber, a laterally extending threaded valve connected with said nipple and controlling said lateral passage, a cap surmounting the nipple and having an orifice, a cylinder within the cap surmounting the nipple and a piston within the cylinder equipped with a valve controlling said orifice.
4. The combination of a nipple having a chamber with a central vertical passage therefrom and a lateral passage, a cylinder connected with the upper portion of said nipple into which sald vertical passage opens, a piston within said cylinder, a cap surmounting said nipple and inclosing said cylinder, said cap having a central orifice at Its apex and a needle valve extending into said orifice and equipped with a piston working in said cylinder, for the purpose set forth.
5. The combination of a nipple having a chamber with two passages leading therefrom, a cylinder in co nmunication with one passage, a piston working in said cylinder and equipped with an upward extending valve, a cap surmounting said nipple and forming with the cylinder an annular passage for gas, the said cap having a reduced externally threaded upper portion and a mixer tube secured on said cap.

\section*{No. 102,355. Tanning Apparatus. Appareil de tannage.}

The Buffalo Leather Company, assignee of William Rosco Smith, all of Buffalo, New York, U.S.A., 4th December, 1906 ; 6 years. Filed 30th July, 1906. Receipt No. 138.255.
Claim.-1. An apparatus for treating skins, etc., comprising a vat, a liquid circulating pump adjacent to the vat,
suction and discharge pipes communicating with the pump and with the bottom portion of the vat, and an air inlet whereby the liquid forced by the pump into the vat is aerated.
2. An apparatus for treating skins, etc., comprising a vat, a liquid circulating pump adjacent to the vat, suction and discharge pipes communicating with the pump and with the bottom portion of the vat and an air inlet whereby the liquid forced by the pump into the vat is aerated, said air inlet having means for regulating the quantity of air admitted.
3. An apparatus for treating skins, etc., comprising a liquid retaining vat, a circulating pump adjacent to the vat, suction and discharge pipes communicating with the pump and with the vat, the said discharge pipe having radiating branches containing liquid distributing perforations which are arranged to direct the liquid in an approximately horizontal direction and impart a gyratory movement thereto.
4. An apparatus for treating skins, etc comprising a vat or a series of vats, a liquid storage tank, a circulating pump, a suction pump connecting the pump with the liquid storage tank and provided with an air inlet, and a discharge plpe connecting the pump with the vat or vats.
No. 102,356. Artificial Tooth. Dent artificielle.

Dental Protective Supply Company of the Uniter States of America, Chicago, Illinois, assignee of Joseph Morris, North Wales, Pennsylvania, U.S.A., 4th December. 1906;
6 years. Filed 30th July, 1906. Receipt No. 138,258.
Claim.-1. An artificial tooth comprising a body of porcelain, a backing of composition material containing a metal oxide, and one or more fastening devices embedded in said composition material, substantially as described.
2. An artificial tooth comprising a body of porcelain, a backing of composition material containing a metal oxide, capable of uniting wih sald porcelain body under burning, and one or more fastening devices embedded in said composition material, substantially as described.
3. An artificial tooth comprising a body of porcelain, a backing composed of mingled porcelain and metal oxide, and one or more fastening pins embedded in said backing, substantially as described.
4. An artificial tooth comprising a body of porcelain, a backing composed of mingled porcelain and aluminum oxide. and one or more fastening pins embedded in said backing, substantially as described.
5. An artificial tooth comprising a body of porcelain, a backing of mingled porcelain and metal oxide fused therewith, and one or more fastening pins embedded in said backing. substantially as described.
6. An artificial tooth comprising a body of porcelain, a backing of mingled porcelain and aluminum oxide fused therewith, and one or more fastening pins embedded in said backing, substantially as described.
7. An artificial tooth comprising a porcelain face, a cutling member backing the cutting edge of said face, a body member backing the major portion of said face, a body of porcelain and metal oxide inset in said body member, all of said parts being fused together, and one or more pins anchored in said composition member, substantially as described.
8. The method of manufacturing artificial teeth which consists in fusing with the porcelain body of a tooth, a backing of composition material containing a metal oxide constituting an anchorage for the usual fastening pins, substantially as described.
9. The method of manufacturing artificial teeth which consists in moulding with the porcelain body of a tooth a backing of composition materlal containing a metal oxide constituting an anchorage for the usual fastening pins, and then integrating said parts by heat, substantially as described.
10. The method of manufacturing artificial teeth which consists in moulding with the porcelain body of a tooth a backing of composition material containing a metal oxide constituting an anchorage for the usual fastening pins, drying the moulded tooth by a baking heat, trimming the tooth, and finally integrating and hardening the tooth by subjecting the same to a burning operation, substantially as described.
11. The method of manufacturing artificial teeth which consists in subjecting a metal oxide to a high temperature, subsequently mixing said oxide with powdered porcelain. and then fusing said mixture with the body of a porcelain footh and around the usual anchoring pins thereof, substantially as described.
12. The method of manufacturing artificial teeth which consists in charging the cavity of a mould member with a plastic porcelain, erecting in the cavity of a companion mould member, one or more fastening pins, partially charging said last-named cavity around said fastening pins with anchoring material of superior strength to the porcelain and fusible with the latter, filling the rest of said cavity with plastic porcelain, uniting the mould members with said cavities in registration, and fusing said parts of the tooth together, substantially as described.
13. The method of manufacturing artificial teeth which consists in charging the cavity of a mould member with plastic porcelain, erecting in the cavity of a companion mould member one or more fastening pins, charging one end of said last-named cavity with plastic porcelain to form in part the backing of the tooth, further partially charging said last-named cavity around said fastening pins with an anchoring material or mixed porcelain and metal oxide. charging the rest of said cavity with body porcelain. uniting the mould members with said cavities in registration, subjecting the mould to a baking heat, then removing and trimming the tooth, and finally subjecting it to a heat sufficient to fuse and integrate the parts, substantially as described.
14. The method of manufacturing artificial teeth which consists in subjecting a metal oxide to a high temperature, mixing said oxide with powdered porcelain in a plastic state to form an anchoring composition, charging the cavity of a mould member with plastic porcelain, erecting in the cavity of a companion mould member one or more fastening pins, charging one end of said last-named cavity with plastie parcelain to form the backing of the lower end of the tooth, further partially charging said last-named cavity around said fastening pins with said composition anchoring material, charging the rest of said cavity with body porcelain, uniting the mould members with said cavities in registration, subjecting the mould to a baking heat, then removing and trimming the tooth, and finally subjecting it to a heat sufficient to fuse and integrate said parts, substantially as described.

\section*{No. 102,357. Methods of Treating Asbestos.}

\section*{Méthode de traitcment de l'amiante.}

Alpheus Hugh Hipple, Omaha, Nebraska, U.S.A., 4th December, 1906; 6 years. Filed 30th July, 1906. Receipt No. \(138,246\).
Claim.-1. The method herein described of treating asbestos, which consists in working asbestos fiber and sulphur into a pulp with water, removing the water, saturating the residual mass with oil and subjecting the mass thus treated to the action of heat until vulcanization takes place.
2. The method herein described of treating acbestos, which consists in working asbestos fiber and sulphur into a pulp and water. shaping said pulp into the form of bap or of articles, causing said paper or articles to absorb oil a d subjecting said paper or articles containing said oil to the action of heat until vulcanization takes place.

\section*{No. 102,358. Process of Rendering Lithopone Stable Against Light.}

Procédé pour rendre le lithopone stable contre la lumière.
Dr. Wilhelm Ostwald, Leipzig, Germany, 4th December, 1906; 6 years. Filed 26th July, 1906. Receipt No. 138.185.
Claim.-1. The process for manufacturing lithopone stable against light, which consists in excluding the access of air to the mixture of sulphate of barium and sulphide of zinc during the burning process and cooling in water.
2. The process for manufacturing lithopone stable against light, which consists in burning and cooling the mixture of sulphate of barium and sulphide of zinc in an atmosphere deprived of free oxygen.

\section*{No. 102,359. Method of Making Substances for} Building and Isolating Substances.
Wéthode de faire des substances isoloires pour constructions.
Alfred Schlomann, München, Germany. 4th December, 1906 ; 6 years. Filed 7th August, 1006. Receipt No. 138,474.
Claim.-1. A process for the manufacture of moisture re-claim.-1. A process isolating material consisting in treating suitable substances with isolating properties inside a vacuum and heating and pressing same at the same time.
2. A process for the manufacture of moisture resisting isolating materials consisting in treating layers of moisture

attracting, isolating substances, such as asbestos fiber covered with layers of waterproof substances, such as copal inside a vacuum while heating and pressing same at the same time.
3. A process for the manufacture of moisture resisting isolating materials consisting in treating layers of a mixture of moisture attracting, isolating substances and other isolating materials. covered with layers of waterproof substances by heating and pressing same while inside a vacuum.
4. A process for the manufacture of moisture resisting isolating materials consisting in treating a mixture of a water attracting. isolating substance with a solution of a waterproof substance by heating and pressing same while inside a vacuum.
5. A process for the manufacture of moisture resisting isolating materials consisting in treating a mixture of isolating substances with a melt of waternroof substances inside a vacuum while heating and pressing same at the same time.
6. A process for the manufacture of moisture resisting isolating materials consisting in treating moisture attracting substances with isolating properties together with waterproof substances inside a vacuum while heating same and pressing same in employing an elastic pressure automatically regulating itself in accordance with the shrinking of the pressed material.
7. In an apparatus for the manufacture of materials by heating and pressing suitable substances inside a vacuum, a casing, a vacuum conduit conducting to said casing plates to be heated from inside, movably arranged within said casing, a pressing piston introduced into said casing and working said movable plates.
8. In an apparatus for the manufacture of materials by heating and pressing suitable substances inside a vacuum, a casing, a vacuum conduit for said casing, rectilinearly guided plates movable in said casing. means for heati \(g\) said plates from their inside, adjusting appliances between each of said heated movable plates, a pressing piston working against said movable plates.
9. In an apparatus for the manufacture of materials by heating and pressing suitable substances inside a vacuum, a casing with a vacuum condult, plates heated from inside, movably arranged in said casing, a pressing plate in said casing. means for automatically regulating the pressure of said pressing plate.

No. 102,360. Paper Making Machinery. Machine à faire le papier.

Robert B. Wolf, Berlin, New Hampshire, and Harry E. Tidmarsh. Sandy Hill, New York, U.S.A., co-inventors. 4th December, 1906 ; 6 years. Filed 21st September, 1906. Receipt No. 139.689.
Claim.-1. The combination of a stock vat, a cylinder mould therein, a white water chamber in conmunication with the interior of the cylinder mould, and an intermediate chamber between the stock vat and the white water chamber to prevent leakage between said vat and chamber.
2. The combination of a stock vat. a cylinder mould having an axial sleeve, a white water chamber communicating with the interior of the cylinder mould by way of said sleeve and an intermediate chamber between the vat and the white water chamber, said slecve passing through said intermediate chamber.
3. The combination of a stock vat, a cylinder mould having an axial sleeve, a white water chamber communicating with the interior of the cylinder mould by way of said sleeve, an intermediate chamber between the vat and the white water chamber and packing between the wall of the intermediate chamber and the sleeve.
4. The combination of a stock vat, a cylinder mould having an axial sleeve, a white water chamber communicating with the interior of the cylinder mould by way of said sleeve, an intermediate chamher between the vat and the white water chamber, and packing between the walls of the intermodiate chamber and the slneve to prevent loakage from the vat and white water chamber respectively into the intermediate or overfow chamber.
6. The combination of a stock vat, a cylinder mould therein having an axial sleeve and a shoulder between the sleeve and the cylinder end, a white water chamber communicating with the interior of the cylinder mould by way of caid sleeve, an intermediate chamber between the vat and white water chamber, and a packing collar or washer surrounding said sleeve and engaging the wall of the intermediate chamber and the shoulder of the rylinder respectively.
6. The combination of a stock vat, a cylinder mould therein having an axial sleeve and a shoulder between the sleeve and the cylinder end, a white water chamber communicating with the interior of the cylinder mould by way of said sleeve, an intermediate chamber between the vat and white water chamber, a packing collar or washer surrounding said sleeve and engaging the wall of the intermedate ehamber and the shoulder of the cylinder respectively, and a packing sleeve engaging the packing collar and shoulder of the cylinder respectively and overlying the joint between the two.
7. The combination of a stock vat, a rylinder mould having an axial sleeve provided with a shoulder at its junction with the cylinder and a flange at its outer end, a white water chamber communicating with the interior of the cylinder by way of said sleeve, an intermediate chamber between the vat and the white water chamber through Which said sleeve passes, and packing means interposed between the walls of the intermediate chamber and the shoulder and flange respectively of the sleeve.
8. The combination of a stock vat, a cylinder mould having an axial sleeve provided with a shoulder at its junction With the cylinder and a flange at its outer end, a white water chamber communicating with the interior of the cylinder by way of sald sleeve, an intermediate chamber between the vat and the white water chamber through which said sleeve passes, packing rings located between the walls of the intermediate chamber and the shoulder and flange respectively of the sleeve, and packing sleeves closing the joints between the packing rings and the shoulder and flange respectively.
9. The combination of a stock vat. a cylinder mould therein, a white water chamber in communication with the cylin. der mould, an intermediate chamber between the stock vat and the white water chamber to receive any leakage from the stock vat or the white water chamber, and means for discharging the collected secpage from said internediate chamber.
10. The combination of a stock vat, a cylinder mould therein, a white water chamber in communication with the cylinder mould, an intermediate chamber between the stock vat and the white water chamber to recrive any leakage from the stock vat or the white water chamber, and a connection for said intermediate chamber to a stock chest or other storage roceptacle.
11. The combination of a stock vat, a cylinder mould therein having an axial sleeve. a white water chamber communicating with the interior of the cylinder mould by way of said sleeve, and an Intermediate chamber between the vat and the white water rhamber, the wall separating sald intermediate chamber from the vat being lower that the vat sides to permit the stock to overflow into said chamber When the level of the stock is raised in said vat.
12. The combination of a stock vat. a cylinder mould therein having an axial sleeve, a white water chamber communicating with the interior of the cylinder mould by way of said sleeve, an intermediate chamber between the vat and the white water chamber. the wall separating said said intermediate chamber from the vat being lower than the vat sides to permit the stock to overflow into said chamber When the level of the stock is raised in-sail vat. and mea's for conducting the stock from said inter:nediate chamber to a stock chest or other receptacle.
13. The combination of a stock vat. a cylinder mould therein having an axial sleeve, a white water chamber com-
municating with the interior of the cyllnder mould by way of said sleeve, an intermediate chamber between the val and the white water chamber, the wall between said intertnediate chamber and the stock vat being lower than the vat sides to permit the stock to overflow into said chamber when the level of the stock is ralsed in said vat, and packing means between the other wall of said intermediate chamber and the end of the axial sleeve to preveat leakage between the intermediate chamber and the white water chamber.
14. The combination of a stock vat, a cylinder mould therein having an axial sleeve, a white water chamber communicating with the interior of the cylinder mould by way of said sleeve, an intermediate chamber between the vat and the white water chamber, the wall between said intermediate chamber and the stock vat being lower than the vat sides to permit the stock to overflow into said chamber when the level of the stock is raised in said vat, a packing ring between the other wall of the intermediate chamber and the flanged end of the axial sleeve and a packing slenvo embracing the peripheral edges of the packing ring and flange.

No. 102,361. Shuttle for Looms.
Navette pour meficrs.

Felix O Donnell and Susan Alwilda Brown, assignee of a half interest, both of Pawtucket, Rhode Island, U.S.A.. 4th December, 1906; 6 years. Filed 22nd October, 1906. Receipt No. 140,519.
Claim.-1. A device of the character described comprising an arm or member for engaging the shuttles as ahe latter is moved forward with the lay of the loom. and means carried by said arm for yieldingly holding the same in a normally outward position.
2. A device of the character described comprising an arm or member provided at one end with a shoe for engaging the shuttle as the latter is moved forward with the lay if the loom, and means carried by said arm for yieldingly holding said shoe in a normally outward position.
3. A device of the character deseribed comprising an arm or member for engaging the shuttle as the latter is moved forward with the lay of the loom, and a spring carried by saif arm for yieldingly the same in a normally outward nosition.
4. A device of the character described comprising a shuttle engaging arm mounted in bearings. and means carrierl by said arm for yieldingly holding the same in a normally forward position.
5. The combination with a longitudinally reciprocable arm or member arranged to intercept a projecting portion of a shuttle as the latter is carried forward by the lay of the loom, and means carried by said arm for holding the same in a normally outward position, of means for stopping the loom when said arm or member yields to the movement of said shuttle.
6. The combination with the breast beam of a loom of an arm or member for engaging a projecting portion of a shuttle as the latter is moved forward by the lay of the loom, a spring for holding said arm or member normally forward, a shaft mounted adjacent said breast beam and provided with a member normally in engagement with said first-mentioned arm or member, whereby said shaft will rock when said arm or member moves against the action of its spring, and means controlled by said shaft for stopping the loom.

\section*{No. 102,362. Stop Motion for Looms.}

Mouvement d'arrêt pour méticrs.

Felix O'Donnell and Susan Alwilda Brown, assignee of a half interest. both of Pawtucket, Rhode Island, 4th December, 1906; 6 years. Filed 22nd October, 1906. Receipt No. 140,520.
Claim.-1. In a stop motion for looms, the combination of the shuttle, the lay, and the temples, and means whereby the loom will be stopped automatically if for any cause the temples are drawn inward.
2. In a stop motion for looms, the combination of the shuttle, the lay, and the temples, and means whereby the loom will be stopped automatically to prevent breaking down the warp threads when the shuttle stops in the shed and is carreld forward by the lay against either of said temples.
3. In a stod motion for looms, the combination of the shuttle, the lay, and the vibrator, means whereby the vibrator beam will yield when an excess tension is exerted on the warp threads and spring actuaed means released by the movement of the vibrator to stop the loom.
4. In a stop motion for looms, the combination of the shuttle, the lay, and the vibrator, means in said vibrator arranged to hold it normally against the ordinary tension of the warp threads, and means whereby said vibrator may be allowed to yield when an excess of tension is exerted on the same, and means whereby the movement of said vibrator operates mechanism to stop the loom.
5. In a stop motion for looms, the combination of the shuttle, the lay and the vibrator a spring actuated lateh bolt arranged to normally hold said vibrator in a given position against the ordinary tension of the warp threads upon it, and means whereby said bolt is operated automatically to release sald vibrator and slacken the warp when an excessive strain is brought to bear upon the same and thereby prevtn the warp from breaking.
6. In a stop motion for looms, the combination of the shuttle, the lay, and vibrator, a spring actuated latch bolt arranged to normally hold said vibrator in a given position againstthe ordinary tension of the warp thread upon it, and means whereby said bolt is operated automatically to release said vibrator and slacken the warp when an excessive strain is brought to bear upon the same, and means whereby the movement of the vibrator when released operates to stop the loom and prevent the warp from breaking.
7. In a stop motion for looms, the combination of the shuttle, the lay, a vibrator pivotally hung from the loom frames, a spring actuated latch bolt arranged to normally hold said vibrator in a given position against the ordinary tension of the warp threads upon it, means whereby said bolt may be withdrawn automatically and allow said vibrator to tip down and release the warp when an excess tension is applied to the same, and means whereby the tipping down of said vibrator operates mechanism to stop the loom.

\section*{No. 102,363. Egg Lifter. Appareil a soutever les arifs.}

Joseph Magnie Anderson, assignee of Carl Fredrick Swanson, both of Eagle Bend, Minnesota, U.S.A., 4th December, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,564.
Claim.-1. An egg lifter, comprising a plate having openings and also having perforations. a plurality of pairs; of rock shafts mounted on the plate, loops attached to the rock shafts and having their members extending through said perforations, and means for causing movements of the rock shafts.
2. An egg lifter, comprising a plate having openings and perforations, a plurality of pairs of rock shafts provided with crank ends, having swinging connection with said plate, wire loops attached to the rock shafts and having their
members extended through the perforations in the plate, operating bars at opposite sides, of the plate, link connec-

tions between said bars and the rock shafts, whereby the rock shafts of the bar may be moved in opposite directions, and means for onerating said bars.
3. An egg lifter, comprising a plate having openings and perforations, a plurality of pairs of rock shafts provided with crank ends having swinging connection with the plate, spring yielding loops extended from the rock shafts through the perforations in the plate, operating bars at opposite sides of the plate, link counections between said bars and the rock shafts, whereby the rock shafts of a pair are swung in opposite dircetions when the said bars are moved upward or downward, guides on the bars and swinging levers having bars engaging in said guides.
4. An egg lifter, comprising a plate having openings and perforations, a plurality of pairs of loops movable in the perforations, and meaus for simultaneously swinging all the pairs of loons.

No. 102,364. Rotary Engine. Machine rotatoire.

Edward David Mousscau, assignee of Edward Anthony Ezra Mousscau, both of Hull. Quebec, Canada. 4th December, 1906: f; years. Filed 7th February. 1996. Receipt No. 132.662.

Cluim.-1. In a rotary engine the combination with the rotor of a plurality of transversely slidable plugs located within the same and adapted to protrude from either side thereof to form a fluid abutment and means for excrting a fluid pressure on the side of said plugs when protruding, as and for the purpose sperified.
2. In a rotary engine the combination with th? rotor of a Ilurality of transveresly slidable plugs located within the same, means alternately moving the plugs to protrude from one side to form fluid abutments and the other of the rotor and means for exterting the fluid pressure on the sides of plugs when so protruding, as and for the purpose specified.
3. In a rotary engine the combination with the rotor, of a plurality of transversely slidable plugs located within the same and adapted to protrude from either side thereof, a casing enclosing the rotor. a plurality of cam grooves in sald casing alternately moving the plugs from one side of the rotor to the othor. and means for exerting a fluid pressure on the side of saili plugs, as and for the purpose speciffed.
4. In a rotary engine the combination with the rotor, a rasing eliclosing the same. of a plurality of transver:ely slidable plugs located in the rotor and adanted to pme. from rither side of the same, a plurality of cam grooves in the casing altornatoly moving the plugs from one side of
the rotor to the other, and means for intermittently admitting a motive fluid into said cam grooves to exert a pressure on the plugs, as and for the purpose specified.
5. In a rotary engine the combination with the rotor of a plurality of transversely slidable plugs located in the same, and adapted to protrude from either side thereof and means for intermittently exerting a pressure on the sides of said plugs for a predetermined nart of the revolution thereof, as and for the purpose specified.
6. In a rotary engine the combination with the rotor and casing enclosing the same, of a nlurality of transvorsely slidable plugs. In the rotor adapted to protrude from either side thereof. a plurality of cam groovec in the casing. alternately moving the plugs from one side of thereto to the other and means for intermittently abutting and exhausting the motive fluid from said cam grooves for predetermined portions of the revolution, as and for the nurpose specifled.
7. In a rotary engine the combination with the rotor and casing enclosing the same, of a nluralitr of transversely slidable plugs in the rotor adanted to protrude from either side thereof to form steam abutments, a plurality of cam grnoves in the casing alternately moving the plugs from nom side of the rotor to the other and means automatically nonerated by the rotation of the rotor for intermittently adinit.ting and exhausting the motive fluid from said cam gronves for oredetermined portions of the revolution, as and for the purpose specifled.
8. In a rotary engine the comhination with the rotor. a casing enclosing the same, of a nluralitv of pressirer rec iving projections on satd rotor. fluid conducting ports through said casing and fluid conducting channels on safi rotor for conducting the motive fluid to said pressure recoivine projections during nredetermined portions of the revolution. as and for the purpose snecifled.
9. In a rotary engine the combination with the rotor and casing enclosing the same, of a plurality of transversely slidable plugs in said rotor adanted to protrude from either side thereof, cam grooves in said casing. alternately moving the plugs from one side of the rotor to the other, fiuid ports extending through said casing. and fluid conducting channels formed on the sides of the rotor for conducting the motive fluld from the ports to the grooves. as and for the purpose specifled.
10. In a rotary engine the combination with the rotor and casing enclosing the same, of a plurality of transversely slidable plugs in said rotor adapted to protrude from elther side thereof, cam grooves in said casing. alternately moving the plugs from one side of the rotor to the other, fluid ports extending through said casing, fluid conducting channels formed on the sides of the rotor for conducting the motive fluid from ports to the erooves and a plurality of exhaust ports automatically opening by the rotation of the plugs, as and for the purpose specified.
11. In a rotary engine the combination with the rotor and casing enclosing the same, of a plurality of transversely slidable plugs symmertically arranged around the rotor and adapted to protrude from either side of the same, a plurality of cam grooves in the casing alternately moving the plugs from one side of the rotor to the other, fluid ports extending through the casing, a plurality of fluid conducting channels formed on the sides of the rotor between the plugs and adapted to conduct the motive fluid from the ports to the grooves and exhaust ports in the bottom of the said grooves opened by the rotation of the plug, as and for the purpose specifled.
12 In a rotary engine the combination with the rotor and casing enclsing the same, of a plurality of transpersely slidable plugs located in said rotor and adapted to protrude from either side thereof, cam grooves for alternately moving the plugs to protrude from one side or the other thereof, steam ports extending through the casing at the beginning of said cam grooves, means for connecting the same to a suitable supply of motive fluid, fluid ports at the opposite end of said cam grooves, means for connecting the same to a supply of motive fluid, and a plurality of conducting channels on the rotor adapted to conduct the motive fluid from said ports to said grooves, as and for the purpose specified.
13. In a rotary engine the combination with the rotor and casing enclosing the same, of a plurality of transversely slidable plugs located in the rotor and adapted to protrude from either side thereof, a plurality of cam grooves in the casing alternately moving the plug from one side of the rotor to the other, a set of ports for admitting the motive fluid into said cam grooves, a second set for admitting the motive fluid to the cam grooves in the opposite dircction and a three-way valve controlling the admission of said motive fluid to said ports, as and for the purpose snnelfied.
14. In a rotary engine the combination with the rotor and casing enclosing the same, of a transversely slidable plug located in the rotor and adapted to protrude from the side thereof, to form a fluid abutment, a groove formed in sald casing within which said plug is adapted to rotate, a cam
surface at each end of said groove for moving the plug in and out of the groove, as and for the purpose specified.
15. In a rotary engine the combination with the rotor and casing enclosing the samet of a transversely slidable plug located in the rotor and adapted to protrude from the side thereof, to form a fluid abutment, a groove in the casing within said plug is adapted to rotate, a cam surface at each end of said groove, generated by radial lines passing through the axis of the engine for moving said plug in and out of the groove, as and for the purpose specifled.
16. An improved rotary engine comprising a rotor, a two part casing enclosing the same, a plurality of symmetrically arranged transversely slidable plugs located in slots provided in the rotor, a plurality of grooves in each side of the casing in which the plugs are adapted to rotate. cam surfaces at each end of said grooves for moving the plugs in and out of the same, steam ports extending through each side of the casing, conducting channels formed on each side of the rotor between the plugs for conducting the steam from said ports to said grooves and exhaust ports located in the bottom of said grooves and adapted to be opened hy the passage thereover of the plugs, substantially as described.

No. 102,365. Chaff Blower.
Machine souflante pour la balle.

The Neepawa Manufacturing Company, assignee of David Richard Gardiner, all of Necpawa, Manitoba, Canada, 4th December, 1906; 6 years. Filed 13th September, 1906. Receipt No. 139,483.
Claim.-1. A chaff blower comprising a casing having inlet openings at onposite sides and having a tangentially disposed outlet and a rotary fan therein, having its blades arranged to force air through said outlet and having central discs at its opposite sides, the said discs confronting the said onenings in the sides of the casing but located at a distance therefrom sufficient to allow the passage of air through said openings over said discs and in front of the outer lengths of the blades of the fan.
2. A chaff blower comprising a rotary fan having troughshaped blades facing in the direction of rotation of the fan and having central discs at the sides of less diameter than the fan as a whole, and a casing enclosing the fan having opposite inlet openings co-axial with said discs and having a tangentially disposed outlet, the sides of the casing being spaced at a substantial distance from the respective discs.
3. A chaff blower comprising a trough whose bottom slants downward from opposite ends towards an intermediate point, a vertically disposed blower casing located in the trough and having a tangentially disposed outlet, and a rotary fan therein adapted to blow the air taken from said inlet openings through said outlet.
4. In combination with a straw conveyer for conveying off the straw from a separator, a chaff blower comprising a casing located at an approximately central point between the separator and having opposite inlet openings and a tangentially disposed outlet chute, a rotary fan therein, a trough for directing chaff into said openings, and a shield for preventing the chaff from passing to the straw conveyer.

\section*{No. 102,366. Wood Planing Machinery. Machine à blanchir le bois.}

Major Harper and Son, assignee of Charles Ernest Harper both of Whitby, Ontario, Canada. 4th December, 1906; 6 years. Filed 4th October, 1906. Receipt No. 140,022.
Claim.-1. A feed roll section comprising an annular rim, clutch members therein, a clutch hub, clutch members car-
ried by the clutch hub to engage with the first-mentioned clutch members and cause the revolution of the rim, and

spring tensioned means within the rim to normally maintain it to revolve in a flxed curvilinear plane and permit it to yield therefrom under abnormal conditions.
2. A feed roll section comprising an annular rim. clutch members projecting inwardly from the inner surface thereof, a clutch hub, clutch members forming part of the clutch hub and co-acting with the first-mentioned clutch members, feed roll section hubs independent from the rim arranged at the sides of the clutch hub, spring tensioned spokes carried by the feed roll section hubs and engaging the inner surface of the rim.
3. A feed roll section comprising a rim, clutch members projecting inwardly from the inner surfaces thereof, a clutch hub, clutch members for the clutch hub co-acting with the first-mentioned clutch members to cause the revolution of the rim, feed roll section hubs at the sides of the clutch hub and separated from the rim, spoke seats in the feed roll section hubs, spokes contained in the spoke seats, flanges for the spokes between their inner and outer ends, springs encircling the spokes between the flanges and the bottom of the spoke seats to normally press them into contact with the inner surface of the rim, and a retaining ring encircling the feed roll section hubs to hold the inner ends of the spokes in the spoke seats.
4. A feed roll section comprising a feed roll shaft, a series of independently acting feed roll sections encircling the shaft and separated therefrom but revoluble therewith, each feed roll section comprising an annular rim, clutch members projecting inwardly from the inner surface thereof, a clutch hub for each feed roll section mounted on the shaft to revolve therewith. clutch members for each clutch hub co-acting with the clutch members of the rim to cause the latter to revolve with the feed roll shaft, feed roll section hubs loosely mounted upon the feed roll shaft and of less diameter than the rim to provide for the radial movement of the latter, spoke seats contained in the feed roll section hubs, spokes having their inner ends in the spoke seats. and springs normally pressing the spokes outwardly against the inner surface of the rim to maintain it normally concentric with the center of the feed roll shaft.
5. A feed roll section comprising a ferd roll shaft, a series of independently acting feed roll sections encircling the shaft and separated therefrom but revoluble therewith, cach feed roll section comprising an annular rim, clutch members projecting inwardly from the inner surface thereof, a clutch hub, for feed roll section mountrd on the shaft to revolve therewith, clutch members for each clutch hub co-acting with the clutch members of the rim to cause the latter to revolve with the feed roll shaft, feed roll section hubs loosely mounted unon th: feed roll shaft and of less diameter than the rim to provide for the radial movement of the latter, spoke seats contained in the feed roll section hubs, spokes having their inner ends contained in the spoke seats, and springs normally pressing the spokes outwardly against the inner surface of the rim to maintain it normally concentric with the center of the feed roll shaft, and means to limit the outward movement of the spokes.
6. A feed roll section comprising a feed roll shaft, a series of independently acting fed roll sections encircling the shaft separated therefrom but revoluble therewith, each feed roll section comprising an annular rim, clutch members projecting inwardly from the inner surface thereof, a clutch hub for each teed roll section mounted on the shaft to revolve therewith, clutch members for each clutch hub co-acting with the clutch members of the rim to cause the latter to revolve with the feed roll shaft, feed roll section hubs loosely mounted upon the feed roll shaft and of less diameter than the rim to provide for the radial movement of the ? atter. spoke scats contained in the feed roll section hubs,
spokes having their inner ends contained in the spoke seats, springs normally pressing the spokes outwardly against the inner surface of the rim to maintain it normally concentric with the center of the feed roll shaft, means to limit the outward movement of the spokes consisting of an annular rim encircling the feed roll section hubs having slots therein registering with the spoke scats, and flanges connected to the spokes within the circle of the annular rim to engage with the inner surface thereof.

No. 102,367. Pitchfork Blank. Blanc pour fourchcs.

The Maple Leaf Harvest Tool Company, assignee of Carl K. Jansen, Frank Eisbrenner, and Kash Eisbrenner, all of Tilsonburg. Ontario, Canada, 4th December, 1906; 6 years. Filed 23rd January, 1906. Receipt No. 132,154.
Claim.-1. An integral blank for forming pitchforks and the like, comprising the shank portion, the outer tine portions extending in the same direction as the shank, the inner tine portions extending in the opposite direction, the head of the fork connecting the parts and cut convex towards the inner tine portions. and intermediate tine portions connecting with the blank at the juncture of the head and the outer tine portions, e and extending in the same direction as the inner tine portions, substantially as described.
2. An integral blank for forming pitchforks and the like, comprising the shank portion, the outer tine portions, extending in the same direction as the shank, and separated therefrom by spaces corresponding in shape and size to the inner tine portions, the inner tine portions extending in the opposite direction, and separated by a space corresponding in shape and size to the shank, the head of the fork connecting the parts, and intermediate tine portions connected with the blank at the juncture of the head and the outer tine portions and separated from the inner tine portions by spaces corresponling in size and shape to the outer tinc portions. substantially as described.
3. An integral blank for forming pitchforks and the like, comprising the shank nortion, the outer tine portion extending in the same direction as the shank, and separated by spaces corresponding in shape and size to the inner tine portions, the inner tine portions extending in the opposite direction and separated therefrom by a space corresponding in shage and size to the shank, the head of the fork connecting the parts, and cut convex towards the inner tine portions. and intermediate tine portions connected with the blank at the juncture of the head and the outer tine and dircction, and separated therefrom by a space corresponding ing in size and shape to the outer tine portions, substantially as described.

\section*{No. 102,368. Screw Driver. Tourne-vis.}

Milo J. Cowgill, Victor, Colorado, U.S.A., 4th December. 1906; 6 years. Filed 12th October, 1906. Receipt No. \(140,255\).
Claim.-A screw driver having the forward end of its shank provided with a laterally enlarged head, the forward end of which is disposed at substantially right angles to the shank, the side edges of the head being inclined outwardly in opposite directions from the front edge, said edge portions constitute independent bits, the forward end of the shank
extending longitudinally across opposite sides of the head to points adjacent the front edge thereof with the sides of the

shank converging forwardly across the head in substantially parallelism with the respective side edges of the head.

No. 102,369. Clamp. Crampon.

James R. Kearney, Topeka. Kansas, U.S.A.. 4 th December, 1906; 6 years. Filed 8th October, 1906. Receipt No. 140,157.
Claim.-1. A supporting clamp for electric co.lductors comprising a pair of superposed clamping plates, binding means connecting these plates, and a hanger connection disposed at one side of the plane of the conductor extending between the plates.
2. A supoprting clamp for electric conductors comprising a pair of superposed clamping members or plates having conductor seats, binding means connecting these plates, and a hanger connection disposed at one side of the piane of the conductor extending between the plates.
3. A supporting clamp ior electric conductors comprising a pair of superposed clamping plates. one of which is provided with a hanger connzction, and binding means connecting the two plates.
4. A supporting clamp tor electric condu-tors conprising a pair of superposed clamping plates formed with longitudinal conductor seats and one of which is provided with a hanger connection, and binding means connecting the two plates.
5. A supporting clamp for electric conductors, conprising a pair of superposed clamping members formed with conductor seats and one of which is provided with a laterally offset hanger connection, and binding means connecting the two members.
6. A supporting clamp for electric conductors comprising a pair of superposed clamping members formed with longitudinally disposed conductor seats in their inner faces and one of which is provided at one end with a lateral'y offset hanger flange for the connection of a stain insulator therewith, a binding connection between the two nlates
7. A supporting clamp for electric conductors comprising a pair of superposed clamping members formed with longitudinally disposed conductor seats having gripping faces, one of said members being further provided at one end with a laterally offset hanger flange for the connection of a strain insulator therewith, and binding bolts connecting the two members at opposite sides of the plane of the seats.
8. A supporting clamp for electric conductors romprising a pair of superposed clamping nembers having wire gripping means and one of which is provided with a laterally offset
hanger flange, a supplemental clevis strap secured to one of the members and overlying the hanger flange to recoive the connecting rod of a strain insulator, and binding bolts connecting the two members.
9. In combination with an electrical conductor having a right angle bend, of supnorting clamps secured uyon the conductor respectively at opposite sides of the bend thereof and each of which clamps is provided with a hanger connection, a strain insulator secured to a bracis:g guy leading from each insulator in line therewith.
10. In combination with an electrical conductor having a right-angled bend and the supporting cross arm, of a pair of supporting clamps clamped upon the conlu tor respectively at opposite sides of the bend thereof. said clamps being disposed at right-angles to each other and each provided on one of its members with a hanger flange, a strain insulator connected with the fange of each clamp, and a bracing guy leading from each insulator.
No. 102,370. Hammer. Marteat.

Henry C. Lyon, Howard Lake, Minnesota, U.S.A., 4th Decem-
ber, 1906: 6 years. Filed 19th O tober, 1906. Receipt
No. 140,426.
Claim.-1. The combination with a hammer had having a handle secured thereto, of a hopper, curvel \&ulte plates connected with said hopper, a movable shutter provided with an clongated slot, a shelf arranged below said shutter, a hopper enclosing said shelf, a reciprocating blo \(k\), and means for moving said shutter and block together, substantially as shown and described.
2. The combination with a hammer head having a handle secured thereto, of a hopper having a bent lever pivoted thereto and provided on one end with a weight and adapted to extend at its opposite end into said hopper. curved guide plates arranged below said hopper, a recipro:ating shutter. provided with an elongated slot, a shelf arranged below said shutter, a conical hopper enclosing said sholf, a reciprozating block provided with clamping jaws. and meins for operating said shutter and block together, subsiantially as shown and described.
3. The combination with a hammer head hiving a handle secured thereto. of a hopper. curved guide platez having diverging edges arranged below said hopper, a reciprocating shutter provided with an elongated slot adapted to register with a passage formed by said guide plates. a shelf arranged beneath said shutter, a conical hopper enclosing sill shelf. a reciprocating block provided with clamping jaws and means for operating said shutter and block toveth: \(r\), substantially as shown and described.
4. The combination with a hammer head having a landle secured thereto, of a hopper. inclined guide plates arranged beneath said hopper, a reciprocating shutter provilod with an elongated slot having end slots connected therewith, a shelf arranged below said shutter, a conical honpe- enclosing said shelf, a reciprocating block provid d with clamping jaws. and means for operating said shutter and block together, substantially as shown and described.
5. The combination with a hammer head having a handle secured thereto. of a hopper, inclined guide plates co nected with said hopper, a reciprocating shutter provided with an elongated slot, a shelf adapted to register with the clot of said shutter, a conical hopper provided with off cet lips adapted to register with the ends of the slot for nef in said shutter. a reciprocating block provided with clamping jaws, and means for operating said shutter and block together, substantially as shown and described.
6. The combination with a hammor head having a handle secured thereto, of a hopper, curved guide plates connected
with said hopper, a reciprocating shutter provided with an elongated slot, a shaft arranged beneath said shutter, a hopper enclosing said shelf and provided with offset lips, a reciprocating block provided on its upper portion with a guide plate having an open-ended slot and with spring clamping jaws secured to the central portion of said block, and means for operating said shutter and block together, substantially as shown and described.
7. The combination with a hammer head having a handle secured thereto. of a hopper, curved guide plates conected therewith, a reciprocating shutter, a shelf arranced beneath said shutter, a conical hopper enclosing said shelf. a reciprocating block provided with spring jaws and a slotted guide plate, a rod having a longitudinal movement on said handle and provided with an upper arm engaging said shutter, and a lower arm engaging said block, a bent lever pivoted on said handle and connected with said rod. and a spring bearing against said lever and handle. subs'a tially as shown and described.
8. In a hammer having a ball provided with a transversp recess, the combination with a hopper, of curved guide plates connected therewith, a reciprocating shutter proviled with an elongated slot, a reciprocating block provited with clamping jaws and movable in said recess, and a reriprocating bar provided with arms connected with said shutler and block respectively, substantially as shown and described.
9. In a hammer the combination with a handle havi \(g\) a head secured thereto and provided with a transverse recess, of a hopper, a block movable in said recess and provided with spring jaws and an upper guide plate having an openended slot and bevelled edges adjacent to said slot, a reciprocating bar mounted upon said handle, and connected with said block, and means for reciprocating said block in one direction, substantially as shown and described.

No. 102,371. Trolley Hanger. Support de trolléc.

Thomas Price, Minneapolis. Minnesota, U.S.A., 4th December, 1906; 6 years. Filed 26th October, 1906. Receipt No. 140.660.
Claim.-1. A trolley hanger comprising essentially a link having an upwardly extending threaded pin portion and a swivel mounted thereon, a grapnel having a threaded opening therein and adapted to engage with, and adjustment upon the said threaded pin portion, a cylindrical bar of non-conducting material suspended in the said link, legs rigidly secured to the said insulated bar, elamps or grips loosely connected to the said legs, a slecve mounted upon and longitudinally movable upon the said leg and clamps and a jam nut mounted and adjustable upon the said leg above the said sleeve, all substantially as shown and for the purpose speclifed.
2. In a trolley hanger, the combination of a link, a grapnel adjustably affixed thereto. a cylindrical bar of nonconductive material suspended in the said link, legs of conductive material affixed to the said suspended bar. clamps loosely pivoted to the said legs, a sleeve mounted upon the said legs and means for holding the said sleeve in engagement with the said leg and clamps, substantially as shown and for the purpose specified.
3. In a trolley hanger, the combination of the legs \(d\) square or rectangular in cross section and having their lower portions reduced upon their opposite sides, pins extending laterally from said reduced portions, clamps square or rectangular in cross section, and having their upper portions reduced in thickness, holes in or through the said reduced portions, a square or rectangular sleeve mounted upon and longitudinally movable upon the said legs and clamps, and means for holding the said sleeve in place, all substantially as shown and for the purposes specified.

No. 102,372. Apger Brace. Vilebrqquin.

Zaccheus Scott, McKeesport, Pennsylvania, U.S.A., 4th December, 1906; 6 years. Filed 13th October, 1906. Receipt No. 140,271.
rlaim.-1. The combination with a brace, of an angular one-piece shank and a handle consisting of a single section of material, the said handle having annular grooves in its inner wall, holes opening into sald grooves, balls loacted in said grooves, and means for closing the holes after the balls are introduced and the said shank having grooves corresponding to the grooves in the handle.
2. In a brace, a shank having a screw-threaded end and a shoulder adjacent said end, said end being adapted to receive a chuck having a screw-threaded socket with a spring pressed pin passing hrough the shoulder and adapted to engage the chuck.
3. In a brace, the combination with a one-piece shank, having a cranked portion, of a one-picce handle mounted on said cranked portion and revoluble thereon, and sustained against longitudinal movement by grooves in the shank, corresponding grooves in the handle and interposed balls.
4. In a brace, a shank having a crank portion formed exclusively by bending the shank and of even diameter between the bends, said crank portion being provided with a plurality of circumferential grooves, in combination with a handle consisting of a single piece of metal pierced for the passage of the shank and provided with grooves in its bore, located wholly inside the ends of the handle and spaced apart a distance equal to the spacing of the grooves in the shank and balls located in the ways formed by the coinciding grooves in the shank and handle.
5. In a brace the combination with a shank baving a shoulder near its end and a screw thread exteriorly of the shoulder, a pin passing through the shoulder a spiral spring surrounding said pin and impelling the pin through the shoulder. of a chuck having a screw-threaded cavity in its end. to receive the threaded end of the shank and a hold adjacent said cavity to receive said pin.
6. In a brace the combination of a shank, a slecve revolubly mounted on the shank, means for maintaining the sleeve on the shank, a curved bar carried by said sleeve, a curved metallic breast plate, bolts having nuts countersunk in said breast plate and heads disposed on the outer side of said bar, and spiral springs interposed between the breast plate and said bar and seated in recesses in said bar.

\section*{No. 102,373. Shaft Packing.}

\section*{Garniture d'arbre de couchc.}

James Wilkinson, Providence, Rhode Isiand, U.S.A., 4th December, 1906; 6 years. Filed 17th September. 1906. Receipt No. 139,532.
Clain.-1. A liquid packing for rotating shafts comprising in combination a chamber around the shaft, a rotatab. element within said chamber, and a circulating body within said chamber, and a circulating body of liquid acted upoin by said element to produce a continuous axial circulation thereof in said chamber under a head of pressure exceeding the differential in the pressures between which the packing is disposed.
2. In a liquid packing means for rotating shafts, a centrifugal pump driven by the shaft, a pump chamber surrounding the shaft, and a body of liquid in said chamber which is acted upon by sald pump and by the pressures to which \(i_{1}\) it exposed to induce an axial circulation thereof between said pump and chamber which seals all openings or clearances in or around said pump. for the purposes specified.
3. The combination with a rotating shaft and a stationary element surrounding it, of an annular chamber in said ele-
ment also surrounding sald shaft, an annular element rotatable with said shaft and having a rim which rotates in close

proximity to the circumferential wall of said chamber, one or more passages leading through said element from its low to its high pressure side, and an axially circulating body of liquid in said chamber which enters said passages at their low pressure ends and is forced through them by centrifugal action against the higher pressure to which the liquid is exposed to maintain the circulation of said liquid, for the purposes described.
4. In a liquid packing means for a rotating shaft, a chambered element rotatable with the shaft, liquid in the chambers exposed to different pressures and subjected to centrifugal action by rotation with said element, a port in said element connecting said chambers, and a stationary chamber in which said element rotates and induces an axially flowing belt of circulating liquid to seal the clearance between the element and chamber, substantially as described.
5. In a liquid packing means for a rotating shaft, an eie ment rotatable with said shaft an exposed to different pressures, a conduit rotatable with said element and exposed to said pressures, a chamber in which said element rotates. and a body of sealing liquid trerein which circulates in said chamber around said element and through said conduit, in the manner and for the purpose described.
6. In a liquid packing means for rotating shaft, a chamber around said shaft, an element rotatable with said shaft and disposed in said chamber, a body of sealing liquid in said chamber acted upon by the pressures to which it is exposed and by said element to produce an axial circulation thereof for the purposes described, and means to throttle the stream of circulating liquid.
7. In a liquid packing means for a rotating shaft, a chamber around said shaft, an annular element rotatable with the shaft and disposed in said chamber, a body of liquid exposed to different pressures and continuously actei upon by said element to produce a constantly flowing belt of liquid which circulates axially around the periphery of said element between said element and chamber, and means to retard the flow of said body of liquid, as and for the purposis described.
8. In a liquid packing means for a rotating shaft, a chamber around sald shaft, an element rotatable with the shaft and disposed in said chamber, projections on said chanber and element which form a tortuous passage, and a sealing liquid upon which said element acts continuously to produce an annular axially circulating body or belt of liquil flowi:!g through said tortuous passage, for the purposes described.
9. In a liquid packing means for a rotating shaft, a stationary chamber around said shaft, an element rotatable with the shaft and provided with two annular rotating chambers opening toward said shaft and disposed within said stationary chamber, means to establish communication between said rotating chambers near their outer peripheries, a liquid in said chambers subjected to centrifugal effect by their rotation, means to discharge the liquid in a substantially annular stream from the rotating chamber exposed to the higher pressure, said anular body of fluid being acted upon by said higher pressure and caused to flow back around said element to the low pressure rotating chamber and in its passage to seal the joint between said rotating element and stationary chamber.
10. In a liquid packing means for a rotating shaft, a rotating element provided on each side with anular chimijers, means to establish communication between said chanbers through said element, bodies of liquid in said chambers exposed to different pressures, an annular jet orifice in the outer side wall of the chamber exposed to the higher pressure, the centrifugal effect on said bodies of liquid being such as to cause the discharge of an annular jet through said orifice, and a stationary chamber in which said element rotates, the joint between said latter chamber and element
being sealed by the flow of said anular jet of liquid induced by the difference in pressures to which the liquid is exposed. 11. In a liquid packing means for a rotating shaft. an annular chamber surrounding said shaft, an element rotatable with said shaft, a body of liquid in said chamber, and a circulating passage for sald liquid formed by the clearance between said element and stationary chamber and by one or more ports in said element, said element being adapted to act as a centrifugal pump to maintain the circulation of the liquid through said passage to seal it.
12. In a liquid packing means for a rotating shaft, an annular chamber surrounding sald shaft, an element rotatable with sald shaft, a body of liquid in said chamber, a circulating passage for said liquid formed by the clearance between said element and stationary chamber and by one or more ports in said element. said element being adapted to act as a centrifugal pump to maintain the circulation of the liquid through said passage to scal it, valves for said ports which are opened by the circulating liquid towards a pressure which closes them when the element ceases to rotate, means to produce a tortuous passage in the rlevrance between said element and chamber. and mans to introduce liquid into said tortuous passage to flush and scal it, for the purposes described.

\section*{No. 102,374. Wire Drawing Drum.}

Tambour pour laminoirs pour fls ale fre.

he Iroquols Machine Company, New York City, assignee of Jane Alexander, Horton, Providence, Rhode Island, U.S.A., 4th December, 1906; 6 years. Filed 15th November, 1906. Receipt No. 141,235.
- Clain.-1. A wire drawing drum having a positively driven circumferential wire forwarding seat mounted for a limited yielding movement.
2. In a wire drawing machine, a clrum having a radially yielding positively driven wire seat.
3. In a wire drawing machine, a drum, and a shoe or wire seat so mounted on the drum as to yield elastically to the varying tension of the wire, and connected for positive rotation thereby.
4. In a wire drawing machine, a drum, a wire seat driven by and having a peripheral movement on said drum, and means for positively limiting said movement.
5. In a wire drawing machine, a drum and a circumferen tial spring ring forming a seat for the wire so mounted on the drum as to enable it to contract and expand and having a positive driving connection with said drum
6. In a wire drawing machine, a drum and a cushioned wire seat positively driven thereby.
7. In a wire drawing machine, a drum, a circumferential positively driven wire seat thereon, and a cushion between said seat and the drum.
8. In a wire drawing machine, a series of drums and dies adapted to impart successive reductions to the wire, said drums having yielding positively driven wire seats.

\section*{No. 102,375. Flushing Tank.}

\section*{Chasse d'eau pour cabinets d'aisance.}

The Ideal Manufacturing Company, assignee of Frank V. Bartlett, Detroit, Michigan, U.S.A., 4th December. 1906 ; 6 years. Filed 25th June, 1906. Receipt No. 137,278.
Claim.-1. The combination with a flushing tank for water closets, of a facing detachably secured to the tank and covering the sides exposed to view.
2. The combination with a flushing tank for water closets, of a finished facing therefor and means by which said facing may be detachably secured to cover an exposed face of said tank.
3. The combination of a flushing tank, operating devices on the outside of said tank, and a detachable facing for

said tank spaced therefrom to enclose the operating devices.
4. The combination of a flushing tank, a detachable facing for the exposed face thereof, and guides and guide-ways on the facing and tank whereby the two parts may be slidingly engaged and disengaged.
5. In a flushing apparatus for low down closets, the combination of a tank proper and a removable facing therefor enclosing the sides. front and top of the tank, and having a sliding engagement with the latter.
6. In a flushing apparatus for low down closets, the combination of a tank proper, of a removable facing therefor, comprising sides, front and top. and flanges at the rear free edges of the sides engaging corresponding grooves in the tank.
7. In a flushing apparatus for low down closets, the combination of the tank proper, valve actuating means therein, a removable facing for the tank, and a detachable member for the valve mechanism extending through the facing.
8. In a flushing apparatus for low down closets, the combination with the tank proper, of a flushing valve lever therein, a removable finished facing enclosing the tank and having a slot formed in one of its walls, and a detachable handle extending through the casing slot and having connections with the valve lever.
9. In a new article of manufacture, a facing for water closet flushing tanks provided with means for detachably securing it to such tanks.
10. As a new article of manufacture, a closet tank. a removable facing therefor, the facing having a slidably interlocking engagement with the tank.
11. As an article of manufacture, a closet tank, a removable facing therefor, and a detachable interlocking engagement between the facing and tank substantially throughout their respective lengths.
No. 102,376. Cylinder Drain Valve.
Noupape pow cylindre ar drainage.

Posey P. Brooks and William C. Bennett, assignee of a half interest, both of Hattiesburg. Mississipyi. U.S.A.. tih December. 1906; 6 years. Filed 10th September, 1906. Receipt No. 139.386.
Claim.-1. An automatic drain cock comprising a casing provided at the front with an outlet and having a lateral inlet at an intermediate point for connection with a steam
cylinder, said casing being also provided in rear of the lateral inlet with a piston head chamber and having a rear inlet port for the admission of fluid pressure, a valve seat located in advance of the lateral inlet, and a valve cooperating with the seat and provided with a piston head operating in the said chamber in rear of the lateral inlet, said valve being also provided at an intrermediate point with a face of less area than the piston head and located at the lataral inlet, whereby it is subjected to constant cylinderpressure.
2. An automatic drain valve comprising a casing having a lateral inlet and provided in rear of the same with a piston head chamber and having a rear inlet port for the admission of fluid pressure, a valve seat arranged in advance of the lateral inlet, and a valve co-operating with the seat and provided with a piston head operating in the said chamber, said piston head being of greater diameter than the valve and provided at its front with a partial steam groove exposed at the lateral inlet.
3. An automatic drain valve comprising a casing having a lateral inlet and provided in rear of the same with a piston head chamber and having a rear inlet for the admission of fluid pressure, a valve seat arranged in advance of the lateral inlet, and a valve having a front seat engagi.ig portion and provided with a rear piston head operating in the said chamber in rear of the lateral inlet and provided at its front with a partial stem groove exposed at the said lateral inlet. said valve being also provided with an intermediate connerting nortion located between the sleam groove and the seat engaging portion.
4. An automatic drain valve comprising a casing having a lateral inlet and provided in rear of the same with a piston head chamber and having a rear inlet port for the admission of fluid pressure, a valve bonnet secured to the casing in advance of the lateral inlet and provided with a valve seat. said bonnet being also provided with an interiorly arranged shoulder, and a winged valve having a seat engaging portion and provided in rear of the lateral inlet with a piston head, the wings of the valve extending into the bonnet and terminating short of the said shoulder.
5. An automatic drain valve comprising a casing having a lateral inlet and provided in rear of the same with a piston head chamber and having a rear inlet port for the admission of fluid pressure, a separate valve bonnet secured to the front of the casing in advance of the inlet and provided with a valve scat and having a front outlet, and a valve cooperating with the valve seat and provided with a piston head operating in said chamber in rear of the lateral inlet, said valve being also provided at an intermediate point with a face of less area than the piston head and located at the lateral inlet, and the said outlet being located in front of the valve and at a point opposite the rear inlet which is located back of the piston head.

No. 102,377. Waste Pipe. Tuy/au de trop-plein.

Charles Nevin Fiscus, assignec of Henry Joseph Luff, botb of Cleveland, Ohio, U.S.A., 4th December. 1906: 6 years. Filed 17th October, 1906. Receipts Nos. 140,395 and 14'.36:
claim.-1. The combination with a waste pipe and a closet bowl, of a connection comprising an annular cup formed integral with the rim of the waste pipe, a pipe section having one end arranged to extend into said cup and provided at its other end with means for supporting the closet bowl, a seal arranged in said cup around the end of the pipe section and a ring arranged within said pipe section and adapted to rest on the inner wall of said cup. said ring havi g a bevelled inner face to serve as a deflector for material passing through the pipe section, substantially as described and for the purpose set forth.
2. The combination with a waste pipe and a closet bowl, of a connection comprising an annular cup formed integral with the rim of the waste pipe, a pipe section arranged to extend into said cup, means for locking the pipe section in the cup so as to. prevent the withdrawal of the pipe section from the cup or the turning of the pipe section in the cup and a deflector arranged within the pipe section so as to rest on the rim of said cup. for the purpose set forth.
3. The combination with a waste pipe and a closet bowl, of an annular cup formed integral with the rim of the waste pipe, a pipe section provided at one end with means for securing it to the closet bowl and having its lower end extending into the said cup so as to divide the cup into two chambers, one of said chambers being accessible from the exterior of said pipe section and a seal arranged in sald cup around the end of said pipe section, substantially as described and for the purpose set forth.
4. The combination with a waste plpe and a closet bowl, of a connection comprising an annular cup formed integral with the rim of the waste pipe, a pipe section provided at one end with means for securing it to the closet bowl and having its other end extending down into said cup, projections arranged on the interior surface of said cup and on the lower end of said pipe section, and a seal arranged in said cup and forming a locking medium between said projections so as to prevent the said pipe section turning in the sald cup.
5. The combination with a waste pipe and a closet bowl, of a connection comprising an annular cup formed integral with the rim of the waste pipe, a pipe section having one end arranged to fit into said cup and provided a short distance above said end with an annular shoulder arranged to rest on the inner wall of said cup and a seal arranged in sald cup around the ends of the pipe section, substantially as described and for the purpose set forth.

No. 102,378. Wood Fibre Cutter.
Machine potr faire des flbrcs de bois.

The Ohlo Fiber Machinery Company, assignee of Howard Martin Leonard, both of Elyria, Ohio, U.S.A., 4th December, 1906; 6 years. Filed 16th Jnue, 1906. Receipt No. \(136,962\).
Claim.-1. A wood fibre cutting machine provided with a set of saws and means to feed a \(\log\) to the saws and to rotate the logs before the saws comprising a line of mechanism proceeding from the saw carrylng shaft to the arbours carrying the logs and adapted to vary the speed of rotation of the logs, and a line of mechanism for governing the feed of the log to the saws proceeding initially from the arbours carrying the logs and engaging the log carrier between their ends.
2. A wood fibre cutting machine adapted to cut one or two logs at a time and comprising a pivoted carrying yoke for each log, a line comprising mechanism for rotating each log independently of the other berore the saws, and each of said lines of mechanism supplemented by means for in-\(12-4\)
dependently pressing the logs to the saws, said supplemental mechanism comprising pulleys on said yokes respectively, and spring tightened cords over said pulleys.
3. In wood fibre cutting machines, a set of saws, a yoke to carry a log before said saws pivoted at its bottom on the main frame, an arbour shaft for said \(\log\) and differential gear mechanism for conveying power from the shaft carrying the saws to the arbour shaft for the log. a pulley mounted on said yoke above its pivot, a stretched cord engaged around said pulley to control the position of the log in respect to the saws and positive actuating connection from said arbour shaft to the shaft of said pulley, so that the speed of rotation of the log controls the rate of feed of the log to the saws.

No. 102,379. Bath Tub. Baignoire.

Eugene H. Sloman, Detroit, Michigan, U.S.A., 4th December, 1906; 6 years. Filed 25th August. 1906. Receipt No. 138,976.
Note.-This patent is a re-issue of No. 99,863 , dated tho 3rd day of July, 1906.

Claim.-1. A both tub made from a single piece of metal in which the metal is in such a state of rest that it can be reheated without distartion when cooled.
2. A porcelain coated bath tub in which the metal body is formed from a sheet of metal in such a state of rest that on reheating it to apply the porcelain it was not distorted when cooled.

\section*{No. 102,380. Valve for Flush Tanks.}

Soupape de chasse d'eau pour cabinets d'aisance.

William A. Alexander, Wilkinsburg, Pennsylvania, U.S.A., 4th December, 1906; 6 years. Filed 27th September, 1906 Receipt No. 139,853.
Claim.-A shut-off valve for flush tanks, consisting of the base partion provided with a means for connection with a water supply pipe and formed with a valve seat, the valve 29, operating within a casing, the float lever 18 , the short lever 14, the yoke 16 connected thereto, the float lever 18 connected to sald yoke, the double link connection 21 and 25 connecting the valve 29 and the float lever with the intermediate lever 14, in a manner that will cause the two links to be brought the one in line with the other when the float moves upward, as and for the purpose described.

Digitized by

No. 102,381. Razor. Rasoir.

Morton Green Bunnell, Porter, Indiana, U.S.A., 4th December, 1906 ; 6 years. Filed 26th September, 1906. Receipt No. 139,791
Claim.-1. A safety razor having a substantially flat detachable blade and clips to clamp the blade at its corners.
2. A safety razor having a substantially flat detachable blade and clips to clamp the blade at its corners, at least one of the clips being movable to permit the insertion and withdrawal of the blade.
3. A safety razor having a substantially flat detachable blade and clips to clamp the blade at its corners, at least one of the clips being yieldingly held thereon to permit the insertion and withdrawal of the blade.
4. A safety razor having a substantially flat detachable blade, two rigid clips and two yielding clips.
5. In a safety razor the combination of a substantially flat detachable blade and a holder therefor having a rigid clip on one side and a yielding clip on the other side.
6. In a safety razor the combination of a substantially flat rectangular blade ground on two edges and without perforations, recesses or projections and a holder therefor having clips to clamp the blade thereto at its corners.
7. In a safety razor the combination of a substantially fiat detachable blade, a rigid clip for the blade, a yielding clip for the blade, a bracket to which the yielding clip is secured and a spring co-operating with the bracknt.
8. In a safety razor the combination with a substantially flat detachable blade, ground on two edges, of a holder therefor havine a guard, two rigid clips upon one side of the Einder, and two movable clips on the other side of the holder to clamp the blade at its corners to the holder, a bracket to which the two movable clips are secured, a spring pressing upon a bracket and a housing for the spring. the bracket projecting from the housing and forming a pressure piece for the thumb.

No. 102,382. Wire Perforating and Forming Machine.
Machine à perforer ct former le fll.

George Crompton, Toronto, Ontario, Canada, 4th December, 1906; 6 years. Filed 9th November, 1906. Receipt No. 141,051.
Claim.-1. In a wire perforating and forming machine, the combination with a reciprocating punch and associated parts, of duplex forming dies disposed in ylelding relation to one another between which the wire passes and thereby chamfering the perimeter of the previously formed perforation simultaneously with the punching operation, substantially as and for the purpose hereinbefore set forth.
2. In a wire perforating and forming machine the combination with a reciprocating punch and associated parts, of upper and lower plates between which the wire passes and having aligning openings therein, duplex forming dies
disposed in yielding relation to one another and adapted to reciprocate within the oppositely disposed openings of sald plates, means for forcing said forming dies towards each other simultaneously with the punching operation and thereby chamfering the previously formed preforation, substantially as and for the purpose hereinbefore set forth.
3. In a wire perforating and forming machine the combination with a reciprocating punch and associated parts, of upper and lower plates between which the wire passes, a combined stripper and gripping jaw inserted in the upper plate and actuated by a locking lever pivoted in the sald plate, duplex forming dies adapted to reciprocate within the oppositely disposed openings of the said plates, and means for forcing said forming dies towards each other simultancously with the punching operation and thereby chamfering the perimeter of the previously formed perforation. substantially as and for the purpose hereinbefore set forth.

No. 102,383. Wrench. Clé à écrou.

John F. Dickason, Keystone, Indiana, U.S.A., 4th December, 19066 years. Filed 19th November, 1906. Receipt No. 141,336.
Claim.-A wrench comprising a stock having a handle at one end and bifurcations at its other end, a head pivoted between said bifurcations, said head consisting of a circular portion provided with ratchet teeth, wrench jaws extending laterally from sald circular portion and being so disposed with relation to each other and the circular portion that radial lines drawn from the center of said circular portion to the outer pointed ends of the jaws will lie along their entire length within the edges of the circular nortion and the jaws, all portions of the opposite surfaces of the sides of said head lying in planes parallel to each other, and a spring operated pawl pivoted between said bifurcations and normally engaging said ratchet teeth at one end and extending beyond the stock and terminating in a finger grip at its opposite end, said nawl adapted to be swung on its pivot to engage at one edge the end of the stock between the bifurcations and at its end one of the laterally extending wrench jaws and at its opposite edge one of the ratchets of the circular portion.

No. 102,384. Machine for Crushing Clods of Earth. Machine d broyer les mottes de terre.

Charles Henry, Cayuga, Ontario, Canada, 4th December, 1906; 6 years. Filed 2nd November, 1905. Receipt No. 129,734.
Claim.-1. In a machine for crushing clods or lumps of earth, a frame, a centrally located bar in the frame, a
stationary transverse shaft rigidly secured to said bar and the frame, a section or number of discs secured in contiguity with each other on the shaft, and on each side of the bar, and adapted to rotate on the shaft.
2. In a machine for crushing clods or lumps of earth, a frame, a centrally located bar forming a part of the frame, a stationary transverse shaft rigidly secured to the frame, a section or runiber of dises in contiguity with each other on the shaft and on each side of the bar, and adapted to rotate on the shaft, means on a number of the discs to center and to rotate on the shaft, and means on the dises to rigidly secure each said section of the discs together.

No. 102,385. Shower Bath. Douche.

Andrew Murdock, Montreal, Quebec, Canada, 4th December, 1906; 6 years. Filed 7th September, 1906. Receipt No. 139,318.
Clatm.-1. A device of the class described comprising a wertical standard, a revoluble brush mounted thereon, and a sprinkler adagted to direct streams of water onto said brush.
2. A device of the class described comprising a vertical standard, a revoluble brush slidably mounted thereon. and an overhead sprinkler adapted to direct streams of water onto said brush.
2. A device of the class described comprising a vertical fixed standard, a brush slidably mounted thereon at right angles thereto, means for rotating said brush, and means for directling streams of water onto said brush.
4. A device of the class described comprising a fixed standard, a block slidably mounted thereon, a revoluble shaft mounted on said block at right angles to sald standard, a removable brush rigidly mounted on one end of said shaft, means for rotating said shaft, and means for directing streams of water onto said brush.
5. A device of the class described comprising a vertical standard, a ball bearing block slldably mounted thereon, means for locking said block at any point on the standard, a revoluble shaft mounted on said block at right angles to the standard, a removable brush rigidly mounted on the outer end of said shaft. means for rotating said shaft, and means for directing streams of water vertically downward onto said brush.

\section*{No. 102,386. Flunhing Valve.} Soupape de chasse d'cau.
Whilam S. White, Denver, Colorado, U.S.A., 4th December, 1990 : 6 years. Filed 15th September, 1906. Receipt No. 139,539.
Claim.-1. The combination of a reservoir or receptacle having a chamber at the lower end, a water supply pipe leading to said chamber, a water outlet pipe communicating with said chamber, a float valve in said reservoir and controlling the communication between said chamber and the outlet pipe, means for raising the float valve and means for gradually decreasing the bouyancy of the float valve to permit the gradual descent of the valve to its seat.
2. The combination of a reservoir, a water supply pipe leading to the lower part of the reservoir, a water outlet pipe leading from the lower end of the reservoir and communicating with the water supply pipe, a float valve located in said reservoir and controlling the said communication, means for raising the float valve from its seat to permit the water to flow from the supply pipe into the outlet, and means for gradually withdrawing the air from the float valve to permit the gradual descent of the valve.
3. The combination of a reservoir, a float valve operating therein, means establishing a water passage. said passage being commanded by said float valve, means for raising the float valve, and a tubular stem extending from the interior
of the float into said water passage, whereby the current of water in the passage will act through the stem to withdraw

air from the float valve and permit the descent of the same to the seat.
4. The combination of a reservoir, a water supplf pipe leading into the lower part thereof, a water outlet pipe communicating with the supply pipe, a float valve controlling said communication, means for raising the float valve from its seat and a tubular stem extending from the interior of the float downward into the outlet pipe, for the purpose specifled.
5. The combination of a reservoir, a float valve operating therein, a supply pipe leading to the lower part of the reservoir. an outlet pipe communicating with the supply pipe, such communication being controlled by said float valve, a tubular stem adapted to withdraw alr from the float valve for the purpose specificd. a cushioning or dash pot device in connection with the stem and means adapted to engage the stem for raising the float valve from its seat.
6. The combination of a reservoir. a float valve operating therein, a supply pipe leading to the reservoir, an outlet pipe communlcating with the supply pine. such communication being controlled by said float valve, a tubular stem fastened in the float valve and rommunicating at its upper portion with the interior thereof. an inverted cun or cylinder attached to the lower portion of the tubular stem, a piston-like member operating in said cup or cylinder, a tuhular stem extension attached to said piston-like member and telescoping over the main tubular stem. and means adapted to engage said tubular stem nxtension for lifting the float valve from its scat.
7. The combination of a rescrvoir. a float valve noerating therein. a sunply nipo leafing to the reservoir an outlit nive communicating with the sunnlv nine. such rommunication being controlled by sald float valve. a tubular stem fastened to the float valve and communicating at its upper nortion with the interior thereof. an inverted cun or cylinder attached to the lower portion of the tubular stem, a niston-like member operating in said cup or cylinder. a tubular stem extension attached to salid piston-like member and telescoping over the main tubular stem, and means adapted to engage said tubular atom extension for lifting the float valve from its seat, sald means comprising a slide operating in the outlet plpe. a swinging arm having connection with the slide and means for rocking said arm.
8. The combination of a rescrvoir. a guide therein, a float valve contained in the reservoir and operating in the guide, a supply pipe, walls forming a chamber at the base of the reservoir into which chamber the float valve projects, an outlet pipe, the supply and outlet pipes communicating with the chamber, the float valve controlling sald communication, means for raising the float valve from its seat, and means for withdrawing the air from the float valve to permit the gradual return of the valve.
9. The combination of a reservoir. a guide therein, a float valve contained in the reservoir and operating in the guide, a supply pipe, walls forming a chamber at the base of the reservoir into which chamber the float valve projects, an outlet pipe, the supply and outlet pines communicating with the chamber, the float valve controlling said communication, means for raising the float valve from its seat, means for withfrawing the air from the fioat valve to permit the gradual return of the valve and walls forming a by-pass passage extending from the upper part of the reservoir to the said outlet pipe, the by-pass passage being also controlled by the float valve.
10. The combination of a reservoir having a chamber at its lower end, a float valve contained in the reservoir and projecting into the said chamber, a supply pipe and an out-
let pipe communicating with said chamber, the said foat valve controlling the communication of the outlet pipe with said chamber. means forming a passage leading from the upper part of the reservolr to said outlet pipe, the said float valve also controlling said passage, means for raising the float valve from Its seat. and means for gradually decreasing the buoyancy of the float valve to permit the gradual descent of the valve to its seat.
11. The combination of a reservoir. a water supply pipe leading to said reservoir, a water outlet pipe communicating with the supply pipe, a float valve controlling said communication, means forming a passage establishing communication between the upper end of said reservoir and the outlet pipe, means for raising the float valve from its seat. and a tubular stem extending from the interior of the float valve downward into the outlet pipe and adapted to withdraw air from the float valve.
12. The combination of a reservoir provided with an opening in its bottom and having a chamber at its lower e"d communicating at its top with sald opening. the said chamber baving an odening in ita bottom, an annular flange surrounding said opening and having its innor pace tanered. a cunnlv pine connected rirectiv with sald chamber at one cide thereof. an nutlet pine connected with the lower end of the reservoir and communicating the onening in the hottom of said chamber. a float valve incatry in cald ragervoir and ofanted to extend through saif chamber. the said finat valve living \(\rightarrow\) tapered lower portion adapted to seat within the sald flange, the sald reservoir being provided with a nassage leading from the upper part of the reservoir to the discharge pipe. the sald float valve controlling the communiration between the saif chamber and the outlet nine and also controlling the said passage, and mcans for raising the float valve from the seat.
13. The combination of a reservoir. a water supnly pipe communicating therewith. the sald water supply nine also communicating with a water outlet pipe. a float valve controlling said communication. and means for raising and lowering the said float valve from and to its seat.
14. The combination of a reservoir. a water supply pipe communicating therewith, the sald water supply pipe also communicating with the water outlet pine, the upper part of the reservoir also communicating with the water outlet nipe by mrans of a by-pass passage. a float valve controlling the said three communications, and means for raising and lowering the sald float valve from and to its seat.
15. The combination of a reservoir having a chamber at its base. a water supply plpe leading to sald chamber, a water outlet pipe communicating with said chamber. the chamber communicating with the reservoir, the upper part of the reservoir communicating with the water outlet pine. and means for controlling the said three communications.

No. 102,387. Dental Flask and Clamp.
Appareil dentaire.

Thomas Wlllams, Summerhill, New South Wales, Australia, 4th December, 1906; 6 years. Filed 9th August, 1906. Recelpt No. 138,526.
Claim.-An improved dental moulding and vulcanizing flask and clamp. consisting of the usual flask and cover provided with sultable lugs to prevent their shifting, a frame to receive this flask, a screw and star-shaped spring to exert an equal pressure on top of the flask, and a suitable detach-
ed device providing means for lifting and handling the whole apparatus when in a heated condition, all as berein fully described and illustrated by the accompanying drawings.
No. 102,388. Box Bit. Portc-mèches.

Frederick Alonzo Hanes and William Staples, co-inventors. both of Huntsville, Ontario, Canada, 4th December. 19.56: 6 years. Filed 21st November, 1906. Receipt No. 141.376. Claim.-A box bit comprising a stock having a reduced upper and lower end and slot at the side, and a pin extendinp through the lower end, opposing jaws internally tapered or inclined and outwardly flared and provided at the outer end with opposing notches to grip the nut and at the inner end with openings through which the pin in the stock extends, a casing provided with flaring sides and a pin exlending into the inclined or tapered inside portion of thr jaw, and a set screw extending through the upfer ends of the casing into the slot in the stock. as and for the purnose syecified.

No. 102,389. Metallic Packing For Piston Rode. Garniture métallique pour tiges de piston.

John H. Lewls and Louis G. Kunzer, Chicago, Lllinois. U.S.A., 4 th December, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,237.
Claim.-1. In a metallic packing ring for piston rods. the combination with the cylinder head and piston rod. of a packing head ring \(C\), gland \(D\), division ring \(G\) and a palr of metallic segmental packings rings \(F\) F each comprising a plurality of segments, having at their meeting ends doubie notches or offsets in different planes forming overlappiag leaves, and three joints at different points of the circumference, one of which points extends only through on portion of the radial thickness of the packing ring and th. other two of which joints extend each only part way throuri the other portion of the radial thickness of the paching ring, said segments being furnished on their inner learis or members with a compression finger or member orerlapped by the outer leaf or member of the adjacent segment asd serving by its upsetting or compression to permit the sef. ments to contract and compensate for each other, subsiantially as speciffed.
2. In a metallic packing for piston rods, the combinat:inn with the cylinder head and piston, of a packing head riag C. a gland \(D\), a division ring \(G\) fitting within sald glans and between it and said ring \(C\) and a nair of segmencel
metallic packing rings \(F F\), one fitting on each side of said division ring \(G\) and each comprising a plurality of segments having overlapping leaves or members at their meeting ends forming a plurality of partial radial joints, substantially as syecified.
3. In a metallic packing for piston rods, the comblnation with the cylinder head and piston, of a packing head ring C, a gland \(D\), a division ring \(G\) fitting within said gland and between it and said ring \(C\) and a pair of segmental metallic packing rings \(F\) F, one fitting on each side of said division ring \(G\) and each comprising a plurality of segments having overlapping leaves or members at their meeting ends forming a plurality of partial radial joints, said division ring \(G\) being of a \(T\)-shape in cross section and its outer rim being clamped between said gland \(D\) and ring \(C\), substantially as specified.
4. In a metallic packing for piston rods, the combination with the cylinder head and piston, of a packing head ring C, a gland D, a division ring G fitting within sald gland and between it and said ring \(C\) and a pair of segmental metallic packing rings \(F F\), one fitting on each side of said division ring \(G\) and each comprising a plurality of segments having overlapping leaves or members at their meeting ends forming a plurality of partial radial joints, said segments of each of said metallic packing rings being provided with narrow compression members yielding or upsetting to permit contraction of the segments and compensation for wear, substantially as syecified.

No. 102,390. Monld. Moule.

Nason M. Goodwin, San Diego, assignee of Harry J. Schade, Los Angeles, both in California, U.S.A., 4th December, 1906; 6 years. Filed 5th August, 1906. Recelpt No. 140,300.
Claim.-1. In a block forming machine a bed plate having transverse guideways therein, supporting benches having legs resting in and guided by said guideways, a die plate resting upon said benches, side and end plates adjustably secured together and adapted to be moved vertically upwardly and downwardly past said die plates, sald die plate, sides and ends forming a mould box, and means to move said side and end boards comprising a shaft mounted 1 , bearings in the bed plate, two bevel gears secured upon said shaft, one at each end thereof, two vertical shafts each carrying bevel gears at their lower end and having their upper end screw-threaded, said bevel gears meshing with the gears on the horizontal shaft, bearings secured to the center of the end of the mnilt 'nx and having vertical threaded openings extending therethrough for the reception of said threaded shafts, vertical guide frames for ouiding said bearings, and means for rotating said horizontal shaft.
2. In a block forming machine a mould hox comnosed of ond plates having bearing lugs centrally secured upon their outer faces, side plates adjustably secured to said end plates, said side and end plates forming when adjusted the sides and ends of the mould box, a die nlate adapted to form the bottom of the mould box, adjustable means for supnorting said die plate in position while the block is being formed, guide frames for receiving and guiding vertically the bearing lugs of the cond plates, screw-threaded shafts nassing vertically through said bearing lugs in threaded contact therewith and revolubly mounted in crossbars in the guide frame. and means to cause the simultancous revolution of said vertical shafts.
3. In a moulding machine a mould box composer of \(n\) die nlate forming the bottom thereof. two end nlates having the bearing lugs in the center of the outer surfaces thefrof and having slots near the corners thereof. vertical adiusting bars on the exterior sides of said end nlates. bolts nassing through said adiusting bars and through the slots in thn end plate and secured to the side nlates. screw-threaded horizontal rods passing through said adjusting bars in threaded contact therewith and having a right hand thread on one end
and a left hand thread on the other end thereof, sald rods also passing through said bearing lugs revoluble therein and having means secured thereto to prevent the longitudinal movement of the rods in the lugs.
4. In a block forming machine a bed having transverse guideways therein, supporting benches having lugs resting In and guided by said guideways, and supporting benches having transverse slots in the top thereof, a die plate resting upon said benches, end plates having bearing lugs in the outer surfaces thereof and having slots near the corners thereof, vertical adjusting bars exterior said end plates at the ends thereof, side plates between said end plates secured to the adjusting bars by bolts passing through said adjusting bars in threaded contact therewith and having a right hand thread on one end and a left hand thread on the other end, said rods also passing through said bearing lugs revoluble therein and having means secured thereto to prevent the longitudinal movement of the rods within the lugs, means to cause the simultaneous movement of said horizontal rods, screw-threaded shafts passing vertically through said bearing lugs in threaded cotnact therewith. means to cause the simultaneous revolution of said vertical shafts, means to support said vertical shaft. means to giude the bearing lugs of the end plates vertically, a turntable composed of two L-shaped end pleces connected by a transverse bar, a supporting frame upon which said turntable rests, and means to move said turntable into engagement with the stone black upon the lowering of the sides and ends below the block.
5. In a block forming machine a turntable composed of two L-shaped end pieces connected by a transverse bar, a supporting frame upon which said turntable rests, a removable bottom board on sald turn table, and means to move said turntable and bottom board into engagement with the stone block upon the lowering of the sides and ends below the block.
6. In a moulding machine, a mould box composed of vertically movable side and end pieces, a stationary closure for the bottom of the opening between the side and end pleces, a removable lid secured to the top of said side and end pleces, and means to move said side and end pieces and lid toward the bottom closure.

No. 102,391. Flushing Tank.
Chasse d'eau pour cabinets d'aisance.

William A. Alexander, Wilkinsburg, Pennsylvania. U.S.A., 4th December, 1906; 6 years. Filed 27th September, 1906. Receipt No. 139,854.
Claim.-1. In an apparatus of the class described the combination with a tank having an inlet and an outlet, a valve controlling said inlet and a valve controlling said outlet, a lever pivotally mounted within said tank and adapted to control said outlet valve, of an auxiliary tank mounted within the first-named tank, said auxiliary tank having an outlet located near the bottom of the first-named tank, a flap valve controlling said outlet, a float controlling the movement of said flap valve, and means mounted within said auxiliary tank to control said inlet valve and close sald outlet valve.
2. In an apparatus of the class described the combination with a tank having an inlet and an outlet both located below the normal low water line of the tank, a valve controlling said inlet and a valve controlling said outlet. a lever nivotally mounted within said tank and adapted to control said outlet valve, a rod arranged exteriorly of the tank and connected to said lever, of an auxiliary tank mounted within the first-named tank, said auxiliary tank having an outlet located adjacent the bottom of the first-named tank. means to control said outlet, and means mounted within said auxi-
liary tank to close said inlet and said outlet valves, substantially as described.
3. In an apparatus of the class described the combination with a flushing tank having an inlet and an outlet. a valve controlling said inlet and a valve conbrolling said outlet. of an auxiliary tank mounted within the first-named tank, said tank having an outlet. a flay valve carried by said lastnamed outlet. means to control said flan valve. means carried by the first-named tank to open said first-named outlet valve, and means mounted within said auxiliary tank and adapted to automatically close said inlet valve and said firstnamed outlot valve. substantially as described.
4. In an apparatus of the class described, the combination with a flushing tank having an inlet and an outlet, of a valve controlling said inlet and a valve controlling said outlet. a lever mounted within said tank and actuated from the exterior of said tank to open said outlet valve, an auxiliary tank mounted within the first-named tank, and means supported within said auxiliary tank and adapted to successively close said valves at predetermined times, substantially as described.
5. In an apparatus of the class described. the combination with a flushing tank having an inlet and an outlet. a valve controlling said inlet and a valve controlling said outlet, and means for onening said outlet valve from the exterior of the tank, of an auxiliary tank. and means mounted within said auxiliary tank for closing said inlet and said outlet, substantially as described.
6. In an apparatus of the class described, the combination with a flushing tank having an inlet and an outlet, a valve controlling said inlet and a valve controlling said outlet. and means for establishing a primary flush. of an auxiliary tank mounted within the first-named tank, means carricd by said auxiliary tank and actuated by the primary flusb to cause a secondary flush, and means mounted within said auxiliary tank and actuatgd by the secondary flush to close said inlet valve and said outlet valve, substantially as described.
7. In an apparatus of the class described, the combination with a flushing tank having an inlet and an outlet. a valve controlling said inlet and a valve controlling said outlet means actuated from the exterior of the flushing tank tc establish a primary flush, of means for maintaining a secondary flush within said flushing tank independent of the primary flush, means actuated by, the nrimary flush to bring into action the secondary flush. an auxiliary tank and a foat arranged in said auxiliary tank and connected to the inlet and the outlet valves and actuated by the secondary flush to close said inlet and said outlet valves, substantially as described.
8. In an apparatus of the class described, the combination with a flushing tank adapted to contain a body of water, said tank having an inlet and an outlet port, a valve controlling each port, of means for maintaining a body of water independent of the first-named body. means actuated by the first-named body when passing through said outlet to release the indenendent body of water prior to the complete passage of the first body of water, and means actuated by the passage of the independent body of water to close the valves controlling said inlet and said outlet ports. substantially as described.
9 . In an apparatus of the class described, the combination with a flushing tank adanted to contain a body of water, said tank having an inlet and an outlet port, a valve controlling each port. of means for maintaining an independent body of water within said flushing tank, means actuated by the first-named body when passing through said outlet to release the indegendent body of water and permit it to llow into the flushing tank prior to the complete passage of the first body of water, means to re-establish said independent body of water, and means actuated by the reestablishment of the indenendent body of water to close establishment inlet and outlet valves, substantially as described.
10. The combination of a flushing tank having inlet and outlet ports and valves controlling both ports, with an auxiliary tank having a port leading into the main tank, a valve governing the gassage of water through the lastnamed port, a float connected to the last-named valve and a float arranged in said auxiliary tank and means connected to said last-named float for governing the valves on the inlet and outlet ports of the flushing tank.
11. In an apparatus of the class described, the combination with a flushing tank having an inlet port and an outlet port. a valve controlling said inlet port, and a valve controlling said outlet port, of a pivoted lever connected to the valve on the outlet nort, means connected to said lever and extending exteriorly of the tank for operating said lever, a second lever susgended from said plvoted lever and having a groove. a pivotally mounted rod having its free end extending into said groove, said rod being connected to the valve on said inlet port, and a float carried by said rod.
12. In an apparatus of the class described, the combination wth a flushing tank having inlet and outlet ports and valves controlling sald ports, of a pivoted lever connected to the valve controlling the outlet port, a pivoted rod connected to the valve controlling the inlet port, a float carried by said rod. a swinging lever connected to the said pivoted lever and adapted to be engaged by said rod, and means extending outside of the said tank for moving said pivotal lever to open the outlet valve.

No. 102,392. Mould. Moule.

Willis Herman Fisher, Baltimore, Maryland, U.S.A., 4th December, 1906; 6 years. Filed 22nd September, 1906. Receipt No. 139,715.
Claim.-1. A mould box comprising a bottom, side plates and end plates hinged to the bottom, a partition dividing the box into compartments, and a facing plate mounted upon the partition.
2. A mould box comprising a bottom, side plates and end plates hinged to the bottom, a partition dividing the box into compartments and a facing plate removably mounted upon the partition.
3. A mould box comprising a bottom, side plates and end plates hinged to the bottom, a removable pallet provided with core-receiving openings adapted to be placed upon the bottom, downwardly tapering cores detachably fitting in the openings of the pallet and resting upon the bottom of the box.
4. A mould box for forming artificial stone and the like provided on one of its sides with a facing plate being provided with a plain surface and an ornamental surface below the plain surface whereby a compression plate may be placed on top of the material to form the block and it the mould.
5. A mould box provided with a partition adapted to divide the box into compartments, a facing plate mounted upon the partition, said facing plate being provided with a plain surface and an ornamental surface below the plain surface, whereby a compression plate may be placed upon the top of the material to form the block and fit the compartment.
6. A mould box provided with a partition adapted to divide the box into compartments, a facing plate removably secured to the partition, said facing plate being provided with a plain surface and an ornamental surface whereby a compression plate may be placed upon the ton of the material to form the block and fit the compartment.
7. In a mould box the combination with hinged doors. means for dividing the mould box into compartments, pallets having core receiving openings arranged in the compartments, removable and detachable cores fitting in the opening of the pallets, and compression plates having openings adanted to receive the cores.

\section*{No. 102,393. Carbureter. Carburatetur.}

Richard M. Mick, Bussey. Iowa, U.S.A.. 4th December. 1906;
6 years. Filed 20th November, 1906. Receipt No. 141,354. Claim.-An improved carbureter comprising a T-plpe coupling, a supply main screwed into one branch thereof. an air pipe screwed into another branch thereof. a supporting leg connected with the \(T\)-pipe coupling, a plug in the lower end of the supply pipe, an open-ended tube supported by said plug, a hydro-carbon supply pipe, a valve therein. said valve supported unon the said sunporting leg, a coil pipe communicating with said valve, said coil inclined as se forth and filled with granular substance. a valve communicating with said coil and discharging into the \(T\)-coupling below said tube, a burner arranged below the coil. a pipe contained within the supply main passsed through the plug in the bottom thereof, a plug in theT-coupling having said
pipe passed through it, a burner pan supported upon said burner and a casing completely inclosing the burner, the

coil and said valves and formed with a doorway to provide access to the interior thereof, as set forth.

No. 102,394. Lubricator for Engine Valves.
Graisseur pour tiroir de machine.

David Morehouse, Delphos, Ohio, U.S.A., 4th December, 1906; 6 years. Filed 21st September, 1906. Receipt No. 139,672.
Claim.-In a lubricator for engine slide valves, a valve seat having oil outlets in its face adjacent to and o: the outer side of or beyond the inlet ports therein and so arranged that both will be covered by the valve during the middle part of its stroke, and alternately covered and uncovered by the valve at the ends of its strokes. whereby oil delivered from the outlets will be carried i.to and through the ports into the cylinder as the inlet ports are opened respectively, and means indepondent of the pressure of the valve chest, to supply oil to said outlets.

\section*{No. 102,395. Extraction of Precions Metals.}

Extraction de métaux précicux.

Sidney Theodore Muffly, Philadelphia, Pennsylvania, U.S.A., 4th December, 1906; 6 years. Filed 14th December, 1905. Receipt No. 131,023.
Claim.-1. The process of treating ores which consists in pulverizing sald ores while they are immersed in a solution capable of dissolving the contained gold and silver, said solution being exposed to air under pressure greater than that of the atmosphere, substantially as described.
2. The process of treating ores which consists in subjecting them to the action of the cyanide solution exposed to constantly rencwed bodies of air under pressure greater than that of the atmosphere, collecting the hydro-cyanic acid gas evolved, passing the gas with air to a solvent liquid. dissolving said gas in the liquid and afterward permitting said air to escape, substantially as described.
3. The process of treating ores which consists in continuously conveying them through successive bodies of a cyanide solution, absorbing in a liquid the hydro-cyanic acid gas evolved. and using said liquid to act on further bodies of ore, substantially as described.
4. The process of treating ores which consists in acting upon them by a solution of cyanlde, dissolving the hydrocyanic acid gas evolved in a solution of a double cyanide, and using said solution to act on further bodies of ore, substantially as described.
5. The process of treating ores which consists in acting upon them by a solution of cyanide, dissolving the hydrocyanic acid gas evolved in a solution of a double cyanide and a hydrate compound, and using said solution to act on further bodies of ore, substantially as described.
6. The process of treating ores which consists in continuously conveying the pulverized ores through successive bodies of a cyanide solution under a direct downward air pressure greater than that of the atmosphere, substantially as described.
7. The process of treating ores which consists in continuously conveying the pulverized ores through a cyanide solution exposed to direct downward pressure of constantly renewed bodies of compressed air, absorbing the hyrocyanic acid gas evolved in a body of liquid, and using said llquid to act upon further bodies of ore, substantially as described.
8. The process of treating ores which consists in first crushing the ores, then subjecting them to the action of an alkaline hydrate solution, then pulverizing said ores within a cyanide solution, then conveying the pulverized ores through further bodies of cyanide solution, substantially as described.
9. The process of treating ores which consists in pulverizing said ore within a cyanide solution, then conveying said ore through successive bodies of a solution under air having a direct downward pressure greater than that of the atmosphere, substantially as described.
10. The process of treating ores which consists in pulverizing said ore within a cyanide solution after neutralizing acid salts in the same. then conveying said ore through successive bodies of cyanide solution under a direct downward air pressure greater than that of the atmosphere, said air being maintained at a temperature above the normal, substantially as described.
11. The process of treating ores and extracting gold and silver therefrom, which consists in rapidly and continuously passing them through an alkaline hydrate solution and immediately thereafter conveying them through an alkaline cyanide solution under a direct downward air pressure greater than that of the atmosphere, substantially as described.
12. The process of treatng ores whirh consists in subjecting them to an alkaline hydrate solution and immediately thereafter subjecting them to the combined action of an alkaline cyanide solution and air of an equable temperature having a direct downward pressure upon the solution greater than that of the atmosphere, substantially as described.
13. The process of treating ores continuously for the extraction of gold and silver, which consists in acting upon them with an alkaline neutralizing solution, then immedately thereafter conveying and subjecting them to a cyanide solvent solution in the presence of heated air having a direct downward pressure upon the solution greater than that of the atmosphere, and passing the hydro-cyanic acid fumes to and absorbing same in a compound alkaline cyanide and alkaline hydrate solution, and at the same time precipitating base metal vapours arising with the hydrocyanic acid fumes, substantially as described.
14. The process of treating ores to extract the gold and silver they contain, which consists in crushing the ore and neutralizing the acid salts in same, immediately conveying and pulverizing the sald ores in an alkaline cyanide solution under air pressure greater than that of the atmosphere, immediately and continuously conveying the ores through other bodies of cyanide solutions also under air pressure greater than that of the atmosphere and forcing the hydrocyanic acid fumes through and absorbing same in a compound alkaline cyanide and alkaline hydrate solution, using said solution in the treatment of further bodies of ore and simultaneously precipitating vapours of base elements arising with the hydro-cyanic acld fumes, substantially as described.

\section*{No. 102,396. Apparatug for Extracting Precions Metals.}

Appareil pour extraire les métaux precieus.

Sidney Theodore Muffly, Philadelphia, Pennsylvania, U.S.A. 4th December, 1906; 6 years. Filed 14th December, 1905. Receint No. 131,024.
Claim.-1. A system for treating ores to extract the preclous metals therein contained, which consists of the combination of an ore neutralizing device, an enclosed stamp mortar, and a closed conduit connecting said device with the stamp, substantially as described.
2. A system for treating ores to extract the precious metals therein contained, which consists of the combination of an ore neutralizing device, an enclosed stamp mortar, a closed conduit connecting said device with said stamp mortar, and an automatic valve in said conduit, substantially as described.
3. A system for treating ores to extract the precious metals therein contained, which consists of the combination of an ore neutralizing device, an enclosed stamp mortar, and a closed conduit connecting sald device with the stamp mortar, said conduit having a conveyer placed to receive material from sald neutralizing device, and an automatic valve placed to receive material from the conveyer, substantially as described.
4. A system for treating ores to extract the precious metals therein contained, which consists of the combination of an ore neutralizing device, a stamp mortar having an air tight casing, and a source of air supply connected to deliver air to sald stamp mortar casing, substantially as described.
5. A system for treating ore to extract the precious metals therein contained, which consists of the combination of an ore neutralizing device, a stamp mortar having an air tight casing, and a source of air supply connected to deliver air to the said stamp mortar and casing, said mortar having within it means for discharging the air both above the surface of a body of liquid in it and also under the surface of said liquid adjacent to the stamps and dies, substantially as described.
6. A system far treating ores to extract the precious metals therein contained, the same consisting of an enclosed conduit, an ore neutralizing device discharging into one end of said conduit, and a stamp mortar and lixiviating means, all operative in the conduit, substantially as described.
7. A system for treating ores to extract the precious metals therein contained, the same consisting of an enclosed conduit, a stamp mortar, lixivating means connected to receive material from the stamp mortar, and a source of air supply connected to cause direct downward pressure upon the bodies of liquid in seid conduit, substantially as described.
8. A system for treating ores to extract the precisus metals therein contained, which includes a crusher, a neutralizing device, a stamp mortar, a lixiviating device, means connecting said parts to form a continuous enclosed passage for ore, and a compressor connected to said passage for maintaining the air in the stamp mortar and in the lixiviating device under a pressure above the normal, substantially as described.
9. A system for treating ores to extract the precious metals thereln contained, which includes a stamp mortar having an enclosed casing, a series of lixiviators connected to the stamp mortar, each lixiviator consisting of a casing having a drum provided with buckets and riving means, and means for supplying cyanide solution and air under pressure to the stamp mortar and to the lixiviator casings, substantially as described.
10. In a system for treating ores to extract the preclous metals therein contained, the combination of an enclosed stamp mortar, a series of enclosed lixiviators connected to receive material from the stamp, a vessel for receiving liquid from lixiviators, means for removing the tailings, and an absorbing apparatus connected to said lixiviators for receiving the hydro-cyanic acid gas evolved in said lixiviators, substantially as described.
11. A system for treating ores to extract the precious metals therein contained which includes an enclosed stamp mortar, a series of enclosed lixivfators connected to receive material from the stamp, a series of receiving tanks, an absorbing device and a conveyer, all connected to the lixlviators, said abeorbing devices consisting of a chamber having connected to it a source of supply for solution capable of absorbing hydro-cyanic acid fumes, substantially as described.
12. A system for the treatment of ores of precious metals including a series of lixiviators and an absorbing chamber connected thereto, said chamber having a serles of partitions forming a tortuous passage therethrough, and being provided with means whereby a solvent solution may be supplied to said partitions, substantially as described.
13. A system for the treatment of the ores of precious metals including a serles of lixiviators and a gas absorbing chamber connected thereto, said chamber having series of partitions forming a tortuous passage therethrough, one series of partitions being formed of fabric aprons having means whereby they are made to dip into a body of liquid in the bottom of the chamber, and means whereby their surfaces are supplied with relatively thin films of said liquid.
14. In a system for the treatment of the ores of precious metals, the combination of a series of lixiviators, a source of compressed air connected thereto, means for receiving liquid and pulp after said materials have passed through lixiviators, an absorbing chamber for receiving the hydrocyanic acid gas evolved, and means for permitting the escape of the compressed air after it has passed through the absorbing chamber, substantially as described.
15. In a system for the treatment of the ores of precious metals, the combination of a series of lixiviators, a source of compressed air, means for receiving liquid and plup after said materials have passed through said lixiviators, with an absorbing chamber connected to the lixiviators for receiving the hydro-cyanic gas evolved, and pasitively acting means for periodically permitting the escape of the compressed air after it has passed through the absorbing chamber, substantially as described.
16. A chamber for absarbing gas consisting of a container having partitions extending upwardly from its bottom, pairs of rollers between certain of the partitions, fabric aprons extending vertically between each pair of rollers and entering bodies of liquid in the lower part of the chamber, substantially as described.
17. A chamber for absarbing gas, cousisting of a container having partitions extending upwardly from its bottom, pairs of rollers between certain of the partitions, fabric aprons extending vertically between each pair of rollers and entering bodies of liquid in the lower part of the chamber, and means for turning certain of the rollers to cause movement of the aprons, substantially as described.
18. A system including the combination of an enclosed stamp mortar and a series of enclosed lixiviators, with a chamber connected thereto for absorbing hydro-cyanic acid gas evolved, a container for cyanide solution, and a container for alkaline hydrate solution, both connected to said absorbing cbamber, substantially as described.
19. In a system for the treatment of the ores of precious metals, the combination of a stamp mortar capable of holding liquid, a casing therefor capable of holding compressed air, a source of compressed air, and means for connecting said source of air with the casing, said connecting means including a pipe connecting with the top of the stamp mortar and a second pipe placed to discharge adjacent to the stamps and dies, substantially as described.
20. In a system for the treatment of fine are sand clays, concentrates and mail tailings containing precious metals, which consists of the combination of an acid neutralizer with a chute at the back for the material to enter, a closed conduit at the front having a conveyer with an automatic valve placed to discharge the material to a series of lixiviators connecting with a gas absorbing chamber, having an automatic valve, connection with an ore conveyer, with a sand pump, with a solution pump, with solution tanks, with an air compressor, and with an electrolytic or other gold and silver precipitating apparatus, substantially as described.
21. In a system for the treatment of ores containing precious metals, which consists in the combination of an ore crusher connected by a chute with an acid neutralizer at the back for the broken ore to enter, with a closed conduit at
the front having a conveyer with an automatic valve to discharge the broken ore into a fine crushing or pulverizing mill having pipe attachments for supplying air under pressure, a pipe for supplying solvent solution, connecting bv an enclosed conduit with a series of lixiviators having air recelvers, with pipe connections with an air compressor, with pipe connections, with solution tanks, with a gas absorbing chamber, with an ore conveyer, with a solution pump, with a sand pump and an electrolytic or other gold and silver precipitating apparatus, substantially as described.

\section*{No. 102,397. Elastic Fluid Turbine. Turbine a fuide élastique.}

James Wilkinson, Providence, Rhode Island, U.S.A., 4th December, 1906; 6 years. Filed 15th September, 1906. Recelpt No. 139,533.
Claim.-1. An elastic fluid turbine having a sectional casing, in combination with a shell or jacket surrounding said casing, elements projecting inwardiy from said shell and disposed so as to hold the casing between them, and means to force the sections of said casing together.
2. An elastic fluid turbine having a sectional casing, in combination with a shell or jacket surrounding said casing, abutments carried by sald shell and adapted to engage the end sections of the casing, and adjustable means to force the sections of the casing together between said abutments.
3. An elastic fluid turbine having a sectional casing, a shell or jacket surrounding said casing, means carried by said shell which engages one end of said casing, a detachable abutment connected to said shell and overhanging the other end of said casing, adjustable devices such as screws carrled by said abutment and adapted to be forced against said casing to hold its parts in position.
4. An elastic fluid turbine having end sections, a tubular shell or jacket provided with abutments adapted to engage said end sections, one of said abutments being removable, and adjustable means carried by an abutment and adapted to engage the adjacent end section.
5. An elastic fluid turbine having a sectional casing, in combination with a shell or jacket surrounding said casing and provided with an abutment adapted to engage one end of said casing, a channel or groove in said shell, a locking ring seated in said channel and projecting therefrom, means to prevent the disengagement of said ring from said channel, and screws carried by said ring and adapted to be screwed against the adjacent end of sald casing to force the latter againgt sald abutment.
6. An elastic fluid turbine having an inner casing and an outer shell or jacket, a chamber formed between said shell and casing, a packing chamber between said shell and casing, and a movable element adapted to enter said chamber and act upon the packing therein to pack the joint between said shell and casing.
7. An elastic fluid turbine having an inner casing and an outer shell or jacket, a steam chamber formed between said casing and shell, an annular packing chamber formed between an end of said casing and said shell, a packing ring, and adjustable means to force said ring into said packing chamber.
8. An elastic fluid turbine having an inner casing and an outer shell or jacket, locking abutments in said shell between which said inner casing is disposed, means to hold said casing in place between said abutments, a fluid pressure chamber between said shell and casing, and means to prevent leakage from said chamber comprising an annular packing chamber near an end of the casing, a segmental ring adapted to enter sald chamber, and screw means to force sald ring into said chamber.
9. An elastic fluid turbine having a sectional casing, in combination with a shell or jacket surrounding said casing 12-5
and provided with means adapted to engage one end of said casing, a detachable abutment carried by said shell near the other end of said casing, an annular packing chamber between said shell and casing adjacent to said abutment, a packing ring adapted to enter said packing chamber, and set screws carried by said abutment and adapted some of them to engage said ring and some the adjacent end of the casing, substantially as described.
10. A turbine comprising an inner sectional casing, an outer shell, a fluid pressure chamber between said parts, an annular packing chamber between the ehell and casing near an end of the latter, and an annular element adapted to enter said chamber, packing for said chamber between the oppositely disposed faces of said element and chamber, said faces being so inclined relatively to each other as to force said packing outwardly against the shell when moved together to compress it.
11. In an elastic fluid turbine, an inner casing, an outer shell or jacket surrounding said casing, and means connecting the inner casing to the shell which comprise an element projecting inwardly from the shell and overhanging an end of the casing, and adjustable devices interposed between said element and casing.

No. 102,398. Mould for Building Blocke.
Moule pour blocs de construction.

John Wengs, Monroe, Michigan, U.S.A., 4th December, 1906;
6 years. Filed 25th October, 1906. Receipt No. 140,604.
Claim.-1. The comblnation with a mould box, of a bench for supporting the mould box having a top, bearing brackets on the bench extending laterally therefrom, a shaft rotatable in said bearings at one side of the top, means for securing the mould box at one side of its longitudinal center line to the shaft to turn therewith, said box being adapted to rest upon said top when in its vertical position and be supported by said top and shaft, and means for turning the shaft.
2. The combination with a mould box, of a bench having a toD, laterally extending bearing brackets on said bench, a shaft mounted on said bearing brackets, bolts secured to the mould bottom at one side of its longitudinal center llne and extending through openings in the shaft, sleeves on the bolts for spacing the mould box from the shaft, and means for turning the shaft.
3. In a mould, the combination with a bed plate and sides attached to sald bed plate, of end plates hinged to the bed plate, facing plates inside the end plates, adjusting screws extending through the end plates and secured to the facing plates to adjustably support said facing plates, and coiled springs attached to the base pläte at one end and to the end plates at their opposite ends to normally hold sald ends turned outward on their hinges.
4. In a mould, the combination with a bed plate, of a side and ends hinged to said bed plate, brackets secured to the bed plate opposite the hinged side, a detachable board forming the opposite side, adjusting screws oxtending through the brackets and engaging the board, a movable bottom facing plate, arms on the ends adapted to engage the outer surface of the hinged side and provided with outwardly extending pins, and hooks on the hinged slde to engage said pins.
5. In a mould, the combination of a bench having laterally extending bearings, a shait in sald bearings, a bed plate, bolts extending through said shaft to secure the bed plate thereto, sleeves on the bolte between the shaft and bed plate, brackets secured to one edge of the bed plate, a movable facing bottom, bolts on the facing bottom, extending through openings in the bed plate, a board forming the slde wall of the mould engaging the brackets, ends hinged to the ends of the bed vlate, facing plates, adjusting screws on the ends secured to and supporting said facing plates, arms on the ends engaging the outer surface of the hinged side wall, pins on said arms, hooks on the side wall engaging sald pins, outwardly extending arms on the ends of the
bed plate, springs attached at one end to said arms and at their opposite ends to the mould ends, a top board, and means for securing the top board in place.

\section*{No. 102,399. Mould for Artificial Stone Building Blocks. \\ Moule pour blocs de pierre artificielle pour construction.}

Albert A. Pauly, Youngstown, Ohio, U.S.A., 4th December, 1906 ; 6 years. Filed 23rd October, 1906. Receipt No. 140,529.
Claim.-1. In an apparatus the combination of a trackway, a plurality of presses erected above said trackway, a car adapted to travel upon said trackway beneath said presses, a moulding frame carried by said car and comprising hinged gates, detachable dies carried by said presses, a polishing device mounted between sald presses above said trackway, said polishing device consisting of a plurality of notary polishers, an endless conveyer mounted adjacent to said presses, means to vertically reciprocate said dies, means to revolve said polishers, and means to simultaneously operate said conveyer, substantially as described.
2. An apparatus of the type described embodying a trackway, a car mounted upon said trackway, a moulding frame carried by said car and consisting of a plurality of interlocking gates, presses mounted above said trackway, vertically reciprocating interchangeable dies carried by said presses, a polishing device mounted between two of said presses, and means to simultaneously operate and independently control said presses and said polishing device, substantially as described.
3. An apparatus of the type described embodying a plurality of presses, a movable car located beneath said presses, a moulding frame carried by said car and adapted to receive concrete. pallets mounted in said moulding frame, vertically reciprocating dies carried by said presses and adapted to engage said concrete, and adjusable polishing device mounted between two of said presses, means to operate said presses, means sto operate said polishing device, means to strip said moulding frame, substantially as described.
4. An apparatus of the type described embodying a plurality of presses, a movable car located beneath said presses, a moulding frame carried by said car, vertically reciprocating detachable dies carried by sald presses, an adjustable polishing device supported between two of said presses, means to operate said presses, and means to operate said polishing device, substantially as described.
5. In an apparatus the combination with a trackway, of a car mounted upon said trackway, a moulding frame carried by said car, interlocking gates hinged to said frame, pallets mounted in said frame, presses mounted above said trackway, a plurality of detachable dies carried by said presses, a polishing device supported between two of eaid presses, revoluble polishers adjustably carried by said device, an endless conveyer mounted adjacent to said presses, means to strip said moulding frame, means to operate said presses, means to operate said polishing device, means to operate said conveyer, and means to independently control said presses, sald device and said conveyer, substantially as described.
6. In an apparatus the combination with a trackway and a car mounted thereon, of a moulding frame carried by said car, interlocking gates hinged ito said frame, pallets mounted in said frame, a plurality of presses mounted above said trackway, vertically reciprocating dies detachably carried by sald presses, a polishing device supported between two of said presses, means to reciprocate said dies, and means to operate said polishing device, substantially as described.
7. In an apparatus the combination with a moulding frame, interlocking gates carricd by said frame, pallets supported by said frame, of a plurality of presses, vertically reciprocating dies detachably carried by said presses a polishing device mounted between two of said presses, means to operate said presses, means to operate said device, and means to move said moulding frame beneath sald presses and sald device, substantially as described.

8, In an apparatus the combination of a moulding frame, pallets carried by said frame, a plurality of presses, detachable dies carried by sald presses, a polishing device mounted between two of said presses, means to vertically reciprocate said dies, means to operate sald device, and means to move said moulding frame beneath said dies and polishing device, substantially as described.
9. In an apparatus the combination with a trackway and a car mounted thereon, of a moulding frame carried by sald car and adapted to receive concrete, interlocking gates hinged to said frame, pallets carried by said frame, means to strip said frame, means to lock said gates, means to subject the concrete in said irame to an initial pressure and a refilling pressure, and means to smooth and polish the concrete in said frame, substantially as described.
10. In an apparatus the combination with a trackway and a car, of a moulding frame carried by sald car and adapted to recelve concrete, interlocking side gates and end gates carried by said frame, supplementary side gates and supplementary end gates mounted within the first-named side gate and end gates, pallets carried by said frame, means to strip said frame, means to subjecat the concrete of sald frame to pressure, substantally as described.
11. In an apparatus the combination with a trackway and a car, of a moulding frame adapted to receive concrete, interlocking side gates and end gates carried by said frame, supplementary side gates and supplemenstary end gates mounted Within and interlocked with the first-named gates, means to strip said frame, means to subject the concrete of said frame to pressure, substantially as described.
12. In an apparatus the combination with a trackway and a car, of a moulding frame carried by said car, presses mounted above said trackway, movable dies carried by said presses, a polishing device supported between two of sald presses, a conveyer arranged adjacent to said trackway, means to operate said presses, means uto operate said polishing device, and means to operate said conveyer, substantiaily as described.
13. An apparatus of the type described embodying a plurality of presses, detachable dies carried by said presses, a movable moulding frame adapted to travel beneath said dies. means to vertically reciprocate said dies, and means to move said frame, substantially as described.
14. An apparatus of the type described embodyng a plurality of presses, dies carried by said presses, a moulding frame, a polishing device interposed between said presses, means to move said moulding frame beneath said presses and said polishing device, and means to independently operate said presses and said polishing device, substantially as described.
15. An apparavtus of the type described embodying a plurality of vertically reciprocating dies, a movable moulding frame adapted to travel beneath said dies \({ }^{4}\), a polishing device mounted adjacent to said dies, and means to independently operate said dies and said polishing device, substantíally as described.
16. An apparatus embodying a plurality of sets of vertically reciprocating dies, a moulding frame, and means to move said frame from one set of dies to another set of dies, substantially as described.
17. An apparatus consisting of a polishing device, a moulding frame adapted to contain concrete, means to subject the concrete of said frame to pressure, and means to move sald frame to meet said polishing device to be polished thereby, substantlally as described.
18. An apparatus consisting of a moulding frame, presses, a polishing device, a conveyer, and means for simultaneously operating hthe presses and polishing device, substantially as and for the purpose described.
19. An apparatus consisting of a moulding frame, presses, a polishing device, and means for simultaneously operating the presses and polishing device, substantially as and for the purpose described.

No. 102,400. Monld for Blocks. Moule pour blocs.
The Ideal Concrete Machinery Company, London, Ontario. Canada, assignee of Frank A. Borst, South Bend Indiana, U.S.A., 4th December, 1906; 6 years. Filed 22nd October, 1906. Receipt No. 140,517.
Claim.-1. In a building block mould, the combination of a frame, a stationary back plate mounted thereon, a front plate hinged to said frame and normally parallel to the back plate, end plates, a bottom plate extending across
said mould and connected to said front plate and provided with a groove and a vertically slidable dividing plate ad

apted to fit in said groove in the bottom plate and divide the mould.
2. In a building block mould, the combination of a frame, a back plate having notches at its upper edge, a front plate hinged to said frame and normally parallel to the back plate, said front plate also provided with notches at its upper edge, end plates, a bottom plate extending across said mould and connected to said front plate and provided with grooves and a dividing plate adapted to fit in said grooves and provided with extensions to engage the notches in the plates
3. In a building block mould, the combination of sides, ends and bottom of the same, a dividing plate adapted to be securely held in said mould to permit the forming of a plurality of blocks simultaneously, and a guide for said plate comprising a movable slotted bar having hooks to engage a side of said mould.

No. 102,401. Mould for Building Blocks.
Moule pour blocs de construction.

The Ideal Concrete Machinery Company, London, Ontario, Canada, assignee of Frank A. Borst, South Bend, Indiana, U.S.A., 4th December, 1906; 6 years. Filed 22nd October, 1906. Receipt No. 140,516
Claim.-1. A core for concrete block machines comprising members hinged together and adapted to have their adjacent ends contact when the members form a right angle, a post attached to one of said members, and a brace pivoted on said post and adapted to engage the free end of another member and lock the same in position.
2. A core for concrete block machines comprising three members, hinged together and adapted to have adjacent ends contact when the adjacent members form substantially right angles, a post on the middle member, and a brace pivoted on said post and adapted to engage the free ends of the other members to lock the same in position.
3. A core for concrete block machines comprising a main member, a loaf hinged thereto, and a brace to hold said leaf at a predetermined angle to the main member.

\section*{No. 102,402. Carbureter for Explosive Engines. Carburateur pour machincs d explosions.}

Emanuel John Boyler, Courtland John Aggett and Angus Stalker, the two latter being assignees of two-thirds of the interest, all of Peterborough, Ontario, Canada, 4th December, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,206.
Claim.-1. A carbureter comprising a mixing chamber having a fuel inlet and an air inlet, an automizer con-
tained within the mixing chamber to assist the vapourization of the fuel, a gas outlet and a valve controlling the?

gas outlet automatically opened by the gas within the mixing chamber.
2. A carbureter comprising a mixing chamber, having a fuel inlet and an air inlet, an atomizer contained within the mixing chamber to assist the vapourization of the fuel, a gas outlet, a valve controlling the gas outlet automatically opened by the gas within the mixing chamber, and a spring to automatically close the valve against its seat when the gas has passed out of the mixing chamber.
3. A carbureter comprising a mixing chamber having a fuel inlet and an air inlet, an atomizer contained within the mixing chamber, a gas outlet and a valve controlling the gas outlet automatically opened by the pressure of the gas within the mixing chamber and and an injector comprising a fuel chamber, a fuel inlet connected with the fuel chamber, a valve to close the communication between the fuel chamber and the fuel inlet, a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet and an operable means to create a partial vacuum within the fuel chamber to admit fuel thereto and then create a pressure therein to eject the fuel therefrom.
4. A carbureter comprising a mixing chamber, having a fuel inlet and an air inlet, an atomizer contained within the mixing chamber to assist the vapourization of the fuel, a gas outlet, a valve controlling the gas outlet automatically opened by the gas within the mixing chamber and a spring to close the valve against its valve seat when the gas has been passed out of the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet connected with the fuel chamber, a valve to close the communication between the fuel chamber and the fuel inlet, a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet and an operable means to create a partial vacuum in the fuel chamber to admit fuel thereto, and then create a pressure therein to eject the fuel therefrom.
5. A carbureter comprising a mixing chamber, having a fuel inlet and an air inlet, an atomizer contained within the mixing chamber to assist the vapourization of the fuel, a gas outlet and a valve controlling the gas outlet automatically opened by the gas within the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet connected with the fuel chamber, a valve to close the communication between the fuel chamber and the fuel inlet, a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet, a sucker and operable means for actuating the sucker.
6. A carburcter comprising'a mixing chamber, having a fuel inlet and an air inlet, an atomizer contained within the mixing chamber to assist the vapourization of the fuel, a gas outlet, a valve controlling the gas outlet automatically opened by the gas within the mixing chamber and a spring to automatically close the valve against its seat when the gas has passed out of the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet connected with the fuel chamber, a valve to close the communication between the fuel chamber and the fuel inlet, a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet, a sucker, and operable means for actuating the sucker
7. A carbureter comprising a mixing chamber, having a fuel inlet and an air inlet, an atomizer contained within the mixing chamber to assist the vapourization of the fuel, a gas outlet and a valve controlling the gas outlet automatically opened by the gas within the mixing chamber and an injector comprising a fuel chamber, a fuel inlet, a valve seat located between the fuel chamber and fuel inlet. a valve to engage the valve seat, a valve stem for the valve, a spring to close the valve against the valve seat, a fuel outlet for the fuel chamber connected with the fuel inlets of the mixing chamber, a valve controlling the fuel
outlet, a spring to close the last-mentioned valve against its seat, a slideway opposed to the fuel chamber and a sucker contained in the slideway.
8. A carbureter comprising a mixing chamber having a fuel inlet and an air inlet, an atomizer contained within the mixing chamber, a gas outlet and a valve controlling the gas outlet opened by the gas within the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet, a valve seat located between the fuel chamber and fuel inlet, a valve to engage the valve seat, a spring to close the valve against the valve seat, a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve controlling the fuel outlet, a spring to close the last-mentioned valve against its seat, a slideway opposed to the fuel chamber, a sucker contained in the slideway, and operable means for actuating the sucker.
9. A carbureter comprising a mixing chamber having a fuel inlet, an air inlet and a gas outlet and a valve controlling the gas outlet automatically opened by the action of the gas within the mixing chamber.
10. A carbureter comprising a mixing chamber having a fuel inlet, an air inlet and a gas outlet, a valve controlling the gas outlet automatically opened by the gas within the mixing chamber, and a spring to automatically close the valve against its seat when the gas has passed out of the mixing chamber.
11. A carbureter comprising a mixing chamber having a fuel inlet, an air inlet and a gas outlet. a valve controlling the gas outlet automatically opened by the pressure of the gas within the mixing chamber and an injector comprising a fuel chamber, a fuel inlet connected with the fuel chamber, a valve to close the communication between the fuel chamber and the fuel inlet, a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet, and an operable means to create a partial vacuum within the fuel chamber to admit the fuel thereto and then create a pressure therein to aject the fuel therefrom.
12. A carbureter comprising a mixing chamber having a fuel inlet, an air inlet and a gas outlet, a valve controlling the gas outlet automatically opened by the gas within the mixing chamber, and a spring to close the valve against its valve seat when the gas has passed out of the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet connected with the fuel chamber, a valve to close the communication between the fuel chamber and the fuel inlet. a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet, and an operable means to create a partial vacuum in the fuel chamber to admit fuel thereto and then create a pressure therein to eject the fuel therefrom.
13. A carbureter comprising a mixing chamber having a fuel inlet, an alr inlet and a gas outlet, and a valve controlling the gas outlet automatically opened by the gas within the mixing chamber, and an injector comprising a fuel chamber. a fuel inlet connected with the fuel chamber. a valve to close the communication betwren the fuel chamber and the fuel inlet. a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet, a sucker, and operable means for actuating the sucker.
14. A carbureter comprising a mixing chamber having a fuel inlet, an air inlet and a gas outlet, a valve controlling the gas outlet automatically opened by the gas within the mixing chamber, and a spring to automatically close the valve against its seat when the gas has passed out of the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet connected with the fuel chamber, a valve to close the communication between the fuel chamber and the fuel inlet, a fuel outlet for the fuel chamber connected with the fuel inlet of the mixing chamber, a valve to close the fuel outlet, a sucker, and operable means for actuating the sucker.
15. A carbureter comprising a mixing chamber having a fuel inlet, an air inlet and a gas outlet, and a valve controlling the gas outlet automatically onened by the gas within the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet, a valve seal located between the fuel chamber and the fuel inlet, a valve to engage the valve seat, a spring to hold the valve against the valve seat, a fuel outlet connected with the fuel Inlet of the mixing chamber, a valve controlling the fuel outlet, a spring to close the last-mentioned valve against its seat, a slideway opposed to the fuel chamber, and a sucker contained in the slideway.
16. A carbureter comprising a mixing chamber having a fuel inlet. an air inlet and a gas outlet and a valve controlling the gas outlet opened by the gas within the mixing chamber, and an injector comprising a fuel chamber, a fuel inlet, a valve seat located between the fuel chamber tuel infet, a valve inlet, a valve to engage the valve seat, a spring to hold the valve against the valve seat, a fuel outlet connected with the fuel inlet of the mixing chamber, a
valve controlling the fuel outlet, a valve stem therefor, a spring to close the last-mentioned valve against its seat, a slideway opposed to the fuel chamber, a sucker contained in the slideway and operable means for actuating the sucker.

\section*{No. 102,403. Fead Rest for Beds. \\ Appui-têtes pour lits.}

Joseph S. Visger and Cleophas Pagnuelo, assignee of a half interest, both of Montreal, Quebec, Canada, 4th December, 1906 ; 6 years. Filed 3 rd October, 1906. Receipt No. 140,010.
Claim.-1. In a head rest for beds, a pair of brackets fixed tho the side rails of the bed, a pair of side members pivoted to said brackets, thrust blocks pivoted to said brackets, plvoted blocks on the lower extremities of said side members and threaded rods revolubly mounted in said thrust blocks and co-aching with said pivoted blocks.
2. In a deyice of the class described, the combination with the side ralls of a bed, of a pair of brackets fixed thereto a pair of side members pivoted to said brackets, pivoted thrust blocks on said brackelts pivoted blocks on the lower extremities of said side members, threaded rods revolubly mounted in said thrust blocks and co-acting with said pivoted blocks, and pulleys mounted on said rods.
3. In a device of the class described the combination with the side rails of a bed, of a pair of brackets fixed thereon, a pair of side members pivoted to sald brackets, a plurality of transverse members connecting said side members, thrust blocks pivoted to said brackets, pivolted blocks on the lower extremities of said side members, threaded rods revolubly mounted in said thrust block and co-acting with said pivoted blocks, pulleys fixed to said rods adjacenit the thrust blocks and an endless belt connecting said pulleys.

No. 102,404. Method of Drawing Wire.
Laminoir de fll de fer.

The Iroquois Machine Company, New York City, assignee of James Alexander Hortoh, Providence, Rhode Island, U.S. A., 4 th December, \(1906 ; 6\) years. Filed 3rd September, 1904. Recelpt No. 118,225.

Claim.-1. A wire seat for wire drawing drums composed of a material softer than the wire.
2. In a wine drawing machine, a drum having a wire seat composed of lubricalting material capable of coating by attrition wire having substantially the hardness of steel.
3. A wire seat for wire drawing drums composed of a metallic alley similar to that used in coating the wire.
4. The process of drawing wire consisting in lubricating the wire by attrition with the wire forwarding seat by revolving a wire forwarding sealt composed of a wire coating material faster than the speed of the wire and reducing the wire in a die.

\section*{No. 102,405. Shortening Compound.}

\section*{Composé pour le pain, etc.}

Frederick Alfred Sallemand, Montreal, Quebec, Canada, 4th December, 1906; 6 years. Filed 28th April, 1905. Recelpt No. 124,664.
Clasim.-1. An improved shortening compound consisting of fatty animal oll and an alkaline solution sufficient to produce a partial saponification of the oll.
2. An improved shortening compound consisting of animal fat and a dilute alkaline solution sufficient to produce a partial saponification of the oll.
3. An improved shortening compound consisting of animal fat, lime water, and an alkali, the latter of a strength and in quantity sufficient to produce a partial saponification of the fat.
4. An improved shortening compound consisting of partially saponified fatty animal oil and milk.
5. An improved shortening compound consisting of fatty animal oil, lime water, an alkali bicarbonate, and milk, the alkali bicarbonate being of a strength and in quantity sufficlent to produce a partial saponification of the oil.
6. The improved shortening compound consisting of animal fat, water, lime and bicarbonate of sodium combined substantially as and in the proportions set forth.

No. 102,406. Means of Vaponrizing Heavy Hy-dro-Carbons.
Moyen de vaporiser l'hydro-carbure.

Dan Albone and Frederick Boswell, co-inventors, both of Biggleswade, Bedford, England, 4th December, 1906; 6 years. Filed 30th August, 1906. Recelpt No. 139,096.
Claim.-1. In a device of the class described the combination with the mixing pipe, of a serles of tubes extending across and through the mixing pipe and means for passing the products of combustion through the said tubes, as and for the purpose specified.
2. In a device of the class described the combination with the carbureter, of a mixing pipe jointed thereto, a series of tubes extending within and through the mixing pipe and means for passing the products of combustion from the motor through the said tubes, as and for the purpose specified.
3. In a device of the class described the combination with the mixing pipe, of a pipe passing obliquely across the mixing pipe and opening thereinto, end plates to the oblique pipe, tubes supported in the end plates and extending therebetween and means for passing the products of combustion from the motor through the tubes, as and for the purpose sjecifled.
4. In a device of the class described the combination with the mixing pipe, of a pipe passing obliquely across the mixing pipe and opening thereinto, end plates within the oblique pipes, tubes supported from the end pipes and extending therebetween, a nozzle at the outlet and an inlet fitting, to the oblique pipe, said inlet being elastically attached to the pipe by means of studs passing within the openings in the flange of the fitting and having adjustable nuts for the studs and spiral compression springs enveloping the studs and between the nut and the flange, a cock in communication with the inlet and means whereby the
products of combustion may be passed to the inlet and through the tubes, as and for the purpose specified.
5. In a device of the class described the combination with the mixing pipe and the oblique pipe and its dependent tubings, of adjustable means denendent from the pipes whereby access may be had for initially heating the tubes, as and for the purpose specifled.
6. In a device of the class described the combination with the mixing pipe and the oblique pipe with its dependent tubings, of a branch pipe directly connected to the inner chamber and in proximity to the lower end of the tubes, a normally closed pivoted cover to the pipe and a wing nut designed in withhold the cover in the closed position, as and for the purpose specified.

No. 102,407. Vapouriser for Combuntion Engines. Vaporisateur pour machines à combustion.

Francis W. Brady Englewood, New Jersey, U.S.A., 4th December, 1906; 6 years. Filed 13th September, 1906. Receipt No. 139,487 .
Claim.-1. In a vapourizer for internal combustion engines, a fuel port, means for feeding fuel through the port into the vapourizer at intervals, and means for creating a back draft through the port after the fuel feed.
2. In a vapourizing apparatus for internal combustion engines, a fuel port, a fuel supply pipe communicating with said port, means for feeding fuel through said pipe and port at intervals, and means for withdrawing the fuel in the pipe from proximity to the port after the fuel feed.
3. In a vapourizer for internal combustion engines, a heated vapourizing surface, a fuel port. means for feeding through the port and onto said surface at intervals, a quantity of liquid hydro-carbon and means for creating a back draft through said port after each fuel feed.
4. In a vapourizing apparatus for internal combustion engines, a vapourizing chamber, a fuel inlet port therein, a fuel supply pipe communicating with said inlet port, a fuel pump feeding oll to said supply pipe and means for adjusting the amount of fuel fed from the pump chamber to the supply pipe on each stroke of the pump without varyIng the length of the pump stroke.
5. In a vapourizing apparatus for internal combustion engines, a vapourizing chamber, a fuel inlet port therein and a fuel pump having an eduction port communicating with the fuel inlet port in the vapourizing chamber, a fuel induction port in the pump and means for relleving the suction through said fuel induction port during part of the suction period of the pump.
6. In a vapourizing apparatus for internal combustion engines, a vapourizing chamber, a fuel inlet port therein, and a fuel pump having a pump chamber, a plunger moving therein, an eduction port in said pump chamber communicating with the inlet port in the vapourizing chamber, an induction port in said pump chamber for the admission of fuel, a second induction port in said chamber and means for opening the second induction port during the outward movement of the pump plunger to relieve the suction through the fuel induction port.
7. In a vapourizing apparatus for internal combustion engines, a vapourizing chamber, a fuel inlet port therein. and a fuel pump having an eduction port, a fuel feed pipe connecting the eduction port of the pump with the fuel inlet nort of the vapourizing chamber, a fuel induction port in the pump, a second induction port in the pump, a pipe connecting the second induction port with the said fuel feed pipe and means for opening the second induction port at a predetermined time during the suction period of the pump to relleve the suction through the fuel induction port of the pump and withdraw the fuel from proximity to the fuel inlet nort of the vapourizing chamber.
8. In a vapourizing apparatus for internal combustion engines, a vapourizing chamber, a fuel inlet port therein and a fuel pump having an eduction port communicating with the fuel inlet port in the vapourizing chamber, a fuel induction port in the pump and adjustable means for relleving the suction through said fuel induction port during part of the suction period of the pump.
9. In a vanourizing apparatus for internal combustion engines, a vapourizing chamber, a fuel inlet port therein, and a fuel pump having a pump chamber, a plunger moving therein, an eduction port in said pumn chamber communicating with the inlet port in the vapourizing chamber, an induction nort in said pump chamber for the admission of fuel, and a second induction port in said chamber and adjustable means for opening second induction port during the outward movement, of the pump plunger to relieve the suction through the fuel induction port.
10. In a vapourizing device for internal combustion engines, a vapourizing chamber, a fuel inlet port therein, a fuel pump having a plunger. a chamber in which said plunger reciprocates, an eduction port in the pump chamber, a fuel feed pipe connecting the eduction port of the pump with the fuel inlet port of the vapourizing chamber, a fuel induction port in the pump chamber, a second induction port opening into the side of the pump chamber in a position to be opened by the outward movement of the pump plunger, and a pipe connecting the second induction port with the said fuel feed pipe. whereby the second induction pipe is opened at a predetermined point in the suction stroke of the pump, to relieve the suction through the fuel induction port and withdraw the fuel from proximity with the fuel inlet port of the vapourizing chamber.
11. In a vapourizing device for internal combustion engines, a vapourizing chamber, a fuel inlet port therein, a fuel pump, a plunger for said pump having a bevelled end, a chamber in which the plunger reciprocates, an eduction port in the pump chamber, a fuel feed pipe connecting the eduction port of the pump with the fuel inlet port of the vapourizing chamber, a fuel induction port in the pump chamber, a second induction port opening into the side of the pump chamber in a position to be uncovered by the outward movement of the pump plunger, the pump plunger being so supported that it can be rotated to vary the point at which it uncovers the second induction port.

No. 102,408. Internal Combustion Engine.
Machine al combustion interne.

Francis W. Brady, Englewood, New Jersey, U.S.A., 4th December, 1906; 6 years. Filed 13th September, 1906. Receipt No. 139,488.
Claim.-1. An internal combustion engine having a vapourizer comprising a vapourizing chamber provided with a curved spraying surface, a hot fluid passage formed in part by the partition bearing surface, a valve for the admission of air at one side of said chamber and an outlet on the other end connecting with the explosion chamber of the engine, a fuel tank connected with said vapourizer, a regulating valve for varying the amount of fuel fed to the vapourizer, a second regulating valve between the engine and vapourizer for varying the amount of vapour fed to the engine, a centrifugal governor geared to the main shaft of the engine, and means connecting said governor with both of said valves, whereby a variation of the speed of the engine varies proportionally the amount of vapour fed to the engine and of fuel fed to the vapourizer, substantially as described.
2. An internal combustion engine having a vapourizer adapted to supply air saturated with vapourized fuel, said vapourizer comprising a vapourizing chamber provided with a spraying surface, a regulable valve for the admission of air at one side of said chamber and outlet at the other end connecting with the explosion chamber of the engine, a fuel tank connected with said vapourizer, a regulating valve for varying the amount of fuel fed to the vapourizer, a second regulating valve between the engine and vapourizer
for varying the amount of vapour fed to the engine, a governor geared to the main shaft of the engine and means connecting said governor with both of said valves, whereby a variation of the speed of the engine varies proportionally the amount of vapour fed to the engine and of fuel fed to the vapourizer, substantially as described.
3. A vapourizer having a casing, a curved partition therein engaging with the ends and sides of the casing and dividing the vapour into two chamber, means for spraying fuel upon one side of sald partition, means for conducting air through the chamber into which the fuel enters, and means for conducting a heating fluid through the other of said chambers.
4. A vapourizer having a casing, a curved partition therein engaging with the ends and sides of the casing and dividing the vapourizer into two chambers, means for spraying fuel upon the convex side of said partition, means for conducting air through the chamber into which the fuel enters, and means for conducting a heating fluid through the other of said chambers.
5. A vapourizer having a cylindrical casing, a longitudinally extending and laterally curved partition thereln which engages with the ends and sides of the casing and means for spraying fuel upon one side of said partition, means for conducting air through the chamber into which the fuel enters, and means for conducting a heating fluid through the other of said chambers.
6. A vapourizer having a cylindrical casing, a longitudlnally extending and laterally curved partition therein which engages with the ends and side of the casing and divides the vapourizer into two chambers, means for spraying fuel upon the convex side of said partition, means for conducting air through the chamber into which the fuel enters and means for conducting a heating fluid through the other of said chambers.
7. A vapourizer having a casing, a partition therein engaging with the ends and sides of the casing and dividing the vapourizer into two chambers, means for supplying fuel to one of said chambers, means for conducting air througn the chamber to which the fuel is supplied, means for conducting a heating fluid through the other of said chambers and an adjustable valve controlling the flow of air through the fuel chamber.

No. 102,409. Stuffing Box Packing. Garniture de boites d étoupe.

Samuel M. Guss, Reading, Pennsylvania, U.S.A., 4th December, 1906; 6 years. Filed 3rd November, 1906. Receipt No. 140,887 .
Claim.-1. In a stuffing box packing, a clamping ring having an oppositely flared opening, and a pair of split packing rings of conical form arranged with their smaller ends contiguous and their larger ends projecting oppositely through said clamping ring, substantially as set forth.
2. A stuffing box packing comprising a clamping ring having an oppositely flared opening, a pair of split packing rings of conical form arranged with their smaller ends contiguous and their larger ends projecting oppositely through said clamping ring. a compressible packing and interposed washer, and an adjustable gland, substantially as set forth.
3. A hydraulic stuffing box packing comprising a clamping ring of porous material having an oppositely flared opening, a pair of split conical packing rings within said clamping ring arranged with their smaller ends adjacent and forming between them an annular lubricating chamber and with their larger ends projecting oppositely through said clamping ring, and means for pressing together said packing rings, the norous material of said clamping ring enabling the operating medium under pressure to occupy said annular lubricating chamber.

\section*{No. 102,410. Extraction of Metal.}

Extraction des métaux.
Adolf Gutensohn, Plaistow, London, England. 4th December, 1906; 6 years. Filed 5th March, 1906. Receipt No. 133,573.
Claim.-A flux for use in extracting metal from ore or waste material, consisting of the admixture of one part borate of manganese, one part carbon, and four parts of a slag liquifying material, substantially as set forth.

No. 102,411. Grinding Wheel. Roue \(d\) moufur:

Gilbert Hart, Detroit, Michigan, U.S.A., 4th December, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,491. Claim.-1. As an article of manufacture, a grinding segment having pin receiving openings, a metallic plate provided with pins to enter said openings, and solder to connect the plate and segment and interposed between the pins and the segment.
2. As an article of manufacture, a grinding segment having pin receiving openings, a metallic plate provided with integral headed pins to enter said openings, and solder to connect the plate and segment, the diameter of the pins being greater than that of the openings, the solder surrounding the pins.
3. As an article of manufacture, a grinding segment having pin receiving openings, and pouring openings extending into the same from a side edge and intersecting the other openings.

No. 102,412, Wrench. Clé à érrou.

Frederick Alonzo Hanes and William Staples, co-inventors. both of Huntsville, Ontario, Canada, 4th December, 1906; 6 years. Filed 17 th September, 1906. Receipt No. 139.576.

Claim.-1. In a ratchet wrench and bit therefor, the combination with an arm having an orifice formed in the end thereof provided with an annular enlargement and a retalning plate, of a socket having gear teeth fitting in the annular enlargement and having an orifice extending therethrough and through the arm, and a bit fitting exteriorly on the outer end of the socket and means for securing the bit of the socket, as and for the purpose specified.
2. In a ratchet wrench and bit therefor, the combination with an arm having an orifice formed in the end thereof provided with an annular enlargement and a retaining plate, of a socket having gear teeth fitting in the annular enlargement and having an orifice extending therethrough and through the arm, and a bit fitting exteriorly on the outer end of the socket, and a spring finger extending around one of the gear teeth of the socket at one end and into a notch in the bit at the opposite end, as and for the purpose specifled.
3. In a device of the class described, the combination with the arm and socket suitably held therein and operated and having an open-ended orifice extending therethrough and through the arm, of a bit having an open-ended orifice extending therethrough and fitting on to the outside of the profecting end of the socket, as and for the purpose specifled.
No. 102,413. Strainer for Fried Caken.
Passoirc pour gateaux rôtis.

John Ramsey, Syracuse, New York, U.S.A., 4th December, 1906; 6 years. Filed 29th May, 1906. Receipt No. 136,385.
Claim.-1. The combination with the base frame and relicular strainer attached to said frame, of posts attached to said frame at one side of the periphery thereof, a plurality of superposed reticular strainers hinged to said posts and formed with coinciding slots extending across said superposed strainers, and a bail attached to the base frame and passing through the aforesaid slots, as set forth and shown.
2. The combination with the kettle, of a fried cake strainer consisting of a base frame seated in said kettle, a reticular strainer attached to said frame, posts attached to the frame at one side of the periphery thereof, a Dlurality of reticular strainers hinged to said posts at different elevations and provided with props diametrically opposite the posts and with coinciding slots extending across the strainers, a bail attached to the base frame and passing through the aforesaid slots, a standard provided with a supporting foot engaging the bottom of the kettle, and an arm pivoted at the top of the standard and adapted to bear on the top of the bail, as and for the purpose set forth.

No. 102,414. Cnlinary Vessel. Ustensile de cuisinc.

William Sowerby, Indiana, Pennsylvania, U.S.A., 4th December, 1906; 6 years. Filed 26th June, 1906. Recelpt No. 137,307.
Claim.-1. An attachment for culinary vessels having handles comprising a spring clamp formed of wire and
adapted to engage the handle of the vessel, a plate carried by said clamp, said plate being sheared to form brackets, a strap carried by said plate, a lid hinged to said strap, a rod mounted in said brackets and connected to said lid, the one end of said rod being bent upwardly to form a handle, substantially as described.
2. In an attachment of the character described, the combination with a culinary vessel having a handle and a lid. of a spring clamp adapted to embrace said handle, a strap carried by sald clamp to which said lid is hinged, a reciprocating rod mounted upon said clamp and connected to said lid.
3. An attachment for culinary vessels comprising a clamp composed of spring wire having a U-shaped arm adapted to engage the underneath surface of a handle and having arms parallel to said \(U\)-shaped arm and connected thereto by a coll, a plate carried by sald last-named arms, a strap carried by said plate, a lid hinged to said strap and a reciprocating rod, slidably mounted on brackets carried by said plate, and pivotally connected to the said lid.

No. 102,415. Polishing Machine. Machine à polir.

Gustav Tüschel. New York City, New York. U.S.A., 4th December, 1906; 6 years. Filed 6th June, 1906. Receipt No. 136,597.
Claim.-1. In a polishing machine, the combination. with a frame and a work holder on the same, of a plurality of polishing ball carriers, polishing balls arranged in said carriers, and means for effecting movement of the work holder and ball carriers the one with reference to the other, substantially as described.
2. In a polishing machine of the class described, the combination with a frame, and a movable work holder on the same, of a plurality of adjustable hollow polishing ball carriers, a plurality of polish balls made of felt carrier by each carrier, a suitable fabric covering said balls, means for adjusting said ball carriers vertically, means for adjust ing the same laterally, and means for rotating the same, substantially as set forth.
3. In a polishing machine of the class described, the combination with a frame, a suitable work holder arranged on the same, and means for moving said work holder forwardly and backwardly, of a plurality of vertical rotatable spindles arranged above said work holder, a hollow polishing ball carrier for each spinde, and capable of containing any desired polishing material, means for removably attaching the ball carriers to the rotatable spindles, a plurality of felt balls projecting from the under side of each ball carrier, means for adjusting the same vertically, and means for rotating the same, substantially as set forth.
4. In a polishing machine of the class described, the combination with a frame, a suitable work holder arranged on the same, and means for moving said work holder forwardly and backwardly, of a plurality of vertical rotatable spindles arranged above said work holder, a hollow polishing ball carrier for each spindle, and capable of containing any desired polishing material, means for removably attaching the ball carriers to the rotatable spindles, a plurality of felt balls projecting from the under slde of each ball carrier, a bearing for each spindle, and a laterally adjustable bracket, wherein said bearing may be moved upward and downward, means for adjusting said brackets laterally, and means for rotating the spindles, substantially as set forth.
5. In a polishing machine of the class described, the combination with a frame, a sultable work holder arranged on the same, and means for moving said work holder forwardly and backwardly, of a plurality of vertical rotatable spindles arranged above said work holder, a hollow pollshing ball carrler for each spindle, and capable of containing any desired polishing material, means for removably attaching the ball carriers to the rotatable spindles, a plurality of felt balls projecting from the under side of each ball carrler, a bearing for each spindle, and a laterally adjustable bracket, wherein said bearing may be moved upward and. downward, a belt pulley on the upper end of each spindle,
an electric motor, means for mechanically connecting said motor, to the belt pulleys on the spindles, and means for laterally adjusting said brackets, substantially as set forth.

No. 102,416. Carbureter. Carburateur.

Carl Alfred von Soden-Fraünhofen, Unterturkheim, Wurttemberg, Germany, 4th December, 1906; 6 years. Filed 24th September, 1906. Receipt No. 139,731.
Claim.-1. A carbureter comprising in combination a mixing chamber provided with a nozzle for the entrance of the gaseous fiuid, a throttle mounted in said chamber, and adapted to partially revolve, a shaft fixedly connected with said throttle and adapted to partially revolve, and means connected with said shaft to counteract to the motion of the latter and governing the throttle in such manner that as the load on the motor increases, the resistance which the said means exercises against the alteration of position of the throttle, also increases.
2. A carbureter comprising in combination a mixing chamber provided with a nozzle for the entrance of the gaseous fluid, a throttle mounted in said chamber and adapted to partially revolve, a shaft fixedly connected with said throttle and adapted to partially revolve, a crank fixedly connected with said shaft, tubular pivoted casings forming a hollow space and adapted to be operated by said crank, a spring located in said hollow space and having helices of increasing pitch.
3. A carbureter comprising in cumbination a mixing chamber provided with a nozzle for the entrance of the gaseous fluid, a throttle mounted in sald chamber and a lapted to partially revolve, a shaft fixedly connected with said throttle and adapted to partially revolve, a cam carried by said shaft, a leaf spring bearing with its free end on said cam, and a set screw for varying. the degree of compression.
4. \(A\) carbureter comprising in combination a mixing chamber provided with a nozzle for the entrance of the gaseous fluid, a throttle mounted in said chamber and adapted to partially revolve, a shaft fixedly connected with said throttle and adapted to partially revolve, a cam disc of varying thickness, two clamping or contact springs adapted to come in contact with the disc and a set screw for regulating the amount of frictional contact.
5. A carbureter comprising in combination a mixing chamber provided with a nozzle for the entrance of the gaseous fluid, a throttle mounted. in said chamber and adapted to partially revolve, a shaft fixedly connected with said throttle and adapted to partially revolve a bell crank lever consisting of an about vertical and about horizontal arm, and also adapted to partially revolve, a weight adjustably secured to the vertical arm, a cam fixedly mounted on said shaft and supporting the horizontal arm of the bell crank lever.

\section*{No. 102,417. Valve Stem Clamp and Lubricator. Agrafe de tige de soupape et graisseur.}

Joseph Carter Williamson and William D. Barker, both of Tallahassee, Florida, U.S.A., 4th December, 1906; 6 years. Filed 3rd October, 1906. Receipt No. 140,015.
Claim.-1. A combined valve stem clamp and lubricator, comprising upper and lower members having vertical registering recesses forming a chamber for the lubricant, and transverse recesses co-acting to form an opening for the passage of the valve stem, sald chamber communicating with said opening, said upper member having ears provided with openings for receiving the stuffing box bolts. and vertical bolts traversing both of the members and provided with nuts whereby to tighten said members on the valve stem.
2. A combined valve stem clamp and lubricator, comprising upper and lower members having registering recesses forming a chamber for lubricants, and having recesses co-acting to form an opening for the passage of the
valve stem. said chamber communicating with said opening, and bolts traversing both of said members, and provided

with nuts whereby to tighten said members on the valve stem.

No. 102,418. Cash Register. Rrgistre ìmonnaie.

The National Cash Register Company, assignee of Frederick J. Nutting, both of Dayton. Ohio, U.S.A., 4th December, 1906; 6 years. Filed 21st October, 1905. Receipt No. 129,434.
C'laim.-1. In a cash register, the combination of a plurality of keys, of a plurality of pivoted operating arms having operating edges of different lengths, and also provided with projecting noses, projections mounted on the keys and engaging said edges, and arms mounted on the keys and adapted to engage said noses.
2. In a cash register, the combination with a plurality of keys, of a plurality of cam arms having projecting cam noses, projections on the keys engaging said cam arms to move them in one direction, and arms mounted on the keys and adapted to engage the cam noses to move the cam arms in the opposite direction.
3. In a cash register, the combination with a plurality of main operating keys, of a pivoted operating lever arranged to be operated by said keys, a locking device for said lever, a plurality of special keys, and means connecting the locking device and the special keys whereby said device is unlocked upon the depression of any one of sald special keys.
4. In a cash register, the combination with a plurality of keys, of a printing mechanism, two pivoted printing levers, separate toggle links plvoted together and to the respective
printing levers, and means for aligning the toggle links when the keys are operated and thus imparting movement to the printing levers.
5. In a cash register, the combination with a plurality of keys, of a printing mechanism adapted to be operated by the same, a printing lever having a permanent joint, a special key. and means connecting said key and lever for rendering the joint of the latter either flexeible or rigid at will.
6. In a cash register, the combination with a plurality of keys, of a printing mechanism adapted to be operated by the same, feeding devices for a check strip, an independent motor for actuating said devices, and a release for said motor.
i. In a cash register the combination with a plurality of keys, of a printing mechanism connected thereto, a knife for cutting a check strip, an indeyendent motor for operating said knife independently of the regular operation of the machine, and a release device for said motor.
8. In a cash register. the combination with a plurality of heys, of a printing mechanism, a printing lever having a permanent joint. a spring for normally holding the respective portions of said lever in alignment, and a locking device for the joint of said lever adapted to be operated hy a socecial key.
9. In a cash register, the combination with a plurality of keys, of a printing mechanism, a printing lever comprising two permanently joined seetions, devices for locking or unlocking the joint between said sections, means for locking one of said sections to the frame, and a special key for operating said devices and means.
10. In a cash register, the combination with a plurality of keys, of a printing mechanism, an inking device, a lever for operating said knife independently of the regular opersaid lever, and devices connected to the keys and adapted to engage said foot when operated in one direction but force it to one side out of its path when operated in an opposite direction.
11. In a cash register, the combination with a plurality of keys, of a printing mechanism, a spring actuated feeding mechanism for a paper supply, a latch for said latter mechanism, a ratchet wheel adapted to operate said lateh. means for operating said ratchet wheel connected to the keys, and a special key for throwing said means into or out of engagement with the ratchet wheel.
12. In a cash register, the combination with a plurality of keys, of a printing mechanism, pivoted printing levers. toggle levers connected to the first-mentioned levers and adapted to move eccentrically to part a double back and forth movement to the first-mentioned levers at each operation of the machine, and means connecting the toggle levers with the keys.
13. In a cash register, the combination with a plurality of keys, of a printing mechanism, a slide, inking arms carried by said slide, projections mounted on said arms and extending into suitable slots formed in a fixed portion of the frame for positively spreading or drawing said arms together, and means connecting the slide with the keys.
14. In a cash register, the combination with a plurality of keys, of an operating lever connected to the same, a pivoted catch lever having a locking stud engaging the operating lever, a rod for operating said catch lever, and special keys which are adapted to operate said rod.
15. In a cash register, the combination with a plurality of keys, of an operating lever adapted to be operated by the same, a plurality of printing wheels, a plurality of alignang arms adapted to engage said printing wheels, a rock shaft carrying said arms, a trip on said shaft, and a projection on the operating lever adapted to strike said tria.
16. In a cash register, the combination with a recording mechanism, of a series of keys, a series of operating arms adapted to be engaged by sald keys when the latter are moved in one direction and having operating edges of different lengths, and projections mounted on said keys and adapted to return said arms to their normal positions when the keys are moved to opposite directions.
17. In a cash register, the combination with a plurality of keys, of a printing mechanism, devices for feeding and cutting a check strip, an independent motor for actuating said latter mechanism, and a release for said motor.
18. In a cash register, the combination with a plurality of keys, of a printing mechanism, devices for feeding and cutting a check strip, a spring motor for actuating said latter mechanism, and means for releasing said motor by the operation of the machine.
19. In a cash register, the combination with a series of keys each having a pendant projection, of a movable spring pressed rack plate so arranged as to be engaged by all of said pendant projections whereby the keys are locked in their adjusted pasitions.
20. In a cash register, the combination with a plurality of keys, of a printing mechanism, devices for feeding and cutting a check strip, an independent motor for actuating said devices independently of the regular operation of the machine, means for releasing said motor. and devices for arresting said motor after a predetermined period of operation.
21. In a cash register, the combination with a recording mechanism, of a series of keys each having a pendent projection, a pivoted spring pressed rack plate arranged to be engaged by all of said projections to lock the same in position, independent keys, and means connected to the latter and arranged to rock the rack plate to release the first-mentioned keys.
22. In a cash register, the combination with a plurality of keys, of a plurality of arms having cam edges of diffcrent lengths, and projections mounted on the keys and arranged to engage opposite sides of said arms and force them positively backward and forward, the construction being such that the arms are locked against independent movement by the projections.
23. In a cash register, the combination with a plurality of keys, of a printing mechanism, feeding means for a paper supply, an independent motor device for said feeding means, a latch for said motor, a releasing device for said latch, and means connecting the releasing device to said keys.
24. In a cash register, the combination with a plurality of keys, of a printing mechanism, feeding devices for a paper supply, an independent motor for said feeding devices, a latch for sald motor, means connected to the keys for tripping said latch, and a special key for throwing said means into and out of operative condition.
25. In a cash register, the combination with an operating mechanism, a printing mechanism, a motor for operating a part of the printing mechanism independently of the regular operating mechanism, means for releasing the motor controlled by the operating mechanism, and a special key for throwing said means out of operative condition.
26. In a cash register, the combination with a series of amount keys, of a key coupler arranged to be operated thereby, a lever connected to said coupler, a series of special keys, a movable frame common to the special keys, a lock for the lever, and a cam slide intermediate the special key frame and the lock.
27. In a cash register, the combination with an operating mechanism, of a printing mechanism including movable platen carrying members, toggle levers connected to said members, and means for causing the toggle levers to impart a double back and forth movement to the platen carrying members at each operation of the machine.
28. In a cash register, the combination with a series of amount keys, of a printing mechanism connected to said keys, a series of special keys, a type carrier controlled by the special keys, and means for locking the amount keys until one of the special keys is operated.
29. In a cash register, the combination with a series of amount keys, of a type carrier controlled thereby, a series of special keys, a type carrier controlled by said special keys, and means for preventing the operation of the amount keys until one of the special keys is operated.
30. In a cash register, the combination with a series of amount keys, of a type carrier operated thereby, a series of special keys, a type carrier operated by these latter keys, and means for preventing the setting of the amount type carriers until the special type carrier is first set.
31. In a cash register, the combination with a printing mechanism, of a series of keys for operating the same, a series of special keys, a type carrier for the special keys, and means for preventing the operation of the printing mechanism until the type carrier for the special keys has first been set.
32. In a cash register, the combination with a printing mechanism including amount type carriers, of a series of amount keys for controlling the printing mechanism and type cariers, a series of special keys, a type carrier for the same, and means for locking the amount keys until one of the special keys has been operated.
33. In a cash register, the combination with a series of amount keys, a type carrier operated by said keys, a platen also operated by the keys, a series of special keys, a type carrier for these latter keys, and means for compelling the operation of one of the special keys for recording which clerk makes the sale, before the amount keys ing which clerk
34. In a cash register, the combination with a plurality of operating keys, of a common member arranged to be actuated by any one of said keys, a locking device for sald member, a series of special keys, and means connecting the mecking device to the special keys whereby said device is operated upon the depression of any one of said special keys.
35. In a printing attachment for cash registers, the combination with type carriers and means for setting the same, of a paper feeding device, a spring motor, a special key for controlling the release of said spring motor, and means for causing the paper feed device to be operated when the spring motor is so released.
36. In a printing attachment for cash registers, the combination with type carriers and means for setting the same, of means for taking an impression on a check strip. a knife for severing said check strip, and a spring motor for operating sald knife.
37. In a printing attachment for cash registers, the combination with type carriers and means for setting the same, of means for taking an impression on a check strip, a knife for severing said check strip, a spring motor for operating said knife, and a special key for controlling the release of said spring motor.
38. In a printing attachment for cash registers, the combination with type carriers and means for setting the same. of a platen for taking an impression on a check strip, a feeding device for said check strip, a knife for severing the check strip, a spring motor, and means connected with said spring motor for operating the check feed device and also the knife.
39. In a printing attachment for cash registers, the combination with type carriers and means for setting the same, of a platen for taking an impression on a check strip. a feeding device for sald check strip, a. knife for severing the check strip, a spring motor, means connected with said spring motor for operating the check feed device and also the knife, and a special key for controlling the release of said spring motor.
40. In a cash register, the combination with printing devices, of a spring motor with connections for controlling certain parts co-operating with the printing devices, and means for releasing said motor.

No. 102,419. Cash Register. Registre à monnaie.

The National Cash Register Company, assignee of William H. Muzzy, Dayton, Ohio, U.S.A., 4th December, 1906; 6 years. Filed 21st October, 1905. Receipt No. 129,435.
Claim.-1. A machine of the character described, comprising a primary accounting device containing mechanism arranged to be preliminarily adjusted according to desired numbers or designations, and a distant and structurally separate accounting device whose accounting mechanism is controlled in extent of movement by the primary accounting mechanism, with devices for positively limiting the extent of such movement of the distant accounting mechanism.
2. A machine of the character described, comprising \(\varepsilon^{8}\) primary accounting device containing mechanism arranged to be preliminarily adjusted according to desired numbers or designations, and a distant and structurally separate accounting device whose accounting mechanism is controlled in extent of movement by the primary accounting mechanism, with devices controlled by a movable part of the primary accounting device for effecting the actual morement of the accounting mechanism of the distant accounting device.
3. A machine of the character described, comprising a primary accounting device contrining mechanism arranged to be preliminarily adjusted according to desired numbers or designations, and a distant and structurally separate accounting device whose accounting mechanism is control-
led in extent of movement by the primary accounting mechanism, with devices for positively limiting the extent of such movement of the distant accounting mechanism, and also with devices controlled by a movable part of the primary accounting device for effecting the actual movement of the accounting mechanism of the distant accounting device.
4. The combination with a cash register including its operating member, of circuit controlling devices forming part of the cash register mechanism and controlling differont circuits for different amounts or designations, a distant accounting device controlled in extent of movement by said circuit controlling devices. and means controlled by said operating member for effecting the actual movement of said accounting device.
5. The combination with a cash register containing a differentially movable accounting element. of a distant and structurally separate differentially movable element controlled in position by said last-mentloned differentially movable element.
6. The combination with a cash register containing a differentially movable accounting element, of a distant and struoturally separate differentially movable element controlled as to its extent of movement in one direction by said first-mentioned differentially movable element, and means for restoring said distant element to normal position after such movement.
7. The combination with a cash register containing amount determining mechanism arranged to be preliminarily adjusted according to desired numbers or designations, of a distant and structurally separate differentially movable element controlled as to its extent of movement in one direction by said amount determining mechanism, and means for restoring said distant element to normal position after such movement
8. The combination with a cash register, of circuit controlling devices forming part thercof and controlling different circuits for different amounts, an accounting element arranged to be controlled by said circuit controlling devices, a circuit controller movable with said accounting element. and a magnetic stop device for said element included in said circuits.
9. In an accounting device. the combination with an accounting element, of means for moving the same, and amount determining mechanism and electrical devices coonerating therewith for positively limiting the movement of said element whereby to determine the extent of movement of the same.
10. The combination with a cash register. a distant and structurally separate accounting instrument comprising devices for effecting an accounting. means for operating said devices. and means controlled from the cash register for controlling said operating means.
11. The combination with a cash register containing devices arranged to be set in predetermined positions corresponding to numbers selected, of a distant and structurally separate accounting instrument comprising devices for effecting an accounting, means for operating sald devices, and means controlled from the said cash register devices for controlling said operating means.
12. In a recording instrument, the combination of a device for giving a record. means for moving said device, a locking means for engaging the device and locking the same in any one of a plurality of positions, an electro-magnet for controlling said locking means, and a circuit closer operated by said device in its movement, said circuit closer included in the circuit for said electro-magnet.
13. The combination with a cash register, of a recording instrument including a device for giving a record, means for moving said device, a locking means for engaging the device and locking the same in any one of a plurality of positions, an electro-magnet for controlling sald locking means, a circuit closer operated by said device in its movement. said circuit closer included in the circuit for said electro-magnet, and a selector for said circuit operated from said cash register.
14. In combination with a cash register having recording devices, of a recording instrument having recording devices, and means for adjusting them to a recording position upon and through the adjustment to a recording position of the recording devices of the cash register.
15. In combination with a recording mechanism, a recording instrument comprising a plurality of devices for recording purposes, means for shifting the devices to a position to give a record, and electro-magnetically operated means for controlling the position of said devices, said electro-magnetically operated means being controlled from the recording mechanism.
16. In combination with a recording mechanism, a recording instrument comprising a plurality of devices for recording purposes, means for shifting the devices to a position to give a racord, electro-magnetically operated means for controlling the position of sald devices, oircuits for
the electro-magnets of sald means, and means for controlling the circuits, which are operated from the recording mechanism and the recording instrument.
17. The combination with a cash register having recording devices, of a recording instrument, and means for operating the recording instrument upon an operation of the recording devices in the cash register.
18. The combination with a cash register having recording devices, of a recording instrument comprising recording devices and electrically controlled means for operating the recording devices, which means are controlled upon an operation of the recording devices in the cash register.
19. The combination with a recording mechanism, of a recording instrument comprising devices for giving a record, means for operating and setting said devices, and means controlled from the recording mechanism for controlling the operating and setting means.
20. The combination with a recording mechanism, of a recording instrument comprising devices for giving a record, means for operating said devices, electro-magnetically operated means for controlling the said operating means, and means for controlling the electro-magnets of sald elec-tro-magnetically operated means from the recording mechanism.
21. The combination with a cash register, of a recording instrument comprising a device for giving a record, means for moving said device from a normal to a recording position, electro-magnetically operated means for controlling the position of said record device, a clrcuit for said elec-tro-magnetically operated means, and a circuit selector operated from the cash register for controlling the said circuit.
22. In a cash register, the combination with circuit controllers, of an operating mechanism, a motor, indicators controlled by the motor, means for controlling the motor from the operating mechanlsm, and means for preventing the movement of the operating mechanism to de-energize the motor until after said motor has made its full movement.
23. In a cash register, the combination with circuit controllers, of an operating mechanism, a motor, means for energizing the motor by movement of the operating mechanism, and means for preventing the motor being deenergized by the operating mechinasm until the motor has been fully operated.
24. In a cash register, the combination with circuit controllers, of an operating mechanism, a series of indicators also having controllers, a motor for operating the indicators, means controlled by the operating mechanism for energizing the motor, and means for preventing the motor being de-energized until it has been fully operated.
25. In a cash register, the combination with circuit controllers, of an onerating mechanism, a motor, indicators operated by the motor, means, controlling the motor from the operating mechanism, and means for preventing the operating mechanism de-energizing the motor until the latter has concluded its full movement.
26. In a cash register, the combination with circuit controllers, of an operating mechanism, a motor, circuit controllers moveable by the motor and locking devices for the latter circuit controllers for locking them in their set positions while the first mentioned controllers return to their normal jositions.
27. In a cash register, the combination with differentially movable circuit controllers, of an operating mechanism, a motor, differentially movable circuit controllers actuated by the motor, indicators controlled by the last-mentioned circuit controllers, and means for locking the last-mentioned circuit controllers in their set positions while the firstmentioned controllers return to their normal positions.
28. In a cash register, the combination with setting means, of an operating mechanism, a series of indicators located at a distance from the register, a motor for actuating the Indicators, means controlled by the operating mechanism for energizing and de-energizing the motor, and means controlled by the motor for preventing movement of the operating means to de-energize the motor, until said motor has made its full stroke or operation.
29. In a cash negister, the combination with a series of differentially movable circuit controllers, of a cash drawer for operating the same, a motor, a series of differentially movable corresponding circuit controlkers actuated thereby, means oontrolled by the cash drawer for energizing and deenergizing the motor, and means controlled by the motor for preventing movement of the cash drawer to de-energize it until the motor has made a full operation.
30. In a cash register, the combination with a series of oscillatory elements having differential movements, keys for limiting the movements of said elements in one direction, a cash drawer for returning the elements in an opposite direction, circuit controllers movable with said elements, a motor, indicator operated by said motor, means controlled by the cash drawer for energizing and de-ener-
gizing the motor, and means controlled by the motor for preventing it being de-energized by the cash drawer until said motor has been fully operated.
31. In a cash register, the combination with a series of oscillatory differentially movable elements, circuit controllers carried by said elements, a cash drawer for operating raid clements, a motor, indicators operated by the notor, means for energizing the motor upon the opening of the cash drawer and de-energizing it when the cash drawer is closed, and means for locking the cash drawer in its oprn position until the motor has been fully operated.

3:. In a cash register, the combination with circuit controllers, of an operating mechanism, a motor, indicators actuated by the motor, means for energizing the motor during the initial movement of the operating mechanism and de-energizing it during the final movement of said mechanism, and means for locking the operating mechanism between its initlal and final movements until the motor has been completely operated.
33. In a cash register system in which are employed sending and receiving machines, electrically connected means for controlling the receiving machine by the sending machine, and means for preventing the improper control of the receiving machine by too rapid movement of the sending machine.
34. In a cash register system employing a sending ma--hine and a receiving machine, and means for locking the receiving machine in set position while the sending machine resumes its normal position.
35. In a cash register system employing a sending machine and a receiving machinc, of controlled means intermediate the two machines, and means for preventing a misoperation of the receiving machine by too rapid operation of the sending machine.

No. 102,420. Cash Register. Rigistrc à monnaic.

The National Cash Register Company of Ohio, assignee of William H. Muzzy, both of Dayton. Ohio. U.S.A., 4th Decrmber, 1906; 6 years. Filed 21st October, 1905. Recelpt No. 12!.437.
cluim.-1. In a cash register, the combination with an operating mechanism, of a series of clerks' setting ele\(m\) nts, a special signalling device controlled thereby, a series of cash receptacles, means controlling said receptacles, and special drawer signalling devices governed by the drawer controlling means whereby the two signalling devices co-act to produce a single intelligible signal.
2. In a cash rcgister the combination with an operating mechanism, of a plurality of cash receptacles, clerk's controlling clements, and independent signals representing the cash receptacles and the clerks controlling elements, and co-acting to produce a single intelligible signal.
3. In a cash register, the combination with an operating mechanism, of clerks controlling mechanism, a series of cash rrceptacles, and independent signals representing the clorks' selecting mechanism and the cash receptacles, and co-acting in such manner as to produce a single intelligible signal.
4. In a cash register, the combination with an operating mechanism, of a series of clerks' keys, a series of cash receptacles, a serles of keys controlling said receptacles, and independent signals for the clerks' keys and receptacles, coacting in such manner as to produce a single intelligible signal.
5. In a cash register, the comblnation with an operating mechanism, of a serles of clerks' keys, a series of casb receptacles, a special indicator, a special signal connected to the indicator, and independent signals for the cash receptacles, said signals co-acting to produce a slagle inceptacles, said
telligible signal.
6. In a cash register, the combination with an operating mechanism, of a series of clerks' keys, a special indicator controlled by the same, a rotary signal connected to said indicator, a series of cash receptacles, and independent signals representing said receptacles, and signals co-acting to produce a single intelligible signal.
7. In a cash register, the combination with an operating mechanism, of a series of clerks' keys, a series of cash r . reptacles, and a series of receptacle keys located immediately adjoining the corresponding clerks' keys whereby a clerks' key and a receptacle key corresponding thereto may be onerated by the pressure of a single finger.
8. In a cash register, the combination with an operating mechanism, of a series of clerks keys, a series of casb drawers, and a series of independent drawer release kess located immediately adjoining the clerks' keys whereby corresponding clerks' and drawers, keys may be simultaneously onerated by one finger.
9. In a cash register, the combination with an operating mechanism, of a series of cash receptacles, apertured k-s guides, and a series of controlling elements mounted in the respective apertures in said guides and each comprising a clerks' key and a drawer release key sliding against the same, and guided by said clerks' key.
10. In a cash register, the combination with an operating mechanism, of a clerks' controlling mechanism, a movabla member formed with an aperture and connected to the controlling mechanism whereby the aperture may be posilloned according to the operation of said controlling mechanism, a series of cash receptacles, and signals representing said recentacles and located at the different points senting said receptacles and located at
to which the aperture may be brought.
11. In a cash register, the combination with an operating mechanism, of a clerks' selecting mechanism. a morable apertured member controlled by said selecting mechanism whereby the aperture may be brought to different positions. a series of cawh recentacles, and a series of signals rrpresenting sald receptacles and occupying the different positions to which the aperture may be brought.
12. In a cash register, the combination with an operating mechanism, of a series of clerks' keys, an apertured discontrolled by said keys whereby the aperture may bbrought to different positions. a series of cash receptacles. means for opening said receptacles, a series of signals occupying the different positions to which the aperture of the dise may be brought, and means for bringing the sigaals into operation according to the cash receptacle opened.
13. In a cash register, the combination with an operating mechanism, of a series of clerks' keys, an apertured disc controlled by said keys, a series of cash drawers. a series of signals. and means for bringing the signals toto operation according to the cash drawer opened.
14. In a cash drawer. the combination with an operating mechanism, of a series of clerks' keys, an indicator controlled by said keys, a series of cash drawers, a series of drawer release keys, a rotary disc provided with signal apertures and connected to the indicator, and a series of signals controlled by the drawer release keys. the apirtured disc and signals co-acting to produce a single intellifible signal.
15. In a cash register, the combination with an operating mechanism, of a series of clerks' keys, a series of drawer keys, an indicator controlled by the clerks' keys, a oreies of cash drawers released by the drawer keys, and independent signals controlled by the drawer keys and the indicator and co-acting to produce a single intelligible signal.
16. In a cash register, the comblnation with an operating mechanism, of a clerks' setting mechanism, a movable member controlled by the clerks' setting mechanism and formed with a series of apertures covered by transparins rolored matcrial, a scries of cash receptacles, a scries of signals positioned back of the movable member. and tacan. for bringing the signals into operation according to th. cash receptacle opened.
17. In a cash register. the combination with an op-ra:tng mechanism and connections, of a special rotary indicator: an apertured dise connected to said indicator, a series of lights occupying the different positions to which the aperture of said dise may be brought, a series of cash reref. tacles. and means for bringing the lights into operation ac. cording to the cash receptacle opened.
18. In a cash register, the combination with an operating mechanism, of two spaced rotary discs connected thereto and formed with apertures, a series of cash receptacles, and a series of lights located between the spaced discs and arranged to be thrown into operation according to the receptacle opened to display the signal from each side of the machine.
19. In a cash register, the combination with an operating mechanism, of two spaced rotary discs connected thereto, and each of the same formed with a series of apertures covered with transparent coloured material. lights located between said discs, a serirs of cash receptacles, and means for bringing the lights into operation according to the receptacle opened whereby a coloured signal is displayed at both sides of the machine.
20. In a cash register, the combination with an operating mechanism, of a series of clerks' keys, a signal operating member controlled by the same, a sories of cash drawers, drawer release devices, series of illuminated signals controlled by the drawer release devices, and means for retaining the illuminated signals in operation after one drawer release device is actuated until another drawer release is subsequently moved.

No. 102,421. Cash Register. Registrc à monnaic.

The National Cash Register Company of Uhio, assignce of William H. Muzzy, both of Dayton, Ohio, 4th December, 1906: 6 years. Filed 21st October, 1905. Receipt No. 129,438.
Claim.-1 In a cash register, the combination with a series of cash receptacles, of a series of indicators, means for operating the indicators, mechanism for concealing the indicators when any one of the cash receptacles is released, and devices for releasing the receptarles independently of the indicator operating means.
2. In a cash register, the combination with a series of cash receptacles, of a series of indicators, means for operating the indicators, devices for concealing the indicators, and means for causing the opening of the respective receptacles and the operation of the concealing means independently of the indicator operating means.
3. In a cash register, the combination with a series of cash receptacles, of a series of indicators, means for operating the indicators, means for concealing the indicators, and devices for releasing the cash receptacles arranged to control the concealing means independently of the movement of the indicator operating means.
4. In a cash register, the combination with a series of cash drawers, of a series of indicators, means for operating the indicators. indication concealing means and devices for releasing the cash drawers arranged to control the consealing means independently of the movement of the indicator operating means.
5. In a cash register, the combination with an operating mechanism, of a series of cash receptacles, a series of indicators, means for concealing the indicators, devices for releasing means independently of the movement of the operating mechanism, and a connection between the concealing means and the operating mechanism.
6. In a cash register, the combination with a series of cash drawers, of a seríes of indicators. means for operating the indicators, a flash for said indicators, and a series of keys for releasing the cash drawers and controlling the flash independently of the movement of the indicator operating means.
7. In a cash register, the combination with a series of cash drawers, of a series of indicators, indicator operating
mechanism. a flash for the indicators, a series of keys for releasing the cash drawers and means intermediate the keys and the flash for causing the latter to conceal the indicators when any one of the keys is operated and independently of the operation of the indicators.
8. In a cash register, the combination with a series of cash receptacles, of a series of indicaters, Indicator operating mechanism, concealing devices for said indicators, a printing mechanism, a series of controlling clements, and mechanism intermediate said elements and the cash receptacles, printer, indicators and concealing devices for releasing the receptacles and the concealing devices without operating the indicators.
9. In a cash register the combination with a series of cash drawers, of a series of indicators, concealing flashes for the indicators, a printing mechanism. and a series of keys for controlling the cash drawers, the printing mechanism and the flashes.
10. In a cash register the combination with an operating mechanism, of a serles of cash receptacles, a series of indicators. a flash for the indicators, and a series of keys arranged to release the receptacles and drop the flash independently of the regular operation of the machine.
11. In a cash register the combination with a series of cash receptacles. of a series of indicators, flashes for the indicators, a latch for holding the flashes away from the indicators, and means for exposing the desired receptacle and tripping said latch.
12. In a cash register the combination with a series of cash receptacles, of a series of indicators, flashes for the indicators, a printing mechanism, a latch for the flashes, and a series of keys for releasing the cash receptacles, tripping the latch and controlling the printing mechanism.
13. In a cash register the combination with a series of cash receptacles, of a series of indicators, flashes for the indicators, a printing mechanism, a series of controlling keys for the printing mechanism and indicators, an operating mechanism for setting the indicators and operating flash, controlling means intermediate the keys and flash, and devices operated by the keys for releasing the cash recentacles.
14. In a cash register the combination with a series of cash receptacles, of a series of indicators, means for concealing the indicators, and devices for determining which receptacle will be opened, arranged to release the concealing means.
15. In a cash register the combination with a series of cash drawers, of a series of indicators, a flash for the indicators, an operating mechanism for setting the flash, and a drawer selecting mechanism arranged to trip the flash.
16. In a cash register, thec ombination with a series of cash receptacles, of a series of indicators, flashes for the indicators, a printing mechanism, and a selecting means controlling the receptacles and printing mechanism and arranged to release the flash.
17. In a cash register the combination with a series of keys controlling the indicator, means for controlling the flash operated by the keys, a printing device also controlled by the keys, and a series of drawer latches connected to the keys.
18. In a cash register the combination with an operating mechanism, of printing devices for printing the amounts, a series of cash receptacles. a series of indicators, a series of spec'al keys for controling the cash receptacles, a flash, connecting means intermediate the special keys and flash, and a special printing device controlled by the special keys. 19. In a cash register the combination with a operating mechanism, of a series of cash drawers, a series of Andicators for indicating the amounts and the clerks' designation, a flash for the indicators, a printing mechanism for printing the amounts and the clerks' designation, and \(a\) series of keys for releasing the cash drawers and tripping the tlash.
20. In a cash register the combination with a series of indicators, of a flash, an operating mechanism for raising the flash, a latch for securing the flash in its raised position, a series of keys, means common to said keys for controlling the latch, and a series of cash receptacles controlled by the keys.
21. In a cash register the combination with a series of cash drawers, of a series of indicators, flashes for the indicators, latches for the cash drawers, a series of keys, independent means connecting the keys to their respective latches, and means operated by the keys for tripping the flashes.
22. In a cash register the combination with a series of cash receptacles, of a series of indicators, a flash for the indicators, a series of keys for controlling the receptacles, means operated by the keys for releasing the flash, and printing devices onerated by the keys.
23. In a cash register the combination with a serles of cash receptacles, of a series of indicators, a flash for the
indicators, a printing mechanism including a series of independent type carriers, a series of keys for controlling the cash receptacles, means operated by the keys for releasing the fiash, and means connecting the keys independently to their respective type carriers.
24. In a cash register the combination with a series of cash receptacles, of a printing mechanism for printing the amounts and the clerks' designation, an operating mechanism for the amount printing devices, keys for controlling said mechanism and keys for controlling the cash receptacles and operating the special clerks' designation printing devices.
25. In a cash register the combination with a series of cash receptacles, latches for the same, a series of special keys having projecting pins, a series of pivoted levers having cam slots into which the pins project, and means connecting said levers to their respective latches.
26. In a cash register the combination with the main operating mechanism, a series of keys, an indicator controlled by the keys and actuated by the operating mechanism, a detent for the keys actuated by the operating mechanism, a series of cash receptacles, and latches for said receptacles controlled by the keys alone.
27. In a cash register the combination with a series of cash receptacles, an indicator for the same, an operating mechanism for said indicators, and a series of keys which alone control the cash receptacles and also limit the movements of the indicators.
28. In a cash register the combination with a series of cash receptacles, of a serles of latches for the same, a scries of keys arranged to operate the latches when fully depressed, means for arresting the keys in intermediate positions in which the latches will not be operated and accounting devices co-operating with the keys when in their intermediate positions.
29. In a cash register the combination with a series of receptacle, of a series of latches for the same, a series of keys arranged to operate the latches and again free the same upon being released, an operating mechanism, means controlled thereby for preventing the full return of the keys and accounting devices co-operating with the keys.
30. In a cash register the combination with a series of cash drawers, of a series of latches for the same, a series of keys for operating said latches independently of the regular operation of the machine, an indicator, and means controlled by the keys for preventing the completion of the indication until after the regular operation of the machine.
31. In a cash register the combination with the register proper'including indicating and printing mechanism, of a series of cash receptacles, setting means for controlling the printing and indicating mechanism. latches for the receptacles operated by setting devices. and means operated by the setting devices for rendering one of the regular functions of the machine ineffective until after the regular operation of the machine.
32. In a cash register the combination with register indicating and printing mechanism, of a series of cash receptacles, latches for said receptacles, a series of keys for operating the latches, and means operated by the keys'for rendering one of the regular functions of the machine ineffective until after the operation of the machine.
33. In a'cash register the combination with an operating mechanism, of accounting devices connected thereto, a series of independent cash receptacles, latches for said roceptacles, means independent of the operating mechanism for actuating the latches to open the receptacles and means intermediate the latches and the operating mechanism for preventing the relatching of any one of the receptacles after it is opened until the operating mechanism has first been operated to actuate the accounting devices.

\section*{No. 102,422. Cash Register. Registre ì monnaic.}

The National Cash Register Company of Ohio, assignee of William H. Muzzy, both of Dayton, Ohio, U.S.A., 4th December, 1906 ; 6 years. Filed 11th November, 1905. Receipt No. 129,988.
Claim.-1. In a cash register the combination with operating devices, of a selecting mechanism for different clerks or departments connected therewith, a serles of independent cash safes having movable members, a telltale device normally'inactive, and means for setting or operating said telltale device when the operation of the selecting mechanism and a cash safe do not correspond.
2. In a cash register the combination with operating devices, of a selecting mechanism for the clerks or departments, a series of cash drawers, an alarm or slgnal normally inartive, and means for rendering said alarm or signal active should an attempt be made to open a cash drawer without actuating the selecting mechanism correspondingly.
3. In a cash register the combination with operating devices, of a selecting mechanism for the clerks or depart-
ments, a series of cash receptacles, an alarm or signal normally inactive, and means for rendering said alarm or signal

active if a cash receptacle is opened without first setting the selecting mechanism corresponding thereto.
4. In a cash register the combination with operating devices, of a selecting mechanism, means for latching the selecting mechanism co-operating with the operating devices, a series of cash receptacles, an alarm or signal normally inactive, and means for rendering the alarm or signal active if the opening of a cash receptacle is not'accompanied by a corresponding setting movement of the selecting mechanism.
5. In a cash register the combination with an operating mechanism. of a series of selecting devices connected therewith, a series of cash receptacles, an alarm or signal normally inactive, and means for rendering the alarm or signal active if a cash receptacle is opened without a corresponding operation of the selecting devices pertaining thereto.
6. In a cash'register the combination with an operating mechanism, of a series of clerks or department keys, a series of rash receptacles, an alarm or signal normally inactive, and means for rendering said alarm or signal active if a cash recentacle is opened without depressing the corresponding clerks or department key.
7. In a cash register the combination with an operating mechanism. of a series of clerks or department keys connected thereto. a series of cash drawers. an alarm or signal normally inactive, and means for rendering said alarm or signal active if a cash drawer is opened without the depression of the corresponding clerks or department key.
8. In a cash register the combination with operating devices. of a clerk's or department selecting mechanism connected thereto, an accounting device controlled by the selecting mechanism, a series of cash receptacles, an alarm or signal normally inactive, and means for rendering said alarm or siganl active when the opening of a cash receptacle is not accompanied by a corresponding setting movement of the selecting mechanism.
3. In a cash register the combination with operating devires. of a clerk's or department selecting mechanism, a recording dovice controlled'by said selecting mechanism, a series of cash receptacles, an alarm or signal normally inactive. and means for rendering said alarm or signal active when the operation of a cash receptacle is not accompanied by a corresponding operation of the selecting mechanism.
10. In a cash register the combination with an operating mechanism. of a series of selecting devices, a series of electric circuits including contact pieces operated by sadd selecting devices, a main circuit controlled by all of the individual circuits, an alarm or signal controlled by the main eircuit, a series of cash receptacles having movable members and contact pieces for the individual circuits controlled by said movable members.
11. In a cash register the combination with an operating mechanism, of a series of clerk's or department keys, a series of electric circuits controlled by said keys, a series of cash receptacles also controlling said circuits and an aiarm or signal included in said circuits.
12. In a cash register the combination with an operating mechanism, of a series of clerk's or department keys, a printing device controlled by said keys, a series of cash drawers, a series of electric circuits controlled by said keys and said drawers and an alarm included in said circuits.
13. In a cash register the combination with operating devices, of a series of clerk's or department keys, a series of individual electric circuits controlled by the respective keys, a serles of cash drawers, means independent of the keys for
releasing the drawers, contact pieces for the individual circuits, controlled by the drawers, and an alarm or signal included in said circuits.
14. In a cash register the combination with operating devices, of a selecting mechanism, a series of cash receptacles, individual circuits controlled by the selecting mechanism and their respective cash receptacles, an alarm included in said circuits and independent means for opening the respective cash receptacles.
15. In a cash register the combination with an operating mechanism, of a series of clerk's or department keys, a printer controlled thereby, a series of cash drawers, an electric circuit including an alarm, means for closing said circuits when a key is operated without a corresponding exposure of a cash drawer. and independent means for releasing the respective cash drawers.
16. In a cash register the combination with an operating mechanism, of a series of clerk's or department keys, a series of individual circuits having contact pieces co-acting with the respective keys, a series of cash receptacles, contact pleces included in the circuits and co-operating with said receptacles, an alarm or signal included in said circuits and a series of independent keys for releasing the respective cash receptacles.
17. In a cash register the combination with an operating mechanism, of a series of indicators, selecting devices, means for destroying the indication controlled by said selecting devices, a series of cash receptacles arranged to be exposed at will, a normally inactive alarm or signal. and means for rendering said alarm or signal active if a cash receptacle is exposed without a corresponding operation of the selecting devices.
18. In a cash register the combination with an operating mechanism, of a series of indicators, means for causing the indicators to return to normal positions when unrestrained, latches for securing the indicators in set positions, a series of clerk's or department keys controlling said latches, a series of cash receptacles arranged to be exposed at will, a normally inactive alarm or signal, and means for rendering said alarm or signal active if a cash receptacle is exposed without the operation of the corresponding key.
19. In a cash register the combination with operating devices, of a selecting mechanism, a series of cash receptacles, an alarm or signal normally inactive, means for rendering the alarm or signal active if the operation of the receptacle is not accompanied by the corresponding operation of the selecting mechanism. and means under lock and key for preventing the control of the alarm or signal by the operator after it is once rendered active.
20. In a cash register the combination with an operating mechanism, of a series of clerks' or department keys, a detent for holding the keys in their depressed positions. means connected to the operating mechanism for actuating the detent, a series of cash receptacles, a series of circuits and connections for breaking the circuits by the depression of the keys and making the circuits by the opening of the cash receptacles. and an alarm or signal included in said circuits.
21. In a cash register the combination. with operating deVices, of a selecting mechanism. a series of cash receptacles arranged to be exposed at will, an alarm or signal normally inactive, means for rendering the alarm or signal active if the receptacle is exposed alone without a corresponding operation of the selecting mechanism, and a special indicator connected to the operating mechanism for indicating when the movement has not been completed.
22. In a cash register the combination with a series of oscillatory elements. of means for limiting the movernents of the elements in one direction, an operating handle for returning the clements to their normal positions, a special indicator mounted independently of the operating handle, and means connecting the handle to the indicator whereby the two move together for indicating an incomplete operation of said handle.
23. In a cash register the combination with an operating mechanism including a series of oscillatory elements. of keys for limiting the movements of the elements in one direction. an operating handle for moving the elements in the opposite direction and a special indicator mounted independently of the handle but connected thereto for movement therewith for indicating the position of the same.
24. In a cash register the combination with operating devices, of a selecting mechanism, a series of independent cash receptacles, a normally inactive electric alarm or signal, a relay instrument controlling sald alarm, connections for operating the relay whenever a cash receptacle is opened without a corresponding movement of the selecting mechanism, and devices for holding the contacts of the relay permanently together after they have been electrically operated.
25. In a cash register the combination with an operating mechanism, of a series of selecting keys, a serles of individual circuits. a contact breaker for each key included in said
circuits, a series of cash drawers, a contact breaker for each drawer also included in the circuits, an alarm or signal included in the circuits, and means for closing one of the circuits if the opening of a cash drawer is not accompanied by the depression of the corresponding key.
26. In a cash register the combination with a plurality of auxiliary operating yokes, of keys for limiting the movements of the yokes in one direction, a main operator for moving the yokes in opposite direction, an operating handle connected to said main operator, a special indicator mounted independently of the handle, and means connecting said special indicator and main operator for simultaneous movement whereby a partial operation of the latter will be shown by said indicator.
27. In a cash register the combination with an operating mechanism, of a series of indicators, means for automatically returning the indicators to their normal positions when released, a series of special keys, latches for the indicators operated by said keys, a series of cash receptacles, an alarm normally inactive and means for rendering said alarm active if a cash receptacle is exposed without the depression of a corresponding key.
28. In a cash register the combination with an operating mechanism, of a series of keys, a series of indicators, latches for the indicators, a detent for said keys, detents for the indicators, a latch for the detent operated by the keys, means connecting said latch to the indicator latches, a series of cash receptacles, an alarm or signal, and means for oderating said alarm or signal if a cash receptacle is exposed without the depression of one of the keys.

No. 102,423. Cash Register. Registre d monnaie.

The National Cash Register Company of Ohio, assignee of John H. McCormack, Columbus, Ohio, U.S.A.. 4th December, 1906; 6 years. Filed 11th November, 1905. Receipt No. 129,989.
Claim.-1. In a cash register, the combination with a counter, of a counter operating lever means for supporting said lever in position, but adapted to release it at will, and a hand operating lever for resetting the register operating lever but movable independently of the same.
2. In a cash register, the combination with a registering device, of a main yoke having an oscillatory movement, a series of auxiliary yokes operated by the main yoke. means for limiting the movements of the auxiliary yokes, and a hand lever for moving the main yoke in one direction, the construction being such that the main yoke moves independently in the opposite direction.
3. In a cash register, the combimation with a registering mechanism, of a series of auxiliary yokes and connections, a series of keys for limiting the movements of said yokes, a main yoke for operating the auxiliary yokes, and a hand lever for actuating the main yoke only during a portion of its stroke.
4. In a cash register, the combination with a counter, of a counter oderating member, an operating lever for said member, a latch for said lever arranged to be tripped by said member, after the latter has made a predetermined portion of its stroke, and means for moving the operating lever after it has been released.
5. In a cash register, the combination with a counter, of counter operating pawls, a yoke for operating said pawls, an operating lever, a latch for said lever arranged to be tripped by the yoke after the latter has made a predetermined portion of its stroke, and means for moving the operating lever after it has been released.
6. In a cash register, the combination with a counter or register, a main yoke, a series of auxiliary yokes, means for limiting the movement of the auxiliary yokes, an operating lever for elevating the main yoke, and a latch for said lever arranged to be tripped by the main yoke after the latter has made a predetermined independent movement.
7. In a cash register of the class described. the combination with a counter, of an operating mechanism, an operating lever for said mechanism, a resetting lever adapted to move the operating lever, a latch for said resetting lever adapted to be actuated by the operating lever and means for moving the resetting lever.
\(s\). In a cash register of the class described, the combination with a counter, of a counter operating mechanism, an indicating mechanism, locking devices for the indicating mechanism, alever for operating the cutting and indicating mechanisms, mechanism for supporting said lever and moving the locking devices and a hand lever for actuating this latter mechanism.
9. In a cash register, the combination with a counter, of a cash drawer, a pivoted hand operated member, a drawer closing lever adapted to be engaged by a projection of said member during a portion of its stroke only and counter operating devices arranged to be operated by said hand operated member.
10. In a cash register of the class described, the combination with a counter, of an operating mechanism. a cash drawer, a pivoted operating lever for actuating said mechanism, means for releasing said lever, a resetting lever, for resetting the first-mentioned lever and \(a\) hand lever for operating the resetting lever and closing the drawer.
11. In a cash register, the combination with a counter. of a counter operating lever, a support for said lever, a cash drawer, a drawer latch, means connecting the drawer latch and lever support and devices for resetting the operating lever.
12. In a cash register, the combination with a counter. of an operating mechanism, an operating lever for said mechanism, an operating shaft. a support for said lever mounted on said shaft, and means connecting the shaft and support whereby the former may move a predetermined distance before moving the latter.
13. In a cash register, the combination with a counter, of an operating mechanism, a cash drawer, an operating lever, a spring actuated shaft, a support for said lever mounted on said shaft and means for releasing said shaft to permit it to operate.
14. In a cash register of the class described, the combination with a counter. operating mechanism, a support for the said mechanism, means for withdrawing said support and means for first resetting the counter operating mechanism and then forcing the support under the same.
15. In a cash register, the combination with a counter, of an operating mechanism, a counter operating lever and a support for the same comprising a rock shaft and a lever mounted thereon and means for tripping said shaft to allow the same to rock and withdraw the lever from supporting gosition.
16. In a cash register of the class described, the combination with a plurality of keys, of a counter, an operating mechanism, a rock shaft, a release device for the said mechanism mounted on said shaft. key locking devices, and means connecting the shaft with said devices so that they are operated simultaneously with the release.
17. In a cash register, the combination with a frame, a plurality of keys, of a register, register operating devices, a rock shaft, means for operating said shaft. a tripping plunger connected to said shaft and adapted to strike a stationary projection, and a key locking mechanism adapted to be operated by the said tripping plunger.
18. In a cash register, the combination with a counter, of operating pawls for the same, supporting devices for said pawls, arranged when operated to permit said pawls to drop independently, a rock shaft connected to sald devices and a hand lever for operating said rock shaft.

\section*{No. 102,424. Cash Regiater Mechanism.}

\section*{Mécanisme de registre à monnaif.}

The National Cash Register Company of Ohio. assignee of Thomas Carroll, both of Dayton, Ohio, U.S.A., 4th December, 1906; 6 years. Filed 8th May, 1906. Receipt No. 135.699.
Claim.-1. In a cash register the combination with an operating mechanism, of a cash safe for moving same. means normally preventing outward movement of said safe, said means being disabled by an inward movement of the receptacle.
2. In a cash register the combination with an operating mechanism. of a cash safe and means normally locking the operating mechanism, said locking means arranged to be released by an inward movement of the cash safe.
3. In a register the combination with an operating mechanism, of a cash safe for controlling same normally prevent-

ed from outward movement, means preventing an inward movement of said safe and keys for disabling said preventing means.
4. In a cash register the combination with an operating mechanism, of a cash safe having a movable part of controlling said mechanism, an abutment preventing inward movement of said movable part, and keys for removing the abutment from the path of the said movable part.
5. In a cash register the combination with an operating mechanism, of a reciprocating cash safe having a movable part for operating same, means normally preventing outward movement of said movable part, an abutment normally preventing inward movement of said part, means for removing the abutment, and means operated by a movement of said safe inward from normal position for disabling the first-mentioned preventing means.
6. In a cash register the combination with an operating mechanism, of a cash safe having a movable part for driving said mechanism, means normally preventing operation of the movable part, and means operated by an inward movement of said part for disabling said preventing means.
7. In a cash register the combination with an operating mechanism, of a cash safe having a movable part for driving said mechanism and normally slightly advanced from its rearmost position, and means for preventing outward operative movement of said movable part until an inward movement has been made.
8. In a cash register the combination with an operating mechanism and a cash safe having a movable part for operating same, of releasable means for preventing inward movement of said movable part.
9. In a cash register the combination with an operating mechanism. of a cash safe having a movable part for operating same, means for preventing inward movement of said part and keys for releasing said preventing means.
10. In a cash register the combination with an operating mechanism, of a cash safe having a movable part for operating same and normally in intermediate position, means preventing inward movement thereof and keys for cont.olling said means.
11. In a cash register the combination with an operating mechanism and a cash sale having a movable part for eperating same, of two devices preventing movement of sald part and separate means for disabling said devices respectively.
12. In a cash register the combination with an operating mechanism, of a main motor spring for driving same and an auxiliary spring and connections for assisting the maln spring.
13. In a cash register the combination with a cash receptacle. of a bar normally preventing movement of same, a series of keys, a plate moved by any of said keys and connections between said plate and bar.

No. 102,425. Thermostats for Fire Alarm Cirouits. Thermostate pour circuits d'arertisseur d'incendic.
John Dunklee Gould, assignee of Max Johann Levy, both of New York City. New York, U.S.A., 11th December, \(1900^{\circ}\); 6 years. Filed 13th November, 190 . Receipt No. 130,068 . Claim.-1. An electric cable for fire detecting or thermostatic alarm circuits, consisting of an inner conductor of low fusing metal, a relatively porous insulating covering thereon. and an exterior enveloping metallic tubular conductor of relatively high fusing point.
2. An electric cable for fire detecting or thermostatic alarm circuits, consisting of an inner conductor composed of con-
tiguous strips of metal respectively, of relatively high and low fusing points, a covoring for the inner conductor which

covering is of insulating material readily dissociated by heat and an enveloping metallic tubular conductor of relatively high fusing point.
3. A thermostatic section in a fire detecting circuit, consisting of an inner conductor of low fusing metal, an insulating covering thereon, an enveloping metallic tubular conductor of relatively high fusing point, and one or more insulating blocks in which the ends of the low fusing conductor are sealed, which blocks have metallic terminals, each of which is adapted for electrical connection with one of the conductors of the thermostatic section and one of the circuit conductors.
4. In an electrical thermostat provided with two conductors normally insulated from each other. an insulating block or base provided with an interior recess for the cxposed ends of the conductors, and a can for the base provided with means substantially as described, to prevent moisture from entering the recess in the basc.
5. In an electrical thermostat provided with two conductors normally insulated from each other. a base provided with an interlor chamber for the exposed ends of the conductors, and depressions as \(b^{1}\), around the openings for its fastening devices, and cap for the base provided with projections, as \(c^{8}\), around the openings for its fastening devices, for the puryose described.

No. 102,426. Tape Measure. Mrsure c'и rubrn.

Charles Ernest Flint and David Barclay. assignec of a third interest, both of West Hobart. Australia. 11th December, 1906; 6 years. Filed 7th September, 1906. Receipt No. 139.313.

Claim.-1. The combination with a tape measure, of markers slidable thereon, and means for securing the tape in position upon the figure of a person being measured.
.2. The combination with a principal tape of one or more attached tape measures adapted to be moved along sald principal and to swing from side to side thereof, and markers sliding upon the tapes, as and for the purpose set forth.
3. A tape measure having a hook at one end and a weight at the other end and markers upon the tape adapted to slide thereon, as herein described.
4. A principal tape measure and one or more secondary tapes loosely connected to the principal in such a way as to slide and swing thereon, in combination with the hooks on the tapes and markers adapted to slide along the same, as and for the purpose specified.
5. In combination, a principal tape, a hook on one end thereof and a weight upon the other. a secondary tape swinging on said principal, and other tapes slidable thereon and swinging on their sliding pieces, hooks on said sliding pieces and markers upon the tapes adapted to be moved along the same to the place to be marked, substantially as described.

12-7

No. 102,427. Hot Water Feater. Chauffeur d'cau.

Thomas Benjamin Stultz, Roanoke, and the Coppridge Heater Corporation, Richmond, Virginia, U.S.A., assignee of Joel Anderson Coppridge, 11th December, 1906; 6 years. Filed 14th November, 1906. Receipt No. 141,211.
Claim.-1. The hot water heater herein described comprising the outer shell or casing, the inner wall plate within said shell and made in trunco conical form and inclined inwardly toward its upper end forming a water chamber within the shell the lower end of the inner plate being secured to the outer plate or shell. the top plate tlanged att its inner and outer edges and secured at such edges respectively to the inner wall plate and the shell forming the top of said water chamber, the intermediate plate or partition flanged at its upper end and secured at such end to the top plate between the inner and outer plates and provided at its lower end with reversely projecting lugs spacing it apart from the inner and outer plates, said partition forming the water chamber into inner and outer compartments, the lower dome arranged above said water chamber, the tapered slip nipples connecting said dome with the inner compartment of the water chamber, the centrally depending tubular extension projecting from said dome downwardly into the fireloox formed by the upper end of the inner wall plate and provided with downwardly extending tubes, the upper dome having a central discharge opening for smoke, etc., and fitting within the upper end of the outer shell and provided above said shell with the lateral flange, the tapered slip nippers connecting said upper dome section with the lower dome section, the bolts secured at their lower ends to the shell and projections thence upwardly through the lateral flange of the upper dome section, the nuts on said bolts, the feed pipes leading from the upper dome section for connection with the radiators and the return pipes delivering to the outer compartment of the water chamber within the shell, all substantially as and for the purpose set forth.
2. In a heater substantially as described, the combination of the outer shell, an inner wall, a top plate between the outer shell and inner wall. a partition plate depending from said top plate and dividing the water chamber between the outer and inner plates into separate compartments, means being provided whereby said compartments communicate at their lower ends.
3. A water heater having an annular water chamber and an intermediate partition dividing the same into inner and outer compartments, means for feeding the water to the outer compartment and for conducting the water from the inner compartment, the outer compartment forming a cover for the inner compartment and communicating there with, substantially as set forth.
4. The combination in a water heater with the shell or casing, of the water chamber and firepot within the same, and the dome over the firepot and communicating with the water chamber, and provided with a depending central extension having laterally projecting tubes within the firepot, substantially as described.
5. The combination with the outer shell and the inner trunco conical plate forming a water chamber within the
suter shell, of a partition plate dividing sald water chamber into inner and outer compartments which communicate at their lower ends, and the dome above said water chamber and communicating with the inner compartment thereof, substantially as set forth.
6. The combination of the outer shell or casing, the trunco conical inner plate within the shell, the top plate between the upper end of said inner plate and the shell and the partition plate depending from said top plate and spaced at its lower end away from the shell, the dome above the water chamber and connected with the compartment or space between the inner plate and the partition plate.
7. The combination of the outer shell, the trunco conical inner plate, rivets securing the lower end of said plate to the outer shell, the top plate secured at its outer edge to the shell, and at its inner edge to the trunco conical plate. the partition depending from the top plate between the inner plate and the shell and forming inner and outer compartments in the water chamber, said compartments communicating at their lower ends, and the dome above the water chamber and communicating with the inner compartment thereof, substantially as set forth.
8. The combination in a heater of the shell, the plate within the same and forming a water chamber, the lower dome slip nipples connecting the lower dome with the water chamber, the upper dome, slip tubes connecting said dome with the lower dome, and devices between the upper dome and the casing or shell whereby the upper dome may be pressed down toward the lower dome and the latter toward the water chamber, substantially as set forth.
9. The water heater comprising the shell having an annular water chamber, a lower dome above and communicating with the water chamber, an upper dome above and communicating with the lower dome, and devices for securing the upper dome in connection with the shell, substantially as set forth.
10. In a water heater the combination with the shell or casing and means providing a frepot within the same, of a dome above said firepot, a tubular extension depending from said dome within the firepot, and laterally and downwardly extending tubes projecting from said extension within the firepot, substantially as set forth.
11. The combination in a hot water heater with a shell, and an inner wall plate, of a partition plate extending between the shell and inner wall plate and provided at its lower end with reversely projecting lugs spacing it apart from the inner wall plate and the shell whereby to establish communication between the compartments at the outer and inner side of the said partition, substantially as and for the purposes set forth.

No. 102,428. Tack Puller. Arrache-broquettcs.

The United Shoe Machinery Company of Canada, Boston, Massachusetts, assignee of Clarence Lamber Eaton, Rochester, New York, U.S.A., 11th December, 1906; 6 years. Filed 7th December, 1904. Recelpt No. 120,598.
Claim.-1. In a tack pulling machine, the combination with a rotating head and a tack puller carried thereby, of a curved guard or foot provided with a closed slot against one end of which the tack is held to be acted upon by the tack puller, substantially as described.
2. In a tack pulling machine, the combination with a rotating head and a tack puller carried thereby, of an adjustable guard or foot provided with a closed slot notched at one end, substantially as described.
3. In a tack pulling machine, the combination with a rotating tack puller having a tack engaging edge parallel with the axis of rotation, of a guard or foot against which the tacks are held, and means for relatively adjusting the tack puller and the guard or foot to secure the position of the tacks in proper relation to the path of movement of the tack puller, substantially as described.
4. In a tack pulling machine, the combination of a movable tack puller and a guard or foot provided with an abutment arranged transversely to the line of movement of said tack puller and against which the tacks are held, substantially as described.

No. 102,429. Linotype. Linotype.

The Linotype and Machinery Limited, assignee of Frederick William Sutcliffe, all of London, England, 11th December, 1906; 6 years. Filed 12th December, 1905. Receipt No. 130,942.
Claim.-1. The combination of mould carrier having a single mould of the longer length, vice having a movable jaw, filling piece adapted to be al ternately but into and out of its operative position, mutilated gear, gear alternately driven and left by the multilated gear, and rod connecting the filling piece to the alternatively driven gear.
2. The combination of mould carricr having a single mould of the length, vice having a movable jaw. flling piece adapted to be alternately put into and out of its operative position, mutilated gear, gear alternately driven and left by the mutilated gear, and detachable rod connecting the flling piece to the alternately driven gear.
3. The combination of mould carrier having a single mould of the longer length, vice having a movable jaw, flling piece adapted to be alternately put into and out of its operative position, mutilated gear, gear alternately driven ani le.t by the mutilated gear, rod connecting the filling pdece to the alternatively driven gear, automatic means for presenting the composed line to the mould twice in succession, automatic means for justifying it to the respective bength after each pnesentation, and an automatic repeating machanism to provide for such second presentation.
4. The comblnation of mould carrier having a single mould of the longer length, vice having a movable jaw, filling piece adapted to be put alternately into and out of its operative position, mutilately into and out of its operative position, mutilated gear, gear alternately driven and left by the mutilated gear, rod connecting the flling plece to the alterastively driven gear automatic means for presenting the composed line to the mould twice in succession, automatic means for justifying it to the respective length after each presentation, and an automatic repeating mechanism to provide for such second prosentation.
5. The combination of mould carrier having a single mould of the longer length, vice having a movable jaw, the respective end liner of the mould fast to the said jaw, filling piece adapted to be alternately put into and out of its operative position, mutllated gear, gear alternately driven and left by the mutilated gear, and rod connecting the filling piece to the alternately driven gear.
6. The combination of mould carrier having a single mould of the longer length, vice having a movable jaw, the respective end liner of the mould fast to the said jaw, fllling plece adapted to be alternately put into and out of its operative position, mutflated gear, gear alternately driven and left by the mutilated gear, and detachable rod connecting the flling piece to the alternately driven gear.
7. The combination of mould carrier having a single mould of the longer length, vice having a movable jaw, the respective end liner of the mould fast to the said jaw, flling plece adapted to be alternately put into and out of Its operative position, mutilated gear, gear alternately driven and lefi br the mutilated gear, rod connecting the filling plece to the alternately driven gear, automatic means for presenting the composed line to the mould twice in succession, and automatic means for justifying it to the respective length after each presentation.
8. The combination of mould carrier having a single mould of the longer length, vice having a movable jaw, the respective end liner of the mould fast to the said jaw, flling plece adapted to be put alternately into and out of its operative position, mutllated gear. gear alternately driven and left by the mutilated gear, rod connecting the fllling plece to the alternately driven gear, automatic means for presenting the composed line to the mould twice in succession, automatic means for justifying it to the respective length after each presentation. and an automatic repeating mechanism to provide for such second presentation.
9. The process of casting two linotypes of different lengths from the same composed line. consisting in composing the line for the shorter length, shortening the vice previously set for the longer length by means of a filling piece. justifying the said line to the shorter length. presenting the respective mould. casing the respective linotype, withdrawing the filling piece. justifying the composed line to the louger length, presenting 'the respective mould, and casting the respective linotype.

No. 102,430. Linotype. Linotypr.

The Linotype and Machinery Company Limited, assignee of Frederick William Sutcliffe, all of London, England, 11th December. 1906; 6 years. Filed 7th August, 1906. Recelpt No. 138.467.
Claim.-1. The combination of mould carrier having a single mould of the lenger length, vice to recetve the composed line and having a movable jaw, fllling plece adapted to be put alternately into and out of its operative position, automatic alternating mechanism worked by the first elevator, and a repeating mechanism controlled by the said elevator.
2. The combination of mould carrier having a single mould of the longer length, vice to recelve the composed line and having a movable jaw, filling piece adapted to be put alternately into and out of its operative position, spring and cam controlling the respective positions of the filling piece, ratchet wheel, gravity lever and pawl pivoted thereon and engaging with the ratchet wheel to turn the cam, and reciprocating arm to rock the lever agalngt gravity in one direction.
3. The combination of mould carrier having a single mould of the longer length, vice to receive the composed line and having a movable jaw, fllling piece adapted to be put alternately into and out of its operative position, spring and cam controlling the respective positions of the filling plece, ratchet wheel, gravity lever and pawl pivoted thereon and engaging with the ratchet wheel to turn the cam, reciprocating arm to rock the lever against gravity in one direction, and a repeating mechanism-controlled by the cam.
4. The combination of mould carrier having a single mould of the longer length, vice to receive the composed line and having a movable jaw, flling plece adapted to be put alternately into and out of its operative position, spring and cam controlling the respective positions of the filling piece, ratchet wheel, gravity lever and pawl plvoted thereon and engaging with the ratchet wheel to turn the cam, automatic means for presenting the composed line to the mould twice in succession, and automatic means for justifying it to the respective length after each presentation.
5. The combination of mould carrier having a single mould of the longer length, vice to receive the composed line and having a movable jaw, flling plece adapted to be put alternately Into and out of its operattve position, spring and cam controlling the respective positions of the filling piece, ratchet wheel, gravity lever and pawl pivoted thereon, and engaging with the ratchet wheel to turn the cam, automatic means for presenting the composed line to the mould twice in succession, automatic means for justifying it to the respective length after each presentatiun, and automatic repeating mechanism controlled by the said cam to provide for the second presentation of the composed line and for its distribution alternately.
6. The combination of mould carrier having a single mould of the longer length, vice to receive the composed line and having a movable jaw, respective end liner of mould tast to the said jaw, flling piece adapted to be put alternately
into and out of its operative position, automatic alternating mechanism worked by the first elevator, and a repeating mechanlsm controlled by said cam.
7. The combination of mould carrier having a single mould of the longer length, vice to receive the composed line and having a movable jaw, respective end liner of mould fast to the said jaw, flling plece adapted to be put alternately into and out of its operative positions of the filling plece, ratchet wheel, gravity lever and pawl pivoted thercon and engaging with the ratchet wheel to turn the cam, and reciprocating arm to rock the lever against gravity in one direction.
8. The combination of mould carrier having a single mould of the longer length, vice to receive the composed line and having a movable jaw, respective end liner of mould fast to the said jaw, flling piece adapted to be put alternately into and out of its operative position, spring and cam controlling the respective positions of the filling piece, ratchet wheel, gravity lever and pawl pivoted thereon and engaging with the ratchet wheel to turn the cam, reciprocating arm to rock the lever against gravity in one direction, and a repeating mechanism controlled by the cam.
9. The combination of mould carrier having a single mould of the longer length, vice to receive the composed line and having a movable jaw, respective end liner of mould fast to the said jaw, filling piece adapted ta be put alternately into and out of its operative position. spring and cam controlling the respective positions of the filling plece, ratchet wheel, gravity lever and pawl pivoted thereon and engagin with the ratchet wheel to turn the cam, automatic means for presenting the composed line to the mould twice in succession, and automatic means for justifying it to the respective length after each presentation.
10. The combination of mould carrier having a single mould of the longer length. vice to receive the composed line and having a movable faw, respective end liner of mould fast to the sald jaw, flling piece adapted to be put alternately into and out of its operative position, spring and cam controlling the respective positions of the flling piece, ratchet wheel. gravity lever and pawl pivoted thereon and engaging with the ratchet wheel to turn the cam, automatic means for presenting the composed line to the mould twice in succession, automatic means for justifying it to the respective length after each presentation, and automatic repeating mechanism controlled by the said cam to provide for the second presentation of the composed line and for its distribution alternately.
No. 102,431. Linotype. Linotype.

The Linotype and Machinery Company, Limited, assignee of Frederick William Sutcliffe, all of London, England, 11th December, 1906; 6 years. Filed 7th August, 1906. Receipt No. 138,468.
Claim.-1. The combination of moulds, vice, flling piece, automatic means for alternately Inserting and withdrawing the latter, automatic means for presenting the composed line in the casing position twice in succession, and automatic means for justifying it to the respective length after each presentation.
2. The combination of mould carrier, two moulds of different lengths, filling piece adapted to be put into operative position by the mould carrier as it presents the shorter mould in the casting position, and automatic means for putting the said piece out of operative position when the shorter mould is not in the cauting position.
3. The combination of mould carrier, two moulds of different lengths, means for presenting them successively in the casting position, vice and filling plece, means by which the mould carrier puts the filling piece in to operative position when it presents the shorter length mould in the casting position, automatic means for withdrawing the filling plece from that position when the shorter length mould is not in
the casting position, automatic means for presenting the composed line in the casting position twice in succession, and automatic means for justifying it to the respective length after each presentation.
4. The combination of mould carrier, two moulds of different lengths mounted thereon, vice adapted to hold the composed line in the casing position and having one jaw movable to and from the other jaw. abutment adjustable to hold the movable jaw at a given distance from the said other jaw, filling piece situated between the abutment and the movable jaw. spring to hold it in its inoperative position and in the path of the mould carrier when the shorter length mould is to be cast from. and a hole in the mould carricr to pass over the filling piece when the longer length mould is to be cast from.
5. The combination of mould carrier, two moulds of different lengths mounted thereon, vice adanted to hold the composed line in the casting position and having one jaw movable to and from the other iaw. abutment adjustable to hold the movable jaw at a given distance from the said other jaw. filling piece slutated between the abutment and the movable jaw, spring to hold it in itc inonerative position and in the path of the mould carrier when the shorter longth mould is to be cast from, a hole in the mould carrier to pass over the filling niece when the longer length mould is to be cast from. and automatic means for nutting the said plece out of onerative nosition when the shorter mould is not in the easting nocition.
6. The combination of mould carrier. two moulds of different lengths mounted thereon. vice adanted to hold the composed line in the casing nosition and having on faw movable to and from the other faw. abutment adjustable to hold the movable iaw at a given distanen from the said other iaw. flling piece situated between the abutment and the movable faw. snring to hold it in its inoperative oosition and in the nath of the mould earrior when the longer length mould is to be cast from. a hole in the mould rarrier to nass over the flling niere when the chorter length mould is to to cast from. automatic means for presenting the composed line in the casting nocition twire in succession. and automatic means for fustifying it to the respective length after each presentation.
7. The combination of mould carricr, two moulds of different lengthe mounted thereon. filling niece adapted to be nut into operative nosition by the monld carrine as it presents the shorter mould in its rasting nosition automatic means for putting the filling niece ont of onerative nosition when the shorter mould is not in the casing position, and automatic means for presenting the composed line to each mould in succession.
8. The combination of mould carrier. two moulds of different lengths mounted thereon. filling niece adanted to be put into onerative nocition by the mould carrior as it nresents the shorter mould in its casting nocition automatic means for putting the filling niere nitt of onerative nosition when the shorter mould ic not in the eacting nosition antomatic means for presenting the comnosert line to rarh mould in succession. and automatio moans for fustifyins the said line to the respective length after each such presentation.

\section*{No. 102,432. Draft Gear for Railway Cars.} Appareil de tirage pour rhars de chemin de fer.
The W. H. Miner Comnany. assignee of John F. O'Connor both of Chicago. Illinois. U.S.A.. 11th December. 1906; 6 years. Filed 12th November, 1906. Receipt No. 141.142.
Claim.-1. In a tandem spring draft rigging the combination with the drawbar and drawhar strap. of side plates or stop castings having front and rear stops, tandem arranged s.prings, a front follower bearing against the front end of the front spring, a rear follower bearing against the rear pnd of the rear spring and two intermeshing, flush fitting. telescoping skeleton intermediate followers. one integral with the front follower and the other integral with the rear follower, the two intermediate flush fitting followers both engaging the adjacent ends of each spring when the springs are not compressed, and sliding or telescoping in respect to each other to compress the springs. and integral interfitting longitudinally extending tongurs connecting said intermediate followers and the front and rear followers respectively, substantially as snecified.
2. In a tandem spring draft rigeing the combination with the drawbar and drawbar stran. of side plates or ston castings having front and rear stons, tandem arranged springs, front and rear followers. and two intermeshing skelnton insprings are not compressed, and to telescone or slide anart when the springs are compressed. and integral interfitting bongitudinally extending tongues connerting said intermediate followers and the front and rear followers respectivels. substantially as specified.
3. In a tandem spring draft rigging the combination with the drawbar and drawbar strap, of side plates or stop cast-
ings having front and rear stops, tandem arranged springs, front and rear followers, and two intermeshing skeleton in-

termediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart when the springs are compressed, and two interfitting sets of integral tongues, one set integral with one of said intermediate followers for connecting it with the front follower, and the other set integral with the other intermediate follower for connecting it with the rear follower, substantially as specified.
4. In a tandem spring draft rigging. the combination with the irawbar and drawbar strap, of side plates or stops castIngs having front and rear stops. tandem arranged springs, front and rear followers, and two intermeshing skeleton intermediate followors adapted to shut together when the springs are not compressed and to telescope or slide apart when the springs are compressed, said intermeshing skelpton intermediate followers being integral one with the front foll: wer, and the other wi'h the rear follower, and integral interftiting longitudinally extending tongues connecting said intermediate followors and the front and rear followers respectively, sub ta tililly as specified.
5. In a tandem spring draft rigging, thec ombination with the drawbar and drawbar strap, of side plates or stop castings having front and rear stons, tandem arranged springs, front and rear followers, and two intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart when the surings are compressed. sald intermeshing skeleton intermediate followers having each an \(H\) shap d centinvous crossbar and a slotted crossbar, substantially as specified.
6. In a tandem, spring draft rigging, the combination with tandem arranger springs, of front and rear followers, and two complementing ir intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed, and to telescope or slide apart to compress the springs. whereby the adjacent ends of the two tandem springs are adapted to be brought close together or be separated a distance only equal to the necessary thickness of one follower, and integral interfitting longitudinally extending tongues connecting said intermediate followers and the front and rear followers respectively, substantially as soecified.
7. In a tandem spring draft rigging, the combination with tandem springs, front and rear followers, and two complementing or intermeshing skeleton intermediate fullowers, one of said intermediate skeleton followers being integral with the front follower and the other with the rear follower, and integral interftting longitudinally extending tongues connecting said intermediate followers and the front and rear followers respectively, substantially as spectfled.
8. In a tandem spring draft rigging. the combination with tandem springs, front and rear followers, and two complementing or intermeshing skeleton intermediate followers one of said intermediate skeleton followers being integral with the front follower and the other with the rear follower. one of said intermediate followers having extension legs to limit the follower movement and the compression of the springs, substantially as specified.
3. In a tandem spring draft rigging, the combination with tandem springs. front and cear followers, and two comple-
menting or intermeshing skeleton intermediate followers one of said intermediate skeleton followers being integral with the front follower and the other with the rear follower, said intermediate followers having interfitting extension legs engaging shoulders on the front and rear followers to limit the movement and the compression of the springs, substantially as spectfied
10. In a tandem spring draft rigging, the combination with the drawbar and drawbar strap, of side plates or stop castings having rear and front stops, tandem arranged springs, front and rar followers, and two intermeshing skeleton intermediate followers adayted to shut together When the springs are not compressed and to telescope or slide apart when the springs are compressed, a plurality of integral tongue connections between one of said intermediate followers and the front follower and a plurality of integral tongue connections between the other intermediate follower and the rear follower, said tongue connections of the one intermediate follower interfitting and alternating with those of the other intermediate follower, substantially as specified.
11. In a tandem spring draft rigging, the combination with tandem arranged springs, of a front follower having an integral bottom plate or web, a rear follower having integral bottom plate or web, and two complementing or intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed. and to telescope or slide apart to compress the springs, and integral Interfitting longitudinally extending tongues connecting sald intermediate followers and the front and rear followers respectively. substantially as specified.
12. In a tandem spring draft rigging. the combination with tandem arranged sorings, of a front follower having an integral bottom plate or web, a rear follower having an integral bottom glate or web and two complementing or intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed, and to telescope or slide apart to compress the springs, the ends of said integral bottom plates or webs on the front and rear followisrs abutting together to linit the compression of the springs, substantially as specified.
13. In a tandem spring draft rigging, the combination with tandem springs, front and rear followers having integral bottom plates or webs and integral side walls, and two complementing or intermeshing skelet on intermediate followers integral one with the front follower and the other with the rear follower. and integral interfitting longitudinally extending tongues connecting said intermediate followers with the front and rear followers respectively, substantially as specifled.
14. In a tandem spring draft rigging. the combination with tandem springs, front and rear followers having integral bottom plates or webs and integral side walls, and two complementing or intermeshing skeleton intermediate followers intgeal one with the front follower and the other with the rear follower. and itegral interfitting longitudinally extending tongues connecting said intermediate followers with the front and rear followers respectively, sald intermediate followers having interfitting extension legs, substantially as specified.
15. In a tandem spring draft rigging, the combination with tandem arranged springs, front and rear followers, and two iterfiting telfscoping \(H\)-shaped and slotted crossbar intermediate followers. substantially as specified.
16. In a tandem spring draft rigging. the combination with tandom arranged springs. front and rear follnwers, and two interfitirg telescoping \(H\)-shap d and slotted crossbar intermediate followers, one of said interm diate followers being integral with the front follower and the other with the rear follower, substantially as sprcified.

\section*{No. 102,433. Draft Gear for Cars.}

Appareil de tirage pour chars.
The W. H Miner Comrany, assignee of John O'Connor, both of Chicago. Illinois. U.S.A.. 11th December. 1906: 6 years. Filed 12th November, 1906. Receipt No. 141,143.
Claim.-1. In a railway car coupling and raft appliance. the combination with the main frame of a car, of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler and draft rigging mechanism mounted upon and carricd by said supplemental swinging framn and a socket and plunger at the opposite sides of the swinging frame adaitert to engage the co-operating plunger and socket of tho swinging frame of the adjacent car to turn the two swinging frames into parallelism and the couplers and dawbars into alignment with each other ai the cars approach, substantially as specified.
2. In a rallway car coupling and draft appliance, the combination with the main frame of the car. of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler and draft rigging mechanism mounted
upon and carried by said supplemental swinging frame, a curv'd track and hangers for supporting the front end of

said supplemental swinging frame, and a socket and plunger at the opposite sides of the swinging frame adapted to engage the co-operating plunger and socket of the swinging crame of the adjacent car to turn the two swinging frames Into parallelism and the couplers and drawbars into alignment with each other as the cars approach, substantlally as soecified.
3. In a railway car coupling and draft appliance, the combination with the main fiame of the car, of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler and draft rigging mechanism mounted upon and carried by said supplemental swinging frame, means for centering said supplemental swinging frame with the main frame, and a socket and plunger at the opposite sides of the swinging frame adapted to engage the co-operating plunger and socket of the swinging frame of the adjacent car to turn the two swinging frames into parallelism and the couplers and drawbars into alignment with each other as the cars approach, substantially as specified.
4. In a railway car coupling and draft appliance, the combination with the main fame of the car, of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler draft rigging mechanism mounted upon and carried by said supplemental swinging frame, a curved track and hangers for supporting the front end of said supplemental swinging frame, and means for centering said supplemental swinging frame with the main frame. and a socket and plunger at the opposite sides of the swinging frame adanted to engage the co-operating plunger and socket of the swinging frame of the adjacent car to turn the two swinging frames into parallellsm and the couplers and drawbars into alignment with each other as the cars approach, substantially as syecified.
5. The combination with the car frame, of a supplemental drawbar and draft rigging carying frame pivotally connected to the main framc, and a coupler drawbar and cushioning device mounted upon and carried by saif supnlemental frame, said supplemental frame having socket and plunger devices adapted to engage similar devices on the adjacent car to turn sald supplemental frame on its pivot so as to bring the drawbar carried thereby into alignment with the drawbar of the adjacent car, substantially as specified.
6. The combination with a car erame. of a supplemental drawbar and draft rigging carrying frame pivotally connected to the main frame, and a coupler drawbar and cushioning device mounted unon and carried by said supplemental frame, and means for centering said supplemental frame with the car frame, said supplemental frame having socket and plunger devices adapted to engage similar devices on the adjacent car to turn said supplemental frame on its pivot so as to bring the drawbar carried thereby into alignment with the drawbar of the adjacent car, frame, substantially as specified.
7. The combination with the car frame, of a supplemental triangular frame pivotally connected to the main frame and provided with parallel bars, side plates or stop castings secured to said parallel bars, followers, a cushioning device
and a drawbar mounted upon and carried by said supplemental frame, substantially as specified.
8. The combination with the car frame, of a supplemental triangular frame pivotally connected to the main frame and provided with parallel bars, side plates or stop castings secured to sald parallel bars, followers, a cushioning device, a drawbar mounted upon and carried by said supplemental frame, and a centering device for said supplemental frame. slbstantially as specifled.
9. The combination with the car frame, of a supplemental triangular frame pivotally connected to the main frame and provided with parallel bars, side plates or stop castings secured to said parallel bars, followers, a cushioning device, a drawbar mounted upon and carried by said supplemental frame, a centering device for said supplemental frame and means for turning said supplemental frame on its pivot to bring the drawbar carried thereby into alignment with the drawbar of the adjacent car as the cars approach each other for coupling on a curve, substantially as specified.

No. 102,434. Draft Gear for Railway Cars. Apparedl do tirage pour chars de chemin de fer.

The W. H. Miner Company, assignee of John F. O'Connor both of Chicago, Illinois, U.S.A., 11th December, 1906; 6 years. Filed 12th November, 1906. Receipt No. 141,144.
Claim.-1. In a draft rigging, the combination with side plates or stop castings and the drawbar and drawbar strap or extension, of a reciprocating spring cage or box furnished with a pair of chambers or pockets to recelve two series or sets of flat straight spring plates, a pair of followers, said followers and said spring cage or box having co-operating curved bearing faces engaging the springs, and two tandem arranged sets or series of flat straight springs interposed in the chambers or pockets of said spring cage or box bebox, substantially as specified.
2. In a draft rigging, the combination wlth side plates or stop castings and the drawbar and drawbar strap or extension, of a reciprocating spring cage or box furnished with a pair of chambers or pockets to recelve the series or sets of flat straight spring plates, a pair of followers, said followers and said spring cage or box having co-operating curved bearing faces engaging the springs, and two tandem arranged sets or series of flat straight springs interposed in the chambers or pockets of said spring cage or box between it and the followers, said followers having walls or flanges telescoping with the ends of said spring cage or flanges substantially a sspecified.
3. In a draft rigging, the combination with side plates or stop castings and the drawbar and drawbar strap or extension, of a reciprocating spring cage or box furnished with a pair of chambers or pockets to recelve two series or sets of flat straight spring plates, a pair of followers, said followers and said spring cage or box having co-operating curved bearing faces engaging the springs, and two tandem arranged sets or series of flat stralght springs interposed in the chambers or pockets of sald spring cage or box between it and the followers, said followers having shoulders abutting against the ends of said spring cage or box to limit the extent of flexure or compression of the springs, substantially as specified.
4. In a draft rigging, the combination with the drawbar and drawbar strap or extension, and side plates or stop castings having front and rear stops for the followers to abut against, of a reciprocating spring cage or box, a fol-
lower and a series of straight flat springs interposed between said follower and the spring cage or box, said spring cage or box and the follower having co-operating curved bearing faces to engage the springs and cause their flexure, substantially as specifled.
5. In a draft rigging, the combination with the drawbar and drawbar strap of extension and side plaes or stop castings having front and rear stops for the followers to abut against, of a reciprocating spring cage or box, a follower and a serles of straight flat springs interposed between cald follower and the spring cage or box, said spring cage or box, and the follower having co-operating curved bearing faces to engage the springs and cause their flexure and means for connecting said serles of straight flat springs together, substantially as specified.
6. In a draft rigging, the combination with the drawbar and drawbar strap or extension, and side plates or stop castings having front and rear followers to abut against. of a reclprocating spring cage or box, said spring cage or box and the follower having co-operating curved bearing faces to engage the springs and cause their flexure, said side plates or stop castings having a lower removable guide upon which said spring cage or box and said follower reciprocates, substantially as specified.
7. In a draft rigging, the combination with the drawbar, and drawbar strap or extension, of side plates or stop castings having front and rear stops for the followers to abut against, of a reciprocating spring cage or box having a closed or air confining pocket to receive the springs and a curved bearing face to engage the springs, a follower having a correspondingly curved bearing to engage the springs. and a series of straight flat springs interposed between said follower and the spring cage or box and operating to compress the air in the confined chamber of the cage or box as the springs are flexed, substantially as specifled.
8. In a draft rigging, the combination with a spring cage or box having a closed or air confining chamber into which the springs are flexed, a follower and a series of straight flat spring plates interposed between the follower and the bearing face of the spring cage or box and operating in compress the air in the chamber of the spring cage or box as the springs are flexed, and thus increasing the resisting capacity of the draft rigging. substantially as specifled.
9. A combined air and spring resistance draft rigging having in combination a spring cage or box, a follower, and interposed straight flat springs fitting the interior of said spring cage or box and forming therewith a closed air chamber, substantially as specified.

\section*{No. 102,435. Draft Gear for Railway Cars.} Apparetl de tirage pour chars de chemin de fer.

The W. H. Miner Company, assignee of John F. O'Connor, both of Chicago, Illinois, U.S.A., 11th December, 1906; 6 years. Filed 12th November, 1906; Receipt No. 141,145. Claim.-1. In a draft rigging for rallway cars, the combination with the drawbar, springs and followers, of side plates or stop castings each cosisting of a cast web of substantially uniform thickness throughout, free from T and other flange-like sections, and having integral upright convolutions therein forming upright stop shoulders. and having also horizontal convolutions therein forming longitudinal strengthening ribs or flanges, substantially as specified.
2. A railway draft rigging side plate or stop casting. consisting of a cast web of substantially uniform thickness, free from \(T\) and other flange-llke sections, and having upright convolutions therein forming stops or shoulders for the followers to abut against, substantially as specified.
3. A railway draft rigging side plate or stop casting, consisting of a cast web of substantially uniform thickness
throughout, free from \(T\) and other flange-like sections, and furnished with a series of upright convolutions therein forming stops or shoulders for the following to abut against and furnished with horisontal or longitudinal convolutions therein forming longitudinal strengthening ribs or flanges, substantially as specifled.
4. A railway draft rigging side plate or step casting, comprising a cast metal web of substantially uniform thickness throughout, free from \(T\) and other flange-like sections, and having a plurality of upright convolutions therein forming stops or shoulders for the followers to abut against, and provided with further upright convolutions therein forming intermediate stops or shoulders for the followers to abut against to limit the compression of the springs, substantially as specified.
5. In a draft rigging for railway cars, the combination with the drawbar, springs and followers, of side plates or stop castings each consisting of a cast web of substantially uniform thickness throughout, having integral upright bends or convolutions therein forming upright stop shoulders, and having also horizontal convolutions therein forming longltudinal strengthing ribs or flanges, sald horizontal convolutions extending between but not across said upright convolutions, substantially as specified.
6. In a railway draft rigging side plate or stop casting, consisting of a cast web of substantially uniform thickness throughout, furnished with a series of upright convolutions therein forming stops or shoulders for the following to abut against, and furnished with horizontal or longitudinal convolutions therein forming longitudinal strengthening ribs or flanges, gaid horizontal convolutions extending between but not across sald upright convolutions, substantially as shecifled.
7. A rallway draft rigging side plate or stop casting, comprising a cast metal web of substantially uniform thickness throughout, and having a plurality of upright convolutions therein forming stops or shoulders for the followers to abut against, and provided with further upright convolutions therein forming intermediate stops or shoulders for the followers to abut against to limit the compression of the springs, said main web having also horizontal or longitudinal convolutions therein, substantially as specified.
8. A railway draft rigging side plate or stop casting, comprising a casting metal web of substantially uniform thickness throughout, and having a plurality of upright convolutions therein forming stops or shoulders for the followers to abut against, and provided with further upright convolutions therein forming intermediate stops or shoulders far the followers to about against to limit the compression of the springs, said main web having also horizontal or longitudinal convolutions thereln extending between but not across said upright convolutions, substantially as specified.

No. 102,436. Draft Rigging for Railway Cars. Apparetl do tirage pour chars de chemin de fer.

The W. H. Miner Company, assignee of John F. O'connor, both of Chicago, Illinios, U.S.A., 11th December, 1906; 6 years. Filed 12th November, 1906. Recelpt No. 141,146.
Claim.-1. In a draft rigging the combination with the drawbar, springs and followers, of a one piece stop casting comprising a main cast web of uniform thickness throughout free from \(T\) and other flange-like sections, and having a plurality of longitudinal convolutions and a plurality or tranverse convolutions to form stops or shoulders for the followers to abut against, substantially as specified.
2. A one piece stop casting for railway draft rigging consisting in a continuous cast web of substantially uniform thickness free from \(T\) and other flange-like sections furnished with longitudinal convolutions, and wih a plurality of transverse convolutions to form stops or shoulders for the followers to abut against, substantially as specified.
3. A one piece stop casting for railway draft rigging, consisting in a continuous cast web of uniform thickness free from \(T\) and other fiange-like sections provided with a plurality of transverse convolutions to form stops or shoulders for the followers to abut against, substantially as specified.
4. A one plece stop casting for railway draft rigging, consisting in a continuous web of uniform thickness provided with a plurality of transverse convolutions to form stops or shoulders for the followers to abut against, and provided also with intercediate c-nvolutions to limit the compression Cf the springs, substantially as specified.
5. A one piece stop casting consisting in a continuous single plece web having upright outer limbs \(f\), adapted to fit against and be secured to the car frame sills or pleces, and integral inclined members \(\mathcal{P}\), integral upright members \(f\), and integral horizontal members \(f\), said web being also provided with transverse convolutions to form stops or shoulders for the followers to abut against, substantially as specifled.

No. 102,437. Draft Gear for Railway Passenger Cary.
Appareil de tirage pour chars de passagers.

The W. H. Miner Company, assignee of John F. O'Connor, both of Chicago, Illinois, U.S.A., 11th December, 1906; 6 years. Filed 12th November, 1906. Receipt No. 141,147.
Claim.-1. In a draft rigging for railway passenger cars the combination with the drawbar, springs and followers, of side plates or stop castings, each consisting of a cast web of substantially uniform thickness throughout, having an integral upper longitudinal convolution therein adapted to fit against and be secured to the upright web of the center sill, and furnished also with a plurality of upright convolutions forming steps or shoulders for the followers to abut against, substantially as specified.
2. In a draft rigging for rallway passenger cars the combination with the drawbar, springs anl followers, of said plates or stop castings, each consisting of a cast web of substantially uniform thickness throughout, having an integral upper longitudinal convolution therein adapted to fit against and be secured to the upright web of the center sill, and furnished also with a plurality of upright convolutions forming stops or shoulders for the followers to abut against, said cast web having also a longitudinal convolution at its lower part, substantially as specified.
3. In a draft rigging for railway passenger cars the combination with the drawbar, springs and followers, of side plates or stop castings, each consisting of a cast web of substantially uniform thickness throughout, having an integral upper longitudinal convolution therein adapted to fit against and be secured to the upright web of the center sill, and furnished also with a plurality of upright convolutions forming stops or shoulders for the followers to abut against, said upright convolutions terminating below said upper longitudinal convolutions, substantially as specified.
4. The rallway passenger car draft rigging side plate or stop casting, consisting of a cast web of substantially uniform thickness having upright convolutions therein forming stops or shoulders for the followers to abut against, and an upper longitudinal convolution to fit against the car sill, substantially as specified.
5. The railway passenger car draft rigging side plate or stop casting, consisting of a cast web of substantially uniform thickness having upright convolutions therein forming stops of shoulders for the followers to abut against and an
upright longitudinal convolution to fit against the car sill. said upright convolutions being below said upper longitudinal convolution, substantially as specifled.
6. The railway passanger car draft rigging side plate or stop casting, consisting of a cast web of substantially unlform thickness having upright convolutions therein forming stops or shoulders for the followers to abut against, and an upper longitudinal convolution to fit against the car sill. said web having also at its lower portion a longitudinal convolution, substantially as specifled.
7. The railway passenger car draft rigging side plate or stop casting, consisting of a cast web of substantially uniform thickness, having upper and lower longitudinal or horizontal convolutions. and provided with upright convolutions extending below the upper longitudinal convolutions and forming stops or shoulders for the followers to abut against, substantially as specified.

No. 102,438. Draft Gear for Railway Cars.
Appareil de tirage pour chars de chemin de frr.

The W. H. Miner Company, assignee of John F. O'Connor, both of Chicago, Illinois, U.S.A., 11th December, 1906 ; 6 years. Filed 12th November, 1906. Receipt No. 141,148.
Claim.-1. In a draft rigging the combination with the side plates or stop castings, springs and followers, of a drawbar strap or extension and a drawbar having a pivotal connection therewith to enable it to swing laterally, said drawbar being provided with lateral pivot or rocker arms, and a longitudinally movable drawbar centering block interposed between the rear end of the drawbar and the front follower and having lateral seats or bearings to engage said lateral rocker or pivot arms on the drawbar to cause the draft rigging spring to be compressed when the drawbar swings, and thus to center the drawbar or restore it to position through the action of the draft rigging spring itself. and fller blocks and rivets connecting the drawbar, drawbar strap and drawbar centering block, substantially as specified.
2. In a draft rigging the combination with the side plates or stop castings, springs and followers, of a drawbar strap or extension and a drawbar having a pivotal connection therewith to enable it to swing laterally, said drawbar being provided with lateral pivot or rocker arms, and a longitudinally movable drawbar centering block interposed between the rear end of the drawbar and the front follower and having lateral seats or bearings to engage said lateral rocker or pivot arms on the drawbar to cause the draft rigging spring to be compressed when the drawbar swings laterally, and thus to center the drawbar or restore it to position through the action of the draft rigging spring itself. fller blocks furnished with hubs or thimbles, rivets connecting the drawbar with its strap or yoke and extending through the filler blocks, the drawbar having a transverse slot to receive the front rivet and filler block hub or thimble, and the drawbar centering block having a longitudinal slot to receive the rivet and filler hub block or thimble passing through it. substantially as specified.
3. In a draft the combination with the spring and follower, of a drawbar strap or yoke, a drawbar pivotally connected to sald drawbar or yoke and having lateral pivot or rocker arms, and a longitudinally movable drawbar centering block having sets or bearings engaging said arms on the drawbar, fller blocks furnished with three hubs or thimbles to recejive the rivets, rivets passing through the drawbar strap or yoke and said hubs or thimbles, the drawbar having a transverse slot to recelve the front rivet and fller block hubs or thimbles and the drawbar centering block having longitudinal slots to receive the middle and rear rivets and filler block hubs or thimbles, substantially as specified.
4. A draft rigging and drawbar centering mechanism consisting in the combination with a drawbar, of a drawbar
strap or yoke, draft rigging spring and followers and a longitudinally movable drawbar centering block interposed between the front follower and the drawbar, the drawbar being provided with lateral rocker or pivot arms and sald centering block having seats to engage said arms, and means comprising a pair of filler blocks and three rivets connecting the drawbar, drawbar straps and drawbar centering block whereby the drawbar is permitted to swing laterally and the centering block to move longitudinally and compress the draft rigging spring as the drawbar swings laterally and thereby cause it to be restored to position. substantially as specifled.

No. 102,439. Draft Rigging for Railway Cars.
Appareil de tirage pour chars de chemin de fer.

friction shoes in said case or shell at one end of said spring, a pair of rockers pivotally mounted on said friction shoes and having circular contacting faces about a center in advance of the pivotal center of said rocker and a movable pressure block interposed between said rocker and the drawbar, said friction shoes having central strengthening ribs and said rockers having slots to recelve said ribs, substantially as specifled.
6. In a friction spring draft rigging the combination with the side plates or stop castings, drawbar and drawbar strap or extension, of a longitudinally movable friction case or shell, a spring therein, sliding friction shoes in said case or shell at one end of said spring, rocking spreaders bearing against sald shoes to force the same into frictional engagement with said case or shell, a pressure block bearing against said rocking spreaders and actuated by the drawbar, said rocking spreaders and pressure block being provided with means to cause the lateral or spreading force exerted upon the friction shoes to bear a constant ratio to the longitudinal thrust or load upon the drawbar, substantially as specifled.

No. 102,440. Acetylene Gas Generator. Générateur à gaz acétylène.

Joseph Octave Bousseau, North Hatley. Quebec, Canada, 11th December, 1906; 6 years. Filed 3rd Feburary, 1906. Reclept No. No. 132,549.
Resumd.-1. Dans un appareil a acetylène, la combinaison dun levier sous pression, lequel en ouvrant automatiquement l'ouverture supérieure du magasin a garbure, couvre en meme temps le dessus de la tire qui communique au bouchon inferieur du dit magasin, et par ce fait, empeache ce bouchon d'être ouvert pendant que l'ouverture supérieure du magasin est ouverte, tel que d crit en substance.
2. Dans un appareil a acetylène, la combinaison, d'un cou vercle sur l'embouchure latérale servant a recevoir l'eau de l'extérieur lequel couvercle est muni de deux broches ou leviers, dont l'un est raccordé à un robinet qui ouvre un passage d'air de l'exterieur au genérateur, et dont l'autre est reccordé a la chantepleur ou robinet servant à vider le générateur cette combinasion ayant pour but empecher la perdition du gaz, et le melange d,air au gaz, tel que derit en substance.
3. Dans un appareil a acétylene, une valve fiottante \(C\) fig. \(1: 5\), composée d'un capuchon 19, avec deux flottants 18 , l'un attaché de chaque coté du dit capuchon et deux barres une chaque coté du bout inférieur des flottants 18 les rattachant ensembles, le tout formant la soupage flottante.
4. Dans un appareil à acêtylène d'une résêrre le carbure restant dans le magasin et ne tombant que par l'opération du mécanisme automatique de l'apparnil, mais tombant sous un choc quelconque transmis a l'extericur de l'appareil, tel que décrit en substance.
5. Dans un apparell a acetylee d'un couvercle hermétique sur la boite de surêté, par laquelle s'echappe le gaz ou l'air expulse de l'appareil, solt sous un surcrolt de pression dans les differentes parties de l'appareil, ou pendant le changement de l'eau, dans le générateur, tel que décrit en substance.
6. Dans un appareil a acetylène la comblnaison dyune trappe liquide placée au bas du tube, par lequel l'eau descend du gazogène ou cloche, dans le générateur cette trappe ayant pour effet de laisser descendre l'eau, sans laisser descendre le gaz, mals au contraire de laisser monter le gaz du générateur au gazogène ou cloche, tel que décrit en susbtance.
7. Dans un appareil à acétylène la combinaison d'un generateur, d'un gazogène ou cloche, d'un réservoir a garbure, dont l'ouverture supérieur est formée par une trappe a penture, dont la pésanteur est suffisante pour contrebalancer la pression du gaz interne et l'empêcher de sortie.

No. 102,441. Bearing. Coussinct.
 Joseph Dove-Smith and Frank Edward Lauer, co-inventors, both of Toronto, Ontario, Canada, 11th December, 1906 ; 6 years. Filed 18th August, 1906. Receipt No. 138,788.
Claim.-1. An anti-friction bearing for end, thrust and step bearing purposes comprising a series of load bearing rollers each having two conical bearing surfaces tapering from the middle of its peripheral surface towards the ends thereof, a series of spacing rollers intermediate the load bearing rollers, each having its ends tapered to correspond with the taper of the conical surfaces of the load bearing rollers, and having a V-shaped groove extending from the inner edges of the tapered ends of the medium line of its peripheral surface with the apex of the V-shaped groove aligned with the apex of the conical suriace of the adjacent load bearing roller, a retaining ring at each end of the load bearing and spacing rollers and fastening bolts locking the retaining rings together to hold the load bearing and spacing rollers in their assembled condition.
2. An anti-friction bearing for ond, thrust and step bearing purposes comprising a series of load bearing rollers. each having two conical bearing surfaces tapering from the middle of its peripheral surface towards the ends thereof, a series of spacing rollers intermediate the load bearing rollers, each having its ends tapered to correspond with the taper of the conical surfaces of the load bearing rollers, and having a \(V\)-shaped groove extending from the inner edges of the tapered ends to the medium line of its peripheral surface with the apex of the \(V\)-shaped groove aligned with the apex of the conical surface of the adjacent load bearing roller, a retaining ring at each end of the load bearing and spacing rollers and fastening bolts passing through the retaining rings and centrally through their respective load bearing rollers.
3. An anti-friction bearing for end, thrust and step bearing purposes comprising a series of load bearing rollers, each having two conical bearing surfaces tapering from the middle of its peripheral surface towards the ends thereof, a series of spacing rollers intermediate the load bearing rollers. each having its ends tapered to correspond with the taper of the conical surfaces of the load bearing rollers and having a \(V\)-shaped groove extending from the inner edges of the tapered ends to the medium line of its peripheral surface with the apex of the \(V\)-ghaped groove aligned with the apex of the conical surface of the adjacent load bearing roller, a retaining ring at each end of the load bearing and spacing rollers and fastening bolts locking the retaining rings together to hold the load bearing and spacing rollers in their assembled condition, in combination with a shaft having a conical bearing surface contacting the conical bearing surfaces at one side of the middle of the load bearing rollers and tapered to correspond with the taper thereof. and a load resisting element having a conical bearing surface contacting the conical bearing surfaces at the other side of the middle of the load bearing rollers, at a place
diametrically opposite and parallel to the place of contact of the conical bearing surface of the shaft.
4. An anti-friction bearing for end, thrust, and step bearing purposes, comprising a series of load bearing rollers each having two conical bearing surfaces tapering from the middle of its peripheral surface towards the ends thereof, a series of spacing rollers intermediate the load bearing rollers, each having its ends tapered to correspond with the taper of the conical surfaces of the load bearing rollers and a V-shaped groove extending from the inner edges of the tapered ends to the median line of its peripheral surface with the apex of the V-shaped groove aligned with the apex of the conical surface of the adjacent load bearing roller, a retaining ring at each end of the load bearing and spacing rollers and fastening bolts passing through the retaining rings and centrally through their respective load bearing and spacing rollers, in combination with a shaft having a conical bearing surface contacting the conical bearing surfaces at one side of the middle of the load bearing rollers, and tapered to correspond with the taper thereof, and a load resisting element having a conical bearing surface contacting the conical bearing surfaces, at the other side of the middle, of the load bearing rollers at a place diametrically opposite and parallel to the place of contact of the conical bearing surface of the shaft.

No. 102,442. Trolley Head. Tête de trollé.

Garnet Bowen Holmes and Arthur Dunscombe Allen, coinventors, both of Wellington, New Zealand, 11th December, 1906; 6 years. Filed 29th March, 1906. Receipt No. 134,410.
Claim.-1. Apparatus for the purpose indicated comprising in combination a trolley pole, a head secured thereto, a bracket pivotally secured to the head, a jaw swivelled in the bracket, a trolley wheel journalled in the jaw, the pivotal connection of said bracket with the head arranged in such position that the bracket normally tends to turn over upon said pivot out of its vertical position, and means for rotating the bracket in its vertical position through the upward pressure of the trolley wheel against the electrical conductor cable, substantially as specified.
2. Apparatus for the purpose indicated comprising in combination a trolley pole, a head secured thereto, a bracket pivotally secured to the head in such manner that it tends to foll out of its vertical position, a jaw swivelled in the bracket, a trolley wheel journalled in the jaw, cheeks projecting from the bracket a pin secured in the checks, slots in the head adapted to receive the said pin and spring, means tending to raise the bracket so that the pin leaves the slots. substantially as set forth.
3. Apparatus for the purpose indicated comprising in combination a trolley pole, a head secured thereto, a pivot pin projecting a each end from the head, a bracket, slots in the bracket receiving said pivot pin, the position of said pivot pin being such that the bracket tends to turn upon it out of its vertical position, a jaw swivelled in the bracket, a trolley wheel journalled in the jaw, cheeks projecting from the bracket, a pin secured in the checks, slots in the head adapted to receive said pin and a spring secured to said pin and to said pivot pin tending to raise the bracket and to cause the pin to leave the slots in the head, substantially as specified.
4. Apparatus for the purpose indicated comprising in combination a trolley pole, a head secured thereto, a bracket pivotally secured to the head in such manner that it tends to sall out of its vertical position, a jaw swivelled in the bracket, a trolley wheel journalled in the jaw, cheeks projecting from the bracket, a pin secured in the checks, slots in the head adapted to receive said pin, spring means tendIng to raise the bracket and to cause the pin to leave the slots in the head, a lever adapted to be struck by said pin, a contact plece upon the lever in connection with an electrical bell wire and a second contact plece upon the other wire of the bell adapted to be engaged by the first contact plece, substantially as specified.

No. 102,443. Car Fender. Chasse-corps pour tramicays.

George Allen, Franklin. Pennsylvania, U.S.A., 11th December, 1906: 6 years. Filed 20th November, 1906. Receipt No. 141,335.
Claim.-1. The combination of a vertical fender having a centrally located vertical pivot, and means for positively turning said fender on its pivot.
2. The combination of a vertical fender having a centrally located vertical pivot and a lever constructed to turn the fender to an inclined or diagonal position and for locking it in such position.
3. The combination with supports, of a vertical shaft mounted near its ends in said supports, a vertical fender, rearwardly converging bars connected at their front ends to said fender, and at their rear ends to sald shaft and means for turning the shaft, substantially as described.

\section*{No. 102.444. Fiber Reducing Machine.}

Machine à réduire les flbres.

Herman Samuel Albrecht, St. Louis, Missourl, U.S.A., 11th December, 1906; 6 years. Filed 17th June, 1906. Receipt No. 137,902.
Claim.-1. In a fibre cutting machine the combination with a pair of upright directing plates converging toward their inner ends, of two series of toothed feed rollers arranged at the inner ends of the directing plates to receive the material between them, the outer rollers of the two series being more widely separated and having larger teeth than the inner ones, a throat cutter plate receiving the material from the inner rollers, and a cutter operating upon the material delivered from the throat cutter plate.
2. In a fibre cutting machine the combination with means for compressing the fibre and a throat cutting plate through Which the compressed material is delivered, of a cutter casing into which the material is delivered, a plurallty of cutter bars arranged within said casing, a rotary cutter havIng a plurality of knives extending from one end of the cylin der to the other and pockets between the knives for holding
the material cut from the supply and subjecting the same to the action of the cutter bars within the casing, means for adjusting the rotary cutter toward the cutter plate, and means for adjusting the cutter bars toward the rotary cutter.
3. A feeding mechanism for fibre cutting machines comprising a table having transversely extending slots, converging upright directing plates mounted at the forward portion of the table, feed rollers located below the table and operating in the slots, the rear two of which are toothed and are located beyond the converging directing plates. a swinging frame yieldingly supported at one end above the lower toothed feed rollers, and feed rollers carried by the swinging frame, the outer one being a greater distance above the rollers below the table than the inner one.
4. In a machine of the character described the combination of a casing, a cutter mounted in said casing, an apertured throat plate at the entrance way into said casing, a table leading to said throat plate. lower feed rollers operating through said table, an oscilliating frame surmounting said lower feed rollers, boxes sidably positioned in said oscillating frame and in which said upper feed rollers are journalled, spring surmounting said boxes, and means for yieldingly holding said osclllating frame, substantially as set forth.
5. In a machine of the character described the combination of a casing, a cutter mounted in said casing, an apertured throat plate at the entrance-way into said casing, a table leading to said throat plate, lower feed rollers operating through said table, an osciliating frame surmounting said table, upper feed rollers surmounting said lower feed rollers, boxes slidably positioned in said oscillating frame and in which said upper feed rollers are fournalled. springs surmounting sald boxes, and spring controlled tension rods connected to said osclilating frame, substantially as set forth.
6. The combination of a cutter casing having guldeways on opposite sides thereof, a fixed throat cutter bar. a pressure bar movable at its ends in said guldeways. set screws mounted in the casing, and springs each seated at one of its ends against the pressure bar and bearing at their other ends against said set screws, substantially as set forth.

No. 102,445. Vehicle Propelling Machine.
Machine d propulsion pour véhiculcs.

August Ahlbrecht, Pittsburg. Pennsylvania, U.S.A.. 11th December, 1906; 6 years. Filed 18th May, 1906. Recelpt No. 136,060.
Claim.-1. An apparatus for propelling vehicles comprising a series of vertically disposed propeller bars supported upon the vehicle and above the roadway and means for moving caid propeller bars vertically and horizontally in opposite relation, said means comprising a reciprocating crosshead carrying said propeller bars and an eccentric grooved disc for moving said bars vertically within the crosshead, whereby one series is engaged to propel the vehicle while the other is moving into position.
2. In an apparatus for propelling vehicles, the propeller 'bars arranged in series and supported in a vertical position
within reach of the roadway, means for giving the same a reciprocating movement and means comprising an eccentric grooved wheel operated to give the propellers a vertical movement.
3. In an apparatus for propelling vehicles, the propeller bars loosely mounted and supported in reciprocating crossheads, said bars being moved vertically by means of an eccentric grooved disc operated by the drive shaft and a serles of connecting bars, as described.

No. 102,446. Fruit Crate. Manne d fruits.

Levin R. Bacon, Laurel, Delaware, U.S.A., 11th December, 1906; 6 years. Filed 20th November, 1906. Receipt No. 141,356.
Claim.-In a knockdown crate the combination with side and end sections of different lengths, respectively, arranged end to end in spaced alternate relation and connected one with the other by means of flexible metallic strips, means carried at the outer end of one of said sections whereby when said sect:ons are folded in crate form said section may be secured to an abutting section, a bottom adapted to be inserted within the side and end sections, flexible metallic straps connected at one end to the bottom of one of sald side sections and extending across and projecting beyond the outer side of, and being secured to said bottom, the projections of said straps being adapted to be secured to the bottom of the other side section, and a lid hinged to the top of said other side section.

No. 102,447. Mould. Moule.

Herman Besser, Alpena, Michigan, U.S.A.; 11th December, 1906; 6 years. Filed 5th September, 1906. Receipt No. 139,280.
Claim.-1. In a mould the combination of a side wall adapted to serve as a pallet and having wedges connected therewith, and a plurality of movable walls, certain of said movable walls being adapted to co-act with said wedges.
2. In a mould the combination of a pallet, movable end walls, a plurality of movable walls connected with the end walls, and means connected with the pallet for moving the last-named walls when the end walls are moved.
3. In a mould the combination of a pallet, a bottom or side wall adapted to be mounted on the pallet, a pair of end walls connected with said bottom or side wall, and means connected with the pallet for lifting the mould when the end walls are swung outwardly therefrom.
4. In a mould the combination of a pallet, a bottom or side wall adapted to be mounted on the pallet, a pair of end walls connected with said bottom or side wall, means connected with the pallet for lifting the mould when the end walls are swung outwardly therefrom, said means comprising a plurality of wedges, and a guide connected with each wall.
5. In a mould the combination of a plate, a wall pivoted to the plate at a point beyond the edge thereof, a frame having guides, and means connected with said wall for moving said frame away from the plate when the wall is swung on its pivot.
6. In a mould the combination of a plate, a wall pivoted to the plate at a point beyond the edge thereof. a frame having guides. means connected with said wall for moving said frame away from the plate when the wall is swung on its pivot. and means for moving both the plate and the frame in a direction transverse to the direction of sald movement.
7. In a mould the combination of a plate, a wall pivotally connected therewith, a movable frame having guides extending outwardly therefrim and drawn on the arcs of circles whose centers are nearer the center of the piate than the pivots on which th wall is mounted. and means connected with said wall for engaging the guides and controlling the motion of the frame.
8. In a mould the combination of a plate, a wall pivotally connected therewith, a movable frame having guides extending outwardiv therefrom and drawn on the arc of circles whose centers are nearer the center of the plate than the pivots on which the wall is mounted, and means connected said wall for engaging the guides and controlling the motion of the frame. and means on said wall for moving it and for locking the wall with respect to the frame.
9. In a mould the combination of a movable wall. a handle nivotally mounted thereon, a bar mounted on said handle and having a slot, a frame provided with a guide having a notch and nassing through said slot. whereby the motion of the wall will cause said frame to move.
10. In a mould the combination of a movable side wall. a movable end wall, a frame. means connected with the end wall for automatically moving the frame when the end wall moves. and means connected with the frame for moving the side wall.
11. In a mould the combination of a movable side wall, a movable end wall. a frame, means connected with the end wall for automatically moving the frame when the end wall moves. and means connected with the frame for moving the sidn wall. sald last-named means comprising a slide mounted on the frame and having a profection, and a nalr of wavs on the side wall having a slotted portion adapted to be oncaged hv said projection.
12. In a mould the combination nif a movable side wall. a movibin nid wall. n frame mennc connected with thn end wall for antomatically moving the frame when the end wall mores, means connccted with the frame for moving the side wall, a pallet located onposite sald sido wall. sald nallet heing provided with a slot, said side wall being provided with a perforation, and a core adapted to rest in said perforation, and extend across the mould, said core having a locking device adapted to pass through the slot in the pallet.

\section*{No. 102,448. Shipping Tag. Etiquette de chargoment.}

Caleb D. Bradham. New Bern, North Carolina. U.S.A.. 11th December. 1906; 6 years. Filed 24th September. 1906. Receipt No. 139,743.
Claim.-1. A shipping tag embodying a holder having marginal guides and an extension at one end provided with an orifice, and a tag adapted to engage the guides and provided at one end with an extension terminating in a notch in alignment with the orifice.
2. The combination with a receptacle of a holder provided with marginal guides and having at one end an extension provided with an orifice, an attaching device engaging the orifice, and a tag adapted to engage the guides and having one end provided with an extension having a notch to engage the attaching device.
3. The combination with a receptacle, of a holder having the name of the sender stamped thereon and provided with marginal guides and with a terminal extension having an
oriffce, an attaching device engaging the orifice, and a tag adapted to engage the guides and provided at one end with

a reduced extension having a notch to engage the attaching device.

\section*{No. 102,449. Fire Extinguisher.}

Extincteur d'incendie.

Charles Brent, Brandon, Manitoba, \({ }^{\circ}\) Canada, 11th December, 1906; 6 years. Filed 30th August, 1906. Receipt No. 139,101.
Claim.-In a fire extinguisher in combination, a tank, and an inverted liquified gas container provided with means for delivering gas only therefrom to the liquid in said tank.
2. In a fire extinguisher in combination, a water tank. a filling plug removably secured to said tank, and a gas contalner removably carried by said plug.
3. In a fire extinguisher in combination, outlet means, a liquified gas container inverted upon the top of sald extinguisher and means for leading off such liquified gas in gascous form and delivering it into said tank.
4. In a fire extinguisher in combination, a tank for holding a quantity of water, suitable outlet means, a plug in top of said tank, a gas container mounted in said plug, and a gas container pipe extending to the upper part of such container for delivering gas alone to the water tank below.
5. In a fire extinguisher in combination, a water tank, suitable discharging means, a plug mounted in the upper part of said tank, a gas container mounted in said plug. and a regulator valve for controlling the admission of gas from said container to said tank.
6. In a fire extinguisher in combination, a tank, a plug in the upper end of said tank, a gas container mounted in said plug, and a reducing valve also mounted in said plug and adapted to controlling the admission of gas from said container to said tank.
7. In a fire extinguisher in combination, a water tank, a plug in the upper end of said tank, a gas container mounted in said plug, a valve in said plug for reducing the pressure of the gas from said container as it enters the water tank, and means for adjusting said valve.
8. In a fire extinguisher in combination, a water tank, a plug in the upper end of said tank, a gas container remorably secured in said plug, a pipe within said container profecting to a point above the level of the liquid thereln and other end, and a valve mounted in said plug for controlling the flow of gas therefrom.
9. A liquified gas container consisting of a tank, a plug in the end of said tank and having an outlet port, a discharge
tube mounted in said plug and projecting to a point near the other end, and a valve mounted in said plug for controlling the passage of gas through said port.
10. In a fire extingulsher in combination, a water tank having suitable discharge means, a plug mounted in the upper end of said tank and having a gas container socket and a valve opening communicating with said socket, a pressure reducing valve mounted in said valve opening. a liquified gas container removably secured in its socket and having a gas outlet tube extending to a point near its upper end, and a valve carried by sald container for controlling the discharge of gas therefrom.
11. In a fire extinguisher in combination, a water tank, discharge means connected to said tank. a plug in the upper end of said tank and having a container socket and a valve opening communicating therewith, a valve seat within said valve opening, an adjacent plug mountod in said valve opening, a valve guided in said plug and co-operating with said valve seat, a spring between said valve and said adjusting plug, means for holding said plug in any adjusted position
12. In a fire extingulsher in combination. a water tank, a filling plug mounted therein and having a gas container socket and a valve opening communicating with each other by means of a suitable port, a valve seat about said port, an adjusting plug having suitable ports through the same and adapted to be shifted within said valve opening. a pressure reducing valve guided in said adjusting plug removably mounted in sald socket and having a gas dischargs pipe extending to a point near the upper end thereof, a valve for controlling the discharge of gas from said contalner. a discharge pipe mounted in said flling plug extending to the bottom of the water tank, and a suitable valve for controlling the discharge from said discharge pipe.

\section*{No. 102,450. Land Marker.}

Machine d marquer les terrain.

Elmer Lewis Brillhart, Ludington, Michigan, U.S.A.. 11th December, 1906; 6 years. Filed 12th November. 1906. Receipt No. 141,105.
Claim.-1. A field marker comprising a beam graduated with a linear scale from its middle to its extremities, teeth adjustable longitudinally thereon, slecves having seats therein adapted to detachably secure the teeth upon the beam at varying distances apart, means for attaching a draft animal to the beam and handles projecting rearwardly from each side of the center.
2. A land marker comprising a graduated beam, adjustable means affording attachment for thills and handles and spring tceth adjustably secured thereon and affording the marking means.
3. A land marker comprising a metallic beam, a graduated scale thereon extending from the center towards the extremities, slotted sleeves adjustably engaged on said beam, spring teeth engaged in said slots, means adjustably engaged on the beam at equal distances from the center adapted to secure thills anl handles, and thills and handles engagad therein.
4. A knock down land marker comprising a bar provided with a linear scale indicated thercon from the center to the extremities of the bar, sleeves engaged on said bar and each provided with an aperture at the rear of the bar, a leg engaged in the aperture in each sleeve, a set screw passing therethrough and acting to lock the sleeve on the bar. thills and handles for said marker and means-for adjustably engaging said thills and handles on the bar.
5. In a device of the class described the combination with a bar provided with a linear scale thereon of recessed sleeves adjustably engaged on said bar, a tooth engaged in
the recess of each sleevc and means for adjustably engaging thills and handles ous said bar.
6. In a device of the class described the combination with a beam of a linear scale thercon. sleeves adjustably engaged on said beam provided with shoulders on their inner surfaces adapted to contact with the beam, a tooth engaged in a recess in each sleeve, a set screw passing therethrough and engaging the beam, clamps adjustably engaged on the beam and thills and handles engaged in said clamps.
7. In a land marker the combination with a beam of legs adjustably engaged thereon, clamps at equal distances from the center of said beam and provided with seats in the top thereof and thills and handles rigidly engaged in said seats.
8. In a land marker the combination with a channel iron beam provided with a linear scale thereon of sleeves adjustably engaged on said beam, bearing shoulder on the inner side of the said sleeve, a spring tooth engaged in each sleeve, -lamps adjustably engaged on said beam and thills and handles carried in said clamps.
9. In a land marker the combination with a channel iron beam of rectangular sleeves adjustably longitudinally thereof, legs engaged in said sleeves, plates having parallel ribs thereon adapted to receive the beam therebetween, thills engaged in seats on the upper plates, a clamping plate above each thill, bolts rigidly engaging said plates and thills to the beam, handles integral with the thills and means for attaching a draft animal.
10. In a land marker the combination with a beam provided with linear scales thereon extending from the center toward the ends, sleeves slidably engaged on said beam, teeth removably engaged in said sleeves, plates having parallel ribs thereon adapted to engage the beam, seats in the upper plates, thills and handles in said seats and a clamping plate adapted to hold the same in place.

No. 102,451. Plough. 'harrue'.

-harles Carlson, Renville, Minnesota, U.S.A., 11th December, 1:06; 6 years. Flled, 14th November, 1906. Receipt No. 141,192.
Claim.-1. In a plough of the class described the combination with a wheel supported frame, of a plough mounted within the frame and having side brackets with inclined slots therein, a bail or arch mounted in the frame engaging in said slots and being adapted to fold forward from an upright to an inclined position and in front of the frame a coupling adapted to release automatically the plough when obstructed, and thus allow said arch to raise it above the obstruction, a spring arranged to pull the raised plough forward into coupled position again, a latch engaging automatically the arch to hold it upright while the spring pulls the plough forward, and means carried by the plough for disengaging the latch automatically when the arch and plough are to descend again.
2. In a plough of the class described the combination with a wheel supported frame, of a plough mounted to move vertically and longitudinally and to tilt in the frame, means for raising the plough above obstructions in the ground by a rearward motion of the plough in the frame and a spring
pulling the raised plough forward again in the frame, said plough having the front end of its beam or a special head plece secured thereon for that purpose formed with opposite longitudinal side grooves having in their rearward ends downward recesses 22, a coupling having at its front and rear ends hooks or lugs slidable in said grooves, two of the lugs being adapted to engage in the recesses and draw the plough, a spring pressed lever pivoted to the head piece and holding the coupling in the recesses. a rock shaft journalled transversely in the front end of the frame and having rocker arms pivotally supporting the coupling intermediate its ends, said coupling being adapted when thus supported and the plough beam is jerked downward by an obstruction to the plough to disengage from the recesses, and means for drawing the plough by the coupling, and means for holding the coupling at different elevations or even let it rest upon the front end of the frame.
3. In a plough of the class described the combination with a wheel supported frame, of a plough mounted to tilt, slide. raise and fall in the frame, said plough having the front end of its beam or a special head plece secured thereto for that purpose provided with longitudinal grooves having downward notches or recesses in their rear ends, a coupling sliding in the grooves and adapted to engage in the recesses and draw the plough, a spring pressed trip lever pivoted to the head plece and pressing the coupling into engagement, a normally partly bent knee point helping to hold the lever against the coupling. means for regulating the normal bending of the knee ioint. means for adjusting the tension of the spring acting on the lever, and means for throwing the coupling automatically out of and into engagement.
4. In a plough of the class described the combination with a wheel supported frame, of a plough monuted to tilt. slide. raise and fall in the frame, said plough having the front end of its beam or a special head plece secured thereto for that purpose provided with longitudinal grooves having downward notches or recesses in their rear ends. a coupling sliding in the grooves and adapted to engage in the recesses and draw the plough. a spring pressed trip lever pivoted to the head plece and pressing the coupling into engagement, a normally partly bent knee joint helping to hold the lever against the coupling. means for regulating the normal bonding of the knee joint. means for adjusting the tension of the spring acting on the lever. and means for throwing the counling automatically out of and into engagement, a spring pressed latch holding the trin lever suspended above the nath of the coupling while the latter ia uncoupled. said latch being disengaged from the lever by the coupling when it returns into the coupled position.
5. A plough comprising a wheel supported frame and a plough mounted to move vertically and longitudinally and to tilt forwardly in the frame, a spring arranged to pull the nlough forwardly in the frame. a coupling mounted in the front end of the plough frame and engaging the plough beam to draw the plough. automatic means for disengaging the coupling from the beam by the obstruction of the plough and engaging the beam again when the plough is pulled forward by the spring. and means for forcing the plough automatically out of the ground by its rearward movement relative to the frame when uncoupled at the front thereof.

No. 102,452. Coop. Cage à volailles.

George J. Cook, Hutchinson, Minnesota, U.S.A., 11th December, 1906; 6 years. Filed 20th November, 1906. Receipt No. 141,358.
Claim.-1. A coop or crate for poultry and the like embodying a bottom, sides and ends and a top composed of slats of different thicknesses, some of the slats extending higher than the remaining slats to form rests whereby when the coops are piled one upon another an air space is left between the tops and bottoms of the same, substantially as described.
2. A coop or crate for poultry and the like comprising a bottom, sides and ends, the ends being provided in their
upper edges with notches or recesses, keeper strips extending across the tops of said notches or recesses, a sliding door having the end portions thereof fitted in said recesses beneath the keepers and a stop carried by said door for limiting the endwise movement thereof, substantially and for the purpose described.
3. The combination with a coop or crate for poultry and the like, of a water trough holder extending across the bottom thereof, a water trough slidably mounted in said holding and a spring catch for holding said trough when pushed inward.
4. The comblnation with a coop or crate for poultry and the like, of a semi-cylindrical water trough holder extending across the bottom of the coop, a semi-cylindrical water trough mounted to move lengthwise in said holder and having end walls, and a spring catch having a reversely beveled lip adapted to engage the inner end wall of said trough, substantially as and for the purpose described.

\section*{No. 102,453. Mowing Machine Guard.}

Garde de faucheuses.

John A. Cumming, Monkland Station, Ontario, Canads, 11th
December, 1906 ; 6 years. Filed 6th September, 1906.
Recelpt No. 139,298.
Claim.-1. In a device of the class described the combination with a finger bar, of a guard removably secured thereto and resilient means for locking the same in position, as and for the purpose specified.
2. In a mowing machine guard the combination with the finger bar of a guard removably secured thereto and a spring operated dog locking the guard in position, as and for the purpose specified.
3. In a mowing machine guard the combination with the finger bar having a transverse slot in the bottom thereof of a guard having a tennon thereon engaging said slot. a dog pivoted to the guard and adapted to engage the finger bar and means for normally holding the dog in its locked position, as and for the purpose specifled.
4. In a mowing machine guard the combination with the finger bar having a transverse slot in the bottom thereof, of a guard having a tennon thereon engaging the slot, of a dog pivoted to the guard and having an- upturned end engaging the rear of the finger bar and means for locking the dog in position, as and for the purpose specified.
5. In a mowing machine guard the combination with the finger bar having the transverse slot in the bottom thereof of a guard having a tennon thereon engaging sald slot. a dog located in a recess in the guard and pivoted thereto. an upturned end on the dog engaging the end of the finger board and spring means for holding the dog in its engaged position. as and for the purpose specifled.
6. In a mowing machine guard the combination with the finger bar having a transverse slot in the bottom thereof of a guard provided with a tennon extending into sald slot, 2 recess in rear of the guard, a dog pivoted within said recess having an upturned end adapted to engage the inner side of the finger bar, a cam surface provided on the end of the dog extending within the slot, a plunger abutting said cam surfaces and reciprocating within the recess provided in the guard and a spring normally holding the plunger in contact with the cam surface, as and for the purpose specified.
7. In a mowing machine guard the combination with the finger bar having a vlurality of transverse dovetailed slots of a plurality of guards fitting within the same and spring operated means for locking the guards in the slots, as and for the purpose specifled.
8. In a mowing machine the combination with the finger bar having a plurality of transversely extending dovetailed slots, of guards fitting within said slots and a spring held dog pivoted to each guard and engaging the finger bar, as and for the purpose specifled.

No. 102,454. Switch. Aiguille.

Henry Dickinson, Flushing, New York, U.S.A., 11th December, 1906 ; 6 years. Filed 31st July, 1906. Receipt No. 138,312.
Claim.-1. In a switch operating mechanism the combination of the switch, a shoe carried by the rall, connections arranged to move parallel to the rail from said shoe to the switch and a cam operating piece carried by the car for wedging between the rail and shoe to operate the switch.
2. In a switch operating mechanism the combination of the switch, shoes carried by the rail at opposite sides thereof, connections arranged to move parallel to the rall from said shoes to the switch and two cam operating pieces carried by the car for wedging between the rail and the shoe to operate the switch.
3. In a switch operating mechanism the combination of the switch, a shoe carried by the rall, connections therefrom to the switch, a locking mechanism for the shoe and an operating piece carried by the car for unlocking the shoe and for wedging in between the same and the rail to operate the switch.
4. In a switch operating mechanism the combination of the switch, shoes carried by the rail at opposite sides thereof connections therefrom to the switch, four operating pieces and two treadles carried by the car, one treadle being arranged to throw two operating pieces into position inside the rails, and the other treadle being arranged to throw two operating pleces into position outside of the rails.
5. In a switch operating mechanism the combination of the switch, a shoe carried by the rall, connections arranged to move parallel to the rall from the shoe to the switch and a cam operating piece yieldingly carried by the car for wedging between the rail and the shoe to operate the switch.
6. In a switch operating mechanism the combination of the switch, shoes carried by the rail, connections therefrom to the switch, a shaft and sleeve carried by the car, operating pleces carried by the shaft and sleeve, a foot treadle connected to the shaft and a foot treadle connected to the sleeve.
7. In a switch operating mechanism the combination of the switch, shoes carried by the rall, connections therefrom to the switch, a bell crank lever carried by each shoe. a latch carried by the bell crank levers and operating pleces carried by the car.
8. In a switch operating mechanism the combination of the switch, brackets from the rall, shoes mounted thereon and running on anti-friction rollers, connections from the shoes to the switch and operating pieces carried by the car.
9. In a switch operating mechanism the combination of the switch, a shoe carrled by the rail, connections therefrom to the switch, locking mechanism for the shoe and an operating plece carried by the car and having a rib to operate the locking mechanism and move the shoe to actuate the switch.

\section*{No. 102,455. Cover for Kegs. Courercle de barils.}

Hans Dittmann and Hermann Dahms, co-inventors, both of Lubeck, Germany, 11th December, 1906 ; 6 years. Filed 16th November, 1906. Receipt No. 141.274.
Claim.-1. Cover for kegs consisting of an open frame having a groove at its lower side adapted to fit into the mouth of the keg, a projecting rim round the opening of the frame, loops at the sides of the frame with which the frame is attached to the keg, means to attach the frame into the keg, a cover having a groove adapted to fit into the rim of the irame turnably arranged on the frame. means to hold the cover in any position, bearings on the frame for supporting the cover, tappets on the cover, a bar passing through the tappets of the cover and the bearings of the frame for turn-
ing the cover any way desired, means to turn the bar, substantially as described and shown.

2. Cover for kegs consisting of an open frame having a groove at its lower side adapted to fit into the mouth of the keg, a projecting rim round the opening of the frame, loops at the sides of the frame with which the frame is attached to the keg, means to attach the frame into the keg consisting of spring hooks, a cover having a groove adapted to fit into the rim of the frame turnably arranged on the frame, means to hold the cover in any position by employing springs between the tappets as shown, bearings on the frame for supporting the cover, tappets on the cover, a bar passing through the said tappets and the bearings for turning the cover, means to turn the cover by providing the bar with a lever, all substantially described and shown.
3. Cover for kegs consisting of an open frame having a groove at its lower side adapted to fit into the mouth of the keg, a projecting rim round the opening of the frame, loops at the side of the frame with which the frame is attached to the keg, means to attach the frame into the keg consisting of spring hooks, a cover having a groove adapted to flt into the rim of the frame turnably arranged on the frame, means to hold the cover in position by employing \(\mathbf{V}\)-shaped springs situated under the tappets as shown, bearings on the frame for supporting the cover, tappets on the cover, a bar passing through the said tappets and the bearings for turning the cover, means to turn the cover by providing the bar with a lever, substantially described and shown.

No. 102,456. Clothes Washer and Wringer.
Laveuse et cssoreuse.

Odon Guitar, Columbia. Missouri, U.S.A., 11th December, 1906; 6 years. Filed 17th November, 1906. Recelpt No. 141,285.
Claim.-1. In a machine of the character described, a tank provided with legs, a concave presser bed therein, a flexible facing secured to the presser bed and provided with transverse corrugations, a hinged frame to which said plate is secured, a spring actuated latch upon said frame and adapted to support the same, a convex presser plate for co-acting with said presser bed, a flexible facing secured to said presser plate and provided with transverse corrugations staggered with relation to the corrugations on the presser bed, the bed and the plate having transverse series of perforations between the corrugations, a hinged frame to which said convex plate is secured, a coll spring for securing said convex plate normally elevated, and means whereby the plate may be elevated and depressed.
2. In a machine of the character described, a tank, a concave presser bed therein, an elastic facing secured to the presser bed and provided with transverse corrugations, a frame supporting said presser bed, means whereby to adjust said frame in the tank, a convex presser plate hinged to the tank and adapted to co-act with said presser bed, an elastic facing securing to said presser plate and provided with transverse corrugations staggered with relation to the corrugations in the lower plate, and means for retaining the presser plate normally out of contact with the bed.
3. A combined clothes washer and wringer comprising a presser bed, an elastic facing on the operating face of the presser bed, transverse corrugations on the facing. the bed and facing having perforations therethrough between the corrugations, a presser plate adapted to co-act with the presser bed, an elastic facing on the operative face of the presser plate, transverse corrugations on the facing. the presser plate and facing having perforations therethrough between the corrugations and means for moving the presser plate.
4. In a combined clothes washer and wringer, a tank provided with legs, a frame hinged to the tank, a presser bed mounted on the frame, a spring actuated latch on the frame, and means on the tank for engaging the latch to support the frame.

No. 102,457. Steam Cooker.
Appareil à cuire à la vapeur.

Verena Ehrsam-Jetzer, Zurich, Switzerland, 11th December, 1906: 6 years. Filed 14th November, 1906. Receipt No. 141,213.
Claim.-1. A steam cooker comprising an oxter cylindrical vessel having a reduced neck and an outwardly flaring collar, an inner cylindrical vessel having a collar to fit that of the external vessel and a fllling nozzle forming safety valve for said external vessel, as set forth.
2. In a steam cooker the combination with an inner cylindrical vessel, an inwardly bulging bottom and an outwardly flaring neck on said vessel, of a larger outer vessel, a reduced neck to fit the inner vessel, an outwardly flaring collar to fit the collar of said inner vessel, an annular groove in the collar of the outer vessel and a packing ring in said groove, as set forth.
3. In the steam cooker herein characterized the combination with the outer vessel, of a filling nozzle, a screw cover for said nozzle, an internal guide tube connecied with the cover, a spring controlled safety valve mounted on said guide tube, as set forth.
4. In the steam cooker herein characterized the combination with the screw cover of the filling nozzle, of an innsr guide tube, an outer valve tube, a valve seat fommed at the bottom of the valve tube, a valve combined with a slide tub, to fit over said guide tube, a flange on said valve and a helical spring mounted upon said slide and guide tubes and pressing against said flange, as set forth.

\section*{No. 102,458. Pulp Screen Mechanism.}

Mécanisme de tamis à pulpe.
Carl Jentz, Grand Mere, Quebec, Canada, 11th December, 1906; 6 years. Filed 31st July, 1906. Receipt No. 138,294.
Claim.-1. In combination with a pulp screen frame having cross braces, headed screw-threaded members removably secured to the cross braces, nuts on the screw-threaded members, bevel edged locking strips disposed under the nuts and bevel edged screen plates abutting against the locking strips.
2. In combination with a pulp screen frame having cross braces, headed screw-threaded members removably secured to the cross braces, nuts on the screw-threaded membirs. bevelled edged locking strips disposed under the nuts, bevel edge screen plates abutting against the locking strips and means for locking the ends of the screen plates.
3. In combination with a pulp screen frame having cross braces. headed screw-threaded members removably secured

to the cross braces, nuts on the screw-threaded members, bevel edged locking strips disposed under the nuts, bevel edged screen plates abutting against the locking strip, removable stirrups disposed on the ends of the screen plates and the locking strips and means for applying pressure to the stirrups.
4. In combination with a pulp screen frame having cross braces, headed screw-threaded members removably secured to the cross braces, nuts on the screw-threaded members, bevel edge locking strips disposed under the nuts, bevel edged screen plates abutting against the locking strips, removably stirrups disposed on the ends of the screen plates and the locking strips and screw-threaded members carrled on the frame and adapted to bear on the stirrups.
5. In combination with a pulp screen frame having cross braces, headed screw-threaded members removably secured to the cross braces, nuts on the screw-threaded members, bevel edged locking strips disposed under the quts. bevel edged screen plates abutting against the locking strips, removable stirrups disposed on the ends of the screen plates and the locking strips, brackets carried by the frame and provided with projecting ears and screw-threaded members disposed through the ears and adapted to bear on the stirrups.
6. In combination with a pulp screen frame having cross braces provided with recesses therein, bolts having heads removably disposed in the recesses, strips secured to the crossbars and provided with registering openings and reduc ed slots through which the bolts project, bevel edged locking strips having openings through which the bolts are disposed, nuts on the bolts and bevel edged screen plates disposed with their edges beneath the edges of the bevel edged locking strips.
7. In combination with a pulp screen trame having cross braces provided with recesses therein, bolts having heads removably disposed in the recesses, strips secured to the cross braces and adapted to maintain the bolts against upward movement, bevel edged locking strips having openings through which the bolts are disposed, which openings are provided with flanges, nuts disposed on the bolts and provided with flanges adapted to abut against the flanges of said openings and bevel edged screen plates disposed with their edges beneath the bevel edged locking strips.
8. In combination with a pulp screen frame, cross braces provided with recesses therein, headed bolts removably disposed in the recesses, means for maintaining the bolts against upward movement, bevel edged locking strips, nuts on the bolts adapted to bear on the upper surface of the locking strips. bevel edged screen plates adapted to be held against movement by the locking strips, and means for locking the ends of the locking strips and the screen plates.

\section*{No. 102,459. Switch. Aiguille.}

Philip Deforest Hibner, Seattle, Washington, U.S.A., 11th December, 1906; 6 years. Filed 3rd November, 1906. Receipt No. 140,883.
Claim.-1. The combination with a rallway track and a winging switch tongue, of a frame, a chambered block having guideways on the outer face of its side walls, sald block being slidable within said frame, mechanical connections between said tongue and the block, a vertically movable pin carried by the block and adapted to be normally in its lowermost position, and means actuated by a
car wheel whereby said pin is elcvated into operative position.

2. The combination with a rallway track and a swinging switch tongue, of a frame in the track bed, a chambered block having guideways on the outer face of its side walls, said block being slidable within said frame. mechanical connections between said tongue and the block, a normally depressed pin carried by the block, means actuated by the wheel of a car for protruding the pin above the top of said frame, and devices carried by the car and adapted to be controlled therefrom whereby the said pin is engaged to predeterminately move said tongue in either direction.
3. The combination with a railway track, a swinging switch tongue, of a frame having transversely arranged guldes, a block slidably mounted on said guides, a vibratory lever connected to said block, mechanical connections between the lever and said tongue, a device carried by said block and arranged to be normally in its lowermost position, means actuated by the wheel of a car for raising said device into position to be engaged by devices carried upon the car when the same are depressed, sald last-named devices, and means to control the actions thereof.,
4. The combination with a railway track, a swinging switch tongue and a semaphore, of a frame having transversely arranged guides, a block slidably mounted on said guides, a vibratory lever connected to said block, mechanical connections between the lever and said tongue and also detween the lever and the semaphore, a device carried by said block and arranged to be normally in its lowermost position, means actuated by the wheel of a car for raising said device into position to be engaged by devices carried by the car when the same are depressed, said last-named devices, and means to control the actions thereof.
5. The combination of a railway track, a switch tongue, a slidable chambered block having guideways on the outer face of its side walls, mechanical connections between the block and the tongue, and means actuated by the wheel of a car for rendering the said block capable of being engaged by devices carried by the car for predeterminately swinging said tongue.
6. The combination of a railway track, a switch tongue, a semaphore, a slidable chambered block having guideways on the outer face of its side walls, mechanical connections between the block and the tongue and also with said semaphore, and means actuated by the wheel of a car for rendering the said block capable of being engaged by devices carried by the car for predeterminately swinging said tongue.
7. The combination of a rallway track, a switch tongue, a slidable block, mechanical connections between the said black and the tongue, and means actuated by the wheel of a car for rendering the said block capable of being engaged by devices carried by the car for predeterminately swinging said tongue, said devices comprising a vertically movable spindle having an off-set in its lower portion, a blade connected to said off-set portion of the spindle. a spring tending to maintain the spindle at its most elevated position, a shaft having an arm at Its top end, means to retain the shaft in various rotary positions, and operative connection between the shaft and the spindle.
8. The combination of a rallway track, a switch tongue, a semaphore, a slidable block, mechanical connections between the block and the tongue and also with the said semaphore, and means actuated by the wheel of a car tor rendering the said block capable of being engaged by devices carried by the car for predeterminately swinging said tongue, said devices, and comprising a vertically

12-9
movable spindle having an off-set in its lower portion, a blade connected to said off-set portion of the spindle, a spring tending to maintain the spindle at its most elevated position, a shaft having an arm at its top end, means to retaln the shaft in various rotary positions, and operative connection between the shaft and the spindle

No. 102,460. Machine for Steaming Grain. Machine i ir:hauder le grain.

Edmond F. Kiler, Sr., Santa Barbara, California, U.S.A., 11th December, 1906; 6 years. Filed 17th November, 1906. Receipt No. 141,291 .

Claim.-1. A grain steamer, consisting of an upright barrel, open at its lower end, adapted to be provided with any style bottom applicable to the device, a cap \(c\). fitting on the upper end of said barrel, and having in its center a threaded perforation, a cylinder \(h\), fitting vertically in said threaded perforation, a packing cylinder \(b\). fitting in the last-mentioned cylinder \(h\), and adapted to revolve therein. a lining \(g\). fitting between the two last-mentioned cylinders, a pulley \(f\). rigidly secured to the cylinder \(l\), above the upper end of said cylinder \(h\), a packing ring \(r\). secured in the upper end if said cylinder \(b\), a perforated cap \(a\), secured on the upper end of said cylinderr \(b\), a steam pipe A, assing down through said cylinder \(b\), a cross pipe \(A^{\perp}\), secured to the lower end of said pipe \(A\), perforated cylinders \(K\) and \(L\), branching out from said cross pipe and running down parallel to each other to near the bottom of the barrel, a supporting shaft \(M\). extending from the lower part of the cross cylinder \(A^{1}\), secured in block \(J\), its lower end pivoted in the bearing \(m\), arms \(T\), extending inwardly from the wall of the barrel, supporting the lower end of said shaft, and a chute \(V\), for conducting the grain in the said barrel, substantially as shown and described, and for the purposes set forth.
2. A vertical barrel open at its lower end, and adapted to be provided with a bottom, a perforated cap secured on the upper end of said barrel, a bearing vertically secured in the perforation of the said cap and carrying a lining a cylinder vertically journalled in said bearing, a pulley rigidly secured near the upper end of said cylinder. a steam pipe, passing down through said cylinder, a packing ring secured in the upper end of said cylinder and held in by a cap, a perforated block secured in the lower end of said cylinder, a \(U\)-shaped pipe, its horizontal part secured to said steam pipe and in said block, its parallel arms perforated and extending downwardly into said barrel, said cylinder, said block and said U-shaped pipe adapted to be revolved by said pulley, and a chute adapted to carry the grain into said barrel, substantlally as shown and described and for the purposes set forth.

\section*{No. 102,461. Load Carrier. Porte-paquet.}

Asher Lambert, Newark, New Jersey, U.S.A., 11th December, 1906; 6 years. Filed 16th November, 1906. Receipt No. 141,252.
Claim.-1. In an apparatus of the character described. the combination of a load carrier, a flexible tripping device, a take-up for said tripping device, and means for adjustably fastening the flexible tripping device to vary the time of discharge of the load carrier.
2. In an apparatus of the character described, the combination of a load carrier, a flexible tripping device. a take-up including a weight for the said tripping device. and means for adjustably fastening the flexible tripping device to vary the time of discharge of the load carrler.
3. In an apparatus of the character described, the combination of a load carrier having a plurality of sections, a
flexible tripping device, a take-up for said tripping device. and means for adjustably fastening the flexible tripping device to vary the time of opening of said load carrier.

4. In an apparatus of the character described, the combination of a load carrier having a plurality of sections, a flexible tripping device, a take-up device including a weight for said tripping device. and means for adjustably fastening the flexible tripping device to vary the time of opening of said load carrier.
5. In an apparatus of the character described, the combination of a skip having two hinged sections, a flexible opening device provided with a takr-up and connected with the outer portions of said sections and means for adjustably fastening the flexible opening device to vary the time of opening the skip.
6. The combination in an apparatus of the character described, of a skip having hinged sections, a support, a suspending device extending from the support to the skip, a flexible opening device provided with a take-up connected with the outer portions of said sections, a guide for the opening device located on the support and means for varying the operative length of said opening device,
7. The combination in an apparatus of the character described, of a skip having two hinged sections, a hoisting rope, a tripping rope provided with a take-up, and means for holding fast either one of said roves and transferring some of the support of the skip to the other rope.
8. The combination in an apparatus of the character described, of a skip having two hinged sections, a hoisting rope, a tripping rope, an automatic take-up for said tripping rope, two independent drums, one for each rope, and means whereby some of the support of sald skip may be transferred from one rope to the other.
9. The combination in an apparatus of the character described, of a skip having two hinged sections, a hoisting rope, a tripping rope, an automatic take-up for said tripping rope , a suitable drum for each rope, and means for holding one drum while the other is rotated.
10. The combination in an apparatus of the character described, of a load carrier, a tripping rope, an independent, suitable drum for the tripping rope, a take-up for said tripping rope, and a brake for holding said drum.
11. The combination in an apparatus of the character described, of a skip having two hinged sections, a hoisting rope, a tripping rope, a take-up for said tripping rope, a power driven drum for the hoist rope, a suitable drum for the tripping rope, and a brake for holding the lastnamed drum.
12. The combination in an apparatus of the character described, of a skip having two hinged sections, a holsting rope, a tripping rope, a power driven drum for the holsting rope, a suitable drum for the tripping rope, said drum being driven in both directions by the movement of said tripping rope, and a brake for holding the last-named drum.
13. The combination in an apparatus of the character described, of a skip, a hoisting rope, a tripping rope, a power driven drum for the hoisting rope, a separate independent drum fixed in position for the tripping rope, a suitable brake for said drum and a take-up device for said tripping rope.
14. A skip combined with a hoist rope, a tripping rode. means for detacbably connecting the hoist rope with said skip, and an independent flexible connecting device for connecting said tripping rope with said means.
15. A skip combined with a hoist rope, a tripping rope, means for connecting the hoist rope directly to the pulley
block and means for connecting the tripping rope to said pulley block through an independent, flexible connecting device.
16. A skip combined with a hoist rope, a tripping rope, means for connecting the hoist rope directly to the pulley block, means for connecting the tripping rope to said pulley block through an independent, flexible connecting device and a take-up device for the tripping rope.
17. The combination in an apparatus of the character described, of a hoist rope, a tripping rope, a counter weight for the tripping rope, a pulley block for the hoist rope, the pulley block and the parts fixedly attached thereto having greater gravity than the counterweight, and a flexible connection between the tripping rope and said pulley block.
18. The combination of a two-part skip with a hoist rope, a tripping rope, means for connecting the hoist rope to a pulley block and means for connecting the tripping rope to said block consisting of a flexible connecting device.
19. The combination of a skip in two sections hinged together, closing points of support and opening points of support on said skip, a haul rope, means connecting the haul rope to the closing points, a tripping rope, means including a detachable connection connecting the tripping rope to the opening points, and a separate flexible section between said tripping rope and the detachable connection.
20. The combination in apparatus of the character described, of a pulley block, a rigid iron bar supparted thereby, a skip having two sections hinged together, exterior points of support on each end of each section, flexible connections between said bar and said points of support, a pair of supporting points on the exterior of the skip intermediate the first-named points, a hoist rope connected to said bar, a tripping rope connected to said intermediate points and means whereby the hoisting rope when tightened closes sald sections and the tripping rope when tightened opens said sections.
21. The combination in apparatus of the character described, of a pulley block, a skid having two sections hinged together, a hoisting rope, a tripping rope, points of connection on the skip for the hoisting rope, points of connection on the skip for the tripping rope, means whereby the slacking of one rope and the tightening of the other cpens the skip and vice versa, and a take-up device for the tripning rope.
22. The combination in apparatus of the character described, of a pulley block, a skip having two sections hinged together, a hoisting rope, a tripping rope, points of connection on the skip for the holsting rope, points of connection on the skip for the tripping rope, means whereby the slacking of one rope and the tightening of the other opens the skip and vice versa, and a take-up device for the tripping rope consisting of a weight and pulley.
23. The combination in apparatus of the character described, of a pulley block, a skip having two sections hinged together, a hoisting rope, a tripping rope, points of connection on the skip for the hoisting rope, points of connection on the skip for the tripping rope, means whereby the slacking of one rope and the tightening of the other opens the skip and vice versa, a take-up device for the skipping rope and means for checking and holding the tripping rope.
24. The combination in apparatus of the character described, of a pulley block, a skip having two sections hinged together, a hoisting rope, a tripping rope, points of connection on the skip for the hoisting rope, points of connection on the skip for the tripping rope, means whereby the slacking of one rope and the tightening of the other opens the skip and vice versa, a take-up device for the tripping rope and means for checking the tripping rope consisting of an independent drum or roller and a suitable friction brake.
25. The combination in apparatus of the character desoribed, of a pulley block, a skip having two sections hinged together, a hoisting rope, a tripping rope, means for connecting the hoisting rope with said skip, means for connecting the tripping rope with said skip so arranged that upon slacking one rope and tightening the other the skip will be opened, a suitable power driven drum for the holsting rope, a suitable take-up device for the tripping rope and means for checking the movement of the tripping rope.
26. The combination in apparatus of the character described, of a pulley block, a skip having two sections hinged together, a hoisting rope, a tripping rope, means for connecting the hoisting rope with said skip, means for connecting the tripping rope with said skip so arranged that upon slacking one rope and tightening the other the skip will be opened, a suitable power driven drum for the hoisting rope, a suitable take-up device for the tripping rope, and means for checking the movement of the tripping rope consisting of an independent wheel or roller and a friction brake therefor.

No. 102,462. Mould. Moule.

Charles Frederick Lancaster, Petoskey, Michigan, U.S.A
11th December, 1906; 6 years. Filed 28 th September, 1906. Receipt No. 139,883 .

Claim.-1. In a moulding apparatus for bullding walls, the combination of a scaffold or support, a mould carried by the scaffold and movable horizontally thereon to be advanced lengthwise of the wall in construction, and means for moving said mould transverse to the line of its movement abovementioned to admit of passage of obstructions in the length of the wall.
2. In a moulding apparatus for building walls, the combination of a scafiold, a platform vertically adjustable upon and at one side of the scaffold, a carriage movable along the platform, and a mould mounted on the carriage.
3. In moulding apparatus for building walls, the combination of a scaffold, a track adjustable vertically upon the scaffold, and a mould movable along the track and arranged to be tilted bodily.
4. In moulding apparatus for building walls, the combination of a scaffold or like support, a track upon said scaffold, a carriage mounted upon the track, a mould composed of parts movably mounted upon the carriage, and means for bodily moving the mould transverse of the track to avoid obstructions in the length of the wall.
5. In moulding apparatus for building walls, the combination of a scaffold or like suport, a track upon said scaffold, a carriage mounted upon the track, a mould movably mounted upon the carriage, and means for tilting the mould independent of the carriage.
6. In moulding apparatus for building walls, the combination of a scaffold, a track upon the scaffold, a carriage mounted upon the track, a mould carried by the carriage, means for moving the mould vertically, and means for tilting the mould laterally with respect to the line of travel of the carriage.
7. In moulding apparatus for building walls, the combination of a scaffold, a mould carried by the scaffold, means for moving the mould horizontally and vertically, and means for tilting the mould laterally with respect to the line of its horizontal movement.
8. In moulding apparatus for building walls, the combination of a scaffold, a vertically movable mould carried by the scaffold, and means for tilting the mould.
9. In moulding apparatus for building walls, the combination a scaffold, and a vertically movable mould pivotally mounted upon the scaffold.
10. In a moulding apparatus for bullding walls, the combination of a scaffold, a vertically movable platform mounted upon the scaffold, a carriage movable along said platform, vertical bars movably mounted on the carriage, means for actuating said bars, arms projected laterally from the bars aforesaid, supporting members supporting the arms upon the bars and embodying socket members receiving the arms, and operating means carried by each supporting member aforesaid for actuating the arms.
11. In a moulding apparatus for building walls, the combination of a scaffold, a support movable vertically of the scaffold, and a mould vertically movable upon the support.
12. In moulding apparatus for building walls, the combination of a scaffold, a vertically movable platiorm carried by the scaffold, a vertically movable mould upon the platform, and means for tilting the mould.
13. In moulding apparatus for building walls, the combination of a scaffold, a carriage movable upon the scaffold, und a mould pivoted so as to be tilted bodily on the carriage.
14. In moulding apparatus for building walls, the combination of a scaffold, and a mould pivoted to the scaffold.
15. In a moulding apparatus ior building walls, the combination of a scaffold, a vertically movable platform mounted upon the scaffold, a carriage movable along said platform, vertical bars movably mounted on the carriage, means for actuating said bars, arms projected laterally from the bars aforesaid, supporting members supporting the arms upon the bars and embodying socket members recelving the arms, and a lever pivoted to each supporting member and operably connected with each arm for actuation thereof, as specifled
16. In moulding apparatus for bullding walls, the combination of a scaffold, a track carried by the scaffold, a carriage movable along the track, vertlcal bars supported by the carriage, means for actuating said bars, arms projected from the bars, a lever for moving said arms, and mould parts carried by sald arms.
17. In moulding apparatus for building walls, the comsination of a scaffold, a track carrled by the scaffold, a carriage movable along the track, vertical bars supported by the carriage, means for actuating said bars, arms projected laterally from the bars aforesaid, levers adjustably connected with said arms, and mould parts carried by the arms and adapted for actuation by the levers aforesaid.
18. In moulding apparatus for building walls, the combination of a scaffold, a track carried by the scaffold, a carriage movable along the track, vertical bars supported by the carriage, means for actuating said bars, arms projected laterally from the bars aforesaid, means for adjusting sald arms to vary the normal operative positions thereof, mould parts carried by the arms, and means for actuating the arms to impart movement to the mould parts.
19. In moulding apparatus for building walls, the combination of a scaffold, a track carried by the scaffold, a carriage movable along the track, vertical bars supported by the carriage, means including rack and pinion devices for actuating the bars aforesaid, a mould supported by the bars and composed of mould parts, and means adjustably connected with the mould parts for actuation thereof.
20. In moulding apparatus for building walls, the combination of a scaffold, a track upon the scaftold, a carriage upon the track, supporting members connected with the carriage and adapted for tilting movement, vertically movable bars carried by the supporting members, means for actuating the bars, and mould parts carried by said bars.
21. In moulding apparatus for building walls, the combination of a scaffold, a track upon the scaffold, a carriage upon the track, supporting members connected with the carriage and adapted for tilting movement, vertically movable bars by the supporting members, means for actuating the bars, arms extending laterally from the bars, mould parts pendent from sald arms, and means for actuating said arms to lmpart movement to the mould parts.
22. In mould apparatus for building walls, the combination of a scaffold a track upon the scaffold, a carriage movable along the track, supporting members pivoted to the carriage, vertically adjustable arms carried by the supporting members, hook devices for holding the supporting members in a predetermined position, means for actuating the vertically movable bars, and mould parts carried by the vertically movable bars.
23. In moulding apparatus for building walls, the combination of a scaffold composed of a plurality of uprights, brackets movably mounted upon the uprights, dogs carried by the brackets to hold the same at a gredetermined adjustment, a track supported by the brackets, a carriage movable upon the track, and a mould mounted upon the carriage.
24. A mould for building walls comprising a plurality of arms, mould parts caried by said arms, a socket member receiving the arms, and a pivot levar operably connected with the arms for actuation thereof.
25. In combination, a socket member, a plurality of arms passing through the socket member, mould parts carried by the arms, a lever pivoted to the socket member, and pins projected from the lever and operably connected with the arms for actuation thereof.
26. In combination, a socket member, a plurality of arms passing through the socket member, mould parts pendent from the arms, a lever pivoted to the socket member. pins projected from the lever and operably connected with the arms for actuation thereof, and a latch pivoted to the sockel member to hold the lever in operative position.
27. In combination, a mould embodying movable sides, a clamp for the mould comprising a bar, a plurality of clamp members pivoted to the bar, and a lever operably connected with said clamp members.
28. In combination, a mould embodying movable sides, a clamp for said mould comprising a bar, a plurality of clamp members pivoted to the bar, toggle links connecting certain of sald members, and a lever pivoted to the bar and operably connected with the toggle links aforesaid.

No. 102,463. Journal Bearing. Coussinet de tourillom

Fred Latulip, Syracuse, New York, U.S.A., 11th December, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138.824.

Claim.-1. A machine bearing, consisting of multiple sheets of mica roughened on their adjacent. surfaces and having the roughened scoring filled with a Iubricant, said sheets being compresed into a composite block, as and for the purpose specified.
2. A machine bearing, consisting of multiple sheets of mica roughened on their adjacent surfaces and having the roughened scorings flled with a lubricant, said sheets being compressed into a composite block, and a metal body having a seat for the said block. the mica block being arranged in the metal body with the sheets of mica at right angles to the direction of motion, as and for the purpose specifled.
3. A journal bearing, comprising a plurality of blocks of mica longitudinally arranged therein and parallel in relation one to the other, as and for the purpose specified.
4. A journal bearing. comprising a plurality of mica forms arranged circumferentially in said bearings, as and for the purpose syecified.

No. 102,464. Aerial Tramway. Tramuay aéricn.

William C. Lawson, Rural Retreat, Virginia, U.S.A., 11th December, 1906; 6 years. Filed 19th November, 1906. Recelpt No. 141,338.
Claim.-1. In an aerial tramway, a track including a plurality of carriage supporting ralls formed from a single cable, and means for maintaining the rails in taut condition and against longitudinal movement.
2. In an aerial tramway, a track including a plurality of carriage supporting rails formed from a looped cable, the sides of said loop constituting said rails, and means for clamping the rails against longitudinal movement.
3. In an aerial tramway, the combination with a support, of guides mounted on the support, and a looped cable havIng one end portion passing about the guldes, the sides of said loop being spaced apart and constituting carriage supporting ralls.
4. In an aerial tramway, the combination with a support, of spaced guide sheaves mounted on the support, another guide sheave mounted on the support between the spaced sheaves and transversely thereof, and a looped cable having its looped end portion passing about the sheaves, the sides of said looped able being spaced apart and constituting carriage supporting rails.
5. In an aerial tramway, the combination with spaced standards, of spaced cross beams connecting the same, spaced sheaves mounted transversely of the cross beams, another sheave mounted between the beams longitudinally thereof and between the spaced sheaves, and a looped cable having its looped end portion passing about the spaced sheaves and the intermediate sheave, the sides of sald loop
being spaced apart and constituting carriage supporting rails.
6. In an aerial tramway, the combination with spaced supports, of a looped cable having its side portions stretched between the supports and forming spaced carriage supporting ralls, the looped end of the cable being movably gulded on one of the supports, and means mounted on the other support for securing the ends of the cable.
7. In an aerial tramway, the combination with spaced supports, of a looped cable having its side portions stretched between the supports and forming spaced carriage supporting rails, sheaves mounted on one of the supports for guiding the looped end portion of the cable, and clamps mounted on the other support for securing the ends of the cable.
8. In an aerial tramway, the combination with a support, of a guide mounted thereon, a rail cable passing about the guide, a clamp engaging the cable, and a holding device engaging the cable and also engaging the clamp to hold the same in position.
9. In an aerial tramway. the combination with a support, of a guide roller mounted thereon, a rail cable passing about the roller, a clamp engaging the portion of the cable that passes about the roller, and a holding clip embracing the cable and also engaging the clamp to hold the same in position.
10. In an aerial tramway, the combination with supporting standards, of cross beams mounted thereon. spaced plates located on the beams, a roller fournalued between the plates, a rall cable passing over the roller, a clamp plate interposed between the spaced plates and engaging the portion of the cable that passes over the roller, said clamp plate having a recess. and a holding clip embracing the cable and engaing in the recess of the clamp plate.
11. In an aerial tramway, a track composed of a series of sections, each section comprisng a plurality of spaced carriage supporting rails formed from a single cable.
12. In an arrial tramway. a track composed of a serles of sections, each section comprising a looped cable independent of the other section, and each looped cable forming spaced carriage supporting rails.
13. In an acrial tramway. the combination with a plurality of spaced supports, of guides mounted on the supports, and a track composed of a series of sections. each section extending between a set of supports and comprising a looped cable extending about the guides on one of the supports and having its ends affixed to the other support.
14. In an aerial tramway, the combination with a plurallty of spaced supports, of spaced guide sheaves mounted on each support, a plurality of looped cables, each cable having its ends sccured to one support and having its looped end portion passing over the sheaves of the other support and extending across the space between said sheaves.
15. In an aerial tramway. the combination with a plurality of spaced supports. of spaced guide sheaves mounted on each support, a plurality of looped cables, each cable having its ends secured to one support and having its looped end portion passing over the sheaves of the other support and cxtending across the space betwen said sheaves, and track section plates bridging the spaces between the ends of the adjacent cables.
16. In an aerial tramway, the combination with a plurality of cable track sections disposed in angular relation and having their ends spaced apart, of a curved track plate interposed between and having its ends aligned with the adjacent ends of the sections.
17. In an aerial tramway, the combination with a plurality of cable track sections disposed in angular relation and having their ends spaced apart, of a curved track plate interposed between and having its ends aligned with the adjacent ends of the sections, said track plate constituting clamps therebetween that engage the sections.
18. In an aerlal tramway, the combination with supporting means, of guides mounted thereon, angularly disposed track cables passing over the guides, and a laterally curved track plate mounted on the supporting means between the guides and bearing against the portions of the cables passing thereover.
19. In an aerial tramway, the combination with spaced supports, of spaced plates mounted on each support, a guide sheave journalled between the plates of each support, a track cable passing over each sheave, and a curved track section plate bridging the space between the supports. the ends of said plate being engaged between the spaced sets of plates on the support and being disposed in co-acting relation to the ends of the track cable.
20. In an aerial tramway, the combination with spaced supports, of a track section connected to each support and comprising a single cable having spaced stretches, said stretches forming substantially parallel carriage supporting rails, and curved track plates bridging the space between the supports and between the corresponding cable fails of each track section, said track plates having their eñas aligned with the cable ralls.

Ne. 102,465. Brake. Frein.

Elias Lewis, Terre Haute, Indiana, U.S.A., 11th December, 1906; 6 years. Filed 19th November, 1906. Receipt No. 141,533.
claim.-1. The combination with a whecled truck, brake shoes pivotally mounted on the truck, rotatable shafts carried by each truck. means co-operatively connecting the shafts and the brake shoes together, said shaft and said connecting means having provisions in virtue of which when the shaft is rotated in one direction the brake will be applied and when rotated in an opposite direction the brakes will be released, and means for rotating the shaft.
2. The combination with a wheeled truck, brake shoes pivotally mounted on the truck, rotatable shafts carried by each truck, means co-operatively connecting the shafts and the brake shoes together, said shaft and said connecting means having provisions in virtue of which when the shaft is rotated in one direction the brakes will be applied, and when rotated in an opposite direction the brakes will be released, means for rotating the shaft, said last-named means comprising a pulley segment secured to the shafts. an operating cable connected with the pulley segment, and means for drawing taut or relaxing the cable, substantially as shown and described.
3. The combination with a wheeled truck, hangers pivotally mounted thereon, brake heads pivotally carried by said hangers, brake shoes carried by said brake heads, a tumbler shaft mounted on said truck, cam heads for said tumbler shaft, cam bars connecting said cam heads and said brake heads, and means for rotating said tumbler shaft to apply the brakes, substantially as shown and described.
4. The combination with four wheeled truck, brake heads pivotally supended from said truck, one for each wheel, a tumbler shaft carried by the truck and having cam portions, cam heads connecting the cam portions of the shaft with each brake head, means for rotating said shaft to apply or release the brakes, substantially as shown and described.
5. The combination with a four wheeled truck, brake heads pirotally supported from said truck, one for each wheel, a tumbler shaft carried by the truck and having cam portions, cam heads connecting the cam portions of the shaft with each brake head, means for rotating said shaft to apply or release the brakes, said last-named means comprising an operating cable and a pulley segment connected with the shaft.
6. The combination with a wheeled truck, of brakes for each wheel carried by the truck, a tumbler shaft co-operatively connected with said brakes, means for rotating said tumbler shaft, said tumbler shaft and its connection with the brakes having provisions in virtue of which when the shaft is rotated in one direction, the brakes will be applied to the wheels and when the shafts rotate in the opposite direction the brakes will be withdrawn from the wheels, substantially as shown and described.
7. The combination with a wheeled truck, bracket members supported theron, hangers pivotally mounted on said brackets, brake heads pivotally secured to said hangers, one brake head for each truck wheel. a brake shoe carried by each of said brake heads, tumbling shaft holders having bearings and secured to said truck, a tumbling shaft mounted in said tumbling shaft holder bearing and having cam portions, a cam lever connecting each of said brake heads with said cam portions of the tumbling shaft, a gear carPled by the tumbling shaft, a cable mounted thereto and passed over the gear segment. Idler pulleva mounted in bearings secured to the car body over cach of said cables, and an air actuating mechanism for operating said cable, substantially as shown and described.
8. The combination with a brake shoe and a rotatable shaft, of means connecting the brake shoe and the shaft and having provision in virtue of which when the shaft is rotated in one direction, the brake shoe will be applied to the wheel and when the shaft is rotated in the other direction the brake shoe will be withdrawn from the wheel, substantially as shown and described.
9. The combination with a plurality of brake shoea and means for mounting the same, of a rotatable shaft common to all of said brake shoes and co-operatively consected therewith, said rotatable shaft and its connection with the brake shoes having provision in virtue of which when the shaft is rotated in one direction the brake shoe will be applied to the wheel and when the shaft is rotated in the opposite direction the brake shoes will be withdrawn from the wheel, substantially as shown and described.
10. The combination with a plurality of brake shoes and means for mounting the same, of a rotatable shaft common to all of said brake shoes and co-operatively connected therewith, said rotatable shaft and its connection with the brake shoes having provisions in virtue of which when the shaft is rotated in one direction the brake shoes will be applied to the wheel and when the shalt is rotated in the opposite direction the brake shoes will be withdrawn from the wheel, and means for rotating said shaft.
11. The combination with a wheeled truck. of bracket members carried thereby and arranged in pairs, hangers pivotally suspended from said bracket members, brake heads carried by said hangers, brake shoes carried by said brake heads, a tumbler shaft having cam heads, one for each pair of brakes, cam levers connecting said brake heads with said cam heads. a cable co-operatively connecting with said shaft for rotating the same, and means for drawing in or letting out the cable, substantially as shown and described.
12. The combination with a wheeled truck, of bracket members carried thereby and arranged in pairs, hangers pivotally suspended from sald bracket members, brake heads carried by said hangers, brake shoes carried by said brake heads, a tumbler shaft having cam heads, one for each pair of brakes. cam levers connecting said brake heads with said cam heads, a cable co-operatively connecting with said shaft for rotating the same, said cam heads comprising a body portion. a pair of disc members and cam pins held between said disc members and uniting the same and receiving said cam levers, substantially as shown and described.
13. The combination with a wheeled truck, bracket members supported thereon. hangers pivotally mounted on said brackets, brake heads pivotally secured to said hangers, one brake for each truck wheel, a brake shoe carried by each of said brake heads, tumbling shaft holders having bearings and secured to said truck, a tumbling shaft mounted in said tumbling shaft holder bearings and having cam portions, a cam lever connecting each of said brake heads with said am portions of the tumbling shaft, a gear carried by the tumbling shaft, a cable secured thereto and passed over the gear segment, idler pulleys mounted in bearings secured to the car body over each of said cables, and air actuated acchanism for operating said cable. said air actuating mechanism comprising an air operated cylinder and piston, a lever pivotally connected with the car body and with the eylinder piston, a float lever connected with said piston connected lever, said cables connected with said float lever, substantially as shown and described.
14. The combination with a wheeled truck, brake shoes pivotally mounted on the truck, rotatable shafts carried by each truck, means co-operatively connecting the shafts and the brake shoes together, said shaft and said connecting means having provisions in virtue of which when the shaft is rotated in one direction the brakes will be applied, and when rotated in an opposite direction the brakes will be released, means for rotating the shaft, said last-named means comprising a pulley segment secured to the shafts, and operating cable connected with the pulley segment, means for drawing taut or relaxing the cable, said lastnamed means comprising an air actuated pusher rod, a lever connected therewith, a float lever connected with gald pusher rod connected lever, said cables connected with said float lever and means for supporting sald float lever, substantially as shown and described.
15. A brake operating mechanism combined with means for adjusting the braking percentage of the brake operating mechanism, substantially as shown and described.
16. A car truck, brake devices mounted on the car truck, pneumatic means for operating the brake devices, connecting means between the operating means and the brake devices, combined with means interposed in said connecting means for adjusting the breaking percentage, substantially as shown and described.
17. Brake operating means. brakes operable by said brake operating means, connections between sald brake operating means and said brakes combined with means interpased in said connecting means for varying said connecting means
to change the breaking percentage，substantially as shown and described．
18．The combination with a wheeled truck，bracket mem－ bers supported thereon，hangers pivotally mounted on said brackets，brake heads pivotally secured to said hangers，one brake for each truck wheel，a brake shoe carried by each of said brake heads，tumbling shaft holders having bearings and secured to said truck，a tumbling shaft mounted in said tumbling shaft holder bearings and having cam portions，a cam lever connecting each of said brake heads with said cam portions of the tumbling shaft．a pulley segment car－ ried by the tumbling shaft，a cable secured thereto and passed over the pulley segment，idler pulleys mounted in bearings secured to the cam body over which said cable passes，an air actuated mechanism for operating said cable． said air actuating mechanism comprising an air operated cylinder and piston，a lever pivotally connected with the car body and with the cylinder piston，a float lever con－ nected with said niston connected lever，said cables con－ nected with said float lever．and adjusting mechanism co－ operating with the piston connected lever，substantially as shown and described．
19．The combination with a whecled truck．brake shoes plvotally mounted on the truck．rotatable shafts carried by each truck，means co－operating connecting the shafts and the brake shoes together．said shafts and said connect－ ing means having provisions in virtue of which when the shaft is rotated in one direction the brakes will be applied． and when rotated in an opposite direction the brakes will be released，means for rotating the shaft．said last－named means comprising a nulley scement secured to the shafts， an operating cable connected with the pulley scoment， means for drawing taut or relaxing the cable．said last－ namod means comprising an air actuated pusher rod．a lever connected therewith．a float lever connected with said push－ or rod connected lever．said cabies connerted with sald float lover．means for supnorting said foat lever，and adiusting mechanism co－operating with the piston rod connected Inver．substantially as shown and described．

2＾．In a brakn rigging．a brakn merhanism，a brake oper－ ating mechanism．nower transmission connections between tho brakn operating mechanism and the brake mechanism． said nower transmission connections including a pivoted power transmitting lever．combined with an adjusting mech－ anisin for varying the leverage of said lever．substantially as shown and described．
21．In a brake rigging，a brake mechanism．a brake oper－ ating mechanism．power transmission connertions between the brake operating mechanism and the brake mechanism． said power transmission connections including a pivoted power transmitting lever．combined with an adjusting mech－ anism for varying the levorage of sald lever，said adjust－ ing mechanism comprising an endwise movable rod．a slid－ ing conncetion for said lever to which said rod is pivotally connected．and means for moving sald rof longitudinally． substantially as shown and described．

22．In a brake rigging．a brake mechanism，a brake oper－ ating mechanism，power transmission ronnertions between tho brake operating mechanism and the brake mechanism． said power transmission connections including a pivoted power transmitting lever．combined with an adjusting mech－ anism for varying the leverage of said lever，said adjusting mechanism comprising an endwise movable rod．a sliding connection for said lever to which said rod is pivotally connected．means for moving said rod longitudinally，said last－named means comprising a slide bar connected with said rod．a crank shaft．a worm carried by said crank shaft， and entering a slot in said slide rod．substantially as shown and described．
23．In a brake rigging a brake mechanism，a brake oper－ ating mechanism．power transmission connections between the brake operating mechanism and the brake mechanism． said power transmitting connections including a pivoted power transmitting lever．combined with an adjusting mech－ anism for varying the leverage of said lever，said adjusting mechanism comprising an endwise movable rod．a sliding connection for said lever to which said rod is pivotally connected．means for moving said rod longitudinally．said last－named means comprising a slide har connected with said rod．a crank shaft．a worm carried by said crank shaft，and entering a slot in said slide rod．and means for holding the crank shaft in its adjusted positions，substan－ tially as shown and described．

No．102，466．Garment Fitting System． Nystìme d＇ajuster les vêtements．
Harry Litwin，Montreal，Quebec，Canada，11th December， 1906： 6 years．Filed 16 th November，1906．Receipt No． 141，263．
Claim－1．A fitting system comprising a plurality of flex－ ible mezabers，and means for sticking the said members to－
gether in conformity with the figure or thing being fitted， substantially as described and for the purpose set forth．

2．A fitting system comprising a plurality of flexible pat－ tern shapes and other pieces and means for sticking the said shapes and other pieces together in conformity with the figure or thing being fitted，substantially as described and for the purpose set forth．
3．A pattern comprising a plurality of flexible strips stuck together，substantially as described and for the purpose set forth．

4．A shape comprising a series of separate patterns conjointly corforming to a figure or thing to be fitted and each made up of a plurality of fiexible pleces stuck to－ gether，substantially as described and for the purpose set forth．
5．A shape comprising a series of separate patterns con－ jointly conforming to a figure or thing to be fitted and each made up of a plurality of flexible pleces stuck together． and a cord tied around the smallest part of the figure or thing，substantially as described and for the purpose set forth．

6．A form unon which to fit a garment，comprising a series of united patterns conjointly conforming to a figuire or thing to be fitted and each made up of a plurality of flexible pieces stuck together，substantlally as described and for the purpose set forth．

7．A form unon which to fit a garment，comprising a series of united patterns conjointly conforming to a figure or thing to be fitted and each made up of a plurality of flexible pieces stuck together，and a cord tied around the smallest part of the figure or thing．substantially as des－ cribed and for the purpose set forth．
8．The method of forming a pattern consisting in sticking together，unon the figure or thing to be fitted，a plurallty of nieces of flexible material and mounding the sald pleces to the figure or thing while being stuck together，substan－ tially as lescribed and for the purpose set forth．
9．The method of forming a pattern consisting in sticking together，unon the figure or thing to be fitted，a plurality of pleces of flexible material and moulding the said pieces to the figure or thing while being stuck together and tying a cord around the figure or thing during the process，sub－ stantially as described and for the purpose set forth．

No．102，467．Commode Top．Dcssus de commode．

William H．Mackenrot，Fort William，Ontario，Canada，11th December，1906： 6 years．Filed 27th June，1906．Ro－ ceipt No．137，336．
Claim．－1．In a commode the combination of a seat pro－ vided with the usual opening and having an annular groove formed therein to receive the rim of a pail，a tubular rub－ ber nacking in the bottom of the groove，a lld provided with a tubular rubber packing ring adapted to engage the

\footnotetext{

\(\qquad\)

\(\qquad\)
\(\qquad\) 
教都  析者
 \(-\)

top of the seat, and a projection on the IId of substantially the same size and shape as the opening in the seat, substantially as described.
2. In a commode the combination of a seat provided with the usual opening and having an annular groove formed thereln to receive the rim of a pail, and a tubular rubber packing in the bottom of the groove, substantially as descri blead.

No. 102,468. Vehicle Brake. F'vin de véhiculcs.

John W .McIlvain, Canyon Creek, Montana, U.S.A., 11th December, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,008.
Claim.-1. In a vehicle brake, the combination with a rotatable device having an annular flange at one side, of a brake shoe, a suitable support therefor, a flange extending from the shoe at one side, a iriction device interposed between the shoe and rotatable device and interposed between and detached from their flanges, and means for preventing longitudinal displacement of the friction device.
2. The combination with a rotatable device adanted to be secured to the wheel of a vehicle, of a beam, a recessed shoe forming a seat for the beam, an annular strap secured to the shoe and extending over the recess, sald strap surrounding the beam, means within the strap for adjustably securing the shoe to the beam, an integral flange at one side of the shoe, and a friction plate concentric with the rotatable device and engaging the shoe and overlapped by its flange, said plate adapted to contact with and to be held in engagement with the shoe solely by the rotatable device.
3. The combination with wheels of a vehicle and flanged friction drums secured thereto, of a spring controlled brake beam interposed between eaid wheels, recessed shoes constituting seats for the brake beam, angular straps secured to said shoes and extending around the beam, means within the straps for adjustably securing the shoes to the beam, said shoes having integral flanges upon their adjoining faces, friction plates concentric with the drums and interposed between the flanges of the shoes and drums, and means upon the plates for detachably engaging the shoes, said plates being adapted to contact with and to be held in engagement with the shoes solely by the drums.
4. In a vehicle brake, the combination with a rotatable device having an annular flange at one side, of a beam, a brake shoe secured thereto, a flange extending from the shoe, a friction plate interposed between the shoe and the rotatable device and between their flanges and means upon the plate for loosely engaging the shoe, said means being held in engagement with the shoe by the rotatable device upon which the friction plate works.

No. 102,469. Bod. Lit.
John Gilbert Ryan, Montreal, Quebec, Canada, 11th December, 1906; 6 years. Filed 5th ctober, 1906. Receipt No. 140,046.
Claim.-1. A head rest comprising a U-shaped frame, pivoted members supporting the extremities of said frame, a toothed segment integral with one of said pivoted members. a worm engaging said segment. a lever formed integral with the other of said pivoted members, a spring actuated tension drum, means connecting the extremity of the lever and the drum, and a sliding stop adapted to lock said drum in position.
2. A head rest comprising a pivotally supported frame. a toothed segment mounted on one side of said frame, a worm engaging said segment, a lever mounted on the op-
posite side of said frame, a pin on the extremity of said lever, a spring actuated drum, means connecting said pin and drum, and means for locking sald drum in position.

3. A head rest comprising a U-shaped frame work, pivoted members supporting the extremities of said framework, a toothed segment mounted on one of said pivoted members, a worm engaging said segment, a lever mounted on the opposing pivoted member, a pin on the extremity of said lever, a spring actuated drum, a chain connecting said pin and drum and locking said drum in position.
4. In a device of the class described, a U-shaped frame, pivoted members supporting the extremities of said frame, a toothed segment integral with one of said pivoted members, a"worm engaging with said segment, a lever integral With the opposite pivoted member, a pin on the extremity of said lever, a drum, a fixed post carrying said drum, a spiral spring carried by said drum, a chain connecting said pin and drum, and a sliding stock adanted to lock said drum in position.
5. In a device of the class described, a U-shaped framework, a pivoted member supporting the extremities of said framework, a toothed segment mounted on one of said pivoted members, a worm engaging said segment, a lever mounted on the opposite pivoted member, a spring actuated drum, means connecting the extremity of the lever and the drum, toothed flanges mounted on said drum, and means for locking saîd drum in position.

No. 102,470. Horseshoe. Fer d cheval.

Harvey W. Seiber, Canal Dover, Ohio, U.S.A., 11th Deccember, 1906; 6 years. Flled 19th November, 1906. Receipt No. 141,334.
Claim.-1. A horseshoe provided with a recess defined by a concave wall with its radius substantially equal to the radius of the adjacent portion of the shoe, a caulk having convex sides so proportioned that either will fit the concave wall and the other conform to the curvature of the shoe, and means for securing the caulk within the recess.
2. A horseshoe provided with a recess defined by a concave wall with its radius substantially equal to the radius of, but oppositely disposed to the curvature of the adjacent portion of the shoe, a caulk having convex sides so proportioned that either will fit the concave wall and the other conform to the curvature of the shoe and means for securing the caulk removably within the recess.
3. A harseshoe provided with a recess, one side of which is defined by the curvature of the shoe and the opposite wall curved in a similar ardius, a socket formed within the area of the recess, a caulk having convex sides so pro-
portioned as to interchangeably fit the concave wall of the recess and baving a stud proportioned to fit within the socket and means to secure the stud removably within the socket.
4. A horseshoe provided with a recess, one side of which is defined by the curvature of the shoe and the opposite wall curved in a similar radius. a socket formed within the area of the recess, a caulk having convex sides so proportioned that either will fit the concave wall and the other conform to the curvature of the shoe and having a stud proportioned to fit within the socket, and means to secure the stud removably within the socket.
5. A horseshoe provided with a recess, one side of which is defined by the curvature of the shoe and the opposite wall curved on a similar radius, a socket formed within the area of the recess, an opening transecting the socket, a caulk having convex sides so proportioned that either will fit the concave wall and the other conform to the curvature of the shoe, a stud formed rigid with the caulk and proportioned to fit within the socket and having an opening approximately registering with the opening in the shoe, and a pin proportioned to be removably driven into the opening in the shoe and through the opening in the caulk.

\section*{Mo. 102,471. Addressing Machime.}

Machine à adresser.

Edward P. Sheldon and Ward B. Story, co-inventors, both of New York City, New York, U.S.A.. 11th December, 1906; 6 years. Flled 18th November, 1904. Receipt No. 120,116.
Claim.-1. In an addressing machine, the combination with a Prame having a bed and galleys adapted to hold separate lines or groups of lines of type and to be slid over the bed, of feeding fingers adapted to engage the successive lines or groups of lines of type of one or the other of the galleys and move the same the distance occupied by the line or group of lines, and means for moving the fingers to enable them to propel the galleys.
2. In an addressing machine, the combination with a frame provided with anti-friction rollers and a bed, of galleys adapted to hold lines of type and to travel, one at a time. over the bed and rollers, pivoted fingers adapted to engage successive lines of type of one or the other galley, sliding blocks carrying the pivots of the fingers, and means for actuating the blocks.
3. In an addressing machine, the combination with a frame having a bed, of galleys adapted to contain separate lines or grouns of lines of type and to travel on either side of the bed, feeding fingers adapted to alternately engage successive lines or groups of lines of the galleys, means for actuating the feeding fingers and means for shifting the feeding fingers so that but one is operating at a time.
4. In an addressing machine, the combination with a frame having a bed, of galleys adapted to slide on either side of the bed and carry separated lines or groups of llnes of type, feeding fingers engaging the type of one of the galleys on each side of the bed alternately, means for aotuating the fingers so as to advance a galley a certain distance and means operated by the advancing galley to shift the fingers for engagement with the galley on the other side of the bed.
5. In an addressing machine, the combination with a frame having a bed, of galleys adapted to travel on either side of the bed and carrying lines of type, pivoted fingers adapted to be alternately in and out of engagement with the lines of type, sliding blocks carrying the pivoted fingers, means for sliding the blocks to cause the fingers to
reciprocate longitudinally and advance a galley a predetermined distance, a projection carried by the galleys and means connected with the fecding fingers sdapted to strike the projection and throw out of operation the feeding finger of the galley and render operative the finger for the galley on the other side of the machine.
6. In an addressing machine, the combination with a frame having a bed, of galleys adapted to travel over the bed alternately and carry separated lines or groups of lines of type, feeding fingers adapted to alternately engage a line of type of one or the other galley, sliding blocks carrying the fingers, means for sliding the blocks, a plate carried by the bed between the two galleys, a sliding bar carried by the plate and obstructing the movement of the inoperative galley, projections carried by the galleys and adapted to shift the obstructing bar and simultaneously disengage one feed finger and engage the other, and means carried by the plate, connected with the slide bar and feed fingers, and adapted to be struck by the projections and shift those parts.
7. In an addressing machine, the combination with a frame having a horizontal bed, of galleys adapted to travel on each side of the horizontal bed and carrying separated lines or groups of lines of type, feeding flugers on each side of the bed adapted to be alternately shifted so as to be thrown in and out of engagement with the lines of type, sliding blocks carrying the feed fingers, means for sliding the blocks, a plate carried by the bed between each galley, a slide bar carried by the plate and adapted to obstruct the movement of either one galley or the other. projections carried by the galleys and their ends, a fourarm lever pivoted to the plate, curved fingers connected with the lever and adapted to engage the projections carried by the galleys, and change the position of the lever and means connected with the lever for automatically carrying and holding one feed finger beyond the range of the lines of type and allowing the other feed finger to engage the lines of type or vice versa.
8. In an addressing machine, the combination with a frame having a horizontal bed, of galleys adapted to travel on each side of the bed and carrying separated lines or groups of lines of type and projections, feeding fingers adapted to be alternately shifted and held out of engagement with the lines of type, means for alternately holding the fingers out of range of the lines of type, a plate secured to the bed between the galleys, a sliding bar carried by the plate and adapted to be moved in the path of the indejection of one or the other galley and prevent its reverse movement, means for sliding the bar, curved fingers adapted to engage the projection of the moving galley and means connected with the engaging curved finger for effecting the shifting of the bar and actuating the means for holding the feed fingers out of range of the lines of type.
9. In an addressing machine the combination of a trame having a bed, of galleys adapted to travel over the bed one at a time and carry separated lines or groups of lines of typs, feeding fingers adapted to alternately engage the type lines of one or the other galley, sliding blocks carrying the feedIng fingers, oscilliating levers connected with the sliding blocks, and means for rocking the oscillating levers.
10 In an addressing machine the combination wih a frame having a bed, of galleys adapted to travel over the bed and carry separated lines or groups of lines of type, feeding fingers adapted to be thrown into engagement with the type of the galleys alternately, means for alternately shifting the fingers, sliding blocks carrying the feed fingers, a shaft journalled in the frame of the machine, crank arms carried by the shaft and connected with the sliding blocks by links, an arm carried by the shaft, a driving shaft and a cam on the driving shaft adapted to rock the arm on the first shaft.
11. In an addressing machine the combination with a framo having a bed, of galleys adapted to travel over the bed and carry separated lines or groups of lines of type, sliding blocks carried by the bed, guide ways with retaining means for the sliding blocks, feeding fingers pivoted to the blocks and alternately engaging the type in one galley or the other galley, means carrled by the galleys for alternately disengaging the feeding fingers, and means for actuating the sliding blocks.
12. In an addressing machine the combination with a frame having a horizontal bed, of galleys adapted to traverse the bed, means for propelling the galleys, a laterally disposed and sliding bar on the bed adapted to be set in the path of one of the galleys, to limit its movement along the bed, a driving shaft, a pulley loosely mounted on the driving shaft, means for connecting the pulley with the driving shaft, and means interposed between the connecting means and the sliding bar for starting the machine when the bar is slid out of the path of the galley.
13. In an addressing machine the combination with a frame having a horizontal bar, of galleys adapted to traverse the
bed, means for propelling the galleys, a laterally disposed and sliding bar adapted to be set in the path of one of the galleys, a spring connected yoke carried by the sliding bar, a crank arm carried by a vertical shaft journalled in the bed of the machine, said crank arm having its free end connected with the yoke, a second crank arm carried by the vertical shaft, a lever fulcrumed to the under side of the bed and having one end connected with the second crank arm by a link, a starting rod connected with the other end of the lever, u driving pulley, a driving shaft carrying same and having means for connecting and disconnecting to itself the driving pulley, and means connected with the starting rod and lever for operating the connecting and disconnecting means on the driving shaft.
14. In an addressing machine the combination with a frame having a bed, of galleys adapted to traverse the bed, feeding fingers adapted to propel one or the other galley, means for operating the feeding fingers, a laterally disposed and sliding bar adapted to be set in the path of one or the other of the galleys, a forked leves connected wih the sliding bar, crank arms carried by a vertical shaft journalled in the bed of the machine, one of the arms being connecird with the forked lever, hooked fingers carried by opposite arms on the vertical shaft and adapted to shift the la:t.... slugs or projections carried in the lower ends of the gall?ys and engaged by one or the other of the hooked fingers, means for disengaging the hooked finger after it has ion carried a limited distance by the slug, a spring connected with an arm of the vertical shaft to hold the same in one if two shifted positions, arm secured to engage the feeding fingers and hold them alternately out of play and connections between the cams and the arms beneath the table for operating the cams when the hooked fingers shift the vertical shaft.
15. In an addressing machine the combination with a irame having a bed, of galleys carrying separated lines of type or groups of lines of type and adapted to traverse each side of the bed of the machine, sliding blocks moving longitudl aily along the bed, means for sliding the blocks, feeding fitgers pivoted to the blocks and adapted to engage the lines of one or the other galley, cams controlling the swing of the fingers and adapted to throw one or the other out of line of engagement with the lines of type, projections or slugs carried by the galleys, and means adapted to engage the slugs and reverse the action of the cams.
16. In an addressing machine the combination with a irame having a bed, of galleys carrying separated lines or groups of lines of type and adapted to travel on different sides of the bed, blocks carried by the bed and adapted to reciprocate parallel with the movement of the galleys, means for reciprocating the blocks, pivoted feed fingers carried by the blocks and adapted to alternately engage the type of the galleys, cams with shafts journalled in the bed and acting upon the fingers so as to bold one or the other finger out of engagement with the lines of type, crank arms at the lower ends of the cam shafts, slugs or projections in the galleys, a plate secured to the bed between the path of the galleys, a four-armed lever pivoted to he plate, curved fingers carried by opposite arms of the lever and held in the path of the projections or slugs to engage the same so as to shift the four-armed lever, a lever secured to the pivot of the latter, links connecting the ends of the same to the crank arms on the shafts of the cams and a spring connected with one of the thems of the four-armed lever to hold it to one side or the arms
17. In an addressing machine the combination with a frame having a bed, of galleys adapted to traverse each side of the bed, independently operating feed fingers far propelling the galleys, means for operating the feed fingers, inking rollers carried by brackets at the front end of the machine, a yoke pivoted to the brackets and carrying at its free end an ink supply roller which is nermally adapted to rest on the inking rollers, means for rotating the supply roller, levers pivoted to the frame, the inner ends of which are connected with the yoke by a link, a roller carried by the outer ends of the levers and adapted to be depressed when either galley with type is introduced into the machine and to cause the supply roller to leave the inking rollers.
18. In an addressing machine, the combination with a frame having a bed, of galleys adapted to move singly alone the bed, means for moving the galleys, impression blocks adapted to carry the paper to be addressed against the face of the type in one of the galleys, a crossbar carrying the stems of the impression blocks, springs interposed between the blocks and the crossbar, vertical rods carrying the ends of the crossbar and playing through openings in the bed, and means for actuating the vertical rods.
19. In an addressing machine, the combination of the following parts: a power shaft, cams carried by the same, a horizontal bed, vertically moving rods actuated by the cams and passing through the bed, a crossbar joining the vertical rods above the bed, lmpression blocks with stems brerings on the crossbar for the stems each having a slot
to receive a pin on the stem and springs interposed betwen the tions and the bearings.
20. In an addressing machine, the combination with a bed, of a latterly disposed and slotted frame carried by the bed, punches plying through the upper wall of the slot, a crossbar moving vertically, means for moving the crossbar, a spring adjustable on the crossbar and pressing on the puluches to actuate the same when the crossbar descends. fird mians for removing the bits of paper removed by the juments.
21. In an addrocsing machine, the combination with a bcc, of a latterly disposed and slotted frame carried by the bed, punclies piaying vertically through the horizontal walls of the s.ot a compartment for the reception of waste benezth the slot and open at one end, a bellows discharging into the compartment at the closed end, a srossbar cirryisy in adjustable spring which is adapted to depress tiue punches when the cross arm descends, means for oferaing the crossbar and means for operating the bellows.
22. In 37 addressing machine, the combination with a bed, of galleys adapted to move singly along the bed, in \(\rightarrow\) ans for prictling the galleys, means for supporting a wob of paper. infans for feeding the web of paper, impressior tlocks, a crossbar carrying the blocks, vertical rods carrying the ciossbar at each end and adapted to move vcrtically through the bed, a power shaft, means carried by the sam: in actuate the vertical rods, punches adapted to overate simultareously with the impression blocks to perforala the paper when the address is printed, a presser spring carried ijy the crossbar and adapted to operate the punches, wians for removing the waste from beneath the punches and micans connected with the dower shaft for operatizg this means.
23. In an addressing machine, the combination with a fram? having a bed, of galleys adapted to traverse the bed one at a time, means for propelling the galleys, anti-frictlon rollers, levers carryifg the rollers and pivoted beneath the hed, pivoted arms supporting the free ends of the l.vers, and means automatically operated by the galleys to rock the arms and release the free ends of the levers.
24. In an addressing machine, the combination of a frame having a bed provided with openings, of galleys adapted to move singly along each side of the bed, means for moving the galleys, levers pivoted at one end in the openings, rollers carried by the levers, pivoted arms supporting the levers at their free ends, means operated by .he galleys to automatically release the levers from the support of the pivoted arms when the galleys leave the bed and reach the rollers on the levers, endless belts moving beneath the normal position of the levers and adapted to receive the galleys when the levers drop, means for moving the belts and means for returning the levers to their normal positions.
25. In an addressing machine, the combination with a frame having a bed provided with openings, and levers pivoted beneath the bed and within the openings, of galleys adanted to move along the bed of the machife and on to the levers, means for moving the galleys, anti-friction rollers on the levers, swinging arms supporting the free ends of the levers, means for returning the swinging arms to their normal positions, a shaft rigidly carrying the pivoted ends of the levers, arms secured to the hubs of the levers, springs attached to the latter arms and to the frame of the machine and adapted to return the levers o their normal positions, levers fulcrumed on the shaft links carried by the upper ends of the fulcrumed levers in the paths of the galleys, adjustable lateral projections carried by the links, links connecting the lower ends of the fulcrumed levers with the swinging arms, rollers carried by the shaft, endless belts passing around the rollers and in the path of the galley carrying levers and means a the front end of the machine for carrying and driving the endless belts.
26. In an addressing machine, the combination with a frame having a harizontal bed provided with openings, of galleys adapted to traverse the bed, pivoted levers arranged in the openings and adapted to receive the galleys, anti-friction rollers carried by the levers, means for retaining the levers in their normal position, means for releasing a lever after it has received its galley, endless bands travelling in the path of the released lever to receive the galleys, pulleys on the pivotal shaft of the levers and carrying the bands, pulleys at the front end of the frame, motive means for the latter pulleys, shelves at the front of the machine adjacent to the motive pulleys and brackets on the inner sides of the frame parallel with the upper parts of the bands to support same while carrying the galleys.
27. In an addressing machine the comb'nation with a frame with an upright structure, and means for supporting a roll
of paper carried by the same, of constant feeding means, intermittent re-winding means, means for addressing the paper between the feeding and the re-winding, means for taking up the slack paper between the feeding means and the addressing means, a friction disc driving the feed rolls, a rock bar and ratnhet wheel driving the re-winding rolls, a power shaft, means connecting he friction disc with the power shaft, and means interposed between the power shaft and the rack bar to reciprocate same.
28. In an addressing machine the combination wih a frame having an upright structure, and means for supporting a roll of paper carried by the said upright structure, of feeding rollers, a friction disc carried by the shaft of one of the rollers, a friction pulley adapted to drive the disc, a vertical shaft carrying the pulley at one end, a micre gear at the other end of the vertical shaft, a stud carrying a corresponding mitre ger, gearing with the first, nd a pinion, and a gear wheel meshing with the pinion, and a gear wheel on the power shaft meshing wih the gear wheel which drives the pinion, printing means for addressing the paper rewinding means and intermediate gearing meshing with the gear wheel on the power shaft, and means for taking up the slack between the feed rollers and the printing means.
29. In an addressing machine he combination with means for supporting a roll of paper, and means for feeding the paper continuously, of printing means for addressing the paper, means for taking up the slack interposed between the printing and continuous feeding means, an intermittent re-winding roller, a weighted re-winding shaft carrying the addressed paper, intemediate rollers between the intermittene roller and the re-winding shatt and its paper roll and supporting and rotating the latter, a ratchet wheel on the shaft of the re-winding roller, a pawl adapted to carry the ratchet wheel through a predetermined arc, a gear wheel connected with the pawl, a rack bar operating the gear wheel, and means for reciprocating the rack bar.
30. In an addressing machine the fombination with a paper roll supporting means and paper reeding means, of printing means, perforating means connected with the printing means a re-winding roller, a shaft for the re-wound roll, interposed supporting and rotating rollers, a reciprocating rack bar intenmittent means operated by the rack bar for actuating the re-winding roller, a driving shaft with a gear wheel, a gear pheel meshing with the wheel on the driving shaft, a crank arm on the shaft of this second gear wheel, and means for adjustably connecting the end of the rack bar with the crank arm.
31. In an addressing machine the combination with a bed, of galleys adapted to traverse the bed itermittently, alternately on one side and then on the other, means for alternately intermittentiy feeding the galleys, rollers, adapted to ink the type of the galleys, an ink supply roller, means for automatically removing the supply roller from the inking rollers when a galley enters a machine, means for supporting a web of paper, continuous feed means for the wed of paper, intermittent printing means, means for intermittently rewinding the web after the address has been printed and means carried by each galley for shifing the feed to the other galley when the last address of the first galley has been printed.
32. In an addressing machine the combination with a bed, of galleys with addresses in type adapted to traverse the same, printing means, intermittent feeding means adapted to feed one galley at a time, means carried by each galley at its lower end which as the galley carries the last address awiay from the printing means shifts the feeding means into engagement with a new galley, inking means, means for supporting a web of paper, continuous paper feeding means, means for taking up the slack paper between the paper feed and the printing means, punching meaus, and adjustfeede re-winding means to allow the printing of the addresses at predetermined distances apart on the paper.
33. In an addressing machine the combination with a bed, of galleys with type set addresses, a sliding bar adapted to limit the movement of the first galley along the bed, inking means, paper feeding means, printing means, intermitting and alternating feed means for the galleys, punching means for the paper, re-winding means, and means for simultaneously starting the machine and shifting the sliding bar.
34. In an addressing machine the combination with a bed, of galleys adapted to be fed one at a time along the bed, means for feeding the galley, means for shifting the feed of the galleys, a sliding bar in the path of the first galley, means for removing the sliding bar when the machine is started, a bar shlfting to obstruct the path of the galley remaining at rest, and means connected with the feed shifting means for shifting the second bar from the path of the galley which the feed means is about to operate upon.

No. 102,472. Rail Joint. Joint de rall.

Jacob L. Stoffer, Homeworth, Ohio, U.S.A., 11th December, 1906; 6 years. Filed 20th November, 1906. Receipt No. 141,357.
Claim.-In a device of the class set forth, a bolt provided with a slot, a locking member mounted upon said bolt and provided with a tang and a recess, and a wedge member positioned in said slot and a recess and provided with a looth to be engaged by said tang.

No. 102,473. Locomotive Tender.
Tender de locomotives.

Charles M. Taylor, Lapinta, Callfornia, U.S.A., 11th December, 1906; 6 years. Filed 16th October, 1906. Receipt No. 140,344.
Claim.-A locomotive tender having a coal pit, a vertically swinging follower for moving coal forwardly in the pit, said follower being hinged at its lower end to the tender, a vertically swinging cyllnder arranged on and pivoted to the top of the tender at one side of the longitudinal vertical center thereof, a vertically swinging cylinder arranged on and pivoted to the top of the tender at the opposite side of the longitudinal vertical center thereof, a pipe for supplying the rear portions of the cylinders with fluid pressure, and pistons movable in the cylinders under the action of fluid pressure and connected to the follower at points intermediate the vertical center and side edges thereof.

\section*{No. 102,474. Rotary Tumbler Washer.}

\section*{Apparell rotatoire d laver les verres.}

Fred William Will, Aurora, Oregon, U.S.A., 11th December, 1906; 6 years. Filed 13th November, 1906. Receipt No. 141,178.
Claim.-1. A tumbler washer, comprising a frame having a depending arm at its upper end, and a foot at its lower end of feed discs connected with the foot, said discs having aligned openlngs, hubs journalled in the openings and each provided with a gear, the gears meshing with each other, a shaft journalled at one end and in the frame and having its other end secured to one of the hubs, flexible shafts provided with brushes secured to the other hubs, and means for rotatingy the first-named shaft.
2. A tumbler washer, comprising a frame having a depending arm at its upper end and a foot at its lower end,

spaced discs connected with the foot, said discs having aligned openings, hubs journalled in the openings and each provided with a gear, the gears meshing with each other, a vertical shaft journalled at one end in the frame and having its other end secured to one of the hubs, flexible shaits provided with brushes secured to the other hubs, a horizontal shaft journalled on the frame and provided with a handle whereby to rotate the same, and a connection between the vertical and the horizontal shafts.
3. A tumbler washer, comprising a frame having a foot at its lower end, spaced discs secured to the foot, said discs having aligned openings. hubs journalled in the openings and each provided with a gear, said gears meshing with each other, a shaft journalled at one end in the frame and having its other end secured to one of the hubs, flexible shafts provided with brushes adjustably secured to the other hubs, and means for rotating the first-named shaft.

No. 102,475. Electric Motor. Moteur électrique.

James Burke, Erie. Pennsylvania, U.S.A., 11th December, 1906; 6 years. Filed 15th January, 1906. Receipt No. 131,877.
Claim.-1. The combination of a driven shaft, a plurality of armatures disposed around the axial line of sald shaft and geared thereto, a composite field winding for each of said armatures alternating therewith and adapted to maintain a magnetic circuit common to two or more of sald armatures. 2. The combination of a driven shaft, a plurallty of armatures disposed around the axial line of said shaft and geared thereto and a composite field winding for each of said armatures, alternated therewith and adapted to maintain a single magnetic circuit common to all of said armatures.
3. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thercto, and a composite field winding for each of said armatures, alternated therewith and adapted to maintain a common magnetic circuit, said windings having extended radiating surfaces on their outer sides.
4. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, a single field core and composite fleld winding for each of said armatures, alternated therewith and maintaining a common magnetic circuit, the whole forming a cylindrical surface of alternate armatures and magnets.
5. The combination of a driven shaft, a plurality of arma-
tures disposed around the axial line of said shaft and geared thereto, a single field core and composite field winding for each of said armatures alternated therewith and adapted to maintain a common magnetic circuit and a cylindrical housing enclosing said parts and supporting said cores and windings.
6. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaf and geared thereto, fleld magnets alternated with said armatures, and a cylindrical housing enclosing sa armatures and magnets and serving to support said magnets.
7. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, fleld magnets alternated with said armatures forming a cylindrical outer surface of alternate armatures and magnets, and a cylindrical non-magnetic housing enclosing said armatures and magnets.
8. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, field magnets alternated with said armatures forming a cyylindrical outer surface of alternate armatures and magnets.
9. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, a single field core and composite field winding for each of said armatures alternated therewith and adapted to maintain a common magnetic circuit, and a housing enclosing said elements.
10. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, field magnets alternated with said armatures forming a common magnetic circuit, and a housing enclosing said armatures and magnets and supporting said magnets.
11. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, field magnets alternate with said armatures forming a common magnetic circuit, and a non-magnetic housing enclosing said armatures and mgnets and supporting said magnets.
12. The combination of a driven shaft, an electric motor geared thereto, comprising a plurality of armatures and field magnets and forming a substantially continuous annular ring about the axial line of said shaft, said magnets having a composite field winding for each armature and maintaining a common magnetic circuit.
13. The combination of a driven shaft, a plurality of armatures geared thereto, field magnets alternated with said armatures, and a composite field winding for each armature adapted to maintain a single magnetic circuit common to all of said field magnets and armatures.
14. The combination of a driven shaft, ap lurality of armatures disposed around the axial line of said shaft and geared thereto, a composite field winding for each armature adapted to maintain a single magnetic field circuit common to all of said armatures, said field winding being connected in series across the supply line for exciting said magnetic circuit.
15. In an electric motor, the combination of a plurality of armatures and field magnets alternately arranged to provide a single magnetic circuit common to all of said armatures and field magnets, said armatures being connected in series with each other, geries colls on sald magconnected in series, and shunt coils on sald magnets, said shunt coils being all in series with each other and in shunt nets alternated with said armatures and the whole being with all the armatures.
16. The combination of a driven shaft, a plurality of armatures disposed around the axial line of sald shaft and geared thereto, field cores alternated with sald armatures, and composite exciting coils on said cores, the several turns of said colls being wound in a direction substantially radial with reference to the shaft whereby the length of said coil circumferentially is contracted at its inner side and exapnded at its outer side, the whole structurehaving a substantially cylindrical outer surface.
17. The combination of a driven shaft, a plurality of armatures disposed around the axial lline of said shaft and geared thereto, field cores alternated with said armatures each of said cores having a comparatively shallow recess in its outer portion and a comparatively deep recess in its inner portion, and fleld coils wound in said recessed portions, the whole forming a compact and substantially cylindrical motor.
18. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, fleld magnets alternated with said armatures, a housing encircling said armatures and magnets and for supporting said magnets, and end heads for supporting said armatures.
19. The combination of a driven shaft, a plurality of armatures disposed around the axial line of sald shaft and geared thereto, field magnets alternated with said armatures, a housing encircling said armatures and magnets
and for supporting said magnets, and heads for supporting said armatures, brushes for said armatures, and means for supporting all of said brushes from one of sald heads.
20. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, fleld cores alternated with said armatures, each of said cores having a comparatively shallow recess in its outer portion and a comparatively deep recess in its inner portion, field coils wound in sald recessed portions, the whole forming a compact and cylindrical motor, a housing encircling said armatures and magnets and supporting said magnets, and heads for supporting said armatures, brushes for said armatures, and means for supporting all of said brushes from one of said heads.
21. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, a composite field winding for each of said armatures, alternated therewith and adapted to maintain a magnetic circuit common to all of sald armatures, sald windings having extended radiating surfaces on their outer sides, a housing for said part, and a ventilating space between sald housing and the extended surfaces of said windings.
22. The combination of a driven shaft, a plurality of armatures disposed around the axial line of said shaft and geared thereto, a single field core and compoaite feld winding for each of said armatures, alternated therewith and adapted to maintain a magnetic circuit common to all of seld armatures, said windings having extended radiating surfaces on their outer sides, a housing surrounding said parts and supporting said field cores, and ventilating spaces between said housing and the extended surfaces of said windings.

No. 102,476. Gas Lamp. Lampe ì gaz.

Louis C. Fuller. Kansas City, U.S.A., 11th December, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138.325.
Claim.-1. In an incandescent gas lamp having a Bunsen tube, an outer tube sleeved thereon and a chimney holder secured to said outer tube; the combination of a heat insulating bushing mounted upon said outer tube, and a tip holder mounted upon said bushing, whereby the heat communicated by the flame to the tip holder will be insulated from the chimney holder.
2. In a mantle gas lamp, a mantle holder formed of a single plece of wire and comprising a looped hook adapted to engage the upper edge of a chimney. a downwardly extending leg adapted to bear against the inner side of a chimney, and a depending hook adapted to support a mantle, qubstantially as described.
3. In a mantle gas lamp, the combination of a Bunsen tube provided with large longitudinal slots for the admission of air, an outer regulating tube revolubly mounted thereon and also provided with slots, a tubular screw formed of perforated metal mounted on the regulating tube to cover the slots therein and a chimney holder mounted on said Bunsen tube.
4. In a mantle gas lamp having a Bunsen tube and a chimney holder carried by said tube, the combination of a heat insulating bushing mounted on said tube, a tip holder mounted on sald bushing, a tip of woven wire carried by said holder and comprising a cylindrical portion and a top, and a perforaated disc secured to the inner side of said top.
5. In a mantle gas lamp, the combination of a Bunsen tube, a chimney holder and chimney supported thereby, a tip of woven wire mounted over the upper end of said tube and comprising a cylindrical portion and a top, and a perforated disc secured to the inner side of said top.

No. 102,477. Metal Piling. Pile métallique.

James J. Harold, New York City, New York, U.S.A., 11th December, 1906; 6 years. Filed 13th November, 1904 Receipt No. 300,201 .
Claim.-1. In metal sheet piling, a beam section consisting of a flat web plate and companion, locking angles rigidly mounted thereon, the respective edges of the web plate extending beyond the line of the free hook edges of the angles.
2. In metal sheet piling, a beam section consisting of a web plate and companion, locking angles rigidly mounted on and located adjacent to the respective edges thereof, the bent around hook edges of said angles being set at angle other than right angle.
3. In metal sheet piling, a channel beam section, and a piling section consisting of a web plate and companion angles rigidly mounted thereon and provided with hook edges adapted to conform to and interlock with the companion flanges on the channel beams in assembling the piling section in thelr alternate arrangement.

No. 102,478. Hull. Coquc.
Trax

Carcy Alan Manker, Pearl, Illinois, U.S.A., 11th December, 1906; 6 years. Filed 27th August, 1906. Recelpt No. 139.012.

Claim.-1. A vessel hull provided at its bow with means for horizontally dividing the waves through which it travels.
2. A vessel hull so constructed that as it travels through the water it splits the waves in horizonal planes and deflects them underneath the bottom of the hull.
3. A vessel hull provided at its bow with an approximately horizontally disposed wave cutting edge arranged above the surface of the water in which the vessel travels. 4. A vessel hull provided at its bow with a flat portion which extends upwardly and terminates in a wave cutting edge.
5. A vessel hull provided at its bow with a flat portion which inclines upwardly from the surface of the water and terminates in an inclined wave cutting edge extending in a horizontal plane below the top of the hull.
6. A vessel hull provided at its bow with laterally projectig wings arranged adjacent to the surface of the water and adapted to split the waves horizontally, the upper surfaces of said wings being concaved.
7. A vessel hull provided at its bow with means for horizontally dividing the waves through which it passes and having its sides inclined rearwardly and inwardly from a polnt adjacent the bow.
\[
2+2+0
\]

8. A vessel hull provided at its bow with means for horizontally dividing the waves through which it passes and deflecting them underneath the hull and having the sides of its submerged portion inclined rearwardly and inwardly from a point adjacent to the bow, said hull being provided with a concaved bottom.
9. A vessel hull provided at its bow with means for horizontally dividing the waves through which it travels and having the sides of its submerged portion inclined rearwardly and inwardly from a point adjacent the bow, said submerged portion having a concaved bottom surface which is narrower at its rear end than at its front end.
10. A vessel hull provided at its bow with a flat upwardly projecting portion that terminates in a horizontally disposed wave cutting edge, said flat portion extending rearwardly and merging into a tapered portion having a concaved bottom.
11. A vessel hull having a flat portion at its bow which is inclined upwardly from the water and terminates in a horizontally disposed wave cutting edge arranged in a plane below the top of the hull, the submerged portion of the hull diminishing graduallv in width toward the stern of the hull and being provided with a bottom surface that is concaved longitudinally and transversely.
12. A vessel hull which is of greatest width adjacent thbow and is provided with a horizontally disnosed wave cuting edge, the sides of said hull being inclined rearwardland inwardly from said widest portion toward the stern of the hull. and stability guards arranged above the water line and projecting laterally from the sides of sald hull.
13. A vessel hull which is of greatect width adiacent the bow and is provided with a horimnitally dienosed wave cutting edge. the sides of sain hull boing inclined rearwardlo and inwardly from said widest portion toward the stern of the hull, and stability guards arranged above the wathr line and projecting laterally from the sidns of said hull. sald stability guards increasing gradually in width from a point approximately midships toward the stern of the hull.
14. A vessel hull which is aporoximately cigar-shaned above the water line and which. below the maior nortion of the water line. is annroximatoly woden-shaned. with the wide portion of the wendge at the how of the hull and profecting above the surface of the water.
15. A vessel hull which is annroximatoly cicar-shanod ahove the water line and whirh below the maine nortinn of the water line. is anoroximatoly weder-shaned. with the widn portion of the wedge at the bow of the hull and nroincting above the surface of the water. the bottom surface of said wedge-shaned nortinn being concaved.
16. A vessel hull in which the nortinn holow the water line is approximately wedge-shaned with tho wide nortion of the wedge at the point of first contact of the hull with thi water.
17. A vessel in which the nortion below the water line is annroximately wedge-shaded with the wide nortion of the wedes at the noint of first contact of the hull with the water. the sides of caid submerger nortion curving inwardly toward the longitudinal axis of the hull.
18. A vessel hull in which the submerged nortion of the hull is of greatest width at first water contart section of the bow and thence diminiahea in width towari the stern of the hull where it comes to a noint. sald submerged portion increasing gradually in denth from the bow to the stern.
19. A vessel hull in which the Inngitudinal water lines of the stern extend forwardly and outwardly in convexed curver to points of first contact of the hull with the particles of water closing in the wake of the hull.
20. A vessel's stern lines diverging outwardiy and forwardy in convex curves to points of first contact of the hull with the water closing in the wake of the vessel.
21. A vessel hull in which the longitudinal water lines of the stern extend forwardly and outwardly in curves to points of first contact of the hull with the particles of water closing in the wake of the hull.
22. A vessel's stern lines diverging outwardly and forwardly in curves to points of first contact of the hull with the water closing in the wake of the vessel.
23. A vessel hull in which the side surfaces of the submerged portion are denoted by horizontal curves which diverge forwardly to position of greatest beam in horizontal planes, respectively represented by said curves, said beams gradually increasing from aft to a position approximately at the bow.
24. A vessel hull in which the side surfaces of the submerged portion are denoted by convex rurves which diverge forwardly to position of greatest beam in horizontal planes, respectively represented by said curves, said beams gradually increasing from aft to a position approximately at the

No. 102,479. Lamp Globe. Globe de lampes.

Charles Oliver, Woolwich. Kent, England. 11th December, 1906; 6 years. Filed 5th September, 1905. Receipt No. 128,199.
Claim.-1. In an enclosing globe or lantern for electric arc lamps wherein the points of both carbons are directed downwards in the well known flame or arc lamps, the ronstruction and arrangement of the sides of said globe or lantern of such material and in suchwise tha the surfaces of the globe directed along the street or turned towards the longer axis of the space to be lighted are made broader than the surfaces of said globe facing across the street or the short axis of the space to be lighted and arranging such broader surfaces so that same inwardly taper downwards and forming same of a material (such as ground glass) which will break up or diffuse laterally the downwardly directed rays of light from the aforesaid source substantially in the manner and for the purposes hereinbefore described.
2. The arrangement and combination with an electric arc lamp wherein the points of both carbons are directed downwards, as in the well known flame are lamp, of an enclosing globe or lantern having two broad sides oppositely disposed and two narrow sides locaed between same and having the broad sides inclined inwardly downwards and formed of ground glass or opalescent glass or the like which will break up or diffuse laterally the downwardly directed rays of light from the aforesaid source, substantially as and for the purpose hereinbefore set forth.

No. 102,480. Concrete Constructing Machine.
Machine pour la construire en béton.

Albert A. Yauly, Youngstown, Ohio, U.S.A., 11th December, 1906; 6 years. Filed 13th October, 1906. Receipt No. 140,269.
Olaim.-1. In a machine the combination with a base plate, of a rectangular frame adjustably mounted upon said plate, standards carried by said frame, brace rods connecting said standards and said frame, revoluble shafts carried by said brace rods, a crosshead carried by sald standards, a bar supported by said crosshead, chains connected with said shaft and extending over said crosshead and said bar, retaining boards supported by said standards, retaining boards adjustably mounted upon posts, substantially as described.
2. In a machine the combination of a base plate, standards adjustably mounted upon said base plate, a crosshead carried by said standards, a bar supported by said crosshead, retaining boards suspended from said crosshead and said bar, other retaining boards mounted adjacent to said base plate, means to adjust said retaining boards, substantially as des: cribed.

No. 102,481. Machine for Making Recentacles of Compressed Pulp.
Machine à faire des réceptacles de pulpe compressée.

William E. Schneider, Washington, District of Columbia. U.S.A., 11th December, 1906; 6 years. Filed 22nd Au gust, 1906. Receipt No. 138,815.
Claim.-1. A machine of the character described having a contractible mould, a collapsible mandrel, means to insert said mandrel into sald mould, means to feed material tis said mould, and means to remove the completed receptacle
2. A machine of the character described having a mould, a mandrel, a pipe leading from a source of supply of material for making receptacles, a measuring cup pivotally mounted below the outlet of said pipe, said cup having a plate extending therefrom adapted to close the outlet of said pipe while the cup is feeding the material contained therein to the mould.
3. A machine of the character described having a mould, a mandrel adapted to be raised from said mould, means to collapse said mandrel when raised, to release the completed receptacle, a basket mountd on pivoted arms, and means to swing sald basket on saild arms to a position below the mandrel and out from below said mandrel, for the purposes described.
3. A machine of the character described having a mould. a mandrel adapted to be raised from said mould, means to collapse said mandrel when raised to release the completed receptacle, a swinging basket for carrying off the completed receptacle, a pivoted feeding cup, an arm sccured to said cup, a link connecting said arm and basket, and means to oscillate said arm whereby said cup and basket are both actuated.
5. A machine of the character described having a plunger rod. a mandrel comprising welge sections and intermediate sections. a cap fitting over the ends of said sections and secured to said rod. said cap having radial slots in its horizontal nortion and vertical slots in its vertical portion, headed bolts secured to the wedge sections and extending through sald radial slots, unheaded bolts secured to the intermediate sections and extending through said vertical slots, a ring around said cap and connected to the projecting portions of sald unheaded bolts, a spring within said mandrel normally holding it expanded and a fixture adapted to engage said ring and collapse the mandrel against the energy of said spring.
6. A machine of the character described having a plunger rod, a mandrel secured to said rod and comprising wedge sections and intermediate sections, a portion of said rod extending into the mandrel, a nuut on the end of said portion of said rod, a spring arranged around said rod and abutting at one end against said nut, means to retain the wedge sections of the mandrel always in the same relation with the plunger rod, means to move the werge sections vertically with relation to the intermediate sections to collapse the mandrel, a bottom piece arranged below the ends of the sections of the mandrel, and a tube secured to said hottom piece and extending over and forming a bearing for the other end of said spring.
7. A machine of the character described having a contractible mould comprising a plurality of interlocking jaw members, toggle joints. one arranged between each of said jaw members and a fixture, each toggle having one member provided with a laterally offset finger extending in a line with the longitudinal axis of said member, a mandrel adapted to be inserted into said mould, a vertically movable piece arranged in the bottom of the mould and normally arranged below the level thereof, levers supporting said plece, and vertically movable rods having pins adapted to engage the fingers of the toggles to operate the same, said rods also having collars to engage the levers to raise the piece in the bottom of the mould.
8. A machinc of the character described having a contractible mould comprising a plurality of jaw members, each jaw member having an extending tongue engaging a groove in the adjacent member and each member having a portion of its inner surface near the base of its tongue cut out to give shape to the receptacle to be formed in the mould.
9. A machine of the character described having a contractible mould comprising a plurality of jaw members, said members having chambers therein, one between each adjacent pair thereof, the inner walls of said members having perforations leading to said chambers, a plate arranged below said member and having countersunk openings therein connected by grooves. said openings being located below said chambers. pipes fitted in said openings, and means to create a vacuum in said chambers and draw off the water pressed from the material through said pipes.
10. A machine of the character described having a contractible mould comprising a plurality of jaw members, said members having chambers therein, sald members having perforations leading to said chambers, a plate arranged below said members and having openings therein arranged below said chambers. an air-tight box arranged below sald plate. pipes connecting said box with the openings in sald plate and a pump connected up with sald box for the purpose specified.
11. A machine of the character described having a contractible mould comprising four jaw members, each member having two extending tongues arranged parallel to each other, one on the inner surface of said mould and the other at the outer surface thereof, and a third tongue extending across betwen said parallel tongues at the top of said jaw members, said members having chambers arranged between said inner and outer parallel tongues and below sald third tongues, sald chambers communicating with the interior of said mould. and means to draw water from the mould through sald chambers.
12. In a machine of the character described, a vertically movable head plate mounted on suitable guides, a screw connected to sald head plate and secured against rotation. a horizontal bevelled gear interiorly screw-threaded and mounted upon sald screw, oppositely extending shafts. each carrying a bevelled pinion and a loose gear, said pinions meshing with said horizontal gear, clutches on sald shafts to engage said loose gears, a gear wheel having cams on the sides of its periphery. each cam having three surfaces which are arranged in inverse order on opposite sides of said gear, a longitudinally movable mod having projecting rollers engaging said cams, pivoted levers engaging sald clutches and adapted to be actuated by said longitudinally movable rod, and means to revolve sald cam carrying gear for the purpose specified.
13. In a machtne of the character described. a contractible mould comprising a plurality of jaw members, means to onen and close said jaw members including vertically movable rods and a head plate to which sald rods are secured. a hollow screw connected to sald plate and secured against rotation, a horizontal bevelled gear interiorly screw-threaded and mounted on sald screw. a plunger rod extending up through said hollow screw, a mandrel secured to the end of said plunger rod, means to periodically reciprocate said plunger rod, and means to revolve said horizontal gear first in one direction then in another, and to leave sald gear stationary at the times when said plunger rod is being reciprocated.
14. In a machine of the character described. a contractible mould. means to open and close sald mould neriodically, a plunger rod, a mandrel mounted on said rod. a crank shaft carrying a crank adapted to reciprocate said plunger rod. a cam on sain shaft. a cup for feeding material to the mould, means of connection betwren said cam and cup whereby the former will operate the latter. and means to revolve the crank shaft at intervals when the mould is open to operate the cam for actuating the feeding cup and to turn sald crank to lower and raise the mandrel.

No. 102,482. Concrete Mizer. Mélangcur de bítnn.
Charles Raymond Weaver, Baltimore, Maryland, U.S.A.. 11th December, 1906; 6 years. Filed 19th October. 1906. Recelpt No. 140,437.
Claim.-1. In a concrete mixing and handing apparatus, the combination of a plurality of hoppers having bottom openings and adapted to be nested one within the other. and means for connecting said hoppers in series to permit them to be successively raised from their nested position and cause the material to pass successively from one hopper to the other as they are ralsed.
2. In a concrete mixing and handling apparatus, the combination of a plurality of hoppers having bottom openings and adanted to be nested one within the other, a preliminary mixing device associated with one of said hoppers,
and means for connecting said hoppers in series to permit them to be successively.raised from their nested position

and cause the material to pass successively from one hopper to the other as they are raised.
3. In a concrete mixing and handling apparatus, the combination of a plurality of hoppers having bottom openings and adapted to be nested within each other, a preliminary mixing device disposed within the top hopper. and means connecting said hoppers in series to permit them to be raised successively from their nested position and cause the material to pass successively from one to the other hopper of the series as thew are raised.
4. In a concrete mixing and handling apparatus, the combination of a plurality of hoppers having bottom openings and adapted to be nested within each other, doors for closing said openings, means connecting said hoppers in series to permit them to be successively raised from their nested poaition, and devices associated with said hoppers for automatically opening the doors of the upper hoppers as they are successively raised from said nested position.
5. In a concrete mixing and handling apparatus, the combination of a plurality of hoppers having bottom openings and adapted to be nested within each other, doors for closing said openings, means for successively raising the hoppers from their nested position, and devices associated with said hoppers for opening the doors to permit the material to pass from one hopper to the other.
6. In a concrete mixed and handling apparatus, the combination of a plurality of hoppers having bottom openings and adapted to be nested within each other, doors for closing said openings, a preliminary mixing device disposed in the top hopper of the series, means for successively raising the hoppers from their nested position, and devices for opening the doors to permit the material to pass from one hopper to the other.
7. In a device of the character described, the combination of a plurality of hoppers having bottom openings and adapted to be nested within each other, a preliminary mixing device disposed in the top hopper, means for connecting said hoppers in series to permit them to be successively raised from their nested position, and means for raising the preliminary mixing device in the top hopper.
8. The combination of a hopper, a preliminary mixing device disposed within said hopper, and having guides for centering gald device in said hopper and means for raising the preliminary mixing device.
9. The combination of a hopper having a bottom opening, a door for closing said opening, means for opening said door, a preliminary mixing device disposed within said hopper, and having guides for centering said device in said hopper, and means for raising the preliminary mixing device.
10. A device of the character described comprising a plurality of hoppers having bottom openings, doors for closing said openings, means for connecting said hoppers in series, to permit them to be successively raised, and automatic devices connected to the doors of the upper hoppers for successively opening the doors of the upper hoppers as they are raised.
11. In a device of the character described, the combination of a plurality of hoppers having bottom openings, and adapted to be nested in each other, hoisting slings for lifting the top hopper, wire ropes connecting the other hoppers of the series with the top hopper and stops arranged on said ropes for raising the hoppers successively, said stops. being disposed a distance apart to permit an upper hopper to be raised from the one beneath it before the latter is raised.
12. In a device of the character described, the combination of a plurality of hoppers having bottom openings, and adapted to be nested in each other, doors for closing said bottom openings, a flexible connection between the doors of each of the upper hoppers and the next lower hopper, guides through which said connections pass, and means for successively raising the hoppers from their nested position to cause the doors of the upper hoppers to be successively opened and permit material to pass through the bottom openings of the upper hoppers.
13. In a device of the character described, the combination of a plurality of hoppers having bottom openings and adapted to be nested in each other, means for flexibly connecting said hoppers in series to permit them to be successively raised from their nested position and cause material to pass successively from one hopper to the other as they are raised, and supports for the bottom hopper to sustain the nested hoppers in position to receive a charge of miaterials to be mixed.
14. In a device of the character described, the combination of a plurality of hoppers having bottom openings and adapted to be nested in each other, doors for closing said bottom openings, automatically operating devices for opening sald doors, means for flexibly connecting said hoppers in series to permit them to be successively raised from their nested position, and cause material to pass successively from one hopper to the other as they are raised and supports for the bottom hopper to sustain the nested hoppers in position to recelve a charge of material to be mixed.

No. 102,483. Electric Cleaning and Colour Setting Process.
Procédé électrique à colorer et netroyer.

George Dexter Burton, Boston, Massachusetts, U.S.A., 11th December, 1906; 6 years. Filed 5th December, 1905. Receipt No. 130,721.
Claim.-1. The process of treating fibrous substances and fabrics, which consists in immersing said material in a bath containing a chlorine producing solution, and passing an electric current through said bath while said materials are immersed therein.
2. The process of treating fabrics and other similar materials, which consists in immersing said material in a bath. and producing in said bath, by electrolysis, chlorine gases during the immersion of said material therein.
3. The process of treating fabrics and other similar materials, which consists in immersing said materials in a bath containing a solution of chloride of sodium, and passing an electric current through said bath while said materials are immersed.
4. The process of treating fabrics and other similar materials, which consists in immersing said materials in a bath containing a solution of chloride of sodium, and passing an electric current through said bath while sald materials are immersed, and then adding to said bath a quantity of sodium carbonate.
5. The process of treating fabrics and other similar materials, which consists in immersing said material in a bath containing a chlorine producing solution, heating sald bath, and then passing through it a current of electwcity while said material is immersed therein.
6. The process of treating fabrics and other similar materials, which consists in immersing said material in a bath containing a solution of water, chloride of sodium and
sodium carbonate, heating said bath, and then passing therethrough a current of electricity while said material is immersed therein.
7. The process of treating fabrics and other similar matrrials, which consists in immersing said material in a bath of water containing sufficient chloride of sodium and sodium carbonate in the proportion of one part of the former to three of the latter to increase the density of the water to about 1.015 or \(1 \cdot 020\), raising the temperature of said solution to about eighty degrees fahrenheit, and then passing through said bath a current of electricity while said material is immersed therein.
8. The process of treating fabrics and other similar materials, which consists in immersing said material in a bath in which wool has been degreased and cleansed, mixing in said bath a solution of about one part chloride of sodium to about three parts sodium carbonate, heating the solution, and then passing through said bath a current of electricity while said material is immersed therein.
9. The process of treating textile, porous or flbrous substances, which consists in placing said material in a suitable receptacle containing a chlorine producing solution, passing a suitable electric current through said solution containing the substance to be treated during a whole or a part of the time the process is being carried on, substantially as shown and described.
10. The process of treating textile, porous or fibrous substances, which consists in placing said material in a suitable receptacle containing a chlorine producing solution, passing a suitable electric current through said solution containing the substances to be treated during a whole or a part of the time the process is being carried on, the passage of the current through the material and solution causing the generation and development of the required chlorine gases, for the purposes described.

\section*{No. 102,484. Briquette Making Machine.}

Machine à faire des briquettes.

William C. Renfrew, assignee of Edgar D. Misner, both of .St. Louis, Missouri, U.S.A., 11th December, 1906; 6 years. Filed 4th August, 1906. Receipt No. 138,421.
Claim.-1. A moulding machine comprising two die housings, a double series of dies located between the two die housings, means for reciprocating said dies, two end sets of dies movable each toward and away from one die housing, means for simultaneously operating all of the dies so that one set of end dies will always be co-operating with the first-mentioned dies, and means for supplying pulverulent material to said die housings.
2. A moulding machine comprising two spaced apart die housings, a series of double ended dies located between said die housings, means for constantly reciprocating said dies, two end sets of dies movable each toward and away from gne die housing, said end sets of dies being connected together, means for reciprocating said end sets of dies simultaneously with the shifting of the double-ended dies, and means for supplying pulverulent material to said die housings.
3. The combination with the two spaced apart die housings having die openings, of the die carrying body located between said housing, double-ended dies mounted in said body and projecting laterally therefrom and into said die openings, two end sets of dies. carrying bodles therefor. means connecting said latter bodies, a constantly operated shaft, means thereon for actuating the first-mentioned die rarrying body, a set of cams on said shaft, and rods connereted to one of said bodies of the end sets of dies having frames in engagement with said set of cams.
4. The combination with a die housing having a series of die openings, of a series of dies working in said openings, means for reciprocating the same, a second set of dies also working in said die openings, a rotary shaft, means actuated thereby connected to said firstmentinned series of dies, cams on said shaft, rods secured to sald set of dies having frames with openings to accommodate said cams. idlers mounted in sald frames for engaging said cams, and means for guiding the frames in their movements.
j. The combitation with a die housing having a series of die openings, of a series of dies working in said openings, means for reciprocating the same, a second set of dies also working in said die openings, a rotary shaft, means actuated thereby connected to said first-mentioned serles of dies, cams on said shaft, rods secured to said set of dies having frames with openings to arcommodate said cams. Idlers mounted in said frames for engaging said cams, said frames having end projections, and idlers mounted in adjustable bearings, said projections engaging said idlers.
6. The combination with the feed hopper, of the feeder movable beneath said hopper and having ovenings ur pockets, die housings having vertical supply openings and horizontal die openings into which said supply openings extend, a series of double-ended dies extended into the die openings of both housings, two end sets of dies movable toward and away from said die housings, and means for simultaneouslv actuating said feeder and all of the dies, as -set forth.
7. In a moulding machine, the combination with the two die housings, of the double set of dies working in both housings, the end sets of dies, each working in one die housing, means for reciprocating all the dies simultaneously, a reciprocating feeder for supplying pulverulent material to both die housings, a horizontally disposed hopper above said feeder, rotary agitators in said hopper, mixers above said hopper, and means for controlling the supply to the latter.
8. The combination with the die housings, the series of dies, the feeder, two sets of hoppers and rotary agitators in said hoppers, of the horizontally adjustable' bottoms for controlling the outlet from one set of hoppers to the other, and hot mixers for supplying the hogpers.
9. A moulding machine comprising a die housing, two series of co-operating dies, a feeder for supplying material to said die housing having a series of pockets, ejectors for forcing the material from sair pockets into said die housing, means for actuating said ejectors, and means for simultaneously operating the dies for compressing the material within the die housing.
10. A moulding machine comprising two die housings, dies located between the die housings, means for reciprorating said dies, two end sets of dies movable each toward and away from one die housing, means for simullaneously operating all of said dies so that one end set of dies will always be co-operating with the first-mentioned dies, means for supplying pulverulent material to said die housings, and means for ejecting the material from said last-mentioned means into said die housings.
11. A moulding machine comprising two die housings, dies located between the die housings, means for reciprocating said dies, two end sets of dies movable each toward and away from one die housing, means for simultaneously operating all of sald dies so that one end set of dies will always be co-operating with the first-mentioned dies, means for supplying pulverulent material to said die housings, and two serles of efectors, one for each die housing, for forcing the material from the last-mentioned means into the respective die housings.
12. The combination in a moulding machine, of two die housings, double series of dies located between the two die housings, means for reciprocating said dies, two end sets of dies movable each toward and away from one die housing, means for simultaneously operating all of the dies so that one set of end dies will always be co-operating with the first-mentioned dies, a reciprocating feeder having two series of pockets for supplying pulverulent material to said die housings, and two series of ejectors, designed to be alternately operated for forcing the material from said nockts into said die housings.
13. The combination in a moulding machine, of a die housing having vertical supply openings, two series of cooperating dies, means for actuating said dies, a feeder for
pulverulent material having a series of pockets designed to coincide with said supply openings, a series of vertically disposed ejectors designed to force the material from said pockets and through said supply openings into said die housing, a lever for actuating said ejectors, and means for intermittently actuating said lever.
14. The combination with the die housings, the series of dies, and the feeder, of the supply hopper having two shafts located therein and movable in opposite directions. and agitator arms carried by said shafts, the arms of each shaft being deflected from a plane at right angles to such shaft and designed to extend to within a short distance of the other shaft.
15. In a moulding machine comprising hot mixers, agltators therein, means for operating such agitators, a die housing, hoppers interposed between said said hot mixers and said die housing, said hoppers having agitators therein, means for operating said agitators, co-operating dies, and means for operating said dies, the respective operating means of said hot mixer agitators, said hopper agitators, and said dies being each capable of being independently cperated.
15 The cumbination with the die housing and the feed supply hopper, of the feeder interposed between the hopper and said die rousing, the rods connected to said feeder, tha levers to which said rods are secured, the movable frame el.gaging said levers, and means for actuating said frame.
17. Th., comination with the die carrying body having a series of horizcntal die openings, and a series of vertical openings beneath and opening into said die openings and projecting laterally from said body, and the springs mounted in said vertical openings and forming bearings for said dies.

No. 102,485. Process of Finishing Photographically Printed Sheots.
Procédé pour finir des feuilles photographiques imprimées.

Charles F. Pease, Chicago, Illinois, and Williams, Brown and Earle, Philadelphla, Pennsylvania, U.S.A., 11th December, 1906; 6 years. Filed 2nd June, 1906. Receipt No. 136,485 .
Claim.-1. A process of finishing photographically printed paper by a continuous operation which consists in first moving the said paper in a dry condition, upwardly and simultancously wetting the printed surface thereof and then aryiveg the raper by artificial means.
2 The process of finishing sheets of photographically printed paper ty a continuous operation, which consists n first noving the said sheets in a dry condition, upwardiy ard simultanrocs!y expesing the printed surface thereof t.) falling water and then drying the same by artificial means.
3. The rrecess of finishing sheets of photographically printed paper by a continuous operation, which consists
n first moving the dry sheets upwardly and simultaneously exposing the printed surface thereof to falling water, then removing the superfluous water from the sheets and finally drying the said sheets by artificial means.
4. The process of finishing sheets of photographically printed paper by a continuous operation, which consists in first moving the dry sheets upwardly and exposing only the printed surface thereof to falling water then removing the superfluous water from the sheets and finally drying said sheets by artiticial means.
5. The process of finishing dry sheets of photographically printed paper by a continuous operation, which consists in wetting only the printed surface of the same and drying the sheets by artificial means.
6. The process of finishing dry sheets of photographically printed paper by a continuous operation, which consists in wetting only the printed surface of the same, then remoring supertluous water from the sheets and finally drying the said sheets by artificial means.

\section*{No. 102.486. Thermic Mirture. Mélange thermique.}

Th. Goldschmidt, assignee of Hans Goldschmidt, both of Essen-on-the-Ruhr, Rhine, Germany, 11th December, 1906; 6 years. Filed 30th January, 1906. Receipt No. 132,403.
Claim.-1. A thermic mixture of calcium and silicon and of a metal compound suitable of being reduced to a metal, the substances being thoroughly mixed with each other and the proportions of the active reducing metals being such that silicon forms the smaller part in weight of the weigh: of the active metals.
2. A thermic mixture consisting of calcium and sillicon and of a metal compound containing only metal and axygen, the substances being thoroughly mixed with each other and the proportions of the active reducing metals being such that silicon forms the smaller part in weight of the active metals.
3. A thermic mixture consisting of calcium and silicon and of iron oxide ( \(\mathrm{Fe}^{y} \mathrm{O}^{3}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{4}\) ) or of both, the substances being thoroughly mixed with each other.
4. A thermic mixture consisting of an alloy of calcium and sllicon and of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{3}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{\mathrm{s}} \mathrm{O}^{4}\) ) or of both, the substances being thoroughly mixed with each other.
5. A thermic mixture consisting of calcium and silicon and of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{3}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{\prime}\) ) or of both, the substances being thoroughly mixed with each other, and with an addition of metallic iron or of another inactive metal.
6. A thermic mixture consisting of an alloy of calcium and silicon and of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{2}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{4}\) ) of of both, the substances being thoroughly mixed with each other and with an addition of metallic iron or of another inactive metal.
7. A thermic mixture consisting of calcium and silicon and of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{2}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{4}\) ) or of both, the substances being thoroughly mixed with each other and with an addition of metallic iron or another inactive metal and with the addition of one or several active metals such as magnesium or aluminum.
8. A thermic mixture consisting of an alloy of calclum and silicon and of iron oxide \(\left(\mathrm{Fe}^{2} \mathrm{O}^{\mathbf{2}}\right.\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{3} \mathrm{O}^{4}\) ) or of both, the substances being thoroughly mixed with each other and with an addition of metallic iron or another inactive metal and with the addition of one or several active metals such as magnesium or aluminum.
9. A thermic mixture consisting of calcium and silicon and of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{3}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{3}\) \(\mathrm{O}^{4}\) ) or of both, the substances being thoroughly mixed with each other, and with the addition of one or several active metals such as magnesium or aluminum.
10. A thermic mixture consisting of an alloy of calcium and sillicon and of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{2}\) ) or of iron oxide. protoxide ( \(\mathrm{Fe}^{-3} \mathrm{O}^{4}\) ) or of both, the substances being thoroughly mixed with each other and with the addition of one or several active metals such as magnesium or aluminum.
11. A thermic mixture consisting of calcium and silicon and of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{2}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{3}\) \(0^{4}\) ) or of both, the substances being thoroughly mixed with each other and the proportions of the active reducing metals being such that silicon forms the smaller part in weight of the weight of the active metals.
12. A thermic mixture consisting of about 20 per cent of calcium, 10 per cent of silicon and 70 per cent of iron oxide \(\left(\mathrm{Fe}^{2} \mathrm{O}^{3}\right.\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{3} \mathrm{O}^{4}\) ) or of both.
13. A thermic mixture consisting in proportion of about 20 per cent of calcium, 10 per cent of silicon and 70 per cent of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{3}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{4}\) ) or of both. with an addition of metallic iron or of another Inactive metal as maganese or of both.
14. A thermic mixture consisting in proportion of about \({ }^{2}\) 'J per cent of calcium, 10 per cent of silicon and 70 per cent of iron oxide ( \(\mathrm{Fe}^{2} \mathrm{O}^{3}\) ) or of iron oxide protoxide ( \(\mathrm{Fe}^{3} \mathrm{O}^{4}\) ) or of both, with a partial substitution of another active meta: such as aluminum, magnesium or both.

No. 102,487. Mould for Concrete Pipe.
Moule pour tuyaux de béton.

The Miracle Pressed Stone Company, Minneapolis, assignee of Arthur Pomeroy Melton, Gary, both in Indiana, U.S.A., 11th December, 1906; 6 years. Filed 19th October, 1906. Receipt No. 140,410 .

Claim.-1. A mould for a bell mouthed concrete pipe comprising an inner member consisting of a bell mouth part at the bottom and a cylindrical body part stepped on the top of the bell mouth part and contractible while so stepped thereon and separable therefrom by direct lifting, and an outer member also consisting of a bell mouth part at the bottom and a cylindrical body part stepped on the top of the bell mouth part and expansible while so stepped and separable therefrom by direct lifting.
2. A mould for a bell mouthed concrete pipe comprising an inner member consisting of a bell mouth part at the bottom interiorly rabbeted at its upper end, a contractible cylindrical body part stepped in the rabbet at the top of the bell mouth part and adapted to be separated therefrom by direct lifting, and an outer member consisting of a bell mouth part at the bottom and an expansible cylindrical body part stepped on the bell mouth bottom. part and separable therefrom by direct lifting.

\section*{No. 102,488. Dynamo Electric Machine. \\ Machine dynamo électrique.}

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Ernst F. W. Alexanderson, Schenectady, New York, U.S.A., 11th December, 1906; 6 years. Filed 17th April, 1906. Receipt No. 134,95i.
Claim.-1. In an alternating current dynamo electric machine, a field magnet, field coils carried thereby, and a short circuited damping winding of high conductivity carried by the fleld magnet having an effective cross section per pole of more than one-fourth of the effective cross section of said fleld coils.
2. In a single phase dynamo-electric machine, a field magnet, firld ceils carried thereby, and a short circuited damping winding of high conductivity carried by the fleld magnet, said winding having an effective cross section sufficient to carry the current induced by armature reaction without undue heating.
3. In a single phase dynamo-electric machine, a field magnet, field coils carried thereby, and a short circuited damping winding of high conductivity carried by the field magnet, said winding having an effective cross section sufflcient to carry without undue heating current neutralizing the full load ampere turns of the armature.
4. In an alternating current dynamo-electric machine, a field magnet, field coils carried thereby, and a short circuited damping winding of high conductivity carried by the field magnet, said winding having an effective cross section sufficient to carry without undue heating a current neutralizing the cross magnetizing ampere turns of the armature under all conditions of load.
5. In an alternating current dynamo-electric machine, an armature winding, a fleld magnet, field coils carried thereby, and a short-circuited damping winding of high conductivity carried by the field magnet having an effective cross section not less than half the effective cross section of the armature copper.
6. In a dynamo-electric machine, a stationary armature, a rotary cylindrical field magnet, field colls embedded in said magnet, end plates of high conductivity carried by said magnet, and axially extending bars of high conductivity connecting said end plates.
7. In a dynamo-electric machine, a stationary armature, a rotary cylindrical field magnet, field colls embedded in said magnet, end plates of high conductivity carried by said magnet, and bars of high conductivity extending axially through said magnet near its periphery and electrically connecting said end plates.
8. In a dynamo-electric machine, a stationary armature, a rotary cylindrical fleld magnet composed of laminations arranged perpendicularly to the axis, field coils embedded in said magnet, end plates of high conductivity carried by said magnet, and bars of high conductivity extending axially through said magnet electrically connecting said end plates and serving to clamp the laminations together.
9. In a dynamo-electric machine, a stationary , armature, a rotary cylindrical field magnet composed of laminations arranged perpendicularly to the axis, field coils embedded in said magnet, heavy copper end plates carried by said magnet, and heavy copper bars electrically connecting said end plates and serving to clamp the laminations together.
10. In a dynamo-electric machine, a stationary armature, a rotary cylindrical field magnet composed of laminations arranged perpendicularly to the axis, field coils embedded in said magnet, heavy copper end plates carried by said magnet, and heavy copper bars extending axially through said magnet near its periphery electrically connecting said end plates and serving to clamp the laminations together.
11. In a dynamo-electric machine, a stationary armature, a rotary cylindrical field magnet, field coils embedded in said magnet, end plates of high conductivity carried by said magnet, and axially extending bars of high conductivity connecting said end plates, said bars having a cross section per pole not less than one-fourth the effective section per pole not less than
cross section of the field colls.
12. In a dynamo-electric machine, a stationary armature. a rotary cylindrical field magnet composed of laminations arranged perpendicularly to the axis, field coils embedded in said magnet, end plates of high, conductivity carried by said magnet, and bars of high conductivity extending axially through said magnet electrically connecting said end plates and serving to clamp the laminations together, said bars having a total effective cross section not less than half the effective cross section of the armature coils.

\section*{No. 102,489. Pounding-Up Machine.}

Machine pour attacher les eml.eignes aux semelles des chausames.
The United Shoe Machinery Company of Canada, Boston, assignee of Stephen Snow. Everett, Massachusetts, U.S.A., 11th December, 1906; 6 years. Filed 13th December, 1904. Receipt No. 120,719.
Claim.-1. In a pounding-up maohine, the combination with means for supporting a shoe, of means for forcing the upper material downwardly toward the inner sole and inwardly away from the edge of the innersole.
2. In a pounding-up machine, the combination with means for supporting a shoe, of means for pounding the upper material downwardly toward the inner sole and inwardly away from the edge of the inner sole, and means for determining the position of the shoe with relation to the pounding means.
3. In a pounding-up machine, the combination with means for supporting a shoe, of a pounding-up device, actuating
mechanism for said device, an adjustable rest for engaging the bottom of the shoe, and a rest for the edge of the shoe.

4. In a pounding-up machine, the combination with means for supporting a shoc, of a pounding-up device, and operating mechanism therefor including means for actuating said device inwardly over the shoe bottom as it approaches the shoe.
5. In a pounding-up machine, the combination with means for supporting a shoe, of a pounding-up device, means for actuating said pounding-up device toward and from the bottom of the last, and additional means for causing said device to strike the shoe obliquely for drawing the upper material over the edge of the inner sole.
6. In a pounding-up machine, the combination with means for supporting a shoe on a last. of a pounding-up device, and means for actuating said device downwardly and inwardly with relation to the last bottom for forcing the upper over the last.
7. In a pounding-up machine, the combination with means for rigidly supporting a shoe, of a pounding-up device, and means for yieldingly actuating said device for flattening the upper material down onto the inner sole and simultancously forcing it over the inner sole.
8. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly toward the inner sole and inwardlyaway from the edge of the inner sole, of a support for the shoe, and means for actuating said support to move the shoe toward and from position to be operated upon.
9. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly toward the inner sole and inwardly away from the edge of the inner sole, of a support for the shoe, means for actuating sald support to move the shoe toward and from position to be operated upon, and means for locking said support with the shoe in position to be operated upon.
10. In a machine for pounding-up shoes, the combination with means for pounding the upper material downwardly upon the inner sole and forcing it inwardly away from the edge of the inner sole, of a support for the shoe. means for actuating said shoe support toward and from the pounding means, and automatic means for locking and rigidly sustaining said shoe support.
11. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly toward the inner sole and inwardly away from the edge of the inner sole, of a shoe support movable toward and from position for the shoe to be operated upon, automatic means for locking said shoe support in its said position, and manually controlled means for simultaneously unlocking and withdrawing said support.
12. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly toward the inner sole and inwardly away from the edge of the inner sole, of a support for the shoe, means for lifting the shoe support to put the work into position to be operated upon, a device for locking the shoe support in elevated position, yielding means for advancing the locking device, and unyielding means for insuring the advance movement of the locking device.
13. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly toward the inner sole and inwardly away from the edge Of the inner sole, of a support for the shoe, means for lifting the shoe support to put the work into position to be operated upon, a device for locking the shoe support in elevated position, ylelding means for advancing the locking device, and positive means for retracting said device.
14. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly
oward the inner sole and inwardly away from the edge of the inner sole, of a support for the shoe, means for lift ing the shoe support to put the work into position to be operated upon, a device for locking the shoe support in elevated position, and means connected with said shoe sup port and adapted to advance and retract automatically the locking device as the shoe support is raised and lowered.
15. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly toward the innersole and inwardly away from the edge of the inner sole, of a support for the shoe, actuating means for raising and lowering the shoe support, a slide bar having an inclined upper face adapted to engage a similarly shaped face on the shoe support, and means controlled by said actuating means for advancing and retracting the slide bar as the shoe support is raised and lowered.
16. In a machine for pounding-up shoes, the combination with means for forcing the upper material downwardly toward the inner sole and inwardly away from the edge of the inner sole, of a supeprt for the shoe, actuating means for raising and lowering the shoe support, a sllde bar having an inclined upper face adapted to engage a similarly shaped face on the shoe support, and mechanism controlled by said actuating means for advancing and retracting the slide bar as the shoe support is raised and lowered. said mechanism being arranged to maintain the inclined faces of said slide bar and shoe support in continuous engagement for locking the support against depression in any position thereof.
17. In a machine for pounding-up shoes, the combination with means for forcing the upper material at the margin of the shoe bottom downwardly toward the inner sole, of positioning means arranged to engage the inner sole' inside said upper material
18. In a machine for pounding-up shoes, the comblnation with means for pounding the upper material downwardly toward the inner sole and inwardly away from the edge of the inner sole, of means for supporting the shoe, and means for engaging the inner oole to position the shoe in predetermined relation to the path of the pounding means.
19. In a pounding-up machine, the combination with means for supporting a shoe, of means for pounding the upper material downwardly and inwardly, and means for holding the upper material against the last adjacent to the point where the pounding means operates.
20. In a pounding-up machine, the combination with a support for a lasted shoe, of means for acting upon the shoe bottom near its edge for forcing the upper material downwardly toward the inner sole and inwardly away from the edge of the inner sole, and means for holding the upper material against the side of the last.
21. In a pounding-up machine, the combination with a support for a lasted shoe, of means for acting on the shoe adjacent to its edge for holding the upper material against the side of the last, and means for pounding downwardly the upper material on the bottom of the last, said two means co-operating for shaping the edge of the shoe.
22. In a pounding-up machine, the combination with a support for a lasted shoe, of means for acting on the shoe. adjacent to its edge for holding the upper material against the side of the last, and means for drawing the upper material on the bottom of the last inwardly away from the edge of the last.
23. In a pounding-up machine, the combination with a shoe support arranged to permit the shoe to be turned to present different portions thereof in position to be operated upon, of a pounding-up device and means for reciprocating said device for pounding-up the shoe.
24. In a pounding-up machine, the combination with pounding-up means for acting on the upper material on a shoe bottom, of an abutment for determining the position of the shoe with relation to the pounding-up means, said abutment being adjustable to stop the shoe in different positions with relation to the stroke of the pounding-up means.
25. In a pounding-up machine, the combination with pounding-up means for acting on the upper material on the shoe bottom, of an abutment, a shoe support, means for automatically raising the support for presenting the shoe against the abutment in position to be acted upon by the pounding-up means, said abutment being adjustable to vary the position to which the shoe may be raised by the support, and thereby vary the length of the stroke of the pounding-up means.
26. In a machine of the class described, the combination with means for pounding-up a shoe, of means for holding the shoe in position to be operated upon comprising sustaining means for engaging the shoe on the side opposite to that on which the pounding means operates and positioning means for engaging the shoe on the same ilde af the pounding means

3056
the class described, a support for a 27. In machine of the class lewering said support, from hoe, means for raising and material inwardly away supmoans for forcing the upper the shoe carried b the edge of the innersole port.
port. In a machine of the class described, the combination
28. In ally controlled 28. In a machine of the a shoe, and manually controling a with means for supporting a sho the shoe for support of a means for raising and means for pounding-up of blows to the shoe.
No. 102,490. Bread Mizer. Malaxeur de pâtc.

Landers, Frary and Clark, assignee of Alonzo Abner Warner, all of New Britain, Connecticut, U.S.A., 11th Denem' 1906; 6 years. Filed 10th August, 1906 . Recelpt No. 138,556.
Claim.-1. In a mixing machine, the combination of a essel having a top rim with a holder having clamping devices to secure it to a proper support, holding arms devices to soce side of the vessel just under the rim, and arojecting holding lug for engaging the vessel at the tod inside of its rim.
2. In a mixing machine, the combination of a vessel having a top rim with a holder having clamping devices to secure it to a proper support, means for holding the vessel by its top rim and one side, and a post projecting upwardly from the said means, and a shaft bearing arm having a socket and set screw fitted to the said post.

No. 102,491. Compound for Piles, Hemorrhoids, Etc.
Composé pour les hémorroildes, etc.
The South African Remedy for Piles Syndicate, assignee of Albert William Fuller, both of Johannesburg. Transvaal, South Africa, 11th December, 1906; 6 years. Filed 23rd February, 1905. Receipt No. 122,762.
Claim.-1. An article of manufacture made by the mixture of the julcy extract from the root of the plant san: sevieria thyrsifiora with a preservative substance to prevent fermentation.
2. An article of manufacture composed of the juicy extract from the root of the plant sansevieria trysifiora and 20 per cent of glycerine.
3. An article of manufacture consisting of a soft extract formed by the concentration of the juice from the root of the plant sansevieria thrysiflora by evaporation under vacuum and a temperature not exceeding 180 degrees Fahren-- helt.
4. An article of manufacture consisting of a heat concentrated extract from the root of the plant sansevieria thyrsifiora and a vehicle or holding substance to form pills, tablets, lozenges, or the like, substantially as described.

\section*{No. 102,49\%. Regulation of Electric Currents. Régulation des courants électriques.}

Ladische Anilin and Soda Fabrik, assignee of Johannes Hessberger, all of Ludwig, Shafen-on-the-Rhine, Germany, 11th December, 1906; 6 years. Filed 23rd November, 1904. Receipt No. \(120,256\).
Olasm.-The process of supplying currents to a plurality of chrcuits containing arcs suitable for the production of compounds of nitrogen and oxygen with the minimum die-

The Sherwin-Williams Company, assignee of Albert D. Anderson, all of Cleveland, Ohio, U.S.A., 11th December 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,334.
Claim.-1. In combination with a continuously operating expelling press, a tempering apparatus for the material to be treated, said apparatus discharging directly into the press.
2. The combination with a continuously operating expelling press, a tempering apparatus, and means contained within said tempering apparatus for agitating the material therein and feeding it to the press, substantially as described.
3. In combination with a continuously operating expelling press, a tempering trough discharging into the press, and a series of agitators or stirrers mounted in said trolugh and serving to agitate the material therein and to advance it along the trough toward the discharge end thereof.
4. In combination with a continuously operating expelling press, a tempering trough discharging into the press, means for heating said trough, a shaft extending through the trough, and a series of blades or stirrers carried by the shaft, said blades or stirrers serving to agitate the material and thereby bring it into intimate contact with the surface of the trough and also to advance the materlal along the trough toward the discharge end thereof.
5. In combination with an expelling press, a grinding mill, a tempering apparatus for the ground material, and means for effecting a feeding of the material from the mill, through the tempering apparatus and to the press.
6. In combination with an expelling press, a grinding mill, a tempering apparatus for the ground material, means for effecting a feeding of the ground material from the mill, through the tempering apparatus and to the press, and means for returning any over feed.
7. In combination with an expelling press, a grinding mill, a hopper to receive the ground material from the mill, a tempering trough discharging into the press, means for feeding the material from the hopper to the tempering trough, and a conveyer adapted to recelve any surplus material from the tempering trough and to transfer it to the hopper.
8. In combination with an expelling press, a grinding mill, a hopper to receive the ground material from the mill, a tempering trough, an endless conveyer serving to convey the material from the hopper to the tempering trough, a spout leading from the tempering trough to the press, a conveyer trough discharging at one end into the hopper, and a second spout leading from the tempering trough to said conveger trough.
9. In combination with an expelling press, a grinding mill, a tempering apparatus, means for effecting a leeding of the material from the mill, through the tempering apparatus and to the press, and means to separate the solid matter from the oll which passes from the press.
10. In combination with an expelling press, a grinding mill, a tempering apparatus. means for effecting a feeding of the material from the mill, through the tempering apparatus and to the press, means for effecting a separation of the solid matter from the oil as it passes from the press, and means for feeding such solid matter to the tempering apparatus.
11. In combination with an expelling press, a grinding mill, a tempering apparatus. means for effecting a feeding of the material from the mill. through the tempering apparatus and to the press, means for returning any overstock from the tempering apparatus to the mill. means for effecting a separation of the solid matter from the oll as it passes from the press. and means for feeding such solid matter to the tempering apparatus.

No. 102,494. Process of Obtaining Caoutchouc.
Procédé pour obtenir le caoutchouc.

Bernhard Grätz, assignee of Heinrich Scholz, both of Berlin, Germany, 11th December, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,425.
Claim.-The process of producing pure caoutchouc from substances containing caoutchouc, consisting in extracting from such substances the caoutchouc together with the resins by means of bisulphide of carbon, or benzine, or turpentine oil or ether and separating the rubber by means of methylic alcohol, or ethylic alcohol, or amyl alcohol in case of blsulphide of carbon serving as a solvent, methylic alcohol in cases of benzine serving as a solvent, methylic alcohol or ethylic alcohol, or acetone in case of turpentine oll serving as a solvent, amyl alcohol in case of ether being used as a solvent.

\section*{No. 102,495. Process of Preparing India Rubber} for Vulcanization.
Procédé pour préparer le caoutchouc pour la vulcanisation.
Bernhard Grätz, assignee of Heinrich Scholz, both of Berlin, Germany, 11th December, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,426.
Claim.-1. The process of preparing rubber for vulcanization, consisting in treating the rubber prior to its vulcanization with glacial acetic acid or amyl alcohol, to dissolve the resinous matter, and separating the thus treated rubber from the liquid.
2. The process of preparing rubber for vulcanization, consisting in treating the rubber prior to its vulcanization with amyl alcohol in the hot mixed with water for the purpose of keeping down the temperature.

\section*{No. 102,496. Valve. Soupape.}

Theodore Henry Haberkorn, Fort Wayne, Indiana, U.S.A., 11th December, 1906; 6 years. Filed 29th October, 1906. Receipt No. 140.737.
Claim.-1. In a valve gear for a double engine operated by fluld under pressure, the combination with the two valves and the two piston operated crossheads, of two parallel shafts provided respectively with a power receiving arm and two power transmitting arms, with the latter un-
equal in length, and with the power receiving arm of one of the shafts operatively connected with one of the cross-

heads, and with the power receiving arm of the other shaft operatively connected with the other crosshead, a link connection between the shorter power transmiting arm of each shaft and the longer power transmitting arm of the other shaft, which link connection comprises two links of unequal length, with the longer link pivoted at one end to one end of the shorter link and at its opposite end to the shorter shaft arm and with the shorter link pivoted at its opposite end to the longer shaft arm, means for transmitting motion from the longer link of one of the link connections to one of the valves, and means for transmitting motion from the longer link of the other link connection to the other valve, and the axes of the pivotal connections of the shorter link of each link connection being spaced correspondingly with the distance between the axes of the shafts.
2. In a valve gear for a double engine operated by fluid under pressure, the combination with the two valves and the two pistons relativeiy arranged substantially as indicated, of two parallel shafts provided respectively with a power recelving arm and two power transmitting arms, with the latter unequal in length and with the power receiving arm of one of the shafts operatively connected with one of the pistons and with the power receiving arm of the other shaft operatively connected with the other piston, a link connection between the shorter power transmitting arm of each shaft and the longer power transmitting arm of the other shaft, which link connection comprises two links. with one of the links pivoted at one end to one end of the other link and at its opposite end to the shorter shaft arm and with the last-menioned link pivoted at its opposite end to the longer shaft arm, means for transmittino motion from the first-mentioned link of one of the link connections to one of the valves, and means for transmitting motion from the first-mentioned link of the other link connection to the other valve, and the axes of the pivotal connections of the second-mentioned link of each ilink connection being spaced correspondingly with the distance between the axes of the shafts.
3. In a valve gear for a double engine operated by fluid under pressure, the combination with the two valves and the two pistons, of two parallel shafts provided respectively with a power receiving arm and two power transmitting arms, with the latter unequal in length and with the power recciving arm of one of the shafts operatively connected with one of the pistons and with the power receiving arm of the other shaft operatively connected with the other piston, a link connection between the shorter power transmitting arm of each shaft and the longer power transmittinc arm of the other shaft, which link connection comprises two links, with one of the links pivoted at one end to one end of the other link and at its opposite end to the shorter shaft arm and with he last-mentioned link pivoted at its opposite end to the longer shaft arm, means for transmitting motion from one of the link connections to one of the valves, and means for transmitting motion from the other link connection to the other valve, all relatively arranged substantially as described and for the purpose set forth.
4. In a valve gear for a double engine operated by fluid under pressure, the combination with the two valves and the two piston operated crossheads, of two parallel shafts operatively connected with the piston and provided respectively with two power transmitting arms unequal in length, an operative connection between the shafts and the crossheads, a link connection between the shorter arm of each shaft and the longer arm of the other shaft, which link connection comprises two links of unequal length, with the
longer link pivoted at one end to one end of the shorter link and at its opposite end to the shorter shaft arm and with the shorter link pivoted at its opposite end to the longer shaft arm, means for transmitting motion from the longer link of one of the link connections to one of the valves, and means for transmitting motion from the longer link of the other link connection to the other valve, and the axes of the pivotal connections of the shorter link of each link connection being spaced correspondingly with the distance between the axes of the shafts.
5. In a valve gear for a double engine operated by fluid under pressure, the combination with the two valves and the two pistons relatively arranged substantially as indicated, of two parallel shafts operatively connected with the shafts and provided respectively with two power transmitting arms, a link connection between the shorter power transmitting arm of each shaft and the longer power transmitting arm of the other shaft. which link connection comprises two links, with one of the links pivoted at one end to one end of the other link and at its opposite end to the shorter shaft arm and wilth the last-mentioned link pivoted at its opposite end to the longer shaft arm, means for transmitting motion from the first-mentioned link of one of the link connections to one of the valves, and means for transmitting motion from the first-mentioned link of the other link connection to the other valve, and the axes of the pivotal connections of the second-mentioned link of each link connection being spaced correspondingly with the distance between the axes of the shafts.
6. In a valve gear for a dnuble engine operated by fluid under pressure, the combination with the two valves and the two pistons, of two parallel shafts operatively connected with the piston and provided respectively with two power transmitting erms unequal in length, a link connection between the shorter power transmitting arm of each shaft and the longer power transmitting arm of the other shaft, which link connection comprises two links. with one of the links pivoted at one end to one end of the other link and at its opposite end to the shorter shaft arm and with the last-mentioned link pivoted at its opposite and to the longer shaft arm, means for transmitting motion from one of the link connections to one of the valves, and means for transmitting motion from the other link connection to the other valve, all relatively arranged substantially as and for the purpose set forth.
7. In a valve gear for a double reversible engine operated by fluid under pressure, the combination with the pistons, the valves, the reverse shaft having two arms spaced longitudinally of the shaft and projecting toward the valve rods, the blocks pivoted to the shaft arms, rods extending loosely through the said blocks and operatively connected with the valves, the pivotally supported link hangers, the links pivotally supported from the hangers, and the shiftablo link blocks pivoted to the rods and connected with the links, of the two parallel shafts operatively connected with the pistons and operatively provided respectively with two power transmitting arms unequal in length, two rods estals. lishing operative connection between the shorter power transmitting arm of the different parallel shafts respectively and the different, link hangers respectively, and a link connection between the longer power transmitting arm of each of the said parallel shafts and the shorter power transmitting arm of the other of the said shafts, which link connection comprises two links of unequal length. with the longer link pivoted at one end to one end of the shorter link and at its opposite end to the shorter shaft arm and with the shorter link pivoted at its opposite end to the longer shaft arm, two rods operatively connecting the longer link of the different last-mentioned link connections respectively and the link of the different link hangers respectively, all relatively arranged and operating substantially as and for the purpose set forth.
8. In a valve gear for a double reversible engine operated by flutd under pressure, the combination with the two pistons, the two valves, the reverse shaft, two rods operatively connected with the revarse shaft and with the different valves respectively, the two plvotally supported link hangers, two links pivotally supported from the different hangers respectively, ard the shiftable link blocks pivoted to the different rods respectively and connected with the different links respectively, of the two parallel shafts operatively connected with the piston and provided respectively with two power transmitting arms unequal in length, two rods establishing operative connection between the shorter power transmitting arm of the different parallel shafts respretively and the different link hangers respectively, and a link connection between the longer power transmitting arm of each of the said parallel shafts and the shorter arm of the other of the said shafts, which link connection comprises two links of unequal length, with the longer link pivoted at one end to one end of the shorter link and at its opposite end to the shorter shaft arm and with the shorter
link pivoted at its opposite end to the longer shaft arm, two rods operatively connecting the longer link of the different last-mentloned link connections respectively with the link of the different link hangers respectively, all relatively arranged and operating substantially as and for the purpose set forth.
9. In a valve gear for a double reversible engine operated by fluid under pressure, the combination, with the cylinders \(B\) and \(b\), the pistons \(C\) and \(c\), the suitably guided crossheads \(E\) and \(e\) operatively connected with the pistons \(C\) and \(c\) respectively, the valve chests \(K\) and \(k\), the valves \(M\) and. \(m\), the valve rods \(T\) and \(t\) operatively connected with the valves \(M\) and \(m\) respectively, the reverse shaft, the rods \(U\) and \(u\) operatively connected with the valve rods \(T\) and \(f\) respectively and with the reverse shaft, the pivotally supported link hangers \(S\) and 8 , the links \(F\) and \(p\) pivotally supported from the hangers \(S\) and \(s\) respectively, and the two shiftable link blocks pivoted to the rods \(U\) and \(u\) respectively and connected with the lirks \(P\) and \(p\) respectively, of the two parallel shafts \(x\) and \(y\) operatively provided respectively with a power receiving arm 35 and two power transmitting arms 36 and 37 , with the power receiving arms operatively connected with the crossheads and with the power transmitting arms unequal in length. the rods 38 and 48 establishing operative connection between the shorter power transmitting arms of the shafts \(x\) and \(y\) respectively and the link hangers S and 8 respectively, the links 40 and 42 , the rod 46 , the links 50 and 52 , and the rod 56 all relatively arranged and operating, substantially as and for the purpose set forth.
10. In a valve gear for a double reversible engine operated by fluid under pressure, the combination, with the cylinders \(B\) and \(b\), the pistons \(C\) and \(c\), the valve chests \(K\) and \(k\), the valves \(M\) and \(m\), the valve rods \(T\) and \(t\) operatively connected with the valves \(M\) and \(m\) respectively, the reverse shaft, the rods \(U\) and \(u\) operatively connected with the reverse shaft, the rocker shaft \(V\) having the arms 17 and 18 , the rocker shaft \(v\) having the arms 27 and 28 , the pivotally supported link hangers \(S\) and 8 , the links \(P\) and \(p\) pivotally supported from the hangers \(S\) and 8 respectively, and the two shiftable link blocks pivoted to the rods \(U\) and \(u\) ©espectively and connected with the links \(P\) and \(p\) respectively, of the two parallel shafts \(x\) and \(y\) operatively connected with the pistons and provided respectively with two power transmitting arms 36 and 37 unequal in length, the two rods 38 and 48 establishing operative connection between the shorter power transmitting arm of the shafts \(r\) and \(v\) respectively and the link hangers \(S\) and \(s\) respectively. the links 40 and 42 , the rod 46 , the links 50 and 52 and the rod 56 , all relatively arranged and operating substantially as and for the purpose set forth.

No. 102,49'7. Rotary Engine. Machinc rotatoire.

Hubert Irwin Call, Spokane, Washington, U.S.A., 11th December, 1906; 6 years. Filed 8th October, 1906. Receipt No. 140,138.
Claim.-1. In a rotary engine, a cylinder having a cross section of unequal diameter, a rotary piston concentric within said cylinder to provide oppositely disposed equal steam spaces between the piston and cylinder. peripheral steam admission and steam exhaust ports for said steam spaces, and slidable piston blades extending tbrough said rotary piston and adapted to be maintained in contact at their ends with the cylinder wall, substantially as described.
2. In a rotary engine, a cylinder having a cross section of unequal diameter, a rotary piston concentrically mounted within the same to provide two oppositely disposed, equal steam spaces between the piston and cyinder, said cylinder being provided with two oppositely disposed steam admission ports, one for each steam space, and two oppo
sitely disposed exhaust ports, one for each steam space, and slidable piston blades extending through said rotary piston and arranged to have their ends normally in contact. with the walls of the cylinder, substantially as described.
3. In a rotary engine, a cylinder having a cross section of unequal diameter, a rotary piston concentric within said cylinder to provide two oppositely disposed equal steam spaces between the piston cylinder, slidable piston blades extending through the rotary piston and adapted to have their ends in operative contact with the wall of the cylinder, said cylinder being provided with two sets of oppositely disposed steam admission ports, and two sets of oppositely disposed exhaust ports, the admission and exhaust ports of each set communicating with its respective steam space. and means for controlling the said ports to render one or the other of the set inactive, substantially as described.
4. In a rotary engine, a fixed cylinder having oppositely disposed steam spaces, a rotary piston mounted concentrically therein, movable piston blades, steam admission ports arranged in the periphery of the cylinder in two opposing sets, those of one set connect each with the end of the adjacent steam space, exhaust ports arranged in sets intermediate the steam admission ports, regulating valves disposed respectively in said steam admission and discharge ports, auxiliary exhaust connections between the said discharge ports and each of the steam admission openings, and means for simultaneously operating said valves whereby one of each set of said admission ports can be alternately placed in operative sequence with one of the discharge ports, and the dead admission ports of each set can be placed in operative connection with one of the active discharge openings, substantially as described.
5. In a rotary engine, a cylinder, a rotary piston therein adapted to provide two oppositely disposed steam spaces between the piston and cylinder, and piston blades adapted to contact with the wall of the cylinder, said cylinder being provided with two sets of admission and exhaust ports for each steam space, adapted for alternate operation, said exhaust ports of each steam space having a valve adapted to alternately open and close the same, and a secondary exhaust port for each primary exhaust port arranged in successive relation thereto and in communication therewith, substantially as described.
6. In a rotary engine, a cylinder having a cross section of unequal diameter, a rotary piston concentric within said cylinder to provide two oppositely disposed equal steam spaces between the piston and cylinder, slidable plston blades extending through said piston and adapted to have their ends in operative contact with the walls of the cylinder, said cylinder teing provided with steam admission and steam exhaust ports for said steam spaces, and. a secondary exhaust port for each steam space, adapted to remain open after the primary exhaust has been cut off by one of the piston blades, substantially as described.
7. In a rotary engine, a cylinder having a cross section of unequal diameter, a rotary piston concentric within sald sylinder to previde two oppositely disposed equal steam spaces between the piston and cylinder, slidable piston blades extending through said piston and adapted to be in operative contact at their ends with the cylinder wall, said cylinder being provided with two sets of admission and exhaust ports for each steam space, valves for controlling said port, and a secondary exhaust port communicating with each admission port and controlled by the valves thereof, substantially as described.
8. In a rotary engine, a cylinder having a cross section of unequal diameter, a rotary piston concentric within said cylinder to provide two oppositely disposed equal steam spaces between the piston and cylinder. slidable pistion blades extending through said piston and adapted to be in operative contact at their ends with the cylinder wall, said cylinder being provided with two sets of admission and exhaust ports for each steam space, a valve for each pair of steam ports connectint opposite steam spaces and adapted to alternately control the same. and means for controlling said valve to simultaneously throw one set of ports in and the other out of operation, substantially as described.

\section*{No. 102,498. Seltagene and Like Containers of Aerated Liquids. Gazogène.}

Robert Hunter Campbell, Angel Road, Middlesex, England, 11th December, 1906; 6 years. Filed 7th December, 1905. Receipt No. 130,780.
Claim.-1. In a seltzogene or the like the combination of a head therefor having a nipple piece, with means for holding a charging receptacle, means for securing such means to said nipple piece, means for discharging said charging receptacle through said nipple piece into the receptage to be charged, and means to prevent the escape of the charging substance on the removal of its container and means for
holding the latter after the said container has been discharged.

2. In seltzogenes and the like, the combination of a head therefor having a nipple piece, with means for holding a charging receptacle, means for securing such means to said nipple piece, means for opening said charging receptacle and securing its discharg e through lateral openings in said means into the receptacle to be charged, and means to prevent the escape of the charging substance on the removal of its container, and means for holding the latter after the said container has been discharged.

No. 102,499. Metallic Packing. Garniture métılliquc.

Edward J. Fuller, Elyria, Ohio, U.S.A., 11th December, 1906;
6 years. Filed 25th October, 1905. Recelpt No. 129,561.
Claim.-1. In a metallic packing, the combination with the cage, of a pair of rings within said cage, one having radial cuts and the other having tangential cuts extending from the inner periphery to the outer periphery thereof, the cuts of one ring being out of alignment with the cuts of the other.
2. In a metallic packing, the combination with the cage, of a pair of rings within said cage, one of said rings having four radial cuts and the other having four tangential cuts extending from the inner periphery to the outer periphery thereof, means for holding the parts of both rings together, and means for retaining the cuts of one ring out of alignment with the cuts of the other.
3. In a metallic packing, the combination with the cage. and cylinder head to which it is applied, of a pair of rings within said cage, one of said rings having radial cuts and being placed nearer to the cyllnder head than the other, said other ring having tangential cuts extending from the
inner to the outer periphery thereof and being placed between the first-mentioned ring and the cage, means for holding the parts of the two rings together. and means for retaining the cuts of one ring out of alignment with the cuts of the other.
4. In combination a cylinder head and piston rod, a packing cage secured to said cylinder head and having suitable grooves for the reception of the packing rings, a pair of rings in each of said grooves one of the rings in each pair being radially cut into four narts and being placed nearer to the cylinder head than the other, said other ring being tangentially cut into four parts and being placed between the first-mentioned ring and the eage, the cuts of said last-mentioned ring extending from the inner to the outer periphery theroof means for holding the several parts of both rings together around the rod, and means for retaining the cuts of one ring out of alignmant with the cuts of the other.

No. 102,500. Lubricator. Graissrur.

(:harles L. Grayber and Edward R. Kerrigan, co-inventors, both of Deer Lodge, Montana, U.S.A., 11th December, 1906; 6 years. Filed 11 th September, 1906. Receipt No. 139,435.
Claim.-1. A lubricator comprising an oll chamber having a steam jacket, means for admitting steam to said chamber and to said jacket, a pipe communicating with said chamber and said jacket, and discharging into the steam chest of an engine, and means for effecting communication between said jacket and the atmosphere.
2. A lubricator comprising an oil chamber having a steam jacket, a pipe having communication with said chamber and said jacket, means for shutting off sard communication, a pipe discharging into the steam chest of an engine and communcating with said chamber and said jacket, said pipe having means for shutting off communication with said chamber and said jacket, and a by-pass effecting communication between said jacket and the atmosphere.
3. A lubricator comprising an oil chamber having a steam jacket, means for simultaneously introducing steam into said chamber and into the said jacket, a pipe communicating with said chamber and discharging into a steam chest, said pipe having a sight oll feed, a second pipe communicating with said jacket and said first pipe, means for shutting off said communication between said first pipe and said jacket, and a by-pass communicating with said second pipe, and discharging into the atmosphere.
4. A lubricator comprising an oil chamber having a steam jacket, a live steam pipe communicating with said oil chamber, and having a branch communicating with said jacket, said branch having a throttle valve, and said pipe having a throttle valve between said branch and said chamber, an outlet pipe from said chamber discharging into the steam chest of an engine, and having a sight oil feed, a pipe having a throttle valve, and effecting communication between said jacket and said outlet pipe, and a by-pass having a throttle valve and effecting communication betwen said jacket and the atmosphere.
5. A lubricator having a cylinder and a second cylinder therewith constituting an oil chamber, said cylinders forming a steam jacket therebetween, means for introducing steam into said oil chamber and into said jacket, an outlet pipe from said chamber to the steam chest of an engine and having a sight feed and a throttle valve, a seconi pipe communicating with said first pipe and said jacket. and having a throttle valve, and a by-pass effecting communication between said second pipe and the atmosphere.
6. A lubricator comprising a cylinder, a second cylindotherewith constituting an oil chamber, said cylinders having a stearn jacket therebetween, a steam pipe communicating with said inner cylinder through said outer cylinder,
a branch pipe communicating with said jacket, means for shutting off the flow of steam through said steam pipe and said branch pipe, an outlet pipe leading from said inner cylinder, through said outer cylinder, to the steam chest of an engine, and having a sight feed and a throttle valve, a second outlet pipe leading from said jacket to said first outlet pipe. and having a throttle valve, and a by-pass effecting communication between said second outlet pipe and the atmosphere, and having a throttle valve.

No. 102,501. Gas Producer. Producteur de !ıız.

Ernest Digby Hopcroft, Bridgeport, Connecticut, U.S.A., 11th December, 1906; 6 years. Filed 3rd November, 1906. Receipt No. 140,880 .

Claim.-1. In a gas producer, the combination of a retort, means in communication therewith whereby gas generated therein is washed, scrubbed and dried, a distributing chamber in communication with the lower part of said retort, a vapour tank, means whereby said tank is placed in communication with said chamber, means whereby gases are introduced to said chamber in volume proportionate to the quantity of gas drawn from said retort, and an automatic regulator acuated through said last-mentioned gases Whereby the volume of steam admitted to said chamber is automatically controlled to preserve the proportions of said vapour and said gases in the mixture in said chamber.
2. In a gas producer, the combination of a retort, means in communication therewith whereby gas generated therein is washed, scrubbed and dried, a distributing chamber in communication with the lower part of sald retort, a vapour tank, means whereby said tank is placed in communication with said chamber. means whereby gases are introduced to said chamber in volume proportionate to the quantity of gas drawn from said retort including a blower casing, a wheel mounted therein having vanes whereby said gases will rotate said wheel, a centrifugal governor actuated by said wheel, a damper plate or valve, and connections between said governor and sald plate or valve whereby the volume of steam admitted to said chamber is automatically controlled to preserve the proportions of said vapour and said gases in the mixture in said chamber.
3. In a gas producer, the combination of a retort, means in communication therewith whereby gas generated therein is washed, scrubbed and dried, a distributing chamber in communication with the lower part of said retort, a vapour tank, a tank adapted to contain chemicals in communication with said vapour tank, means whereby said tank is placed in communication with sald chamber, means whereby gases are introduced to said chamber in volume proportionate to the quantity of gas drawn from said retort including a blower casing, a wheel mounted therein having vanes whereby said gases will rotate said wheel, a centrifugal governor actuated by said wheel, a damper plate or valve, and connections between said governor and said plate or valve whereby the volume of steam admitted to said chamber is automatically controlled to preserve the proportions of said vapour and said gases in the mixture in said chamber.
4. In a gas producer, the combination of a retort, means in communication therewith whereby gas generated therein is washed, scrubbed and dried, a distributing chamber in communication with the lower part of said retort, a vapour tank, means whereby gases are introduced to said chamber in volume proportionate to the quantity of gas drawn from said retort including a perforated drum, a pipe leading therefrom and opening into said chamber, a damper plate or valve in said pipe, a blower casing communicating with
said chamber, a wheel mounted therein having vanes whereby said gases will rotate said wheel, a centrifugal governor actuated by said wheel and connections between said governor and said damper plate or valve whereby the volume of steam admitted to said chamber is automatically controlled to preserve the proportions of sald vapour and said gases in the mixture in said chamber.
5. In a gas producer, the combination of a retort, means in communication therewith whereby gas generated therein is washed, scrubbed and dried, a pipe leading therefrom to the inlet port of an internal combustion engine, a distributing chamber in communication with the lower part of said retort, a vapour tank, means whereby gases are introduced to said chamber in volume proportionate to the quantity of gas drawn from said retort including a perforated drum in said vapour tank, a pipe leading therefrom and opening into said chamber, a damper plate or valve in said pipe, a blower casing communicating with said chamber and with the exhaust port of a gas engine, a wheel mounted therein having vanes whereby the exhaust gases from said engine will rotate said wheel, a centrifugal governor actuated by said wheel, and connections between said governor and said damper plate or valve whereby the volume of steam admitted to said chamber is automatically controlled to preserve the proportions of said vapour and said gases in the mixture in said chamber.

No. 102,502. Brake. Frein.

Aubrey James Reid, Mount Street, North Sydney, New South Wales, Australia, 11th December, 1906; 6 years. Filed 14th November, 1906. Receipt No. 141,214.
Claim.-1. Improved brake for rallway and other vehicles characterized by engaging members, of a clutch adapted to brake the axle or the hub of the wheel and the moving nember of said clutch adapted to operate gear to apply a brake block to the periphery or tread of the wheel, substantially as herein described and explained.
2. Improved brake for railway and other vehicles characterized by a clutch adapted to brake the axle or the hub of wheel whose members are normally held in disengagement and the moving member on engagement with the fast member is adapted by means of a tight band thereon to apply a brake block to the periphery of the wheel, substantially as herein described and explained.
3. In brakes as set forth in the preceding first and second claims, a braking clutch fork or lever for operating the moving member of the clutch connected to a thrust spring kept normally in compression and a controlling pull rod in tension for compressing said spring, substantially as herein described and explained and as illustrated in the drawings.
4. In brakes as set forth in the preceding first and second claims a tight band on the moving member of a braking clutch linked to the applying lever of peripheral brake blocks, substantially as herein described and explained and as illustrated in the drawings.
5. In brakes having the mechanisms set forth in the preceding third and fourth claims, a push rod reversely connecting the thrust spring to the applying lever of peripheral brake blocks, substantially as herein described and as, illustrated in the drawings.
6. In multiple brakes having the mechanisms set forth In the preceding third and fourth claims connecting the gears of each pair of wheels by levers and parallel rods to impart synchronous movement in braking all the axles and wheels, substantially as hercin described and explained and as illustrat?i in the drawings.
7. The comblation and arrangement together of all the mechanical parts forming a brake for railway and other vehicles for the purposes set forth substantially as herein described and explained and as illustrated in the figures 1 to 4 of the drawings.

12-12
8. The combination and arrangement together of all the mechanical parts forming a brake for railway and other vehicles for the purpose set forth, substantially as herein described and explained and as illustrated in figure 5 of the drawings.
9. Improved brakes for rallway and other vehicles characterized by controlling pull rods jointed at one end to a revolving drum on the one vehicle and connected by a flexible or rope connection at the other end to a similar connected revolving drum on the coupled vehicle the shafts of said drums being adapted to move longitudinally relatively to the vehicle and revolvably as moved by either of two other drums controlled by connecting ropes to the coupled vehicle, substantially as herein described and explained.
10. The combination and arrangements together of all the mechanical parts forming compensating coupling for the controlling pull rods for brakes of railway and other vehicles for the purposes set forth, substantially as herein described and explained and as illustrated in figure 6 of the drawings.
11. Improved brakes for rallway and other vehicles characterized by the mechanism as set forth in the preceding ninth claim modified by the interposition of purchase pulleys controlled by a spring take-up, substantially as herein described and explained.
12. The combination and arrangements together of all the mechanical parts forming compensating coupling for controlling pull rods for brakes of rallway and other vehicles for the purposes set forth, substantially as herein described, and explained and as illustrated in figure 7 of the drawings.
13. Improved brakes for railway and other vehicles characterized by, controlling pull rods operated by a power cylinder having steam and exhaust ports and an air inlet port with valves operated by the one lever or actuating handle and an air exit port for the purposes set forth, substantially as herein described and explained.
14. The combination and arrangements together of all the mechanical parts forming podwer control apparatus for brakes of railway and other vehicles for the purposes set forth, substantially as herein described and explained and as illustrated in the figures 8 and 9 of the drawings.

No. 102,503. Coupling for Wire.
Accouplement pour îls.

Charles E. Atkinson, John M. Montz, and Alexander Gordon, each an assignee of a third interest, 11th December, 1906; 6 years. Filed 31st May, 1906. Receipt No. 136,435 .
Claim.-1. A coupling device consisting of two segmental and complimentary members divided longitudinally at an angle and dovetailed convergently together in their contacting faces, all substantlally as shown and described.
2. A coupling consisting of two segmental members which are compliments of each other and which are divided by contact faces, which faces are formed at an angle longitudinally, said faces being dovetailed together longitndinally by a tapering tongue and a tapering under-cut slot formed in the respective male and female members, substantially as described.
3. A coupling device formed of a male and a female member adapted to be coupled and uncoupled manually, the male member having a tapering tongue extending longitudinally above its contact face and the female member having a tapering slot formed longitudinally in its contact face to receive said tongue, and means for connectig the terminals of wires in each of said members, all substantially as set forth.
4. A coupling device consisting in combination of two oppositely disposed members each having a wire terminal secured therein and the members being separated by a common line disposed at an angle and an under-cut tapering slot formed in the face of one of the members and a
tapering tongue rising above the face of the other member and adapted to fit and interlock with said slot of the opposite member, substantially as shown and described and for the purposes set forth.
5. In a coupling dvice consisting of two members each integral in itself and each having secured in one end the terminal each of a separate wire, the members being joined on a line disposed at an angle longitudinally forming a contact face for each member, and means for detachably connecting said faces which means consists of an under-cut tapering slot formed longitudinally in the face of one member and a tapering tongue formed longitudinally in the face of the other member and adapted to fit sald slot when the members are connected.
6. A coupling consisting of a cylindrical body divided on an angle longitudinally into two separate members \(A\) and \(B\), the member A having an under-cut tapering slot extending from end to end centrally of its face, the member \(B\) having a diverging tapering tongue extending from end to end centrally of its face, said tongue being adapted to fit said slot when the members are coupled together.
7. A connector for wires composed of two terminal members having engaging longitudinal dovetailed parts, said parts being wedge-shaped or wider at one end than at the other.
8. A coupling for electric wires composed of two wedgeshaped members, each having at the larger end a wire socket, said members having engaging longitudinal dovetailed parts, which parts are wider at one end than at the other whereby increased strain on the wires increases the force of engagement between the parts.

No. 102,504. Mine Door. Porte pour mincs.

Newton K. Bowman, North Lawrence, Ohio, U.S.A., 11th December, 1906; 6 years. Filed 6th November, 1906. Recelpt No. 140,963 .
Claim.-1. In electric haulage lines or systems and in combination with the trolley line gate and gate actuating mechanism operated by means of the approaching car, a spanner or bridge located upon one side of the gate and in electrical connection with the trolley line and adapted to be tripped and swung across the path of the gate and make electrical connection with the trolley line upon the opposite side of said gate to safely carry the trolley wheel thereby without necessitating interruption of the electrical current.
2. In electric haulage lines or systems and in combination with the trolley line and gate, oppositely inclined approaches located upon opposite sides of the gate, clips at the outer ends of the approcahes embarcing opposite sides of the trolley line, fastenings connecting opposite side members of the clips and confining the trolley line therein, hangers at the inner ends of the approaches, and a bridge pivoted to one of the approaches and adapted to be tripped upon opening of the gate to close the gap or space between tho approaches for carrying the trolley wheel thereby and maintaining continuity of the electric current.
3. In electric haulage means or systems, and in combination with the trolley line and gate, oppositely inclined approaches spaced apart at their inner ends and secured at their outer ends to the trolley line, hangers connecting the inner ends of the approaches with the trolley line, one of said hangers having oppositely inclined guides at its lower end, a bridge pivoted to the other hanger and adapted to be tripped upon the approach of a car to safely carry the
trolley by the space formed between the inner ends of said approaches. and a wedge-shaped piece attached to the free end of the approaches for co-operation with the oppositely inclined guides of the first-mentioned hanger, substantially as set forth.
No. 102,505. Mine Gate. Barrirve pour mines.

Newton K. Bowman, North Lawrence, Ohlo, U.S.A., 11th December, 1906; 6 years. Filed 6th November, 1906. Receipt No. 140,964.
Claim.-1. In a gate structure, the combination of a gate, a frame therefor, a brace for strengthening the same, a bar mounted upon said brace, an arm attached to said bar and movable therewith and having connection with the gate to effect movement thereof, a counterbalanced arm attached to said bar and the arm for operating the gate, and actuating means adapted to be operated by a moving car to effect opening of the gate.
2. In combination, a gate, a supporting frame therefor, braces for strengthening said frame, bars mounted upon the braces midway of their ends, arms connected at one end to said bars and having their opposite ends curved and connected with the gate to effect opening thereof, counterbalanced arms connected with said bars and with the arms connected to the gate, gate actuating means adapted to be operated by a moving car, and adjustable connections between the gate actuating means and the aforesaid bars.
3. In combination, a gate, a supporting frame therefor, braces for strengthening said frame, a bar mounted upon each bracc, arn:s connected at one end to the respective bars and having their opposite ends connected with said gate, a counterbalanced arm for each bar, a rocking bar extending bencath the rails of the track, arme fast to each end of said rocking bar, and adjustable connections between said arms and the aforesaid bars.
4. In combination, a gate, a series of rocking bars mountedr at each side of the gate, connecting means between one of the said rocking bars and the gate, crank arms and bars connecting the series of rocking bars, a lever, links connecting opposite ends of the lever with the bars connecting each series of the aforesald rocking bars, and connecting means between the gate and the said series of rocking bars and their co-operating connecting means.
5. In combination, a gate, a rocking bar, connecting means between said gate and rocking bar, and a mounting for the rocking bar consisting of a bracket having rigid connection with the rocking bar and pivotally supported to permit said rocking bar to oscillate with the said bracket.

\section*{No. 102,506. Gate. Barrière.}

James F. S. Goble, New Albin, Iowa, U.S.A., 11th December, 1906; 6 years Filed 17th October, 1906. Receipt No. 140,383.
- Claim.-1. The combination with a sliding gate having a supporting roller at one of its lower corners, of a tilting track, a roller connected with the other end of the gate and working on said track, and operating levers for tilting said track, substantially as described.
4. The combination with a sliding gate having an extended rail, of a tilting track, a weighted carriage connected with the gate rail and having rollers movable along the track, a bifurcated lever arm forming an open center extension of the track through which the extended rall moves, a sliding yoke to which said lever arm is connected, and gate operating levers connected with said yoke and adapted to shift the yoke, causing said yoke to tilt the track, substantially as described.
3. The combination with a sliding gate, of a carriage connected to the gate, a tilting track upon which said carriage moves, a vertically movable yoke having the tilting track connected therewith, gate operating levers having their
adjacent ends connected with the yoke, and rollers on on said yoke between which the adjacent ends of the gate operating levers work, substantially as described.

4. The combination with a sliding gate provided with a supporting roller at one end of its lower corners, of a wheeled and weighted carriage projecting from the opposite end of the gate, a tilting track on which said carriage moves having upwardly deflected end portions forming checks for the carriage, a vertically movable yoke to which the tilting track is connected, and operating levers having their inner ends in sliding engagement with said yoke for shifting the latter, substantially as described.
5. The combination with a sliding gate. of a tilting track forming a reversely inclinable support for the gate, a sliding yoke, a lever arm on said tilting track connected with the yoke, gate operating levers connected with the yoke for shifting the latter, and a latch pivoted on the gate post and having interlocking engagement with a portion of the gate and arranged to be shifted by the movement of the yoke.
6. The combination with a sliding gate having an extended rail, of a tilting track embodying parallel ralls mounted on a common fulcrum post intermediate the ends of the rails, a weighted carriage connected with the gate rail and supported by rollers which move along the track rails, a lever arm connecting the track rails at one end and straddling the extended rail of the gate, and gate operating levers connected with said tilting track, substantially as described.
7. The combination with a sliding gate having an extended rail, of a weighted carriage connected to said rail and provided with supporting rollers, a tilting track on which said rollers move having an upwardly deflected end partion, means for tilting said track, and a post provided with a cap beneath which the upwardly deflected end portion of the rack moves, said cap acting as a stop for the carriage at one end of its throw, substantially as described.

No. 102,507. Fence. Clôture.
Robert Henry Guthrie, South Dumfries, Brant, Ontario, Canada, 11th December, 1906; 6 years. Filed 23rd October, 1906. Recelpt No. 140,553.
Claim.-1. In a fence, the combination with the posts and the stringers attached thereto, of anchors in the ground below the stringers and metallic stays connecting the anchors with the stringers, all substantially as described and for the purposes specified.
2. In a fence, the combination with the longitudinal stringers of posts to which the stringers attach, braces supporting said posts above the ground, anchors in he ground supporting the braces, metallic stays embedded in the anchors and secured to the braces, binding wires connecting the braces with the posts, said binding wires serving to hold the posts in an upright position, all subsantially as described and for the purposes specifled.
3. In a fence, the combination with the longitudinal stringers of a post having an enlarged base and being superimposed movably upon a solid foundation, a metallic anchor projecting from the ground, its upper end passing through said movable post and engaging a nut by the turning of which said post may be moved upon its foundation, all substantially as described and for the purposes specified.
4. In a fence, the combination with the longitudinal stringers of an end post having an enlarged base, and being superimposed movably upon a solid foundation, a metallic anchor supporting said post, a gate hanger upon the upper side of said anchor, said gate hanger being com-
portion being furnished with collars adapted to support the hinges of a gate, and said horizontal portion being

secured to said post, all substantially as described and for the purposes specified.
5. In a fence, the combination with the end posts and the longitudinal stringers attached thereto, of anchors in the ground below the stringers, metallic stays connecting the anchors and stringers, intermediate posts between the und posts, side braces supporting the intermediate posts, concrete foundations under the braces, metallic stays embedded in the foundations and connecting with the braces, and binding wires connecting the braces and posts, all substantially as described and for the purposes specifled.

No. 102,508. Hinge. Penture.

Harry Glen Kimple, Dicksonburg, Pennsylvania, U.S.A., 11th December, 1906; 6 years. Filed 11th October, 1906. Recelpt No. 140,207.
Claim.-1. In a hinge the combination with an apertured base having oppositely disposed grooved ears, of a strap. oppositely extending projections thereon engaging the ears, and means within the aperture for holding the projections within the ears.
2. In a hinge the combination with an apertured base having ears adjacent its aperture, of a strap projecting between the ears, oppositely extending projections thereon engaging the ears, and a detachable follower seated within the aperture and adapted to hold the projections against displacement.
3. In a hinge the combination with an apertured base having longitudinally grooved ears adjacent its aperture, of a strap, oppositely extending projections thereon rotatably mounted within the grooves, and a detachable follower
within the apertured grooves for holding the projections asainst displacement.
4. In a hinge the combination with a supporting structure, of an apertured base secured thercto and having ears adjacent its aperture, a strap extending between and rotatably mounted within the ears, and a follower withln the aperture and interposed between the strap and supportans structure.
5. In a hinge the combination with an apertured base adapted to be secured to a supporting structure, and longitudinally grooved ears adjacent the aperture, of a strap between the ears, oppositely extending projections upon the strap rotatably mounted within the grooves, and a follower detachably mounted within the aperture and grooves for holding he projections against displacement. satd follower adapted to be held against movement by the structure to which the hinge is secured.
6. A hinge comprising a member having an aperture therein and integral ears, another member between and engaging the ears, and means within the aperture for holding said last-mentioned member in engagement with the cars.

No. 102,509. Sliding Shoe for Furniture.
Plaque glissante pour meubles.

Orton C. Little, Menasha, Wisconsin, U.S.A., 11 th December, 1906: 6 years. Filed 11th September, 1906. Receipt No. 139,423.
Claim. - 1. A sliding shoe for furniture or for ot her articles having a flat lower surface and upwardly curevd outer edge, a support arranged concentrically within the shoo having a portion of its upper surface between its vertical sides and top, and provided with an outwardly curved surface, a socket fitted to oscillate upon said curved surface within prescribed limits and a pin arranged to pass through said socket and being adapted to be engaged by a bore in a suitable piece having a diameter corresponding with the diameter of said pin, and a depth equal to the length of the pin required to be used in said bore, and means for prevonting the enparation of said concentrically arranged support and socket, substantially as described.
2. A sllding shoe for furniture or other articles having a flat lower surface and upwardly curved outer edge, a support arranged concentrically within the shoe having a portion of its upper surface between its vertical sides and tor, provlded with an outwardly curved surface, a socket fitted to oscillate upon said curved surface within prescribed limits, and a split pin arranged to pass through said socket and being adapted to be engaged by a bore in a suitable piece having a diameter corresponding with the diameter of said pin when compressed to its smallest dimensions, and a depth equal to the length of the pin required to be used in said bore, and a housing connecting said concentrically arranged support and socket, and preventing their separation, substantially as set forth
3. A sliding shoe for furniture or other articles, formed of earthenware material having a flat lower surface and opwardly curved outer edge, means for securing a housing concentrically around and over a portion of lis upper surface, a socket formed centrally within the upper surface of the shoe, a supporting piece mounted concentrically withia said socket having a central aperture and a portion of lis upper surface between its vertical sides and sald aperture. curved outwardly, in combination with a pin having a head or enlargement upon its closed end and a socket secured to said pin, and being adapted to osclllate within prescribed limits upon he aforesald supporting piece, and means for preventing the separation of said last-named socket and the shoe by the application of a houaing, substantially as described.
4. A sliding shoe for furniture or other articles, formed of earthenware material having a flat lower surface and upwardly curved outer edge, means for securing a housing concentrically around and over a portion of its upper surface, a socket formed centrally within the upper surface of the shoe, a supporting piece mounted concentrically within said socket having a central aperture and a portion of its upper surface between its vertical sides and said aperture curved outwardly, in combination with a split pin having a head or enlargement upon its closed end and a socket secured to sald pin, it being adapted to osclllate within prescribed limits upon the aforesaid supporting piece said pin being adapted to enter a bore in a sultable plece having a diameter corresponding with the diameter of sadd pin when compressed to its smallest dimension and a depth equal to the length of pin required to be used in said bore. and means of preventing the separation of sald last-named socket and the shoe by the application of a housing. substantially as shown.

No. 102,510. Davenport. Sofa-lit.

Arthur Mayrick Padmore, Chliago, Illinois, I'S.A.. 11th Ihecember, 1906; 6 years. Flled ioth September, 196 . Receipt No. 139,368 .
Claim.-1. A comblned davenport or bed comprising a main frame provided with side pieces and rear standards. said frame being provided adjacent to sald side pi....s with guide grooves and the standard with guide groovi. having forwardly curved lower ends, a head piece exientina between and secured to the standards, scat and back s. - tions comprising upholstered frames hingedly coancci.d. the seat frame belng provided with runners movable in the guldeways in the seat frame and the back frame, rollers to traverse the guides in the standards whereby the seat and back portions may be adjusted in unison to extent the seat portion beyond the main frame and to bring the back portion to the masition normally occupied hy sald scat portion, and a strip upon the front edge of the reat porlion to conceal the joint between the same and the mala frame when the parts are in normal position
2. A combined davenport and bed comprising a mala frame composed of a bottom, side pieces, rear standaris. and a head piece extending between the standarda. the bottom portion of the frame being provided adjacent to the side pleces and standards with gulde grooves having channelled wear strips inserted therein, and tha standaris With vertical grooves having forwardiy profecting lower terminals, the top and bottom walls of said grooves forming stops, seat and back frames hingedy connected a: their meeting edges, the seat frame being provided at i:s ends with runners movable in the channelled gulde pleces and the back frame upon the normally upper porcions of
its ends with rollers to travel in the guide grooves in the standards and engage said stops, a strip secured to the front portion of the seat frame to cover the joint between the same and main frame when the parts are in normal position, and a leg pivoted to the forward portion of the main frame and adapted to fold behind said strip.
3. A sofa of the character described comprising a main frame provided at the front thereof with a receiving recess and horizontal and vertical guideway, hingedly connected seat and back portions provided with guide members to respectively travel in said horizontal and vertical guideways, the sald seat portions being extendible beyond the frame and the back portion adjustable to the position normally occupied by the seat portion, a hinged supporting leg upon the front rail of the seat portion adapted to be turned to an inactive position and to occupy said receiving recess when the seat and back portions are restored to their normal positions, said leg having a lug, a strip upon the front rall of the seat portion to conceal the joint between the same and the main frame and conceal the leg when the seat portion occupies its normal position. and a keeper pin unon the rear side of said strip adapted to be engaged by the lug to hold the leg in folded position.
4. A sofa comprising a main frame provided with horizontal guldeways and vertical guldeways having offset portions, a seat provided with gulde members adjustable in said horizontal guideways so as to be extended beyond the front portion of the frame, and a back provided with guide members to travel in said vertical guideways and adapt the same to be swung outward and downward to a horizontal position above the portion of the main frame usually occupled by the seat, said gulde members being also adapted to be moved into the offset portions of the vertical guldeways to support the back in an Inclined position.
5. A sofa comprising a main irame provided with horizontal guideways and vertical guideways, the vertical guldeways being provided with offset portions. a seat provided with guide members adjustable in said horizontal guldeways \(s 0\) as to be extended beyond the front portion of the frame, a back provided with gulde members to travel in said vertical guideways and adapt the same to be swung outward and downward to a horizontal position above the portion of the main irame usually occupied by sald seat, said guide members being also adapted to be moved into the offset portions of the vertical guideways to support the back in an inclined position, and springs mounted in the horizontal guideways to prevent the seat from moving.
6. A sofa comprising a main frame provided with horizoncal and vertical guideways, the horizontal guideways being provided with stop shoulders, a seat provided with guide members adjustable in said guideways so as to be extended beyond the front portion of the frame, said gulde members being recessed for engagement with the stop shoulders, and a back provided with guide members to travel in said vertical guideways and adapt the same to be swung outward and downward to a horizontal position above the portion of the main frame usually occupied by the seat.
7. A sofa comprising a main frame provided with horzontal guldeways formed with ston shoulders and with vertical guideways formed with offset portions, a seat provided with guide members adjustable in said horizontal guideways so as to be extended beyond the front portion of the frame, said guide members being recessed for engagement with said gtop shoulders, a back provided with guide members to travel in sald vertical guldeways and adapt the same to be swung outward and downward to a horizontal position above the portion of the main frame usually occunied by the seat, said guide members being also adapted to be monod into the offset portions to support the back in an inclined position, and springs mounted in the horizontal guideways to prevent the seat from moving.

No. 102,511. Couch. Canapé.
Virginnia Whittington, Valdosta, Georgia, U.S.A., 11th December, 1906; 6 years. Filed 4th September, 1906. Recelpt No. 139,231.
Claim.-1. In a bed, a head section, a foot sostion, a plurality of spaced supporting members secured to said sections, side rails engaging one of the members on each section and movable vertically into engagement with the adjacent member, a covering detachably secured to the side rails, and means for locking the side rails in engagement with the supporting members.
2. In a bed, a head section, a foot section, a plurality of spaced supporting members secured to saia sections and each provided with a clamping face, side rails having similar clamping faces adapted to engage one of the members on each of said sections and movable into engagement with adjacent members and a fastening means engaging the clamping faces of the members and side rails.
3. In a bed, a foot section and a head section connected by side rails, a covering engaging the side rails and an

overhanging bracket detachably secured to one of said sections and provided with spaced depressions for the reception of lifting straps
4. In a bed, a head section and foot section connected by side rails, an overhanging bracket secured to one of said sections and provided with a horizontally disposed bar having depressions formed therein for the reception of lifting straps, a covering engaging the side rails, a rubber sheet detachably secured to the covering, and a waste pipe supported by said covering.
5. In a bed, a head section and a foot section detachably connected by hinged side rails and provided with spaced recesses, a covering engaging the side rails, detachable supporting hooks seated in the recesses of the head and foot sections, and a lifting sheet adapted to engage sald hooks
6. In a bed, a head section and a foot section provided with corner posts having spaced recesses formed therein, side rails detachably secured to said posts and having their intermediate portions hinged, hooks detachably engaging the recesses in said posts, and a lifting head adapted to engage the supporting hooks.
7. In a bed, a head section and a foot section connected by side rails, a covering detachably secured to the side rails and formed with a circular opening, a waste pipe extending through said opening and provided with an inflatable rim adapted to engage the upper face of the covering and flexible strips secured to the waste plpe and detachably engaging the lower face of said covering.
8. In a bed, a head section and a foot section connected by detachable side rails, a covering engaging the side ralls and provided with a central opening, a rubber sheet detachably secured to the covering and provided with a central opening disposed in alignment with the opening in the supporting shect, a lifting sheet provided with a similar opening, and a waste pipe adapted to engage said opening and provided with an inflatable rim.
9. In a bed, a head section and a foot secrion connected by side ralls, a covering engaging the side ralls and provided with an opening, a rubber sheet detachably secured to the covering and having an Inflatable marginal rim, said sheet being provided with an opening disposed in alignment with the opening in the covering, and a waste pipe having an inflatable rim interposed between the rubber sheet and covering and engaging said openings.
10. In a bed, a head section, supporting members slidably mounted for vertical movement on said sections, side rails engaging one of the members on each section and movable verically into engagement with the adjagent member, a covering engaging the side rails, a sheet of impervious materlal detachably secured to the covering and having a marginal infiatable rim, means for locking the supporting members in adjusted position, and means for locking the side rails in engagement with the supporting members.

\section*{No. 102,512. Folding Bed. Lit pliant.}

Gaius C. Fuller, Cleveland, Ohio, U.S.A.. 11th December, 1906: 6 years. Filed 3rd October, 1906. Receipt No. 140,001.
Claim.-1. In a folding bed, the combination of a supporting member, a bed frame plvoted thereto, an arm pivoted to said frame for raising and lowering the same, and means connected with said arm intermediate of the pivot and the end remote therefrom to assist in operating the same, substantially as specified.
2. In a folding bed, the combination of a supporting member, a bed frame pivoted thereto, an arm pivoted to said frame and of sufficient length to engage the floor during a portion at least of the folding movement of said frame and having its free end provided with a roller or
similar anti-friction device, and means connected with said arm intermediate of the pivot and the end remote there-

\section*{5 \\ }
from for assisting to move the same toward the pivot of the frame to elevate the latter, substantially as described.
3. In a folding bed. the combination of a supporting member, a bed frame pivoted thereto, an arm pivoted at one end to said frame and at its other end to the end of the bed which is remote from said base member, and means connected to said arm intermediate of the ends thereof for assisting to move the same and the connceted end of the bed toward the pivot of the frame to elevate the latter, frame, substantially as specified.
4. In a folding bed, the combination of a supporting momber, a bed frame pivoted thereto, a transverse frame pivoled at one end to said bed frame and having rollers at its other end for engaging the fioor during a portion at least of the closing movement of the bed frame. and means connected with the transverse frame intermediate of the pivot and the end remote threfrom for assising to move it toward the pivot of the bed frame to elevate the latter fram? substantially as specified.
5. In a folding bed, the combination of a supporting member, a bed frame pivoted thereto, an arm pivoted to said frame and of sufficient length to engage the floor luring a portion at leeast of the folding movement of said frame, and mechanism connected with said arm intermediate of the pivot and the end remote therefrom to assist in moving the same toward the pivot of the frame to raise the said frame, substantially as specified.
6. In a folding bed, the combination of a supporting nember, a bed frame pivoted near one end to said member, a transverse frame pivotally connected at one end to said bed frame and provided at its other end with rollers, and means connected with said transverse frame intermediate of the pivot and the end remote therefrom to assist in moving the same toward the pivot of the bed frame to elevate the latter frame, substantially as specified.
7. In a folding bed, the combination of a supporting member, a bed frame having its side rails pivoted to said member, an arm pivotally connected to each of said rails and being of sufficient length to engage the fioor, and means connected to said arms intermediate of the pivots and the ends remote therefrom to assist in removing them toward the pivot of the frame to elevate the latter, substantially as specified.
8. In a folding bed, the combination of a supporting member, a bed frame pivotally connected to said member and comprising a longitudinal member, an arm pivotally connected to said frame, and mechanism carried by said longitudinal member and connected to said arm intermediate of the pivot and the end remote therefrom to assist in moving the same toward the pivotal connection of the bed frame to elevate the latter, substantially as specified.
9. In a folding bed, the combination of a supporting member, a bed frame pivotally connected thereto, an arm pivotally connected to said irame, and a spring connected to said arm intermediate of the pivot and the end remote therefrom and arranged to assist in moving the same in a direction to elevate the bed frame, substantially as specifled.
10. In a folding bed, the combination of a supporting member, a bed frame pivotally connected thereto and comprising a longitudinal member, an elevating arm pivotally connected to said frame, a spring carried by said longitudinal member, and an operative connection between said spring and said arm intermediate of the pivot and said spring and said arm, substantially as specifled.
11. In a folding bed, the combination of a supparting member, a bed frame pivotally connected thereto, said frame comprising a longitudinal member, an elevating arm pivotally connected to said frame, a spring carried by said longitudinal member and exerting its force in the direction of the pivot of the bed frame, and an operative connection between said spring and said arm intermediate of the pivot and the end remote therefrom, substantially as specified.
