12. In a folding bed the combination of a supporting miember, a bed frame pivotally connected thereto and comprising a longitudinal member, an elevating arm pivotally conneced to sald frame, a spring carried by sald longitudinal member, a sliding block engaged by said spring and a link connecting said block and said arm, substantially as specified.
13. In a folding bed the combination of a supporting member, a bed frame pivoted to said member and comprising a hollow longitudinal member having a longitudinal slot therein, a spring mounted in said longitudinat member, a block slidably mounted in said longitudinal member in engagement with said spring and having a shank or extenslon projecting through said slot, an elevating arm pivotally connected to said bed frame and a link connecting said arm and the shank of said block, substantially as specified.
14. In a folding bed the combination of a supporting member, a bed frame pivoted thereto and comprising a hollow longitudinal member. said member having a slot therein, a rod supported within said longitudinal member, a collar loosely mounted on said rod, a block or plunger connected to said rod and having a shank extending through the slot in the longitudinal member, a spring on said rod between said collar and block, an elevating arm pivoted to said frame and a link connecting the shank of said block and said arm, substantially as specified.
15. In a folding bed the combination of a supporting member, a bed frame pivoted thereto, an elevating arm plvoted to said frame, a spring operatively connected to said arm intermediate of the pivot and the end remote therefrom, and means for adjusting the tension of said spring, substantially as specified.
16. In a folding bed the combination of a supporting member, a bed frame pivoted to said member, an elevating arm pivoted to each of the side rails of said frame, a spring carried within each o said side rails, and an operative connretion between each of said springs and each of said arms, and said arms, substantially as specified.
17 In a folding bed the combination of a supporting member a bed frame pivoted to said member, a transverse elevating frame comprising arms cach plvoted at one end to a side rail of the bed and at the other end to the end of the bed remote from the supporting member, springs carried by said rails and connections between said springs and said arms. subtantially a specifled.
18. In a folding bed the combination of a supporting member a bed frame formed with chambered side ralls each having a longitudinal slot in the lower portion thereof adjacent the supporting member, a block or plunger slidably fited in each of said rails having an extension projecting through the slot, and means for pivotally connecting sald extension and said supporting member, substantially as specified.
19. In a folding bed the combination of a supporting member, a bed frame formed with chambered side ralls each having a longitudinal slot in the lower portion thereof adjacent the supporting member, a block or plunger slidably fitted in each of said rails and having an extension projecting through thte slot, means for pivotally connecting said extension and said supporting member. and means connected with said frame for moving it longitudinally on said blocks or plungers during the folding and unfolding movements of the bed and for resisting the starting of such movements, substantially as specified.
20. In a folding bed the combination of a supporting member, a bed frame pivotally connected thereto, an elevating arm pivotally connected to said frame, and means comprising a collapsable link for assisting to move said arm in a direction to elevate said frame, substantially as specified.
21. In a folding bed the combination of a supporting member, a bed frame pivotally connected thereto, an elevating arm pivotally connected to said frame, a spring and a collapsable link connecting said spring and said arm to assist in moving the latter in a direcion to elevate the frame, substantially as specified.
22. In a folding bed the combination of a supporting member, a bed frame pivoted to said member and provided with a longitudinal hollow rail, an elevating arm pivoted to said frame, and a spring within said rall connected to said arm to move it in a direction to elevate the bed frame, substantially as specified.
23. In a folding bed the combination of a supporting membere, a bed frame pivoted to sald member and provided with a longitudinal rail, a spring carried by said rail and
exerting its force in the direction of the said rall, an elevating arm pivoted to said frame, and means for connecting said spring to said arm to move it in a direction to elevate said spring to said arm to move it in
said frame, substantlally as specified.
24. In a folding bed the combination of a supporting member, a bed frame pivated to said member and provided with a pair of hollow rails, springs mounted in said rails and exerting their force in the direction of the length thereof, elevating arms pivoted to said frame, and means for connecting said spring to said arms to move them in a direction to elevate said frame, substantially as specified.

No. 102,513. Spring and Mattress for Invalid Beds. Matclas.

Edith B. Preston, Mexico, Missouri, U.S.A., 11th December, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,819.
Claim.-1. In means of the class described the combintion of a spring frame, a mattress supported thereby, hinge connections between certain portions of the frame admitting of adjustment thereof with regard to the other portions of the frame, and means for effecting the adjustment of the portions of the frame above-mentioned.
2. In means of the class described, the combination of a spring frame, a mattress supported thereby, hinge connections between certain portions of the frame admitting of adjustment thereof with regard to the other portions of the frame, and elevating means for effecting the adjustment of the portions of the frame above-mentioned.
3. In means of the class described, the combination of a spring frame made in a number of adjustment sections, a mattress comprising a number of sections carried by the frame, a supplementary frame attached to the frame firstmentioned and movable relatively thereto to form an opening in the body of the spring frame, and a mattress section having connection with the suplementary frame abovementioned, and supported thereby.
4. In combination, a spring embodying a section movable to form an unobstructed opening, and a mattress for sald spring also embodying a section movable to admit of formation of an opening common with that of the spring.
5. In combination, a bed spring embodying a section movable to form an unobstructed opening, a mattress for said spring also embodying a section movable to admit of for ation of an opening common with that of the spring, and means for connecting the movable sections of the mattress and spring.
6. In combination, a bed spring, a mattress thereon, and a sliding section applied to the spring and movable to form an opening therein, the mattress embodying a sliding section attached to that of the spring.

No. 102,514. Bed Brace. Agrafe pour lit.
Baxter Shemwell, St. Louis, Missouri, U.S.A., 11th December, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,379.
Claim.-1. In a bed brace, a tension device including spaced supporting members each provided with oppositely disposed wire engaging hooks arranged at an angle to the longitudinal axis of said members, and means for adjusting the supporting members to vary the tension of the wires.
2. In a bed brace, a tension device including spaced supporting members each provided with oppositely disposed wire engaging hooks the bills of which are arranged at an angle to the longitudinal axis of said members and spaced from the adjacent face of the same, and means for adjusting the members longitudinally to vary the tension of the wires.
3. In a bed brace, a tension drvice including spaced supporting members provided with main and auxiliary wire

engaging hooks, and means for adjusting the supporting members to vary the the tension of the wires.
4. In a bed frame, a tension device including spaced supporting members provided with oppositely disposed main and auxiliary wire engaging hooks, and means for adjusting the supporting members in the direction of their length thereby to vary the tension of the wires.
5. In a bed brace, a tension device including spaced supporting members provided with main and auxiliary wire engaging hooks the bills of which are space apart and disposed in opposite directions, and means for adjusting the supporting members to vary the tension of the wires.
6. In a bed brace, a tension device including spaced supporting members provided with oppositely disposed main and auxiliary wire engaging hooks disposed at an angle to the lingitudinal axis of said members, and means for adjusting said members longitudinally to vary the tension of the wires.
7. In a bed brace, a tension device including supporting plates each having a threaded extension and provided with a wire engaging hook the bill of which is disposed at an angle to the longitudinal axis of the plate and spaced from the adjacent face of the latter, and a turn buckle engaging the threaded extensions of the plates for adjusting the latter longitudinally thereby to vary the tension of the wires.
8 . In a bed brace, a tension device including spaced supporting plates having threaded extensions and provided on its opposite faces with diagonally disposed main and auxiliary wire engaging hooks the bills of which are spaced apart and extended in opposite directions, and a nut engaging the threads on the extensions for adjusting said plates longitudinally to vary the tension of the wires
9 In a bed brace the combination with the corner posts and side rails, of a tension device provided with main and auxiliary wire engaging hooks, and stay members secured to the posts and side rails and engaging the main and auxiliary hooks.

No. 102,515. Oil Cup. Godet ithuile.

Edwin, Appleton Record, Boston, Massachusetts, U.S.A. 11th December. 1906; 6 years. Filed 15th October, 1906. Receipt No. 140,327.
Claim.-1. An oil cup having an outlet passage, a valve having a close sliding fit in said passage and movable longi-
tudinally therein, and a projection forming part of the valve having its under surface inclined outwardly and downwardly therefrom adapted to seat against a complemental surface beside the passage.
2. An oil cup having an outlet passage, a solid cylindrical valve having a close sliding fit in sald passage and movable longitudinally therein, and an outwardly and downwardly inclined seating portion surrounding a part of the valve adapted to co-operate with a complemental seat surrounding the passage.
3. An oil cup provided with an internal boss having a vertical passage therethrough, its upper surface surrounding the passage being formed with a convex spherical curvature, and a valve comprising a solid stem closely fitting on all sides the said passage and a flange formed on its under side with a concave spherical surface ground to nt the spherical surface of said boss.
4. An oil cup provided with an internal boss having a vertical passage therethrough, its upper surface surrounding the passage being inclined downwardly toward its periphery, and a valve comprising a stem fitting said passage closely with a sliding fit and a complementally inclined portion adapted to seat on the inclined surface of said boss.
5. An oil cup provided with an internal boss having a vertical longitudinal cylindrical bore, the upper end of which is slightly contracted, and a solid cylindrical valve pin slidably mounted in such bore and having its lower end upset to a diameter less than the internal diameter of the main portion of the bore but greater than that of the contracted upper end thereof..

No. 102,516. Lubricator. Graisseur.

Thomas J. Kehoe, Dayton, Ohio, U.S.A., 11th December, 1906; 6 years. Filed 19th April, 1906. Receipt No. 135,077.
Claim.-1. In mechanism of the class described, a fountain having a series of independent leads communicating therewith through its bottom, a series of plungers working in the leads respectively, openings for the passage of oil from the fountain into the uppermost part of each lead, an outlet valve in each of the leads, a rotating shaft arranged horizontally in the fountain and having mechanism in connection therewith to actuate the same, one or more eccentric cylinders mounted longitudinally and loosely upon the shaft, the shaft having means in connection therewith to engage and actuate the cylinders, a series of vertically movable yokes corresponding with said plungers and having connections aespectively therewith, and each yoke having a stem which extends up through the top of the fountain, and a series of springs, one in connection with each of said yokes, and acting upward against the top of the fountain and downward upon the yoke to hold the latter in lowermost position, the said cylinders being adapted to engage and lift said yokes.
2. In mechanism of the class described, a fountain having a series of leads communicating therewith through its bottom, a rotating shaft anranged in the fountain and having mechanism in connection therewith to actuate the same one or more eccentric cylinders mounted longitudinally and loosely upon the shaft, the shaft having means in connection therewith to engage and actuate the cylinders, a series of yokes, each having a plunger in connection therewith which operates in the corresponding lead, the said yokes being adapted to be lifted by said cylinders, and a series of springs, one in connection with each of said yokes tending to hold the latter in lowermost position.
3. In mechanism of the class described, a fountain having one or more leads communicating therewith, a rotatable shaft having means in connection therewith to actuate the same, one or eccentric cylinders mounted longitudinally and loosely upon the shaft, the shaft having means to engage the cylinders and actuate the same, and one or more yokes corresponding with the leads, each having a plunger which operates in the corresponding lead, and each yoke having relation with the corresponding cylinder to actuate the former.
4. In mechanism of the class described, a fountain having one or more leads communicating therewith, one or more yokes, each having a plunger in connection therewith which operates in the corresponding lead, automatic mechanism for actuating the yokes, and means to operate the plungers independent of the automatic mechanism.
5. In mechanism of the class.described, a fountain having one or more leads communicating therewith, a plunger in each of said leads, automatic mechanism having actuating relation with each of the plungers, and means to actuate each plunger independent of the automatic mechanism.
6. In mechanism of the class described, one or more leads having in connection therewith means for supplying the same with oll, a plunger operating in each lead, and automatic mechanism for actuating the plungers, each plunger being adapted to be operated independent of the automatic mechanism.
7. In a device of the class described, a fountain having one or more leads communicating therewith, a rotating shaft having thereon a ratchet wheel, means in connection with the shaft and each lead to force oil from said fountain through the respective leads, a swinging arm having two ratchets pivoted thereto adapted to engage the ratchet wheel, a spring acting between the forward end of one ratchet and the rear end of the other ratchet to hold said ratchets into engagement with said ratchet wheel, and means to actuate said swinging arm.
8. In a device of the class described, a lead having a source of oil supply, a plunger operating in the lead, a rotatable shaft, an eccentric loosely mounted upon the shaft, the shaft having a projection which is adapted to engage the eccentric and actuate the latter, and a yoke having connection with the plunger and engaging relation with the eccentric, the plunger being adapted to be operated independent of the eccentric.

No. 102,517. Lubricator. Graisseur.

William H. Decker, Regina, Saskatchewan, Canada, 11th December, 1906; 6 years Filed 8th March, 1906 Receipt No. 133,652.
Claim.-In a device of the class described, comprising a vehicle axle having a journal thereon, a hub rotatably mounted on the journal, a ferrule at the inner end of the hub, there being a lug on the inner face of said ferrule, a rotatable shaft supported by the axle, a spur wheel on the shaft in the path of the said lug, a worm-gear on the oher end of the shaft, a train of gear wheels supported on the axle and operated by the said worm gear, a stationary dise supported on the axle having a screw-threaded peri phery, an oil tube communicating with the interior of the hub and also with said stationary disc, an oil cup open al its bottom and closed at its top and having a screw-threaded interior to engage the screw threads on said disc and also having cog teeth on its exterior in mesh with one of the wheels of said train of gear wheels, substantially as and for the purposes stated.

No. 102,518. Lubricator. Graisseur.

Fred Anderson, Warren, Pennsylvania, U.S.A., 11th December, \(1906 ; 6\) years. Filed 8th May, 1906. Receipt No. 135,686.
Claim.-1. An attachment for lubricators adapted for connection to the lubricator and to the part to be lubricated, and having an oil passage therethrough, and a cup at the bottom of said passage and loosely connected to said attachment.
2. An attachment for lubricators adapted for connection to the lubricator and to the part to be lubricated and having an oil passage therethrough, there being a shoulder extending from the lower end of said attachment, a cut surrounding said shoulder and a rod connected to said cup and extending into said passage.
3. An attachment for lubricators adapted for connection to the lubricator and to the part to be lubricated and having an oil passage therethrough, there being a shoulder extending from the lower end of said attachment, a cup surrounding said shoulder and a rod connected to said cup and extending through said passage and having a hook at its upper end by which the rod is suspended in said passage.

4 In combination, a lubricator having a screw-threaded lower end, a coupling having its upper end internally screw-threaded for attachment to said screw-threaded lower end of the lubricator and having also an internally screw-threaded lower end, a sleeve with its upper mid screwing into said coupling and its lower end sicrewthreaded for attachment to a cylinder, said sleeve having a shoulder extending from the lower end thereof, a cup surrounding said shoulder, and a rod connected to said cup and extending through an oil passage in said sleeve and having a hook at its upper end by which the rod is loosely suspended in said passage.

No. 102,519. Lubricator. Graisseur.

Ole O. Kittleson, Lee, Illinois, U.S.A., 11th December, 1906; 6 years. Filod 8th August, 1906. Receipt No. 138,496.
Claim.-1. The combination with a holder, of a piston operating therein, a support, a stem connected to the piston and having a threaded engagement with the support, operating means including a device rotatable about the stem, a dog for holding said device and stem against relative movement and permitting the sliding movement of the stem through the device, and means for automatically operating the dog to disengage the stem and driving device to permit

12-13
ihe rotation of the latter with respect to the former when said stem has reached a predetermined position.
2. The combination with a holder, of a piston operating a stationary support, a stem connected to the piston and having a threaded engagement with the support, an operating wheel roatable about the stem, a dog carried by the wheel for holding said wheel against relative rotation and permitting the sliding movement of the stetm through the wheel, and means carried 'by the stem and engaging dog when said stem has reached a predetermined position to unlock the wheel from the stem and permit the free rotation of said wheel.
3. The combination with a holder, of a piston slidable therein, a cup secured upon the upper end of the holder, a stem connected to the piston and having a threaded engagement with the cap, an operating wheel mounted on the cap and rotatable upon the stem, said stem also being slidable through the wheel and being provided with a longitudinally disposed keyway, a dog pivoted upon the wheel and normally engaged in the keyway to prohibit the relative rotation of the wheel and stem to permit the sliding movement of said stem, said stem having a shoulder located at the upper portion of the keyway and arranged to engage the inner end of the dog and move it out of said keyway when the stem moves downwardly to a predetermined position.
4. The combination with a holder, of a piston operating therein, a stationary support, a stem connected to he piston and having a threaded engagement with the support, said stem having a keyway, a wheel having a bore that slidably receives the stem, said wheel being rotatable about the stem, a worm engaging the wheel for operating he same, a dog movably mounted on the wheel and normally engaging in the keyway to prevent the rotation of said wheel about the stem, means located in the keyway for moving the dog out of the same when the stem reaches its predetermined position, said stem having a supporting shoulder located in the keyway above said means, said dog being arranged to rest upon the shoulder in the keyway and support the wheel out of engagement with the worm, and a handle carried by the wheel.
5. The combination with a holder, of a piston operating therein, means for moving the piston including a worm wheel, spaced journal bearings located at one side of the wheel, a shaft passing through the bearings, means connected to the shaft for rotating the same, a worm loosely journalled on the shaft between the bearings and meshing with the worm wheel, a clutch connection between one end of the worm and the shaft, a coiled spring bearing against the other end of the worm for yieldingly maintaining he clutch connection, said spring being mounted on the shaft and passing through the adjacent bearing, and means adjustably mounted on the shaft outside the bearing and engaging the spring to vary the tension thereof.
6. The combination with a holder, of a piston operating therein, means for moving the piston including a worm wheel spaced journal bearings located at one side of the wheel, a shaft passing through the bearings, a ratchet wheel secured to the shaft on the outer side of one of the bearings, a worm loosely journalled on the shaft between the bearings and meshing with the worm wheel, a clutch connection between the shafts and the end of the work that is adjacent to the ratchet wheel, and means for yieldingly maintaining said clutch connection, said means bearing against the other end of the worm and passing through the adjacent bearing.
7. The combination with a holder, of a rotatable actuating device having an axial bore, a plunger operating in the holder and having a stem longitudinally slidable in the bore, a key movably associated with the stem and actuating device to prevent their relative rotation and permit the said sliding movement of the stem, means normally engaging the actuating device for operating the same, said device being slidable upon the stem out of operative engagement with the operating means and thus constituting means for manually operating the stem, and means carried by the stem and engaged by the key for holding the actuating device out of engagement with the operating means to permit the said manual operation of the stem.
8. The combination with a holder, of a stationary element associated therewith, a rotatable actuating wheel having an axial bore, a plunger slidably mounted in the holder, a rotatable stem having a threaded engagement with the stationary element and having longitudinally sliding movement through the bore of the wheel, a key movably mounted on the wheel and having a slidable engagement wth the stem to hold said stem and wheel against relative rotation, operating means engaging the wheel for rotating the same, said wheel having a handle and being movable on the stem to a position out of engagement with the operating means and said stem having means by the key to maintain said wheel out of such engagement to permit the manual rotation thereof.

No. 102,520. Lubricator. Graisscur.

William S. Fatterson, Salt Lake City, Utah. U.S.A.. 11th December, 1906 ; 6 years. Filed 6th October. 1906. Receipt No. \(140,099\).
Claim.-1. A lubricator whose oil cap, neck base, adjuster housing and lugs on the lower side of said base are integral, an adjustable Tever journalled in said lugs, an intake for the oil and an adjustable cover therefor, as described.
2. A lubricator comprising an oil cup provided with an oil inlet in its top, an oil channel extending downward from said cup and opening into a chamber, a ball valve in said chamber to close said channel, and an adjustable lever to support and vertically move said ball for the purpose specified.
3. A lubricator comprising an oll cup provided with an oil inlet, ay oil channel extending downward from said cup and opening into a chamber, a ball valve in sald chamber to close said channel, a lever to support said ball valve, there being a finger on said lever, a spring engaged by said finger, an adjusting boit attached to said spring, there being a housing exterior to the oll cup (in which said bolt is longitudinally movable) provided with teeth on its upper surface and a nut on said bolt having notehes to engage said teeth, as described.

No. 102,521. Method of Cleaning Cotton.
Méthorle pour nettoyer le coton.

George Dexter Burton, Boston, Massachusetts, U.S.A., 11th December, 1906; 6 years. Filed 27 th November, 1905. Receipt No. 130,449.
Claim.-1. The process of treating cotton and other similar materials which consists in immersing said material in a bath in which wool has been degreased and cleansed, adding to said bath a quantity of sodium-carbonate, heating the solution and then passing through said bath a current of electricity while said material is immersed therein.
2. The process of treating cotton and other similar materfals which consists in immersing said material in a bath in which wool has been degreased and cleansed, adding to said bath a solution about one part chloride of sodium to about two parts of soda-carbonate, heating the solution and then passing through said bath a current of electricity while said material is immersed therein.
3. The process of treating cotton and other similar materials which consists in immersing said material in a bath in which wool has been degreased and cleansed adding to bath a quantity of sodium-carbonate and then passing
through said bath a current of electricity while said material is immersed therein.
4. The process of treating cotton and other similar materials which consists in immersing said material in a bath in which wool has been degreased and cleansed, adding to said bath a solution about one part clploride of sodium to about two parts soda-carbonate and then passing through said bath a current of electricity while said material is immersed therein.
5. The process of treating cotton and other simflar material which consists in immersing wool in a bath containing a quantity of sodium-carbonate, keating the solution, passing through said bath a current of electricity while said wool is immersed therein, drawing said solution into a vat and permitting it to settle, returning said solution into the original vat, immersing therein an equal amount of cotton, heating the solution and passing through said bath a current of electricity while said cotton is immersed therein.
6. The process of treating cotton and other similar material which consists in immersing wool in a bath contalning a quantity of sodium-carbonate, passing through said bath a current of electricity while said wool is immersed therein, drawing said solution into a vat and permitting it to settle, returning said solution into the original vat, immersing therein an equal amount of cotton and passing through said bath a current of electricity while said cotton is immersed therein.
7. The process of treating raw cotton which consists in immersing it in a bath containing animal grease from wool and adding thereto a quantity of sodium-carbonate and then passing through said bath a current of electricity while said cotton is immersed therein.
8. The process of treating raw cotton which consists in immersing it in a bath containing animal grease from wool and chemicals for strengthening its fibre and subjecting the cotton so immersed to the action of an electric current to cause said cotton to absorb the wool grease and thereby become softened, with its yarns of less diameter and of greater tensile strength.
9. The process of treating cotton which consists in placing said cotton in a suitable receptacle containing a solution composed of water, chemical salts and animal grease and passing through said solution and the cotton contained therein a current of electricity.
10. The process of treating cotton which consists in placing said cotton in a suitable receptacle containing a solution composed of water, chemical salts and animal grease, and passing through said solution and the cotton contained therein a current of electricity, said current of electricity being of sufficient pressure and volume to create in sald solution electrolytic gas or gases.
11. The process of treating cotton which consists in placing cotton in a suitable receptacle containing a solution composed of water, chemical salts, and animal grease and passing through said solution and the cotton contained therein a current of electricity, thereby causing the vegetable fibre of which the cotton is composed to absorb the animal grease or oil contalned in said solution.
12. The process of treating cotton which consists in placIng said cotton in a suitable receptacle containing a solution composed of water, chemical salts, and animal grease, and passing through said solution and the cotton contained therein a current of electricity to cause the animal grease to be transferred to said cotton and thereby cause it to perform the functions of wool.

No. 102,522. Typewriting Machine. Clarigraphr.
Arthur H. Martin and Charles E. B. Lamson, assignee of a half interest, both of Buffalo, New York, U.S.A., 11th December, 1906; 6 years. Filed 14th May, 1906. Receipt Nio. 135,873.
Claim.-1. The combination with a typewriter machine platen, and devices for pressing the record sheeis agzinst the platen, of a guide which is stationarily supported adjacent to the platen and has a portion extending to a position to allow two record sheets to be inserted between the platen and presser devices on opposite sides of the guide without moving the guide, an ink ribbon supported adjacent to the platen, said guide being constructed to allow the presser devices to press the record sheets against the platen and having parts which direct the record sheets to opposite sides of said ink ribbon, substantially as set forth.
2. The combination with a typewriting machine platen. and devices for pressing the record sheets against the platen, of a curved guide which partially surrounds the platen and separates two record sheets, said gulde providing open spaces which allow the presser devices to press the record sheets against the platen, an ink ribbon supported adjacent to the platen, and parts on said guide
arranged to direct the record sheets to opposite sides of said ink ribbon, substantially as set forth.

3. The combination with a typewriting machine platen, and devices for resessing the record sheets agalnst the platen, of a curved guide which partially surrounds the platen and separates two record sheets, sald guide providing open spades which allow the presser device to press the record shects against the platen, and an ink ribbon, said guide having means for supporting said ink ribbon adjacent the platen, and portions arranged to direct the record sheets to opposite sides of said ink ribbon, substantially as set forth.
4. The combination with a typewriting machine platen, and devices for pressing the record sheets against the platen, of a curved guide which partially surrounds the platen and separates two record sheets, said guide providing open spaces which allow the presser devices to press the record sheets against the platen, an ink ribbon, and a guard located between said ink ribbon and the outer record shect, said guide having portions arranged to direct the record sheets to opposite sides of said ink ribbon and guard, substantially as set forth.
5. In an attachment of the character described, a substantially trough-shaped gulde which partially encloses the typewriter platen and has guides at its ends for an ink ribbon, a ribbon slot between said guides, and open spaces at opposite sides of sald ribbon slot, substantially as set forth.
6. In an attachment of the character described, a substantially trough-shaped guide which partially encloses the typewriter platen and has guides at its ends for an ink ribbon, a ribbon slot between said guides, oval-shaped openings at one side of said ribbon slot, and triangular openings at the opposite sides of said ribbon slot, substantlally as set forth.
7. In an attachment of the character described, a guide which partially surrounds the typewriter platen and has a slot for an ink ribbon, and portions at one edge of said slot which overlap the adjacent edge of the ink ribbon to direct record sheets to opposite sides of the ribbon, and means overlapping the opposite edge of said ribbon slot to prevent the engagement of the latter with the record sheets, substantially as set forth.
8. In an attachment of the character described, a guide which partially surrounds the typewriter platen and has a slot for an ink ribbon, and portions at one edge of sald slot which enclose the adjacent edge of the ribbon, and a guard which is enclosed by said portions at one edge of the ribbon slot and overlaps the opposite edge of the ribbon slot, substantially as set forth.
9. In an attachment of the character described, a guide which partially surrounds the typewriter platen and has a slot for an ink ribbon, and portions at one edge of said slot which enclose the adjacent edge of the ribbon, a guard which is enclosed by said portions at one edge of the ribbon slot and overlaps the opposite edge of the ribbon slot, and a band which is secured to the opposite edge of said ribbon slot and extends in between said rlbbon and guard, substantially as set forth.
10. In an attachment for typewriting machines, the combination of a curved gulde adapted to partially surround the platen and separate two record sheets and provided with openings through which the presser devices press the record sheets against the platen, an ink ribbon retained in position by sald guide, sald guide having parts arranged to direct the record sheets to opposite sides of said ink ribbon, and means for supporting the guide in position to partially surround the platen, substantially as set forth.

No. 102,523. Steam Hammer. Martcau dapeur.

The John Bertram and Sons Company, Dundas, Ontario, Canada,, assignee of William Joseph Hagman, Philadelphia, U.S.A., 11th December, 1906; 6 years. Filed 15th November, 1906. Receipt. No. 141,232.
Claim.-In a steam hammer, the combination of a main frame having two outwardly presenting faces in line with each other, a guide seat structure secured to said faces of the main frame comprising two vertical portions having outwardly presenting faces, and having crossties connecting the vertical portions, and hammer guides secured to the guide seats having faces corresponding to the guide seat faces, and provided with hammer guide ways opposite each other and at right angles to the faces connecting the hammer seat structure and the hammer guides.

No. 102,524. Internal Combustion Engine.
Engin à combustion intorne.

John Croft, Benjamin James Broadway, William Lingham Broadway, assignees of three-fourths interest, Birmingham, England, 11th December, 1906; 6 years. Filed 5th October, 1906. Receipt No. 140,073.
Claim.-1. In internal combustion engines, the combination of a cylinder receiving its charge from a passage communicating with the crank chamber, means for returning fuel from the cylinder to the crank case when working at less than full power with means for drawing in the damp remains from the exhaust pipe for preventing back firing and giving enhanced power, and means comprising a special exhaust aperture for effecting a gradual and comparatively slow release of the gases.
2. In internal combustion engines, the combination of a cylinder recelving its charge from a passage communicating with the crank chamber, means comprising a return pipe with suitable control from the cylinder to the crank case for conserving fuel when working at less than full power, means comprising a connection from the exhaust pipe to the main passage from crank case to cylinder with sultable valve for the purpose of allowing damp remains from exhaust tube to be drawn into said side passage forming a medium for preventing back firing and for enhancing the power, and an exhaust aperture of special shape comprising a slit gradually widening and becoming suddenly pronounced and finishing in a regular opening for the purpose of giving a gradual and comparatively slow release of the gases, thus forming a comparatively silent exhaust.
3. In internal combustion engine, the combination of a cylinder recelving its charge from a side passage, means for returning fuel from said cylinder to the sald crank casc, comprising an external pipe and having suitable controlling means, means comprising a pipe with suitable valve for conveying damp remains to the main passage form said crank casc to said cylinder, means comprising a special exhaust outlet for effecting a gradual and quiet release of the gases and means comprising a compartment in the crank case, said compartment communicating with said passage to the cylinder, and a port in the piston for drawing in the charge and expelling it to the cylinder.
4. In internal combustion engines, the combination of a cylinder receiving its charge from a passage communicating with the crank case, a return pipe from the said cylinder to the said crank case, said return being controlled by a valve suitably operated for the purpose of returning fuel from the cylinder to the crank case whrn working at less than full power.
5. In internal combustion engines, the combination of a cylinder receiving its charge from a passage communicating with the crank case, a return pipe from said cylinder to said crank case, and means comprising a pipe communicating with the exhaust pipe and with the said passage, said pipe having a suitable valve for drawing in non-combustible matter from the said cxhaust pipe to the said passage.
6. In internal combustion engines, the combination of a cylinder receiving its charge from a passage communicating with the crank case, a return plpe from said cylinder to said crank case, a pipe from the exhaust pipe to the said passage, and means comprising a special exhaust aperture having a slit gradually widening and becoming suddenly more pronounced and finishing in a regular lower part for effecting a gradual and silent relcase of the gases.
7. In internal combustion engines, the combination of a cylinder receiving its charge form a passage communicating with the crank case, a return pipe from said cylinder to said crank case, a pipe from the cxhaust pipe to the said passage, a special exhaust aperture and means comprising a division of the crank case and a port on the piston for taking in the proper charge and expelling it to the cylinder.
8. In internal combustion engines, the combination of a cylinder receiving its charge from a passage communicating with the crank case, and means comprising a flexible compartment in the crank case communicating with the said passage, a port in the piston adapted to onen communication between the said passage and the induction pipe for taking a charge of proper quantity into the said flexible compartment and from thence to the cylinder.

\section*{No. 102,525. Transformer. Transformateur.}

The Canadian Westinghouse Company, Limited, Hamllton. Ontario, Canada, assignee of Frank Conrad, Edgewood Park, Pennsylvania, U.S.A., 11th December, 1906; 6 years. Flled 13 th May, 1905. Receipt No. 125,140.
Claim.-1. A trangformer core which provides two magnetic circuits, one of a large cross sectional area and interrupted by an air gap, and the other of a much smaller cross sectional area.
2. A transformer core having three legs, one of the outer legs having a smaller cross sectional area than the other two and the other outer leg being interrupted by an alr gap.
3. A transformer core which provides two magnetic circuits, one unsaturated and of high reluctance and the other saturated and of low reluctance
4. A transformer having primary and secondary windings and two magnetic circuits passing through the primary winding, one unsaturated and of high reluctance, the other saturated of low reluctance, and surrounded by the secondary winding.
5. A transformer comprising primary and secondary windlngs and an iron core having three legs, the primary coil being wound on the inner leg. the secondary on an outer leg having a smaller cross sectional area than the other two, and the other outer leg being interrupted by an alr gap.
6. A transformer having primary and secondary windings, a primary magnetic circuit of high reluctance and a prim-

ary magnetic circuit of relatively low reluctance which is also the magnetic circuit for the secondary winding.
7. A transformer having primary and secondary windings, and two magnetic circuits of different reluctance only one of which is common to both primary and secondary coils.
8. A transformer having a primary and secondary coils, and two magnetic circuits of respectively high and low reluctance, the latter being common to both primary and secondary windings.

No. 102,526. Protective Apparatus for Electrical Circuits.
Apparcil protectcur pour circuits électriques.

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Harry P. Davis, Pittsburg, and Frank Conrad, Edgewood Park, both in PenuSylvania, U.S.A., 11th December, 1906; 6 years. Filed 13th May, 1905. Receipt No. 125,142.
Claim.-1. The combination in an alternating current system of electrical distribution having parallel distributing lines and circuit breakers in one or both of the ends thereof, of means for selecting and energizing the tripping coil of the proper circuit breaker comprising a relay translormer having two primary windings which are respectively enegized by currents proportional to the currents in the disributing conductors and which normally induce in a magnetic circuit opposing fluxes in approximately equal amounts, and a secondary winding which is energized by the resultant of the primary fluxes, current windings in series with sald secondary windings, voltage windings receiving a voltage approximately proportional to the voltage between two of the distributing conductors, and a switch actuated by said current and voltage windings for closing an auxiliary circuit through either of the said circuit breaker tripping coils.
2. The combination in an alternating current system of electrical distribution having parallel distributing lines, with circuit breakers in either or both ends thereof, and means for selecting and energizing the tripping coil of the proper circuit breaker, of means for energizing current windings of said selecting apparatus comprising a transformer having two primary windings which normally induce in a magnetic circuit opposing flues in approximately equal amounts and a secondary winding which is energized by the resultant of the primary fiuxes.
3. The combipation in an alternating current system of electrical distfibution having parallel distributing lines, with circuit breakers in either or both ends thereof. and means for'selecting and energizing the tripping coil of the proper circuit breaker, of means for energizing the voltage windings of said selecting apparatus with an approximately constant voltage procortional to the voltage between two of the distributing conductors, comprising a etransformer having a magnetically saturated iron core and a leakage path for the flux.
4. A system of elcctrical distribution comprising a generating station, parallel distributing lines, circuit breakers in each line near the distributing ends thereof, tripping colls for sald breakers energized from an auxiliary circuit series transformers the primary windings of which are respectively in series with conductors of the distributing lines and the sceondary windings of which having the same phaso are connected to relay windings which normally induce in a magnetic circuit opposing fluxes in approximately equal amounts. and a secondary winding which is energized by the resultant of the primary fluxes.
5. In an alternating current system of electrical distribution having parallel distributing lines, circuit breakers in the respective lines, means for tripping each breaker when the current in a conductor of its line exceeds by not less than a predetermined amount that in the corresponding conductor of another line.
6. In an alternating current system of electrical distribution having parallel distributing lines, circuit breakers in the respective lines, means for tripping each braker when the current in any conductor of its line exceeds by not less than a predetermined amount the current in the corresponding conductor of another line and means for selecting the proper tripping coil in accordance with circult conditions.
7. In an alternating current system of electrical distribution having parallel distributing lines, circuit breakers in the respective lines having tripping coils, auxiliary circuits for sald coils, and selective means connected to the several lines and operating to close one of said auxiliary circuits when the current of a given phase in one line excceds by not less than a predetermined amount the current of the same phase in another parallel line.
8. The combination in an alternating current system of clectrical distribution having parallel distributing lines, with circuit breakers in one or both ends thereof and means for selecting and energizing the tripping coll of the proper circuit breaker, of means for energizing relay transformers each having two primary windings receiving energy respectively proportional to that flowing in corresponding conductors of parallel lines and secondary windings which are energized only when the current in one of said primary windings exceeds by not less than a predetormined amount that in the other of the same transformer and which are in series with said current windings.
9. The combination in an alternating current system of electrical distribution paving parallel distributing bines, with circuit breakers in one or both ends thereof and means for selecting and energizing the tripping coil of the proper circuit breaker, of means for energizing current windings of said selecting apparatus only when the current in a conductor of one line exceeds by not less than a predetermined amount that in the corresponding conductor of a parallel line.
10. A system of electrical distribution comprising parallel lines each of which has one or more circuit breakers, and means for trloping the e-eaker or breakers of either line when the current in that line exceeds by more than a predetermined amount, the current in the other line.
11. A system of electrical distribution comprising a plurality of parallel lines and means for opening either line when its current exceeds, by more than a predetermined amount that in the other lline.
12. A system of electrical distribution comprising two parallel lines and means for opening either line without distributing the other when its current exceeds by more than a predetermined amount that of the other.

\section*{No. 102,527. Electric Motor. Motcur électrique.}

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Benjamin G. Lamme, Pittsburg. Pennsplvania. U.S.A.. 11th December, 1906; 6 years. Filed 13th May, 1905. Receipt No. 125,144.
claim.-1. The combination with a source of alternating current energy, a source of direct current energy and a motor having series connected armature and fleld magnet windings, of means for causing the ampere turns in the fleld magnet winding to assume a higher value when the motor is operated by direct currents than when it is operated by alternating currents.
2. The enmbination with a source of alternating current energy and a motor having series connected armature and

field magnet windings, of means for automatically causing the ampere turns in the field magnet winding to assume a higher value when the motor is operated by direct currents than when it is operated by alternating currents.
3. The combination with a source of alternating current energy, a source of direct current energy and a motor having series connected armature and field magnet windings, of means for automatically causing the ampere turns in the field magnet winding to assume a higher value when tho motor is operated by direct currents than when it is operated by alternating currents, said means comprising an inductive winding having a lead connected to a point therein which is intermediate its terminals and having a terminal connected with a terminal of the field magnet winding, and a non-inductive resistance in series with the inductlve windings and having one terminal connected to the terminals of the field magnet and armature windings which are connected together.
4. Th? combination with a motor having series connected armature and field magnet windings. of an inductive winding and a non-inductive resistance which are connected in scries with each other and in parallel with the motor ficld magnet winding. and a terminal lead which is contiected to a point in the inductive winding which is intermediate its torminals.
5. The combination with a source of electrical energy and a motor raving series connected armature and fleld magnet windings. of an inductive winding and a non-induclive resistance which are connected in series with each other and in rarallel with the motor field magnet winding. one terminal of the non-inductive resistance being connected to the terminals of the armatures and field magnet windings which are connected together, and means for connerting a point in the inductive winding which is intermediate its terminals to the cource of electrical energy
6. The combination with a source of alternating current energy and a source of direct current energy, of a motor having series connected armature and field magnet windings, an inductive winding and a non-inductive winding connected in series with each other and in parallel with the field magnet winding, and means for connecting one terminal of the armature winding and a point intermediate the terminals of the inductive winding to the respective terminals of the one or the other of said sources of energy.
7. The combination with source of alternating current nnergy and a source of direct current energy, of a motor having serles connected armature and field magnet windings, an inductive winding and a ron-inductive resistance connected in series with each other and in parallel with the motor field magnet winding, one terminal of the noninductive resistance being connected to the terminals of the armature and field magnet windings which are connecad together, and the other terminal of the armature winding and a point in the inductive winding intermediate its triminals being connected to the respective terminals of the one or the other of said sources of energy.
\(\therefore\) The combination with a source of alternating current enorgy, a source of direct current energy and a motor having series connerted armature and field magnet windings, of means for automatically causing the ampere turns in the field magnet winding to assume a higher value when the motor is operated by direct currents than when it is operated by alternating currents, said means comprising a circuits in two portions one of which offers greater re-
3. The combination of a source of electrical energy. reistances having their middle points respectively connected

to said source, auto-transforming windings connected between the terminals of said resistances, leads connected to intermediate points in the said inductive windings, the first and second, fourth and fifth, etc.. of which are respectively connerted to corresponding points in the auto-transformer windings and the third, sixth, etc., of which are connected alternately and consecutively to the auto-transformor windings intermediate the other leads, a translating device or devices having one terminal connected to the middle point of one of said resistances and means for connecting the other terminal with any two of said leads.
4. The combination of a source of energy, resistances having their middle points respectively connected to said source, auto-transformer windings connected between the terminals of said resistances, stationary contact terminals the first and second, fourth and fifth. etc., of which are respectively connected to corresponding points in the autotransformer windings and the third, sixth, etc., of which are connected alternately and consecutively to the autotransformer windings intermediate the other leads, a translating device or devices having one terminal connected to the middle point of one of said resistances and means for conmecting the other terminal with any two of said leads.
5. The conbination of a source of electrical energy, subdivided auto-transformer windings having their terminals connected thereto, a translating device or devices having one terminal connected to one pair of terminals of the said auto-transformer windings, and means for connecting the other terminal to points of sub-division of said windings.
6. The combinat'on of a source of electrical energy, subdividd auto-transformer windings having their terminals connected thereto, the end poritons of said windings containing a definite amount of resistance, a translating device or devices having one terminal connected to one pair of terminals of the said auto-transformer windings and means for conuecting the other terminal to points of subdivision of said windings.
7. The combination of a source of electrical energy, resistances having points intermediate their cerminals respectively connected to said source, sub-divided auto-transformer windings connected between the terminals of said resistances, a translating device or devices connected between the middle of one of said resistances and points o! sub-division of the auto-transformer windings.
8. The combination of a source of electrical energy, noninductive resistance having points intermediate their terminals respectively connected to said source. sub-divided auto-transformer windings connected between the terminals of said resistances, a translating device or deviecs connected between an intermediate point in one of said resistances and points of sub-division of the said auto-transformer windings.
9. The combination wih two inductive windings and resistance m?mbers connecting corresponding terminals thereof, of an alternating current generator having its terminals respectively connected to intermediate points. said resistance members, a translating device having one terminal connected to an intermediate point in one of the resistance members, and means for making progresisve connection between the other translating device terminal and nection between the other translating dings.
difierent points in the inductive windings.
10. The combination of a source of elfctrlcal energy, subdivided auto-transformer windings having their terminals connected thereto, a translating device or devices having one terminal connected to one pair of terminals of the said auto-transformer windings, and means for connecting the other terminal successively to points of sub-division of said winding that are symmetrically and unsymmetrically located.

No. 102,529. Process of Cleaning and Renovating. Procédé pour nettoyer et renouveler.
Jules Doux. Utica, New York, U.S.A., and George Young Allene, Montreal, Quebec, Canada, assignee of a half interest, 11th December, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,004.
Claim-1. The process of cleaning and renovating stock, material and fabrics, which consists in subjecting it to a washing operation in a bath composed of benzine impregnated with anhydrous ammonia.
2. The process of cleaning and renovating stock, material and fabric which consists in subjecting it to a washing operation, in an alkaline bath, practically free from water and composed of benzine and anhydrous ammonla.
No. 102,530. Alarm and Signal. Arrissenf it si!mal.

The Zorge Safety Railway Equipment Company, assignee ui Ellsworth Ephraim Flora, Chicago, Illinois, C.S.A., 11th December, 1906; 6 years Filed 13th January, 1906. Receipt No. 136,876.
Claim.-1. The combination with a irack rail, of a torpedo carrier operating to place a torpedo immediately above the rail, a spring serving to operate said torpedo carrier, stops on the torpedo carrier, a vibrating stop, a spring serving to move said vibrating stop in one direction. and an electro-magnet serving normally to hold said vibrating stop against the action of its spring.
2. The combination with a railway track, of a device for the purpose set forth, comprising a rotary torpedo carrier, a spring tending to rotate said torpedo carrier, stops arranged on different radil and moving with the torpedo carrier, and a suitably conirolled vibratory stop adapted to co-act with said stops.
3. A device for the purpose set forth. comprising a casing having an upper chamber and a lower chamber, a torpedo carrier housed in the upper chamber, a shaft extending through the torpedo carrier and equipped at its lower end with an actuating spring, ratchet wheel and pawl connection between the upper end of the shaft and ... torpedo carrier, stops carricd by the torpedo carrier, a substantially vertical vibratory stop, a spring tending to move said vibratory stop in one direction, a magnet tending to move said vibratory stop in the other direction, and a circuit for said magnet controlled with relation to the condition of a railway track.
4. The combination with a railway track having a movable switch point, of a torpedo carrier, potential means for actuating said carrier, an electro-magnet controlling the movement of the torpedo carrier, and an electric circuit, or circuits, for said magnet having a make-and-break device controlled with relation to the movement of the switch point and having also a train conrolled electric switch, for the purpose set forth.
5. The combination with a railway track having a movable switch point, of a torpedo carrier, a magnet controlling said torpedo carrier, a branch circuit for said magnet connected with the switch point, and a second branch circuit for said magnet having a train actuated normally closed switch located on the opposite side of the detonating device to which the switch point of the railway track is located, for the purpose set forth.
6. The combination with a track rail, a signalling device, and an electric circuit controlling said signalling device, of a normally closed train actuated switch which is actuated to break the circuit when the train moves in one direction and which works idly to leave the circuit unbroken when the train moves in the other direction.
7. The combination with a track sail, a signalling device, and an electric circuit controlling said signalling device, of a normally closed train actuated switch arm movable about a vertical axis and a wheel actuated lever movable about a horizontal axis and serving to turn said switch arm and
break the circuit when the train movement is in one direction and to move idly without affecting the switch arm when the train movement is in the other direction.
8. A train actuated switch for the purpose set forth, comprising a switch arm, a vertical shaft on which said arm is secured, a spring tending to rotate said arm in one direction and close the circuit, a lever connected with said shaft by a horizontal pivot. said lever having a long arm with an oblique lateral surface, and a spring tending to hold the free end of said arm normally elevated.
9. The combination with a railway track, of a torpedo placing device, an electro-magnet controlling said device and having a circuit with an electric generator therein, a visual signal, an electro-magnet controlling said visual signal, said visual signal and said first-named circuit, and an electric circuit for said second-named electro-magnet electrically connected with said track.
10. The combination with a railway track of a torpedo placing device, an electro-magnet controlling said device and having a circuit equipped with an electric generator, a visual signal, an electro-magnet controlling said signal, a circuit for said second-named electro-magnet electrically connected with the track, and governing mechanism operated by said second-named electro-magnet and controlling the period of closure of said first-named circuit.
11. The combination with a railway track, of a torpedo placing device, an electro-magnet controlling the same and having a circuit equipped with an electric generator, a visual signal having a movable member connected with said electric circuit and equipped with a governing device controlling the closing of said circuit, an electro-magnet serving to actuate said movable member of the visual signal, and a circuit for said sceond-named magnet equipped with a generator and controlled by a movable rail of the track placed on one side of the torpedo placing devier and a train actuated electric switch !laced on the other side of the torpedo phacing device.

\section*{No. 102,531. Electrolytic Diaphragm.}

Jiaphon!me ćlrctiolytique.

\(15253 /\)

Isaih Lewis Roberts, New York City, New York, U.S.A., 11th December, 1:006; 6 years. Filed 28th September, 1906. Receipt No. 139,891.
Claim.-1. An electrolytic diaphragm comprising a rigid body of porous material, a layer of non-porous material thereon, and a fabric on the non-porous material to retain the same on the rigid body, as set forth.
2. An electrolytic diaphragm comprising a rigid body of porous material, a layer of non-porous material thereon, a fabric on the non-porous material to retain the same on the rigid body, and a reticulated support for the fabric, as set forth.

No. 102,532. Semaphore. Sémaphorc.
The Electric Signagraph and Semaphore Company, Chicago, Illinois, assignce of Jean F. Webb, Jr., Denver, Colorado, U.S.A., 11th December, 1906; 6 years. Flled 24th August, 190b. Receipt No. 138,958.
Claim.-1. In a sempahore of the class described, an oscillating signal shaft, a semaphore arm on sald signal shaft, a rotatable drive shaft, connections between the rotatable drive shaft and the oscillating signal shaft whereby the signal shaft may be operated by the rotatable shaft, an electrically operated means for uni-directlonally rotating said drive shaft, substantially as shown and described.
2. In a signalling apparatus, an oscillating emaphore, a rotatable drive shaft to co-operatively connected with said oscillating semaphore, electrically operated means for intermittently rotating the drive shaft always in the same direction to oscillate the semaphore to alternately display safety and danger signals. substantially as shown and described.
3. In an apparatus of the class described, an oscillating semaphore, a rotalable drive shaft, connection between

said drive shaft and said semaphore, whereby the rotary motion of the drive shaft is converted into oscillating molion at the semaphore, and electrically operated devices for rotating said drive shaft always in the same direction sub-- tantially as shown and described.
4. A s maphore comprising an oscillating signalling shaft, a rotatable drive shaft, connections between said drive and signal shafts, an electrically operative mechanism for intermittently rotating said drive shaft always in the same direction to oscillate the signal shaft to alternately display saffly and danger siguals, substantially as shown and described.
. . A scmaphore of the class described, comprising an oscillating signal carrying shaft, and a rotatable drive shaft co-i perativ.ly connected with the signal carrying shaft, means for locking said signal carrying shaft from rotation at times, electrically operated means for rotating said drive shatt in one direction only, to oscillate the signal shaft, substantially as shown and described.
6. In a signalling apparatus, an oscillating signal carrying shaft, a rotatable drive shaft co-operatively connected therewith, means for rotating the drise shaft always in one direction to oscillate the signal shaft to alternately display safety and danger signals, and return signalling circuits including circuits closers con-nperatively connected with the semaphore operating mechanism for operating return signals at each movement of the semaphore signals, subsiantially as shown and described.
T.An oscillating semaphore, rotatable electrically operated devices co-operatively connected with said semaphore to oscillate the same to alternately display safety and danger signals, and return signalling circuits including circuit closers co-operatively connected with the semaphore operating mechanism for operating return signals at each movement of the semaphore, substantially as shown and described.
8. An apparatus of the class described, comprising an uscillating semaphore signal carrying shaft and a rotatable drive shaft co-o eratively connected therewith to impart cscillatory motion to the signal shaft, electrically controlled mechanism for intermitiently rotating said drive shaft uni-directi-nally, return signalling circuits including circuit closers co-operatively connected with the semaphore operating mechanism for operating return signals at tath movement of the semaphore, substantially as shown and described.
!. An apparatus of the class described, comprising an oscillating semaphore signal carrying shaft and a rotatable drive shaft co-operatively connected therewith to impart oscillatory motion to the signal shaft, electrically controlled mechanism for intermittently rotating said drive shaft uni-directionally, return signalling circuits including circuit closers co-operatively connected with the semaphore operating mechanism for operating return signals at each movement of the semaphore, and means for automatically rendering said electrically controlled mechanism inoperative at times, substantially as shown and deseribed.
10. In an apparatus of the class described, an oscillating semaphore signal carrying shaft, a rotatable drive shaft, connections between said drive shaft and said signal shaft whoreby the motion of the former is imparted oscillatingly to the latter, electrically operating mechanism for rotating said drive shaft uni-directly, means for automatically cutting out said electrically operating mechanism at times, and means for simultaneously operating a return signal. subsantially as shown and described.
11. In an apparatus of the class described, an osclllating somaphore signal carrying shaft, a rotatable drive shaft, connertions between said drive shaft and sald signal shaft whereby the motion of th: former is imparted oscillatingly W) the latter electrically oprating mechanism for rotating said drive shaft uni-directionally, means for automatically rutting out said electrically operating mechanism at times. mians for simultanco:isly operating a return signal, and -Inctrically controlled mechanism for again cutting in said "luctrically oprating mechanism at times, substantially as shown and described.
13. In all apparatus of the class described, an oscillating signal shaft, a rotatable drive shaft, means for rotating said drive shaft uni-directionally, connection between said rotatable drive shaft and said oscillating signal shaft for co-operatively connecting the same, said connections including means for locking said signal shaft from oscillation by external operation. substantially as shown.
13. A semaphore of the class deseribed comprising an osrillatable signal earrying shaft, a uni-directionally rotalable shaft electric motor, connections between said motor and said signal carrying shaft for oscillating the same, substantially as shown and described.
14. In a semaphore of the class described, an oscillatable signal carrying shaft, a rotatable drive shaft, connections between the drive shaft and the signalling shaft whereby the latter may be operated by the former, an electric motor for rotating said drive shaft uni-directionally, substantially as shown and described.
15. In a stmaphore of the class described, an oscillatable signal carrying shaft, a rotatable drive shaft, connections betwenn the drive shaft and the signalling shaft whereby the latter may be operated by the former, an electric motor for rotating said drive shaft uni-directionally, and means for automatically opening the motor circuit at times, substantially as shown and described.
16. In a semaphore of he class described, an oscillatable signal carrying shaft, a rotatable drive shaft. connections between the drive shaft and the signalling shaft whereby the latter may be oderated by the former, an electric motor for rotating said drive shaft uni-directionally, means for automatically obening the motor circuit at times, and return signal circuits controlled by said drive shaft for operating a return signal as the motor circuit is opened, substantially as shown and described.
17. In a semaphore of the class described, an oscillatable signal carrying shaft, a rotatable drive shaft, connections between the drive shaft and the signalling shaft whereby the latter may be operated by the former, an electric motor for rotating said drive shaft uni-directionally, means for automatically onening the motor circuit at times and an electrically controlled means for again closing the motor circuit, substantially as shown and described.
18. In a semanhore of the class described, an oscllatable signal carrying shaft, a rotatable drive shaft, connections between the drive shaft and the signalling shaft whereby the latter may be operated by the former, an electric motor for rotating said drive shaft uni-directionally, means for automatically onening the motor at times, and return signals controlled by said drive shaft for operating a return signal as the motor circuit is opened, and electrically controlled means for again closing the motor circuit.
19. In a semaphore of the class described, an oscillatable signal carrying shaft. a rotatable drive shaft, connections between the drive shaft and the signalling shaft whereby the latter may be operated by he former, an electric motor; for rotating suid drive shaft uni-directionally, means ..r automatically opening the motor circuit at times and means for locking the oscillating shaft from oscillation by application of external means when the motor is at rest, substantially as shown and described.
20. In a semaphore of the class described, an oscillatable signal carrying shaft, ortatable drive shaft. connections between the drive shait and the signalling shaft whereby the latter may be operated by the former. an clectric notor for rotating said drive shaft uni-directionally, means for automatically opening the motor circuit at times, return signal circuits controlled by said drive shaft for operating a return signal as the motor circuit is opened and means for locking the nscillating shaft from oscillation by application of external means when the motor is at rest, substantially as shown aud described.
21. In a semaphore of the class described, an oscillatable signal carrying shaft, a roiatable drive shaft, connections between the drive shaft and the signalling shaft whereby the latter may be operated by the former, an electric motor for rotating said drive shaft uni-directionally, means for automatically opening the motor circuit at times, an electrically controlled means for again closing the motor circuit, and means for locking the oscillating shaft from oscillation by application of external means when the motor is at rest, substantially as shown and described.
22. In a semaphore of the class described, an oscillatable signal carrying shaft, a rotatable drive shaft, connections between the drive shaft and the signalling shaft whereby the latter may be operated by the former, an electric motor for rotating said drive shaft uni-directionally, and means for automatically opening the motor clrcuit at times, return signals controlled by said drive shaft for operating a return signal as the motor circuit is opened, electrically controll means for again closing the motor circuit, and means for locking the oscillating shaft from oscillation by application of external means when the motor is at rest, substantially as shown and described.
23. In an apparatus of the class described, a main support, a signal shaft mounted therein, a supplemental support secured to the main support, a drive shatt mounted in said supplemental support, a crank arm secured to said drive shaft, an arm secured to said signalling shaft, pin and slot connections betwee: said arms, electrically operating means for imparting uni-directionally rotary movement to said drive shaft to set the signals, substantially as shown and described.
24. In an aparatus of the class described, a main support, a signal shaft mounted therein, a supplemental support secured to the main support, a drive shaft mounted in said supplemental support, a crank secured to said drive shaft, an ar:n secured to said signalling shaft, pin and slot connections between said arms, electrically operating means for imparting uni-directionally rotary movement to said dirive shaft to set the signals, and electro-mechanically controlled devices for cutting in and cutting out the motor trom operation, substantially as shown and described.
25. In an apparatus of the class described, a main support, a signal shaft mounted therein, a supplemental support secured to the main support, a drive shaft mounted in said supplemental support, a crank arm secured to said drive shaft, an arm secured to said signalling shaft, pin and slot connections between said arms, electrically operating means for imparting uni-directional rotary movement to said shaft to set the signals, means for automatically opening the motor circuit at times, substantially as shown and described.
26. In an apparatus of the class described, a main support, a signal shaft mounted therein, a supplemental support secured to the main support, a drive shaft mounted in said supplemental support, a crank arm secured to said drive shaft, an arm secured to said signalling shaft, pin and slot connections between said arms, electrically operating means for imparting uni-directional rotary movement to sald drive shaft to set the signals, means controlled by the rotatable drive shaft for automatically opening the motor circuit at times, substantially as shown and described.
27. In an apparatus of the class described, a main support, a signal shaft mounted therein, a supplemental support secured to the main support, a drive shaft mounted in said supplemental support, a crank arm secured to said drive shaft, an arm secured to said signalling shaft, pin and slot cunections teneen sald arms, electrically operating means for imparting uni-directional rotary movement to said shaft to set the signals, means controlled by the rotatable drive shaft for automatically opening the motor circuit at times, and means controlled by the semaphore mechanism for operating return signals when the semaphore signals are set.
28. In an apparatus of the class deseribed, a main support. a signal shaft mounted therein, a supplemental support secured to the main support, a drive shaft mounted in said supplemental support, a crank arm secured to said drive shaft, an arm secured to said signalling shaft, pin and slot connections between said arms, electrically operating means for imparting uni-directional rotary movement to said shaft to set the signals. means controlled by the semaphore mechanism for operating return signals when the semaphore signals are set.
29. In an apparatus of the class described, a main support, a signal shaft mounted therein, a supplemental support secured to the main support, a drive shaft mounted in said supplemental support, a crank arm secured to sald drive shaft, an arm secured to said signalling shaft, pin and slot connections between said arms. electrically operating means for imparting uni-dircctional rotary movement to said shaft to set the signal, means for automati-
cally opening the motor circuit at times, and an electrically energized means for closing the motor circuit at times.
30. In an apparatus of the class described, a main support, a signal shaft mountid therein, a supplemental support secured to the main support, a drive shaft mounted in said supplemental support, a crank arm secured to said drive shaft, an arm secured to said signalling shaft, pin and slot connections between said arms, electrically operating means for imparting uni-directional rotary movement to said shaft to set the signals, means for automatically opening the motor circuit at times, and electrically energized means for closing the motor circuit at times, and means con trolled by the semaphore mechanism for operating return signals when the semaphore signals are set, substantially as shown and described
31. In an apparatus of the class described, a semaphore signal carrying shaft, electrically operated uni-directional rotatable means co-operatively connected with said signal shaft, for oscillating the same to alternately display danger and safety signals, substantially as shown and described.
32. In an apparatus of the class described, a semaphore signal carrying shaft, electrically operated uni-directiona rotatable means co-op ratively connected with said signal shaft, for oscillating the same to alternately display danger and safety signals, and electro-mechanical means for controlling said continuously rotatable means, substantially as shown and described.
33. In an apparatus of the class described, supporting standards having bearing portions, a signal carrying shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft a rotatable drive shaft mounted in bearings in said support, a crank arm secured to said drive shaft, a wrist pin on said crank arm to enter the slot, in sald operating arm, and an electric motor geared to said drive shaft to rotate it to operate the signals, substantially as shown and described.
34. In an apparatus of the class described, upright supporting standards having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on said orank arm to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate 1t, a motor circuit, a switch in said motor circuit and means controlled by the movement of the drive shaft for opening said switch at times.
35. In an apparatus of the class described, upright supporting standards having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted oporating arm secured to the shaft, a rotatable drive shaft mounted in bearings in said support. a crank arm connected to said drive shaft, a wrist pin on said crank arm to enter the slot in saidoperating arm an electric motor geared to said motor circuit, means controlled by the movement of the drive shaft for opening said switch at times, and electro-magnetic devices for closing said switch at times.
36. In an apparatus of the class described, upright supporting standards having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotter operating arm secured to the shaft, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on said crank arm to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate it, a motor circuit. a switch in said motor circuit, means controlled by the movement of the drive shaft for opening said switch at times. electro-magnetic devices for closing said switch at times, means for locking said switch to its closed position.
37. In an apparatus of the class described, upright supporting standards having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on said crank arm to enter the slot in said operating arm. an electric motor geared to said drive shaft to rotate it, a motor circuit, a switch in said motor circuit, means controlled by the movement of the drive shaft for opening said switch at times, electro-magnetic devices for closing said switch at times, means for locking sald switch to its closed position, and return signals controlled by the movement of the drive shaft to indicate the position of the semaphore signals.
38. In an apparatus of the class described, supporting standards having bearing portions, a slgnal carrying shaft mounted therein. a semaphore carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on
said crank arm to enter the slot in said operating arm, an electric motor geared to sald drive shaft to rotate it to operate the gignals, and return signals controlled by the movement of the drive shaft to indicate the position of the semaphore signals.
39. In an apparatus of the class described, upright supports having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a pair of supplemental glass carrying arms secured to the shaft, a signal light secured between the supports to co-operate with the signal glasses, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on said crank arm to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate it, substantially as shown and described.
40. In an apparatus of the class described, upright supports having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a pair of supplemental glass carrying arms secured to the shaft. a signal light secured between the supports to co-operate with the signal glasses, a rotatable drive shaft mounted in bearings in sald support, a crank arm connected to said drive shaft, a wrist pin on said crank arm to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate it, and return signals controlled by the movement of the drive shaft to indicate the position of the semaphore and light signels, subsantially as shown and described.
41. In an apparatus of the class desoribed, supporting standards having bearing portions, a signal carrying shaft mounted therein, a semaphore signal carrying arm secured to the shaft, slotted operating arm secured to the shaft, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on said crank arm to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate it to operate the signals, return signals controlled by the movement of the drive shaft to indicate the position of the semaphore signals, a motor circuit, a switch in said motor circuit and means controlled by the movement of the drive shaft for opening said switch at times, substantially as shown and described.
42. In an apparatus of the class described, supporting standards having bearing portions, a signal carrying shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on sald crank arm to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate it to operate the signals, return signals controlled by the movement of the drive shaft to indicate the position of the semaphore signals, a motor circuit, a switch in said motor, means controlled by the movement of the drive shaft for opening said switch at times, and electro-magnet devices for closing said switch at times, substantially as shown and described.
43. In an apparatus of the class described, upright supports having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a pair of supplemental glass carrying arms secured to the shaft, a signal light secured between said supports to co-operate with the signal glasses, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on said crank to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate it, a motor circuit, a switch in said motor circuit, means for locking said switch to its closed position, and means controlled by the movement of the drive shaft for unlocking said switch at times, substantially as shown and described.
44. In an apparatus of the class described, upright supports having bearing portions, a signal shaft mounted therein, a semaphore signal carrying arm secured to the shaft, a slotted operating arm secured to the shaft, a pair of supplemental glass carrying arms secured to the shaft, a signal light secured between the supports to co-operate with the signal glasses, a rotatable drive shaft mounted in bearings in said support, a crank arm connected to said drive shaft, a wrist pin on said crank arm to enter the slot in said operating arm, an electric motor geared to said drive shaft to rotate it, a motor circuit, a 6 witch in said motor circuit, means for locking said switch to its closed position, means controlled by the movement of the drive shaft for unlocking said switch at times, and return electric signal circuits inoluding circuit closing terminals and circuit closers carried by the drive shaft for closing said signal circuits at times, substantially as shown and described.
45. In an apparatus of the class described, an oscillating signal shaft, a rotating drive shaft, connections between said drive shaft and sald signal shaft whereby the rotary motion of the former is converted into oscillating motion in the latter, a ratatable electric motor, gear connections between said electric motor and said drive shaft whereby the motor breaks the drive shaft, an electric motor circuit, a switch in said electric motor circuit, means for normally holding said switch closed, means controlled by the drive shaft movement for releasing said switch to open the motor circuit at times, a main line setting circuit. electro-magnetically operating means in sald main line setting circuit for closing the motor circuit at times, substantially as shown and described.
46. In an apparatus of the class described, an oscillatiag signal shaft, a rotating drive shaft, connections between said drive shaft and said signal shaft whereby the rotary motion of the former is converted into oscillating motion in the latter, a rotatable elcetric motor, gear connections beween said electric motor and caid drive shaft whereby the motor rotates the drive shaft, an electric motor circuit. a switch in said electrlc motor circuit, means for normally holding said switch closed, means controlled by the drive shaft movement for releasing sald switch to open the motor circuit at times, a main line setting circuit. electro-magnetically operating means in said main line setting circuit for closing the motor circuit at times, and a pair of return signalling circuits, said return circuits including circuit closers controlled by the movement of the drive shaft for closing and opening said return signal circuits, all being arranged substantially as shown and described.
47. In an apparatus of the class described, an osclllatable semaphore signal carrying shaft. a rotatable drive shaft an electric motor for rotating said drive shaft, connections between the drive shaft and the signal shaft whereby the rotary motion of the former is converted into nscillating motion in the latter, said connections between the drive and signal shafts being so arranged that when the signal shaft is at the ex'reme movement of its danger and safety positions the signal shaft will be locked from independent movement, substantially as shown and described.
48. In an apparatus of the class described, an oscillatable semaphore signal carrying shaft, a rotatable drive shaft, an electric moior for rotating sald drive, connections between the drive shaft and the signal shaft whereby the rotary motion of the former is converted into oscillating motion in the latter, said connections between the drive and signal shafts being so arranged that when the signal shaft is at the extreme movement of its danger and safety positions, the signal shaft will be locked from independent movement, and a housing for enclosing the operating mechanism, said signal shaft projecting through said housing, substantially as shown and described.
49. In an apparatus of class described, a supporting frame, a signal shaft carried by the supporting frame which controls the signal, a rotatable operating shait, connections between the operating and signal shafts whereby the rotatable motion of the former is converted into oscillating motion in the latter, an elsctric motor for rotating the operating shaft, electrically controlled means for starting the motor into operation, means for automatically cutting out the motor from operation at times, means for sending in return signals from the semaphore to the towner operator, a station to indicate the position of the signals, and means whereoy the signalling snaft can be locked from independent movement when in its extreme danger or safety positions, substantially as shown and described.

\section*{No. 102,533. Potato Digger. Arrachc-patatcs.}

George E. Chute, Princeton, Minnesota, U.S.A., 11th December, 1906; 6 years. Filed 28th November, 1906. Receipt No. 141,607.
Claim.-1. An attachment for potato diggers, comprising a plank adapted to drag on the ground and having a crosspiece secured to the upper face thereof at the forward end of the plank, an evener bar hitched centrally between its ends to said crosspiece, a pair of hitching rods attached to said evener bar, one near each end, and hitching rings connected to the other ends of said hitching rods.
2. An attachment for potato diggers, comprising a sled like member in the form of a plank adapted to drag on the ground, a guard fender supported thereby adjacent the rear end of the plank, an evener bar pivoted centrally of its
length to the forward end of the glank, a pair of hitching rods having their one end pivotally attached to the evener

bar, and means carried by the other end of said rods for attaching them to a vehicle.

No. 102,534. Production of Voltaic Strong Currents.
Production de courants forts voleaïqucs.

Salpetersaure-Industric-Gesellschaft, G.M. b. H., assignce of
Harry Pauling, both of Gelsenkirchen. Westphalia,
Prussia, 11th December, 1906; 6 years. Filed 19th April, 1906. Receipt No. 135,061.

Claim.-Tho process for the production of voltaic strong current arcs between electrodes of great mutual distance, consisting in blowing the discharges of an auxiliary spark gap into the space between such electrodes, substantially as and for the purposes set forth.

No. 102,535. Production of Voltaic Strong Current Arcs.
Production de courants forts d arcs voltaiques.

Harry Pauling, 84 Wilhelmstrasse, Gelsenkirchen IV., West phalia, Germany, 11th December, 1906; 6 years. Filed stin November, 1906. Receipt No. 141,037.
Claim.-1. The herein described process, consisting in supplying currents of a gas to be acted upon by electrical discharges to pairs of blast pipes having opposing discharge openings, each pair of such blast pipes being separated by the plane of the electrodes designed for effecting the said discharges, substantially as and for the purpose set forth.
2. The herein described process, consisting in supplying currents of a gas to be acted upon by electrical discharges to pairs of blast pipes having opposing discharge openings, each pair of such blast pipes being separated by the plane of the electrodes designed for effecting the said discharges, and in subjecting the voltaic arcs originated to the influence of magnetical means adapted to co-operate with the currents of gas issuing from the blast pipes, substantially as and for the purpose specified.

No. 102,536. Rng Holder. Attacinc-carpette.

Edward H. Bailey, New York City, New York, U.S.A., 11th December, 1906; 6 years. Filed 14th September, 1906. Reccipt No. 139,511.
Claim.-1. A rug holder made up of a single piece of rubber moulded into shape and having a body portion and a shank extending from said body portion, and an edging of fabric moulded with said body portion and projecting therefrom for attachment to the rug.
2. A rug holder made up of a single plece of rubber moulded into shape and having a body portion provided with corners and a shank extending from said body portion, one of said corners being formed with a bulbous enlargement in line with said shank.

No. 102,537. Briqueting Machine.
Machine à briquetle.

Richard C. Hills, Denver, Colorado, U.S.A., 11th December, . 1906 ; 6 years. Filed 16th June, 1906. Receipt No. 136,968.
Claim.-1. In a briqueting machine, the combination of a nould box composed of a movable member and a stationary co-operating member, a reciprocating ram entering the movable member, and a yleldingly supported relief plunger entering the stationary member and co-operating with the ram, substantíally as described.
2. The combination of a mould box comprising a movable member and a co-operating stationary member, a ram, entering the movable member, a relief plunger entering the stationary member, and means for imparting reciprocating motion to the ram and the movable mould box member.
3. In a machine of the class described, the combination with a suitable casc, of a mould box provided with a movable mould member arranged to slide in the case, a plunger arranged to enter the mould from the front, and means for operating the plunger and the movable mould box member, the arrangement being such that the movement of the mould box member is uniformly more rapid than that of the plunger.
4. In a machine of the class described, the combination with a suitable frame having a casc, a mould having a member movable in the case, a plunger arranged to enter the mould from the front, a shaft provided with an eccentric with which the plunger is connected in operative relalion, a frame connected with the movable mould box member and provided with front and rear tappets, cams mounted on the eccentric shaft and arranged to engage the front and rar tappets respectively, for imparting a relatively rapid reciprocating movement to the movable mould member, and a relief plunger entering the mould from the rear, substantially as described.
․ In a multiple mould briquet machine, the combination with a suitable frame, of a mould case extending transverscly across the machine, of moulds provided with movable mould members slidable in said case, driving plungers entering the mould from the front, a shaft provided with eccentrics with which the driving plungers are connected in operative relation, frames provided with front and rear tappets, said frames being connected with the movable mould box members, and cams mounted on the eccentric shaft and adapted to respectively engage the front and rear tappets for imparting a reciprocating movement to the movable mould box members.
6. The combination with a suitable frame having a mould case extending transversely thereacross, moulds having members slidable in said case. said moulds being open at the front and rear, resistance plungers entering said moulds from the rear and having a limited movement as described, driving plungers entering said moulds from the front, a shaft having eccentrics with which the driving plungers are connected, frames connected with the movable mould box members and provided with front and rear tappets, and two sets of cams mounted on the eccentric shaft, one set acting on the front tappets to impart movement to the movable mould box member in one direction, and the other set acting on the rear tappets to impart movement in the opposite direction.
7. The combination with a suitable frame, and a mould case extending transversely across the same intermediate its extremities, of moulds mounted in the mould case, each mould having a member slidable in said case, the said moulds being open at the front and rear, driving plungers arranged to enter the moulds from the front, resistance plungers entering the moulds from the rear, a hydraulic resistance cylinder. and a piston therein suitably connected with all of the resistance plungers, for the purpose set forth.
8. The combination with a suitable frame and a mould case extending transversely across the same intermediate lis extremities, of moulds mounted in the mould case, each mould having a member slidable in said case, the said moulds being open at the front and rear, driving plungers arranged to enter the moulds from the front, a shaft having eccentric with which the driving plungers are connected, resistance plungers entering the moulds from the rear, relicf heads with which the resistance plungers are connected, a hydraulic resistance cylinder, a piston therein, and an operative conection between the cylinder piston and the relief heads, whereby the latter act on the piston successively, and means operated from the eccentric shaft for actuating the movable mould box members, substantifor actuating as described.
9. In a briqueting machine, the combination with a suitable frame and a mould case mounted thereon, of moulds open at both ends and provided with movable mould members, driving plungers entering said moulds in front, resistance plungers entering said moulds from the rear, a shaft journalled in the frame, rellef heads mounted on said shaft, cach relief head being connected with the shaft to actuate the latter independently and without moving the other heads, the resistance plungers being connected with the relief heads, a hydraulic resistance cylinder, a piston therein, a rack mounted on the piston stem, and a cogged segment fast on the relief shaft and engaging the rack of the piston stem.
10. The combination with a suitable frame and a stationary mould case, of moulds located in said case, each mould having a movable member, driving plungers entering the
moulds from the front, a driving shaft, connections between said shaft and the driving plungers and movable mould members, whereby the said plungers and mould members are reciprocated, the movement of the mould members being more rapid than the movement of the plungers, resistance plungers entering the moulds from the rear, relief heads connected with said plungers, a relief shaft upon which said heads are mounted, a hydraulic cylinder, a piston therein. and a suitable connection between the piston and the relief head shaft.
11. The combination with a stationary mould case, of moulds located therein, each mould having a movable member, driving plungers entering the moulds from the front. a driving shaft, connections between said shaft and the driving plungers and movable mould members, whereby the said plungers and mould members are reciprocated, the movement of the mould members being uniformly more rap'd than the movement of the plungers.
12. The combination with a mould case, of moulds supported by said case each mould having one movable member, driving plungers entering the moulds from the front, a driving shaft. connections between said shafts and the driving plungers and movable mould members whereby the said plungers and mould members are reciprocated, resistance plungers entering the moulds from the rear, relief heads respectively connected with said plungers. a rilief shaft upon which said heads are mounted, a hydraulic cylinder, a piston therein, and a suitable operative conncetion between the"niston and the relief shaft.
13. The combination with a frame and a mould case, of mould boxes located in said case. each box having a member slidable in the case. driving plungors entering the mould boxes from the front, means for reciprocating the driving plungers and movable mould box members, relief plungers entering the mould boxes from the rear, relicf heads respectively engaging the relief plungers and relicf shaft upon which said heads are mounted, a hydraulic cylinder, a piston thercin. and a suitable onerative connection between the relief shaft and said piston, substantially as described.
14. In a briquet machine the combination with suitable frame, of a mould mounted on the frame open at the front and rear and having a movable member, a driving plunger arranged to enter the mould at one extremity. a resistance plunger arranged to fnter the mould at the opposite extremity, a briquet extractor mounted on the movable mould member the latter being provided with an opening through which the extractor projects downwardly, whereby as the movable mould member moves forwardly, the extractor is brought into contact with the briquet to release and eject the samic, substantially as described.
15. The combination with a suitable frame of a mould mounted on the frame and open at the front and rear, said mould having a movable member. a driving plunger arranged to enter the mould at one extremity. a resistance plunger arranged to enter the mould at the opposite extremitv, an extractor devier mounted on the rear extremity of the movable mould member, the latter having an opening throngh which the extractor projects downwardly to engagement with the briquet to be extracted as the movable mould member moves forwardly. the extractor device being provided with a roller, and a stationary actuating device mounted on the frame and adapted to engage the roller of the extractor device where the latter is moved downwardly at the point where the briquet is to be discharged.
16. In a briquet machine the combination with a suitable frame. of a mould mounted on the frame and onen nt the front and rear. said mould having a movable monld member. a driving pluncer arranged to enter the mould at one extremity. a resistance nlunger arranged to enter the mould at the opposite extromity. a snring sunported extractor device mounted on the rear extremity of the movable mould member. a stationary bar mounted on the frame. an antifrictional roller mounted on the extractor deviec and adantcid to engage said har which is nrovided with an inclinent face. whereby as the movable mould member movers forwardly. the roller of the extractor device enoages said inclined face which foren the evtractor deviec downwardly to ejpet the briquet. substantiallv as describet.
17. In a brialiet machine the combination with \(\mathfrak{q}\) mould rase. of a mould having a member slidable in said case. a driving nluneer enterine the mould from the front a honner mounted on the mould case and communicating with the fred snace with which the mavable mond momber is nrovided when the latter is nemnerly adinsted. and a stirring devien mounted on the slidable molid member. and antering the honner. the said stirring devies moving
slifahin mould member far the nurnose set forth.
18. The rambination with a ctatinnary mould case a mould hov located in en:d rase and havine a movabin moיitit member. a drivinc nlunger onfaging eald monld hnvenm the front. a en-onerating resistance nlunger engacing the
mould box from
ing a feed space communicating with the chamber of the mould box, a vertically movable feed plunger mounted on the frame, and suitable means for actuating the same whereby as the feed space of said movable member reaches the proper position, the said plunger descends and causes the briquet material to enter the mould box chanber in front of the plunger.
19. The combination with a suitable frame and mould case, of a mould box located in said case and having a movable mould member, means for reciprocating sald member, the movable mould member having a feed space, a hopper mounted on the mould case and arranged to discharge into the feed space of the movable mould member when the latter is in the proper position, a horizontally reclprocating driving plunger entering the mould box from the front, a relief plunger entering the mould box from the rear, a vertically movable feed plunger adapted to enter the feed space of the vertically movable mould member when the latter is in the proper position. said feed plunger being provided with an anti-frictional roller, suitable guides for the peed plunger, a cam mounted on the frame. and means for actuating the cam whereby the feed plunger engages the roller and raises the plunger at predetermined intervals, substantially as described.
20. In a briquet machine the combination with a suitable frame, of a movable mould box member provided with a feed space, a hopper for supplying material to said space, means for reciprocating the movable mould box member. and a vertically adjustable gange plate suitably mounted on the frame and projerting into the feed space of the movable mould box member, for the purpose set forth.

No. 102,538. Motor. Moteur.

Gabriel P. B. Hoyt, New York City, New York, U.S.A., 11th
December, 1906; 6 years. Filed 14th August, 1906. Receipt No. 138,700.
Cluim.-1. An explosion engine comprising a pair of aligned cylinders closed at both ends and each having a compression and an explosion chamber and an auxiliary chamber for sucking in, mixing and compressing the charge, the chambers being connected with each other by a by-pass, the entrance port of which into the explosion chamber is controlled by the cylinder piston, and the said explosion chamber having an exhaust port also controlled by the cylinder piston and partly uncovercd previous to the uncovering of the entrance port of the by-pass, pistons reclprocating in the said cylinders and rigidly connected with tach other, and converting means intermediate the cylinders and connected with the connected pistons for converting the reciprocating motion thereof into rotary motion.
2. An explosion engine comprising a pair of aligned cylinders closed at both ends and each having a compression and an explosion chamber and an auxiliary chamber for sucking in, mixing and compressing the charge, the chambrrs being connected with each other by a by-pass, the entrance port of which into the explosion chamber is controlled by the cylinder piston, and the said explosion cham.
ber having an exhaust port also controlled by the cyllnder piston and partly uncovered previous to the uncovering of the entrance port of the by-pass, pistons reciprocating in the said cylinders, a piston rod common to both pistons and provided with a guideway at a right angle to the piston rod, and a crank shaft having its arm engaging the sald guideway.
3. An explosion engine comprising a pair of aligned cylinders closed at both ends and each having a compression and an explosion chamber and an auxiliary chamber for sucking in, mixing and compressing the charge, the chambers being connerted with each other by a by-pass, the entrance port of which into the explosion chamber is controlled by the cylinder piston, and the said explosion chamber having an exhaust port also controlled by the cylinder piston and partly uncovered previous tothe uncovering of the entrance port of the by-pass, pistons reciprocating in the said cylinders, a piston rod common to both pistons to rigidly connect the same with each other, a guideway on the said piston rod intermediate the said cylinders. a bearing slidable on the said guideway, and a crank shaft having its crank pin engaging the said bearing.
4. An explosion engine comprising a pair of aligned cylinders closed at both ends and each having a compression and an explosion chamber and an auxillary chamber for sucking in, mixing and compressing the charge, the chambers being connectod with each other by a by-pass, the entrance port of which into the explosion chamber is controlled by the cylinder piston, and the said explosion chamber having an exhaust nort also controlled by the cylinder piston and partly uncovered previous to the uncovering of the entrance port of the by-pass, pistons reciprocating in the said cylinders, a piston rod common to both pistons for rigidly connccting the pistons with each other, a guideway on the said piston rod at a right angle thereto and intermediate the said cylinders. crank shafts having their crank pins engaging the said guideway, and gear wheels secured on the said crank shafts and in mesh with each other.
5. A two cycle explosion engine having a cylinder, and a piston reciprocating therein, the said cylinder having a compression and explosion member at one end and a suction, mixing and compression chamber at the other end, the said compression and explosion chamber having an exhaust port near its inner end and the said chambers being connected with each other by a by-pass leading from the outer end of the suction, mixing and compression chamber into the compression and explosion chamber at a point partly in the rear of the said exhaust port for the piston to first partly uncover the exhaust port and then the by-pass.
6. A two cycle explosion engine having a cylinder and a piston recinrocating therein, the said cylinder having a compression and explosion chamber at one end and a suction, mixing and compression chamber at the other end, the said compression and explosion chamber having an exhaust port near its inner end and the said chambers being connected with each other by a by-pass leading from the outer end of the suction, mixing and compression chamber into the compression and explosion chamber at a point partly in the rear of the said exhaust port for the piston to first partly uncover the exbaust port and then the by-pass, and an inlet valve op?ning into the said by-pass and connected with a gas supply.
7. A two-eycle explosion engine having a cylinder and a piste \(n\) reciprocating therein, the said cylinder having a compression and explosion chamber at one end and a suction, mixing and compression chamber at the other end, the sald compression and explosion chamber having an exhaust port near its inner end and the said chambers being connected With each other by a by-pass leading from the outer end of the suction, mixing and compession chamber into the compression and explosion chamber at a point partly in the rear of the said exhaust port for the piston to first partly uncover the exhaust port and then the by-pass, and a screen over the portion of the by-pass connecting with the compression and explosion chamber to prevent back firing.
8. An explosion engine comprising a pair of aligned cylinders closed at both ends and each having a compression and an explosion chamber and an auxiliary for sucking in, mixing and compressing the charge, the chambers being connected with each other by a by-pass, the entrance port of which into the explosion chamber is controlled by the cylinder piston, and the said explosion chamber having an exhaust port also controlled by the cylinder piston and partly uncovered previous to the uncovering of the entrance port of the by-pass, pistons reciprocating in the said cylinders, a piston rod common to both pistons and provided with a guideway at a right angle to the piston rod, a crank shaft having its arm engaging the said guideway, and stuffing boxes for he piston rod arranged in the inner or opposite heads of the cylinders.
9. An explosion engine comprising multiple sets of cylinders arranged one alongside the other and each set having
two aligned cylinders spaced apart, pistons reciprocating in the said cylinders, a piston rod for the pistons of a pair of aligned cylinders to connect the said pistons rigidly with each other, a guideway on each piston rod and at a right angle thereto, crank shafts transverse to the said cylinders and piston rods and having diametrically disposed crank pins engaging the said guideways, and gear wheels secured on the said shafts and in mesh with each other.
10. An explosion engine comprising multiple sets of cylinders arranged one alongside the other and each set having two aligned cylinders spaced apart, each cylinder being closed at its ends and having a compression and explosion chamber and a suction, mixing and compression chamber, and each cylinder having an exhaust port in the compression and explosion chamber and a by-pass connecting the sad chambers of the cylinder with each other, the entrance end of the by-pass into the said compression and explosion chamber being opposite and partly in the rear of said exhaust port, pistons reciprocating in the said cylinders, a piston rof for the pistons of a pair of aligned cylinders to connect the said pistons with each other, a guideway on each piston rod and at a right angle thereto, crank shafts transverse to the sa'd cylinders and piston rods and having diametrically disposed crank arms engaging the said guideways, and grar wheels secured on the sald ghafts and in mesh with rach other.
11. An explosion engine comprizing multiple sets of cylinders arranged onf alongside tre other and each set having two aligned cylinders spac d apart, each cylinder being closed at its end and having a compression and explosion chamber and a suction, mixing and compression chamber, and each cylinder having an exhaust port in the compression and explosion chamber and a by-pass connecting the said chambers of the cylinder with each other. the entrance end of the by-pass into the said compression and explosion chamber being opposite and partly in the rear of the said exhaust port, pistons reciprocating in the said cylinders, a piston rod for the pistons, of a pair of alig.ed cylinders to connert the said pistons with each other. a guideway on cach piston rod and at a right angle thereto, crank shafts transverse to the said cylinders and piston rods and having diametrically disposed crank arms engaging the said guldeways, gear wheels secured on the said shafts and in mesh with each other, and a suction check valve for each cylinder.
12. An explosion engine comprising multiple sets of cylinders arranged one alongside the other and each set having two aligned cylinders spaced apart, pistons reciprocating in the said cylinders, a piston rod for the pistons of a pair of aligned cylinders to connect the said pistons with each other, a guideway on each piston rod and at a right angle thereto, crank shafts transverse to the said cylinders and pistons and having diametrically disposed crank pins engaging the sald guideways, gear wheels secured on the said shafts and in mesh with each other, a fly wheel on one crank shaft and a power transmission wheel on the other crank shaft.
13. An explosion engine comprising multiple sets of cylinders arranged one alongside the other and each set having two aligned cylinders spaced apart, pistons reciprocating in the said cylinders, a piston rod for the pistons of a pair of aligned cylinders to connect the said pistons with each other, a guideway on each piston rod and at a right angle thereto, crank shafts transverse to the said cylinders and pistons and having diametrically disposed crank arms engaging the said guideways, gear wheels secured on the said shafts and in mesh with each other, a fly wheel on one crank shaft, and a power transmission wheel on the other crank shaft, the fly wheel and transmission wheel being located on opposite sides of the engine.
14. An explosion engine comprising a pair of aligned cylinders closed at both ends and each having a compression and an explosion chamber and an auxiliary chamber for sucking in, mixing, and compresing the charge, the chambers being connected with each other by a by-pass, the entrance port of which into the explosion chamber is controlled by the cylinder piston, and the said explosion chamber having an exhaust port also controlled by the cylinder piston and partly uncovered previous to the uncovering of ihe entrance port of the by-pass, pistons reciprocating in the said cylinders and rigidly connected with each other, each piston having a baffle plate at its outer face and extending opposite the said entrance port at the time the piston is uncovering the said entrance port.

\section*{No. 102,539. Method of Extracting Metals. \\ Méthode d'extraire les métaux.}

Alexander Lenart, Mikovitca, Budapest, Hungary, 11th December, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,649.
Claim.-1. An apparatus for extracting metals from ores and other metalliferous substances, consisting of an upper
chamber to receive the ore to be treated, a lower chamber, a permeable false bottom between the upper and lower

chamber, electrodes of both poles arranged in sald lower chamber, diaphragms surrounding the cathodes, means for connecting the cathodes and anodes to the poles of a source of electrical energy, and means to feed into and to discharge the cathode electrolyte from the diaphragms.
2. An apparatus for extracting metals from ores and other metalliferous substances, consisting of an upper chamber to receive the ore to be treated, a lower chamber, a permeable false bottom between the upper and lower chamber, electrodes of both poles arranged in said lower chamber, diaphragms surrounding the cathodes, means for connecting the cathodes and anodes to the poles of a source of electrical energy, means to feed into and to discharge the cathode electrolyte from the diaphragms, and means to feed the anode electrolyte into the lower chamber.
3. An apparatus for extracting metals from ores and other metalliferous substances, consisting of an upper chamber serving for receiving the ore to be treated, a lower hamber, a permeable false bottom between the upper and lower chamber, electrodes of both poles arranged in said lower chamber, diaphragms surrounding the cathodes. means for connecting said cathodes and anodes to the poles of an electric current source, means to feed into and to disharge the cathode electrolyte from said diaphragms, means to feed the anode electrolyte into the lower chamber and means to discharge the anodic electrolyte from the upper rhamber.
4. An apparatus for extracting metals from ores and other metalliferous substances, consisting of an upper chamber serving for receiving the ore to be treated, a lower chamber, a substantially horizontal permeable false bottom between the upper and lower chamber, anodes of insoluble material in the lower chamber, distributed uniformly under the permeable bottom, free spaces between the anodes, Inlets for the anode electrolyte under the anodes, cathodes in the lower chamber, distributed uniformly over the anodes and arranged in proximity thereof, diaphragms surrounding the cathodes, there being apertures between sald diaphragms cathodes, there being apertures between said diaphragas uniformly distributed over the anodes, means to feed the cathode electrolyte ino the diaphragms, means to discharge it from said diaphragms, and means to withdraw the electrolyte from the top of the upper chamber.
5. An apparatus for extracting metals from ores and other metallifer us substances, consisting of an upper chamber serving for receiving the ore to be treated, a lower chamber, a substantially horizontal permeable false bottom between the upper and lower chamber, anodes of insoluble material in the lower chamber distributed uniformly under the permeable bottom, there being apertures on said anode plates allowing a free passage to the anode electrolyte, inlets for this latter uniformly distributed under the anode plates, a plurality of tubular diaphragms in the lower chamber arranged in proximity of the anodes and forming a grate covering the whole area corresponding to the permeable bottom, cathodes extending through said tubular diaphragms, an alkall collecting vessel, means for connecting one end of said tubular diaphragms with the alkall collectng vessel, a cathode electrolyte conduit, and means for ccnnecting the other end of the diaphragm tubes with the cathode electrolyte conduit.
6. An apparatus for extracting metals from ores and other metalliferous substances, consisting of an upper chamber serviug for receiving the ore to be treated, a lower chamber, a substantially horizontal permeable false bottom between the upper and lower chamber, anodes of insoluble material in the lower chamber distributed uniformly under the permeable bottom provided with apertures allowing the free passage to the anode electrolyte, Inlets for this latter uni-
formly distributed under the anode plates, a plurality of tubular diaphragms in the lower chamber arranged in proximity of the anodes and forming an inclined grate covering the whole area corresponding to the permeable bottom and rising from the fecd end toward the discharge end, cathodes extending through said diaphragms, an alkali collecting vessel, means for connecting one end of sald diaphragm tubes with the alkali collecting vessel, a cathode electrolyte conduit, and means for connecting the other end of the diaphragm tubes with the cathode electrolyte conduit.
7. An apparatus for extracting metals from ores and other metalliferous substances, consisting of an upper chamber serving for recciving the ore to be treated, a lower chamber, a substantially horizontal permeable lalse bottom between the upper and lower chamber, anodes of insoluble material in the lower chamber distributed uniformly under the permeable bottom provided with apertures allowing the free passage of the anode electrolyte, inlets for this latter uniformly distributed under the anode-plates, a plurality of tubular diaphragms in the lower chamber arranged in the proximity of the anodes and forming an inclined grate covering the whole area corresponding to the permeable bottom and rising from the feed end toward the discharge end, the tubular diaphragms being inserted on the one end separately and connected on the other end in groups by means of fecding tubes, cathodes extending through said diaphragms, an alkali collecting vessel, means for connecting one end of said diaphragm tube with the alkali collecting vessel, a cathode electrolyte conduit, and means for connecting the other end of the diaphragm tubes with the cathode elpctrolyte conduit.
8. In an apparatus of the kind described embodying diaphragm tubes, a head-piece for the diaphragm tubes provided with a lateral tubular projection, a bolt tightly fitted to said tubular projection, a contact piece secured to the inner end of said bolt and projecting from the mouth of the head-piece, means for sccuring the cathode to the projecting end of the contact picce, an alkali collecting vessel, means for connecting the one end of the head-piece with a diaphragm tube, and the other end with a connection leading to the alkall collecting vessel.

No. 102,540. Trolley Car Clincher. Trolley.

Ernest Otto Marsh, Seattie, Washington, U.S.A., 11th December, 1906; 6 years. Filed 5th November, 1906. Receipt No. 140,948 .
Claim.-1. A device for clinching the margins of a trolley wire ear upon the wire consisting of a clincher having a surface adapted to turn the edges of said margins inward, and means for moving said clincher against the said edges and margins.
2. A device for clinching the margins of a trolley wire ear upon the wire consisting of a clincher, means for moving it against the said margins, and clamps for supporting the ear and wire against the thrust of the ear.
3. A trolley wire ear clincher consisting of a clincher proper having a concaved face, means for moving the.concave face of the clincher against the edges of the ear, and clamps for engaging and holding the ear and wire against the thrust of the clincher.
4. A trolley wire ear clincher consisting of a movable clincher proper, levers for moving it against the edges of the trolley wire ear, and means for engaging the ear on opposite sides thereof and holding it against the thrust of the clincher.
5. A trolley ear clincher consisting of a casing, a movable clincher nrocer supported and guided in the casing to be moved against the edges of the trolley ears, clamps to engage and hold the ear and wire against the thrust of the clincher, and levers for moving the clincher.

No. 102,541. Method of Making Battery Plates.
Mŕthode pour la fabrirntion drs plaques pour piles électriques.

George J. Miller, Toledo, Ohio, U.S.A., 11th December, 1906
6 years. Filed 1st October, 1906. Receipt No. 139,931.
Claim.-1. The improvement in the methods of making battery plates provided with transverse ribs, which consists in scoring the plate across the ribs.
2. The improvement in the methods of making battery plates provided with transverse ribs, which consists in scoring the plate across the ribs in an upward direction. 3. The improvement in the methods of making battery plates provided with transverse ribs, which consists) in scoring the plate at short distances apart to deflect the ridges of said ribs.
4. The improvements in the methods of making battery plates which consists in forming the plate with transverse ribs, and then drawing a tool across the face of the plate in contact with the ribs.
5. The inprovement in the methods of making battery plates which consists in primarily forming the plate with ribs disposed in planes transverse to the body of the plate, and then drawing a tool over the face of the plate to deflect the ribs out of their original planes.

No. 102,542. Dye Tub. Cure pour teindre

Francis I. Stone, Atlanta, Georgia, U.S.A., 11th December. 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,684. Claim.-1. The within described dyer's vat consisting of an outer casing closed at the bottom and with a ring at the top having an inward inclined flange, a smaller casing within the outer casing open at both ends and provided with a support for the contents, detachable to permit the contents to pass bodily out of the bottom of the casing, means for supporting the inner casing with its bottom above that of the outer casing, and a perforated steam pipe arranged to discharge steam upward between the two casings, substantially as set forth.
2. The combination in the receiving vessel, of a dyeing apparatus, of a loose bottom within said vessel, and laterally detachable supports for said bottom, substantially as set forth.
3. The combination in the receiving vessel of a dyeing apparatus, of a loose bottom within said vessel, and detachable crositars supporting said bottom and extending through the vessel so as to be withdrawn therefrom to relase the bottom, substantially as set forth.

No. 102,543. Photo Holder. Porte photographique.

Jodie Wallick, Sumpter, Oregon, U.S.A., 11th December, 1906; 6 years. Filed 17th November, 1906. Receipt No. 141,289.
Claim.-1. In a holder for photos or the like, the combination of a frame composed of sides, a plurality of strips connecting said sides, and members arranged for movement longitudinally of said strips and co-operating to support photos thereon.
2. In a holder for photos or the like, the combination of a frame, a plurality of strips connecting sides of the frame, and adjustable toward and from each other, and members arranged for movement longitudinally of said strips and co-operating to suppart photos thereon.
3. In a holder for photos or the like, the combination of a supporting frame embodying a plurality of sides, double supporting strips connecting sides of said irame and adjustable toward and from each other, said supporting strips having end portions thercof looped about sides of the frame for connection therewith and admitting of adjustment of the double strips toward and from each other and buttons arranged for movement longitudinally of the double strips and co-operating therewith to support a photo thereon.
4. In a holder for photos or the like, the combination of a frame comprising sides, a top and bottom, the sides having openings through which end portions of the top and hattom parts pass, knobs fastened to the top and bottom bottom narts pass, knobs fecuring the same to the sides, parts at the ends and securing having loops at the ends double photo supporting wires having loops at the ends thereof receiving the top and bottom parts of the frame for connection of the double wires toward and from each other, and ment of the dable longitudinally of the double wires to cobuttons slidable in in holding photos thereon.
No. 102,544. Means of Protecting Railway Trains.
Moyens pour protéger les trains de chemins de fer.
Eduard Unvericht. Altona, Germany, 11th December, 1906;
6 years. Filed 11th April, 1906. Receipt No. 134,852.
Claim.-1. Means for automatically protecting railway trains, consisting of the combination of a plurality of electric eircuits, each of which contains two open portions at a distance from one another along the line, means adapted to be actuated by a passing train for closing one of said open
portions, means adapted to be actuated by an object endangering said passing train for closing the other of said open

portions, a pfurality of section stops arranged in conjunction with each circuit, and means adapted to be actuated by the current in each circuit when closed for setting said section stops whereby when the current flows said section slops are so set as to apply tne brakes on the train.
2. Mcans for automatically proteteting railway trains, consisting of a plurailty of electric circuits, each of which contains two open portions at a distance from one another of three sections, said plurality of circuits being so arranged that each of a plurality of them overlaps the next for twothirds of its length, means in conjunction with each circuit adapted to be actuated by a passing train for closing one of the open portions of said circuit, means adapted to be actuated by a train endangering said passing train for closing the other of said open portions, two section stops arranged in conjunction with each circuit, one stop being at a distance of one section from the one open portion of the circuit, and the other stop being one section from the other open portio: of th circuit, and means adapted to be actuated by the current in cach circuit when closed for setting said section stops, whereby when the current flows said section stops are so set as to apply the breaks on the trains.
3. Means for automatically protecting rallway trains, consisting of the combination of a plurality of electric circuits, cach of which contains at a distance from one another along the line two tubes of insu!ating material partially filled with mercury, cach of said tubes being normally in a perpendicular position, whereby the circuit has normally an open portion between the top of the mercury and the top end of cach lube. means adanted to be actuated by a passing train for turning one of said tubes into a substantially horizontal posilion, and thereby closing the circuit in said tube, means adapted to be actuated by an object endangering said passing train for turning the other tube into a substantially horizontal position and thereby completely closing the circuit, a plurality of section stops arranged in conjunction with each circuit, and means adapted to be actuated by the current in each circuit when closed for setting said section stops whereby when the current flows said section stops are so set as to apply the brakes on the train.
4. Means for automatically protccting railway trains, consisting of a plurality of electric circuits, each of which contains at a distance from one another along the line of threc sections two tubes of insulating material partially filled with mercury, each of said tubes being normally in a perpendicular position, whereby the circuit has normally an open por'ion between the top of the mercury and the top end of each tube, said plurality of circuits being so arranged that each of a murality of them overlaps the next for two-thirds of its length, means in conjunction with each circuit adadted to be actuated by a passing train for turning one of the mercury tubes into a substantially horlzontal position and thereby closing the circuit in said tube, means adarted to be actuated by a train endangering said passing train for turning the other tube into a substantially norizontal position and thereby completely closing the cir cuit, two section stops arranged in conjunction with each circuit, one stop being at a distance of one section from the one mercury tube, and the other stop being one section from the other mercury tube, and means adapted to be actuated by the current in each circuit when closed for setting said section stops, whereby when the current flows said section stops are so set as to apply the brakes on the trains
5. Means for automatically protecting railway trains, hav ing underneath breakable compressed air brake pipe caps, consisting of a plurality of electric circuits, each of whe contains at a distance from one another along the line of three sections two tubes of insulating material partiaily
filled with mercury, each of said tubes being normally in
a perpendicular position, whereby the circuit has normally an open portion between the stop of the mercury and the top end of each tube, said plurality of circuits being so arranged that each of a plurality of them overlaps the next for two-thirds of its length, means in conjunction with each circuit adapted to be actuated by a passing train for turning one of the mercury tubes into a substantially horizontal position and thereby closing the circuit in said tube, means adapted to be actuated by a train endangering said passing train for turning the other tube into a substantially horizontal position and thereby completely closing the circult, two section stops arranged in conjunction with each circuit, one stop being at a distance of one section from the one mercury tube, and the other stop being one section trom the other mercury tube, and means adapted to be actuated by the current in each circuit when closed for setting sald section stops, whereby when the current flows said section stops are so set as to engage and break the compressed ar-brake pipe caps when the train passes over said stops.
6. Means for automatically protecting railway trains having underneath breakable compressed air brake pipe caps, consisting of the combination of a plurality of electric circuits, each of which contains two open portions at a distance from one another along the line, menas adapted to be actuated by a passing train for closing one of said open portions, means adapted to be actuated by an object endangering said passing train for closing the other of said open portions, a plurality of section stops 16 , having notches 18 , arranged in conjunction with each circuit, pivoted levers engaging the stops, counterweights 21 on the levers, spring pressed bolts 17 normally engaging in the notches 18 , electro-magnets 20,81 , adapted to be actuated by the currents in the sircuits when closed for disengaging the bolts 17 , springpressed bolts 22 for engaging in the notches 18 after the courterweights have raised the stops into the position in which they engage and break the compressed air brake pipe caps, and keys 23 for disengaging said bolts 22.
7. Means for automatically protecting railway trains having underneath breakable compressed air brake pipe caps, consisting of the combination of a plurality of electric circuits, each of which contains two open portions at a distance from one another along the line, means adapted to be actuated by a passing train for closing one of said open portions, means adapted to be actuated by an object endangering said passing train for closing the other of said open portions, a plurality of section stops 16, having notches 18 , arranged in conjunction with each circuit, pivoted levers engaying the stops, counterweights 21 , on the levers, spring-pressed bolts 17 normally engaging in the notches 18 , and electro-magnets 20,81 adapted to be actuated by the currents in the circuits when closed for disengaging the bolts 17 , to permit the counterweights to raise the stops into the position in which they engage and break the compressed air brake pipe caps.
8. Means for automatically protecting railway trains consisting of a plurality of electric cirucits, each of which contains two open portions at a distance from one another or three sections, said plurality of circuits being so arranged that each of a plurality of them overlaps the next for twothirds of its length, means in conjunction with each circuit adapted to be actuated by a passing train for elosing one of the open portions of said circuit, means adapted to be actuated by a train endangering said pasizing train for closing the other of said open portions, two section stops 16 arranged in conjunction with each circuit, one stop being at circuit and the other stop being one section from the other open portion of the circuit, said stops 16 having notches 18 , pivot'd levers engaging the stops, counterweights 21 on the levers, spring-pressed bolts 17 normally engaging in the notches 18 , electro-magnets 20 , 81 , two for each stop 16 , one electro-magnet being in one circuit and the other in one of the other overlapping circuits, said electro-magnets being adapted when energized to disengage the bolts 17 , to permit the counterweights to raise the stops into the position in which they engage and break the compressed air brake pipe caps.
9. Means for automatically protecting railway trains consisting of the combination of a plurality of electric circuits, each of which contains at a distance from one another along the line two tubes of insulating material partially flled with mercury, each of said tubes being normally in a perpendicular position, whereby the circuit has normally an open partion between the top of the mercury and the top end of each tub?, means adapted to be antuated by a passing irain for turning one of said tubes into a substantially horizontal position, and thereby closing the circuit in said tube, means locking said tube in said horizontal position, an rlectro-magnet adapted when energized to unlock sald locking means, a normally open circuit containing said electromagnet, means at a distance from the above-mentioned means for turning said tube into a horizontal position adapted to be subsequently actuated by the passing train to close

12-15
the latter circuit to release said tube, means adapted to be actuated by an object endangering said passing train for turning the oter tube into a substantially horizontal position and thereby completely closing the circuit, means locking said tube in said horizontal position, an electro-magnet adapted when energized to unlock said locking means, a normally open circuit containing said electro-magnet, means at a distance from the above-mentioned means for turning said tube into a horizontal position adapted to be subsequently actuated by the object endangering the passing train to close the latter circuit to release said tube, a plurality of section stops arranged in conjunction with each circuit, and means adapted to be actuated by the current in each circuit when closed for setting said section stops whereby when the current flows said section stops are so set as to apply the brakes on the train.
10. Means for locking railway switches, consisting of the combination of an electric circuit comprising an electromagnet 24 , means adapted to be actuated by a passing train for closing said circuit, the armature 25 , the pivoted lever 26 , the spring-pressed pawl 27 , the rachet wheel 28 , the cam disc 29 and the spring-pressed bolt 30 having locklng pins 33, substantially as described.

No. 102,545. Railway Control Apparatus. Appareil pour contrôler les trains.

John Barberie, Brooklyn, New York, U.S.A., 11th December, 1906; 6 years. Filed 9th August, 1906. Receipt No. 138,537.
Claim.-1. The combination with a car, provided with a motor for propelling it, a control circuit to control the supply of motive power to the motor, a safety apparatus carried by the car and having an operative and inoperative condition, and means for moving the safety apparatus from one of its conditions to the other and at the same time control the application of the control circuit.
2. In combination with a car, a safety apparatus for electric cars, adapted to prevent the operation of the car past a danger signal if left in its operative condition, and means for moving the safety apparatus from its operative to its inoperative condition without cutting off the motive power from the car.
3. In a safety apparatus, having a control circuit, means to actuate the safety apparatus and apply the brakes, means for placing the safety apparatus into an inoperative condition, without at the same time interrupting the control circuit.
4. In a safety apparatus, means to actuate the safety apparatus and apply the brakes, means for placing the safetyoapparatus in an inoperative condition and means for insuring a limited interval of time between the movement of the safety apparatus into its inoperative condition before the application of the brakes.
5. In a safety apparatus, means to actuate the safety apparatus and apply the brakes, means for placing the safety apparatus into an inoperative condition and means for applying the brakes if the safety apparatus is left in its inoperative condition.
6. In a safety apparatus, a control circuit adapted to be interrupted upon the application of the brakes, means for applying the brakes and interrupting the control circuit when the safety apparatus is in its operative position and additional means for applying the brakes and interrupting the control circuit when the safety apparatus is in its inoperative position. said means adapted to actuate the brakes ouly after an appreciable interval of time after the
safety apparatus has been brought into its inoperative position.
7. In a safety apparatus, a movable part, a track device, means for moving the movable part out of position for engagement with the fixed trip, and means to apply the brakes adapted to operate after an appreciable interval of time if the movable part is not replaced in its operative position.
8. In combination with a safety apparatus, a numbered or otherwise deslgnated destructible nember for the purpose set forth.
9. In combination with a car, a safety apparatus for controlling the car, said apparatus having two conditions, an operative one to stop the car and an inoperative one to permit the car to pass a danger signal, a source of electric supply, a motor carried by the car to propel the same, suitable means to control the supply of electricity to the motor that propels the car, and other means to place the safety apparatus into its operative and inoperative conditiins, both of said means operating together to control the safety apparatus and the supply of electricity to the motor.
10. In a safety apparatus, including a control circuit, the control circuit and safety apparatus being mounted upon a car, a portion of the safety apparatus being adapted to co-act with a co-operating part upon the track, means for moving a portion of the safety apparatus into and out of its operative position, a valve in the train line pipe, means for operating the valve and interrupting the control circuit, means for delaying the opening of the valve in the train pipe, and delaying the interruption of the control circuit, and means including a cylinder, piston and bypass.
11. In a safety apparatus, a closure device in communication with the air brakes, a piston, a hollow piston rod, a cylinder, means mounted on the cylinder for closing the opening in the hollow piston rod when the closure device is in its inoperative position, an emergency stop in the train pipe, means for operating said emergency stop, after an appreciable interval of time after the closure device has been brought into its inoperative position.
12. In a safety apparatus, a track device, a closure device in direct connection with a train line pipe and means for moving said closure device into and out of relation with the track device without cutting out the motive power.

No. 102,546. Block Signalling Mechanism.
Splistìme de sigualix.

Charles P. Bass, Detroit, Michigan, U.S.A, 11th December, 1906; 6 years.
137,072.
Claim.-1. A signal mechanism of the character stated, omprising a semaphore automatically actuated means comprising a sesition, and
for elevating said semaphore, said means including a rotatable member having step-by-step movement, a locking de vice for holding it to each of its intermittent positions and an electro-magnetic controlling device adapted when energized to first release the locking device and then impart movement to the rotatable member, and a circuit closer for cnergizing the electro-magnet of the electro-magnetic controlling devices and arranged to be actuated by the passing car. for the pupposes specificd.
2. A signal mechanism of the character stated, comprising a semaphore automatically actuated to its safety position, a means for elevating the signal and maintaining it at a danger position, said means comprising an electro-mechanlcally operated rotatable member, co-operatively joined with the signal and adapted under predetermined conditions to elevate the signal. independent sets of electro-magnets. independent scts of rotator-actuating devices controlled by each set of electro-magnets, said independently actuating devices being arranged to automatically engage the ratchet member and impart reverse rotary motion thereto, said rotatable member being adapted under a portion of its rotary motion to raise and support the semaphore and under the remainder of its rotary motion to become disengaged from said semaphore to permit the signal to automatically return to its safety position and a trolley actuated means for controlling the circuit closer devices in we magnetic circuits, for the purpose specifled.
3. A signal mechanism of the character stated, comprising a semaphore automatically movable to its safety position, means for elevating sald semaphore, said means including a rotatable member having step-by-step movement, a signal light and bell, means co-operating with the rotatable member for bringing said signal light and bell into electrical circuit with the trolley wire, for the purpose specified.
4. A signal mechanism of the character stated, comprising an electro-mechanical signal operating means, a locking disc having a series of like notches, a lock device adapted to automatically engage with said notches, a second disc joined with said locking disc, a pivoted semaphore controlled by said second disc and adapted under a partial rotary movement of said second disc to be swung to a danger position thereby and under another movement of said second disc to be automatically disengaged therefrom and gravitate to a safety position, a pair of independently operating electro-magnets, means connected with said elec-tro-magnets for releasing the lock devices and imparting a rotary step-by-step movement to the said locking and second disc, for the purposes specified.
5. A signal mechanism of the character stated, comprising an electro-mechanical signal operating means, a locking disc having a series of lock notches, a locking device adapted to automatically engage with said notches, a second disc joined with said locking disc, a pivoted member controlled by said second disc and adapted under a vertical rotary movement of said second disc to be swung to a danger position, thereby and under another movement of said second disc to be automatically disengaged therefrom, and gravitate to a safety position, a pair of independently operating electro-magnets, means connected with said elec-tro-magnets for releasing the locking devices and imparting a rotary step-by-step movement to the said locking and second disc and an independently operating means for returning said locking and second discs to their normal position, for the purposes specifled.
6. In an electrically controlled signal actuating system of the character stated, a gravity dropped signal blade. a rotator having a member for engaging the signal blade and swinging it to its elevated position and maintaining it under such position for a predetermined time, an electromechanical means for alternately actuating the rotator in reverse directions, said means including a pair of independent electric circuits, circuit closing devices for each circuit controlled by the passing trolley, lock devices for holding the rotator to its various positions and a trip for releasing the locking devices and actuated by said Independent electric circuits when operative, as set forth.
7. In a signal mechanism of the character stated, a gravity return signal member, a rotator, means for imparting intermittent motion to the rotator in one direction, means for imparting intermittent motion to the rotator in a reverse direction, said rotator including a member adapted to engage the signal to bring it to a danger position and hold it at said position for a predetermined time, said rotator actuating means including independent sets of elec-tro-magnets, ratchet-and-pawl devices controlled thereby for imparting motion to the rotator an automatically actuated lock for holding the rotator in its different positions and devices under control of the electro-magnets for releasing the said lock devices, at predetermined intervals. 8. A signal mechanism of the character described, comprising pivotally mounted automatically dropped semaphore
or signal member, and electro-mechanical means adapted When energlzed to move the sigual member to a danger position, an electric circuit, closing devices in said circuit under control of the nassing trolley. said electro-circuit meang joined with the electro-mechanical signal actuating means, for operating the said means in one direction to raise the signal, a second electric circuit including the trolley or feed wire and joined with the signal actuating means. a closer device in said second circuit under control of the passing trolley, sald second circuit being arranged when energized to return the signal actuating means to its normal position to permit the semaphore dropping to its safety position. for the purposes specified.
9. In a signal mechanism of the character described, the combination with a signal, a signal actuating means, said means including electro-magnets and devices controlled by magnets when energized to set the signal, an electric circuit joining the magnet with the feeder or trolley wire, of a circuit closing device, said closing device including a swinging contact maker, an arm projecting in the path of the trolley, a means for automatically pulling back said contact maker to break the circuit and a trip device for disengaging the contact maker from the actuating arm, immediately after the clrcuit is closed.
10. In a signal mechanism of the character described, a circuit closing mechanism comprising a casing adapted to be sustained by and over the trolley wire. electric terminals including contact members, a pivotally mounted contact maker automatically movable to its normal or cut-out nosition, a swinging arm hung in the casing and adapted to be engaged by the passing trolley. a latch for connecting said arm and the pivoted contact maker, a trip device for releasing the latch after the current is closed whereby to permit the pivoted contact maker to return to its normal position, as set forth.
11. A signal mechanism comprising a semaphore movable to its safety position, an electro-mechanically actuated means for elevating the semaphore and indicating the number of cars in the block, said means including a rotatable member, having a step-by-step movement, a locking device to hold said rotatable member to each of its step-by-step positions and electro-magnetic controlling devices to release the locking devices and impart movement to the rotatable member, and means for energizing said electromagnetic devices at predetermined times, for the purposes specified.
12. A signal mechanism of the character stated, comprising an electro-mechanical signal operating means, a rotatable member indicating the locking disc and a semaphore controlling disc, a lock device for engaging with said locking disc, a pivoted semaphore controlled by said semaphore controlling disc and adapted under a partial rotary movement of said disc to be swung to a danger position thereby and under another movement of said disc to be disengaged therefrom and gravitate to a safety position, and independently operating electro-magnets for releasing the locking devices and imparting rotary movement to said rotatable member, substantially as shown and described.
13. A signal mechanism of the character stated, comprising signal operating means, a rotatable member, a lock device adapted to engage therewith, a pivoted semaphore controlled by said rotatable member and adapted under a partial rotary movement thereof to be swung to a danger position and under another movement thereof to be disengaged therefrom and gravitate to a safety position, a pair of independently operated electro-magnets, means connected with said electro-magnets for releasing the locking devices and imparting rotary movement to the rotatable member, for the purposes specified.
14. A signal mechanism of the character stated, comprising an electro-mechanical signal operating means, a rotatable member, a lock device adapted to engage therewith, a pivoted semaphore controlled by said rotatable member and adapted under a partial rotary movement thereof to be swung to a danger position, and under another movement thereof to be disengaged therefrom and gravitate to a safety position, a pair of independently operated elec-tro-magnets, means connected with said electro-magnets for releasing the locking device and imparting rotary movement to the rotary member, and an independently operating means for returning said rotatable member to its normal position.

\section*{No. 102,547. Electric Signal Systems for Railways.} Systìme de signaux ćlectriques pour chemins de fer.
Fred. Lacroix, San Antonio, Texas. U.S.A., 11th December, 1906 : 6 years. Filled 7th August, 1906. Receipt No. 138,473.
Claim.-1. In electric signal systems for railways, a normally open circuit extending along the road and adaptetd to be closed by an obstruction on the track, resistance
indicating mechanism, a scond incomplete circuit including sald resistance indicaling mechanism, means for connecting

the two circuits to form a complete circuit, and a source of electricity included in the completed circuit.
2. In clectric signal systems for railways, a normally open circuit extending along the road and adapted to be closed by an obstruction on the track, a shunt wound dynamo having the circuit through its field colls normally incomplete, resistance indicating mechanism in the circuit of the armature coils of said dynamo, and means for connecting the circuit of the field coils with the circuit extending along the road to form a complete oircuit.
3. In elcctric signal systems for railways, conductors extending along the track and forming a normally incomplete circuit. means actuated by an obstruction on the track to form an electric connection between said conductors, a normally incomplete circuit on a carrier movable on the track, means for electrically connecting the incomplete circult on the carrier with the conductors, a source of electricity interposed in the incomplete circuit on the carrier, and resistance indicating mechanism and signals interposed in the circuit of the carrier.
4. In electric signal systems for rallways, conductors extending along the track and divided into blocks of different electric resistances and forming an incomplete circuit, means actuated by an obstruction on the track to form an electric connection between the conductors in the adjacent blocks, a shunt-wound dynamo on the carrier movable on the track, means for electrically connecting the circuit of the field coils of the dynamo with said conductors, and resistance indicating mechanism and signals included in the circuit of the armature colis of said dynamo.
5. In electric signal systems for railways, a track divided into insulated blocks with each rail of each block electrically continuous, a source of electricity in each block, a circuit in each block including the rails and source of electricity and adaptetd to be broken by an obstruction on the rails of the block conductors extending along the track, means in each block actuated by the interruption of the rail circuit of the block for electrically connecting said conductors opposite the block a normally incomplete circuit on a carrier movable on the track, a resistance indicating mechanism included in said circuit on the oarrier, meang for connecting the circuit on the carrier with said conductors to form a complete circuit when said conductors are electrically connected through the interruption of the rail circuit, and a source of electricity included in the completed circuit through the conductors and the circuit on the carrier.
6. In electric signal systems for rallways, a track divided Int? Insulated tlocks with each rail of each block electrically continuous, a source of electricity in each block, a circult in each block including the rails and source of electricity and adapted to be interrupted by an obstruction on the rails
of the block, conductors extending along the track, means in each block actuated by the interruption of the rail circuit of the block for electrically connecting said conductors opposite the block, a shunt-wound dynamo mounted on a carrier movable on the track, means for elctrically connecting the fleld coils of the dynamo with the conductors, and resistance indicating mechanism and signals included in the circuit of the armature coils of said dynamo.
No. 102,548. Signal System for Electric Railways. Système de signaur pour chemins de fer ì traction ílectrique.

Milton H. Landon, Kansas City, Missouri, U.S.A., 11th December. 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,224.
Claim.-1. An electric rallway signalling system embodying a normally closed main circuit including a source of electrical energy, a rheostat and a solenoid-magnet operatively connected with the engineer's brake valve, and a normally open local circuit including a telephone and a Morse sounder, the two circuis being opened or closed by the tolephone hook.
2. An electr cal railway signalling system embodying a normally closed main circuit including a source of electrical energy, a rheostat, visual and audible signalling mechanism, and a solenoid-magnet operatively connected with the engineer's brake valve, and a normally open local circuit including a telephone and a morse sounder, and means actuated by the telephone receiver either to open or to close the two circuits.
3. In an electrical railway signalling system, a normally closed main circuit including a source of electrical energy, a rheostat, and an electrically actuated element operatively connected with the engineer's brake valve, and a normally open circuit including a Morse sounder and a telephone, the opening and closing of the two circuits being controlled by the telephone hook.
4. In an electrical rallway signalling system, a normally closed main circuit including visual and audible signalling mechanism and a solenoid-magnet combined with the engineer's brake valve and a normally open local circuit including a telephoze.
No. 102,549. Train Signal. Signanx pour trains.
Clav. H. Martin, Jackson, Michigan, U.S.A., 11th December, 1906; 6 years. Filed 5th September, 1906. Receipt No. 139,287.
Claim.-1. A train signal comprising an alarm in the way car, a flexible member extending forward along the cars of the train and attached at its forward end to one of said cars of the train, and means actuated by sald flexible member for sounding the alarm in the rear car and displaying said signal upon the separation of the train.
2. A train signal comprising an electric circuit containing an alarm bell and a slidable circuit closer, a cord attaclfed to said circuit closer and extending along the train, its forward end being attached to one of the cars of the train. whereby upon a separation of the train the circuitis closed to sound the alarm, aind a spring for actuating the circuit claser to open the circuit when the strain upon said cord is releaged.
3. A train signal comprising an alarm circuit, a movable circuit closer in said circuit, a cord connected to said circuit closer at its rear end, a luminous signal upon one of the forward cars of the train, means for displaying said signal, sald signal displaying means being connected with the forward end of said cord.
4. A train signal comprising an electrical alarm in the way car, a luminous signal on one of the cars forward from

the way car, means for displaying said luminous signal, and means actuated by the severing of the train for simultancously accusting the signal displaying means, and closing the alarm circuit.
5. A train signal comprising an audible alarm in the way car, a combustible torch upon one of the forward cars of the train, movable means for igniting said torch, movable means for sounding the audible alarm and a cord connecting the torch igniting means and the alarm sounding means, whereby said signals are set upon the severing of the train.
6. A train signal comprising an audible alarm in the way car adapted to be actuated by a movable part, a combustible signal torch upon one of the forward cars of the train covered by a protected movable housing, a friction surface in said housing adapted to ignite said torch as it. is drawn thereover, a cord connecting said movable hous ing with the movable part of the audible alarm and span ning the intervening cars of the train.

No. 102,550. Train Signal. Signaux pour trains.

William B. Severance, Manchester, New Hampshire, U.S.A., 11th December, 1906; 6 years. Fyled 19th September. 1906. Receipt No. 139,629.

Claim.-1. In a signal system of the character described, the combination with an electrically operated signalling device, normally open electric circuits, an electrically controlled time mechanism included in certain of said oircuits. and means whereby said circuits are successively closed through the wheels of a train passing across the same, sabstantially as described.
2. In a signal system of the character described, the combination with an electrically operated signalling device, normally open electric circuits, one rail of the said section being connected with each end of the circuit in which the same is arranged. said sections of rails being insulated apart whereby a train passes over said track said circuits will be successively closed through the wheels of the train, an electrically controlled time mechanism in certain of said circuits, and means whereby said circuits are successively closed through the wheels of a train passing across the same, substantially as described.
3. In a signal system of the character described, the combination with an electrically operated signalling device, normally open electric circuits, a short section of track rail arranged in each of said circuits, one rail of said section being connected with each end of the circuit in which the same is arranged, said sections of rails being insulated apart, whereby when a train passes over said circuits will be successively closed through the wheels of the train, a normally open signal controlling circuit, a time mechanism, and contact points arranged in said circuit in the path of movement of the hand of said time mechanism, whereby said circuits will be closed by said hand at the expiration of the time limit thus operating said signal, substantially as described.

\section*{No. 102,551. Internal Combustion Engine.}

Engin à cambustion interne.

Elmer Stellman Smith. Bound Brook, New Jersey, U.S.A., 11th Decomber, 1906; 6 years. Filed 19th November, 1906. Receipt No. 141,312.
(laim.-1. In an internal combustion engine, a series of cylinders connected in pairs by passages at their compression ends, and means for admitting air to one cylinder of a connected pair and the combustion motive fluid to the other thercof, substantially as and for the purposes set forth.
2. In an internal combustion engine, a series of cylinders connected in pairs by passages at their compression ends, and means for admitting air to one cylinder of a connected pair and the motive fluid to the other thereof, and for cutting off the air and admitting the combustion motive fluid to both cylinders, as occasion may require, substantially as set forth.
3. In an internal combustion engine, a series of cylinders connected in pairs by passages at their compression ends, inlet ports to all of said cylinders, a pipe communicating with all said ports, a valve casing in said pipe intermediate the cylinders of said pairs, a hollow valve in said casing having a port adapted to be placed in communication with said pipe at one side of said casing or to be closed by sald casing, means for setting said valve, and air and motive fluid connections leading respectively into said valve and said valve casing, substantially as and for the purposes set forth.
4. In an internal combustion engine, a series of cylinders connected in pairs by passages at their compression ends, pistons in said cylinders, a crank shaft, and rod connecting said pistons with the cranks of said shaft, said cranks being so disposed that the pistons of the respective pairs of cylinders move in unison and in the same direction, combined with means for admitting air to one cylinder of a connected pair and the combustion motive fluid to the other thereof, substantially as set forth.
5. In an internal combustion engine, a series of cylinders connected in pairs by passages at their compression ends, pistons in said cylinders, a crank shaft, and rods connecting said pistons with the cranks of said shaft, said cranks being
so disposed that the plstons of the respective pairs of cylinders move in unison and in the same direction, combined with means for admitting air to one cylinder of a connected pair and the combustion motive fluid to the other thereof, and for cutting off the air and admitting the combustion motive fluid to both cylinders as occasion may require, substantially as set forth.
6. In an internal combustion engine, a pair of cylinders connected by a passage at their compression ends, and means for admitting air to one of said cylinders and the combustion motive fluid to the other thereof, substantially as and for the purposes set forth.
7. In an internal combustion engine, a pair of cylinders connected by a passage at their compression ends, and means for admitting air to one of said cylinders and the combustion motive fluid to the other thereof and for cutting off the air and admitting the combustion motive fluid to both cylinders as occasion may require, substantially as set forth.
8. In an internal combustion engine, a paid of cylinders connected by a passage at their compression ends, inlet ports to sald cylinders, a pipe communicating with all said ports, a valve casing in said pipe intermediate said cylinders, a hollow valve in said casing having a port adapted to be placed in communication with said pipe at one side of said casing or to be closed by said casing, means for setting said valve, and air and motive fiuid connections leading respectively into said valve and said valve casing, substantially as and for the purposes set forth.

\section*{No. 102,552. Internal Combustion Engine.}

Engin à combustion interne.

Frederick Lamplough, London, England, 11th December, 1906;
6 years. Filed 11th September, 1906. Receipt No. 139,424.
Claim.-1. In an internal combustion engine of that type in which the cylinder has two different bores, and in which two pistons fitting such bores are employed, the smaller piston being prolonged in the form of a tube to its connection with the larger piston and in which the connecting rod is pin jointed at one end in the interior of the compound piston and passes out through the open end of the cylinder and is connected to the crank, the combination therewith of means whereby, whist pressure is exerted on the smaller piston on the firing stroke, a vacuum is caused to act on the larger piston on the return stroke and the exhaust from the firing cylinder is caused to pass into a partial vacuum thereby rendering the engine practically silent.
2. In an internal combustion engine of that type in which the cylinder has two different bores, and in wheh two pistons fitting such bores are employed, the combination therewith of a silencer connected to the exhaust port of the firing cylinder, a condenser connected with the silencer, a water chamber within the condenser, a connection from the upper part of the water chamber to the water jacket of the firing cylinder, means for circulating water through the water chamber and water jacket, a connection from the lower part of the condenser to the inlet valve of the larger cylinder, a valvo between the exhaust port of the firing cylinder and the inlet valve of the larger cylinder to regulate the amount of depression in this ejrcuit, and an outlet or discharge valve communicating with the larger cylinder.
3. In an internal combustion engine of that type in which the cylinder has two different bores, and in which two pistons fitting such bores are employed, the combination therewith a silencer connected to the exhaust port of the firing cylinder, a condenser connected with the silencer, a water chamber within the condenser, a connection from the upper part of the water chamber to the water jacket of the firing cylinder, means for circulating water through the water chamber and water jacket, a connection from the
lower part of the condenser to the inlet valve of the larger cylinder, a valve between the exhaust port of the firing cylinder and the inlet valve of the larger cylinder to regulate the amount of depression in this circuit, an outlet or late the amount of depression in this circuit, an outlet or
discharge valve communicating with the larger cylinder, means for pumping petrol to the petrol nozzle and for regulating the stroke of the pump such means consisting of a pump the suction chamber of which communicates with the petrol tank, a non-return valve in said suction chamber, a pump plunger pressed downwards by a spring and forced upwards by a quadrant, an \(L\)-shaped lever connected by its shorter arm to one end of the quadrant and by its longer arm to tho engine connecting rod, to move the quadrant to and fro under the petrol pump plunger, a lever mounted on a shaft and having a skew toothed segment formed thereon, a link connecting sald lever with one end of the quadrant and a sliding rod having skew teeth thereon gearing with the toothed segment.

No. 102,553. Evaporating Apparatus.
Appareil à étaporer.

The Milwaukee Evaporator Company, assignee of Joseph Atrahim, beth of Milwaukee, Wisconsin, U.S.A., 11th December, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,211.
Claint.-1. In cvaporating apparatus, the combination of a closed vessel having a heating chamber between evaporating and settling chambers, tubes passing througi the heating chamber and onening at the ends into the evaporating and settling chambers, inlet and outlet connections with opposite sides of the heating chamber for the heating medium, and baffle plates extending transversely across said heating chamber betwen its inlet and outlet connections and between the rows of tubes therein and terminating alternately short of the partitions at opposite ends of said tubes, thereby forming a zlgzag passage for the heating medium back and forth lengthwise of the tubes, substantially as described.
2. In evaporating apparatus, the combination of a closed vessel divided by horizontal tube plates into evaporating, heating and settling chambers, inlet and outlet connections with opposite sides of said heating chamber for the heating medium, tubes passing vertically through said heating chamber and opening at the ends into the evaporating and settling chambers, baffle plates extending across the heating chamber between its inlet and outlet connections and betwen successive rows of tubes and terminating alternately short of the upper and lower tube plates, and a deflector projecting into the evaporating chamber over the upper ends of the tubes nearest the inlet connection, substantially as described.
3. In evaporating apparatus, the combination of a closed vessel having evaporating, heating and settling chambers, vessel having evaporating, heating and setting chambers,
connections with opposite sides of the heating chamber for
admission and discharge of the heating medium, tubes passing through said heating chamber and opening at the ends into the evaporating and settling chambers, baffle plates cxtending across the heating chamber between its inlet and outlet connections and between successive rows of tubes and terminating alternately short of the top and bottom walls of said chamber, and an exhaust connection leading out of said evaporating chamber. substantially as described. 4. In evaporating apparatus, the combination of a closed vessel divided by horizontal tube plates into evaporating, heating and settling chambers, tubes passing vertically through the heating chamber and opening at their upper ends into the evaporating chamber and at their lower ends into the settling chamber, an exhaust connection leading out of the upper part of the evaporating chamber, inlet and outlet connections for the heating medium on opposite sides of the heating chamber, valve controlled liquid supply and discharge connections leading into and out of said vessel, and vertical baffie plates extending acrose the heating chamber between its inlet and outlet connections and between successive rows of tubes and terminating alternately short of the upper and lower tube plates, thereby forming a zigzag passage for the heating medium up and down along said tubes, substantially as described.
5. In evaporating apparatus, the combination of a number of closed vessels each divided by horizontal tube plates into evaporating, heating and settling chambers, tubes passing vertically through the heating chambers and opening at their upper ends into the evaporating chambers and at their lower ends into the settling chambers, an exhaust connection leading out of the upper part of the last evaporating chamber, a connection leading from the upper part of the evaponating chamber of each preceding vessel into the heating chamber of the next succeeding versel, a connection with the heating chamber of the first vessel for supplying a heating medium thereto, valve controlled outlet connectrons with the heating chambers opposite their heat supply connections, a valve controlled connection leading from the settling chamber of each preceding vessel into the evaporating chamber of the next vessel, and vertical baffie plates extending across the heating chambers between their heat supply and outlet connections and between successive rows of tubes and terminating alternately at their upper and lower edges short of said tube plates, substantially as described.
6. In evaporating apparatus, the combination of a number of closed vessels each divided horizontally by plates into evaporating, heating and settling chambers, tubes passing vertically through the heating chambers and opening at their upper ends into the evaporating chambers and at their lower ends into the settling chambers, an exhaust connection comprising a condenser leading out of the upper part of the last evaporating chamber, a connection leading from the upper part of the evaporating chamber of each preceding vessel into the heating chamber of the next succeeding vessel, a valve controlled heat supply connection with the first heating chamber, valve controlled outlet connections for the several heating chambers, a valve controlled connection leading from the settling chamber of each preerding vessel into the evaporating chamber of the next succeeding vessel, valve controlled liquid supply and discharge conncctions with the settling chambers of the first and last vessels respectively, and a trap provided with a strainer and having a valve controlled connection above the strainer with the settling chamber and a valve controlled connection below the strainer with the evaporating chamber of the last vessel, substantially as described.

\section*{No. 102,554. Railway Signal.}

\section*{Sianal de chemins de fer.}

John Benjamin Lineback and Robert S. Morris, assignee of a half interest, both of Siloam Springs, Arkansas, U.S. A., 111h December 1906; 6 years. Filed 30th April, 1906. Receipt No. 135.410.
Claim.-1. An electric railway signal system, comprising in combination with a rallway track and stations located at intervals therealong, electric circuits extending from each of said stations in opposite directions toward the next adjacent stations and arranged upon opposite sides of sald track, electrically aciuated signalling devices in said circuits arranged at intervals along said track and at the next adjacent stations, electric generators at said stations for supplying electric current to said circuits, and manually operated switches at said stations for opening and closing sald circuits, each independently of the other.
2. An clectric railway signal system, comprising in combination with a rallway track and stations located at intervals therealong, double electric circuits extending from each of said stations in opposite directions toward the next adjacent stations and arranged upon opposite sides of said
rack, distinguishing electrically actuated signalling devices in the said respective circuits, arranged at intervals along

the track and at the next adjacent stations, electric generators at sald stations for supplying electric current to said circuits, and manually operated switches at said stations for opening and closing said circuits, each independently of the others.

No. 102,555. Apparatus for Extracting Sap. Appareil pour cxtraire la sève.

James White Wade, Mobilc, Alabama, assignee of Vincen P. McVoy, Pensacola, Florida, U.S.A., 11th December, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,916.
claim.-1. The extraction of sap from a tree under a vacuum created at one or more collective points, within spaces formed in the tree and from which the sap is free to flow, such spaces being of greater area than flow outlets for the sap.
2. The extraction of sap from a tree by forming a bore therein, sealing the outer end of such bore, and creating a vacuum therein, the sap being designed to flow from the lower portion of the sap bore.
3. A sap collector comprising a spout adapted for attachment to a tree, a receptacle at the outer end of such spout, and means through which air may be exhausted from the collector to form a vacuum therein.
4. A sap collector comprising a spout adapted for attachment to a tree, a receptacle detachably connected to the spout, and an outlet whereby air may be withdrawn from the collector to form a vacuum therein to facilitate the collection of sap.
5. A sap collector comprising a spout adapted for connection a one end with a tree, a cup, and means for forming an air tight connection between the cup and the spout.
6. A sap collector comprising a spout designed to be hermetically secured over a bore in a tree, and a cup detachably secured to the spout, such spout and cup being closed to the exterior atmosphere.
7. A sap collector comprising a spout adapted for connection at one end with a tree and having lugs at its outer end, and a cup also provided with lugs for interlocking with the lugs of the spout.
8 . A sap collector comprising a spout adapted for attachment to a tree, a receptacle at the outer end of such spout, and means through which air may be exhausted from the collector to form a vacuum therein.
9. A sap collector comprising a receptacle closed at all points except at its point of connection with the tree, and having a valve through which air may be exhausted to form a vacuum therein.
10. A sap collector comprising a spout, a cup, means for detachably connecting the cup to the spout, thus forming a collector closed to the exterior atmosphere and communirating solely with the bore in the tree to effect the extraction of the sap by a vacuum action, and means for heretically sealing the jolnt between the spout and cup.

No. 102,556. Machine for Making Chain Links.
Marhine portr faire les maillos de chaines.

Tho Hercules Chain Company, assignee of Isaac D. Weaver, both of Lebanon, Pennsyivania, U.S.A., 11th December, 1906; 6 years. Filed 14 th November, 1906. Receipt No. 141,198.
Claim.-1. In a device for welding chain, a fixed die having a welding groove, a movable die having a like groove and clamping blocks for engaging opposite sides of a link blank, one of which blocks is vertically movable.
2. In a device for welding chain, a fixed die having a welding groove, a movable die having a like groove, and a pair of laterally movable arms provided with clamping blocks, ono of which blocks is yieldingly attached to the arm.
3. In a device for welding chain, a fixed die having a welding groove, a movable die having a like groove, and a pair of laterally movable arms provided with clamping blocks to engage opposite sides of a link blank, one of which blocks is vertically movable on its arm, and means for automatically restoring said block to its normal position.
4. In a device for welding chain, a fixed die having a welding groove, a movable die having a like groove, a pair of laterally movable arms on opposite sides of the grooves in the dies and provided with clamping blocks, shafts supporting said arms,a sector-shaped gear on each of said shafts, and a rack for operating said gear.
b. In a device for welding chain, a fixed die having a welding groove to supoprt a link blank in horizontal position, a movable die having a like groove, a pair of laterally movable arms of different lengths on opposite sides of the grooves in the die and provided with clamping blocks, the block on the long arm being movable, a motor, and intermediate connections for operating said arms and clamping blocks.

\section*{No. 102,557. Signal for Railways.}

Signal de chemins de fer.
The Western Syndicate, Limited, London, asignee of C. M. Jacobs, Reading, R. J. Insell, Reading, F. Newton, Cardiff, and E. A. B. Bowen, Hanwell, all in England, 11th December, 1906; 6 years. Filed 10th April, 1906. Receipt No. 134,796.
Claim.-1. A signalling device for railways comprising means constituting a normally closed circuit, means constituting a normally open circuit, a single electrical device contained in both circuits, a danger signal controlled by said electrical device, a safety signal contained in the said normally open circuit, mechanical means for opening said closed circuit to give the danger signal when the train passes a signal point, and means for closing said normally open circuit to restrain the danger signal and at the same time give the safety signal.
2. Apparatus for signalling between fixed points on a railway line and a train passing along the line, comprising two signals on the train, restraining means for preventing normally one of the said signals being given, means at each fixed point for invariably removing the said restraining means, means at each fixed point for operating the other of the said signals when desired, and means whereby the first of the said signals is suppressed when the second of the said signals is operated.
3. Apparatus for signalling between fixed points on a railway line and a train passing along the line, comprising a signal on the train, electrically operated restraining means for preventing normally this signal being given, means at
cach fixed point for invariably rendering inoperative the said restraining means, and a device at cach fixed point for sup-

plying electric current to the said electrically operated means when desired.
4. Apparatus for signalling between fixed points on a railway line and a train passing along the line, comprising two signals on the train, a ramp at each fixed point, a lever carried by the train in such a position that it is operated by the said ramp. means connected with the said lever for operating one of the said signals, and means for completing an electric circuit through the said ramp, lever and second signal to operate the latter.
5. Apparatus for signalling from fixed points on a railway ine to a train passing along the line, comprising two signals on the train, an electro-magnetic device controlling one of the said signals, a source of electric current on the train, a switch on the train, a normally closed electric circuit on the train including the said electro-magnetic device, source of current and switch, a device at each point for moving the said switch to control the said circuit and a device at each fixed point to operate the other of the said signals when desired.
C. Apparatus for signalling from fixed points on a railway line to a train passing along the line, comprising two signals on the train, an electro-magnetic device controlling one of the said signals, a source of elcetric current on the train, a switch on the train, an electric circuit on the train including the said electro-magnetic device. source of current and switch, a lever on the train connected with the said switch, a ramp at each fixed point to operate the said lever, an insulated conductor on the said ramp, a source of electric current on the line, an electro-magnetic device on the train controlling the other of the said signals, a device for conveying electric current from the said insulated conductor to the said electro-magnetic device and means for connecting the said source of electric current on the line with the said insulated conductor when required.
7. Apparatus for signalling from fixed points on a railwas line to a train passing along the line, comprising two signals on the train, an electro-magnet controlling. one of the signals, two windings on the said electro-magnet, a source of electric current on the train, a switch on the train, an electric circuit on the train including one of the windings of the said electro-magnet, the said source of current and the said switch, an electrically insulated lever on the said train connected with the said switch, a ramp at each fixed point to operate the said lever, an insulated conductor on the said ramp wherewith the said lever makes contact when operated by the said ramp, a source of electric current on the line, an electro-magnetic device controlling the other of the said signals, an electric circuit including the said source of current, the said insulated conductor, the said insulated lever, the second winding of the said electro-magnet and the said electro-magnetic device, and means on the line for closing the last-named eleetric circuit when desired.
8. Apparatus for signalling from fixed points on a eailway line to a train passing along the line. comprising two signals on the train. an electro-magnetic device controlling one of the said signals, a source of electric current on the train, a switch on the train, an electric current on the train, including the said electro-magnetic device, source of current and switch, a steam boiler on the train, a device operated by the steam boiler when the pressure therein is above a predetermined value to close the said electric circuit, a device at each fixed point for moving the said switch to control the said circuit and a device at each fixed point to operate the other of the said signals when desired.
9. A signalling device for railways of he character referred to, comprising a normally closed circuit, a normally open circuit distinct from the said normally closed circuit. a lever carried by the train and adapted when actuated to open the normally closed circuit, and a fixed ramp for operating the lever, said lever and said fixed ramp constituting a part of the normally open circuit.

\section*{No. 102,558. Explosive. Explosif.}

William Herbert Evans and Robert Westover Withycomb, both of Montreal, Quebec, Canada, assignees of Frank Park Harris, New York City, New York, U.S.A., 11th December, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,145.
Claim.-1. An explosive combound made from tri-nitrololuol together with tri-nitro-phenol and nitrate of soda, as specified.
2. An explosive compound made from tri-nitro-toluol together with tri-nitro-phenol and nitrate of ammonium, as specifled.
3. An explosive compound comprising tri-nitro-toluol mixed with tri-nitrate-phenol and nitrate of soda and parafline, together with a sensitizing ingredient mixed with the aforesaid ingredients and subsequently granulated and powdered, as specified.
4. An explosive compound comprising tri-nitro-toluol mixed with tri-nitro-phenol, nitrate of soda and nitrate of ammonia, and paraffine together with tri-nitro-toluol and pioric acid mixed with the aforesaid ingredients, subsequently granulated and powdered, as specified.
5. An explosive compound comprising tri-nitro-toluol and tri-nitro-phenol and nitrate of ammonia and a parafine, trinitrotoluol, picric acid joined to the aforesaid ingredients and subsequently reduced to a powdered state, as specified.
6. An explosive compound made from tri-nitro-toluol together with tri-nitro-phenol and nitrate of soda and nitrate of ammonia, as specified.

No. 102,559. Pulverizing or Grinding Mill. pulvérisateur ou moulin à moudre.

James Wheeler Fuller, Jr., Catasaugua, Pennsylvania U.S.A., 11th December, 1906; 18 years. Filed 21st March 1906. Receipt No. 134,108 .

Claim.-1. In a pulverizing or grinding mill, a base having an annular depression, a flange carried by said base and partially covering the depression by extending over the same, and a shaft passing through sald base and having a driving wherel terminating with its toothed portion in the depression of said base and below the flange thereof, the depression of said base arranged to recelve a lubricating fluid, and said flange arranged when the wheel is rotated to confine the raised fluid to the depression and conduct \({ }^{3}\) certain portion thereof over the toothed portion of the wheel to thoroughly lubricate the same.
2. In a pulverizing or grinding mill, a base having an annular depression at the upper portion thereof and at the lower portion having projections, a yoke removably connecting the projections with each other, a flange carried by the base and partially covering the depression by extending over the same, a shaft passing through the base and terminating between the projections thereof and above the yoke, a driving wheel secured to said shaft and terminating with the toothed portion in the depression of said base and below said flange, the depression of said base arranged to receive a lubricating fluid, and sald flange arranged when said wheel is rotated, to conduct a certain portion of the fluid over the toothed portion of said wheel, and a bearing carried by sald yoke and adapted to receive the lower end of said shaft.
3. In a pulverizing or grinding mill, a base having an annular substantially \(V\)-shaped depression at the upper portion thereof and rib-like projections at the lower portion, a yoke removably cunnecting the projections with each other, a flange consisting of overlapping sections carried by said base and partially covering the depression thereof, by extending over the same, a shaft passing through said base and terminating between the projections and above said yoke, a driving wheel secured to said shaft and terminating with the toothed portion in the depression of said base and below said flange, the depression of said base arranged to receive a lubricating fluid, and said flange arranged when sald wheel is rotated to conduct a certain portion of the fluid over the toothed portion of said wheel, and bearings carried respectively, by the projections of said base and sald yoke adapted to independently surround said shaft and receive the lower end thereof.

No. 102,560. Mnititubular Boiler.
Chaudiere a tubes.

Charles Bourdon, Paris, France, 11th December, 1906; 6 years. Filed 3rd October, 1905. Receipt No. 128,923.
Claim.-1. In a fire tube boiler composed of easily removable elements, a plurality of elements formed each of a corrugated boller plate folded upon itself to form vertical walls with the internally projecting corrugations of each face in contact with the corresponding projecting corrugations of the other face so as to form a vertical series of superimposed and parallel flbre tubes 7, connecting pieces securing the said folded elements, and end plates into which the said elements are countersunk forming water tight and steam joints th \(\in\) rewith, substantially as described.
2. In a fire tube boller composed of easily removable elements, a plurality of elements formed each of a corrugated boller plate folded upon itself to form vertical walls, so that the inwardly projecting corrugations of the vertical sides of each element are opposite and adjacent to each other,
spacing sleeves and rivets forming a connection between the opposite internal projections, and end plates into which the said elements are countersunk to form water tight and steam tight joints therewith, the spaces 7 between each element forming a vertical series of superimposed and parallel fire tubes, substantially as described.

No. 102,561. Handle for Safoty Razor Blades. Poignée pour les lames de rasoirs de sßrete.

Rider Prenell Cafferty, Jr., Leonia, New Jersey, U.S.A., 11th December, 1906; 6 years. Filed 23rd November, 1906. Recolpt No. 141,459.
-laim.-A handle for razor blades, said handle being tubular in forin and larger at one end than at the other and composed of two parts which are concavo-convex in cross section, said parts being connected at one end and flattened at the other end to form parallel flat jaws, one of said jaws being provided at intervals with holes or apertures and the other with lugs adapted to pass through said holes or apertures, a spring placed between the handle members for forcing them apart and a sleeve mounted on said handle and adapted when moved in one direction to force the separate parts thereof and the said jaws together.

No. 102,562. Lacrosse Stick. Lacrosse.

Decaire Ceel, Caughnawaga, Quebec, Canada, 11th Decem-
ber, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,546.
Clatm.-1. A device of the class described, conslsting of a wooden frame integrally formed and comprising a handle,

a back, the lip, and the toe which is formed upward and inand a suitable guard laced in with laced in proper position, through said toe and secured to with said netting and laced that the upper guard member thereof will in such position the top edge of said back so as to positivelways rest upon thereby at this end which, together with the support given said upper guard member by said toe, the support given the said guard from sagging. 2. A device of the class de
frame integrally formed, and comprising an handle, wooden the lip, and the toe which is formed upward andle, a back, suitable netting suitably laced in proper and inward, a guard comprising the upper guard member, the intermediate guard member and the lower guard member, intermediate guard supports, comprising a strand of suitable material laced in with said netting and twisted around itself mo as to give supoprt to the intermediate and lower guard mombers which are sulably laced through said toe and through or around said back at or near where the handle proceeds therefrom, and provided with two upper loops which fit around the upper guard member, and a lower loop which passes between the twisted parts of said strand and underneath said upper guard member so that when the said strand is pulled into proper position during course of manufacture, the said loops will firmly grip around said upper guard member and prevent said intermediate guard supports from lateral displacement, the said upper guard member being laced through said toe and to said back in such position that it will always rest upon the top edge of said back so as to be positively supported thereby at this end which, together with the support given said upper guard member by said toe, effectually prevents the said guard from sagging.
3. A device of the class described, consisting of a wooden frame integrally formed comprising a handle, a back, the lip, and the toe which is formed upward and inward, the said lip being constructed thicker so as to give additional strength, at the points where the said toe proceeds therefrom and where it proceeeds from said back, and being made thinner intermediate said points, the said wooden frame being made stouter or thicker at the point where said back proceeds from said handle, a sultable netting suitably laced in proper position, and a guard comprising the upper guard member, the intermediate guard member and the lower guard member, intermediate guard supports comprising a strand of suitable material laced in with said netting and twisted around itself so as to give support to the intermediate and lower guard members which are suitably laced through said toe and to said back at or near where the handle proceeds therefrom, and provided with two upper loops which fit around the upper guard member, and a lower loop which passes between the twisted parts of said strand and underneath said upper guard member so that when the said strand is pulled into proper position during course of manufacture, the said loops will firmly grip around said upper guard member and prevent said intermediate guard supports from lateral displacement, the said upepr guard member being laced through said toe and through or around said back in such position that it will always rest upon the top edge of said back so as to be positively supported thereby at this end which, together with the support given said upper guard member by said toe, effectualy prevents the said guard from sagging.
4. The combination with a lacrosse stick frame, a netting suitably laced therein, and a guard, of intermediate guard supports comprising a strand of suitable material laced in with said netting and twisted around itself so as to give support to certain members of said guard, and provided with two upper loops which fit around the upper guard member, and a lower loop which passes between the twisted parts of said strand and underneath said upper guard member so that when the said strand is pulled into proper position during course of manufacture, the said loops will firmly grip around said upper guard member and prevent said intermediate guard supports from lateral displacement.
5. A lacrosse stick frame comprising the handle made stout or thick at a form which proceeds the back \(B\), the lip \(\mathbf{N}\) being thickened where it proceeds from the back \(\mathbf{B}\) by the elbow \(O\) and being thickened at the elbow \(M\) from which proceeds the portion \(L\) which terminates in the toe \(J\), the said lip between the elbows \(M\) and \(O\) being made shallower in cross section than said elbows, the elbow o being thicker in cross section than the elbow \(M\), substantially as set forth and for the purpose specifled.

\section*{No. 102,563. Copper Separation.}

\section*{Sénaration du cuivre.}

Alexander Elliott, Little Rock, California, U.S.A., 11th December, 1906; 6 years. Filed 28th June, 1906. Recelpt No. 137,373.
Claim.-1. In the process of leaching oxidized copper ores which consists in submitting the ore to the action of a non-
the solution of ferrous sulphate and passing air through the solution during the operation of leaching.

2. The process of leaching oxidized copper ores which consists in submitting the ore to the action of a hot non-acid solution of ferrous sulphate and passing air through the solution during the operation of leaching.
3. The process of separating copper from oxidized ores which consists in leaching the ore with a hot non-acid solution of ferrous sulphate and passing air through the solution during the operation of leaching, separating the solution from the residue, and precipitating the copper from the solution by means of iron, thereby regenerating the ferrous sulphate for a repetition of the process.
4. The process of separating copper from ores contalning basic gangue, which consistis in leachlng the ore with hot non-acid solution of ferrous sulphate, passing air through the solution during the operation of leaching, separating the solution from the residue, precipitating the copper from the solution by means of iron and utilizing the resulting solution of ferrous sulphate for a repetition of the process.

\section*{No. 102,564. Support for Anode.}

Supnort pour anode.
Frank Engelhard, Frederick H. Englehard, and William A. Englehard, co-inventors, all of Springfield, Massachusetts, U.S.A., 11th December, 1906; 6 years. Filed 9th August, 1906. Receipt No. \(138,548\).
Claim.-1. As a new article of manufacture, an anode support comprising a comparatively strong interior electrical conducting member, a weaker exterior electrical conducting member, the latter being impervious to the electrolyte and completely covering the lower portion of the in terior member.
2. As a new article of manufacture, an anode support comprising a comparatively strong rod, a tube secured by a wiped joint at the top to such rod, said tube being impervious to electrolytes and both the tube and rod being electrical conductors, and an impervious fllling in the base of the tube under the rod.
3. As a new article of manufacture, an anode support comprising a comparatively strong rod, an externally flanged tube secured to such rod, said tube being impervious to electrolytes and both the tube and rod being electrical conductors, and a filling impervious to an electrolyte in the base of the tube under the rod.
4. The combination in an anode support with a holder adapted to be fastened to a supporting bar and electrical conductor, of an electrical conducting tube closed at the base and adapted to carry anodes, such tube being impervious to electrolytes, and an electrical conducting rod which is comparatively strong inserted in said tube and secured thereto, said rod at its upper end projecting above the tube and being adapted to be engaged with and disengaged from sald holder.
5. The combination in an anode support with a holder adapted to be fastened to a supporting bar and electrical
conductor and having a longitudinal slot therein with a recess at the top, of an electrical conducting tube closed at

the base and adapted to carry anodes, such tube being impervious to electrolytes, an electrical conducting rod, which is comparatively strong, inserted in said tube and secured thereto, said rod at its upper end projecting above the tube and being adapted to enter and leave the slot in said holder, and a removable nut at the top of the rod, having a part receivable in the aforesaid recoss.

No. 102,565. Method of Removing Metallic Coating From Sheet Metal.
Wéthode dentecer la couche métallique des feuilles de métal.

Olin Stephen Fellows and Archibald Elmer Hopkins, Middletown, New York, U.S.A., 11th December, 1906; 6 years. Filed 7th July, 1906. Receipt No. 137,536.
Claim.-1. The method of removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened on the sheet metal, which consists in remelting the set or hardened excess of metallic coating in situ, and then positively removing the said remelted excess from the sheet metal.
2. The method of removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened on the sheet metal, which consists in remelting the set or hardened excess of metallic coating in situ, and then positively removing the said excess of metallic coating from the sheet metal by a fluid blast.
3. The method of removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened on the sheet metal, which consists in remelting the set or hardened excess of metallic coating in situ, and then positively removing the said remelted excess from the sheet metal by a plurality of fuld blasts.

\section*{No. 102,566. Method of Remoring Metallic Coating From Sheet Metal.}

Olin Stephen Fellows and Archibald Elmer Hopkins, coinventors, both of Middletown, New York, U.S.A., 11th December, 1906; 6 years. Filed 7th July, 1906. Receipt No. 137,597.
Claim.-1. The method of removing superfiuous metallic coating from sheet metal after the coating has been applied and positively set or hardened upon the surface of the sheet metal, which consists in remelting the set or hardened excess of metallic coating in situ, and then positively removing the remelted excess of coating by means in direct positive contact therewith.
2. The method of removing sunerfluous metallic coating from shcet metal after the same has been coated and the coating positively set or hardened upon the surface of the sheet metal, which consists in remelting the set or hardened cxcess of metallic coating in situ, and then positively removing the remelted excess of coating by brushing.

No. 102,567. Means of Removing Metallic Coating From Sheet Metal.

Olin Stephen Fellows and Archibald Elmer Hopkins, coinventors, both of Middletown, New York, U.S.A., 11th December. 1906; 6 years. Filed 7th July, 1906. Receipt No. 137,538.
Claim.-1. In apparatus for removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened on the latter, means for applying heat to such excess of metallic coating to remelt the same and liquate it in situ, and means for forcibly removing such liquated excess of metallic coating from the surface of the sheet metal.
2. In apparatus for removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened on the latter, means for applying heat to such excess of metallic coating to remelt the same and liquate it in situ. and means for directing a fluid blast against such liquated excess of metallic coating for the purpose of removing it from the surface of the sheet metal.
3. In apparatus for removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened on the latter, means for applying heat to such excess of metallic coating to remelt the same and liquate it in situ, and means for directing a plurality of fluid blasts against such liquated excess of metallic coating for the purpose of removing it from the surface of the sheet metal.

\section*{No. 102,568. Means of Removing Metallic Coating} From Sheet Metal.
Méthote d'enlever la couche métallique des ícuilles de métal.

Olin Stephen Fellows and Archibald Elmer Hopkins, coinventors, both of Middletown, New York, U.S.A., 11th December, 1906; 6 years. Filed 7th July, 1906. Receipt No. 137,599.
Claim.-1. In apparatus for removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened, the combination of means for applying heat to the set or hardened excess of metallic coating in such manner as to liquate the same in situ, and mechanical means for positively contacting with and removing said liquated excess of metallic coating from the sheet metal plate.
2. In apparatus for removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened, the combination of means for applying heat to the set or hardened excess of metallic coating in such manner as to liquate the same in situ, and a brush arranged to positively remove sald liquated excess of metallic coating from the sheet metal plate.
3. In apparatus for removing superfluous metallic coating from sheet metal after the same has been coated and the coating positively set or hardened, the combination of means for applying heat to he set or hardened excess of metallic coating in such manner as to liquate the same in situ, and a plurality of brushes arranged to positively remove said liquated excess of metallic coating from the sheet metal plate.
No. 102,569. Carbureter. Carburatcur.

Robert H. Gray, Columbla, Missouri, U.S.A., 11th December, 1906; 6 years. Filed 2nd November, 1906. Receipt No. 140.858.

Claim.-1. The combination of a burner, a source of fuel supply, a carbureter connected with the source and burner
for supplying imflammable gas to the latter, means in the carbureter comprising separate valves at the inlet and outlet ends thercof for retaining a supply of gas in the carbureter, means for controlling the supply of fuel from the tank to the carbureter, and a mechanism for simultaneously actuating both of the said means.
2. The combination of a burner, a source of fuel supply, a carbureter connected with the source and burner for supplying inflammable gas to the latter, separate valves at the inlet and outlet ends of the carbureter, means for opening and closing the valves simultaneously, a valve for controlling the supply of fuel to the carbureter, and a device connected with the valve and said means for opening or closing the fuel controlling valve and valves of the carbureter together.
3. The combination of a burner, a source of fuel supply, a carbureter connected with the source and burner for supplying infiammable gas to the latter, a valve hetween the source and carbureter, two valves in the carbureter for retaining a supply of gas therein, and mechanism exterior of the carbureter for actuating the three valves simultaneously.
4. The combination of a burner, a source of fuel supply. a carbureter connected with the source and burner for supplying inflammable gas to the latter, a reciprocating device in the carbureter for retaining and releasing a supply of gas in and from the same, a rotatable valve intermediate the carbureter and source of supply for controlling the flow of fuel, and a mechanism for actuating the said device and valve simultaneously.
5. The combination of a burner, a source of fuel supply, a carbureter connected with the source and burner for supplying inflammable gas to the latter, a reciprocating device in the carbureter for retaining and releasing a supply of gas in and from the same, a needle valve arranged exterior to the carbureter to control the supply of fuel from the source to the carbureter, a mechanism between the stem of the valve and the device arranged to cause the latter to release the supply of sas simultaneously with the opening of the needle valve and to retain a supply of gas when the necdle valve is closed, and means for actuating the needle valve.
6. The combination of a burner, a source of fuel supply, a carburcter connected with the source and burner for supplying inflammable gas to the latter, inlet and outlet ports in the carbureter, connected valves controlling the ports, a valve arranged intermediate the source and carbureter, and a lever arranged intermediate the Jatter valve and the valves of the carbureter whereby all of the valves are opened and closed simultaneously.
7. The combination of a burner, a source of fuel supply, a carbureter connected with the source and burner for supply. ing inflammable gas to the latter, inlet and outlet ports in the carbureter, connected valves controlling the ports, a valve arranged intermediate the source and carbureter, a lever, means on the stem of the last-mentioned valve for tilting the lever, and a link extending from the lever to a point within the carbureter and connected with the valves in the latter.
8. The combination of a burner, a source of fuel supply, a carbureter connected with the source and burner for supplying inflammable gas to the latter, inlet and nutlet ports in the carbureter, separate valves for the ports, a common valve stem, and a device extending from a point within to a point without the carbureter and connected with the stem for actuating the valves.
9. The combination of a burner, a source of fuel supply, a carbureter connected with the source and burner for supplying inflammable gas to the latter, inlet and outlet in the carbureter, separate valves for the ports, a common valve stem to which one valve is positively connected and the other loosely connected, and means for actuating the valves.
10. The combination of a carbureter having separate ports, a valve at one of the ports for controlling the supply of mixture therefrom, a valve at the other port co-operating with the first to hold a charge of gas in the carbureter. means for simultaneously opening and closing the valves, \& stem to which the valves are connected, and diaphragms in the carbureter which guide the movement of the said stem.
11. The combination of a carbureter, a valve for controlling the supply of mixture therefrom, a valve co-operating with the first to hold a charge of gas in the carbureter, a valve stem in the carbureter to which the valves are attached, means exterior of the carbureter for actuating the valve stem, and a plurality of perforated diaphragms in the carbureter which serve to guide the movement of the stem.
12. The combination of a carbureter, a valve for controlling the supply of mixture therefrom, a valve co-operating with thie first to hold a charge of gas in the carbureter to which one valve is positively connected, a lost motion connection between the other valve and the stem, and means for actuating the valve stem.
13. The combination of a carbureter chamber, ports at opposite ends thereof, a plurality of gauze diaphragms in the chamber which are provided with central perforations, a valve stem guided by the perforations of the diphragm. valves on the opposite ends of the stem arranged to close and open the ports simultaneously, and a device for imparting motion to the valve stem.
14. The combination of a carbureter chamber, a partition dividing the chamber into separate compartments, a port in the partition, separate inlets for air and fuel leading to one of the compartments. a plurality of diaphragms in the other compartment. an outlet port, a valve for the latter, a valve controlling the port in the partition, a stem connected with the valves to close and open them simultaneously, and means connected with the stem for actuating the same.

No. 102,570. Spring Bed. Lit d ressort.

John Henkel, Montreal, Quebec, Canada, 11th December, 1906; 6 years. Filed 26th May, 1906. Receipt No. 136,285.
Claim.-1. A spring bed comprising a bottom frame, a top frame, springs between such frame, and a pair of diagonal braces disposed in V-form with their converging ends pivotally connected to a common point upon one frame and their separated ends connected to the other frame for preventing lateral displacement of the top frame relatively to the bottom frame, substantially as described.
2. In a spring bed, an open top irame with longitudinal bars adjacent to the side bars thereof and transverse bars adjacent to the end bars thereof, an open bottom frame, a pair of diagonal braces in \(V\)-form at each end of the bed, means connecting such braces at their apices to the middle of the bottom frame adjacent to the ends of the said frame, means connecting the opposite ends of the said braces to the bars of the upper frame, and springs located between the top and bottom frames, substantially as described and for the purpose set forth.
3. In a spring bed the combination with bars extending at right angles to each other, of means of connection consisting of a notch \(f\) and a staple \(g\) straddling one of the bars and riveted into the other, substantially as described and for the purpose set forth.
4. In a spring bed the combination with a bar having its side edge uppermost, of an angular bracket riveted to the said bar with the inner side of its vertical flange in contact with one of the flat sides of such bar and its horizontal flange extending over and lying upon the said side edge of the latter, substantially as described and for the purpose of connecting a spring to the said bar.
5. In a spring bed the combination with a bar e, of a bracket \(p\), substantially as described.
6. In a spring bed the combination of bars \(b\), bars \(c\) bent at \(c^{1}\), bars \(d\) bent at \(d^{1}\) bars \(e\) notched at \(f\), staples \(g\), frame \(k\) with rounded corners \(k^{1}\), bars \(k^{2}\) bars \(k^{2}\), braces \(m\), brackets \(n\), colled springs \(n\) brackets \(p\), and stays 0 , substantially as described and for the purpose set forth.

No. 102,571. Railway Eignal.
Signal de chemine de for.

Albert J. Hitch, Ridgetown, Ontario, Canada, 11th December, 1906; 6 years. Filed 2nd December, 1905. Receipt No. 130,641.
Claim.-1. In a railway signalling apparatus, a casing provided with openings therein, fixed indicators adapted to be viewed through the openings, movable indicators adapted to cover the openings, resilient means adapted to normally maintain the movable indicators over the openings, and electrically operated means for moving the movable indicators.
2. In a rallway signalling apparatus, a casing provided with openings therein, fixed indicators within the casing, movable indicators disposed within the casing, links connected to the movable indicators, levers connected to the links, resilient means for maintaining the movable indicators in elevated position, and means operated by the passage of a train and adapted to actuate the movable indicators to a lower position.
3. In a rallway signalling apparatus, a casing, fixed indicators within the casing. movable indicators adapted to cover the fixed indicators, levers connected with the movable indicators, brackets within the casing adapted to pivotally support the levers, springs adapted to normally elevate the movable indicators, means for overcoming the tension of the springs operated by the passage of a traln, and means for limiting the movement of the levers.
4. In a railway signalling apparatus, a casing, fixed indicators disposed within the casing, movable indicators adapted to cover the fixed indicators, levers adapted to support the movable indicators, resillent means normally maintaining the movable indicators in one position, means operated by the passage of a train adapted to actuate the levers to another position, and brackets within the casing adapted to limit the movement of the levers.
5. In a rallway signalling apparatus, a casing, indicating members in the casing, resilient means for maintaining one of the indicators in one position, means for moving one of said indicators, electrical connections to said means, casings adapted to receive the ends of said electrical connections, means for resiliently supporting the ends of the casings, and means for maintaining the ends of said connections out of contact with each other.
6. In a rallway signalling apparatus, indicating members, clectrical means adanted to move some of said indicating members, wires forming a circuit to said electrical actuating means, a lower casing adapted to receive the end of one of sald wires, resillent means for supporting said casing, an upper casing disposed on the lower casing and adapted to receive the other of said wires, and springs disposed between said upper and lower casings adapted to normally maintain the ends of said wires apart.
7. In a rallway signalling apparatus, indicating members, electrical means adapted to move some of said Indicating members, wires forming a circuit to sald electrical actu-
ating means, a lower casing adapted to receive the end of one of said wires, an upper casing disposed on the lower casing and adapted to recelve the other of said wires, resilient means for supporting the lower casing, springs disposed between said upper and lower casing adapted to normally maintain the ends of said wires apart, and a resilient support for said lower casing.
8. In a railway signalling apparatus, indicating means, electrical means for operating said indicating means, which electrical means are disposed in electrical circuits normally open, and means for maintaining the ends of said circuits apart comprising a lower casing provided with binding posts, springs disposed on the ends of said lower casing, plates adapted to receive the thrust of said springs, bolts connecting said plates and said casing, an upper casing disposed on the lower casing, and provided with collars on its under surface, binding posts carried by the upper casing, screw-threaded rods carried by the lower casing, and helical springs disposed on said screw-threaded rods.
9. In a rallway signalling apparatus, the combination comprising a casing having the names of stations thereon, and having thereon the representation of the track on which the stations are situated, fixed indicating members adjacent the names of the stations, movable indicating members, and means adapted to be actuated by the passage of a train for moving the movable indicating members to cover the fixed indicating members and to indicate on the casing the position of a train on the tracks with relation to the station names.
10. In a rallway signalling apparatus, the combination comprising a casing having indicated thereon a railway track, and having indicated thereon the stations, switches, and sidings on the track, indicating members arranged to correspond to the stations, the sidings and the switches on the track, and means for operating the indicating members by the passage of a train to denote on the casing the corresponding position of a train on the tracks.
11. In a railway signalling apparatus, the combination comprising a casing having indicated thereon a railway track, and having indicated thereon the stations, switches, and sidings on the track, indicating members arranged to correspond to the stations, the sidings and the switches on the track, and means for operating the indicating members by the passage of a train to denote on the casing the corresponding position of a train on the tracks, and to denotn on the casing the condition of the switches and sidings.

\section*{No. 102,572. Copper Prodncing Process.}

Procédé pour l'extraction du cuivre des mincrais.
Lucien Juman, Paris, France, 11th December, 1906; 6 ycars. Filed 18th July, 1906. Rrecint No. 137,933.
Claim.-1. A process for obtaining simultaneously pure copper and sulphuric acid which consists in heating a solution of a salt of copper in a closed vessel under pressuro in presence of sulphurous acid.
2. A process for obtaining simultaneously pure copper and sulphuric acid which process consists in heating a solution of a salt of copoer in a closed vessel under pressure in prescnce of a sulphite.
3. \(\Lambda\) process for obtaining simultaneously pure copper and sulphuric acid which consists in subjecting a solution of a salt of copper to a preliminary purification to eliminate the precious metals which it contains, the said purification bring effected by treating the said solution with sulphurous acid at a raised temperature and under ordinary pressure, in scparating from the solution the precious metals thus precipitated, in treating the purified solution with sulphurous acid or with a sulphite in a closed vessel under pressure, and in transforming into pure massive copper the copper thus precipitaled by melting it or compressing it.
4. A process for obtaining simultaneously pure copper and sulphuric acid, which prccess consists in heating a solution of a salt of copper in a closed vessel under pressure in presence of sulphurous acid or a sulphite, in compressing the copper thus precipitated into the form of briquettes and in using these briquettes as anodes in ordinary clectrolytic refining vats to ellminate the precious metals which were contain d in the solution subjected to the process.

\section*{No. 102,573. Carbonizing Apparatus.}

\section*{Apparcil d̀ carboniser.}

Rolof Jüreensen. Prag-Uzkon, Austria, 11th December, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,266.
Claim.-1. A coking furnace consisting of a carbonizing chamber, a cooling chamber and a drying chamber, said carboniziog chamber being in interrupted communication with the chambers, and means for automatically discharging
the contents of the same, consisting of a bottom inclined towards the cooling chamber, in combination with a slide door arranged at the bottom thereof and at its outlet.

2. A coking furnace consisting of a carbonizing chamber, a cooling chamber and a drying chamber, said cooling chamber nrovided with a plurallty of radiation pipes through which the non-condensed and cooled products of distllation are nassed and which pipes are in communication with the furnace.
3. A coking furnace consisting of a carbonizing chamber, a cooling chamber and a drying chamber, said cooling chamber being provided with a plurality of radiation pipes through which the non-condensed and cooled products of distillation are passed and which are in communication with the furnace. the said drying chamber being further provided with a plurality of channels opening to the atmospheric air for further cooling the coke.
4. \(\Lambda\) coking furnace consisting of a carbonizing chamber, a cooling chamber and a drying chamber, said carbonizing chamber bring provided with a plurality of heating plpes extending horizintally or nearly horizontally through the lower part of the sald chamb \({ }^{\circ} \mathrm{r}\) and befng in communication elther with a suitab!e furnace and with the drying chamber.

No. 102,574. A Furnace for Redncing Metals.
Fournaise pour réduirc les métaux.

Fredrik Adolf Kjellin, Stockholm, Sweden, 11th December, 1906; 6 years Filed 12th September, 1906. Receipt No. 139.454.

Claim.-1. A method of reducing metals or metalloids from their combination by introducing the reducing agent and the substance to be reduced in separate compartments of a furnace, divided in several such communicating compartments in such a manner that the said agent and the said substance will come in contact only thereby, that the reducing agent in one compartment dissolves itself in the molten bath of the reduced substance in that compartment and in such a dissolved form reduces the metal or the metalloid from its comblnation in another compartment of the furnace.
2. A furnace for reducing metals or metallolds from their combinations consisting of a receptacle divided in several compartments by one or s?veral partitions, dipping into the molten composition which is to be reduced and which is floating upon the molten bath of the substance already reduced for the purpose of preventing the direct contact of the substances, fed to the different compartmens and intended to act upon one another.

\section*{No. 102,575. Electric Resistance Furnace.}

Fournaise ì rísistance électrique.

Fredrik Adolf Kjellin, Stockholm, Sweden, 11th December, 1906; 6 years. Filed 12th September, 1906. Receipt No. 139,460.
Claim.-1. An improved electric furnace containing heating channels with enlarged portions or communicating with separate receptacles for the material to be treated, characterized by the fact that the said material continually or with short intervals is forced through the said heating channels, for the purcose of carrying the heat from the heating channels to the other parts of the furnace.
2. An improved elcctric furnace containing heating channels with enlarged portions or communicating with separate receptacles for the material to be treated, in combination with means for giving the said furnace an oscillating or rocking movement, for the purpose of forcing the material through the heating channels.
3. An improved electric furnace containing heating channels with enlarg d portions or communicating with separate receptacles for the material to be treated, in combination with a refractory body, which is intermittently forced down into the molten material for the purpose of putting it through the channels.
4. An improved electric furnace containing heating channels with enlarged portions or communicating with separate receptacles for the material to be treated, in combination with a refractory body immersed in the molten material and having a movement along the channel or channels, the heating channel proper eventually being formed of the space between the sald body and the walls and bottom of the channel.
5. An improv d electric furnace containing heating channels with enlarged portions or communicating with separate receptacles for the material to be treated, characterized by the fact that the hottom of the channels is inclined, making the deepness of the channel or channels least in the places where the bottom is highest, and that the furnace is combined with means for imparting to it a rotating movement on an inclined axis, so that new portions of the material to be treated are continuously forced through the shallowest part of the chanuels

6 An lmproved electric furnace containing heating channels with enlarged portions or communicating with separate receptacles for the material to be treated, characterized by the fact, that between the heating channels and the enlarged portions or receptacles are arranged partitions of refractory material, immersing into the slag formed during the process, for the purpose of preventing the said slag from entering from the one receptacle to the other or to the heating channels.
7. A process of carrying out metallurgical operations in electric furnaces containing heating channels with enlarged portions or communicating with separate receptacles for the material to be treated, characterized by the fact that the said material is acted upon by different substances in the different receptacles or enlargements in such a manner that the said substances may act upon the material in the most advantageous manner and during the most favourable conditjons.
8. In electric furnaces containing heating channels with enlarged portions or communicating with separate recep-
tacles for the material to be treated, a process of forcing the material through the said channels consisting therein that the gases contained in the enlargements or receptacles above the treated material are intermittently subjected to a varying pressure.

No. 102,576. Feed Water Heater.
Chauffcur d'rau d'alimentation.

John McQuat Mackie, Montreal, Quebec, Canada, 11th December, 1906; 6 years. Filed 12th July, 1906. Receipt No. 137,742.
Claim.-1. A feed water heater comprising a casing or shell consisting of a cylindrical member \(b\) with flanged ends and means for effecting a communication with a steam supply, \(a_{n}\) end or header \(g\) having opening \(j\) and stuffing box \(k\), a base \(m\) with openings \(o, p\) and \(q\), stuffing boxes \(r\) and \(r^{2}\), brackets 8 , and drip pipe 20 , and a feed water receptacle within such casing or shell and consisting of a pair of members 2 and 7 , perforated plates 4 and 11 , and pipes 13, 15, 16 and 20 , substantially as described and for the purpose set forth.
2. A feed water heater comprising a casing or shell consisting of a cylindrical member \(b\) with flanged ends and means for effecting a communication with a steam supply, an end or header \(g\) having opening \(j\) and stuffing \(k\), a base \(m\) with openings \(0, p\) and \(q\), stuffing boxes \(r\) and \(r^{1}\), brackets s, and drip pipe 20 , and a feed water receptacle within such casing or shell and consisting of a pair of hemi-spherical members 2 and 7, perforated plates 4 and 11, and pipes 13, 15,16 and 20 , and deflector 10 , substantially as described and for the purpose set forth.
3. A feed water heater comprising a casing or shell consisting of a cylindrical member \(b\) with flanged ends and openings \(c\) and \(f\) for effecting a communication with a steam supply, an end or header \(g\) having opening \(j\) and stuffing box \(k\), of a base \(m\) with openings \(o, p\) and \(q\), stuffing boxes \(r\) and \(r^{1}\), brackets \(s\), and drip pipe 20 , and a feed water receptacle within such casing or shell and consisting of a pair of arciform members 2 and 7, perworated blades 4 and 11, pipes \(13,15,16\) and 20 , and deflector 10 , substantially as described and for the purpose set forth.
4. A feed water heater comprising a casing or shell consisting of a cylindrical member \(b\) with flanged ends and means for effecting a communication with a steam supply, anend or header \(g\) having openings \(j\), stuffingbox \(k\), and safety valve \(i\), a base \(m\) with openings \(o, p\) and \(q\), stuffing boxes \(r\) and \(r^{2}\) brackets 8 , and a drip pipe 20 , and leed water receptacle within such casing or shell and consisting of a pair of arciform members, 2 and 7 , perforated plates 4 and 11, pipes \(15,15,16\) and 20 , and deflector 10 , substantially as described and for the purpose set forth.
5. A feed water heater casing or shell consisting of a cylindrical member \(b\) with flanged ends and openings \(e\) and \(f\) for effecting a communication with a stenm supply, an end or header \(g\) having opening \(j\) and stuffing box \(k\), an end \(m\) with openings \(o, p\) and \(q\), stuffing boxes \(r\) and \(r^{1}\), brackets 8 , and drip pipe 20, substantially as described and for the purpose set forth.
6. A feel water receptacle for use within a rasing or shell and consisting of a pair of arciform members 2 and 7 , per forated plates 4 and 11, pipes \(13,15,16\) and 29 , and deflector 10. substantially as described and for the purpose set forth.
7. A feed water heater casing or shell consisting of a cylindrical member \(b\) with flanged ends and openings \(c\) and \(f\) for effecting a communication with a steam supply, an end or header \(g\) having opening \(j\) and stuffing box \(k\), an end \(m\) with openings \(o, p\) and \(q\), stuffing boxes \(r\) and \(r^{1}\), and a drip pipe 20, substantially as described and for the purpose set forth.
8. A feed water receptacle for use within a casing or shell and consisting of a pair of arciform members 2 and 7, perforated plates 4 and 11 , and pipes \(13,15,16\) and 20 , substantially as described and for the purpose set forth.
9. A feed water heater having an outer casing forming a steam chamber with steam connections and a feed water receptacle located within the steam chamber, and provided with inlet and outlet, said casing and receptacle being constructed independently of each other so that the complete feed water receptacle can be bodily removed without disturbing the steam connections, openings through the casing and connections with the inlet and outlet of the receptacle passing through such openings, substantially as described.
10. A feed water heater having an outer casing forming a steam chamber with inlet and outlet and a feed water receptacle located within the steam chamber and provided with inlet and outlet, openings through the casing and connections with the inlet and outlet of the receptacle passing through said openings, there being a complete clearance between said casing and receptacle except at said inlet and outlet connections, substantially as described.

No. 102,577. Method of Regulating Furnaces. Méthode de régulariser les fournaises.

Embury McLean, New York City, New York, U.S.A., 11th December, 1906; 6 years. Filed 29th August, 1906. Recelpt No. 139,088 .
Claim.-1. The method of regulating furnaces which consists in maintaining in the furnace chamber a substantially sists in main pressure under varying rates of combustion.
2. The method of regulating furnaces which consists in maintaining in the furnace chamber a pressure substantimally equal to atmospheric pressure under varying rates of combustion.
3. The method of regulating furnaces, which consists in supplying air to the furnace at different rates of delivery and simultaneously discharging gases from the furnace in quantities proportioned to said different rates of delivery, quaneby a substantially uniform pressure is maintained in Whereby a urnace under varying rates of combustion
4. The method of regulating furnaces, which consists in supplying air to the furnace at a pressure above that of the atmosphere and at different rates of delivery and simularmos the furnace in quantities taneously discharging gases irom the fortioned to said different rates of delivery, whereby a substantially uniform pressure is maintained in the furnace under varying rates of combustion.

\section*{No. 102,578. Apparatus for Cleaning and Dyeing Wool, Eitc.}

Appareil pour nettoyer ct teindre la laine, etc.
Maude Nicholas, London, England, 11th December, 1906; 6 years. Filed 30th June, 1906. Receipt No. 137,450.
Claim.-The improved construction of apparatus for cleaning, dyeing, or otherwise treating wool, textile fabrics and other like material, consisting of a cylinder capable of being sealed and containing two perforated plungers held at a distance apart by a rod or rods, and means for reciprocating such plungers, the goods to be treated being con-
tained between the plungers, so that the cleaning agent is caused to pass to and fro through and between the material

when the plungers are reciprocated, substantially as set forth.

No. 102,579. Disc Grinder. Disque d polir.

John M. Ross and John S. Riddle, co-inventors, both of Frobisher, Saskatchewan, Canada, 11th December, 1906; 6 years. Filed 18th May, 1906. Receipt No. 136,053.
Claim.-1. An improved disc grinder comprising a revolving grinding wheel, a disc supporting shaft, a disc thereon, gravity held in contact with the grinding wheel, means for adjusting the position of the shaft and means for holding the same in any adjusted position, as and for the purpose specified.
2. An improved disc grinder comprising a revolving grinding wheel, a disc supporting shaft disposed slightly to one side of the grinding wheel whereby rotation of the latter in contact with the disc on the shaft will rotate the disc, means for adjusting the position of the shaft, a disc thereon, gravity held in contact with the grinding wheel, and means for holding it in any adjusted position, as and for the i) urpose specified.
3. An improved disc grinder comprising a revolving grinding wheel, a disc supporting shaft, a disc tbereon, gravity held in contact with the grinding wheel, means for tilting the shaft, means for moving it nearer to or farther from the grinding wheel and means for holding it in any adjusted position, as and for the purpose specifled.
4. An improved disc grinder comprising a revolving gitno ing wheel, a disc supporting shaft, a disc at the top theref

gravity held in contact with the grinding wheel, means for adjusting the position of the same, means for holding the same in any adjusted position and a lever for raising said shaft, as and for the purpose specifled.
5. An improved disc grinder comprising a grinding wheel, means for rotating the same, a disc supporting shaft, a dise at the top thereof, gravity held in contact with the grinding wheel and a frame supporting the shaft with freedom of vertical movement, means for tiltably supporting the frame and means for holding the frame in any tilted position, as and for the purpose specified.
6. An improved disc grinder comprising a grinding wheel, means for rotating the same, a disc supporting shaft, a disc, gravity held in contact with che grinding wheel, a frame supporting the shaft with freedom of vertical movement. means for tiltably supporting the frame, means for holding the frame in any tilted position, means for moving the frame nearer to or farther from the grinding wheel and means for holding the frame in any adjusted position, as and for the purpose specifled.
7. An improved disc grinder comprising a grinding wheel, means for rotating the same, a tiltably supported frame, a shaft slidably supported therein, a disc at the top thereof, gravity held in contact with the grinding wheel and means for holding the shaft in any position to which•it has been adjusted relative to the rame, as and for the purpose specified.
8. An improved disc grinder comprising a grinding wheel, means for rotating the same, a disc supporting shaft, a frame supporting the same, a tenon on the frame, a plate, a plurality of radial grooves therein adapted to be engaged by said tenon, as and for the purpose specified.
9. An improved disc grinder comprising a grinding wheel, means for rotating the same, a disc supporting shaft, a frame supporting the same, a tenon on the frame, a plate, a plurality of radial grooves therein adapted to be engaged by said tenon, means for moving the plate nearer to or farther from the grinding wheel and means for holding it in any adjusted position, as and for the purpose specifled.
10. An improved disc grinder comprising a grinding wheel; means for rotating the same, a shaft slidably supported therein, means for pivotally supporting the frame, means for holding the frame in any position to which it has been adjusted, a lever pivoted to the frame having a slot therein through which the shaft extends, a collar adjustably secured in the shaft and means for holding the lever in a predetermined position, as and for the purpose specified.
11. An improved disc grinder comprising a grinding wheel, means for rotating the same, a frame, a shaft slidably supported thereln, means for pivotally supporting the frame, means for holding the frame in any position to which it has been adjusted, a lever pivoted to the frame having a slot therein through which the shaft extends, a collar adjustably secured in the shaft, a spring-held dog pivoted to the lever normally engaging the frame, and means operable from the end of the lever for removing the dog from ongagement with the frame, as and for the purpose specifled.
12. An improveci disc grinder comprising a suitable base, a shaft horizontally supported on the top thereof, a grinding wheel on the same, means for rotating the shaft, a bar laterally extending from one side of the base, a plate slidably secured thereon, means for holding the plate in any padjusted position, a plurality of radial grooves in said plate, a prame, a tenon thereon engaging the grooves in the plate, a shaft slidably supported in the frame and means for holding the shaft in any position relative to the frame, as and for the purpose specified.
13. An improved disc grinder comprising a suitable base, a shaft horizontally supported on tod thereof, a grinding wheel on said shaft, means for rotating the shaft, a bar laterally extending from one side of the base and having a longitudinal groove therein, a plate having a plurality of radial grooves therein, a \(\mathbf{U}\)-shaped frame, a tenon thereon adapted to engage the grooves in the plate, a bolt extending through said frame, plate and blot in the bar, a disc supporting shaft extending through the arms of the frame, an adjustable collar thereon, a lever pivoted to the shaft having a slot therein through which the shaft extends and a spring-held dog on said lever engaging the lower arm of the frame, as and for the purpose specified.

\section*{No. 102,580. Boat. Bateau.}

Karl Joseph Seck, Malnz-on-the-Rhine, Germany, 11th December, 1906: 6 years. Filed 12th December, 1905. Receipt No. 120,929.
Claim.-1. A boat composed of \(t\) win boats coupled together by bridge pleces, a plank in the center midaway between the boats, one or more paddle bars rotatably mounted on said plank, and adapted to be oscillated from one hand bar
located at the center of the boat, means connecting sald hand bar with the said paddle bars, and paddles at the ends

of the said paddle bars, substantially as and for the purposes set forth.
2. A bcat composcd of two koats coupled together by bridge pieces, a plank in the center midway between the twin boatst, one or more paddle bars rotatably mounted on said plank, a hand bar pivoted at the center of the boat to the said plank, means for connecting said hand bar with said paddle bars, paddles trunnioned to the ends of the paddle bars and back stops for said paddles, substantially as and for the purposes set forth.
3. A boat composed of two boats coupled together by bridge pleces, a plank in the center midway between the twin boats, one or more paddle bars rotatably mounted on said plank, a stud occured in the center of the sald plank, a sprocket whet for each paddle bar mounted on said stud, a hand bar also mounted on said stud and engaging the said notches of the disc, means for coupling the said sprocket wheels to said disc and means for transmitting motion from the hand bars to sald gaddle bars, substantially as and for the purpose set forth.
4. A boat composed of twin boats coupled together by bridge pleces, a plank in the center midway between the twin boats, one or more paddle bars rotatably mounted on sald plank, a stud provided at the center of the boat in the plank, a sprocket wheel for each paddle bar mcunted on said stud, a disc provided with a rim, and notches mounted on said stud, a hand bar fitting over said stud and adapted to eneage certain of said notches, a coupling pin between the sprocket wheels and the said disc, means to impart motion from the sprocket wheels to the said paddle bars, a paddle on each end of said paddle bars, a back stop for each paddle, and means for maintaining the paddles in effcient position while the paddle bars are oscillated, substantially as and for the purpose set forth.
5. In a boat having one or more paddle bars substantially as described, the combination with shafts mounted in journals at each end of the bars, of paddles trunnioned to the said shaft, a back stop formed on said shaft and paddle, and means for maintaining the paddles in effective position, substantially as and for the purposes set forth.
6. A boat composed of twin boats coupled together as described, in combination with steering mechanism, comprising a rudder adapted to be swung about a horizontal pivot, and means for op rating the said rudder as described.
7. A boat composed of twin boats coupled together as described, a pivotfd hand bar, paddle bars and paddles, means for cperating said paddle bars, in combination with an anchor, means for raising said anchor and connections between said hand bar and said means for raising said anchor, substantially as and for the purposes set forth.
8. In a boat, a pivoted hand bar, paddle bars and paddles, mears for operating said paddle bars, a steering mechanism, comprising a rudder adapted to be swung about a horizontal pivot, and means for operating the said rudder.

\section*{No. 102,581. Disintegrating, Washing and Screen-} ing Machine.
Machine pour désagréger, laver et sasser.
Charles Blades Coverdale Storey, Lancaster, England, 11th December, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,561.
Claim.-1. Apparatus for treating ores or the like so that a portion of the larger, solid particles are sucessively removed and the softer particles are successively ground or abraded by the harder particles of similar size, comprising means for agitating. the agitating means and screens being alternately arranged, means for removing the reject or each screen and means for conveying the material, passing through each screen, to the successive agitating means.
2. Apparatus for treating ores or the like comprising a number of cylinders, screens on said cylinders, means for
rotating said cylinders, means in said cylinders for agitating and conveying the ore, means for removing the reject of each screen and means for delivering to the successive cylinder the material which passes through each scereen.
d. Apparatus for treating ores or the like comprising a number of cylinders, screens on said cylinders, means for rotating the cylinders, means in the cylinders for agitating and conveying the ore, means for introducing liquids to the cylinders, means for removing the reject from each screen, and means for delivering the solid and liquid material, passing through each screen. to the successive cylinder.
4. Apparatus for treating, ores or the like comprising a number of cylinders, screens on said cylinders, means for rotating the cylinders, means in the cylinders for agitating and conveying the ore, means for introducing chemicals to tho cylinders, means for removing the reject from each screen, and means for delivering the material passing through each screen to the successive cylinder.
5. Apparatus for treating ores or the like comprising a number of cylinders, screens on the cylinders, means for rotating the cylinders, means in said cylinders for raising and dropping the material for the purpose of aerating the same, means for removing the reject of each screen, and means for conveying the material, passing through each screen, to the successive cylinder.
6. Apparatus for treating ores or the like comprising a number of nested cylinders, means for rotating said cylinders, screens on the alternate cylinders, means for removing the reject of each screen, and means in the cylinders for agitating the material, each screen being adapted to deliver into the succeeding cylinder the material passing through it.
4. Apparatus for treating ores or the like comprising a number of nested cylinders, screens on the alternate cylinders, baffles in all the cylinders, means for delivering the material successively from one cylinder to the next, means for rigidly connecting all the cylinders. rollers for supportfor rigidly connecting aller, a worm wheel on the latter and ing the outermost cylinder, a worm whe andially and for the pura worm meshing therewith.
poso hereinbefore set lieating ores or the like comprising a
8. Apparatus for treating orenical ends on the alternate series of nested cylinders, conical ends of said cylinders, cylinders, screens at the opposiers immediatcly below said conical ends on the othe cylinders, radial bolts and distance screens, baffles in all the cyling all the cylinders. means for sleeves for rigidly connecting ander and means for rotating sle the same.
No. 102,582. Steel Manufacture. Fabrication d'acier. John Watson Spencer, Newcastle-on-Tyne, England, 11th December, 1906; 6 years. Filed 3rd August, 190 . Recipt No. 117,153.
No. Naim. -The herein described process consin per centum to Claim. - The hereinmally containing from of the charge in a a charge of iron of carbon and maintaining molten mass modi\(\cdot 25\) per centum of and introducing into the produce a modicon to melted condition, a per centum of silicing steel and the like. per centum to two in making plar
No. 102,583. Brake. Frein. Morrison, assignee of a

ceipt No. 141,529 .

operating lever fulcrumed on one side of the bolster, and links connecting the convergently arranged ends of the op-

posite sets of levers to the operating lever above and below the pivotal connection of the latter.
2. In a brake mechanism, the combination of a car truck having a bolster, fulcrum blocks on opposite sides of the bolster, bell' crank brake levers fulcrumed to said blocks. each set of levers carrying brake shoes at their outer ends and having their inner ends convergently arranged and extending outwardly from the bolster, one set of levers having its converging ends extending upwardly at an angle above the plane of the bolster, an operating lever fulcrumed upon one side of the bolster, and links pivotally connecting the convergent ends of the brake levers to the operating lever above and below the pivotal connection of the latter, one set of links extending across the bolster.

\section*{No. 102,584. Axle for Grain Drills.}

L'ssiell pour semoir en ligne.

aseignee of mank Company, aseignee of Springield,
Sathe Oil American Seeding Machine Coorge Pates, all years. The Americanam, and Georger, 1906;
R. Packs. 18 th Decem No. 141,610. and with sup Ohio, U.S.A.j06. Receipt No. combination withependent November, 1906 . In in drill, the combineels of indepenardly Claim.-1. In a grain and carry wheels inclined gafingporting frame, seed box carrying whaft between shatiate for said portingle axles for an intermediannections arsale axicy and downwardly, and universal of said \(r\) and do axles, and univen of voluble termediate shaft a
tially as specife
 vices, a common for
vices, a axles for
pendent axsidy.
and downwar
axles. a countershaft arranged at right angles to said inclined shaft, a pinion on said countershaft engaging said gear disc, and driving connections between said countershaft and the common shaft of said fecding devices, substantially as specified.
3. In a grain drill, the combination with a supporting frame, seed box, seed feeding devices and carrying wheels, of an arched revoluble axle comprising an intermediate horizontal portion, and portions inclined downwardly and forwardly, and universal couplings between said intermediate portions and end portions, substantially as specified.

No. 102,585. Car Azle. Essicu pour chars.

Oscar Williams, William Mills, John Gray and William
Crozier, assignee of one-eighth of the interest, all of Charleston. Pennsylvania, U.S.A.. 18th December, 1906; 6
years. Filed 28th November, 1906. Receipt No.141,613.
Claim.-An axle comprising two axially aligned sections, each section being formed with spaced apart shoulders, the portions of each section intermediate the shoulders being tapered, the contiguous ends of the sections being formed with beads and the abutting ends of the beads being bevelled to form an oil channel, said contiguous beads being grooves to form oil passages in communication with said oil channel, and a sectional coupling clamped about the axle, the inner faces of each coupling section being formed with opposite tapering portions each embracing the tapering portion of each shaft section and confined between the spaced apart shoulders thereof, said coupling member being formed with an intermediate socket for the reception of the beaded contiguous ends of the shaft sections and being further formed with oil chambers in communication with the tapering portions for lubricating the engaging faces of the axle and coupling.

No. 102,586. Plough. Charrue.

Andrew W. Harpstrite, Moweaqua Illinois, U.S.A., 18th December, 1906; 6 years. Filed 22nd November, 1906. Recelpt No. 141,427.
Claim.-1. In a power propelled plough the combination with a frame and soil turning devices carried thereby, of an engine supported on said frame, means connecting said engine with a loose pulley, a shaft on which said loose pulley is mounted, a clutch mechanism for connecting said loose pulley and shaft, a pinion on said shaft, a gear with which said pinion is in mesh, a shaft driven by said gear, sprockets on said gear driven shaft, a traction wheel, a shaft on which said wheel is mounted, sprockets on said last-named shaft, and drive chains connecting said lastnamed sprockets with the sprockets on said gear driven shaft.
2. In a power propelled plough the combination with a frame, soll turning devices carried thereby, an engine and propelling devices driven by said engine, of a pair of axles mounted in the front part of said frame and hinged free to swing in a horizontal plane, wheels mounted on said axles, and steering mechanism for swinging said axles, said mechanism being made up of a bar unon each of sald axles, means for connecting the front ends of sald bars, a steering rod provided with a hub, and a chain wound around sald hub and having its ends connected to the rear ends of said bars.
3. In a nower propelled plough, the combination with a frame, soil turning devices carried thereby, an engine and propelling devices driven by said engine, of a pair of axles mounted in said frame, and means for ralsing and lowering said axles to level the plough.
4. The combination in a plough of a frame, axle members upon which said frame is supported, blocks in which said axle members are mounted, and screws for raising and lowering said blocks to level said frame.
5. Mechanism for raising and lowering the plough share comprising the combination of an operating lever, a shaft upon which said lever is mounted, a gear upon said shaft, a rack an mesh with which is said gear, and a ploughshare mounted on said rack.
6. Mechanism for raising and lowering a coulter comprising the combination of an operating lever, a shaft upon which said lever is mounted, a bell crank, a coulter carrying shaft in engagement with said bell crank, and means connecting said shaft with said bell crank.
7. Mechanism for raising and lowering the ploughshare and coulter comprising the combination of a shaft, means for turning said shaft, a gear on said shaft, a rack in mesh with said gear and secured to the ploughshare, a bell crank, a coulter carrying shaft attached to said bell crank, and means for connecting said shaft and coulter.
8. In a power propelled plough the combination with a frame, a ploughshare carried thereby and an engine mounted on said frame, of a traction wheel driven by said engine and mounted directly in rear of said ploughshare, whereby said wheel follows in the furrow last turned by said ploughshare 9. In a plough the combination of a frame, soil turnin~ devices carried thereby, a pair of axles for supporting said frame and mounted therein free to swing in a horizontal plane, and mechanism for raising and lowering said axles to level said frame.

No. 102,587. Plough. Charruc.

Robert Alven Armstrong, Avonmore. Ontario, Canada, 18th
December, 1906; 6 years. Filed 29th November, 1906. Receipt No. 141,656.
Clam.-1. In a plough the combination of the plough beam and plough downwardly extending from the rear end of same, of means for tiltably supporting the heam from the ground at substantially its center, as and for the purpose specified.
2. In a plough the combination with the plough beam and plough downwardly extending from the rear end of the same, of a transversely extending axle bar, wheels thereon, and means for tlltably connecting the beam to the axle bar at substantially the center of the beam, as and for the purpose specifled.
3. In a plough the combination with the plough beam and downwardly extending from the rear end of the same, of a transversely extending axle bar, wheels thereon, and means for tiltably connecting the beam to the axle at substantially the center of the beam, and means for raising and lowering the beam as a whole relatively to the axle bar, as and for the purpose specifled.
4. In a plough the combination with the plough beam and plough downwardly extending from the rear end of the same, of a transversely extending axle bar, wheels thereon, means for tiltably connecting the beam to the axle bar at substan-
tially the center of the beam, and means operable from the end of the plough beam for raising and lowering the beam as a whole relatively to the axle bar, as and for the purpose specified.
5. In a plough the combination with the plough beam and the plough downwardly extending with the rear end of the same, the axle bar, wheels on the same, of a ring pivoted to the bottom contacting with the axle bar, means for tilt ing the ring, and means for connecting the beam to the axle bar with freedom of vertical movement, as and for the purpose specifled.
6. In a plough the combination with the plough beam and plough downwardly extending from the rear end of the same, the axle bar and wheels thereon of a ring pivoted to the beam and contacting with the axle bar, means for tilting the ring, vertical extending standards secured to the axle bar and extending through a hole in the beam, as and for the purpose specified.
7. In a plough the combination with the plough beam and plough. the axle bar and the wheels thereon, of a vertivally extending standard secured to the axle bar and extending through a hole in the plough beam, and means for raising and lowering the plough beam relatively to the axle bar, as and for the purpose specified.
8. In a plough the combination with the plough beam and plough downwardly extending from the rear end of the same. a transversely extrnding axle bar. whecls thereon, means for tiltably connecting the beam thereto at substantially the center of the beam, and means for adjusting the wheels in position at each end of the axle bar, as and for the purpose specified.
9. In a plough the combination with the plough beam and plough downwardly extending from the rear end of the same, a transversely extending axle bar, wheels thereon, means for tiltably connecting the beam thereto at substantially the center of the beam, and means at the end of the axle bar for adjusting one wheel horizontally and the other wheel vertically, as and for the purpose specified.
10. In a plaugh the combination with the plough beam and plough downwardly extending from the rear end of the same, of a transversely extending axle bo… means for tiltably connecting the beam to the axle bar at substantially the center of the beam, levers journalling the end of the axle, stub shafts secured on said levers and which support the wheels, and means for holding the levers in any adjusted position, as and for the purpose specified.
11. In a plough the combination with the plough beam and plough downwardly extending from the rear end of thr same, the axle bar and the whecls, of means for tiltably connecting the beam to the axle bar at substantially the center of the beam, a lever pivoted intermediate of its length to one end of the axle, a stub shaft at the extremity of the lever supporting the whecl, means for holding the lever in any adjusted position, a sccond lever pivoted at its extremity to the opposite end of the axle bar, an arm integral therewith at substantially right angles thereto, a stub shaft secured to the end of the arm on which the wheel is supported, and means for holding said lever in any adjusted position, as and for the purpose specifled.
12. In a plough the combination with the plough beam and the plough downwardly extending from the rear end of the same, of means for tiltably supporting the beam from the ground at substantially its center, the point of the plough lying immediately below the pivoting point, as and for the purpose specified.
13. In a plough the combination with the plough beam and plough downwardly extending from the rear end of the same, of a transversely extending axle bar, wheels thereon, means for tiltably connecting the plough beam to the axle bar at substantially the center of the plough beam, the plough being so located that its point will lle substantially on the line joining the two wheels and immediately below the pivoting point of the beam, as and for the purpose specifled.

\section*{No. 102,588. Oven Door and Lamp Receptacle Therefor.}

\section*{Porte dc fourneau et reccptable pour lampe.}

Richard Horsley Castle, Toronto, Ontario, Canada, 18th December, 1906; 6 years. Filed 28th November, 1906. Receipt No. 141,600.
Claim.-1. The combination with the oven casing and door thereof located towards one end of the casing, of a recess located at the opposite end of the casing in the back plate and a lamp receptacle at the inner side of the recess provided with a transparent inner window, as and for the purpose specified.
2. The combination with the oven casing and door thereof located towards one end of the casing, of a recess located at the opposite end of the casing in the back plate and a lamp receptacle at the inner side of the recess provided

With a transparent inner window and a cover hinged to the casing, an arc-shaped arm pivotally connected to the cover

and extending through a slot in the casing and provided with means for holding the cover in the raised position, as and for the purpose specified.
3. The combination with the oven casing and door thereof located towards one end of the casing, of a recess located at the opposite end of the casing in the back plate and a lamp receptacle at the inner side of the recess provided with a transparent inner window and a cover hinged to the casing and means for raising and lowering the cover, as and for the purpose specifled.

No. 102,589. Switch Signal. Signal à aiguille.

Prosper Clouticr, Three Rivers, Quebec, Canada, 18th December, 1906 ; 6 years. Filed 27th November, 1906. Receipt No. 141,590.
Olaim.-1. In a safety system for rallway switches the combination with the switch and operating mechanism therefor and the signalling device indicating the condition of the switch, of a locking device controlling with the switch and the signal and preventing independent action thereot.
2. In a safety signalling system for railway switches the combination with the switch and operating mechanism therefor, and the signal indicating the condition of the switch and the operating mechanism therefor, of locking means for the switch releasable by the operation of the signal operating mechanism, as and for the purpose specified.
3. In a safety signalling system for railway switches the combination with the switch and the operating mechanism therefor, the signal indicating the condition of the switch and the operating mechanism therefor, of means automatically thrown into operation when the switch is open for preventing the operation of the signal operating means, as and for the purpose specified.
4. In a safety signalling system for railway switches the combination with the switch, operating mechanism therefor. a signal and operating mechanism therefor, of a detent normally restraining the said operating mechanism, and means operated by the operating means of the signal for moving said detent out of engagement with the operating mechanism of the switch, as and for the purpose specified.
5. In a safety signalling system for railway switches the combination with the switch, operating means therefor, a signal for indicating the condition thereof, the operating means for the signal, a rope or chain extending between the signal and the operating means therefor, of a locking device normally restraining the operation of the switch, and a rope or chain controlling said operating device connected to the rope or chain extending between the signal and the operating means, as and for the purpose specfied.
0. An improved safety rallway switch having a stop on a movable part of the switch operating mechanism, a detent adapted to engage said stop, and means operated by the operating means for the signal indicating the condition of the switch for moving said detent out of engagement with said stop, as and for the purpose specifled.
7. An improved safety switch having a stop secured to a reciprocating member of the switch operating mechanism, a shaft, a detent secured thereto and upwardly extending therefrom, the end thereof being adapted to engage the stop and prevent the reciprocative movement of the member and the side of the detent being adapted to another position to be engaged by a stop whereby rotation of the detent and shaft will be prevented and signalling means operated by the rotation of the shaft supporting the detent for locking said signal in a danger position, as and for the purpose specilied.
8. An improved safety switch having a stop secured to a reciprocating member of the switch operating mechanism, a shaft, a detent secured thereto and upwardly extending therefrom, the end thereof being adapted to engage the stop and prevent the reciprocative movement of the member, the side of the detent being adapted in another position to be engaged by the ston whereby rotation of the detent and shaft will be prevented, a disc having a grooved periphery secured to the shaft. adsignal and operating mechanism therefor and a rope or chain connected to the disc end and in the operating mechanism of the signal whereby when the dise is rotated into \(a\) predetermined position the operation of the signal will he prevented, as and for the purpose specifled.
9. An improved safcty switch having a stop secured to a reciprocating member of the switch operating mechanism, a shaft. a detent secured thereto and upwardly extending therefrom, the end thereof being adapted to engage the stop and prevent the reciprocating movement of the member, the side of the detent being adapted in another position to be engaged by the stop whereby rotation of thr detent and shaft will be prevented. a disc having a grooved periphery secured to the shaft, a signal, an operating mechanism therefor and a rope or chain connected to the disc and to the operating mechanism of the signal whereby when tho disc is rotated into a predetermined position the operation of the signal will be prevented, a lug secured to the dise and upwardly extending therefrom. and a spring normally depressing the lug tending to move the disc into position which will prevent the operating of the signal, as and for the purpose specified.
10. An improved safety switch comprising a switch, operating mechanism therefor having a reciprocating member, a stop secured to the sald reciprocating member, a shaft, a detent secured thereto and outwardly extending therefrom, the end thereof being adapted to engage the stop and prevent the reciprocative movement of the member, the side of the detent being adapted in another position to be engaged by the stop whereby the rotation of the detent and shaft will be prevented, a disc provided with a grooved periphery secured to the shaft. a signal. invity operated means for normally holding it with the danger signal displayed, an operating mechanism for the signal, a rope or chain connected to the disc and to the operating mechanism of the signal whereby when the said mechanism is operated the disc and shaft will be rotated, a lug integral with the disc, and outwardly extending therefrom, a spring normally depressing the lug to rotate the shaft into a position such that the rope or chain connected thereto will prevent operation of the switch operating mechanism, substantially as described.

\section*{No. 102,590. Snow Melting Apparatus.}

\section*{Apparcil pour fondre la neige.}

Felix Dansereau, Montreal, Quebec, Canada, 18th December, 1906; 6 years. Filed 23rd November, 1906. Receipt No. 141,436.
Claim.-1. A snow melting apparatus consisting of a heater presenting a heat radiating snow supporting member, substantially as described and for the purpose set forth.
2. A snow melting apparatus consisting of a snow supporting member, and means for directing a heated blast upon the snow, substantially as described and for the purpose set forth.
3. A snow melting apparatus consisting of a heat radiating snow supporting member, and means directing a heated blast upon the snow, substantially as described and for the purpose set forth.
4. A snow melting apparatus comprising a furnace with a heat radiating top, a housing enclosing the furnace and having apertures through which the snow can be thrown upon the said top, substantially as described and for the purpose set forth.
5. A snow melting apparatus comprising a furnace with a heat radiating top and a plurality of vertical plpes com-

municating with the interior of the furnace and with their mouths turned downwardly, a housing enclosing the furnace and having apertures through which the snow can be thrown upon the said top, substantially as described and for the purpose set forth.
6. A snow melting apparatus comprising a furnace with a heat radiating top and a plurality of vertical pipes communicating with the interior of the furnace and with their mouths turned downwardly and exerting hot blasts in different directions, a housing enclosing the furnace and having apertures through which the snow can be thrown upon the said top, substantially as described and for the purpose set forth.
7. A portable snow melting apparatus consisting of a heat radiating snow supporting member, means directing a heated blast upon the snow, and a vehicle upion which the said apparatus is carried, substantially as described and 'or the purpose set forth.
8. A portable snow melting apparatus comprising a furnace with an undulating heat radiating top having a plurality of vertical pipes with downwardly curved mouths, a housing enclosing the gald furnace and presenting water tanks one at each side thercof, the said housing having a pair of apertures, and a vehicle carrying the sald apparatus, substantially as described and for the purpose set forth.
9. A portable snow melting apparatus comprising a sheet iron furnace with an undulating heat radiating top having a plurality of vertical pipes with downwardly curved mouths, the ends of such furnace having a fire brick lining, a housing enclosing the said furnace and presenting water tanks at each side thereof, the said housing having a pair of apertures, and a vehicle carrying the said apparatus, substantially as described and for the purpose set forth.
10. A portable snow melting apparatus comprising a sheet iron furnace with an undulating heat radiating top having a plurality of vertical pipes with downwardly curved mouths, the ends of such furnace having a fire brick lining, i housing enclosing the said furnace and presenting water lanks at each side thereof, the roof of the housing having n pair of apertures extending longitudinally thereof, a pair nf chutes, a pair of hanging doors, and a vehicle carrying the said apparatus, substantially as described and for the purpose set forth.
11. A portable snow melting apparatus comprising a furnace with an undulating heat radiating top having a plurality of smoke conductors directing blasts upon the said top, a housing enclosing the said furnace and presenting water tanks one at each side thereof, the said housing having a pair of apertures, and a vehicle carrying the said apertures, substantially as described and for the purpose set forth.
12. A portable snow melting apparatus comprising a furnace with an undulating heat radiating top having a plurality of vertical pipes some with downwardly curved mouths and others straight and having cowl plates on their tops, a housing enclosing the sald furnace and presenting water
tanks one at each side thereof, the said housing having a pair of apertures, and a vehicle carrying the said apparatus, substantially as described and for the purpose set forth.
13. A portable snow melting apparatus comprising a sheet iron furnace with an undulating heat radiating top having a plurality of vertical pipes some with downwardly curved mouths and others straight and having cowl plates on their tons, the ends of such furnace having a fire brick lining, a housing enclosing the said furnace and presenting water tanks one at each side thereof, the said housing having a pair of apertures extending longitudinally thereof, a pair of chutes, a pair of hanging doors, and a vehicle carrying the said apparatus, substantially as described and for the purpose set forth.
14. A snow melting apparatus comprising a furnace with a heat radiating top, a housing enclosing the furnace and having apertures through which the snow can be thrown upon the said top and means creating a forced draught in the said furnace, substantially as described and for the purpose set forth.
15. A portable snow melting apparatus comprising a sheet iron furnace with an undulating heat radiating top having a plurality of vertical pipes with downwardly curved mouths, the ends of such furnace having a fire brick lining, and means creating a forced draught in the said furnace, a housing enclosing the said furnace and presenting water tanks at each side thereof, the said housing having a pair of apertures, and a vehicle carrying the said apparatus substantially as described and for the purpose set forth.
No. 102,591. Locomotive. Locomotive.

Gilbert G. Davis, Muckiltoe, Washington, U.S.A., 18th December, 1906: 6 years. Filed 28th November, 1906. Receipt No. 141,605.
Claim.-1. In a locomotive, the combination of a traction wheel, a member provided with a bearing engaging the axle of said wheel, a main frame yieldingly supported on said member, and a rotatable driving element mounted on said member and operatively connected with said wheel.
2. In a locomotive, the combination of a traction wheel, a member provided with a journal engaging the axle of said wheel, a main irame yieldingly supported on said member, a rotatable driving element mounted on said member and operatively related to said wheel, and driving means supported on said frame and connecting with said elements.
3. In a locomotive, the combination of a traction wheel, gear rotatable therewith, a member provided with a journal engaging the axle of said wheel, a main frame yieldingly supported on said member, and a toothed member rotatably mounted on said journal member and engaging said gear.
4. In a locomotive, the combination of a traction wheel, a spur gear rotatable therewith, a member provided with a journal engaging the axle of said wheel, a main frame yieldingly supported on said member, a crank rotatably mounted on said member, and a spur pinion rotatable with said crank and engaging said gear.
5. In a locomotive, the combination of a traction wheel, a spur gear rotatable therewith, a member provided with a journal engaging the axle of said wheel, a main frame yieldingly supported on said member, a crank rotatably mounted on said member, a spur pinion rotatable with said crank and engaging said gear, and driving means supported on said frame and connected with said crank.

No. 102,592. Hay Press. Presse à foin.

Dempsey S. Edenfield, Savannah, Georgia, U.S.A., 18th December, 1906; 6 years. Filed 24th November, 1906. Receipt No. 141,464.
Claim.-1. In a baling press, the combination with a plunger head and its actuating mechanism, of a press box frame provided with flexible resilient metallic strips upon its respective sides, tail frame side pieces carried by the projecting ends of said strips in the rear of the box, and means for drawing the frame side pieces toward each other.
2. In a baling press, the combination with a plungen head and its actuating mechanism, of a press box frame provided with a pair of resilient metallic strips upon its respective sides, tail frame side pieces carried by the projecting ends of said strips in the rear of the box, and means for drawing the pieces toward each other against the resistance of the resiliency of the strips.
3. In a baling press, the combination with a plunger head, its actuating mechanism, and a press box frame provided with side pieces and a plurality of pairs of oppositely disposed uprights, of flexible resilient metallic strips upon opposite sides of the press box frame and secured respectively to the formed uprights and projecting beyond the rearward uprights, tail frame side pieces carried by the projecting ends of said strips respectively in the rear of the box. and means for drawing the tail frame side pieces toward each other.

No. 102,593. Glove. Gant.

Richard Evans, Johnstown, New York, U.S.A., 18th December, 1906; 6 years. Filed 23rd November, 1906. Receipt No. 141,437.
Claim.-1. A gauntlet glove having the hand portion of normal size and shape down to the wrist portion and having the gauntlet extending laterally beyond the wrist portion, and substantially perpendicularly thereto to accommodate the cuff of the wearer without materially increasing the diameter of the wrist portion of the glove, substantially as described.
2. A gauntlet glove having the hand portion of normal size and shape down to the wrist portion and provided with a gauntlet of greater diameter than the wrist portion, and projecting laterally beyond the wrist portion and having its upper ledge substantially perpendicular thereto, and a separate tip connected to the upper edge of the projecting portion of the gauntlet, and having converging edges united to the wrist portion of the glove whereby the laterally projecting portion of the gauntlet will accommodate a cuff of the wearer without materially increasing the diameter of the wrist portion of the glove, substantially as described.
3. A gauntlet glove having the hand portion of normal size and shape down to the wrist portion, and provided
with a gauntlet forming an extension of the hand portion, said gauntlet having a separate gore extending laterally from the wrist portion and having its upper edge substantially perpendicular thereto, and a separate tip united to the upper edge of the gore and having converging edges connected to the wrist portion of the glove, substantially as described.
4. A glove having a gauntlet provided on the outer side with a gore extending from the wrist portion to the end of the gauntlet, and a tip having a curved portion united to the top edge of the gore and converging edges united to the wrist portions of the glove proper, substantially as described.

No. 102,594. Bridle Bit. Bride.

Charles H. Falls, Clarksville, Iowa, U.S.A., 18th December,
1906; 6 years. Filed 21st Nevember, 1906. Receipt No. 141,395 .
Claim.-1. A bit having integral snaffles terminating in eyes, split plugs engaging the hollow ends of the bit, oscillating rein loops conuected to eye in said plugs having a saddle with a seat to be engaged by said rein loops, as set forth.
2. A bit having integral snaffles with eyes in the ends thereot, split plugs having eyes and integral saddles adapted to seat respectively in holiow ends of said bit. and rein loops engaging said eyes formed in said plugs and adapted to seat in said saddles, as set forth.
3. A bit having integral snaffles with eyes in the ends thereof. split plugs having their outer faces tapering and adapted to frictionally engage the inclined walls in the ends of said bit, an integral saddle upon each plug, each saddle having a concaved part forming a scat, the edge of said saddle adapted to engage in a recess formed at right angles in the bit to the length therpof, rein loops engaging elongated eycs formed in said plugs and a jaw strap connecting said loops, as set forth.
4. A bit having Integral snaffles with eyes in the ends thereof, split plugs having their outer faces tapering and adapted to frictionally engage the inclined walls in the ends of said bit, an integral saddle upon each plug, each sadule having a concaved part forming a seat, the inner edge of each saddle having its opposite inclined and designed to engage the tapering walls of recesses in the ends of the bit and rein loops engaging the eyes formed in said plugs, as set forth.
5. A bit having integral snaffies and having eyes at the ends thereof, split plugs engaging in the ends of the bit and provided each with a saddle held in a recess formed at right angles to the length of the bit, rein loops engaging eyes in said plugs and having crossbars to which a jaw strap is adapted to be fastened, as set forth.

\section*{No. 102,595. Butter Separator.}

Appareil pour síparer le beurre de la crème.
John Miller Fleming, Ottawa, Ontario, Canada, 18th December, 1906; 6 years. Filed 29th November, 1906. Receipt No. 141,655.
Claim.-1. In a butter separator the combination with the aerating dasher, of means for supplying the same with air from a point laterally removed from the center of the dasher, as and for the purpose specified.
2. In a butter separator the combination with the aerating dasher, of means extending beyond the side of the liquid containing vessel for supplying the dasher with air, as and for the purpose specifled.
3. In a butter separator the combination with the aerating dasher, of a casing enclosing the same above the surface of the liquid, and an air supply pipe connected to said casing and leading over the side of the separating vessel, as and for the purpose specified.
4. In a butter separator the combination with the frame and separating vessel thereon, a central shaft and the

dasher thercon, of a casing enclosing the dasher and extending into the liquid, means for supporting the casing in the frame, and an air supply pipe connected to the casing and leading over the side of the separator vessel, as and for the purpose specifled.
5. In a butter separator the combination with the central shaft and means for driving the same, of an aerating dasher on the shaft, a casing enclosing the same, a tube secured at the top of the dasher and extending through the casing, means for holding the tube in any adjusted position on the shaft, and an air supply pipe secured to the casing and extending laterally therefrom, as and for the purpose specifled.
6. In a butter separator an improved acrating dasher comprising a tubular portion, having two frustro-conical corrugated discs at the bottom thereof, and means for permitting the passage of alr down the tubular portion and between the discs, as and for the purpose specified.
7. In a butter separator an improved dasher comprising a tubular portion and a corrugated frustro-conical disc secured to the bottom thereor, and a second like disc secured to the tube a short distance above the first, and perforations between the two discs, as and for the purpose specified.
8. In a butter separator the combination with the frame, a stardard upwardly extending therefrom, horizontal arms inwardly extending from the top of the standard, a vertically extending driving shaft journalled in the end of the arm, a pulley thereon, a stub shaft on the standard, a driving wheel thereon, diagonally disposed pulleys on each side of the standard, brackets supporting the same, and a continuous belt extending around the main driving wheel, around the diagonal pulleys and the pulley on the central shaft, as and for the purpose specifled.
No. 102,596. Churn. Barattc.

Harland Garbutt, Londesborough Iron Works, Seamer. York, England, 18th December, 1906; 6 years. Filed 27th November, 1906. Receipt No. 141,575.
Claim.-1. In a churn, a barrel, a shaft passing through the barrel and made in three parts, the outer parts being capable of sliding in their bearings and releasing fe central part, and dashers carried by the shaft.
2. In a churn, a barrel, a revolving shaft carrying dashers passing through the barrel, the dashers at the ends of the shaft propelling the cream towards the center of the barrel, and the central dasher propelling it outwards.

No. 102,597. Car Coupler. Attrlage ale chars.

Jordan Monroe Howell, Dallas, Texas, U.S.A., 18th December, 1906; 6 years. Filed 20th November, 1906. Recelpt No. 141,359.
Cluim.-In a car coupler, a bar having a hollow head, a coupling knuckle pivoted therein and provided with a rearwardly extending arm, a pivoted operating member designed for engagement with said arm when the knuckle is in coupling position, said member having a rearwardly projecting arm and the head being provided with a recess to receive said arm, a movable key adapted for engagement with the arm of the operating member to fix the latter and knuckle against movement and means for moving the key to releasing position, sain kny and knuckle arm having cam faces adapted to co-operate through frictional engagement for holding the key in releasing position.

No. 102,598. Stump Extractor. Arruche-sourhe.

Thomas W. Huckle, Standish, Michigan, U.S.A., 18th December, 1906; 6 years. Flled sth August, 1906. Receipt No. 138,487 .
Claim.-1. A draft apparatus comprising the combination of the body, a holding device along which the body is arranged to roll and a flexible connecting device attached to the body.
2. A draft apparatus comprising a body, a holding device along which the body is arranged to roll. a connector and means for adjustably mounting the connector on the body.
3. A draft apparat 18 comprising a body, a holding device along which the body is arranged to roll, a flexible connector and means fur adjustably mounting the connector on the body.
4. A draft apparatus comp.ising a body, a holding device along which the body is arranged to roll, a flexible conductor and means for adjustably mounting the connector on the body, said means effecting an engagement between the connector and the body at two different points on the body.
5. A draft apparatus comprising the combination of a body, a holding device along which the body is arranged to roll, a connecting device attached to the body, and an arm attached to the body and projecting outward therefrom, said arm serving to have the power applied thereto.
0. A draft apparatus comprising a body, a holding device along which the body is arranged to roll, a jointed connector attached to the body, and pins adjustably held in the body and adapted to be engaged by the connector.
7. A draft apparatus comprising a body in the form of a sheave, a holding device along which the body is arranged to roll and a connector at tached to the body.
8. A draft apparatus comprising a body in the form of a sheave, a holding device along which the said sheave is arranged to roll, a jointed connector and means for mounting the connector on the sheave, sald means engaging the connector at two points.
9. A draft apparatus comprising a body in the form of a sheave, a holding device along which the sheave is arranged to roll, a jointed connector attached at one end to the body, and pins adjustably mounted on the body and adapted to be engaged by said connector.
10. A draft apparatus comprising a body in the form of a sheave, a holding cable attached. to the periphery thereof and a connector mounted on the body.
11. A draft apparatus comprising a body in the form of a sheave, a holding cable attached to the periphery there\(o_{i}\), a jointed connector attached at one end to the sheave, and pins adjustably mounted on the sheave and adapted to be engaged by the connector.
12. A draft apparatus comprising a body in the form of a sheave, a holding device along which the sheave is arranged to climb, a flexible connector attached at one ead to the body, and means located on the body and adapted to be engaged by the connector.
13. A draft apparatus comprising a body in the form of a sheave, a holding device along which the sheave is arranged to roll, a flexible connector attached at one end to the sheave, said sheave having a plurality of orifices therein and a pin capable of fitting a plurality of said orifices.
14. A draft appliance comprising a body, a holding device along which the body is arranged to roll, a connector attached to the body, and means for varying the effective length of the connector.

No. 102,599. Cultivator. Cultiratcur.

William Hull, Souris, Manitoba, Canada, 18th December, 1906: 6 years. Filed 28th November, 1906. Receipt No. 141,601.
Claim.-1. In a device of the class described, the combination with the tongue and the neck yoke, of means movably supporting the tongue from the neck yoke, as and for the purpose specified.
2. In a device of the class described, the combination with the tongue and the neck yoke, of vertical means supporting the tongue slidably from the neck yoke, as and for the purpose specified.
3. In a device of the class described, the combination with the tongue and the neck yoke, of means supporting the tongue slidably from the neck yoke, and means for retaining the tongue relatively to the neck yoke in a predetermined position, as and for the purpose specified.
4. In a device of the class described, the combination with the tongue and the neck yoke, of means for supporting the tongue slidably from the neck yoke, and adjustable means for limiting the upward position of the tongue, as and for the purpose specified.
5. In a device of the class described, the combination with the tongue and the neck yoke, of a rod extending vertically from the center of the neck yoke, and adapted to pass through an opening in the forward end of the tongue, brace rods extending from the free end of the aforesald rod to the extending end of the neck yoke, and means attached to the neck yoke for controlling the relative position of the rod to the tongue, as and for the purpse specified.
6. In a device of the class described, the combination with the tongue and the neek yoke, the tongue having an opening passing vertically through its forward end, of a rod having a threaded end adapted to screw into a female thread centrally in the neck yoke and to pass through the opening in the tongue, brace rods passing from the free end of the threaded rod to the extending ends of the neck yoke, a loose
pulley forwardly on the tongue, a toothed quadrant, a lever, a hand latch, and a detent at the rear end of the tongue, and a cable connecting the lever through the pulley to the neck yoke, as and for the purpose specified.
7. In a device of the class described, the combination with the rear portion of the frame and the main shafts, of arms secured to the main shafts and tension springs extending between the rear portion of the frame and the arms, as and for the purpose specified.
8. In a device of the class described, the combination with the rear portion of the frame and the main shafts, of arms rigidly secured to the shafts, tension springs secured to the arms and means for adjustably securing the outer ends of the springs to the rear portion of the frame, as and for the purpose specifled.
9. In a device of the class described, the combination with the main shafts and the rear portion of the frame, of arms secured rigidly to the main shafts, a tension spring extending rearwardly from the arms, a nut secured to the outer end of the respective rings, and a threaded crank rod extending from the rear portion of the frame and adapted to screw into the nut to adjust the tension of the springs, as and for the purpose specified.
No. 102,600. Loader. Apparil à charger.

Le Grand Kniffen, Chicago, Illinois, U.S.A., 18th December, 1906; 6 years. Filed 29th November, 1906. Receipt No. 141,647.
Claim.-1. The combination with a wheeled axle, of two upwardly extending angular frames mounted thereon and spaced apart, connections transversely uniting said frames, a chute connected at its rear portion to the rear parts of sald frames and bodily movably located between the frames, and means on the frames and chute to elevate the latter.
2. The combination with a wheeled axle, of two upwardly and rearwardly extending angular frames mounted in parallelism thereon and spaced apart, connections transversely uniting said frames, a chute pivotally connected at its rear portion to the rear parts of the frames and bodily movably located between the frames, a shaft transversely journalled on the chute, and a connection secured at one of its ends above the chute and at the other end to said shaft.
3. The combination with a wheeled axle, of two upwardly extending angular frames mounted thereon and spaced apart, connections transversely uniting said frames, a chute connected at its rear portion to the rear parts of said frames and bodily movably located between the frames. a downwardly depending bracket longitudinally mounted on the upper portion of the chute at each of its sides, and means on the frames and chute to elevate the latter.
4. The combination with a wheeled axle, of two upwardly extending angular frames mounted thereon and spaced apart, connections transversely uniting said frames, a chute connected at its rear portion to the rear parts of sald frames and bodily movably located between the frames, a downwardly depending and angular-in-outlines bracket longitudinally mounted on the upper portion of the chute at each of its sides, and means on the frames and chute to elevate the latter.
5. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having near its upper end an opening between its sides, a lever mounted on each side of said opening and extending above the sides of the chute, and means to elevate the latter from the axle. 6. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a lever mounted on
each side of the opening of the chute, mesns to elevate the same from the axle, a carrier adapted to travel thereon and having laterally projecting pivots on its sides to engage said levers whereby the carrler will be partially rotated or tilted to discharge its load through said opening and its further forward movement prevented.
7. The combination with a wheeled axle, of a chúte mounted thereon ahove the wheels and having an opening near its upper eau between ifs sides, a lever mounted on and extending above each side of the chute, means to elevate the same from the axle, a carrier adapted to travel thereon and having laterally projecting pivots on its sides to engage said levers whereby the carrier will be partially rotated or tllted to discharge its load through said opening and its further forward movement prevented.
8. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a spring actuated lever mounted on each side of the opening of the chute, means to elevae the same from the axle, a carrier adapted to travel thereon and having laterally projecting pivots on its sides to engage said levers whereby the carrler will be partially rotated or tilted to discharge its load through said opening and its further forward movement prevented and whereby after the load of the carrier is discharged said carrier will be moved rearwardly by the spring actuated levers.
9. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a spring actuated and recessed lever mounted on each side of the opening of the chute, means to elevate the same from the axle, a carrier adapted to travel thereon and having laterally projecting pivots on its sides to engage the reoesses in said levers whereby the carrier will be partially rotated or tilted to discharge its load through sald opening and its further forward movement prevented and whereby after the load of the carrier has been discharged the carrier will be moved rearwardly on an arc of a circle by the spring actuated levers to the end that it will be started dowr the inclined chute and its lines freed or cleaned of thi" material carried thereby.
10. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a downwardly depending bracket longitudinally mounted on the upper portion of the chute at each of its sides, means to elevate the same from the axle, a lever fulcrumed at its lower portion on cach of said brackets and extending above the sides of the opening in the chute, a carrier adapted to travel on the chute and having laterally projecting pivots on its sides to engage said levers whereby the carrier will be partially rotated or tilted to discharge its load through said opening and its further forward movement prevented.
11. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a downwardly depending bracket longitudinally mounted on the upper portion of the chute at each of its sides, means to elevate the same from the axle, a spring actuated lever fulcrumed at its lower portion on each of said brackets and extending above the sides of theh opening in the chute, a carrier adapted to travel on the chute and having laterally profecting pivots on its sides to engage said levers whereby the carrier will be partially rotated or tilted to discharge its load through said opening and its further forward movement prevented and whereby after the load of the carrier has been discharged the carrier will be moved rearwardly by the spring actuated levers.
12. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a downwardly depending bracket longitudinally mounted on the upper portion of the chute at each of its sides, means to elevate the same from the axle, a spring actuated and recessed lever fulcrumed at its lower portion on each of said brackets and extending above the sides of the opening in the chute, a carrier adapted to travel on the chute and having laterally projecting pivots on its sides to engage the recesses of said levers whereby the carrier will be partially rotated or tilted to discharge its load through said opening and its further forward movement prevented and whereby after the load of the carrier has ben discharged the spring actuated levers will move the carrier rearwardly on an arc of a circle and start it down the inclined chute so as to cause the upper end of the chute to remove material from the carrier.
13. The combination with a chute adapted to be placed in an inclined position, of a downwardly depending and angular-in-out-lines bracket longitudinally mounted on the the upper portion of the chute at each of its sides.
14. The combination with a shute adapted to be placed in an inclined position and having an opening in its upper end between its sides, of a downwardly depending bracket longitudinally mounted on the upper portion of the chute at each of its sides, a lever fulcrumed at its lower portion on each of said brackets and extending above the sides of the opening in the chute, means on the sides of the chute to restrict the movement of said levers, a carrier adapted to travel on the chute and having laterally projecting pivots on its sides to engage sald levers. whereby the carrier will be partlally rotated or tilted to discharge its load through said opening and its further forward movement prevented. 15. The combination with a chute adapted to be placed in an inclined position and having an opening in its upper end between its sides, of a downwardly depending bracket longitudinally mounted on the upper portion of the chute at each of its sides, a spring actuated lever fulcrumed at its lower portion on each of said brackets and rxtending above the sides of the opening of the chutc. a carrier adapted to travel on the chute and having laterally projecting pivots on its sides to engage said levers whereby the carrier will be retarded in its movement and partially rotated or tilted to discharge its load through said opening and its further forward movement prevented and whereby after the load of the carrier has been discharged the spring actuated levers will move the carrier rearwardly and start it down the inclined chute so as to cause the upper end of the chute to remove material from the carrier.
16. The combination with a chute adapted to be placed In an inclined position and having an opening near its upper end between its sides, of a downwardly depending bracket longitudinally mounted on the upper portion of the chute at each of its sides, a spring actuated and recessed lever fulcrumed at its lower portion on each of said brackets and extending above the sides of the opening in the chute, a carrier adapted to travel on the chute and having laterally projecting pivots on its sides to engage the recesses of the said levers whereby the carrier will be retarded and then stopped and partially rotated or tilted to discharge its load through said opening and whereby after the load of the carrier shall have been discharged the spring actuated levers will move the carrier rearwardly on an arc of a circle and start it down the inclined chute so as to cause the upper end of the chute to remove material from the carrier.
17. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a downwardly depending bracket longitudinally mounted on the upper portion of the chute near each of its sides, means to elevate the chute from the axle, a spring actuated lever fulcrumed at its lower portion on each of said brackets and extending above the sides of the opening in the chute, a carrier adapted to travel on the chute and having laterally projecting and movable pivots on its sides to engage sald levers, a bail pivotally mounted on the sides of the carrier at points above and to the rear of the said pivots and having on each of its sides \(a\) lateral projection, and a spring actuated and recessed lever on each of the sides of the carrier adapted to engage said projections on the ball whereby the bail will be rigidly held in its lowered position and released when the pivots of the carrier strike the levers on the upper end of the chute.
18. The combination with a wheeled axle, of a chute mounted thereon above the wheels and having an opening near its upper end between its sides, a downwardly depending bracket longitudinally mounted on the upper portion of the chute near each of its sides, means to elevate the chute from the axle, a spring actuated lever fulcrumed at its lower portion on each of said brackets and extending above the sides of the opening in the chute, a carrier adapted to travel on the chute and having laterally projecting and movable pivots on its sides to engage said levers, a bail pivotally mounted on the sides of the carrier at points above and to the rear of the said pivots and having on each of its sides a lateral projection, a spring actuated and recessed lever on each of the sides of the earrier adapted to engage said projections on the bail, and a wheel journalled on the lower portion of the carrier.
19. A carrier consisting of two upright side pieces each having a channel to receive a handle, a crossbar uniting the side pieces at their lower portions, means on the crossbar to carry the material to be loaded, a transverse rod uniting the side pieces at their upper portions, a bail pivotally secured on said crossbar and having on each of its sides a lateral projection, a pivot on each of the sides of the carrier to strike stops on the upper portion of an inclined chute for the purpose of tilting the carrier, a spring actuated and recessed lever fulcrumed on each of the sides and adapted to engage the projections on the ball.
20. A carrier consisting of two upright side pieces each having a channel to receive a handle, a crossbar uniting the side pieces at their lower portion, means on the crossbar to carry the material to be loaded, a transverse rod uniting the side pieces at their upper portions, a bail pivotally secured on said crossbar and having on each of its sides a lateral projection a pivot on each of the sides of the carrier to strike stops on the upper portion of an inclined chute for the purpose of tiltng the carrier, a spring actuated and recessed lever fulcrumed on each of the sides and adapted to engage the projections on the bail, and a wheel journalled on the crossbar at the lower portion of the carrier.
21. The combination with a chute adapted to be placed in an inclined position and having an opening in its upper end between its sides, of a stop on each side of said opening, a carrier having on each of its sides a long laterally projecting pivot adapted to project over the sides of the chute at its upper end and to strike said stops.
22. The combination with a chute adapted to be placed in an inclined position and having an opening in its upper end between its sides, of a stop located on the chute on each side of the opening therein. a carrier having on each of its sides a long laterally projecting pivot, said pivots being located above and to the rear of the material supporting or carrying part of the carrier and adapted to extend over the sides of the chute at its upper end and to strike said stops, and a bail pivoted to the carrier above said pivots.

No. 102,601. Brake Mechanism. Mécanisme de frin.

James Albert Lightbody, Waterville, Maine, U.S.A., 18th December, 1906; 6 years. Filed 29th November, 1906. Receipt No. 141,648.
Claim.-A brake lever support comprising an inverted yoke piece attached to the brake bar truss and constructed to support the brake lever, substantially as and for the purpose set forth.

No. 102,602. Guard Rail. Garle-rail.

William H. Moore, Waveland, Indiana, U.S.A., 18th December, 1906; 6 years. Filed 26th November, 1906. Receipt No. 141,533.
Claim.-1. A guard rail provided with central and terminal projections to space it from the main rail. 2. A guard rail having inturned ends, a central spacing projection, a terminal spacing projection formed upon the inturned ends, said projections being adapted to engage the main rail and space the guard rail therefrom.
3. A guard rail provided with inturned ends having bevelled outer faces, and terminal projections extending from the outer face thereof to bear upon the maln rail, said projections forming continuations of the bevelled surafces of the inturned ends.
4. The combination with a main rail, of a guard rail having spacing projections bearing upon the main rail, and bolts connecting said rails intermediate said projections.

No. 102,603. Nrit Lock. Arrête-écrou.

William E. Louden, Lisbon, Ohio, U.S.A., 18th December, 1906; 6 years. Filed 26th November, 1906. Receipt No. 141,497.
Claim.-1. In a nut lock, the combination with a rail and fish plate, of a plurality of bolts passing through the rail and fish plate, nuts threaded on the bolts, said nuts comprising outer heads and inner angular necks of less cross sectional area than the heads, a single piece locking plate that fits against the fish plate and has a series of longitudinally disposed key hole openings therein, the larger portions of the openings permitting the passage of the nut heads, the smaller portions snugly recoiving said necks to prevent the turning of the nuts and being of. less area than the heads, and spaced outstanding lugs carried by the lower portions of the ends of the locking plate, and each having a holding spike receiving opening, the lower edge of the locking plate between the lugs being disposed over the base flange of the rail.
2. In a nut lock, the combination with a rail comprising a head flange, a base flange, and a connecting web, of a fish plate bearing against the web and having an outstanding lower portion that rests on the base flange, said fish plate terminating short of the head flange, bolts passing through the rail and fish plates, nuts threaded on the bolts, said nuts comprising outer heads and inner angular necks of less cross sectional area than the heads. a locking plate that engages against the fish plate and has its upper margin fitted over said fish plate and against the rail web between the unper edge of the fish plate and the head flange of the rail. said locking plate furthermore having a series of longitudinally disposed key hole openings therein, the large portions of the openings permitting the passage of the nut heads. the smaller portions snugly receiving the nut necks to prevent their turning and being of less area than the heads, said locking plate having spaced outstanding lugs that extend over and project beyond the outstanding portion of the fish plate. and means passing through the projecting portions of the lugs for securing the plate against longitudinal movemont with rispect to the nuts.

\section*{No. 102,604. Nut Lock. Arrête-écrou}

James William McDonald, Winnipeg, Manitoba, Canada, 18th December, 1906; 6 years. Filed 26th November 1906. Receipt No. 141,499.

Claim.-1. In a nut lock for raflroad rails the combination with a fish plate and the main bolt nuts, of a plate having its ends shaped to fit the sides of the nut and means for securing the latter plate to the fish plate, as and for the purpose specified.
2. In a nut lock for rallroad rails the combination with the main bolt nuts and the overlapping plate between two adjoining rails, of a lock plate having its ends bifurcated and adapted to grasp the nuts, and means for securing the lock plate to the former plate, as and for the purpose specified.
3. In a nut lock for railroad rails, the combination with tre fish plate, and the bolts and nuts, retaining the fish plate to the web of the rails, of a locking bar having bifur-
cated ends adapted to grasp the nuts, a pin extending from between the fish plate and the web outwardly through the

locking bar. and a lock pin adapted to hold the lock bar flush with the fish plate, as and for the purpose specified.
4. In a nut lock for railroad rails, the combination with the fish plate, the bolts and nuts securing the fish plate to the web, and the bifurcated locking bar adapted to grasp the nuts, of pins extending outwardly through the plates from behind the fish plate, and a spring locking pin passing through the frec end of the aforesald pins, as and for the purpose specified.
5. In a nut lock for railroad rails, the combination with the fish plate having a longltudinal groove in the side next the web, the bolts and nuts securing the fish plate to the web and the bifurcated locking bar, of a pin extending from behind the fish plate outwardly through openings in the plate and the locking bar, and having its head resting in the groove, and spring locking pins passing through the ends of the aforesaid pins, as and for the purpose specified.

No. 102,605. Hose. Bas.

George B. McWilliams, Waterloo, Iowa, U.S.A., 18th December, 1906; 6 years. Filed 26th November, 1906. Recelpt No. 141,546.
Claim.-1. Hose composed of the combination with a loosely textured body, of heel and toe portions attached theroto constructed of a more closely textured material.
2. Hose composed of the combination with a loosely textured body, of heel and toe portions attached thereto of more closely textured material provided with means for ventilation therethrough.
3. Hose composed of the combinaion with a knitted body, of soft leather heel and toe portlons attached thereto.
4. Hose composed of the combination with a knitted body, of soft leather heel and toe portions attached thereto provided with a plurality of ventilating perforations.

No. 102,606. Petticoat or Skirt. Jupe.

Edward J. Segrell, Newark, New Jersey, U.S.A., 18th December, \(1906 ; 6\) years. Filed 28th November, 1906 Recelpt No. 141,606.
Claim.-1. In a garment of the character stated, a body provided with a placket, fastening members respectively connected with the ends of the waist portion of said body, for adjustably holding the latter on the wearer, and a lapel connected with the rear of the body, adapted to cover the opening between the members of said placket, and to conceal said members, and means for securing said lapel in operative position.
2. In a garment of the character stated, a body provided with a placket, and a strap and a fastening respectively connected with the ends of the waist portion of said body, for adjustably holding the latter on the wearer.
3. In a garment of the character stated, a body provided with a placket, means for connecting the ends of the waist portion of said body for holding the latter on the wearer, a device on said body adapted to cover the opening between the members of said placket, and means for retaining said device in operative position.
4. In a garment of the character stated, a body having a placket and a piece on said body adapted to cover the opening between the members of said placket.
5. In a garment of the character stated, a body having a placket, flaps extending inwardly from the members of sald placket, a device on sald body adapted to overlap said flaps and cover the opening between the same, and means on said device and body for adjustably retaining the former in operative position.
6. A garment of the character stated composed of a body, a placket, and a lapel extending upwardly from the body, adapted to cover the opening between the members of said placket.
7. A garment of the character stated, having a body and a placket therefor, a lapel extending upwardly from the rear of said body at or about the base of sald placket and adapted to cover the opening between the members of the latter.
8. In a garment of the character stated, the combination with the body threeof which is provided with a placket, of flaps extending from the members of said placket.
9. A garment of the character stated, having a body and a placket therefor, a lapel extending upwardly from the rear of said body at or about the base of said placket, and adapted to cover the opening between the members of the latter, and means on said body adapted to overlap said flaps, and cover the opening between the same.
10. In a garment of the character stated, a body provided with a placket, a lapel adapted to extend from the rear of the body upwardly over the opening between the members of said placket, and means for retaining said lapel in operative position.
11. In a garment of the character stated, a body provided with a placket, a lapel extending upwardly from the rear of said body at or about the base of the placket, adapted to cover the opening between the members of the latter, and fastening on said lapel and the waist portion of the body, for retaining the lapel in operative position.

\section*{No. 102,607. Ewitch. Aiguille.}

John M. Smith, Waite Park, Minnesota, U.S.A., 18th December, 1906; 6 years. Filed 24th November, 1906. Receipt No. 141,468 .
Claim.-1. In combination with a railroad switch, tubular rods, one of said rods connected with a switch operating device, clamps slidably mounted on said rods and secured to the switch points, and springs secured to saif rods and the clamps, substantially as shown and described.
2. In combination with a rallroad switch, slotted tubular rods, one of said rods connected with a switch operating device, clamps slidably mounted on said rods and secured through the slots therein, said clamps being secured to the
switch points, and springs secured in said tubular rods and to said clamps, substantially as shown and described.

3. In combination with a railroad switch, slotted tubular rods, one of said rods being connected with a switch operating means, clamps secured to the switch point and having tubular portions fitting on said tubular rods, bolts securing said tubular portions through the slots in the rods, and springs secured to said bolts and inside of said tubular rods, substantially as shown and described.
4. In combination with a railroad switch, slotted tubular rods, one of said rods being connected with the switch operating device, clamps secured to the switch point and having tubular portions fitting on said tubular rods, bolts secured to said tubular portions and through the slots in the rod, a rod slidably mounted in each tubular rod and having one end secured to the bolt secured to one of the clamps, a spring secured to the same bolt and inside of the tubular rod, and a spring secured to the other end of said rod and inside of the tubular rod, the bolt secured to the other clamp being secured to the last-named spring intermediate of its length, substantially as shown and described.

\section*{No. 102,608. Hot Water Firnace.}

Fournaise à eau chaude.

Simon Tache, Cleveland. Ohio, U.S.A., 18th December, 1906;
6 years. Filed 29th November, 1906. Receipt No. 141,645.
Claim.-A hot water furnace consisting of a series of sections having vertical and horizontal circulating portions \(V\)-shape in cross section and open to each other and hollow fluid circulating grate bars V-shape in cross section and connecting the legs thereof, said several sections having fluid passages transversely through their top and their lower corners, and tie rods passing through said openings and located outside agalnst the sides of the furnace, whereby a uniformly tight union of said sections is effected through all varying temperatures.

No. 102,609. Apparatus for Transporting Ioads. Apparcil pour transporter les charges.
John Ridley Temperley, Joseph Temperley and William Alexander, co-inventors, all of London, England, 18th December, 1906; 6 years. Filed 21st November, 1906. Recelpt No. 141,380.
Claim.-1. In combination in a transporter, a carriage having wheels, supoprting means for the carriage, a frame hinged to the carriage immediately below sald supporting means, in order that the central longitudinal plane of the frame shall not swing outside the intersection of the plane of the wheels with the supporting means, and automatic controlling mechanism.
2. In combination in a transporter, a carriage having
wheels, supporting means for the carriage, a frame hinged

to the carriage immediately below said supporting means in order that the central longitudinal plane of the frame shall not swing outside the intersection of the plane of the whecls with the supporting means, and automatic locking, unlocking and load sustaining devices.
3. In combination in a transporter, a carriage having wheels, a supporting track for the carriage, a frame hinged to the carriage immediately below said supporting track, in order that the central longitudinal plane of the frame shall not swing outside the intersection of the plane of the wheels with the supporting track, locking, unlocking and load sustaining devices carried by the frame, and means on the supporting track acting to control the locking and load sustaining devices.
4. In combination in a transporter, a carriage, supporting means for the carriage, a frame hinged to the carriage im mediately below said supporting means, a fall block guide and locking, unlocking and load sustaining devices carried by the frame.
5. In combination in a transporter, a carriage, supporting means for the carriage, a bell or fall block guide hinged to the carriage so that it may swing longitudinally, load sustaining means, locking mechanism, links slidable relatively to said bell or fall biock guide and pivotally conrected to said load sustaining means and to said locking mechanism, whereby the links and load sustaining means may swing with the bell and at the same time be free to move relatively thereto when the locking mechanism is actuated.
6. In combination in a transporter, a carriage comprising a frame, wheels and wheel carrying members to which the frame is hinged close under the trackway on which the carriage moves, so that it may swing transversely to the trackway, a fall block guide pivoted directly to the fram, locking, unlocking and load sustaining means, said means including a hook and a link slidable relatively to the fall block gulde.
7. In combination in a transporter, a wheeled carriage comprising a frame, wheels and wheel carrying members to which the frame is hinged close under the trackway on which the carriage moves, so that it may swing transversely to the trackway, a bell or fall block guide hinged to the frame so that it may swing longitudinally, locking and unlocking mechanism carried by the frame, links plvotally connected to said locking mechanism and slidable relatively to and guided by the fall block guide, load sustaining hooks pivotally connected to said links and guided by said fall block guide, means whereby the movement of the links in one direction brings the hooks into position for engaging the fall block to support the load and in another direction brings the hooks clear of the fall block guide, and means external to the carriage for controlling the locking and unlocking means.
8. In combination in a transporter, a carriage, a fall block guide, locking, unlocking and load sustaining devices, sald devices including a controlling member, movable relatively to and extending into the fall block guide at a place accessible to the fall block but inaccessible to the rope or other moving part.
9. In combination in a transporter, a carriage, a fall block guide, locking, unlocking and load sustaining devices, said devices including a controlling member movable relatively to and extending into the fall block guide at a place accessible to the fall block but inaccessible to the rope or other moving part and a hook depending from said member, means on the bell and hook for guiding the latter on the movement of said member whereby the hook is moved into or out of engagement with the fall block.
10. In combination in a transporter, a carriage comprising a frame, wheels and wheel carrying members to which the frame is hinged immediately below the trackway on which the carriage runs, a fall block guide, locking, unlocking and load sustaining devices, said devices including a controlling member movable relatively to and extending into the fall block guide at a place accessible to the fall block but inaccessible to the rope or other moving part and a hook depending from said member, means on the bell and hook for guiding the latter on the movement of said member whereby the hook is moved into or out of engagement with the fall block.
11. In combination with a transporter, a carriage comprising a frame, wheels and wheel carrying members, said frame being hinged to the wheel carrying members closely below the trackway on which the carriage travels, a fall block guide pivoted to the frame, locking, unlocking and load sustaining devices including hooks adapted to engage with the fall block on the cable of the transporter, closing and opening means for said hooks, sliding links pivotally connected to said hooks and projecting into the fall block guide at a point accessible to the fall block but inaccessible to the rope and other movable parts, a horned lever, toggle lever mechanism connected to said links and to said horned lever, and means on the trackway co-acting with the horned lever to tilt the same.
12. In combination in a transporter, a carriage comprising a frame, wheels and wheel carrying members to which the frame is hinged closely under the trackway, a fall block guide, locking, unlocking and load sustaining means, including a horned lever, sliding links guided in the fall block guide and accessible to the fall block but not to other moving parts in the bell, load sustaining hooks suspended from the links and toggle means pivotally connected to the horned lever and sliding links.
13. In combination in a transporter, a carriage, locking, unlocking and load sustaining means including a pivoted horned lever, a cam slot in the horned lever, guides in the carriage, a pin passing through the cam slot and guides in the carriage, load sustaining hooks carried from said pin, the slot in the cam being so formed and disposed in relation to the carriage guides that in one position a part of the cam slot lies across the carriage guides whereby the in is locked against movement along the slot and in another position another part of the cam slot colncides with the carriage guides whereby the pin, while movable along the slot and guides locks the horned lever.
14. In combination in a transporter, a carriage, a fall block, a pivoted sustaining hook, a cam-like part, hook disposed in the path of the fall block whereby the latter engaging with the cam-like part moves said hook into engagement with the fall block, a locking member, a direct connection between said locking member and the hook whereby a positive lock is produced in the alternative positions of the mechanism.

\section*{No. 102,610. Mixer. Apparcil à mélanger.}

Felix Notz, assignee of James McBriar, both of Chicago, Illinois, U.S.A., 18th December, 1906; 6 years. Filed 18th August, 1906 . Receipt No. 138,781.
Claim.-1. A mixing machine comprising a mixing chamber, and a plurality of revoluble mixing blades arranged within said chamber at different distances from their axis of revolution and means for imparting different speeds of revolution in the same direction to said blades whereby the stirring and pulling of the batch within the chamber is effected, substantially as described.
2. A mixing machine comprising a mixing chamber, a plurality of mixing blades arranged within said chamber, one of said blades having arms extending lengthwise thereof and arranged to travel in elose proximity to the wall of the mixing chamber and another of said blades having arms extending lengthwise thereof and arranged to revolve within the arms of said first-mentioned bladie and means for imparting different speeds of revolution in the same direction to said blades, substantially as described.
3. A mixing machine comprising a mixing chamber having a curzed body, inner and outer concentrically revoluble mixing blades arranged within sald body, the outer one of sald blades having longitudinal arms shaped substantially as shown and adanted to travel in proximity to the wall of the mixing chamber and the inner of said blades having arms arranged to travel within the path of the outer mixing blade, tubular sleeves connected to the outer mixing blales, shaft sections passing through said tubular sleeves connected to the inner mixing blade and gearing from imparting different speeds of revolution to gaid mixing blades, substantially as described.
4. A mixing machine comprising a mixing chamber having tubular bearings at its ends, supports whereon said

\section*{102610}
bearings are revolubly mounted, gear mechanism whereby said mixing chamber may be turned to discharge its contents, bearing sleeves extending through the tubular bearings at the ends of said mixing chamber, a gear wheel connected to the outer end of one of said bearing sleeves. a mixing blade connected to the inner end of said lastmentioned bearing sleeve, a shaft section extending through one of said bearing sleeves, a gear wheel connected to said shaft section at its outer end, a mixing blado connected to the inner end of said shaft section and a drive shaft provided with pinions engaging sald gearing wheel, substantially as described.

No. 102,611. Levelling Device. Nivcau.

Oscar L. Bonney and William I. Mead, assignee of a half interest, both of Denver, Colorado, U.S.A., 18th December, 1906; 6 years. Filed 18th August, 1906. Receipt No. 138,784.
Claim.-1. The combination with the base of a clock or similar instrument, of a nut embedded in the base in a manner to prevent rotation, a screw-threaded in the nut and protruding both above and below the base, and a key having an unthreaded opening, applied to the upper threaded extermity of the screw and slidable freely on the threaded portion thereof, but connected therewith to cause the two parts to rotate in unison, the threaded portion of the screw extending above the clock base and the key being located at all times entirely above the sajd base.
a. The combination with the base of a clock or similar instrument, of a nut embedded in each corner of the base in a manner to prevent rotation, a screw-threaded in the nut and protruding both above and below the base, and a milled key having an unthreaded opening, applied to thi upper threaded extremity of the screw and slidable freely on the threaded portion thereof, but connected therewith to cause the two parts ito rotate in unison, the key of each Bcrew being located at all times entirely above the clock base.

No. 102,612. Scraper Ior Disc Ploughs. Grattoir pour charrue d disque.

Frank L. Armstrong, Moosejaw, Saskatchewan, Canada, 18th December, 1906; 6 years. Filed 5th April, 1904. Receipt No. 114,100.
Claim.-1. In a disc plough the combination with the lug of the trunnion bearing, of a vertically adjustable bracket having an upper curved end, a pending extension bracket having a curved end, adjustably connected with the former, staple or clip bolts in the shank of the extension bracket, a transverse bearing held by its round sectioned shank in said clip bolts and a disc with trunnion secured to it and journalled in said shanked bearing and having the lower part of its periphery held in contact with the concave face of the main disc and at an acute angle thereto, substantially as set forth.
2. In a disc plough or harrow the combination with the main dise of a smaller disc set at an acute angle thereto and the lower part of the main disc at the rear or rising side thereof, a trunnion secured to sald smaller disc, a bearing in which sald trunnion is fournalled integral with a rod, a bracket having a clip bolt in whirh said rod is held and means of connecting said bracket adjustably with the frame bar which carries the main disc. substantially as set forth.

No. 102,613. Signal Light for Railways.
Signal de chemins de fer.

David Burnfield, Denver, Colorado, U.S.A., 18th December, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,632.
Claim.-In a locomotive head and signal light the combination with the main casing, its lens, the reflector and illuminating device, of auxiliary casings located on opposite sides of and projecting laterally beyond the main casing and communicating with the latter, the auxiliary casings being curved and having lenses located to receive rays from the illuminating device, the main reflector having openings to allow the light to pass from the illuminating device to the lenses of the auxiliary casings, reflect ing tubes entirely concealed by the main and auxiliary casings. the said tubes surrounding the said openings in tho main reflector and being located in line with and be tween the illuminating device and the auxiliary lenses. and curved slides located in the auxiliary casings and adapted to move to positions in front of the lenses of the auxiliary casings. the said slides having openings provised with coloured transparent material adapted to repity with the lenses of the auxiliary casinge.

Mo. 102,614. Mower. Faucheuse.

Joseph Dain, Ottumwa, Iowa, U.S.A., 18 th December, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,084.
Claim.-1. In a mower the combination of a frame, a finger bar adapted to rock about its longitudinal axis, and a plurality of bearings between the inner end portion of said finger bar and said frame.
2. In a mower the combination of a frame, a finger bar projecting la terally at one side of said frame, means connecting said finger bar with said frame, and a plurality of bearings between said connecting means and said frame, said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis.
3. In a mower the combination of a frame, a finger bar projecting laterally at one side of said frame, means connecting said finger bar with said frame, and a pivot bearing and a sliding bearing between sald connecting means and said frame, said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis.
4. In a mower the combination of a frame, a finger bar projecting laterally at one side of said frame, means connecting sald finger bar with said frame, and a pivot bearing and sliding bearing between said connecting means and said frame, said sliding bearing being back of said pivot bearing, said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis.
5. In a mower the combination of a frame, a shoe, a pivot connecting said shoe with said frame and arranged to permit said shoe to swing in the longitudinal plane of the machine, a second bearing between said shoe and said frame, and a finger bar connected with said shoe and extending laterally from said frame.
0. In a mower the combination of a frame, a finger bar adapted to rock about its longitudinal axis, a plurality of bearings between the inner end portion of said finger bar and said frame, and mechanism for raising the finger bar out of operative position.
7. In a mower the combination of a frame, a finger bar projecting laterally at one side of said frame, means connecting said finger bar with said frame, a plurality of bearings between said connecting means and sald frame, sald connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis. and mechanism for raising the finger bar out of operative position.
8. In a mower the combination of a frame, a finger bar projecting laterally at one side of said frame, means connecting said finger bar with said irame, a pivot bearing and a sllding bearing between said connecting means and said frame, said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis, and mechanism for ralsing the finger bar out of operative position.
9. In a mower the combination of a trame, a finger bar projecting laterally at one side of said frame, means connecting said finger bar with said frame, a pivot bearing and a sliding bearing between said connecting means and said frame, said sliding bearing being back of said pivot bearing, said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis, and mechanism for raising the finger bar out of operative position.
10. In a mower the combination of a frame, a shoe, a pivot connecting said shoe with said frame and arranged to permit said shoe to swing in the longitudinal plane of the machine, a second bearing between said shoe and said frame, a finger bar connected with said shoe and extending laterally from said frame, and mechanism for raising the finger bar out of operative position.
11. In a mower the combination of a frame, a finger bar adapted to rock about its longitudinal axis, a plurality of bearings between the inner end portion of said finger bar and said frame, mechanism for raising the finger bar out of operative position, and mechanism for swinging said finger bar upon sald bearings.
12. In a mower the combination of a frame, a finger bar projecting laterally at one side of said frame, means connecting said finger bar with said frame, a plurality of bearings between said connecting means and said frame. said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis, mechanism for raising the finger bar out of operative position, and mechanism for swinging said finger bar upon said bearings.
18. In a mower the combination of a prame, a finger bar projecting laterally at one side of said frame, means connecting said finger bar with said frame, a pivot bearing and a sliding bearing between said connecting means and said frame, said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis, mechanism for raising the finger bar out of operative position, and mechanism for swinging said finger bar about said bearings.
14. In a mower the combination of a frame, a finger bar adapted to rock about its longitudinal axis, and a plurality of bearings \({ }^{*}\) between the inner end portion of said finger bar and said frame, one of said bearings being forward of the finger bar.
15. In a mower the combination of a frame, a finger bar projecting laterally at one side of said frame, means connecting said finger bar with said frame, and a pivot bearing and a sliding bearing between said connecting means and said frame, said pivot bearing being formed of said flnger bar, said connecting means being adapted to swing upon said bearings to rock the finger bar about its longitudinal axis.
14. In a mower the combination of a frame, a pitman extending transversely across the front portion thereof, a laterally extending finger bar, and means for angularly adjusting said finger bar relatively to the pitman.
17. In a mower the combination of a frame, a pitman extending transversely across the front portion thereof, a finger bar extending laterally from the forward portion of said frame, and a plurality of bearings between the inner end portion of said finger bar and said irame, one of said bearings being adjustable to vary the angular relation of sald finger bar to said pitmen.
18. In a mower the combination of a frame, a pitmen extending transversely across the front fortion thereof, a finger bar extending laterally from the forward portion of said frame, and a pivot bearing and a sliding bearing between the inner end portion of said finger bar and said frame, said pivot bearing being adjustable to vary the angular relation of said finger bar to said pitman.
19. In a mower the combination of a frame, a shoe bracket, a shoe pivotally connected with said bracket and adapted to swing laterally, a finger bar connected with said shoe, and means pivotally connecting said shoe bracket in advance of the finger bar with said frame, said shoe bracket having a bearing on said frame back of said pivotal connection.
20. In a mower the combination of a frame having a transversely extending drag bar and a thrust bar connected therewith, a shoe bracket pivotally connected with said frame in alignment with said drag bar, a shoe connected with said shoe bracket, a finger bar connected with said shoe, and a bearing between said shoe bracket and said frame back of said drag bar.
21. In a mower the combination of a frame having a transversely extending drag bar and a thrust bar connected therewith, a shoe bracket pivotally connected with said frame in alignment with said drag bar and adjustable longitudinally thereof, a shoe connected with said shoe bracket, and finger bar connected with said shoe.
22. In a mower the combination of a transversely disposed drag bar, a slecve connected therewith, a shoe bracket having a pivot fitted in said sleeve, a shoe connected with said shoe bracket, a finger bar, and a thrust bas.
23. In a mower the combination of a transversely disposed drag bar, a sleeve connected therewith, a shoe bracket having a pivot fitted in said sleeve, a shoe connected with said shoe bracket, a finger bar, a thrust bar, and a bearing for said shoe bracket back of said pivot.
24. In a mower the combination of a frame having a
ransversely arranged drag bar a thrust bar transversely arranged drag bar. a thrust bar connected therewith, a shoe bracket pivotally connected with sald frame, means for angularly adjusting said shoe bracket relatively to the drag bar, a shoe connected with said shop bracket, and a finger bar.
25. In a mower the combination of a machine frame, a sleeve extending forward at one side thereof, a drive shaft mounted in said sleeve, a crank carried by said drive shaft near its forward end, a pitman connected with said crank and extending transversely of the machine, a drag bar pivotally connected with said sleeve and extending transversely of the machine in advance of said pitman. a shoe bracket pivotally mounted in alignment with said drag bar, a shoe pivotally connected with said shoe bracket, a finger bar connected with said shoe, a cutter bar connected with said pitman, a thrust bar, and a bearing between said thrust bar and said shoe bracket.
20. In a mower the combination of a machine frame, a vertically movable front frame, a finger bar pivotally connected with said front frame so that it may be tilted, and lifting mechanism mounted on said machine frame and acting first to lift said front frame and finger bar and afterwards to tilt said finger bar.
27. In a mower the combination of a machine frame, a vertically movable front frame, a finger bar pivotally connected with said front frame so that it may be tilted, and hand and foot levers for lifting said front frame and finger bar, said hand lever being arranged to be actuated independently of said foot lever to tilt said finger bar after said foot lever has reached the limit of its movement.
28. In a mower the combination of a machine frame, a finger bar, and hand and foot levers for lifting said finger bar, said hand levtr being movable independently of said foot lever to tilt the finger bar after said foot lever has reached limit of its movement.
29. In a mower the combination of a machine frane, a finger bar, a cutter bar carried thereby, means operated by the forward movement of the machine for driving said cutter bar, means for lifting said finger bar to inoperative position, means for automatically throwing said driving mechanism out of operation when said finger bar is raised to inoperative position, and means independent of sald automatic mechanism for disconnecting said driving mechanism.
30. In a mower the combination of a machine frame, a lifting lever, a rocking lever connected with said lifting lever, a swinging fulcrum for said rocking lever, a finger bar, and means connecting said rocking lever with said finger bar.
31. In a mower the combination of a machine frame, a lifting lever, a rocking lever connected with said lifting lever, a swinging fulcrum for said rocking lever, a finger bar, means connecting said rocking lever with said finger bar, and means for limiting the movement of said swinging fulcrum.
32. In a mower the combination of a machine irame, a lifting lever, a rocking lever connected with said lifting lever, a pivotally mounted gag lever on one arm of which said rocking lever is fulcrumed, a finger bar, means connecting said rocking lever with said finger bar, and means for limiting the movement of said gag lever.
33. In a mower the combination of a machine rame, a finger bar, a lifting lever, a rocking lever, a flexible connection between said-lifting lever and one of the arms of said rocking lever, a swinging support on which said rocking lever is fulcrumed, and a connection between said rocking lever and said finger bar.
34. In a mower the combination of a machine frame, a finger bar, a lifting lever, a rocking lever, a flexible connection between said lifting lever and one of the arms of said rocking lever, a gag lever pivotally mounted between its ends, said rocking lever being fulcrumed upon one of the arms thereof, and means for limiting the movement of said gag lever.
35. In a mower the combination of a machine frame, a finger bar, a cutter bar, a drive shaft, means connected with said shaft for reciprocating said cutter bar, a bevelled pinion mounted on sald shaft, a bevelled gear meshing with said pinion, a spur gear, an internal gear meshing with said spur gear, and means for driving said internal gear by the forward motion of the machine.
36. In a mower the combination of a machine frame, a front frame, a shoe connected with said front frame, a finger bar connected with said shoe, draft devices, and means for varying the line of direction of the draft as applied to said front frame.
37. In a mower the combination of a machine irame, a front frame; a shoe connected with said front frame, a finger bar connected with said shoe, draft devices, means connecting the draft devices with the front frame adjacent to the shoe, means connecting the draft devices with the front frame near the center of the machine, and adjustable means for varying the direction of he line of draft as applled to said front frame.
38. In a mower the combination of a machine frame, a front frame, a shoe connected with said front frame, a
finger bar connected with said shoe, draft devices, means connecting the draft devices with the front frame adjacent to the shoe, meas connecting the draft devices with the front frame near the center of the machine, and an aproximately 8 -shaped link for varying the line of direction of the draft as aplied to said front frame.
39. The combination of a rod, a split sleeve fitted thereon and a bolt fitted in the split portions of said sleeve, sald bolt having a V-shaped groove adapted to engage said rod.
40. In a mower the combination of a machine frame, a cutter bar, an axle mounted in said frame, wheels mounted on said axle, for rotating the same by the forward motion of the machine, driving mechanism adapted to be connected with said cutter bar for driving the same, a clutch member for connecting said driving mechanism with sald axle, and means for connecting said clutch member with axle, said connecting means having a tendency to hold said clutch member in operative position.

41 In a mower the combination of a machine frame, a cutter bar, an axle mounted in said frame, wheels mounted on said axle for rotating the same by the forward motion of the machine, driving mechanisin adapted to be connected with said cufter bar for driving the same, and a clutch member for connecting said driving mechanism with said axle, said clutch member having an inclined groove adapted to receive an inclined feather carried by the axle, said parts being so arranged so that the rotation of the axle tends to force said clutch into operative engagement with said driving mchanism.
42. In a mower the combination of a box, a hinged cover thercfor, a latch pivotally mounted on the free edge of the cover and having an arm adapted to extend around under the lower edge of the box and a spring for holding sald arm in engagement with said box.
43. The combination of a box having a hinged cover, a latch pivoted between its ends upon the free edge of the cover, one end of said latch being adapted to project under the lower front edge of the box, and a spring mounted on the cover and engaging the other end of said latch for holding the lower end of the latch in engagement with the box.
44. The combination with a coiled spring, of a bolt having a nut fitted in said spring, said nut having spiral grooves adapted to receive the colls of the spring.
45. In a mower the combination of a machine frame, having a forwardly extending driving shaft, a pitman actuated by said drive shaft and extending transversely of the machine, a cutter bar connected with said pitman, a anger bar, a drag bar connected with the main frame adjacent to the forward end of said drive shaft and extending transversely of the machine forward of the pitman, and a thrust bar connected with said drag bar.
46. In a mower the combination of a machine frame, a sleeve extending forward at one side thereof, a drive shaft mounted in said sleeve, a crank carried by said drive shaft near its forward end, a pitman connected with sald crank and extending transversely of the machine, a drag bar connected with said sleeve and extending transversely of the machine in advance of said pitman, a finger bar and a cutter bar connected with said pitman.
47. In a mower the combination of a machine frame, a sleeve extending forward at one side thereof, a drive shaft mounted in said sleeve, a crank carried by sald drive shaft near its forward end, a pitman connected with said crank and extending transversely of the machine, a one-piece rigid drag bar connected with said sleeve and extending transversely of the machine in advance of said pitman, a finger bar, and a cutter bar connected with said pitman.
48. In a mower the combination of a frame, a finger bar, a gag lever, a bell crank lever fulcrumed on the gag lever, means connecting said bell crank lever with the finger bar, and means for actuating said bell crank lever.

\section*{No. 102,615. Method of Obtaining Ammonia from Gas.}

\section*{Méthode d'obtenir l'ammoniaque du gas.}

August Fillunger, Mährish Ostrau, Austria, 18th December, 1906; 6 years. Filed 15th August, 1906. Receipt No. 138,710.
Claim.-1. A method of obtaining ammonia from gas containing ammonia, consisting in leading said gas through a washer, in passing water through said washer in order to absorb ammonia from the gas, in distilling ammonia from said water, in leading said water after the ammonia has been distilled off back to the washer and in repeating the above continuous cycle of operations.
2. A method of obtaining ammonia from gas contalning ammonia, consisting in leading said gas through a washer. in passing water through said washer in order to absorb ammonia from the gas, in distilling ammonia from said
water, in cooling said water after the ammonia has been distilled off, in leading said cooled water back to the washer and in repeating the above continuous cycle of operations.
3. A method of obtaining ammonia from gas containing ammonia, consisting in leading said gas through a washer, in passing water through said washer in order to absorb ammonia from the gas, in distilling ammonia from sald water by heating the same by superheated steam, in cooling said water after the ammonia has been distilled off, in leading said cooled water back to the washer and in repeating the above continuous cycle of operations.
4. A method of obtaining ammonia from gas containing ammonia, consisting in leading said gas through a washer, in passing water through said washer in order to absorb ammonia from the gas, in distilling ammonia from said water by directly heating the same by superehating steam, in cooling said water after the ammonia has been distilled off, in leading said cooled water back to the washer and in repeating the above continuous cycle of operations.
5. A method of obtaining ammonia from gas containing ammonia, consisting in leading said gas through a washer, in passing water through said washer in order to absorb ammonia from the gas, in distilling ammonia from sald water by heating the same by superheating steam in column distilling apparatus, in cooling said water after the ammonia has been distilled off, in leading said cooled water back to the washer and in repeating the above continuous cycle of operations.
6. A method of obtaining ammonia from gas containing ammonia, consisting in leading said gas through a washer, in rassing water through said washer in order to absorb ammonia from the gas, in distilling ammonia from said water without adding lime, in leading sald water after the ammonia has been distilled off back to the washer and in repeating the above continuous cycle of operations.
i. A method of obtaining ammonia from gas containing ammonia, consisting in leading said gas through a washer, in passing water through said washer in order to absorb ammonia from the gas, in distilling ammonia from said water without adding lime, in cooling said water after the ammonia has been distilled off, in leading said cooled water back to the washer and in repeating the above continuous cycle of operations.

\section*{No. 102,616. Artificial slate. Ardoise artificielle.}

Johann Wetlef Hennings, Neuenfeld Kreis Jork, Germany, 18th December, 1906; 6 years. Filed 16th November, 1906. Receipt No. 141,256 .

Claim.-The process for the manufacture of artificial slate, which consists of intimately mixing and finely triturating cement with an addition of \(20-25\) per cent of brownstone in dry condition, then admixing water to the pulverized material and forming a thin magma and introducing same into glass mowlds in which it is left to solidify in a slow and gradual manner, as set forth

\section*{No. 102,617. Method of Making Aluminates Hydrochloric Acid, and Soda, from Aluminous Materials.}

Méthode d'obtenir l'acide hydrochlorique et le soda de matériaux alumineux.

Paul Klein, Riga, Russia, 18th December, 1906; 6 years. Filed 16th August, 1906. Receipt No. 138,751.
Claim.-A process of manufacturing aluminates, hydrochloric acid and soda from aluminous materials, consisting in introducing the aluminous materials in a finely pulverized state into molten sodium chloric, blowing superheated water vapour through the fused mass when employing anhydrous raw materials, condensing the hydrochloric acid developed, separating the sodium aluminate contained in the molten residue by lixiviation and filtration from any insoluble substance mixed therewith, conducting carbonic acid into the clear solution of sodium aluminate, and finally filtering off the solution of soda thus obtained from the separated aluminium hydrate.

\section*{No. 102,618. Hydro-carbon Burner.}

\section*{Braleur à hydrocarbon.}

Louis Keller Leahy, Los Angeles, California, U.S.A., 18th December, 1906; 6 years. Flled 14th August, 1906. Recelpt No. 138,688.
Claim.-1. A burner comprising a casing having a cylindrical chamber provided with a slot in its side wall, said chamber open at one end, a plug adapted to be inserted into said chamber and being of such size as to fit tightly herein, said plug provided wih a diametric passage and hav-
ing a portion of its peripheral surface cut away to form an oil discharge, leading to the mouth of said slot from

one end of said passage between such cut away portion and the wall of said chamber, said casing having an opening or oil inlet registering with and opening into the other end of said passage, a steam way formed at the lower end of said plug and within said casing and discharging through said slot, and oil and steam pipes connected with said oll inlet and steam way respectively.
2. A burner tip comprising a casing having a cylindrical chamber with a peripheral outlet from said chamber, a cylindrical plug inserted in said chamber and forming between its outer surface and the inner surface of said casing a downwardly extending oll way, terminating at said peripheral outlet, and below said plug, a steam chamber communicating to said peripheral outlet, said plug having a diametric oll passage opening into said oil way in combination with an oil supply pipe connected with said diametric oll passage and a steam supply pipe connected with said steam chamber.
3. A burner tip comprising a hollow casing having a lateral slot and a plug inserted therein being of such size as to fit tightly in said casing and having a portion of its surface cut away to form an oil way or passage between said surface and the wall of sald casing, sald oll way terminating at said slot, said plug having passage transversely through it registering with said oil passage, and a steam way formed below sald oll way and opening to said slot.
4. A burner tip comprising a hollow casing having a lateral discharge slot, the upper wall of the slot lying beyond the plane of the lower wall thereof, and a plug removably held in the chamber of said casing, said plug having transverse oil passage and a portion of the outer surface of its wall cut away to form an oll way between such cut-away portion and the wall of said casing, said oll way leading from said traverse passage and terminating at said slot and a steam way formed below said oll way and communicating with the discharge slot in combination with means for supplying oil to sald oil way and means for supplying steam to said steam way.
5. A burner tip comprising a casing having a cylindrical chamber open at one end and having an oil inlet at one side, a steam inlet near the bottom and a peripheral discharge slot, and a cylindrical plug adapted to be slipped into said chamber through the open end thereof and removably held therein, and fitting tightly within said chamber, said plug having a transverse oil way registering with said oil inlet and having a portion of the outer surface of its front wall cut away and forming between its wall and the inner wall of the casing an oil duct leading from said oil way to said discharge slot, and said casing and plug forming a steam way leading from sald steam inlet to said discharge slot, and means for holding said plug in place.
6. A burner tip comprising a casing having a cylindrical chamber open at one end and having an oll inlet at one side and a peripheral discharge slot, and a cylindrical plug adapted to be slipped into said chamber through the open end thereof and movably held therein, said plug havign a transverse oll way registering with said oil inlet and having the lower portion of the outer surface of its front wall cut away and forming between its wall and the inner wall of the casing an oll duct leading from said oil way to said discharge slot, said plug fitting tightly within said casing and a steam way formed through said casing and plug to said discharge slot.
7. A burner tip comprising a casing having a cylindrical chamber open at one end and having a periheral discharge slot and an opening in its opposite slde above the plane of such slot, a cylindrical plug adapted to insertion into
and snug fit within said chamber and removably held therein, said plug having a closed end forming a closure for the open end of said chamber and a transverse opening registering with said opening in said casing forming an oll way leading through said plug, said plug forming an oil duct between the surface of the lower portion of its front wall and the wall of said casing leading from said transverse opening right angularly to said discharge slot, a steam duct leading to said discharge slot, and means for supplying steam and oll to said respective steam and oil ducts.
8. A burner tip comprising a casing having a chamber open at one end and having an oil inlet at one side and a peripheral discharge slot at the other side, and a plug removably mounted in said chamber and closing the same, said plug having a transverse oll way or chamber registering with said oil inlet and forming a duct between the lower portion of its surface and the wall of the casing, said duct being in communication with sald transverse oil way or chamber and leading downwardly to the mouth of said discharge duct, and a steam way discharge through said discharge slot traverse the plane of said duct.
9. A hydro-carbon burning apparatus comprising a burner tip having oil and steam ducts and a discharge opening, of a steam pipe, an oil plpe therein, a coupling whereinto said oil pipe screws, said coupling having an oil way registering with said pipe and a steam way, the end of said steam pipe inserted in the steam way about said oil pipe, a collar or sleeve engaging said stcam pipe and abutting against the end wall of said steam way, and lock collar engaging an external thread on the wall of said steam way and having a portion erubracing said colla: or sleeve.
10. A hydro-carbon burning apparatus comprising a burner tip having oil and steam ways and a discharge opening, a steam pipe connected with the steam way, an oil pipe inside the steam pipe connected with oil way, a coupling having a coupling flange with external thread, the end of said steam pipe extending within said flange, a threaded sleeve or collar engaging said pipe and bearing against the end of said flange, and a coupling collar embracing said flange and engaging said external thread and bearing against said sleeve or collar.
11. A burner tip comprising a casing having a cylindrical chamber open at one end and having an oil inlet at one sido and a peripheral discharge slot, and a cylindrical plug removably mounted in said chamber and fitting snugly within and closing the same, said plug having a transverse oil way registering with said oil inlet and forming between the surface of the lower portion of its front wall and the inner wall of the casing, an oil duct leading from said oil way to said discharge slot, a steam way formed through said casing and plug to said discharge slot and an abutment in said steam way forming a steam cushion at the mouth of the stiamway.
12. A burner tip comprising a hollow casing having a lateral discharge slot, the upper wall of the slot lying beyond the plane of the lower wall thereof and a plig removably held in the chamber of the casing and fitting snugly therein, said plug having a portion of the lower and front portion of its wall cut away to form an oil way between such cut-away portions and the wall of said casing, said oil way terminating at said slot. said casing provided with a steam inlet, said plug and casing forming a steam way or chamber below said plug, and said plug having a channel forming a cushioning abutment at the mouth of said steamway.
13. A burner tip comprising a casing having a cylindrical chamber open at its top and having a lateral oil inlet and a peripheral discharge slot, and a cylindrical plug mounted in said chamber and closing the toy thereof, said plug provided with an oil way registering with said oil inlet and extending diametrically through said plug, a portion of the surface of the plug cut away opposite said oil inlet and forming with the wall of said casing, an oil duct leading downwardly to said discharge slot, said plug fitting snugly within said chamber, a steam chamber formed between the bottom of said plug and casing, said steam chamber opening to said discharge slot, in combination with means for supplying oil to said oil-way and steam to said steam chamber.
14. A burner tip comprising a casing having a cylindrical chamber and having a lateral oil inlet and a peripheral discharge slot, and a steam inlet and a plug removably mounted in said chamber and provided with a transverse oil-way registering with said oil inlet and having the lower portion of its front surface cut away to form with the wall of the casing, a downwardly extending oil-way leading to the mouth of said discharge slot, a steam chamber or way formed between the bottom of the plug and casing and opening to said discharge slot, and said discharge slot being somewhat wider than the downward oilway so as to discharge a wider sheet of steam than oil.

\section*{No. 102,619. Holder for Cards, Pictures, Etc. Porte-cartes, images, etc.}

Gaylord Logan, Albany, New York, U.S.A., 18th December, \(1906 ; 6\) years. Filed 8th November, 1906. Receipt No. 141,035.
Claim.-1. A card, film and picture holder having an elongated hand divided into sections by means of creased transverse lines, and provided on its edges with retaining strips foldred freely over on to the face of the band and secured thereto at the ends of strips, substantially as shown and deseribed.
2. A card, film and picture holder having an elongated band provided with transverse folding creases and with retaining strips folded freely on to the face of the band with the end of the band folded over and secured to the end wection, substantially as shown and described.
3. A card, film and picture holder having an elongated band provided on its edges with retaining strips folded over against the face of the band and with transverse folding lines dividing said baud and retaining strips into sectlons, said strips being folded freely against the face of said band and bound to the face of the end section to form a fap, substantially as shown and described.
4. A c,rd, film and picture holder having an elongated band of transparent material divided into sections by means of crased transverse lines and provided with retaining sirips folded over on to the face of the band and secured thereto at their ends, substantlally as shown and described. 5. A card. film and picture holder having an elongated band divided into sections by means of creased transverse lines and provided with retaining strips folded over onto the \(f: . c e\) of the band and with openings formed in said sections and a back formed of transparent material, substantlally as shown and described.
6. A card, film and picture holder having an elongated band divided into sections by means of creased transverse lines, and provided with retaining strips folded over onto the face of said band, with a transparent back and a separating leaf arranged between two opposite sections, substantially as shown and described.
7. A card, film and picture holder having the combination of an elongated band provided with retaining strips folded over onto the face of said band, and divided into sections by means of creased transverse lines, a back of transparent material, and a separating leaf of parafine paper arranged between two sections, substantially as shown and described.
8. A card, film and picture holder having an elongated band divided into sections by menas of creased transverse lines and provided with retaining strips folded freely over onto the face of the band and with openings formed in onto the face of the band and with openings
said sections, substantially as shown and described.
9. A card, film and picture holder having an elongated band divided into sections by means of creased transverse lines and provided on its face with retaining strips folded over onto the face of the band and made of material contrasting in colour with film.

\section*{No. 102,620. Sugar Wafer Machine.}

Machine pour la fabrication de losanges.
Frank Max Peters, Chicago, Illinios, U.S.A., 18th December, 1906: 6 years. Filed 16th Angust, 1906. Receipt No. 138,753.
Claim.-1. In a machine of the character described the comblnation with a sunport for wafer sheets, of a paste receptacle having an outlet therein, means for effecting the discharge of the paste in proper quantities trom said receptacle, and means for transferring the discharged paste in a cohesive mass to the wafer sheets, substantially as specified.
2. In a machine of the character described, the combination with a support for wafer sheets, of a paste receptacle having an outlet therein, means for conducting the paste from said outlet, and means for transferring the paste in
a cohesive mass from said conducting means to the wafer sheets, substantially as specified.

3. In a machine of the character described, the combination with a sur port for wafer shets, of a paste receptacle having an outlet therein, means for effecting the discharge of the paste in proper quantities from said receptacles, and mans for transferring the discharged paste in a cohesive mass from said discharging means to the wafer sheets, substantially as specified.
4. In a machine of the character described, the combination with a support for wafer sheets, of a paste receptacle having an outlet therein, a conducting device arranged therein for conveying the parts from said receptacle, and means for removing the paste from said conducting device in a cohesive mass and transferring the same to the wafer sheets, şubstantially as specified.
5. In a machine of the character described the combination with a support for wafer sheets, of a paste receptacle having an outlet therein, a device arranged therein for conveying the paste from said receptacle, means for controling the quantity of paste delivered to said device, and means for removing the paste from said device in a cohesive mass and transferring and spreading the same upon the wafer sheets upon said support, substantially as specified.
6. In a machine of the character described the combination with a support for wafer sheets, of a paste receptacle having an outlet therein, a roller arranged in said outlet, means for controlling the supply of paste conveyed by said roller, and means for removing the paste in a cohesive mass from said roller, substantially as specified.
7. In a machine of the character described, the combination with a support for wafer sheets, of a paste receptacle having an outlet therein, a roller arranged in said outle.t, means for controlling the supply of paste conveyed by said roller, and means for removing the same in a cohesive mass from said roller to the wafer sheets, and spreading the same, substantially as specified.
8. In a machine of the character described, a paste receptacle, a roller for conducting the paste therefrom in the form of a sheet coating the roller, a support for the wafer sheets below said roller, and means for stripping the coating in a cohesive mass from said roller directly over said wafer sheets, substantially as specified.
9. In a machine of the character described, a paste receptacle, a roller for conducting the paste therefrom in the form of a sheet coating the roller, a support for the wafer sheets below said roller, means for stripping the coating in a cohesive mass from said roller directly over said wafer sheets, and means for spreading the material stripped from the roller upon said wafer sheets, substantially as specified.
10. In a machine of the character described, a paste receptacle, a roller for conducting the paste therefrom in the form of a sheet coating the roller, a support for the wafer sheets below said roller and a blade serving at one edge to strip the coating from said roller directly over the wafer sheets and at its other edge to spread the stripped material upon said wafer sheets, substantially as specified.
11. In a machine of the character described the combination with a support for wafer sheets, of a paste receptacle having an opening in the base thereof, a roller arranged in said opening, means arranged at one side of said roller for controlling the supply of paste delivered thereto, and means arranged at the opposite side of said roller for removing the paste from said roller in a cohesive mass to the wafer sheets and spreading the same thereon, substantially as specified.
12. In a machine of the character described the combination with a support for wafer sheets, of a paste receptacle having an opening in the base thereof, a roller arranged partly within and partly without said paste receptacle, means arranged adjacent to the projecting portion of said roller at one side thereof for controlling the delivery of paste to said rollen and means arranged at the opposite side of the projecting portion of said roller for removing the paste therefrom in a cohesive mass and transferring the same to the wafer sheets, substantially as specified.
13. In a machine of the character described the combination with a support for wafer sheets, of a paste receptacle having an opening in the base thereof, a roller arranged partly within and parly without said paste receptacle, means arranged adjacent to the projecting portion of said roller at one side thereof for controlling the delivery of paste to said roller, and means arranged at the opposite side of the projecting portion of said roller for removing the paste therefrom in a cohesive mass and transferring and spreading the same upon the wafer sheets, substantially as specified.
14. In a machine of the character described the combination with a support for wafer sheets, means for actuating said support, a paste receptacle supported above said support having an opening in the base thereof, a roller arranged partly within and partly without said receptacle for conducting the paste from said receptacle, means for actuating said roller, a blade supported adjacent to one side of said roller, means for adjusting said blade, a blade supported adjacent the opposite side of said roller for removing the paste from said roller in a cohesive mass, and means for vertically and horizontally adjusting said blade, substantially as specified.
15. In a machine of the character described the combination with a travelling support for wafer sheets and means for actuating said support, of a paste receptacle supported above said travelling support, an opening in said receptacle arranged transversely of said travelling support, a roller supported below said plate receptacle and extending into the opening in the base thereof, means for rotating said roller, means for controlling the delivery of paste to said roller, and means for removing the paste therefrom in a cohesive mass and spreading the same upon the wafer sheets, substantially as specified.
10. In a machine of the character described the combination with a travelling support for wafer sheets, and means for actuating said support, of a paste receptacle mounted above said travelling support, an opening in the base of said receptacle arranged transversely of said travelling support, a roller supported below said paste receptacle and extending into and conforming partly to the opening therein, a controlling device arranged upon the underside of said paste receptacle at one side of the roller, means for adjusting said device towards and from said roller, a device arranged below said paste receptacle and adapted for contact at one edge with the side of the roller opposite to the controlling device and at its other edge with the wafer sheet and the paste thereon whereby to spread the paste upon said wafer sheets, and means for actuating said device to regulate the thickness of the paste spread upon the wafer sheets, substantially as specified.
17. In a machine of the character described the combination with an endless band for wafer sheets, means for actuating said endless band, brackets arranged at each side of said endless band, a paste receptacle mounted in said brackets having an opening in its base arranged transversely of said endless band, a roller mounted in said brackets below said paste receptacle conforming to and extending into the opening in the base thereof, a blade movably secured to the underside of raid paste receptacle at one side of the roller, means for adjusting said blade towards and from said roller, a blade adjustably arranged at the opposite side of said roller having its inner edge in contact with said roller and its outer edge adapted for vertical adjustment and means for adjusting said blade, substantialiy as specified.
18. In a machine of the character described the combination with an endless band for wafer sheets, means for actuating said endless band, brackets arranged at each side of said endless band, a paste receptacle mounted in said brackets having an opening in its base arranged transversely of said endless band, a roller mounted in said brackets below said paste receptacle conforming to and extending into the opening in the base thereof, a hlade arranged upon the underside of said paste receptacie at one side of the roller, adjusting screws provided upon said receptacle in engagement with said blade whereby to move said blade towards and from said roller, a frame arranged at the opposite side of said roller, adjusting screws thereon for adjusting said frame, a blade
mounted in said frame having its inner edge in contact with said roller, and its outer edges adapted to spread the paste upon the wafer sheets, and an adjusting screw arranged in said frame adapted for adjusting the outer edge of said blade, substantially as specified.

\section*{No. 102,621. Wall Coating Composition.}

Composition pour murs.
The Liquid Wall Paper Company, assignen of Franklin Dana Hagar, both of Boston, Massachusetts, U.S.A, 18th December, 1906; 6 years. Filed 16th March, 1906. Recelpt No. 133,947.
Clain.-1. The herein described composition of matter, containing gum tragacanth, chrome and flock, substantially as described and for the purpose of making a wall covering.
2. The herein describel composition of matter. containIng water, gum tragacanth, chromic oxide and flock, substantially as described and for the purposes specifled.
3. The herein described composition of matter containing water, gum tragacanth, chromate of lead and flock, substantially as described and for the purpose sperified.
4. The herein described compositon of matter containing sum tragacanth, chromic oxide and sawdust, substiatially as described and for the purnose of producing a stippling background.
5. The herein described composition of matter containing gum tragacanth, chromate of lead and sawdust, substantially as described and for the purpose of producing a stippling background
6. The herein described composition of matter containing water, gum tragacanth, chrome nad sawdust, substantially as described and for the purpose specifled.
7. The herein described composition of matter containing gum, tragacanth, chromic oxide, meal and sawdust, substantially as described and for the purpose specified.
8. The herein described composition of matter containing gum tragacanth, chromate of lead. meal and sawdust, substantially as described and for the purpose specifled.
9. The herein described composition of matter containing gum, tragacanth, chrome, water, moal and sawdust, substantially as described and for the purposes specified.
10. The herein described composition of matter containing gum tragacanth. chromic oxide and sraw, substantially as described and for the purpise specifled.
1. The herein described composition of matter cantaining gum tragacanth, chromate of lead and straw, substantially as described and for the purposes specified.
12. The herin descibed composition of matter containing water, straw, chrome and gum tragacanth, substantially as described and for the purposes specificd.
13. The herein described composition of matter containing gum tragacanth, chromic oxide and bronze powder, subtially described and for the purpose of producing an artistic wall covering
14. The herein described composition of matter containing gum tragancanth, chromate of lead and bronze powder substantially as described and for the purpose of producing an artistic wall covering.
15. The herein described composition of matter containing water, gum tragacanth. chrome and bronze powder substantially as described and for the purposes specified.
16. The herein doscribed composition of matter containing gum tragacanth, flock and bronze powder, substantially as descuribed and fot the purpose of obtaining a wall coating composition with a transparent effect.
17. The herein described composition of matter containing water, gum tragacanth. flock and bronze powder, substantially as described and for the purpose of obtaining a wall coating composition with a transparent effect.
18. The herein described composition of matter containing gum tragacanth, flock. meal and bronze powder, substantially as described and for the purposes specified.
19. The herein described composition of matter containing gum, tragacanth, flock, bran and bronze powder, substantially as described and for the purposes specified.
20. The herein described composition of matter containing gum, tragacanth, flock, sawdust and bronze powder, substantially as described and or the purposes specified.
21. The herein describod composition of matter containing gum tragacanth, fiock. straw and bronze nowder, substantially as described and for the purposes specified.
22. The herein described composition of matter containing gum tragacanth, flock, crome and bronze powder, substantally as described aud for the purposes specified. 23. The heren described composition of matter containing water, flock, chrome and bronze powder, substantially as described and for the purposes specified.
24. The herein described composition of matter containing gum tragacanth, flock, water, chrome and bronze pow
der, substantially as described and for the purposes specified.
25. The herein described composition of matter containing gum tragacanth, flock. meal. bran. sawdust, straw and bronze powder. substantially as described anl for the purpozes specified.
26. The herein described composition of matter containing water, gum tragacanth, bronze powder, flock, meal and sawdust. substantially as described and or the purposes specified.
\(\because\). The herein described composition of matter containing gum tragacanth, chromic oxide, flock and whiting, substantially as described and for the purpose syecified.
28. The herein described composition of matter containing water, gum tragaranth, chrome, flock and whiting, substantially as described and for the purposes specified.
29. The herein described composition of matter containing water. rosin, flock, and chrome, substantially as described and for the purpos s specified.
30. The herein described composition of matter containing water, resin. chromic oxide and meal, substantially as describnd and for the purpose specified.
31. The herein described composition of matter containing water, rosin. chromate of lead and meal, substantially as described and for the purpose speciffed.
32. The hereln described composition of matter containing glue, rosin, and flock, substantially as described and for the purposes specified.
33. The herein describod composition of matter containing rosin, water. flock and whitine, substantlally as described and for the purpos? specifled.
34. The herein described composition of matter containing gum tragacanth. flock and mica, substantially as described and for the purpose specified
35. The herein described composition of matter contalning water, glue, flock and mica, substantially as described and for the purpose specifled.
36. The herein described composition of matter, containing gum tragacanth, mica, chrome and bran, substantially as described and for the purposes specified.
37. The herein described composition of matter, containing gum tragacanth, chrome, mica, meal, bran, sawdust and straw, substantially as described and for the purposes specified.
38. The heroin described composition of matter, containing gum tragaranth, bronze powder, and mica, substantially as described and for the purposes specified.
39. The herein described composition of matter, containing gum tragacanth, bronze powder, mica and meal, substantially as described and for the purposes specifled.
40. The herein described composition of matter, containing gum tragacanth, mica and ground silk, substantially as described and or the purposes specifled.
41. The herein described composition of matter, containing gum tragicanth, chrome, flock and ground silk, substantially as described and for the purposes specifled.
42. The herein described composition of matter, containing gum traqacanth, varnish and flock, substantially as described and for tho nurposes specifled.
43. The herein described comoosition of matter, contalning gum tragacanth, varnish and flock, substantially as described and for the purnos:s specified.
44. The herein described composition of matter, containing varnish, chrome and meal, substantially as described and for the purposes specified.
45. The hrrein deceribed comnosition of matter. containing varnish. chrome and sawdust. substantially as described and for the purnoses specified.
46. The herein dnceribed composition of matter, containing gum trag?canth, varnish, chrome. ground silk, and pulvrized cork. substantially as described and for tha purposos specified
47. The herein described csmposition of matter, containing gum tragacanth, chrome, meal, rosin, glue, brown sugar and sawduct, substantially as described and for the purposes specifled.
48. The herein described composition of matter. containing oum tragananth. rhrome. meal and formaldehyde, substantinlly as drscribed and inr the purposos specified.
49. The herein described rompositnn of matter, containing gum tragacanth, flock, and formaldehyde, substantially as deseribed and for the purposes specified.
50. The herein described composition of matter, contalning gum tragacanth, chrome, sawdust and formaldehyde. substantially as described and for the purposes specificd.
51. The herein described composition of matter. containing gum tragacanth, chrome, mica and formaldchyde, suhstantially as described and for the purposes specified.
52. The herein described composition of matter, containing gum tragacanth, chrome. straw and formaldehyde, substantially as described and for the purposes specifed.
63. The herein described composition of matter, contaln ing water, chrome, meal, sawdust and formaldehyde, substantially as described and for the purposes specifled.
54. The hereln described composition of matter, containing gum tragacanth, chrome, flock, bronze powder, rosin, varnish and brown sugar, substantially as described and for the purposes specified.
55. The herein described composition of matter, containing gum tragacanth, chrome, meal. bran. sawdust. straw rosin. mica, ground silk, varnish, pulverized cork, glue and brown sugar. substantially as described and for the purposes snerlfied.
56. The hereln described composition of matter, containing gum tragacanth, chromic oxide, chromate of lead, flock, meal, bran, sawdust, straw, bronze powder, whiting, rosin, mica, pulp. ground silk, varnish, pulverized cork and glue, substantially as described and for the purposes specifed.
57. The herein describnd compos tion of matter, containIng gum tragacanth, chrome, pulp, and formaldehyde, substantially as described and for tho purposes specified.
58. The herein described composition of matter, containin varnish, pulp. chrome, and formaldehyde, substantially as described and for the purposes snecifled.
59. The herein described composition of matter, containing rosin. gum tragacanth, pulp and chrome, substantially as described and for the purposes specifled.
60 . The hereln described composition of matter for mixing with flock in forming a liquid wall paper, conslsting substantially of the following ingredients, gum tragacanth six gills, chromic oxide nine ounces, chromate of lead nine ounces, meal nine ounces, bran three ounces, sawdust three ounces, straw three ounces, bronze powder two ounces, whiting one pound. rosin six gills, mica three pounds, pulp two pounds, ground silk one pound, varnish three tablespoonfuls, pulverized cork three ounces, glue two tablespoonfuls, brown sugar six ounces, formaldehyde three drops.

No. 102,622. Fige Plug. Poire d fusće.

August Weber, Sr., and August Weber, Jr., both of Schenectady, New York, U.S.A., 18th December, 1906; 6 years. Filed 23rd February, 1906. Receipt No. 133,264.
Claim.-1. In a fuse plug and in combination, a screw shell adapted to form one of the exterior contact members, a base of insulating material having its inner end inclosed and secured within said screw shell and provided with a cavity extending from its outer end approximately to its inner end and having a partition erected from its inner end extending across the exterior of its screw shell inclosed portion, a contact member mounted upon the exterior of the inner end of the base, and a fuse extending over said partition and connected with said contact members through apertures in said base, portions of said fuse occupying on opposite sides of said partition chambers respectively inclosed between sald partition and outer screw shell inclosed portions of the wall of the base.
2. In a fuse plug and in combination, a base of insulating material, and a screw shell inclosing and secured upon the inner end of said base adapted to form one of the exterior contact members, said base being provided with a cavity extending approximately to its inner end and with a pair of apertures in its inner end and having a partition erected from its inner end extending between said apertures across the interior of its screw shell inclosed portion, and said screw shell having a connecting member extending through one of sald end apertures into said cavity on one side of said partition, an exterior contact member mounted upon
the exterior of the inner end of the base having a connecting member extending through the other of said end apertures into said cavity on the other side of said partition, and a fuse extending over said partition connected at its opposite ends to said connecting members respectively.
3. In a fuse plug and in comblgation, a hollow base of insulating material provided with a pair of fuse connection apertures and with an enlargement of its cavity at the outer end thereof and a ventilating aperture remote from said fuse connection apertures extending from said cavity enlargement longitudinally through and inclosed on all sides by the wall of the base and opening exteriorly at the side thereof, exterior contact members, a fuse within the base cavity connected with sald contact members through the fuse connection apertures respectively, and a closure for the open end of the base
4. In a fuse plug and in combination, a hollow base of insulating materlal provided with a pair of fuse connection apertures in its inner end wall and with an enlargement of its cavity at the outer end thereof, and a ventlating aperture remote from said fuse connection apertures extending from said cavity enlargement longitudinally through the wall of the base and opening exteriorly at the side thereof, a screw shell inclosing said base adapted to form an ex terior contact member and having an integtal tongue formed by a displaced portion of its end wall projecting through one of sald fuse connection apertures in the end wall of the base, an exterior contact member mounted upon the inner end of the base having a connection member projecting through the other of said fuse connection apertures, a fuse within the base cavity connecting said tongue and connection member, and a closure for the outer end of the base.
5. In a fuse plue and in combination, a hollow base of insulating material provided with a pair of fuse connection apertures in its inner end wall and with an enlargement of its cavity at th outer ed thereof, and a ventilating aperture remote from sald fuse connection apertures extending from said cavity enlargement longitudinally through the wall of the base and opening exteriorly at the side thereof, and having a partlion erected from its inner end wall extending transversely of the base cavity between said fuse connection apertures. a screw shell inclosing said base adabted to forin an exterior contact member and having an integral toneue formed by a displaced portion of its end wall projecting through one of said fuse connection apertures in the end wall of the base, an exterior contact member mounted upon the inner end of the base having a connertion member projecting through the other of said fuse connection apertures, a fuse within the base cavity connecting sald tongue and connection member, ad a closure for the outer end of the base.
6. In a fuse plug and in combination, a hollow base of insulating material provided on its outer side with oppositely located depressions and having a partition erected from its inner end wall extending transversely of the base cavity approximately in line with said depression, a screw shell inclosing the base having side portions introverted into sald side depressions therein. and a fuse extending over said partition and connected with exterior contact members.
7. In a fuse plug and in combination, a hollow base of insulating material having a plain cylindrical portion and an aperture in its inner end, of a screw shell inclosing the plain cylindrical portion of the base and having an integral displaced portion of its end wall projecting through said aperture in the inner end of the base whereby rotative movement of the screw shell on the base is prevented. and means for securing said screw shell against longltudinal movement on the base
8. In a fuse plug and in combination of insulating material and a screw shell adopted to form one of the exterior contacts secured upon and inclosing the inner end of the base, said base being provided with a cavity extending approximately to its inner end and with a pair of apertures in its inner end and having a partition erected from its inner end extending between said apertures across the interior of its screw shell inclosed portion, and said screw shell having an integral displaced portion of its end wall projecting through one of the end apertures in the base, an exterlor contact insulated from said screw shell having a connection member projecting through the other end aperture in the base, and a fuse extending over said partition connecting said connection member and displaced portion of the screw shell.
8. In a fuse plug and in combination a base of insulating material and a screw shell adapted to form one of the exopposite sides of said partition, of a contact member exteriorly mounted upon the inner end of the base having a post projecting through one of said apertures within the base, a screw shell inclosing the base adapted to form the other contact member, and having an integral
tongue formed by an introverted portion of its end wall extending through the other of said apertures within the base, and a fuse extending over said partition connected at its opposite ends to said tongue and post respectively. 10. In a fuse plug the combination with a hollow base of insulating material having an angular exterior inner end and side depressions, of a screw shell inclosing said base provided in its end with an angular opening adapted to fit the angular portion of the base and having side portions introverted to occupy said side depressions.
11. In a device of the class described the combination with a base of insulating material of general cylindrical form having an exterior cam-shaped suiface, a depressed seat adjacent to the higher point of said cam and a flange overhanging said seat on the outer side thereof, of a cap adapted to receive the flanged end of said base and having a spring member adapted to ride upon said cam by a rotative movement of the cap upon the base and adapted to occupy said depressed seat.
12. In a device of the class described the combination with a base of insulating material of general cylindrical form having near one end an exterior cam surface, a depressed seat adjacent to the higher portion of said cam. and a flange overhanging said depressed seat and cam surface on the outer side thereof, and provided with a lateral recess extending from the lower portion of said ram surface through the adiarent end surface of said base, of a cap adapted to receive sald end of the base. said cap having a spring member adapted to be inserted through said recess by a telescoping movement and to ride upon said cam and occupy said depressed seat by a rotativo movement of the cap.
13. In a device of the class described the combination with a base of insulating material of general cylindrical form having near one end an exterior cam surface. a depressed seat adjacent to the higher portion of said cam, and a flange overhanging said depressed seat and cam surface on the outer side thereof, and provided with a lateral recess extending fron the lower portion of said cam surface through the adjacent end surface of said base, of a sheet metal cap adapted to receive said end of the base. said cap being provided with a slit in its side wall and having an edge portion of said side wall adjacent to said slit indonted to form a spring member adapted to be inserted through said recess by a telescoping movement. and to ride upon said cam and occupy said depressed seat by a rotative movement.
14. In a device of the class described the combination with a sheet metal cap having its side walls slitted and portions thereof adjacent to said slits introverted on the side opposite the end wall of the cap. of a disc of insulating material secured within said can between the end wall thereof and the cut edges of said introverted portions.
15. In a device of the class described the combination with a base of insulating material of general cylindrical form having on diametrically opposite sldes thercof near one end an exterlor cam surface, a depressed seat adjacent to the bigher portion of said cam, and a flange overhanging said depressed seat and cam surface on the outer side thereof. and provided with lateral recesess extending from the lower portions of the respective cams through the adjacent end surface of said base, of a sheet metal cap adapted to receive said end of the base, "said cap being provided with an aperture in its end wall, and on diametrically opposite sides with a pair of slits in its side wall. and having edge portions of said wall adjacent to said slits indented to form spring mombers adapted to be inserted through said resnective recesses by a telescopine movement, and to ride upon said respective cams and occuny sald respective denressed seats by a rotative movement. and a transparent disc interposed between the end wall of the cap and the cut edges of said introverted side portions thercof.
10. In a fuse plug and in combination. a hollow base of insulating material provided on its outer side with a depresslon and having a partition erected from its inner find extending transversely of the base cavity in line with said depression, and a screw shell inclosing the base having a side portion introverted into said side depression theroin.

No. 102,623. Sewing Machine. Machine à coudre.
The Arbetter Felling Machine Company, Boston, assignee of Wolf Arbetter, Chelsea, both in Massachusetts, U.S.A., 18th December, 1906; 6 years. Filed 31st October, 1906. Receipt No. 140,799.
Claim.-1. In a machine of the class described, a spring sustained work support having a feed opening, a work feeding device carried by said work support, a presser foot, means to actuate said work feeding device to feed the ma-
terial over the work support under the presser foot, combined with stitch forming means located above the material,

and comprehending a curved thread carrying needle and revoluble second thread carrier to pass its thread through a loop of needle thread, means to reciprocate said needle to enter and emerge from the same side of the material, and means for moving said needle to ensure its entering at one thrust the material passing the work support and presser foot, and at another thrust to enter a portion of a superimposed ply of material moving between the work support and presser foot.
2. In a machine of the class described, an unyielding presser foot, a work support having a feed opening, a lever independent of said work support and pivotally connected therewith, a spring acting on said lever to force the work support toward the presser foot, combined with stitch-forming means located above the material, and comprehending a reciprocable curved thread carrying needie and a revoluble second thread carrier to pass its thread through a loop of needle thread and form in the material a series of blind stitches.
3. In a machinc of the class described, a stationary presser fool, a carriage, guideways to receive said carriage. a work support sustained at the rupper end of sald carriage, a lever, a devirce connecting said lever and said carriage, a spring connected with said lever and acting normally to move the work support toward sald presser foot, stitchforming mechanism located wholly above the presser foot and comprising a curved eye-polnted thread carrying needle and a revoluble looper, means to reciprocate said necdle to enrter and emerge from the same side of the material, and means for moving said needle to ensure its entering at one thrust the material passing between the work sunport and presser foot, and at another thrust to enter a ply of material lying on the material that is clamped betwern the work supnort and presser foot. means to feed the material. and a device acting on said lever to depress the work support for the removal of or insertion of work.
4. In a machinc of the class described, a loop taker, means to move it, a rock shaft having a bearing, a needle carrying shaft in said bearing, said shaft having a two-part arm, one part adjustable on the other part, a curved needle carried by the adjustable part on said arm, and means to turn said rock shaft between one and the next thrust of the needle, the adjustment of the movable part of sald arm carrying said needle. providing for positioning the needle correctly with relation to the path of movement of the under side of the co-acting loop taker.
5. In a machine of the class described, a rock shaft having a bearing, a crossbar carried by said rock shaft, a needlo carrying shaft sustained by the bearing in said rock shaft, a needie in sald needle carrying shaft, means to turn sajd rock shaft between one and the next switch and an adjustable device to insure the elevation of said rock shaft and the needle carrying shaft at alternate thrusts of the needle in the material.
6. In a machine of the class described, a rock shaft having a bearing, a needle carrying shaft sustained in the bearing of said rock shaft, a needle in said needle carrying shaft, a cam. and an arm connected with the upper end of said rock shaft, a spring surrounding said rock shaft and acting normally to keep said arm in contact with said cam, said cam meeting said arm and turning said rock shaft to place the needle in position to enter the material for its diagonal thrust.
7. In a machine of the class described, stitch-forming mechanism for making blind stitches, a spring sustained work support, a bender, and means for moving the same
that its acting end may rise above the work support whatever the position of the work support due to variations in thickness of work.
8. In a machine of the class described, a loop taker, a rock shaft having a bearing, a needle carrying shaft mounted in said bearing and provided with a needle, a rotating shaft having a disc provided with an adjustable plate having a stud, a link embracing said stud. and means connecting said link with the needle shaft, the adjustment of said plate so timing the movement of the needle that its point will terminate at exactly the proper position with relation to the loop taker.
9. In a machine of the class described, a rock shaft having a bearing at one end, an arm connected with said rock shaft near its other end, a roller carried by said arm, a needle carrying shaft mounted in the bearing of said rock shaft and provided with a needle, and a needle swinging cam to act on the roller of said arm to turn the rock shaft and needle carrying shaft, and means acting normally to maintain said roller in contact with said cam.
10. In a machine of the class described, a rock shaft, having a bearing at one end, an arm connected with sald rock shaft near its other end, a roller carried by said arm, a needle carrying shaft mounted in the bearing of said rock shaft and provided with a needle, a needle swinging cam to act on the roller of said arm to turn the rock shaft and needle carrying shaft, means acting normally to maintain said roller in contact with said cam, a bar connected with said rock shaft, and an adjusting device to limit the extent of movement of said arm toward said cam.
11. In a machine of the class described, a rock shaft havIng a bearing and a crossbar having a bevelled toe, and a needle carrying shaft located in said bearing and provided with a needle, a device with which said toe contacts, and a cam to turn said rock shaft that said toe resting on said device may raise the rock shaft and needle carrying shaft at alternate stitches when the needle is to enter only the liaing.
12. In a machine of the class described, stitch forming mechanism comprising an eye pointed needle and complemental under thread carrier both located at one side of the material, means to actuate said stitch forming mechanism, a spring sustained work support to sustain the material, a bender, actuating means therefor to cause said bender to bend the material at one stitch, and means to hold said bender in its inoperative position at a succeeding stitch.
13. In a machine of the class described, stitch forming mechanism comprising a curved eye pointed needle and a complemental under thread carrier, means to actuate said needle that it may penetrate the material for alternate stitches in planes at different angles, a bender, and means to cause said bender to bend the material only when the needle is to enter the body of the material.
14. In a machine of the class described, a spring sustained work support having a bender passage, a presser foot having a space, a bender, and means to raise the bender through the bender passage of the work support to force part of the work into the space of the presser foot, combined with a stitch forming mechanism comprising a needie, a complemental rotatable loop taker curying a second thread, and means to reciprocate said needle in the general direction of movement of the work over the work support, the point of the needle entering the work sustained by the bender.
1). In a machine of the class desor'bed, stitch forming mechanism to form a succession of blind stitches in the material, a slotted work support having a bender passage between its slots, said support presenting a surface occupying a position in a horizontal plane at right angles to said slots to support in the same plane at opposite sides of said slots the material to be stitched, a presser foot provided with a space above the bender passage of the work support, said foot also presenting a guiding edge for guiding a ply of material boing blind stitched to material on which it is laid, work feeding mechanism sustained below said work support, mechanism to actuate the work feeding mechanism that it may rise through the slots in the work support above he upper side of said support, a bender located below the work support, and means to move the bender to act upon the work and force a part thereof into the space of the presser foot to be entered by the needle.
16. In a machine of the class described, means located wholly at one side of the material for forming a series of blind stitches, said means comprising an eye pointed thread caryring needle. and a revoluble loop taker to control a second thread and carry the same through a loop of needle thread a work support. a carriage on which said work support is mounted, a guideway for said carriage means to move said carriage in said guideway, a yoke mounted on sald carriage and provided with feed points, and means to
move sald yoke on said carriage and cause sald feed points to engage and move said material.
17. In a machine of the class described, a work support a spring acting normally to keep said work support in its elevated position, a carriage, means to move said carriage vertically in said work support, a yoke provided with feed points, a compound shaft one part of which is sustained in the frame carrying the work support and has a fed actuating cam, a bearing for the opposite end of said comprund shaft, and means to rotate the xame, said compcund shaft acting to rotate the feed cam in any position of the work support due to difference in thickness of material.
18. In a machine of the class described, stitch forming mechanism located wholly above the material and adapted to make a series of blind stitches as described, combined with a presser foot to bear on the material, and means to vary the throat space in the presser foot to accommodate differences in the thickness of the goods.
19. In a machine of the class described, stitch forming mechanism located wholly above the material, a work support to sustain the material, means to cause the needle of said stitch forming mechanism to penetrate the body of material in a line substantially parallel with the infolded edge of a lining to be attached thereto, means to cause said needle at its next movement to penetrate the infolded lining, and means to draw off thread during the formation of the stitch in the body of the material and give up the slack so formed to the stitch made in the infolded edge of the lining.
20. In a machine of the class described, a work support, a curved eye pointed needle, a needle carrying shaft, means to sustain said shaft, means to turn said needle carrying shaft tcat the needle may penetrate the goods, a presser foot having a throat widened toward the rear end of said foot that the needle may have ample play in said throat both when mesting the material at its straisht and diagonal thrust.
21. In a machine of the class described, a work support, a curved eye pointed needle, a needle carrying shaft, means \(t 0\) shstain said shaft, means to turn said needle carrying shaft that the needle may \(p\) netrate the goods, a presser loot having a wido throat and a curved guide located at the irunt (nd of the foot.
22. In a machine of the class described, a work support, a curved eye pointed needle, a needle carrying shaft, means to sustain said shaft, means to turn said needle carrying shaft that the needle may penetrate the goods, a presser foot having a throat and a guiding edge and a lip extending beyond said edge and adapted to be interposed between the two pieces or material to be stitched together, said lip lifting the edge of the upper layer of material that the point of the curvid needse may readily enter under said edge.
23. In a machine of the class described, a loop taker, having a bobbin case and bobbln, means to sustain said loop taker that it may be turned in a diagonal direction, a vertical shaft having a bearing at its lower end, a needle carrier in said bearing, and a screw to detachably connect said bearing to said shaft, the removal of the screw enabling the removal of the bearing to thus uncover the chamber of the loop taker and enable access to be had thereto to effect the change of bobbin case and bobbin.
24. In a machine for blind stitching, a needle and complementary device for making blind stitches, a work support, a feeding device sustained by said work support, a stationary presser foot, a lever connected with said work support and an adjustable spring connected with said lever to sustain the work support in a yielding manner, and a device co-acting with said lever to lower and hold the work support locked in its lower position.
25. In a machine of the class described, a work support, stitch forming mechanism, a presser foot having a guiding edge combined with means to vary the throat space in the presser foot to accommodate differences in the thickness of goods, said means presenting a lip extended from the inner guiding edge of the presser foot to separate, in advance of the stitching, the materials about to stitched.
26. In a machine of the class described, a work support, a rock shaft, a needle carrier pivotally mounted on sald shaft and provided with a needle, means to vibrate said needle carrier on said rock shaft, an arm connected with said rock shaft, a cam, means to move the same that said cam may act on said arm and turn said rock shaft, a device acting normally to retain said arm in the path of movement of said cam, a crossbar connected with said rock shaft, a spring acting normally to depress said rock shaft, and a controlling device co-acting with said crossbar to raise the rock shaft in its bearing.
27. In a machine of the class described, a work support, a rock shaft, a needle carrier pivotally mounted on said shaft and provided with a needle, means to vibrate said needle carrier on said rock shaft, an arm connected with said rock shaft, a cam, means to move the same that said cam may not on said arm and turn said rock shaft, a device acting normally to retain said arm in the path of movement of said cam, a crossbar connected with said rock shaft, a spring acting normally to depress said rock shaft, and an adjustable controlling device co-acting with said crossbar to enable said rock shaft to be rotated to a greater or less extent.
28. In a machine of the class described, a work support, a rock shaft, a needle carrier pivotally mounted on said shaft and provided with a needle, means to vibrate said needle carrier on said rock shaft, an arm conhected with said rock shaft, a cam, means to move the same that said cam ma ynot on said arm and turn said rock shaft, a device acting normally to retain said arm in the path of movement of said cam, a crossbar connected with said rock shaft. a stud, a co-acting adjusting device to control the axial position of said rock shaft when the needle is enter. ing the material diagonally with relation to the line of feed.
29. In a machine of the class described, a presser foot, a work support, a rod having at one end a bearing, means to turn said rod about its longitudinal axis, rock shaft sustained in said bearing, a needle carrying arm secured to one end of said rock shaft, a second arm loosely pivoted to the opposite end of said rock shaft and provided with a ballshaped end, a rotatable shaft having a crank, a link connected at one end with said crank and having provision at its opposite end to embrace the ball of said second arm.
30. In a machine of the class described, a block or bearing curved at its under side, a loop taker containing a second thread, the shaft of said loop taker being sustained in said block, means to drive sald loop taker, a shaft having a bearing at one end, a needle carrying rock shaft located in said bearing and provided with an eye-pointed needle carrying a thread and co-acting with sald loop taker, combined with a carriage, means to move said carriage vertically, a work support mounted at the upper end of said carriage, a work feeding device mounted on said carriage, and means to actuate said feeding device that the feed dogs at the upper end thereof may engage the under side of the material and move the upper side thereof over the under side of said block.
31. In a machine of the class described, a spring sustained slotted work support to sustain the material to be stitched, a block located above said work support and bearing at its under side on the material, a loop taker sustained in said block, means to actuate said loop taker, an eye-pointed thread carrying needle, means to move the same to present a loop for the entrance of the loop taker, a presser foot located in front of said block, a feeding device located below said work support, and means to actuate the feeding device to engage the material and move the same over the underside of said presser foot and block.
32. In a machine of the class described, stitch forming mechanism comprising a thread carrying needle and rotatable loop taker carrying a second thread, a work support having a bender passage, a bender located below said work support, means to move said bender up through said bender passage, a presser foot having a space above the bender passage in said work support and having a guiding edge to guide the edge of the material being blind stitched onto the material underlying the same and sustained on the work support, said guiding edge occupying a position which, if prolonged, would cross the upper edge of the bender between its ends.
33. In a machine of the class described, stitch-forming means located above the material and comprising a needle and complemental loop taker carrying a second thread and adapted to make a series of blind stitches, a work support presenting a flat surface at right angles to the direction in which the work is fed over the work support to thus sustain the wgrk at both sides of the line of stitching, said work support having in its flat surface slots for the passage of the toothed end of a feeding device, and having a bender passage between said slots, combined with a presser foot having an opening in line with the bender passage in the work support, a feeding device and means to actuate the same to engage the material intermittingly and move the same over the work support, and a bender, and means to move the same from a position below the work support up through said work support, bending the work upwardly into the space of the presser foot to be entered by the needle in making a blind stitch therein.

No. 102,624. Haxvester. Moissonneuse.

William Maloney and The Frost and Wood Company, assignee of a half interest, both of Smith's Falls, Ontario, Canada, 18th December, 1906; 6 years. Filed 10th May, 1905. Receipt No. 125,034.

Claim.-1. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relstively in the rear of said knife, and a reciprocatory plate.
2. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife, and a reciprocatory plate connected with said knife.
3. In a combined harvesting and threshing machine, the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relativels in the rear of said knife, and a reciprocatory plate between said knife and said threshing means.
4. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife, and a reciprocatory plate carried at an angle to said knife.
5. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife, and a reciprocatory plate connected with said knife and extending rearwardly and downwardly therefrom.
6. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife, and a reciprocatory distributing means actuated upon movement of said knife.
7. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife, and a reciprocatory distributing means extending longitudinally of said knife between said knife and said threshing means.
8. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knfe and extending substancially parallel therewith, and a reciprocatory plate.
9. In a combined harvesting and threshing machine the combination compri:ing a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife and extending substantially parallel therewith, and a reciprocatory plate connected with sald knife.
10. In a combined harvesting and threshing machine the comblnation comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife and extending substantially parallel therewith, and a reciprocatory plate between said knife and said threshing means.
11. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife and extending substantially parallel therewith, and a reciprocatory plate carried at an angle to said knife.
12. In a combined harvesting and threshing machine the combination comprising a reciprocatory cutting knife, supporting means therefor, threshing means relatively in the rear of said knife and extending substantlally parallel therewith, and a reciprocatory plate connected with said knife and extending rearwardly and downwardly therefrom.

No. 102,625. Harvester. Moissoneuse.

William Maloney and The Frost and Wood Company, assignee of a half interest, both of Smith's Falls, Ontario, Canada, 18th December, 1906; 6 years. Filed 10th May, 1905. Receipt No. 125,036 .

Claim.-1. In a device of the character described, a frame, a guide brack t comprising approximately parallel ways with channels therein, an extension on one of said ways, a yoke connected with said extension, a vertically elongated axle bearing slidable in said ways, a screw-threaded lug on said bearing, and an rdjusting screw passing through said lug in engagement with said yoke.
2. In a device of the character described the combination with a guide bracket adapted to be bolted to an implement frame, a yoke pivotally connected with sald bracket, a vert cally elongated axle bearing slidable in said bracket, a screw-threaded lug on said bearing, and an adjusting screw passing through said lug in engagement with said yoke.
3. In a device of the character described, a guide bracket comprising approximately parallel ways with channels therein, and means for connecting said ways, an integral extension on one of said ways, a slidable axle bearing adapted to travel in said ways, a screw-threaded lug on said bearing, and an adjusting screw passing through said lug and connected with one of said ways.
4. In an agricultural implement, a frame, a guide bracket bolted thereto, said bracket comprising approximatetly parallel ways with channels therein, an extension on one of said ways, a yoke pivotally connected with said extension, an elongated and vertically slidable axle bearing held in said ways, a screw-threaded lug on said bearing, and an adjusting screw passing through said lug in engagement with said yoke.
5. In a device of the character described, a slotted casting adapted to be bolt \(d\) do an implement irame, integral lugs projecting into the slot of said casting, a slidable axle bearing adapted to be guided by sald lugs, a screw-threaded lug on an extension of said axle bearing, a screw-threaded rod passing through said threaded lug, and a yoke connecting said threaded rod and said casting.
6. In a device of the character described, a slotted casting adapted to be bolted to an implement frame, integral lugs projecting into the slot of said casting, a slidable axle bearing adapted to be guided by said lugs, a screw-threaded lug on an extension of said axle bearing, a screw-threaded rod passing through said threaded lug, and a pivoted yoke connecting said threaded rod and said casting.
7. In a device of the character described, a vertically slotted casting having integral lubs projecting into the slot thereof, and a laterally projecting lug at substantially right angles to one of said first-mentioned lugs, vertically extending perforated lugs integral with the second-mentioned lug, a yoke pivotally connected with said vertically extending lugs and slidable axle bearing, a slotted vertical extension integral with said axle bearing, a perforated screwthreaded lug projecting laterally from said extension, and a screw-threaded rod passing through said screw-threaded lug in engagement with said yoke.

\section*{No. 102,626. Threshing Harvester.}

\section*{Motssonneuse d battre.}

William Maloney, Sherbrooke, Quebec, Canada, 18th December, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,855.
Claim.-1. In a harvesting thresher, a concave, a threshing cylinder co-operating therewith, a conveyer frame pivotally mounted forwardly of said concave, brackets in proximity to said frame and springs connecting said brackets with said frame.
2. In a harvesting thresher, a concave, a threshing cylinder co-operating therewith, a conveyer irame pivotally

mounted forwardly of said concave, a reciprocatory cutter bar carried by sajd frame, brackets in proximity to said frame, and means, supported by said brackets, adapted to raise and lower the forward portion of said frame.
3. In a harvesting thresher, a concave, a threshing cylinder co-operating therewith, a conveyer frame pivotally mounted forwardly of said concave, springs connected with said frame, supports for said springs and rockable means for raising and lowering said frame.
4. In a combined harvesting and threshing machine, a rigid concave, a threshing cylinder, a conveyer in the rear of and below said concave, a bracket supported by said concave and a pivoted conveyer frame supported by sald bracket.
5. In a harvesting thresher, a rigid concave, a threshing cylinder, a bracket connected with said concave, a conveyer frame pivotally mounted on said bracket, a reciprocatory cutter bar carried by said frame, a reel bracket and a reel carried in said frame above said cutter bar.
6. In a havesting thresher, a rigid concave, a conveyer frame pivotally mounted in advance of said concave, a cutter bar mounted on the forward portion of said frame, and a reciprocatory distributing plate between said frame and said concave.
7. In a harvesting thresher, a rigid concave, a threshing cylinder, a supporting frame, a conveyer frame supported in advance of said concave, a reel fixed on said conveyer frame, a conveyer carried by said frame, a lever mounted on said supporting frame and means connected therewith for raising the forward portion of said conveyer frame.
8. In a harvesting thresher, a concave, a threshing cylinder, a conveyer adapted to travel in a plane lower than said concave, a conveyer frame pivotally conected with said concave, a cutter bar carried by sald frame, a distributing plate between said conveyer frame and said concave and means for adjusting the vertical elevation of the forward portion of said conveyer frame and cutter bar.
9. In a harvesting thresher, a rigid concave, a threshing cylinder, a supporting means, a pivotally supported conveyer frame carried by said means in advance of said concave. a rock shaft extending parallel with the axis of said cylinder, means for rocking said shaft. segments on said shaft and means for lifting the forward portion of said frame in combination with a cutter bar on the forward end of the frame, distributing means rearwardly of said frame and actuating means for said cutter bar carried by said conveyer frame.
10. In a harvesting thresher, a supporting frame, threshing means carried thereby, a convejer to the rear of and in a lower plane than said threshing means, said conveyer travelling transverse to the line of draft, a conveyer frame pivotally supported forwardly of sald threshing means, a cutter bar carried at the forward portion of said conveyer frame. a conveyer between said cutter bar and said threshing means, means for raising said conveyer frame and a reel held in fixed relation to said cutter bar.
11. In a threshing harvester, a supporting frame, a rigid concave, a threshing cylinder, a conveyer in a lower plane than said concave and adapted to travel transversely of the line of draft, a vertically adjustable conveyer pivotally mounted forwardly of said concave, a reciprocatory cutter bar forwardly of said conveyer, a reciprocatory plate between said conveyer and sald concave and a rockable member supported at one side of said conveyor and adapted to connect the cutter bar and sald plate.
12. In a threshing harvester, threshing means, a conveyer frame mounted forwardly thereof, a conveyer in said frame adapted to travel in line with the draft of the machine and a compression roller above said conveyer.
13. In a threshing harvester, a supporting frame, a conveyer frame pivotally carried thereby, a reciprocatory cutler bar at the forward end of said conveyer frame, threshing means and a compression roller mounted above said conveyer frame.
14. In a threshing harvester, a supporting frame, an approximately U-shaped conveyer frame carried thereby, a reciprocatory cutter bar and a reel supported on the forward portion of said frame, a reciprocatory plate mounted rearwardly of said conveyer frame, a threshing concave lower than said plate, and a compression roller between said concave and said cutter bar.
15. In a harvesting thresher, a concave, a threshing cylinder co-operating therewith, a cenveyer frame pivotally mounted forwardly of said concave, brackets in proximity to said frame and springs connecting said brackets with said frame, in combination with a cutter bar and means for adjusting the angle of said cutter bar with relation to said conveyer frame.
16. In a harvesting thresher, a concave, a threshing cylinder co-operating therewith, a conveyer frame pivotally mounted forwardly of said concave, a reciprocatory cutter bar carried by said frame, brackets in proximity to said frame and means, supported by said brackets, adapted to raise and lower the forward portion of said frame, in combination with a cutter bar and means for adjusting the angle of said cutter bar with relation to said conveyer frame.
17. In a harvesting thresher, a concave, a threshing cylinder co-operating therewith, a conveyer frame pivotally mounted forwardly of said concave, springs connected with said frame, supports for said springs and rockable means for raising and lowering said frame, in combination with a cutter bar and means for adjusting the angle of said cutter bar with relation to said conveyer frame.
18. In a combined harvesting and threshing machine, a rigid concave, a threshing cylinder, a conveyer in the rear of and below said concave, a bracket supported by said concave and a pivoted conveyer frame supported by said bracket, in combination with a cutter bar and means for adjusting the angle of said cutter bar with relation to said conveyer frame.
19. In a harvesting thresher. a rigid concave. a threshing cylinder, a bracket connected with said concave. a conveyer frame pivotally mounted on saíd bracket. a reciprocatory cutter bar carried by said frame, a reel bracket and a reel carried by said frame above said cutter bar, in combination with means for adjusting the angle of said cutter bar with relation to said conveyer frame.
20. In a harvesting thresher, a rigid concave, a conveyer frame pivotally mounted in advance of said concave, a cutter bar mounted on the forward portion of said frame, and a reciprocatory distributing plate between said frame and said concave, in combination with a cutter bar and means for adjusting the angle of said cutter bar with relation to said conveyer frame.
21. In a harvesting thresher, a rigid concave, a threshing cylinder, a supporting frame, a conveyer frame supported in advance of said concave, a reel fixed on said conveyer frame. a conveyer carried by said frame, a lever mounted on said supporting frame and means cpnnected therewith for raising the forward portion of said conveyer frame, in combination with a cutter bar and means for adjusting the angle of said cutter bar with relation to said conveyer frame.
22. In a harvesting thresher, a concave, a threshing cylinder, a conveyer adapted to travel in a plane lower than said concave, a conveyer frame nivotally connected with said concave, a cutter bar carried by said frame, a distributing plate between said conveyer frame and said concave and means for adjusting the vertical elevation of the forward portion of said conveyer frame and cutter bar. in combination with means for adjusting the angle of said cutter bar witr relation to said conveyer frame.

\section*{No. 102,627. Method of Circulation.}

\section*{Méthode de circulation.}

Frederic Perkins Dewey, Washington, District of Columbia, U.S.A., 18th December, 1906; 6 years. Filed ,20th February, 1906. Receipt No. 133,084.
Claim.-1. The process of treating comminuted material suspended in a liquid which consists in introducing numerous bubbles of re-active gas at various points within a portion of the liquid, permitting the gas to re-act with the liquid, allowing the residual gas to escape from the liquid and causing the liquid and the comminuted solid suspended therein to move in a circulatory path by this alternate addition and escape of gas, substantially as described.
2. The process of treating ores which consists in crushing the ore, mixing the comminuted ore with a liquid and

introducing numerous bubbles of re-active gas at various points within a portion of the liquid, permitting the gas to re-act with the liquid, allowisg the residual gas to escape from the liquid and causing the liquid and the comminuted ore suspended therein to move in a circulatory path by this alternate addition and escape of gas, substantially as described.
3. The process of treating copper ores which consists in crushing the ore, mixing the comminuted ore with a liquid, introducing numerous bubbles of a mixture of air and sulphurous acid at various points within a portion of the liquid, permitting the gas to re-act with the liquid, allowing the residual gas to escape from the liquid and causing the liquid and the comminuted ore suspended therein to move in a circulatory path by this alternate addition and escape of gas, substantially as described.
4. The process of treating copper ores which consists in crushing the ore, mixing the comminuted ore with a liquid, introducing numerous bubbles of a mixture of air and sulphurous acid at various points within a portion of the liquid, permitting the gas to re-act with the liquid, allowing the residual gas to escape from the liquid causing the liquid and the comminuted ore suspended therein to move in a circulatory path by this alternate addition and escape of gas. separating the solution of sulphate of copper thereby produced from the residual ore and recovering the copper from the solution, substantially as described.
5. The double process of carrying on chemical re-actions and causing the circulation of a liquid which consists in maintaining two columns of liquid to direct contact at their lower ends, introducing numerous bubbles of re-active gas at various points within one column of the liquid, permitting the gas to re-act freely with the liquid, allowing the residual gas to escape from the liquid and causing the liquid to move in a circulatory path by this alternate addition and escape of gas, substantially as described.
6. The process of treating coarsely crushed material which consists in maintaining two columns of liquid in direct contact at their lower ends supporting a mass of the crushed material within one column of the liquid, introducing numerous bubbles of re-active gas at various points within the other column of liquid, permitting the gas to re-act with the liquid, allowing the residual gas to escape from the liquid and causing the liquid to move in a circulatory path through the crushed material by this alternate addition and escape of gas, substantially as described.
7. The process of treating coarsely crushed copper ore which consists in maintaining two columns of liquid in direct contact at their lower ends, supporting a mass of the crushed copper ore within one column of the liquid, introducing numerous bubbles of a mixture of air and sulphurous acid at various points within the other column of liquid permitting the gas to re-act with the liquid, allowing the residual gas to escape from the liquid causing the liquid to move in a circulatory path through the crushed copper ore by this alternate addition and escape of gas, separating the solution of sulphate of copper thereby produced from the residual ore and recovering the copper from the solution, substantially as described.

No. 102,628. Belt Fastener. Attache-courroics.
John Joseph Flanagan, Cincinnati, Ohio, U.S.A., 18th December, 1906 ; 6 years. Filed 8th November, 1906. Receipt No. 141,028.
Claim.-1. As an improved article of manufacture, a member of a hinged belt fastener having a flat base with a series of prongs projecting therefrom and a series of apertures in the base in line with the prongs, the prongs being bent to form pintle loops and their extremities again bent towards the base, substantially as described.
2. The combination of belt ends with a hinged fastener composed of members having flat bases with a series of

apertures therein, a series of prongs extending from the adjacent edges of the bases and bent to form pintle loops with their extremities again bent and passed through the belt ends and the apertures in the bases and secured against withdrawal, and a coupling pin lying in alternating pintle loops of the opposed fastener members, substantially as described.
3. The combination of belt ends with a hinged fastener composed of members having belt bases with a series of apertures therein, a series of prongs extending from the adjacent edges of the bases and bunt to form pintle loops, their extremities being again bent to pass through the belt ends and the apertures in the bases where they are secured against withdrawal, the inner faces of the belts being channeled to receive the returning ends of loops flush with the belt surfaces, a coupling pin lying in the alternating pintle loops of the opposed fastener members. substantially as described.

\section*{No. 102,629. Dough Shaping Machine.}

Machine de moulcr la pate.

Herman Hueg. New York City, New York, U.S.A., 18th December, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,040 .
Claim.-1. A dough shaping machine comprising in combinatioa with a pair of concaved feed rollers, a concaved drum, a co-operating apron for the drum, and means for conveying the dough from the feed rollers to the drum together with means for operating the feed rollers and the drum, substantially as shown and described.
2. A dough shaping machine including a pair of concaved feed rollers and a drum co-operating therewith. means for
oprating the feed rollers and the drum, and an adjustable coiling plate interposed between the feed rollers and the drum. substantially as shown and described.
3. A dough shaping machine including a pair of concaved feed rollers and a drum co-operating therewith, means for operating the feed rollers and the drum, an adjustable coiling plato interposed between the foed rollers and the drum. and a guard plate co-operating with the colling plate, substantially as shown and described.
4. A dough shaping machine including a pair of concaved food rollers and a drum co-operating therewith, means for operating the feed rollers and the drum, an adjustable collinge plate interposed between the feed rollers and the drum, a guard plate co-operating with the coiling plate, said coiling plate having side flanges, substantially as shown and described.
5. A dough shaping machine including a palr of concaved feed rollers and a drum and apron operating therewith, together with an adjustable scraper that engages one of said iced rollers and a relatively fixed scraper that engages the other feed roller together with an intervening colling plate betwern the feed rollers and the drum, substantially as shown and described.
6. In a dough shaping machine the combination with a pair of concaved feed rollers and a drum, a colling plate interposed between the feed rollers and the drum, said coiling plato having transverse ribs, a scraper for one of said feed rollers, arranged adjacent said colling platc. sald coiling plate having a pocket portion between said scraper and the adjacent rib of the colling plate, an apron for said drum and means for rotating the feed rollers and the drum, substantially as shown and described.
7. In a dough shaping machine the combination with a pair of concaved feed rollers and a drum, a colling plate interposed between the feed rollers and the drum, said coiling plate having transverse ribs, a scraper for one of said feed rollers arranged adjacent said coiling plate, said colling plate having a pocket portion between said scraper and the adjacent rib of the coiling plate, an apron for said drum, means for rotating the feed rollers and the drum and an adjustable guard plate co-operating with the colling plate,

No. 102,630. Rnfilers for Sewing Machines.
Machinc a coudrc.

William Jam' . Tamaqua, Pennsylvania, U.S.A., 18th December, 1906 : , years. Filed 19th November, 1906. Receipt No. 141,341 .
Claim.-In a domestic sewing machine the combination with a machine standard and a ruffler standard located at the left hand side thereof, of an arm and head carried by the machine standard, a presser bar pendant from the head, a foot extended between the standards from the presser bar and supporting the ruffler standard, a ruffing plate located between the standards and guided by the ruffer standard, an operating lever carried by the ruffler standard and co- operatively related to the ruffling plate, a needle bar reciprocating in the head and located between the operating lever and the machine standard, a lever operating projection extended from the needle bar at that side thereof which is farthest from the machine standard, means permitting the adjustment of said projection longitudinally of the bar and also laterally thereof toward and from the fulcrum of the operating lever to regulate the throw of the latter, and a separator plate secured to the ruffer standard and extended under the same and into co-operative relation with the ruffler plate located between the standards.

No. 102,631. Partition for 8took Cars. Cloison pour wagons d bestiaux.

John H. Phillips, Jr., Jackson, Michigan, U.S.A., 18th December, 1906; 6 years. Filed 15th November, 1906. Recelpt No. 141,225.
Claim.-The combination with a car having notched tracks extending along the side thereof, of hangers slidably mounted on the tracks, a partition hinged to the hangers, and a catch on the hangers and engageable with the notches in the tracks to hold the partition in adjusted position.

No. 102,632. Machinery Por Making Pnoumatic Tires.
Machine pour la fabrication des tubes pneumntiques.

Thomas Sloper and Robert Sloper, co-inventors, both of 14 The Brittox Devizes, Wiltshire, England, 18th December, 1906; 6 years. Filed 10th November, 1906. Receipt No. 141,077.
Claim.-1. In a machine for making pneumatic tires, the combination of a former having a working face of curved cross section, and means for laying a cord upon the working face in such a manner that a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
2. In a machine for making pneumatic tires, the combinallon of a former having a working face of curved cross section, and means for making loops of cord and laying them at the required angle across the former whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
8. In a machine for making pneumatic tires the combiaation of a former having a working the of curved rene, section, means for maintalning the cord under teas: 5 . and means for selecting predetermined lengths of the coid whilst under tension and laying them upon the work:ng face of the former in such manner that a fabric is bis : up corresponding in shape to the finished tire and baver loons in the edges on both sides, substantially as eet fir.h
4. In a machine for making pneumatic tires the comb in. tion of a former having a working face of curved rrioss .... tion, means for maintaining the cord under ansion an! means for folding the cord into loops of predniorm \(-\cdots\), length whilst under tension and laying such loops uann \(p\). working face of the former in such manner that af.e: is built up corresponding in shape to the finished tyr: ar.t having loops in the edges on both sides, substanilally as set forth.
5. In a machine for making pneumatic tires the combita tion of a former having a working face of curved cross scr. tion, means for malntaining the cord under tension. and means for folding the cord Into double loops of prefcier. mined length whilst it is under tension and laying it upon the working face of the former in such manner tha: a fabric is built up corresponding in shape to the Inisbrid tire and having loops in the edges on both sides. substan. tially as set forth.
6. In a machine for making pneumatic tires the con blnation of a former having a working face of curred rens section, means for making loops of the cord of prait.:mined length and laying them on the former, means fir: maintaining tension on the cord whilst the loop is br:s made and laid on the former, and means for temporar': holding a part of each loop in position on the former wh's. the remainder of the loop is being laid thereon. Wheretir a fabric is built up corresponding in shape to the finlah.it tire and having loops in the edges on both sides. eubstantially as set forth.
7. In a machinc for making pneumatic tires the combination of a former having a working face of curvef cross section and a scries of pins on opposite sides thereof. and means for making loops of cord of predetermined \(10 n \mathrm{n}\) :h and delivering them on to the pins in such manace that a fabric is built up corresponding in shape to the finlsbef tire and having loops in the edges on both sides, substantlally as set forth.
8. In a machine for making pneumatic tires the combinafin of a former having a working face of curved cross seetion. means for making loops of cord. and means for tran.forring the loons from the loop forming device and lay:ng them on the former, wheeeby a fabric is bullt up corresponding in shape to tho finlshed tire and having loops it. the edges on both sides. substantially as set forth.
9. In a machine for making noeumatic tires the combination of a former having a working face of curved crose section and a series of pins on opposite sides thereof, means for making loons of cord of predetermined leagth. anit means for transferring the loops from the loop formine device and dellvering tham to the pins of the former whereby a fabre is ruilt up corresponding in shape to it. finished tire and having loops in the edges on both slites. substanilally as set forth.
10. In a mach'ne for making pneumatic tires the combination of a former having a working face of curved cross section, means for supplying cord under tension to the former. a guide \(\mathrm{J}^{1}\) from which the cord passes to the former so that a portion of such cord is normally extended between \(: b\) former and guide, two folding pins \(A^{6} A^{30}\), means for supporting these pins and maintaining them at a distance apart equal to the predetermined length of the folded loops of cord to be applied to the former, means for adjusting threlative positions of the pins and cord so that one pin is brought to one side of the extended portion of the cord an: the other to the opposite side of the same and then movite one relatively to the other in such manner that a double fold or loop of the cord is obtained, and means for delin... ing the loops so folded to the former, whereby a fabric is built up corresponding in shape to the finished tiro an! having loops in the edges on both sides. substantially 11 set forth.
11. In a machine for making pneumatic tires the combina tion of a former having a working face of curved croas biction, means for supplying cord under tonsion to the form. f . a guide \(J^{1}\) from which the cord passes to the former sin that a portion of such cord is normally extended betwe a the former and gulde, two folding pins \(A^{3} A^{10}\). micans for moving one pin \(A^{20}\) back and forth in n clrcular path abou: the other \(A^{0}\) for the purpose of folding the cord in:o lo. \(:\) the contral pin beling situated on that slite of the exteace! portion of the cord which faces in the direction of mornment of the second pin \(\mathbf{A}^{10}\) which lies on the opposife s'de of the cord backwardly and forwardly, moving tranefer: ac
devices to receiva the folded loops from the pins \(A^{8} A^{20}\) one of such devices being situated when at the limit of its movement in one direction in proximity to the pin \(A^{\prime}\), a movable guide for the extended cord portion \(J\), means for moving this guide to deflect the extended portion of cord so that it lies clear of the path of the transferring device allotted to the central pin \(A^{B}\) as the transferring device approaches the pin, means for returning the guide to such position that the cord can pass the transferring device after this has returned, means for moving the pins so that they may not foul the cord whilst the pins and cord are being brought into proper relative position, and means for replacing them to engage the cord preparatory to form ing a loop. whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sldes, substantially as set forth.
12. In a machine for making pneumatic tires the combination of a former having a working face of curved cross sec tion, means for supplying cord under tension to the former, a gulde \(J^{2}\) from which the cord passes to the former so that a portion of such cord is normalls extended between the former and guide in a plane approximately at right ang'es to that occupied by the former, a folding pin \(A^{\text {a }}\) vertical to such plane and situated between the extended cord and the former so that the cord may fold round it ns it is advanced to the former, a second folding pin \(A^{10}\) parallel to the first, means for maintaining this second pio at a distance from the sther equal to the predetarmined length of the folded loops of cord and for moving it to and from the former in a path having the first pin for Its center, the limit of its travel, in a direction away from the former, being such that the pin can be brought to that side of th, extended cord remote from the former and not occupled by the first pin, means for moving both pins ver tically out of the plane of the cord as the second pin travels from the former and for returning them to the same plane to engage the cord as it reaches the limit of its movement in this direction, and means for delivering the loops formed on the nins to the former, whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
18. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section, means for supplying cord under tension to the former, a guide \(J^{1}\) from which the cord passes to the former so that a portion of such cord is normally extended between the former and gulde in a plane approximately at right angles to that occupied by the former, a folding arm extending in a plane parallel to that occupled by the extended cord, vertical pins \(A^{6} A^{10}\) carried by the folding arm and set at a distance apart equal to the predetermined length of the folded loops of cord, means for swinging the arm towards and away from the former about a center co-axial with one of the pins so that the pins at the limit of its movement in one direction lie each on opposite sides of the extended cord and at the limit of its movement in the other direction lie on opposite sides of the former, means for moving the folding arm vertically out of the plane of the cord as it moves from the former so that the pins and cord can oross each other until the arm reaches the limit of its backward movement when it is again moved into the plane and the pins engage the extended cord on opposite sides, and transferring devices to receive the loops from the pins and deliver them on to the former in such manner that a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
14. In a machine for making pneumatic tires the combination with a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord of predetermined length, pins \(A^{5} A^{10}\) to support such loops so that they are presented to the former at the required angle, transferring devices situated one on each side of the former and having a finger adapted to enter the loops and a lug adapted to push the loops off the supporting ribs, means for moving the transferring devices backwards and forwards between the loop pins and the former pins so that as they move in one direction they carry the ends of the loops with them and deliver them to the former pins, whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
15. In a machine for making pneumatic tires the combination with a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord of predetermined length, pins \(A^{s} A^{10}\) to support such loops so that they are presented to the former at the required angle, trans-
ferring devices situated one on each side of the former and each having a finger adapted to enter the loops and a lug adapted to push the loops off the supporting pins, means for moving the transferring devices backwards and forwards between the loop pins and the former pins so that as they move in one direction they carry the ends of the loops with them and present them to the former pins, and means for withdrawing the transferring fingers from the loops as the latter are delivered on to the pins of the former, whereby a fabric is bullt up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth
16. In a machine for making pneumatic tires the combination with a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord of predetermined length, pins \(A^{8} A^{10}\) to support such loops so that they are presented to the former at the required angle, transferring devices situated one at each side of the former and having a pivoted finger adapted to enter the loops and a lug adapted to push the loops off the supporting pins, the pivoted finger normally extending below the lug to receive the loop, means for moving the transferring devices backwards and forwards between the loop pins and the former pins, so that as they move in one direction they carry the ends of the loops with them and present them to the former pins. and means for tripping the pivoted fingers of the transferring devices as the ends of the loops arrive opposite the former pins whereby the fingers are withdrawn behind the lugs as the loops are pushed on to the former pins so that a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
17. In a machine for making pneumatic tires the combination with a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord of predetermined length, pins \(A^{s} A^{10}\) to support such loops so that they are presented to the former at the required angle, transferring devices for the loops situated one on each side of the former and having a finger adapted to enter the loops and a lug adapted to push the loops off the supporting pins, means for moving the transferring devices backwards and forwards in paths coincident with those described by the ends of the loops as they are laid on the working face of the former so that as the transferring devices move in one direction they carry the ends of the loops with them and maintain them under approximately uniform tension whilst delivering them to the former pins, whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
18. In a machine for making pnematic tires the combination with a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord of predetermined length, pins \(A^{5} A^{10}\) to support such loops so that they are presented to the former at the required angle, transferring devices situated one on each side of the former and having a pivoted and sliding finger adapted to enter the loops and a lug adapted to push the loops off the supporting pins, the pivoted finger normally extending below the lug to receive the loop, a spring controlling each finger and tending always to slide it in a direction away from the former, means for moving the transferring devices backwards and forwards in paths coincident with those described by the ends of the loops as they are laid on the working face of the former so that with the aid of the springs the loops are maintained under approximately uniform tension whilst being delivered to the former pins, whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
19. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord of predetermined length and laying them on the former, means for maintaining tension on the cord whilst the loop is being made and laid on the former, and means for temporarily holding the central portion of each loop in position on the former whilst the ends are being delivered on to the pins of the former, whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
20. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord of predetermined length and layfing them on the former, means for maintaining tension on
the cord whilst the loop is being made and laid on the former, and a presser foot \(C\) for temporarily holding the central portion of each loop in position on the former whilst the ends are being delivered on to the pins of the former, whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
21. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making lo ps of cord of predetermined length and laying them on the former, means for maintaining tension on the cord whilst the loop is being made and laid on the former, a presser foot \(C\) for temporarily holding the central portion of each loop in position on the former whilst the ends are being delivered on to the pins of the former, and means operatively connecting the presser foot with the mechanism for bringing the loops into position on the former so that as each loop is brought into position the presser foot is moved to grip it whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges of both sides, substantially as set forth.
22. In a machine for making pneumatic tires of flattened cord the combination with a former having a working face of curved cross section, of means for making loops of the cord and laying them on the working face of the former in such manner that the flattened cord constituting the end portions of each loop lies approximately edgewise relatively to the working face of the former whilst that constituting the central portion of each loop lies with the flattened face approximately parallel with the working face of the former whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
23. In a machine for making pneumatic tires of flattened cord the combination of a former, two folding pins \(A^{5} A^{10}\), means for supporting these pins at a given distance apart, means for folding the flattened cord in loops upon the folding pins so that the flattened face of the cord lies against the pins, both pins being in the same plane, means for presenting the pins to the former in such manner that the loop thereon is presented at the required angle across the former and with the cord edgewise relatively to the working face thereof, a guide above the former whereby the central porlion of the loop is turned as it is presented so that the flat face of the cord at this part lies towards the working face of the former, and means for transferring the ends of the loops from the pins and securing them to the sides of the former without turning them from their edgewise position, whereby a fabric is built up corresponding in shape to the finish dire and having loops in the edges on both sides, substantially as set forth.
24. In a machine for making pneumatic tires of flattened cord the combination of a former, two folding pins \(A^{5} A^{10}\), means for supporting these pins at a given distance apart, means for folding the flattened cord in loops upon the folding pins so that the flattened face of the cord lies against the pins, both pins being in the same plane, means for presenting the pins to the former in such manner that the loop thereon is presented at the required angle across the former and with the cord edgewise relatively to the working face thereof, a guide above the former whereby the central portion of the loop is turned as it is presented so that the flat face of the cord at this part lies towards the working face of the former, means for securing this central portion of the loop to the former whilst in this position and means for transferring the ends of the loops from the pins and securing them to the sides of the former without turning them from their edgewise position, whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
25. In a machine for making pneumatic tires of flattened cord the combination of a former having a working face of curved cross section and a series of pins on opposite sides thereof, two folding pins \(\mathrm{A}^{5} \mathrm{~A}^{10}\), means for supporting these pins at a given distance apart, means for folding the flattened cord in loops upon the folding pins so that the flattened face of the cord lies against the pins, both pins being in the same plane, means for presenting the pins to the former in such manner that the loop thereon is presented at the required angle across the former and with the cord edgewise relatively to the working face thereof a guide above the former whereby the central portion of the loop is turned as it is presented so that the flat face of the cord at this part lies toward the working face of the former, and means for transferring the ends of the loops from the folding pins on to the pins on the sides of the former, whereby they are secured to the former and maintained in their edgewise position, substantially as set forth.
bination of a former having a working face of curved cross section, means for making loops of cord and laying them at the required angle across the former whereby the fabric is. built up corresponding in shape to the finished tire and having loops in the edges on both sides, a member for pressing home the loop last laid against those previously laid, and means for operatively connecting such member with the means for laying the cord on the former so that the cord is thrust home as it is brought into position. substantially as set forth.
27. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section, means for making loops of cord and laying them at the required angle across the former whereby a fabric is built up corresponding in shape to the finished tire and having loons in the edges on both sides, a member for pressing home the loop last laid against those previously laid, means operatively connecting such member with the means for laying the cord on the former so that the cord is thrust home as it is brought into position, a presser foot to hold the cord unon the former when in position, and means for operatively connecting the presser foot with the mechanism for laying the cord, so that the presser foot is broucht into operation after the cord has been brought into position and pressed home by the member referred to, substantially as set forth.
28. In a machine for making pneumatic tires, the combination of a former having a working face of curved cross section, two folding pins \(A^{5} \mathrm{~A}^{10}\), means for supporting these pins at a given distance apart, means for folding the cord in loons upon the folding pins, means for presenting the loop which is extended between the pins to the former and then laying it upon the same, a guide above the former and over which the loop passes so that it is raised above the level of the former, such guide extending to the point where the cord is to be laid, a member situated behind the lonn, and means for advancing such member as the loop is presented so that it pushes the loon from the guide and over the end thereof and presses it against those already laid on the former. whereby a fabric is built up corresponding in shape to the finished tire and having loops in the edges on both sides, substantially as set forth.
29. In a machine for making nneumatic tires the combination of a former having a working face of curved cross section. a pivoted arm upon which the cord is folded into loons and presented to the former, a guide between the arm and the former which raises the central portion of the loop above the level of the former as the loop advances, a presser arm pivoted to the folding arm and depending therefrom to engage the rear of the loon but having an extension on the further side of its pirot, a fixed ston against which such extension is brought when the folding arm approaches the limit of its movement whereby the presser arm is swung forward and pushes the loon from the guide and against those previously laid on the former, and means for laying the loop thus presented to the former upon the working face thereof whereby a fabric is built up corresponding in shape to the finished tire and having loons in the edges on both sides, substantially as set forth.
30. In a marhine for making pneumatic tires, the combination of a former having a working face of curved cross section, means for laying a cord upon the working face in such manner that a fabric is built up corresponding in shape to the finished tire and having a series of cords side by side disposed transversely relatively to the tire, and means whereby each transverse portion of cord last laid upon the former is drawn back whilst the next is laid thereon, substantially as set forth.
31. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section, means for laying a cord upon the working face in such manner that a fabric is built up corresponding in shape to the finished tire and having a series of cords side by side disposed transversely relatively to the tire, means whereby each transverse portion of cord last laid upon the former is drawn back whilst the next is being, laid thereon, and means whereby the former is rotated automatically whilst the cords are laid thereon, substantially as set forth.
32. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord and delivering them on to the pins in such manner that a fabric is built up corresponding in shape to the finished tire and having a series of cords side-by-side disposed transversely relatively to the tire, a displacing device (L*) adapted to engage the loop last laid on the former at a point near the pins, means for moving the displacing device into proximity to the former and in advance of the loop so that movement in a direction towards the former and parallel with it will cause the loop to be engaged and pushed back,
means for advancing the displacing device to thus push the loop back, means for then carrying the displacing device out of the plane of the loops, and means for returning the device to a position ready for advance again towards the former, substantially as set forth.
33. In a machine for making pneumatic tires the combination of a former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord and delivering them onto the pins in such manner that a fabric is built up corresponding in shape to the finished tire and having a series of cords side-by-side disposed transversely relatively to the tire, a displacing device ( \(\mathrm{L}^{*}\) ) adapted to engage the loop last laid on the former at a point near the pins and situated in the same plane as the loops, a spring tending normally to maintain this device clear of the loops on the former, means for advancing the displacing device against the action of its spring so that it is moved parallel with the former and engages and pushes back the loop last laid, means for releasing the displacing device from its advancing mechanism and carrying it out of the plane in which the loops lie so that it is returned by its spring in a different plane, and a guide whereby it is brought again into its normal path as it reaches the limit of its return movement, substantially as set forth.
34. In a machine for making pneumatic tires the combination of a rotatable former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord and delivering them onto the pins in such manner that a fabric is built up corresponding in shape to the finished tire and having a series of cords side-by-side and disposed transversely relatively to the tire, a displacing device ( \(L^{*}\) ) adapted to engage each loop last laid on the former at a point near the pins, means for moving the displacing device into proximity to the former and in advance of the loops so that movement in a direction towards the loops and parallel to the former will cause the last loop to be pushed back, means for advancing the displacing device to thus push the loop back, means for returning the device to its original position and means for rotating the former, substantially as set forth.
35. In a machine for making pneumatic tires the combination of a rotatable former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord and delivering them onto the pins in such manner that a fabric is built up corresponding in shape to the finished tire and having a series of cords side-by-side and disposed transversely relatively to the tire, a displacing device (L*) adapted to engage each loop last laid on the former at a point near the pins, means for moving the displacing device into proximity to the former and in advance of the loop so that movement in a direction towards the loops and parallel to the former will cause the last loop to be pushed, back, means for advancing the displacing device to thus push the loop back, means for returning the device to its original position, and means for rotating the former step-by-step through such an angle as is required to bring one pair of pins thereon into the position formerly occupied by the preceding pair, substantially as set forth.
36. In a machine for making pneumatic tires the combination of a rotatable former having a working face of curved cross section and a series of pins on opposite sides thereof, means for making loops of cord and delivering them on to the pins in such manner that a fabric is b ilt up corresponding in shape to the finished tire and having a series of cords side by side and disposed transversely relatively to the tire, a displacing device ( \(L^{*}\) ) adapted to engage each loop last laid on the former at a point near the pins, means for moving the displacing device into proximity to the former and in advance of the loop so that movement in a direction towards the loops and parallel to the former will cause the last loop to be pushed back, means for advancing the displacing device to thus push the loop back, means for returning the device to its original position, and means for controlling the movement of the former so that it is permitted to rotate step-by-step under the action of the displacing device whilst the latter is pushing back the cord last laid thereon, such limited movement of the former being equal to that required for the purpose of moving one pair of pins thereon into the position occupied by the previous pair of pins, substantially as set forth.
37 In a machine for making pneumatic tires the combination of a rotatably mounted former having a working face of curved cross section. means laying a cord upon the working face in such manner that a fabric is built up corresponding in shape to the finished tire and having a series of cords side by side disposed transversely relatively to the tire, means whereby each transverse portion of cord last
laid upon the former is drawn back whilst the next is laid thereon, such drawing back causing the former to also rotate, and means for limiting the degree of rotation at each operation, substantially as set forth.

\section*{No. 102,633. Sash Fastener. Arrête-croisée.}

William F. Clegg, Greensboro, North Carolina, assignee of James E. Gibbs, Clifton Forge, Virginia, U.S.A., 18th December, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,914.
Olaim.-1. A sash fastener, comprising a pair of spring actuated bolts for engaging the upper and lower sashes of a window, a connecting piece movably connected with each of the bolts to permit an independent reciprocation of the same, and means fngaging the connecting piece between the bolts for actuating the bolts simultaneously.
2. A sash fastener, comprising a pair of spring actuated bolts for engaging the upper and lower sashes of a window, a connecting piece movably connected with each of the bolts to permit an independent reciprocation of the same, and means located between the bolts and engaging the connecting piece at opposite sides of the center thereof for actuating the said bolts simultaneously.
3. A sash fastener, comprising a pair of bolts for engaging the upper and lower sections of a window, a connecting piece, and a cam arranged to engage the connecting piece and provided with a terminal recess forming a seat for the connecting piece, whereby both bolts are locked against movement.
4. A sash fastener, comprising a pair of bolts for engaging the upper and lower sections of a window, a connecting piece for the bolts, a cam provided with opposite sides and having a connecting portion, the sides being arranged to engage the connecting piece adjacent to the bolts, and means connected with the transverse portion for opera ing the cam.
5. A sash fastener, comprising a pair of bolts for engaging the upper and lower sections of a window, a connecting piece for the bolts, a cam having opposite sides for engaging the connecting piece and provided with a transverse portion having a shank, and an operating member connected with the shank for oscillating the cam.
6. A sash fastener, comprising a plate having opposite casings or housings, reciprocating bolts operating in the housings or casings, springs located within the latter and engaging the bolts, a connecting piece for the latter, a cam mounted on the plate between the casings or housings for engaging the connecting piece, and an operating shaft connected with the cam.
7. A sash fastener, comprising a plate having opposite housings, reciprocatable bolts operating therein, springs located within the casings or housings, means for connecting the bolts, a cam located between the casings and arranged to engage the said connecting means for operating the bolts, and a reversible operating shaft.
8. A sash fastener, provided at an intermediate point with a bifurcated bearing, reciprocatable bolts mounted on the plate, means for connecting the bolts, an actuating cam arranged to engage the said means and having a projecting portion located in the bifurcated bearing, and a revers ble operating shaft detachably interlocked with the projecting portion of the cam and adapted to extend into the bearing from either side thereof.
9. A sash fasten r, comprising a frame consisting of a plate provided with lateral extensions arranged in pairs, one member of each pair forming an attachment arm, and the other member being bent over the plate to form the casing or housing, bolts operating in the casings or housings, and means on said frame for actuating the bolts.
10. A sash fastener, comprising a pair of spring actuated bolts, connecting means pivotally connected with the bolts
to permit the same to move independently of each other, and operating mechanism detachably engaging the connecting means at a point between the bolts for simultaneously operating the same.

No. 102,634. Sash Fastener. Ariêtc-croisée.

Isaac M. Deppen, Scrafton, Pennsylvania, U.S.A., 18th December, 1906; 6 years. Filed 31st October, 1906. Receipt No. 140,790 .
Claim.-1. A sash fastener comprising an apertured plate adapted to be secured to the window casing, and having a projecting flange on one end thereof, an angle lever, one of the arms of which extends behind the plate and has on one side a catch passing through an opening in said plate and engageable with the sash, and on the opposite side a laterally extending branch, the other arm of the lever extending through one of the apertures in the plate and fulcrumed on the wall of said aperture, and a spring between the aforesaid flange of the plate and branch of the lever.
2. A sash fastener comprising a plate secured to the window casing and provided with an opening having a stud projecting from the wall thereof, and an angle lever, one of the arms of which extends behind the plate and has a catch engageable with the sash, the other arm of the lever exlending through the opening in the plate and having a notch to receive the aforesaid stud which forms the fulcrum of the lever.

No. 102,635. Sash Fastener. Arrête-croisíe.

Charles M. Evans, Carmichaels, Pennsylvania, U.S.A., 18th December, 1906; 6 years. Filed 6th October, 1906. Receipt No. 140,098 .
Claim.-In a sash fastener, the combination of a casing, the two bolts 6 and 9 mounted in said casing and slidable at right angles to each other, the finger piece 7 projecting upwardly from the bolt 6 through the top of the casing, the casing having a slot therein in which the finger plece 7 is adapted to slide, the finger piece 10 at one side of the casing and carried by the outer end of the bolt 9 , and the pin 11 projecting upwardly from the bolt 9 between the ends or the latter and arranged within the casing aforesaid, the boit 6 being arranged adjacent the bolt 9 whereby the bolt 9 may be rotated so as to cause the pin 11 carried thereby to be thrown into a vertical position in engagement with the bolt 6 , the pin 11 when in engagement with the bolt 6 preventing sliding movement of the bolt 9 , but permitting free sliding movement of the bolt 6 .

\section*{No. 102,636. Sash Fastener. Arrête-crot É.}

Jesse S. Packer. Salt Lake City, Utah, U.S.A., 18th December, 1906; 6 years. Filed 31st October, 1906. Receipt No. 140,786 .
Claim.-In a window sash lock, the integral casing comprising a horizontal plate, a downwardly extending flange adapted to be secured to the side of the lower window sash, downwardly extending flanges which overhang the edge of the lower window sash and rest in a recessed portion, dowel pins carried by said last-named flanges and entering
the body of the window sash, and bolt casings formed upon the horizontal bolt, said casing lying at right angles to each

other, in combination with bolts slidably disposed in said casings.

No. 102,637. Sash Fastener. Arrîte-croiséc.

Elias Etzenhouser and Rosanah L. Morris, Los Gatos, California, U.S.A., 18th December, 1906; 6 years. Filed 19th September, 1906. Recelpt No. 139,632.
Claim.-A sash fastener having in combination two flat plates hinged together along their meeting edges, of one of said plates adapted to be fixedly secured on the top rall of the lower sash and having a housing which extends paralle، with the hinge of said plates, said housing having a closed rear end and a longitudinally extending slot offset at the front end, a spring in the rear portion of the housing, a bolt slidable in the housing and normally projected by the spring, said bolt having a knob operable in the slot of the housing, a turnable bolt mounted in the other plate, sald bolt having a conically shaped head and lateral wings or projections, and a handle piece by which the bolt is turnable, a glate adapted to be secured to the upper sash having keyhole slots engageable by the head and wings of the turnable bolt, and a plate adapted to be secured to the window casing having openings engageable by the spring actuated locking bolt.

No. 102,638. Door Fastener. Attache de portc.

Winfield P. Carter, Raymond, Illinois, U.S.A., 18th December, 1906; 6 years. Filed 12th October, 1906 . Recelpt No. 140,256.
Claim.-1. The combination with a recessed base having a sliding bolt thereon, of a leaf hinged to and adapted 10 fold upon the base, and engaging devices upon the leat adapted to be seated in the recesses.
2. A combination with a base and a leaf hinged thereto of a slotted cap upon the base, a bolt slidably mounted within the cap, and means upon the bolt for securing it against movement.
3. The combination with a base and a leaf hinged thereto, of a bolt slidably mounted upon the base and having a plurality of recesses therein, a slotted cap for retaining the bolt upon the base and a manlpulating device adjust ably mounted in one of the recesses and slidable within the slot, and said device adapted to clamp upon the cap.

No. 102,639. Door Closer. Ferme-porte.

George N. Hall, La Crosse, Wtsconsin, U.S.A., 18th December, 1906; 6 years. Filed 9th October, 1906. Recelpt No. 140,177
Claim.-1. In a door closer, in combination, a supporting structure having side bearings and adapted to be secured to a door casing, a frame pivotally mounted at one of its ends in said bearings and projecting forward beyond the end of said structure, a spring connected at one end with the rear end of sald structure and at its other end with the free end of said irame, means for limiting the pivotal movement of said frame, and a wiper bracket secured to the door in positjon to engage the forward end of said frame.
2. In a door closer, in combination, a supporting structure having bearing openings in its side walls intermediate its ends and an open forward end, said structure being adapted to be secured to a door casing, a frame comprising two side bars, the ends of said side bars being turned outward to form bearing studs adapted to lie in said bearing openings, said frame projecting forwardly through the open forward end of said structure, a spring connected at one end with the rear end of said structure and at its other end with the free end of said frame, one side of said structure forming a stop upon which said irame is arranged to impinge to limit the pivotal movement of said frame, and a wiper bracket secured to the door in position to engage the forward end of said frame.

No. 102,640. Ore 8limer.
Appareil pour enlever la scoric.

Peter H. Craven, Spokane, Washington, U.S.A., 18th December, 1906; 6 years. Filed 25th July, 1906. Receipt No. \(138,157\).
Claim.-1. In a machine of the class described, a slimer table, and means for imparting simultaneously a continuous longitudinal movement and a reciprocatory longltudinal movement.
2. In a machine of the class describel, a frame, means to reciprocate the frame longitudinally, an endless slimer
table mounted upon the frame, and means to move the slimer table independently of the frame.
3. In a machine of the class described, a frame, means to impart a reciprocatory longitudinal movement to the frame, a supporting apron extending about said frame and supported upon proper bearings, means to impart a rotary movement to the supporting apron, and an endless slimer table carried upon and moved by said supporting apron.
4. In a machine of the class described, an endless movable slimer table, riaes formed longitudinally of the table, and means for imparting a reciprocatory movement to the table.
5. In a machine of the class described, an endless slimer table, means to move the slimer table continuously, means to impart an auxiliary intermittent movement to the slimer lable, and a washer arranged to cleanse the surface of the table.
6. In a machine of the class described, an endless flexible slimer table, means to move the slimer table continuously and longitudinally, means to move the slimer table longituainally and intermittently, a tank, and means to guide the slimer table through the tank.
7. In a machine of the class described, an endless slimer table, means to impart a continuous movement to the table, means to impart an intermittent movement to the table, a distributing box disposed adjacent one edge of the table, and a receiving box disposed adjacent the opposite edges of the table.
8. In a machine of the class described, an endless slimer table disposed in an inclined plane, means to move the endless table continuously and longitudinally, means to reciprocate the table independently of the continuous moveemnt, a distributing box extending longitudinally adjacent the upper edge of the table, and a receiving box extending longitudinally adjacent the lower edge of the table.
9. In a machine of the class described, a frame provided with rollers at opposite ends, an endless slimer table disposed about and carried upon the collers, means to move the endless table longitudinally, and means connected with and arranged to impart a shaking movement to the frame.
10. In a machine of the class described, a frame provided w'th rollers at its opposite ends, and disposed coincident with an inclined plane, a flexible endless slimer table disposed about and carried by the rollers and in an inclined position, means for moving the slimer table longitudinally upon the rollers, means connected with and to impart a longitudinal shaking movement to the frame, a distributing box arranged adjacent the upper longitudinal edge of the table, and a receiving box arranged adjacent to and to receive material from the lower edge of the table.
11. In a machine of the class described, an endless flexible slimer table, means to move the table continuously and longitudinally, means to impart a longitudinal shaking movement to the table, and independently of the continuous movement, and means to vary the relative continuous and shsking movements.
12. Ir a machine of the class described, a frame, rollers journilled upon opposite ends of the frame, a flexible endless slinn \(\in\) table disposed about and carried by the rollers, means to move the slimer table continuously relative to the frame, means connected with and arranged to impart a shaking movement to the frame, and means to vary the novement of the table relative to the movement of the liame.
13. in a machine of the class described, a frame, rollers journalled adjacent the opposite ends of the frame, a supporting apron carried by sald frame and having its upper surface substantially coincident with the plane of the frame, an endless flexible slimer table disposed about and carried by the rollers and supported upon the supporting apron, means to impart a rotary movement to the supporting apron and whereby the slimer table is moved continuously and longitudinally of the frame, means connected with and arlanged to impart a shaking movement to the frame, and means to vary the relative movements of the frame and the apron.
14. In a rlachine of the class described, a frame supported in a position coincident with an inclined plane, sprockets journalled adjacent the ends of the frame, an endless slatted supporting apron disposed about and carried by the sprockets, means to impart a rotary movement to the sprockets, rollers journalled at the opposite extremes of the frame, a flexible endless slimer table disposed about add carried by the rollers and supported upon the slatted airon, a distributing box arranged adjacent the upper longitudinal edge of the apron, a receiving box disposed beneath the lower longitudinal edge of the apron, a washer arranged to clearse the surface of the slimer table, means connected Witi and aissnged to impart a shaking movement to the frame ard iis associated apron and slimer table, and means :o vary the relative movements of the frame and apron.

No. 102,641. Concrete Caisson. Caisson en béton.

Tuomas Malcolm McAlpine, Glasgow, Scotland, 18th Decembor, 1906; 6 years. Filed 21st September, 1906. Receipt No. 139,669.
Claim.-The construction, or provision, of caissons or cylinders with rods such as \(b\), in combination with caissons or cylinders having apertures such as \(a\), as set forth.

No. 102,642. Coffee Roaster. Machine àrôtir le café.

Everett Tyler Shortt, St. Louls, Missouri, U.S.A., 18th December, 1906; 6 years. Filed 10th September, 1906. Recelpt No. 139,373 .
Claim.-1. A roaster comprising a casing, a roasting cyIinder journalled within the casing and provided with a corrugated sheet metal lining, said cylinder and lining being provided with openings, said lining having its edges turned up to provide ways, and a cover for the roasting cylinder, said cover being provided with a corrugated sheet metal lining having its edges slidably mounted in said ways.
2. A roaster comprising a casing, a roasting cylinder journalled within the casing and provided witn a corrugated shetet metal lining, said cylinder and lining being provided with openings, said lining having its edges turned up to provide ways, and a cover for the roasting cylinder having its ends offset to engage under the edges of the cyllnder, said cover being provided with a corrugated sheet metal lining having its edges slidably mounted in said ways.
3. A roaster comprising a casing, a roasting cylinder provided with frustro-conical ends terminating in tubular trunnions and with a corrugated sheet metal lining, said cylinder and lining being provided with openings, said lining having its edges turned up to provide ways, a cover for the roasting cylinder, said cover being provided with a corrugated sheet metal lining having its edges slidably mounted in said ways, a testing device fitting within one of said trunnions, and a crank handle having a stud fitting within one of said trunnions.

\section*{No. 102,643. Dust Absorbing Substance.}

\section*{Substance pour absorber la poussière.}

Berthold Singer, Chicago, Illinois, U.S.A., 18th December, 1906; 6 years. Filed 3rd November, 1906. Receipt No. 140,890 .
Claim.-1. The process of producing dust collecting or absorbing substances which consists in thoroughly drying absorbent material, adding thereto a relatively non-volatile oily substance having a boiling point above \(140^{\circ}\) Fahrenheft and commingling the materials.
2. The process of producing dust collecting or absorbing substances which consists in thoroughly drying absorbent material, adding thereto a relative non-volatile oily substance haviag a bolling point above \(140^{\circ}\) Fahrenheit, com-
mingling the materials and subsequently permitting the mixture to stand until the said olly substance is practically wholly absorbed.
3. The process of producing dust collecting or absorbing substances which consists in thoroughly drying absorbent material and adding thereto a relatively non-volatile oily substance having a boiling point above \(140^{\circ}\) Fahrenheit in such proportion as to fill the pores of the absorbent material without leaving an appreciable quantity of the oily substance on the surface thereof.
4. The process of producing dust collecting or absorbent substances which consists in thoroughly drying sawdust and adding thereto a relatively non-volatile olly substance having a boiling point above \(140^{\circ}\) Fahrenheit in such proportions as to fll the pores thereof without leaving a sufficient quantity of the said oily substance upon the surface of the sawdust particles to stain or spot white paper upon which it is placed for a period of three minutes.
5. The process of producing dust collecting or absorbing substances which consists in thoroughly drying sawdust, adding thereto a relatively non-volatlle oily substance having a boiling point above \(140^{\circ}\) Fahrenheit in the approxlmate proportion of seventy-five per cent. of the former to twenty-five per cent. of the latter anc. thoroughly commingling the materials.
6. The process of producing dust collecting or absorbing substances which consists in thoroughly drying sawdust, adding thereto a relatively non-volatile oily substance having a boiling point above \(140^{\circ}\) Fahrenheit in the approximate proportions of seventy-five per cent. of the former to twenty-five per cent. of the latter, thoroughly commingling the materials and permitting the mixture to stand until the olly substance is almost wholly absorbed.
7. The process of producing dust collecting or absorbing substances which consists in thoroughly drying sawdust, adding thereto a relatively non-volatile substance having a boiling point above \(140^{\circ}\) Fahrenheit in the approximate proportion of seventy-five per cent. of the former to twentyfive per cent. of the latter, thoroughly commingling the materials and adding a granular material thereto.
8. The process of producing dust collecting or absorbing substances which consists in drying sawdust and adding thereto a relatively non-volatile oily substance adapted to form an almost imperceptible permanent film thereon whereby said sawdust is given a permanent affinity for dust and like particles.
9. The process of producing dust collecting or absorbing substances which consists in drying sawdust and adding thereto a relatively non-volatile oily substance adapted to give the said sawdust particles a permanent afinity for dust and like particles, the proportions of the materials being such that an almost inappreciable film of the said oily substance remains upon the surface of this sawdust, the remainder of said oily substance being wholly absorbed.
10. The process of producing dust collecting or absorbing substances which consists in drying sawdust and adding kerosene thereto in such proportions that the latter is almost wholly absorbed.
11. The process of producing dust collecting or absorbing substances which consists in drying sawdust and adding kerosene thereto in such proportions as to fill the pores thereof without leaving a sufficient quantity of the kerosene upon the surface of the sawdust particles to stain or spot white paper ugon which it is placed for a period of three minutes.
12. The process of producing dust collecting or absorbing substances which consists in drying sawdust and adding kerosene chareto in the approximate proportions of seventyfive per cent of the former and twenty-five per cent of the latter.
13. A dust collecting substance, comprising comminuted absorbent material impregnated with a relatively non-volatile ally substance having a boiling point above 140 degrees Fahrenheit and free from any constituent or ingredient which, in the finished product is capable of smearing, staining or soiling fabrics upon which it is used.
14. A dust collecting substance comprising sawdust impregnated with kerosene, said material being free from any constituent or ingredient which, in the finished product is capable of smearing, staining or soiling fabrics upon which it is used.
15. A dust collecting substance comprising sawdust approximately free from aqueous moisture, and containing kerosene absorbed therein, said substance being free from any constituent or ingredient which, in the finished product is capable of smearing, staining or soiling delicate fabrics upon which it is used.
16. The herein described product consisting of comminuted absorbent material permanently impregnated with a relatively non-volatile oily substance, the surface of said ab-
sorbent material having a glassy or glazy appearance and being free from globules or particles of the sald oily substance and said material being free from any constituent or ingredient capable, in the finished product of smearing, staining or soiling fabrics upon which it is used.
17. The herein described product consisting of sawdust impregnated with kerosene in such proportions that the said sawdust possesses a glassy or glazy appearance, has a permanent ammity for dust or like particles and is free from globules or appreciable quantities of the kerosene upon Its surface, said material being free from any constituent or ingredient which, in the finished product is capable of smearing, stalning or soiling.fabrics upon which it is used.

No. 102,644. Rubber Hose. Boyau in caoutchouc.

The Canadian Rubber Company of Montreal, Quebec, Canada, 18th December, 1906; 6 years. Filed 12 th February, 1906. Recelpt No. 132,810.

Claim.-1. A non-metallic hose for conducting water and the like consisting of a rubber tube, an encircling layer consisting of a plurality of windings of frictioned woven cotton duck the outer end whereof has a film of rubber attached thereto, a single length of cotton cord wound with its windings in close contact with one another and an outer covering of rubber film, substantially as described and for the purpose set forth.
2. The method of making hose which consists in mountfug a raw or unvulcanized rubber tube unon a mandrel, winding a sheet of frictional woven cotton duck around such tube one end of the said sheet having a film of raw or unvulcanized rubber attached thereto in order to come outside when the said sheet is wound, then winding a single length of cotton cord around the latter with its windings in close contact with one another, then completing the structure by winding a layer of raw or unvulcanized rubber around the same, and finally subjecting the whole to a vulcanizing process, substantially as described and for the purpose set forth.

No. 102,645. Electrostatic Separating Process.
Procédé de séparation électrostatique.

The Blake Mining and Milling Company, Denver, Colorado, assignee of Lucien I. Blake and Lawrence N. Morscher, Lawrence, Kansas, U.S.A., 18th December, 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,857.
Olaim.-1. The electrostatic separating process which consists in giving particles initial electro-static charges dependent upon their composition and in allowing them to fall through an electro-static field and deflecting the particles in propartion to their initial charges.
2. The electro-static separating process which consists in fecding particles of material in contact with one another to produce a stream of falling particles having initial charges dependent upon their composition and in producing a comparatively weak electro-static field adjacent said falling particles to deflect them in proportion to their initial charges.
3. The electro-static separating process which consists in projecting particles previously in contact through a fuid medium and through an electro-static fleld to deflect said particles according to their composition.
4. The electro-static separating process which consists in bringing particles into contact to give them initial charges dependent upon their composition, in projecting them through a fluid medium in substantially separated condition and in acting on said moving particles by an electro-static field having comparatively weak inductive action upon them to deflect said particles according to their composition.
5. The electro-static separating process which consists in bringing particles into contact and giving them intial electro-static charges dependent npon their composition in projecting said particles through a fluid medium and in acting on said particles by an electro-static field to deflect said particles in proportion to their composition and initial charges.
6. The electro-static separating process which consists in bringing particles into contact with one another and giving them initial electro-static charges dependent upon their composition and allowing a stream of such particles to fall through a fluid medium between substantially symmetrically placed and oppositely charged electrodes to deflect said particles.

No. 102,646. Flectric Furnace. Fournaise électrique.

La Sociate Electro-Metallurgique Francaise, Froges, Loire, assignee of Paul L. T. Heroult, Le Praz. Savoie, both of France, 18th December, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,704.
Claim.-1. An electrlc furnace having chutes for feeding the furnace from a distance, and flues surrounding said chtes and carrying away the hot gases from the furnace and thereby preheating the charge.
2. An electric furnace having chutes \(D\) extending directly from the charge to a distance, at least the lower ends of said chutes being made of sheet nickel, and flues \(J\) surrounding said chutes and carrying away the hot gases from the furnace and thereby preheating the charge, sald flues being provided with means for regulating the temperature.
3. An electric furnace having chutes for feeding the furnace from a distance, and flues surrounding said chutes and carrying away the hot gases from the furnace and thereby preheating the charge, and a cover plate having branch pipes leading into said flues.
4. An electric furnace having chutes \(D\) extending directly from the charge to a distance, at least the lower ends of said chutes being made of sheet nickel, and flues \(J\) surrounding said chutes and carrying away the hot gases from the furnace and thereby preheating the charge, sald flues being provided with means for regulating the temperature, a cover plate \(K\) having apertures through which the charge is fed from said chutes and through which the gases escape Into said flues, and branch pipes \(O\) conducting the gases to said flues from points of the furnace intermediate of the location of said flues.
5. An electric furnace having chutes for feeding the furnace from a distance, and flues surrounding said chutes and carrying away the hot gases from the furnace and thereby preheating the charge, an electrode, a cover plate having an opening surrounding said electrode, and a plate fitting over the spaces between said electrode and cover plate.
6. An electric furnace having chutes \(D\) extending directly from the charge to a distance, at least the lower ends of sald chutes being made of sheet nickel, and flues \(J\) surrounding said chutes and carrying away the hot gases from the furnace and thereby preheating the charge, sald flues being provided with means for regulating the temperature, a cover plate \(K\) having apertures through which the charge is fed from said chutes and through which the gases escape into said flues, and branch pipes 0 conducting the kases to said flues from points of the furnace intermediate of the location of said flues, an electrode, a cover plate having an opening surrounding the electrode, and a series of plates \(P\) fitting over the spaces between the electrode and the cover plate and resting on said cover plate.
7. An electric furnace having an electrode of non-circular cross section and including means for shaking the electrode so as to shake down the charge.

\section*{No. 102,647. Fleotric Resistance Finrnace. Fournatse électrique à résistance.}

James Francis Bottomley and Arthur Paget, both of Kent, England, 18th December, 1906; 6 years. Filed 8th May. 1906. Recelpt No. 135,676.

Claim.-1. Electric resistance furnaces for high temperatures characterized by the fact that the resistance plates form in effect the cuver of the furnace, such plates being removably connected at either end to graphite terminal blocks with which they make close contact, the arrangement being such that the materials on the removable hearth are in close proximity to the plates and that there is practically no loss of the heat radiated and the plates can be readlly removed when destroyed by oxidation and the effect of high temperatures and new plates inserted.
2. In electric resistance furnaces the combination with resistance plates, removably connected at either end to graphite terminals blocks with which they make close contact, and forming in effect the cover of the furnace, of vertical shafts terminating in suitable openings in the cover, through which the material to be heated is fed, substantially as described and for the purpose set forth.

No. 102,648. Btep Ladder. Echelle d marches.

William F. Randall and Pelham Falconbridge, co-inventors, both of Grimsby. Ontario, Canada, 18th December. 1906; 6 years. Fyled 26th September, 1906. Recelpt No. 189,979.
Claim.-1. In a step ladder, sides apart and gradually widening asunder in concave order from the top to the botoom thereof, a horizontal step or top on the sides, steps extending between said sides, trusses connected to the underside of the lower steps and extending through the sides of the ladder, and a rear bifurcated support pivotally connected to said sides and extending to the ground in the form of two pleces of material joined firmiy together.
2. In a step kadder, side apart, a horkontal top extendIng on the sides, said sides gradually widening apart in concave order from the top to the bottom thereol. stops extending between said sides, trusses connected to the underside of the lower steps and extending through sald sifes a bifurcatod rear support of the ladder pivotally connarial to the upper part of the sides and extending in two pleces. folned together to the ground, a basket bracket pirotally connected to the upper part of the blfurcated support and adjustable braces pivotally connected to the bracket and the ladder rear support, and means on the braces to retair the same in supporting position.

\section*{No. 102,649. Decantation of Oyanide, Etc.} Methode de transiaser la cyanide, etc.

Patrick Fitzgerald, Lawlers. Western AustraMa. Australta 18th December. 1906; 6 Jears. Filed 24th January. 1906 Receipt No. 132,218.
Claim.-1. In the decantation of cyanide and like solutlons contained in crusbed ores, pulp, sands or slimes for the opparation of solutions contalning precious metals. particularly gold and silver, from the said ores or their compounds. the employment of wash waters by admitting the same under pressure in a vat below such ores, or their compounds, substantially as described.
2. In the decantation of cyandie and like solutions contained in orushed ores, pulp. sands or slimes, a process of separating solutions or solvents containing precions metals, and particularly gold and silver, from ores and their compounds, which consists in agitating mildy a mixture of such ores and such suitable solvent in a vat having a \(\mathrm{al}^{-}\) ter bed bottom beneath and through which wash is admitted under pressure, substantially as described.
3. In the decantation of cyanide and like solutions contained in crushed ores, pulp, sands. or nlimes, a process of separating solutions or solvents containing precions mriais and particularly gold and silver. from ores and their rompounds which consists in forcing such solutions nut of euch ores by substituting thercfor wash waters introduced for such purpose underneath such ores or their compounds under pressure, substantially as described.

\section*{No. 102,650. Apartment Fonse.}

Lawrenco Holmes, Los Angeles, California. U.S.A., Ifth December, 1906: 6 years. Filed 2nd October, 1806. Receipt No. 139,978 .
Claim.-1. A building provided with three adjoining rooms having a common floor at one level and a space between two of sald rooms, and a floor at a higher level in said space, said space being thus formed into another romm with a recess below the eame, an opening belng prorided into said recess from one of said rooms.
2. A building provided with two rooms of unequal leagth spaced apart, a third room adjolning said two rooms, boors for said rooms, an L-shaped secondary floor arranged abore the level of the first-named floors, a bath room and clothes closet above said secondary floor, and a bed under the bath room arranged to be drawn out into one of the Arst-mestioned rooms, and a drawer under the clothes closet and arranged to be drawn out into another of sald rooms.
3. A bullding provided with adjoining rooms and a re cess extending above the level of the floor of one of the rooms and below the floor of the other rooms. and a beld adapted to normally chamber in sald recess.
4. A bullding provided with adjoining rooms, and a re cess opening from one room and extending below the door of the other room, and a bed provided with rollers ams adapted to roll Into sald recess.
5. A building provided with a room and a recoss at one side of the room, a bed provided with rollers and adaptes to chamber in the recess, and means for ralsing and 10 .
ering said bed relative to the rollers for the purpose of adapting the bed for use at a level higher than the recess.
6. A building provided with a room and a recess opening Into the room at the floor thereof, and a bed adapted to chamber in the recess and to fit into the recess, said bed being provided with a footboard which forms a closure for the mouth of said recess.
7. A building provided with a primary and a secondary floor, a recess being between said floors, and a bed adapted to roll into and close said recess.
8. An apartment house comprising a room arranged above the level of a general apartment floor, a recess being between the general floor and the floor of said room, and a bed adapted to fit into said recess.
9. An apartment provided with a secondary floor, a china closet or the like arranged above said secondary floor, a recess being below said secondary floor, and a bed adapted to roll into and out of said recess, the china closet or the like being above the mouth of said recess.
10. A building comprising a room, a primary and a secondary floor arranged one above the other, stairs connecting the two floors, a room or rooms arranged above sald secondary floor, a recess being between said floors communicating with the first-mentioned room, a bed adapted to fit into and close said recess, and ventilating means for said recess.
11. A building provided with three adjoining rooms having a common floor at one level and a space between two of said rooms and a floor at a higher level in said space, seic space being thus formed into another room with a recess below the same, an opening being provided into sald recess from one of said rooms, and a bed adapted to chamber in said recess and close the mouth thereof.
12. A room provided with a recess in a wall, and a horizontal bed in said recess adapted to be moved into said room and having an end board forming a part thereof which closes and conceals the mouth of the recess and forms a base board for the wall of the room when the bed is in the recess.
13. An apartment house having a main and a secondary floor, a recess between said floors, a ventilating opening into the recess, and a vent from the recess, and a bed in said recess closing the mouth thereof.

No. 102,651. Sash Fastener. Arrête-croisée.

Patrick J. O'Brien, Mobile, Newfoundland, 18th December, 1906 ; 6 years. Filed 25th July, 1906. Receipt No. 135,135.
Claim.-1. The combination with a window and a window frame, of spring devices secured to the frame and the window for raising the window, a latch device carried by the window and co-operating with the frame for holding the window against the tension of the spring device, substantially as shown and described.
2. The combination with a window frame and windows thereon, said window frame having a box portion, of plates having grooves secured to the window frame, tension springs held within the window frame and secured at one end to the window frame, stud bolts carried by the window and projecting through said plate grooves and secured to the other end of the spring, and means carried by the window and co-operating with said plate for locking the window in various positions, substantially and described.
3. The combination with a window frame and windows therein, sald window \({ }^{\circ}\) frame having a box portion, of plates having grooves secured to the window frame, tension springs held within the window frame and secured at one
end to the window frame, stud bolts carried by the window and projecting through said plate grooves and secured to the other end of the springs, and means carried by the window and co-operating with said plate for locking the window in various positions, said last-named means comprising a latch member carried by the window, said plates having latch receiving apertures for co-operating with the latch member, substantlally as shown and described.
4. The combination with a window frame, of windows held therein, spring devices within the window frame and secured at one end to the frame, slotted plates secured to the window frame, stud bolts carried by the window and projecting through said slotted plates and into the window frame and connected with said springs, said plates having latch receiving apertures and latch devices carried by the window for engaging said latch apertures of the plates, substantially as shown and described.
5. The combination with a window frame and windows mounted therein, of a plate secured to the window frame, sald plate having an elongated aperture and a transverse aperture merging therewith and latch engaging apertures a stud bolt secured to the window and projecting through said slotted plate, a coil spring within the window frame and secured at one end of said bolt, a second stud bolt secured to the window frame and to the other end of the said spring, a latch member carried by the window and comprising a face plate and a key guard plate secured to the window sash, a latch bolt having a spring portion secured to said face plate and projecting through an aperture therein to engage the latch apertures of said first-mentioned plate, said latch bolt having an apertured head, an operating key adapted to be inserted into sald apertured head through said elongated aperture of said key guard plate to release said latch from said first-mentioned plate latch aperture, substantially as shown and described.

No. 102,652. Electrolysis. Electrolyse.

Geovanni Rambaldini, Milan, Italy, 18th December, 1906 ;
6 years. Filed 30th April, 1906. Receipt No. 135,376.
Claim.-1. In electrolysis a liquid producing a soluble substance and a solid or gaseous substance, the said soluble product being added in the liquid form only to.replace the part in the process decomposing in contact with the electrode, at the point where the soluble product is formed sufficient in volume to the liquid extracted and decomposed solvent and anhydrous esalt being added. to replace the decomposed solid or gaseous product, as specified.
2. In electrolysis a plurality of liquids of varying density superposed one on the other respectively and retained as separate strata only by the difference of density existing between the liquids, means for feeding and withdrawing from each strata individually and means for collecting outside the gases produced at the electrodes, as specified.
3. In electrolysis, a vessel containing a plurality of liquids of varying density superposed one on the other respectively and retained as separate strata only by the difference of density existing between the liquids, a plurality of miner vessels at each side of said vessel and connected therewith and communicating respectively with different strata of liquids, a plurality of sets of electrodes suspended in two of said strata respectively, bell shaped insulators covering sald electrodes, gas exhaust pipes from said bell shaped covers and means for raising and lowering said electrodes, as specified.

\section*{No. 102,653. Produotion of Aluminium-Nitrio Combination.}

Production de nitrate d'aluminium.
Ottakar Serpek, Luterbach Solothurn, Switzerland. 18th December, 1906: 6 years. Filed 20th June, 1906. Receipt No. 137,115.
Claim.-1. The method of producing aluminium nitric combinations which consists in treating aluminium nitric with nitrogen at a higher temperature.
2. The method of producing aluminium nitric combinations which consists in treating aluminium carbide with air at a higher temperature.
3. The method of producing aluminlum nitric combinations which consists in powdering aluminium carbide, heating the powder up to a higher temperature and exposing it to the action of nitrogen.
4. The method of producing aluminiufn nitric combinations which consists in powdering aluminium carbide, heating the powder up to a higher temperature and exposing it to the action of air.
5. The method of producing aluminium nitric combinations which consists in powdering aluminium carbide, heating the powder up to a higher temperature and exposing it to the action of gases containing nitrogen.
6. The method of producing aluminium nitric combina: tions which consists in mixing aluminlum carbide with coal or alumina or choloride of aluminium or any two or all of them powdering the mixture, heating the powder up to a higher temperature and exposing it to the action of nitrogen.
7. The method of producing aluminium nitric combinations which consists in mixing aluminium carbide with coal or alumina or choloride of aluminium or any two or all of them, powdering the mixture, heating the powder up to a higher temperature and exposing it to the action of gases containing nitrogen.
8. The method of producing aluminium nitric combinations which consists in mixing aluminium carbide with copper or aluminium or iron or a similar metal, or an alloy from any two or all of them, powdering the mixture, heating the powder'up to a higher temperature and exposing it to the action of nitrogen.
9. The method of producing aluminium nitric combinations which consists in mixing aluminium carbide with copper, or aluminium with iron, or a similar metal, or an alloy from any two or all of them, powdering the mixture, heating the powder up to a higher temperature and exposing it to the action of gases containing nitrogen.
10. The method of producing aluminium nitric combinations which consists in mixing aluminium carbide with coal or alumina or chloride of aluminium, or any two or all of them, or with copper or aluminium or iron or a similar metal. or an alloy from any two or all of these metals, or with a mixture of any two or several of these bodies, powdering the mixture, heating the powder up to a higher temperature and exposing it to the action of nitrogen.
11. The method of producing aluminium nitric combinations which consists in mixing aluminium carbide with coal or alumina or chloride of aluminium or any two or all of them, or with copper or aluminium or iron or a similar metal, or an alloy from any two or all of these metals, or with a mixture of any two or several of these bodies, powdering the mixture, heating the powdering up to a higher temperature and exposing it to the action of gases containing nitrogen.
12. The method of producing aluminium nitric combinations which consists in mixing aluminium carbide with coal or alumina or chloride of aluminium or any two or all of them, or with copper or aluminium, or iron or a similar metal or an alfoy from any two or all of these metals, or with a mixture of any two or several of these bodies, powdering the mixture, heating the mixture up to a higher temperature and exposing it to the action of nitrogen mixed with muriatic acid gas or sulphurous acid gas.
13. The method of producing a mixture of aluminium carbide, alumina and coal containing nitrogen which consists in mixing alumina with coal, heating the mixture up to such a temperature at which a partial formation of aluminium carbide takes place and exposing the mixture to the aetion of nitrogen or air.
14. The method of producing a mixture of aluminium carbide, alumina and coal containing nitrogen which consists in mixing alumina with coal and copper or iron or a similar metal or an alligation of copper with aluminium, heating the mixture up to such a temperature at which a partial formation of aluminium carbide takes place and exposing the mixture to the action of nitrogen or air. 15. The method of producing a mixture of aluminium carbide, alumina and coal containing nitrogen which con-
sists in mixing alumina with coal, powdering the mixture, compressing the powder, heating it up to such a temperature at which a partial formation of aluminlum carbide takes place and exposing the whole to the action of nitrogen or alr.
16. The method of producing a mixture of aluminium carbide, alumina and coal containing nitrogen which consists in mixing alumina with coal, powdering the mixture, compressing the powder, heating it up in an electrical furnace to such a temperature, at which a partial formation of aluminium carbide takes place and exposing the whole to the action of nitrogen or air.

No. 102,654. Level. Niveau.

Walter Thorburn, Seattle, Washington, U.S.A., 18th December, 1906; 6 years. Filed 13th July, 1906. Receipt No. 137,769.
Claim. -1. In a device of the class described, a sight tuins provided with an off-set tube, means to determine the position of the perpendicular line reflected through the offset tube, means to determine the pasition of the line at an angle to the tube, and means to adjust the means for locating the angular line.
2. In a device of the class described, a tube provided with a sight opening, and an object opening in aligument with the sight opening, an off-set tube communicating with one side of the sight tube, means within the sight tube for receiving and reflecting a vision projected through the off-set tube, means to determine the angular position of the object relative to the sight tube, and means for locating a line at an angle to the axis of the sight tube.
3. In a device of the class described, a sight tube provided with a sight opening, and an object opening, a borizontal sight wire extended across the sight opening. a spirit level secured upon the tube and provided with a mark, and a reflector disposed within the tube and in position to reflect the mark of the spirit level as a continuation of the sight wire.
4. In a device of the class described, a sight tube proFided with a sight opening at one end, and an object opening at the opposite end, an ofr-set tube extending from the sight tube intermediate its ends, a reflector disposed within the sight tube, and at an angle to reflect through the sight opening a ray of light projected through the ofl-set tube, and means for determining the fongitudinal and transverse horizontal position of the sight tube
5. In a device of the class described, a sight tube, a plate disposed within the said tube and movable longitudinally thereof, and provided with a slot, an eccentric sorew engaged within the slot and arranged to move the plate as the screw is moved rotatably means to secure the plate at its adjusted position, and a renector carried by the plate.
6. In a device of the class described, a sight tube, \({ }^{a}\) plate disposed within the sight tube, and movable longitudinally relative thereto, a reflector pivoted upon and movable with the plate, and means for moving the reflector angularly upon its movable pivot.
7. In a device of the class described, a sight tube provided with an off-set tube, a plate disposed within and morable longitudinally of the sight tube, a reflector pivotally able longitudinally of the sight tube, a reffecty to register mounted upon the plate and disposed normally to register with the off-set tube, and means to move the reflector angularly upon the pivot.
8. In a device of the class described, a sight tube provided with a sight opening at one end, and an object opering at the opposite end, a horizontal sight wire spanning the object opening, a reflector mounted within the tube
and inclined relatively thereto, a spirit level mounted upon the tube and provided with a circumferential mark, and means to move the spirit level until the circumferential mark is reflected in the reffector as a continuation of the sight wire.
9. In a device of the class described, a sight tube proFided at one end with a sight opening, and at the opposite end with an object opening. a vertical sight wire spanning the object opening, an ofi-set tube disposed intermediate the ends of the sight tube, a vertical sight wire disposed within the extremity of the off-set tube, a reflector disposed within the tube and in position to refect the image of the sight wire of the off-set tube as a communication of the vertical sight wire of the object opening, and means to change the position of the reflector
10. In a device of the class described, a sight tube provided with an off-set tube, a reflector pivotally mounted within the tube, and registering with the off-set tube. a plate arranged to support the reflector and provided with a slot, and an eccentric screw disposed within the slot and arranged to move the plate angularly upon being rotated.
11. In a device of the class described, a sight tube provided with a sight opening at one end, and an object opening at the opposite end, a horizontal and a vertical sight wire spanning the object opening, a tube off-set from one side of the sight tube intermediate its ends, and provided with an object opening, a vertical sight wire spanning the object opening of the off-set tube, a spirit level secured to the sight tube adjacent the object end, and provided with a circumferential mark, a refector secured within the sight tube, and at an angle to reflect to the sight opening. the circumferential mark of the spirit level as a continuation of the horisontal sight wire of the object opening, a spirit level disposed within and transversely of the sight tube, and in such position that when the tube is horizontal transversely the bubble of the level is in alignment between the vertical sight wire of the object opening and the sight opening, a reflector disposed in position to reflect to the sight opening, the image of the vertical sight wire of the off-set tube as a continuation of the vertical sight wire of the object opening of the sight tube, means to move the !ast-named reflector longitudinally of the sight tube, and means for moving the last-named reflector angularly relative to the axis of the sight tube.

No. 102,655. Production of Packages of Interfolded Sheets.
Moyens de mettre le papior en paquete.

Seth Wheeler, Castleton, New York, U.S.A., 18th December
1906; 6 years. Filed 7th May, 1906. Receipt No. 135,616.
Clatm.-1. The herein described process or method of producing a package of interfolding sheets which consists in severing a sheet from the web, partially folding the same, severing a new sheet, inserting the forward end of the new sheet into the partial fold of the preceding sheet, completing the fold of the preceding sheet, folding the new sheet over the end of the preceding sheet and partially backward upon itself severing another sheet, inserting its forward end into the partial fold of the preceding sheet, and 80 on.
2. The herein described process or method of producing a package of single sheets or units containing two or more superposed sheets, folded into books of three leaves with their terminals interfolded, which consists in severing a unit from a web, partially folding the same over a new unit. inserting the forward end of the new unit into the incomplete last fold of the preceding unit, completing the terminal fold of the preceding unit, folding the new unit over the terminal of the preceding unit and partially backward upon itself, severing another unit, inserting its end into the incomplete tetrminal of the preceding unit, and so on.

No. 102,656. Extemsion Table. Table dallonge.

Charles H. Goller, Hicksville, Ohlo, U.S.A., 18th December, 1906; 6 years. Filed 22nd October, 1906. Receipt No. 146,530.
Claim.-1. In an extension table the opposite table sections, an extension leaf, swinging carrier links for sald leaf having a pivotal support on a fixed member, one of sald links having a tappet pin and a reciprocating operating bar carried by one of the table sections and provided with reversely arranged advance and return press shoulders adapted to engage and disengage said pin.
2. In an extension table, the opposite table sections, a rising and falling extension leaf, swinging carrier links pivotally supported on a fixed frame member and having pivotal connection with the extension leaf, one of said links having a rock arm extension and a release cam and a shouldered operating bar carried by one of the table sections and co-operating with said pin and cam.
3. In an extension leaf, the opposite table sections, a horizontal rising and falling extension leaf, swinging carrier links pivotally supported on a fixed frame member and having pivotal connections at their upper ends with the leaf. one of said links having a rock arm extension provided with a tappet pin and with a rocking release cam above the latter and a reciprocal operating bar having a spring end portion engaged by said cam and provided with the reversely disposed spaced shoulders co-operating with the sald pin.
4. In an extension table, the opposite table sections, a latching device for said sections comprising a notched catch bar and a spring pressed latch lever normally engaging the bar, sald catch bar and latch lever being relatively shiftable, a rising and falling extension leaf, swinging carrier links s:-p eorting said leat and one of which is provided with a tappet pin and a release cam, and a reciprocal operating bar having separate press shoulders co-operting with said pin.
5. In an extension table, the opposite table sections, a rising and falling extension leaf. swinging side rall sections hinged to the end portion of the leaf, single throw links interposed between the side rail sections and a point of fixed support and leaf raising and lowering mechanism.
6. In an extension table, the opposite table sections, a rising and falling horizontally movable extension leaf, swinging side rail ections hinged to the end portiong of the leaf, a single throw link interposed between and having hinged connection respectively with the side rall sections and a fixed support, and leaf raising and lowering mechanism.

No. 108,65't. Clothes Closet. Cabinet pour vétements.
Maximilien Lucien Heurbond, Denver, Colorado, U.S.A., 18th December, 1906 ; 6 years. Filed 17th October, 1906. Recelpt No. 140,371.
Claim.-1. A clothes closet comprising a main arm, a plate fixed thereto, movable arms pivoted to maid plate,
rall detachably connected with said movable arm and means for attaching said rail to sald main arm.

2. A clothes closet comprising a main arm, movable arms jointed to said main arm, a rail comprising sections having a hinged connection therebetween, means for detachably connecting said rail to said movable arms, and a movable member carried by said main arm and adapted to engage said hinged connection so as to lock said rail upon said main arm.
3. A clothes closet comprising a maln arm, outer arms making a pivotal connection with said main arm, intermediate arms also pivotally connected and disposed between said main arm and said outer arms, said outer arms having sockets formed at the extremities thereof, a rail the extremities whereof engage said sockets, and means for attaching said rall to said intermediate arms and to said main arm.
4. A clothes closet comprising a main arm, outer arms making a pivotal connection with said main arm, intermediate arms pivotally connected between said main arm and said outer arms, said outer arms having sockets at the extremities thereof, a rail the extremities whereof are receivedin said sockets, the body of sald rail abutting the extremities of said main arm and said intermediate arms, said intermediate arms having pins projecting at the extremities thereof, said rail having openings recelving said pins and a fastening at said main arm for attaching the same to said rail.

No. 102,658. Diaplay Rack. Ratelier d'étalage.

Jacob H. Kummer, Uhrichsville, Ohio, U.S.A., 18th December, 1906; 6 years. Filed 19th October, 1906. Receipt No. 140,415.
Claim.-1. In a display rack, a plurality of hangers for attachment to a ceiling or other support, a pair of horizontal rails supported by said hangers and adjustable longitudinally therein, supporting brackets carried by the rails, spring actuated display rollers journalled in said brackets and each provided with an angular end portion, means carried by the hangers for locking said rails in adjusted position, and locking clips pivoted to the brackets and adapted to engage the angular end portions of said rollers for locking the latter in the supporting brackets.
2. In a display rack, a plurality of hangers for attachment to a ceiling or other support and provided with terminal sockets having transverse openings formed therein, a pair of spaced horizontal rails engaging said sockets and adjustable longitudinally therein, supporting brackets depending from the rails and adapted to enter the transverse openings in the sockets to thereby permit the adjustment of the ralls, spring actuated rollers journalled
in said brackets, means for locking the rollers in said brackets and means carried by the hangers for clamping the rails in adjusted position.
3. In a display rack, a plurality of hangers for attachment to a ceiling or other support and provided with terminal sockets having transverse openings formed therein, a pair of spaced horizontal rails engaging said sockets and adjustable longitudinally therein, supporting brackets depending from said rails and adapted to enter the transverse openings in the sockets to thereby permit the adjustment of said rails, spring actuated display rollers journalled in said brackets and each provided with ad angular end portion, clamping members carried by said rollers, pivoted clips adapted to engage the angular portions of the rollers for locking said rollers in the supporting brackets, and set screws carried by the hangers and adapted to engage the horizontal rails for locking the latter in adjusted position.
4. In a display rack, a plurality of hangers provided with threaded shanks for attachment to a ceiling or othes support, a pair of spaced horizontal rails supported by said hangers and adjustable longitudinally therein, supporting brackets depending from said rails, spring actuated rollers journalled in said brackets and provided with spring catches. locking clips pivoted to the brackets for engagement with the rollers, clamping bars pivoted to said rollers and having their free end engaging said spring catches, and set screws carried by the hangers and adapted to engage the horizontal rails for locking the latter in adjusted position.

\section*{No. 102,659. Power Transmission.}

\section*{Transmission de pouvoir.}

Chester Phillips, Rochester. New York, U.S.A., 18th December, 19066 years. Filed 5th December, 1906. Recelpt No. 141,831.
Claim.-1. In a device of the kind described comprising parallel shafts, intermeshing gear wheels carried by the shafts, crank arms carried by the shafts and a slotted lever pivoted to one of the crank arms and having its slotted portion in engagement with the other crank arm.
2. In a power transmission device, intermeshing gears, parallel shafts upon which said gears are mounted, oppositely arranged crank arms connected to said shafts, longitudinally slotted lever pivotally connected at one end to the free end of one of said crank arms, the crank portion of the other crank arm working freely in the slot of the lever. 3. In a device of the kind described, parallel shafts, oppositely arranged crank arms carried by the shafts, Jntermeshing gear wheels carried by the shaft, a lever having one end pivotally connected to one of sald crank arms, said end describing a circular path, the said lever being longitudinally slotted adjacent its opposite end, the other crank arm having its crank portion in engagement with said slot and the free end of the lever describing a path upon an irregular line and of greater length than the path described by the pivot end of the lever.

\section*{No. 102,660. Wrench. Clé è écrou.}

William C. Raynard, Jansville, Idaho, U.S.A., 18th December, \(1906 ; 6\) years. Filed 4th September, 1906 . Receipt No. 139,220.
Claim.-1. A wrench consisting of a pair of pivoted han. dles, one bearing a smooth faced jaw and the other a serrated or toothed jam, the jaws near their ends belng curved on a line nearly approaching the arc of a circle and thence to their pivotal point gradually becoming straight.
2. A wrench consisting of a pair of pivoted handles one bearing a smooth faced jaw and the other a serrated or

toothed jaw, the jaws near their ads being curved on a line nearly approaching the are of a circle and thence to their pivoted point gradually becoming straight, the bevel or inclination of the teeth of one jaw being substantially the same with respect to the smooth jaw throughout.
3. A wrench consisting of a pair of pivoted handles, one bearing a smooth faced jaw nnd the other a serrated or toothed jaw, the jaws near their ends being curved on a line nearly approaching the arc of a circle, and thence to their pivotal point gradually becoming straight, the handle bearing the smooth faced jaw having an offset on its front side above its pivotal point and an offset in reverse direction on the opposite side below its joint, a slot extended through the handle between the offsets and the opposite handle extended through said slot and pivoted therein to its co-acting handle.

No. 102,661. Pick Point Folder.
Porte-pointe de marteau à piquer.

Donald Dougl Riley, Hamilton, Victoria, Australia, 18th December, 1906 ; 6 years. Filed 4th December, 1906. Receipt No. 141,806.
Claim.-1. In combination with a recessed head, a pick point or tool shank to enter the same, shoulders at the shank base to be located outside of the said head, a second slot opening into said recess, a double headed wedge located partly in the said recssed head, and projecting into the said second slot and inclined surfacis to the latter, substantially as and for the purpose set forth.
2. In combination with the recessed head, a pick point or tool shank adapted to enter the same, the shank base having shoulders located outside of said head, a second slot in the latter meeting the first-named recess, a wedge having an end portion (adapted to be struck) situated partly in the said recess and partly in but not projecting outside the said second slot and in the latter an inclined surface to allow the striking of the said wedge to free it, all substantially as described.
3. In combination with a recessed head having a second slot opening into the recess and having inclined surfaces as described, a shouldered pick or tool point shank and a wedge partly in the recess and partly in the slot and having an upward projection adapted to be struck forwardly to loosen the said shank.

\section*{No. 102,662. Wardrobe. Garde-robe.}

Anna M. Scherff, Wells, Nevada, U.S.A., 18th December, 1906; 6 years. Filed 8th October, 1906. Receipt No. 140,121.
Cladm.-1. A portable wardrobe comprising a top board consisting of two hinged sections, hangers attached to the 12-28
upper side of said top board, an eye on the under side of each of the top board sections, a rod for engaging in said

eyes, a wedge for engaging between the rod and top board sections and a bag-like structure extended from the tod board.
2. A portable wardrobe comprising a top board composed of hinged sections foldable upwardly upon each other, having a locking device on the underside of the hinged sections for locking the sections to their extended position and a supplemental locking device for holding the first locking device to its adjusted position for locking the hinged sections from folding up.
3. In a portable wardrobe of the character described, in combination with a hinged section 1 and 2 adapted to fold upwardly upon each other, a keeper on the underside of each of the said sections adjacent the hinged connections, a locking member adapted to engage with the said keepers and a means for holding the said locking member positively in engagement with the keepers. for the purpose specified.

No. 102,663. Safety Razor. Rasoir de silreté.

Henry B. Stillman, Upper Montclair, New Jersey, U.S.A., 18th December, 1906; 6 years. Filed 1st December, 1906. Receipt No. 141,727.

Claim.-1. In a safety razor, a handle, a head connected to the handle having flaring edges and a down turned end forming a clamping jaw, a plate having flaring edges which extend beyond the edges of the head and a down turned end. said plates being pivoted to the handle to form a swinging movable clamping jaw and guard and a cutting blade between said jaw.
2. In a safety razor, a handle, a head connected to the handle having flaring or widened edges, a down turned end forming a clamping jaw, a guard plate pivoted to the handle having flaring edges which extend beyond the edges of the head and a down turned end forming a movable clamping jaw having teeth to form a guard and a cutting blade between the clamping jaw, the movable clamping jaw being so arranged with respect to the other that the upper edge will first come in contact with the blade near the cutting edge thereon, and when moved to its normal position will jam the blade and hold it securely in place.
3. In a safety razor, a handle, a head connected to the handle having fiaring edges and a downturned end forming a clamping jaw, a plate having flaring edges which extend beyond the edges of the head and down turned ond, said plate being pivoted to the handle to form a swinging movable clamping jaw and guard and a blade between the jaws, the handle being arranged at an angle to the faws whereby a drawing action is obtained.
4. In a safety razor, a handle, a head connected to the handle and provided owith a clamping jaw, a guard plate also provided with a clamping jaw and so pivoted to the handle that the clamping jaw thereof will move eccentrically to the clamping jaw of the head whereby a cutting blade placed between the jaws may be wedged and securely held in position.
j. In a safety razor, a handle, a head connected to the handle having a down turned end to form a movable clamping jaw, the guard plate being pivoted to the handle, a blade between the jaws and a spring adapted to hold the guard plate against the head and the movable jaw against the blade to secure the blade in position between the jaws.
t. In a safety razor, a handle, a head connected to the handle and provided with a clamping jaw, a guard plate also provided with a clamping jaw, said plate being pivoted to the head in such a manner that the clamping jaw thereof will be eccentric to the clamping jaw of the head, a cutting blade between the two jaws and a spring co-operating with the guard plate to hold the said plate against the head and the clamping jaws in engaging position.
7. In a safety razor, a handle, a head connected to the handle having flaring or widened edges and a down-turned end forming a clamping jaw, a guard plate plvoted to the handle also having flaring edges which extend beyond the edges of the head and a down-turned end forming a movable clamping jaw, and having teeth on the edge of the jaw to form a guard, a cutting blade between the two clamping jaws, the guard plate being so connected to the handle that the movable clamping jaw is eccentric to the clamping jaw on the head, and a spring carried by the handle and co-operating with the guard plate to hold the guard plate against the head and the movable jaw into co-operative position with the other jaw.

No. 102,664. Book Purse. Portefeuille-calpin.

Emma L. Sweet, Wallace, Idaho, U.S.A., 18th December, 1906; 6 years. Filed 27th October, 1906. Recelpt No. 140,673.
Claim.-A book having a substantially circular pocket formed in the cover thereof, adapted to receive a coin, and a folding flap attached to one edge of said cover, said flap having side pieces attached to said flap and to sald cover, said pocket having a recess in the edge thereof opposite the point of attachment of said flap to said cover.

No. 102,665. Bookcase. Bibliothèque.

Fred Walter Tobey, Grand Rapids, Michigan, U.S.A., 18th December. 1906; 6 years. Filed 6th October. 1906. Receipt No. 140,106.
clatm.-1. The combination of two sections of a bookcase arranged end to end, detachable legs supporting the exposed
front corners and arranged diagonally beenath the same, a detachable leg partially beneath each adjacent corner of the cases and facing the front of the cases, two fastening members under each corner of each bookcase section, and two fastening members on each leg adapted to interchangably interlock with the members on the bookcase sections, whereby the legs may be attached in either of said positions.
2. The combination of two sections of a bookcase arrnged end to end, means for supporting the non-adjacent ends of the same, a detachable leg partially beneath the respective adjacent ends of the sections, two fastening members on each bookcase section and two fastening members on the leg adapted to engage with one member on eash bookcase section or both members on one bookcase section. whereby the leg serves to separately support the sections and to couple the same to each other.
3. The combination of two sections of a bookcase arranged end to end, means for supporting the non-adjacent ends of said sections, a detachable leg beneath both adjacent ends of the sections, a screw in each section and slots in the leg to receive the respective screws whereby the leg supports both sections and couples the same together in alignment.
4. In combination with two base sections of a sectional bookcase, two fastening members arranged digonally under each corner of the sections, a detachable leg and two fastening members on the leg and adapted to engage both fastenings under one corner and adjust diagonally under the case or to engage one each of said fastenings under two sections to support both sections and couple the same to each other.
5. In combination with a sectional bookcase, a detachable leg having its upper part provided with parallel horizontal slots spaced apart and screws in the upper side of the case and near each front corner thereof, one of each of said screws being arranged distant from the end of the case substantially one-half of the distance between the center lines of the slots whereby a leg may be attached under either one corner of the section to support the same, or under two corners of two adjacent sections to support both sections and to couple the same together.
6 In combination with the base section of a bookcase, detachable legs each having a segmental plate at the top provided with parallel slots spaced apart and at the respective sides of the central radial line of the plate, screws in the under side of sections spaced apart and arranged on diagonal lines, said slots and screws being so adjusted that the screws at one corner of the case will engage the slots and adjust the leg in one position relative to the case or one screw under each of two adjacent corners of the case will engage the slots and adjust the leg in a different relation to the sections.
7. In combination with the base sections of a sectional bookcase, detachable legs each provided with a segmental top plate having parallel slots to recedve screws and spaced apart parallel and at each side of a centrol radial line on the plate, and screws in the bottom of the case arranged in pairs and on diagonal lines of forty-five degrees, each pair of screws being spaced apart to enter the slots and the screws of each pair most remote from the front being spaced from the end of the section substantially one-half the distance between the center lines of the slots.
No. 102,666. Apparatus for Displaying Advertisoments.
Appareil pour annonces.

Sarah Edith Low and Alfred William Tooley, both of London, England, 18th December, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,283.
Claim.-In apparatus for displaying advertisements and the like, the provision of an improved arrangement for July 1906. Receipt No. 138,283 1906; 6 years. Fis
holding horizontal bars or rods for carrying the advertisement sheets, an improved arrangement of fast and loose toothed wheels for imparting intermittent motion to the revolving rollers, fixed direct to the actuating revolving roller, thereby reducing friction and loss of power to a minimum, and the provision of a continuous raised strip or projection for keeping the catch lever raised till the cross bars for giving intermittent motion have passed the fixed driving wheel on the shaft of the actuating winding roller, thereby causing the catch lever to automatically drop in its place, and prevent overwinding from momentum or other cause, all substantially as and for the purpose herein set forth and described and illustrated in the accompanying drawings.

No. 102,667. Stamp Mill. Moulin d pilon.

G. P. Bounard and G. H. Mackell, assignee of G. W. Benyon, all of England, 18th December, 1906; 6 years. Filed 21st August, 1906. Receipt No. 138,877.
Claim.-1. In apparatus for the aforesaid purposes, and in which two lifts are given to the stamp or weight, or to cach stamp or weight, for each rotation of the shaft, the employment of what we have hereinbefore referred to as a pair of lifting cams and as a supplementary pair of cams, the latter for giving downward impulse for each descent of the stamp or weight. or of each stamp or weight, both the pair of lifting cams and the supplementary pair of cams being carried on one shaft, and providing the said stamp or weight, or each stamp or weight. with projections or tappets, or the equivalents, to be acted upon respectively by the said pair of lifting cams and the said supplementary pair of cams, substantially as hereinbefore described.
2. In or for apparatus for the purposes aforesaid, a lifting cam or lifting cams having the portions which first comes into contact with the part to be raised and the portion which last comes into contact with the said part, of a quicker curvature, or one more nearly concentric than the curvature of the portion between them, this portion between them having a quicker rise or flatter curvature. substantially as and for the purposes hereinbefore described.
3. In or for apparatus for the purposes aforesaid, a supplementary or downward impulse giving cam or cams, to act upon the stamp or weight, the portion of such cam or each such cam which first acts being of quicker curvature. and the portion which follows this having a quicker rise or flatter curvature, to act upon the descending stamp or weight. in the manner hereinbefore described.
4. In apparatus for the purposes aforesald. in which two lifts are given to the stamp or weight. or to each stamp or weight, at each rotation of the shaft, the combination of two projections or tappets, or the equivalents on the stem of the stamp or weight. or on each such stem. and a shaft carrying both the lifting cases and the supplementary or downward impulse giving cams and a hinged lever or hinged levers through the intervantion of which downward impulses are given to the stamp or weight, or to each stamp or weight, substantially as hereinbefore described and illustrated in the accompanying drawings.

\section*{No. 102,668. Amalgamator. Amalgameur.}

William H. Morgan and Henry G. Burton, assignee of a half interest, both of Veterans' Home. 18th December. 1906; 6 years. Filed 14th September, 1906. Receipt Nin 139,507.
Claim.-1. An amalgamator comprising an inclinfit sluice box provided with an amalgamated surface and having depressions forming riffles sunk in the bottom and spiceed apart and charged with mercury, the upper walls of the riffles respectively being overhanging and deeper than the lower walls and a screen arranged to shield the amalgamated surface.
2. An amalgamator comprising a transversely inclined sluice box provided with an amalgamated surface and hav-

ing a series of transversely extending depressions forming riffles sunk in the bottom and spaced apart and charged with mercury, transverse revoluble amalgamated plates arranged respectively above the riffies and a screen arranged to shield the amalgamated surface.
3. An amalgamator comprising an inclined sluice box provided with an amalgamated surface and having depressions forming riffles sunk in the bottom and spaced apart and charged with mercury, the upper walls of the riffles being overhanging and deeper than the lower walls, revoluble amalgamated plates arranged above the riffes and a screen arranged to shield the amalgamated surface and said riffles and plates.
4. An amalgamator comprising a longitudinally inclined sluice box provided with an amalgamated surface and having a series of transversely extending depressions forming riffles sunk in the bottom and spaced apart and charged with mercury, a screen arranged to shield the amalgamated surface, transverse revoluble amalgamated plates arranged under the screen and above the riffles and straight, swinging pendent amalgamated plates between the sunken riffles and beneath the screen, said swinging plates adapted to lie substantially flat upon the surface of the stream passing thereunder.

No. 102,669. Window Hinge. Gond de fenetre.

Thomas Black, assignee of Arthur Plerre Couture, both of Winnipeg, Manitoba, Canada, 18th December, 1906;
6 years. Filed 8th June, 1905. Receipt No. 125,847.
Claim.-1. A hinge comprising a plate provided with a boss thereon and a flange adjacent said boss, and a second plate provided with a flange adapted to engage said boss and provided with a flange adjacent said first flange and provided with a pivot adapted to engage sald first plate.
8. A hinge comprising a plate provided with a boss thereon having a curved edge and a straight edge and provided with a flange adjacent said boss, and a second plate provided with a flange having a curved edge and a straight edge adapted to engage said boss and provided with a flange adjacent said first fiange and provided with a pivot adapted to engage said first plate.
3. A hinge comprising a plate provided with a boss thereon and provided with an integral flange adjacent said boss, and a second plate provided with a flange adapted to engage said boss and provided with a flange adjacent said first flange and provided with a pivot adapted to engage said plate.

No. 102,670. Machine for Making Battery acoumuMachinc pour la fabrication des latrices.

The Gould Coupler Company, New York City, assignee of Willard F. Richards, Buffalo, New York, U.S.A., 18th December. 1906; 6 years. Filed 10th November. 1906. Receipt No. 141,081 .
Claim.-1. The combination of a frame provided with open ended guideways, a grid plate carrier, spinning rollers arranged on opposite sides thereof, journal boxes for said rollers which are arranged to slide toward and from each other in sald guideways, and are removable through the open ends thereof, and devices between which the two open ends thercon, and which are detachably connected rollers are arranged and which are detachably cournal boxes for moving the rollers toward and from each other, substantially as set forth.
2. The combination of a frame provided with open-ended gudeways, a reciprocating grid plate carrier, spinning rollers arranged on opposite sides of the grid plate carrer, cross heads in which the spinning rollers are journalled and which are mounted to slide toward each other in said guideways and are removable through the open ends there, and mechanism detachably connected with said cross heads for moving the spinning rollers toward each other, substantially as set forth.
3. The combination of a frame provided with open-ended guideways, a grid plate carrier, spinning rollers arranged on opposite sides of the grid plate in said carrier, journal boxes for said rollers which are arranged to slide in said guideways and are removable through the open ends thereof, and mechanism for moving said rollers toward each other, the journal boxes for one of said rollers being detachably connected to said mechanism, and the journal boxes for said other roller being removably supported by but disconnected from said mechanism, substantially as set forth.
4. The combination of a frame provided with open-ended guideways, a grid plate carrier, spinning rollers arranged on opposite sides of the grid plate in said carrier, journal boxes for said rollers which are arranged to slide in said guideways and are removable through the open ends thereof, and mechanism for moving said rollers toward each other comprising levers fulcrumed on said frame and detachably connected to the fournal boxes for one of said rollers, slide rods on which the fournal boxes for the other roller are removably supported, levers fulcrumed on the frame and connected to said slide rods, and means for operating said levers, substantially as set forth.
5. The combination of a frame provided with guideways open at their upper ends, upper and lower spinning rollers
mounted to slide toward and from each other in said guideways to operate upon opposite shich the lower spinning roller tically movable supports on which the said upper spinning is removably seate, connected, and mechanism connecting roller is detachably conn for moving said spinning rollers said supports and levers for mos set forth.
toward each other, substantially as carrier for holding the grid plate 6. The combinatin spinning rollers arranged above borizontally. horizontal to move vertically toward pach and below sald carrier to said spinning rollers. a single other. levers connect provided with rock arms. links conhorizontal rock shat levers and forming with sald necting said rock arm toggles for the spinning rolls. and rock arms operating said rock shaft, substantially as set means
forth.
7. In a grid spinning machine. the combination of a irame proyided with open-ended guideways, a grld plate carrier. spinning rollers removably mounted in said guideways on onposite sidies of the grid plate in sald carrier mrans for moving the said soinning rollers toward and from each other, said means being detachably connerted to said rollers to rnable the removal of the rollers from the machinn no of the sninning rollers having a wherl at one pad therenf. and the other spinning roller having a when at the onnosite end thereof. a shaft nroviden at onoosite sides of the machine with whmels, and a bolt connecting each of said wheels on said shaft with tho wherl on one of the spinning rollers. substantially as set forth.
8. The combination of a grid plate carrier nroviden with a projecting shank. a grid niate holder slidably held in said carricr and provided with a nonineting handin whim extends along side of the shank of the carrier. a clamp device secured to sald shank for clamping saif handlthereto. and having a clamping nart which is movable away from the plane of movement of the grid nlate holder. whereby the latter can be slid out of the grid platn carrier past said scruring device, substantialliv as set Preth.
3. The combination of a grid nlate carrier. a grid nlatn holder slidably held in said carrier and provided with a projecting handle. and a device connected to said carmer for securing sald grid plate holdor in said carrier. said devief having a pivoted part to engage said handle. and a nivoted lock for holding sald nivoted nart in nneacement with aald handle, sald pivoted part and lock being constructed to swing away from said handle to free the same and permit the removal of the grid plate holder from sald carrier, substantially as set forth.:

\section*{No. 102,671. Kiln. Séchnir.}

Paul Chmelewski, Helsingsfors, Finland, 18th December. 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,918.
Claim.-1. A kiln of the character described comprising an inner wall, an outer wall surrounding the same and spaced therefrom to form a continuous chamber, removable partitions for dividing said chamber into separate compartments, and temporary tops supported upon the brick masses in said chamber, substantially as described. 2. A kiln of the character decribed, compriing an inner wall, an outer wall surrounding the same and spaced therefrom to form a continuous chamber, said outer wall having filling openings and fire openings, removable partitions between said walls for dividing said continuous chamber into separate compartments, and temporary tops supported upon brick masses in said chamber and having sutlet openings formed therein, substantially as described.
3. A kiln of the character described comprising an inner wall, an outer wall surrounding the same and spaced there from to form a continuous chamber, said outer wall having flling openings and fire openings, removable partitions between said walls for dividing said continuous chamber

Into separate compartments, temporary tops supported upon brick masses or the like in said chamber and having outlet openings formed therein, said inner wall having a smoke passage communicating with the compartments of said chamber, valves for controlling the communication between said passage and said compartments, fire passages in said temporary tops and removable closures for said. fire passages or pipes.
4. A kiln of the character described comprising a center wall having formed therein a longitudinally extending smoke flue which may be located also under this center wall in the surrounding side wall or under the furnace foundation and inlet passages adjacent to its bottom communicating with said flue, valves for controlling said inIet passages an outer surrounding side wall spaced from the center wall to form a continuous chamber, said side wall having filling openings and fire openings adjacent to its bottom, vertically removable temporary partitions be tween said center and side walls to divide said chamber into separate compartments. temporary tops for the compartments of said chamber supported upon the brick masses or the like therein, sald tops having outlet openings, fire passages mounted in said tops and removable caps or closures for said fire passages, substantially as described and for the purpose set forth.
5. A kiln of the character described having an endless fire passage, movable partitions for dividing said passage into compartments. means for introducing heat into some of said compartments adjacent to their bottoms, means for introducing heat into some of said compartments through their tops, outlet passages for sald compartments and means for controlling said outlet passages.

No. 102,672. Band and Slime Soparator. séparateur de sable et de limon.

David J. Kelly, Salt Lake City, Utah, U.S.A., 18th December, 1906; 6 years. Filed 22nd September, 1906. Receipt No. 139,722.
Claim.-1. In a sand and slime separator the combination with a pulp supply, of a revolubly mounted member having side delivery settling compartments adapted to be successively aligned with said supply.
2. In a sand and slime separator the combination with a pulp supply, of a revolubly mounted wheel divided into separate compartments, said compartments having a side delivery and adapted to be successively aligned with said supply.
B. In a sand and slime separator the combination with a pulp supply, of a revolubly mounted wheel having side delivery settling compartments into which the pulp is successively delivered, means for holding the wheel against movement, means for automatically releasing the wheel and means for imparting to the wheel a step-by-step movement.
4. A sand and slime separator comprising a revoluble nember having partitions dividing it into settling compartments having a side delivery, and means for giving a partial rotation to said member to allow the slime to separate from the same and discharge over the edge of the partition.
5. In a sand and slime separator the combination with a source of pulp supply, of a side delivery settling compartment member revolubly mounted, and means whereby the member is given a step-by-step movement in one direction to bring its compartments successively into the range of action of the pulp supply.
6. In a sand and slime separator the combination with a source of pulp supply, of a normally locked revolubly mounted member having side delivery settling compartments, and means controlled by the overfiow from one compartment for automatically releasing the member from its locked position whereby the weight of the contained material in a flled compartment produces a partial rotation of the member and brings a successive empty compartment in the range of action of the pulp supply.
7. In a sand and slime separator the combination with a source of pulp supply. of a revolubly mounted wheel having partitions dividing it into side delivery settling compartments, said wheel capable of a step-by-step movement in one direction to bring the compartments successively into the range of action of the pulp supply.
8. In a sand and slime separator the combination with a pulp supply, of a revolubly mounted wheel having side delivery settling compartments. means whereby said wheel is given a step-by-step movement, and shiftable means for diverting the pulp supply from a flled compartment into an empty compartment co-ordinately with the movement of the wheel from one position to another.
9. In a sand and slime separator the combination with a pulp supply, of a revolubly mounted wheel having compartments, means whereby said wheel is given a step-bystep movement, and tiltine means automatically cohtrolled by the overflow from a filled compartment for diverting the pulp supply from sald compartment into a succeeding compartment co-ordinately with the movement of the wheel from one position to another.
10. In a sand and slime separator the combination with a pulp supply, of a revolubly mounted wheel having compartments, means whereby said wheel is given a step-bystep movement; a tilting launder normally receiving the overflow from one compartment of the wheel, means Whereby, sald overflow tilts the launder out of its normal position, and means connected with the launder for diverting the pulp supply from a flled compartment of the wheel into a succeeding empty pocket thereof co-ordinately with the movement of the wheel.
11. In a sand and slime separator the combination with a pulp supply, of a revolubly mounted wheel having compartments, means for imparting to the wheel a step-bystep movement, a tiltable launder normally receiving the overflow from a flled compartment, an overfiow receiving vessel connected to and movable with the launder, and means connected with the launder for diverting the pulp supply from one compartment of the wheel to another co-ordinately with the movement of the wheel.
12. In a sand and slime separator the combination with a pulp supply, of a revoluble wheel having compartments. projections on the wheel corresponding to each of the compartments, a tiltably mounted launder normally positioned to receive the overflow from a fllled compartment. \(a\) vessel connected with the launder and receiving said overflow, a counterweighted lever connected with the launder, and means Including a stop movable with the lever and normally disposed in the range of action of one of said projections for locking the wheel against discharging movement, said launder automatically tilting to release the stop from the engaged projection when the overflow overbalances the counterwoighted lever.
13. In a sand and slime separator the combination with a pulp supply, of a revoluble wheel having compartments. projections on the wheel corresponding to each of the compartments, a tiltably mounted launder normally positioned to receive the overflow from a fllled compartment. a vessel connected with the launder and recelving said overflow, a counterweighted lever connected with the launder, and means including a stop movable with the lever and normally disposed in the range of action of one of said projections for locking the wheel against discharging movement, said launder automatically tilting to release the stop from the engaged projection when the overflow overbalances the counterweighted lever, and means controlled by the tilting of the launder for diverting the pulp supply from the filled compartment of the wheel into a succeeding empty compartment.
14. In a sand and slime separator the combination with a pulp supply, a revolubly mounted wheel having side delivery, settling compartments and means whereby said wheel is given a step by-step movement to bring the compartments successively into the range of action of the pulp supply, of a mechanism for governing the rate of travel of the wheel.
15. In a sand and slime separator the combination of \(a\) pulp supply, a revolubly mounted wheel having compart ments, means for giving said wheel a step-by-step movement to bring the compartments seccessively into the range of action of pulp supply, and a governing mechan ism including a fluid containing vessel, a rising and fall
ing vessel operable therein and connections between said movable vessel and said wheel whereby the vessel is operated by the wheel to control the rate of movement of the latter.
16. In a sand and slime separator the combination of a revolubly mounted wheel having compartments, means for giving said wheel a step-by-step movement, and mechanism for governing the rate of movement of the wheel, said mechanism including a pair of fluid containing vessels, hollow vessels operable therein and adapted to receive the fluid displaced therefrom, and means whereby the hollow vessels are alternately moved in opposite directions.
17. In a sand and slime separator the combination with a pulp supply, a revolubly mounted wheel having compartments and means for giving the wheel a step-by-step movement, of a tiltably mounted apron normally disposed in the range of action of the wheel and adapted to receive the overflow from a filled compartment thereof, and means carried by the apron and wheel respectively for moving the apron out of the range of action of the wheel as the latter is moving from one position to another.
18. In a sand and slime separator the combination with a pulp supply, a revolubly mounted wheel having compartments and means for giving the wheel a step-by step movement, of a tiltably mounted apron normally disposed in the fange of action of the wheel and adapted to receive the overflow from a filled compartment thereof and means carried by the apron and wheel respectively for moving the apron out of the range of action of the wheel as the latter is moving from one position to another, a launder into which the apron discharges and a splash plate opposing the apron.

No. 102,673. Apparatns for Classifying Materials. Appareil pour classifler les matériaus.

René Emile Trottier, Husseun Dey, Algeria, France. 18th December, 1906; 6 years. Filed 23rd August, 1906. Recelpt No. 138,933.
C'laim.-1. An apparatus for classifying any solid materials first by their linear dimensions, then by their specific gravity and then again by their linear dimensions, comprising a tube, a feed device to introduce the materials into one end of said tube, means to secure a fluid current in said tube in opposite direction to the movement of the materials, a passage of roduced section in said tube, and a classifying table along which the fluid current traverses.
2. An apparatus for classifying and solid materials first by their linear dimensions, then by their specific gravity and then again by their linear dimensions, comprising a tube, a feed device to introduce the materials into one end of said tube, means to secure the fluid current in said tube in opposite direction to the movement of the materials, a passage of reduced section in said tube, a classifying table along which the fluld current traverses, and an adjustable shoe to regulate the speed of the fluid current.
3. An apparatus for classifying any solid materials first by their linear dimensions, then by their specific gravity and then again by their linear dimensions, comprising a lube, a feed device to introduce the materials into one cond of said tube, means to secure a fluid current in said lube in opposite direction to the movement of the materials, a passage of reduced section in said tube, a clasifying table along which the fluid current traverses, an adjustable shoe to regulate the speed of the fluid current, and means to more or less incline the classifying table in order to regulate the classification by specific gravity.
4. An apparatus for classifying any solid materials, first by their linear dimensions, then by their specific gravity and then again by their linear dimensions, comprising a tube, a feed device to introduce the materials into one end of said tube, means to secure a fluid current in said tube in opposite direction to the movement of the mate-
rials, a passage of reduced section in said tube, a classifying table along which the fluid current traverses, an adjustable shoe to regulate the speed of the fluid current, means to more or less incline the classifying table in order to regulate the classification by specific gravity, and a vane to regulate the passage of the materials.

\section*{No. 102,674. Stropping Machine.}

\section*{Machine pour aifuiser les rasofre.}

Henrie Clauss, Fremont, Ohio, assignee of Edward B. Gibford, Adrian, Michigan, U.S.A., 18th December, 1906; 6 years. Filed 27th July, 1906. Receipt No. 138,219.
Claim.-1. In a blade stropping device, the combination of the movable blade holder, the friction roller and movable arm, gearing connecting said roller and arm, said arm having a slidable engagement with the blade holder.
2. In a blade stropping device, the combination with the blade holder, a friction roller journalled between the ends of the blade holder, a pivoted arm, gearing connecting said roller and arm, a pin upon the blade holder having a slidable engagement with sald arm, and a spring in said arm engaging said pin.
3. In a blade stropping device, the combination with the movable blade holder, of a friction roller, a gear wheel thoreon, a second gear wheel meshing therewith, a shaft upon which said second gear wheel is fixed, a movable arm fixed to the end of said shaft, said arm having a slot therein and a slot extending from said slot. a colled spring seated in said socket, and a pin upon the blade holder lying in said slot and engaging said pin.
4. In a stropping device, the combination of the blade holder having a longitudinal slot in the bottom thereof, a friction roller, means connected with said roller for swinging the blade holder from side to side, a slidable spring arm in the blade holder, sald arm having a rivet engaging in the slot in the bottom of the blade holder and having jaws adapted to clamp the handle of the razor.

\section*{No. 102,675. Engine Starter.}

Apparcil pour la mise en marche de moteur deaplosion.

Francis Leonard Orr, Thurman, and Mark Morrow, Percival, both in Iowa, U.S.A., 18th December. 1906; 6 years. Filed 14th November, 1906. Receipt No. 141,210.
Claim.-1. The combination with a cylinder and piston of an engine, of a storage tank, tubular passageways providing communication between the engine cylinder and tank, a check valve in one if said tubular passageways, a controller valve in a separate similar passageway, a cylinder having independent communicating passageway with the storage tank, a valve in the latter passageway, having an exit opening leading to the outer air, a piston in the latter

1
cylinder having a suitably extended rod, means operatively connecting the piston rod with the engine power shaft, whereby the same may be given boosting action, and means operatively connecting the boosting action, and means operatively connecting the bosting devices with the controller valve, substantially as described.
2. The combination in an engine starter, of a suitable tank, a passageway leading from the tank into the engine cylinder, a governor valve in said passaguway, having a projecting stem, a suitably supporicil cam with means whereby it may be driven by operation of the engine, an adjustable arm arranged between sald projecting stem and cam, a cylinder having communicating passageway with the storage tank, a compound valve in the latter passageway, having an opening leading therefrom to the open air, a piston in the latter cylinder having an extended rod, rack teeth of the said rod, a toothed segment loosely arranged on the engine power shaft, a pawl carried by the toothed segment. with the same arranged for engagement with the ratchet wheel teeth, the said rack and segment teeth being arranged for meshing engagement, a bell crank having one end secured to the racked piston rod, a rod extending from the bell crank to the adjustable arm between the governor valve and its operating cam, whereby in operation of the engine the arm is thrown into and out of operative position, and a separate passageway leading from the tank into the engine cylluder, the latter passageway having a check valve therein, whereby to close return flow into the engine cylinder, substantially as described.
3. The combination in an engine starter. of a storage tank having communicating passageway with the negine cylinder, a governor valve in sald passageway, a separate passageway providing communication between the tank and engine cylinder, a check vaive in the latter passageway, means whereby boosting action may be lmparted to the engine power shaft, means for the conveying and controlling of the booster motive power, and means controlling operation of the governor valve, actuated by the means for imparting boosting action, substantially as described.

No. 102,676. Grinding and Polishing Wheel.
Roue d aiguiser et d polir.

A. W. Thomas and B. W. Gerwig, assignee of a half interest, both of Rome, New York, U.S.A., 18th December, 1906; 6 years. Filed 24th October, 1906. Receipt No. 140,573.
Cham.-1. A device of the character described having a lever which comprises a single piece extending across the center of the wheel and bored for an arbour with other pieces with sides converging thereto and having means inserted therein and in the single piece to secure them relatively to the center of the wheel, substantially as described.
2. In a device of the character described, a wheel comprised of a plurality of layers, each layer having a central member extending diametrically across the wheel and each of said members of the several layers disposed at a different angle relative to others, and means engaging the several members of the several layers to hold them relative to the center of the wheel, substantially as described.
3. In a device of the character described, a wheel made up of a plurality of parts, one of said parts extending diametrically across the wheel and being pierced for the arbour, and the other of said parts being grouped radially at the sides of said pioce, the said wheel being provided with a non-porous peripheral band adapted to support a grinding surface, substantially as described.
4. A device of the character described composed of a plurality of layers, each layer having a member bored for the center of the wheel and having sides diverging to form an obtuse angle and having parts grouped in said angles and a ring-like member recessed into parts of each layer adjoining, the said layers being provided on the periphery with a non-porous leather collar secured thereon and provided with a surface adapted to receive and carry grinding material, substantially as described.
5. A wheel of the character described comprising one or more layers, each of the same being composed of a single piece extending diametrically across its layer and having grouped in each of said layers radially extending pieces to complete the layer, the grain of each member of each layer running substantially radially of the center of the layer, the said construction being bored for an arbor, substantially as described.
6. A wheel of the character described comprising one or more layers, each of the same being composed of a single piece extending diametrically across its layers and having grouped on each layers radially extending pieces to complete the surface of the layer, the grain of each member of each layer running substantially radially of the center of the layer, the said constructios being bored for an arbour and being provided with a peripheral non-porous band with grinding material thereon, substantially as described.
7. A wheel of the character described composed of one or more layers, each layer being built up of an integral member lying diametrically across the layer and of sec-tor-like members grouped on each side thereof, and meaus engaging the several members of each layer and the several layers to hold the members of each layer and the adjacent layer relatively to the center of the wheel, substantially as described.
8. A wheel comprising one or more layers, each made up of diametrically disposed members with sector-like members arranged therewith all rigidly connected, and a nonporous peripheral surface to maintain grinding material thereon at a fixed consistency, substantially as described.

No. 102,677. Pnermatic Hammer. Martoau pncumatique.

Fairbanks, Marse and Company, Chicago, Illinois, assignee of Allen J. Patch, Bcloit, Wisconsin, U.S.A., 18th December, 1906; 6 years. Filed 2nd November, 1906. Receipt No. 140,818 .
Claim.-1. A pneumatic hammer comprising in combination a cylinder, a piston, a main valve located at the rear of said cylinder and controlling certain ports and passages for admission of fluid pressure to said piston and exhaust of pressure therefrom, and a supplementary valve at the forward end of said cylinder controlling the exhaust from such forward end and in itself controlled by fuid pressure admitted to and exhausted by means of the main valve.
2. A double valve pneumatic hammer comprising in combination a cylinder, a piston, a main valve, and a supplementary valve, said supplementary valve being independently fluid pressure actuated in both directions, substantially as described.
3. A pneumatic hammer comprising in combination a piston, a cylinder within which said piston operates, and a main distributing valve located at the rear end of the piston chamber, said valve being provided with three pressure areas acted on by admissios or exhaust of motlve fluid intermittently governed through ports controlled by said piston to operate the valve, substantially as described.
4. A pneumatic hammer comprising in combination a piston, a cylinder within which said piston operates, and
a main distributing valve located at the rear end of the piston chamber, sald valve being provided with three pressure areas to which motive fluid is intermittently admitted through ports controlled by said piston, and an auxiliary valve located near the forward end of the piston chamber and controlling the exhaust ports in advance of the piston, substantially as described.
5. A fluid pressure impact tool comprising in combination a cyliader, a piston, a valve located near the forward end of said cylinder, and means co-operating with said valve, whereby when the tool is removed from the work the air pressure will act to force the valve to the rear and rause the piston to cushion and thus prevent the piston from striking the tool, substantially as described.

\section*{No. 102,678. Hardening and Tempering Copper. \\ Trempe du cuivre.}

The Renstrom Tempered Copper Company, assignee of Carrie Renstrom Plumer, all of Seattle, Washington, U.S.A., 18th December, 1906; 6 years. Filed 14th October, 1905 . Receipt No. 129,235.
Claim.-1. The herein described process of hardening copper, or the alloys of copper, comprising subjecting copper or the alloys of copper to heat of a sufficiently high degree to melt the same, and while in a heated condition subjecting the same to the action of sulphate of copper for hardening the same, and also to the action of a chilling ingredient.
2. The herein described process of hardening copper, or the alloys of copper, comprising subjecting the same to heat of a sufficiently high degree to melt the same, and while in a heated condition subjecting the same to the action of sulphate of copper for hardening the same, and also to the action of blchroma:e of potash for chilling or freezing the metal.
3. The herein described process of hardening copper or the alloys of copper, comprising subjecting the same to heat of a sufficiently high degree to melt the same, and while in a heated condition subjecting the mass to the action of sulphate of copper for hardening the mass and to the action of birchromate of potash for chilling or freezing the mass and then reheating the mass and allowing it to cool.
4. The process of hardening copper, comprising the heating of copper until it is reduced to a molten condition and then introducing hardening ingredients and permitting them to chill the molten copper until it is too stiff to be stirred, the materials being stirred until such condition is reached.
No. 102,679. Shears. Cisailles.

The Davies Automatic Shear Company, assignce of Frederick David Davies, all of New York City, New York, U.S.A., 18th December, 1906; 6 years. Filed 27th October. 1905. Receipt No. 129,614.
Claint.-1. A pair of shear members or the like connected by a freely rotatable pivot having a head at one end and an annular groove near the other end, together with a flat spring plate having one end down turned and resting thereby upon the nail surface to dispose its body portion in a longitudinal plane at an angle to the horizontal of the nail, said plate having a slot in slidable engagement with the groove in the pivot, and having a seating portion, and said nail surface being provided with depressions, arranged longitudinally of the nail, to adjustably seat said plate, and prevent lateral movement thereof.
2. A pair of shear members or the like connected by a freely rotatable pivot having a head at one end and an annular groove near the sther end, said groove having a right angular bearing surface, together with a flat spring plate having one end down turned and resting thereby upon the nail surface to dispose its body portion in a longitudinal plane at an angle to the horizontal of the nail, said plate having a slot in slldable engagement with the bearing sur-
face in the pivot groove, and having a seating portion, and said nail surface being provided with depressions, arranged longltudinally of the nail to adjustably seat said plate, and prevent lateral movement thereof.
3. In a pair of shears or the like, a freely rotatable connecting pivot and a spring exerting tension between the pivot and a shear member to retain sald pivot axially while forming a bearing therefor, said spring having a seating portion, the tension of said spring also serving to draw the blade edges together, and depressions in said shear member. arranged longitudinally of the nail, to adjustably seat said spring and prevent lateral shifting thereof.
4. A pivot for shears or the like having an annular groove near one end thereof and a retaining shoulder near its other end, \(a\) tensional device fitting in the groove and bearing against a shear member, and a tensional head retained by the shoulder at the other end of the pivot and bearing against the other shear member.
5. In a pair of shears, a shear member provided with depressions arranged longitudinally of the nail, a plvot, an adjustable tensional device at one end of said pivot adapted to engage with said depressions, and a tensional head at the other end of said pivot whereby pressure applied against the tensional head will cause the pivot to move to relax the tension of the adjustable device, permitting the latter.to be more easily freed from the depression in which seated to facilitate its adjustment.
No. 102,680. Line Structurey for Electrical Distribution.
ronstruction de lignes électriques.

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Budd J. Jones, Chicago, Illinois, U.S.A., 18th December, 1906; 6 years. Filed 19th June, 1905. Receipt No. 126,169.
Claim.-1. A line structure for electrical distribution comprising a supporting arm or bracket, an insulator located above and supported upon said arm or bracket, and a conductor suspended from said insulator, as and for the purpose set forth.
2. A linc structure for electrical distribution comprising a supporting arm or bracket, an insulator resting upon the upper side of said bracket, a messenger wire carried by said insulator, and a conductor suspended from said messenger wire, as and for the purpose set forth.
3. A line structure for electrical distribution comprising a supporting arm or bracket, an insulator adjustably supported upon and above said arm or bracket, and a conductor surppuded from said insulator, as and for the purpose set iorth.
4 : line structure for electrical distribution comprising a suppiorting arm or bracket having an elongated opening, ar insulator adjustably supported upon the upper surface of said arm or bracket, and an electric conductor suspended from said insulator, as and for the purpose set forth.
5. A line structure for electrical distribution comprising a supporting arm or bracket having the end thereof doubled or bent unon itself to form a support, an insulator resting upon the upper surface of such support, and an electric conductor suspended from sald insulator, as and for the purpose set forth.
6. A line structure for electrical distribution comprising a supporting arm or bracket, an insulator located above and supported upon the upper surface of sald arm or bracket. an electric conductor, and flexible suspending devices supported from said insulator and attached to said conductor, as and for the purpose set forth.
7. A line structure for electrical distribution comprising a supporting arm or bracket, an insulator supported upon the upper surface of said bracket, a messenger wire supported by said insulator, an electric conductor, and fexiblp suspending connections between iaid messenger wirc and said conductor, as and for the purpose set forth.
8. A line structure for electrical distribution comprising a flanged arm or bracket, an insulator having a base plate, said base plate having a lateral flange arranged to be received upon, and to be supported by. the flange of said bracket, a conductor, and suspending devices for said conductor, said suspending devices being supported from said insulator, as and for the purpose set forth.
9. A line structure for electrical distribution comprising a supporting arm or bracket, an insulator, a base plate in which said insulator is supported, said base plate having a lateral flange that rests upon said arm or bracket. a messenger wire supported by said Insulator, a conductor, and suspending devices interposed between said conductor and said messenger wire, as and for the purpose set forth.
10. A line structure for electrical distribution comprising a supporting arm or bracket, an insulator having a base plate that rests upon said arm or bracket. hook bolts between said base plate and the edges of said arm or bracket. an electric conductor and suspending devices connected thereto and supported from said insulator, as and for the purpose set forth.
11. A line structure for electrical distribution comprising an angle bar arranged to form a supporting bracket, the end of said bar being bent or doubled upon itself. an insulator, a base plate upon which said insulator is supported. said base plate having lateral flange that rests upon the upper surface of the flange of said angle bar at the looned end thereof, hook bolts connecting said flange and the edge of the web of said angle bar. an electric conductor, suspending devices therefor, said suspending devices being esupported from said insulator, as and for the purpose set forth.
12. A line structure for electrical distribution comprising ad insulator, a support upon and above which said insulator is mounted, and a trolley wire suspended from said insulator. as and for the purpose set forth.
13. In a line structure for electrical distribution, the combination with insulators, and supporting arms upon the tpper surface of which said insulators rest, and a messenger wire carried by said insulators, of a trolley wirc. and a I.lurality of suspending connections intermediate adjacent insulators and extending from said messenger wire to salid trolley wire for supporting the latter, as and for the pur pose set forth.
14. An electric rallway structure comprising an approximately horizontal arm or bar, an insulator adjustably mounted upon said arm or bar, a messenger wire supported by said insulator, and a trolley conductor suspended from said messenger wire.
15. An electric railway structure comprising a support, an arm or bar projecting horizontally therefrom, an insulator adjustably mounted upon said arm or bar, a messenger wire supported by said insulator, and a conductor suspended from said messenger wire.
16. An electric railway structure comprising a pole, an angle iron arm projecting laterally therefrom, a brace for said arm, an insulator adjustably supported upon said arm a messenger wire supported by said insulator, and a conductor suspended from said messenger wire.
17. An electric railway structure comprising a plurality of poles. angle iron arms projecting laterally from said poles, insulators adjustably supported upen said arms, a messenger wire supported by said insulators. and a trolley conductor suspended from said messenger wire.
18. An electric rallway structure comprising poles, arms or brackets projecting laterally therofrom, insulators adjustably mounted unon said arms or brackets. a messenger wire attached to said insulators, and a trolley conductor suspended from said messenger wire.
19. An electric railway structure comprising poles, angle iron arms projecting laterally from said poles, braces for said arms, insulators mounted upon said arms, a messenger wire supported by said insulators, and a trolley conductor suspended from said messenger wire.
20. An electric rallway structure comprising poles. angle iron arms projecting laterally therefrom, brace rods connecting the free ends of said arms with the corresponding poles, insulators adjustably mounted upon said arms, a messenger wire supported by said insulators, and a trolley conductor suspended from sall messenger wire.

\section*{No. 102,681. Manufacture of Insulating Tubes.}

Fabrication de tubes isolants.
The Canadian Westinghouse Company, Limited. Hamilton, Ontario, Canada. assignee of Emil Hacfely, Basle. Switzerland, 18th December, 1906; 6 years. Filed 13th November, \(1: 10 \overline{\text { E }}\). Receipt No. 130,066 .
Claim.-1. A machine for manufacturing insulating tubes comprising a mandrel holder provided with a longitudinal groove of angular cross section to receive a mandrel upon which a coated fabric is wound, a pressure device located
above said mandrel and supported upon the outer layer of fabric during the winding operation.

2. A machine for manufacturing insulating tubes comprising a mandrel. a longitudinally recessed mandrel holder, a pressure device that rests upon the material wound upon said mandrel and means for heating the material as it passes to said mandrel and is wound thereon.
3. A machine for manufacturing in\&ulating tubes compris ing a mandrel, a mandrel holder having a longitudinal recess in which the mandrel is rotated, a pressure device that is supported upon the layer of material wound upon the drum, and means for heating the material during the winding operation.
4. A machine for manufacturing insulating tubes compris ing a mandrel upon which coated fabric is wound, a mandrel holder having a longitudinal recess of angular cross section in which the mandrel is rotated, a pressure device located above the mandrel and resting upon the tube during the winding operation and means for heating the material as it is wound.
5. In a machine for manufacturing tubes, the combination with a mandrel and a holder having a longitudinal recess to receive the mandrel, of means for feeding a sheet of fabric to the mandrel, and a pressure device which exerts a constant and downward pressure upon the material on said mandrel and means for heating the material as it passes to and is wound upon said mandrel
6. In a machine for manufacturing tubes, the combination with a rotatable mandrel and a mandrel holder having a longitudinal angular recess to receive the mandrel, of means for feeding sheet material to said mandrel and a vertically adjustable pressure device that engages the surface of the material as it is wound upon the mandrel and the weight of which is entirely supported by such material, of means for heating the material as it passes to and is wound upon the mandrel.
7. In a machine for manufacturing tubes, the combination with a cylindrical mandrel and a hollow mandrel holder having lateral passages leading from its interior to its exterior and having a heating device located therein, of means for feeding sheet fabric to the mandrel and a pressure device that exerts a constant and uniform downward pressure upon the tube as it is formed upon the mandrel.
8. In a machine for maunfacturing tubes, the combination with a frame, a mandrel holder having a longitudinal recess of angular cross section and having internal heating means, of a mandrel adapted to rest in said recess, means for feeding shect material to said mandrel to be wound around the same and a pressure device which exerts a downward, uniform and constant pressure upon the tube during its formation
9. In a machine for manufacturing tubes from sheet material, the combination with a frame and a hollow, internally heated mandrel holder supported therein, of a mandrel adapted to receive the sheet material to form the tube and to rest upon said mandrel holder, of a pressure device which rests upon the material as it is wound upon the mandrel and exerts a constant and uniform pressure thereon.
10. In a machine for manufacturing tubes, the combination with a frame and a hollow, internally heated mandrel holder, having a plurality of angular, longitudinal recesses in its outer surface and lateral passages between its interior and some of the external recesses, of a cylindrical mandrel adanted to be received in one of said recesses, means for feeding sheet material to said mandrel to be wound thereon and a pressure device which exerts a downward, constant and uniform pressure upon the material as it is wound upon the mandrel.
11. In a machine for manufacturing tubes from sheet material, the combination with a mandrel and a mandrel holder, and means for heating the same, the material of the holder being so disposed as to be uniformly heated, of means for feeding sheet material to the mandrel and a pres sure device which exerts a constant and uniform downward pressure upon the material as it is wound upon the mandrel and along a single line of contact.
12. In a machine for maunfacturing tubes from sheet material, the combination with a mandrel, a hollow mandrel holder having a plurality of longitudinal angular recesses and internal beating means, of means for feeding sheet material to said mandrel to be wound thereon and a pressure device having a longitudinal rib provided with a bevelled outer edge to engage the material on the mandrel as the mandrel is rotated.
13. In a machine for manufacturing tubes, the combination with a mandrel holder, a frame having a guide plate adjacent to said holder, of means for heating said mandrel holder and said guide plate, a mandrel supported by said holder adjacent to one edge of sald guide plate, means for feeding sheet material to said mandrel and a pressure device that rests upon the material as it is wound upon the mandrel.
14. The combination with a hollow mandrel holder having a plurality of exterior longitudinal recesses of angular cross section and having lateral passages between the interior and some of said recesses, of a gas burner in the interior of said mandrel holder, the supparting frame of said holder having a gulde plate adjacent to the holder and heated by the gas burner therein, a mandrel located in the uppermost recess in the holder, means for feeding sheet fabric to said mandrel and a pressure device that rests upon the material as it is wound upon the mandrel.
15. In a machine for manufacturing tubes, the combination With a longitudinally recessed mandrel holder and a frame in which said holder is supported, of a mandrel freely supported in the holder recess, means for feeding sheet fabric to said mandrel, a pressure device normally resting freely upon the material as it is wound upon the mandrel and means for raising the pressure device when it is desired to remove the mandrel and a tube formed thereon, said means comprising a lost motion spring connection.
16. In a machine for manufacturing tubes, the combination with a cylindrical mandrel, a mandrel holder having a longitudinal angular recess to receive said mandrel, and a frame having a guide plate adjacent to said holder, of means for heating the mandrel holder and guide plate, means for feeding the sheet material over said guide plate to said mandrel, and a pressure device the welght of which is supported by sald mandrel and the material wound thereon.
17. In a machine for making tubes from sheet material, the combination with a mandrel and a mandrel holder, of a rotatively adjustable pressure device having a plurality of pressure ribs of different widths.
18. In a machine for making tubes from sheet material, the combination with a mandrel and a mandrel holder having a longitudinal recess of \(V\)-shape in cross section, of a rotatively adjustable pressure device having a plurality of ribs the pressure faces of which are of different widths.
19. In a machine for making tubes from sheet material, the combination with a mandrel and a mandrel holder havling a longitudinal recess of \(V\)-shape in cross section, of a rotatively adjustable pressure device having a plurailty of ribs the pressure faces of which are bevelled and of dif ferent widths.
20. In a machine for making tubes from sheet material, the combination with a frame, of a mandrel, a mandrel holder, a pressure device and an adjustable compensating bar over which the sheet material is fed to the mandrel.
21. In a machine for making tubes from sheet material, the combination with a frame, of a mandrel, a mandrel holder, a pressure device, a compensating bar having its ends fastened to the frame in front of the mandrel holder and means for raising and lowering the middle portion of said bar.
22. In a machine for making tubes from sheet material. the combination with a frame, of a rotatively adjustable hollow mandrel holder having a plurality of longitudinal, \(\mathbf{V}\)-shaped recesses and transverse outlets from the interior to some of said recesses and a pivoted angle bar that is adapted to swing into and out of one of the mandrel holder recesses.
23. In a machine for making tubes from sheet material, the combination with a frame, of a hollow mandrel holder having a plurality of longitudinal, V-shaped recesses and transverse outlets from the interior to some of said recesses, and a pivoted angle bar that is adapted to swing into and out of one of the mandrel holder recesses.
24. In a machine for making tubes from sheet material. the combination with a frame, of a hollow mandrel holder having a plurallity of longitudinal recesses and transverse outlets from the interior to some of said recesses, and a pivoted angle bar that is adapted to swing into and out of one of the mandrel holder recesses.
25. In a machine for making tubes from sheet material, the combination with a irame, of a hollow mandrel holder having a plurality of longitudinal recesses and transverse outlets from the interior to some of said recesses, and a
pivoted bar that is adapted to 8 wing into and out of one of the mandrel holder recesses.
26. In a machine for making tubes from sheet material, the combination with a frame, of a hollow mandrel holder having a plurality of longitudinal recesses and transverse outlets from the interior to some of said recesses, a plvoted bar that is adapted to swing into and out of one of the mandrel holder recesses, a mandrel located in one of said recesses, and a pressure device adapted to rest upon the material as it is wound upon the mandrel.
27. In a machine for making tubes from sheet material, the combination with a frame, of a hollow mandrel holder having a plurality of longitudinal receses and transverse outlets from the interior to some of said recesses, a pivoted bar that is adapted to swing into and out of one of the mandrel holder recesses, a mandrel located in one of said recesses, a pressure device adapted to rest upon the material as it is wound upon the mandrel, and an inclined mica guide attached to the frame adjacent to the front side of the mandrel holder.

No. 102,682. Insulating Tribe and Method of Making the Same.
Tubes isolants et méthode de les fabriquer.

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Emil Haefely, Basle, Switzerland, 18th December, 1906; 6 years. Filed 2nd October, 1906. Receipt No. 139,988 .
Claim.-1. The method of making insulating tubes which consists in winding a varnish coated fabric upon a core to form a plurality of layers and continuously applying heat and uniform pressure during the winding operation.
2. The method of making insulating tubes which coneists in coating a sheet of fabric with varnish and winding it upon a cylindrical, removable core while heat and uniform pressure are continuously applied.
3. The method of making insulating tubes which consists in winding one or more thicknesses of varnish coated sheet material upon a cylindrical core and simultaneously applying heat and constant uniform pressure.
4. The method of making insulating tubes which consists in winding a sheet of varnish coated fabric and a superposed layer of mica upon a cylindrical core and simultaneously applying heat and unlform pressure.
5. The method of making insulating tubes which consists in winding a paper sheet, a coating of varnish and a superposed mica sheet upon a cylindrical core and simultaneously applying heat and a constant, uniform pressure.
6. The method of making insulating tubes which consists in winding a paper sheet, a layer of varnish and a superposed mica sheet upon a cylindrical core and applying heat and uniform pressure to the wound material untll the tube is completed.
7. An insulating tube composed of concentric layers of paper, varnish and mica solldified by heat and pressure to a substantially homogeneous composition.
8. An insulating tube composed of concentric layers of sheet insulation and varnish solidilied by heat and pressure to a substantially homogeneous composition.
9. An insulating tube composed of concentric layers of sheet insulation and varnish which have been solldifled and from which all air and moisture have been expelled by heat and pressure.
10. An insulating tube composed of concentric lajers of sheet insulation and varnish solidified and freed from air and moisture by heat and pressure.

No. 102,683. Transformer Furnace.
Fournaisc convertisseur.

Axel Rudalf Lindblad and Otto Stalhane, Ludvika, Sweden, 18th December, 1906; 6 years. Filed 13th September, 1906. Recelpt No. 139,473.

Claim.-1. In transformer furnaces of the class described, a transformer core, characterized thereby, that the sheets of inon or lamelles of which the said core is formed, are thus arranged, that the leaking lines of force may not be able to leak out of the iron core without passing across a smaller or greater number of the sheets or lamelles of fron, of which the iron core is composed.
2. In transformer furnaces of the class described, a transformer core characterized thereby, that the transformer core is composed of several parts or sections of triangular or substantially triangular cross section each of which parts or sections being thus put together with the other sections and farmed of iron sheets or lamelles arranged in such a way that the sheets or lamelles, of which a certain section is formed or composed, when all the sections are put together to form the complete iron core, will be parallel with or substantially parallel with that side surface of the said iron core, that is formed by.the same part or section.
3. In transformer furnaces of the class described, a transformer core characterized thereby. that the transformer core is composed of several parts or sections of triangular or substantially triangular cross section, each of which parts or sections being thus put together with the other sections and formed of iron sheets or lamelles arranged in such a way that the sheets or lamelles. of which a certain section is formed or composed. when all the sections are put together to form the complete iron core, will be parallel with or substantially parallel with that side surface of the said iron core, that is formed by the same part or section, each section or part being formed with such a cross section, that when the same are put together to form the complete iron core passages or canals are formed between said parts or sections, through which passages or canals a cooling medium may be led for cooling the transformer core.

No. 102,684. Transformer Furnace.
Fournaise convertisseur.

E. A. A. Grönwall, A. R. Lindblad and O. Stalhane, 18th December, 1906; 6 years. Filed 13th September, 1906. Receipt No. 139,472.
Claim.-1. In transformer furnaces, a device characterized thereby, that two colls or two groups of coils, which are not electrically connected with the primary source of current, but which are in such a way connected with each other that the electro-motorical powers inducted in the same counteract each other are placed around the transformer core in such a way that the leaking lines of force generated by the transformer care exent an inducting action only in one of the colls or groups of coils and that the current hereby
generated in the other coil or group of coils magnetically co-operates with the primary coil for the purpose of reducing the self induction of the transformer furnace.
2. In transformer furnaces of the class described, a device characterized thereby that two coils or two groups of colls which are not electrically connected with the primary source of current but which are in such a way connected with each other that the electro-motorical powers inducted in the same counteract each other are placed around the transformer core, of which coils or groups of colls the ons is placed on the leg surrounded by the smelting bath and the other coil or group of colls on the leg s:llivitusel by :hir frimry coll.

\section*{No. 102,685. Measure for Leather.}

Mesure pour le ouir.

Fig. 1.

FIG. 4.
102685

James Robertson and John S. Delaney, Somerville, Massachusetts, U.S.A., 18th December, 1906; 6 years. Filed 2nd October, 1906. Receipt No. 139,994.
Claim.-1. In an Instrument for measuring sheet material, a frame provided with rigid jaws between which the material is to be inserted, a curved footpiece eccentrically pivoted to the upper jaw and extending. normally toward the lower jaw, a curved plate provided with a scale supported by the frame, a pointer rigid or integral with the footplece and serving as an indicator for the scale, means for pressing the footpiece against a sheet of material placed between it and the lower jaw, and means for regulating such pressure of the footplece.
2. In an instrument for measuring sheet material, a frame provided with rigid jaws between which the material is to be inserted, a curved footplece eccentrically pivoted to the upper jaw and extending normally toward the lower jaw, a curved plate provided with a scale supported by the frame, a pointer rigid or integral with the footpiece and serving as an indicator for the scale, an elbow lever pivotally connected with the frame, a link or rod pivotally connecting one arm of the elbow lever with the footpiece at a point which is between the curved portion of the footpiece and its pivot, and means intermediate of said elbow lever and the frame for holding the footplece normally down toward the lower jaw.

No. 102,686. Cap for sheet Piling. Coffe métallique pour pilon.
Edward Andrew Bern, Chicago, Illinois, U.S.A., 18th December, 1906; 6 years. Filed 17th October, 1906. Receipt No. 140,377.
Claim.-1. A cap for sheet metal piling comprising a block having recesses on one face on each diameter, each recess corresponding in shape to the transverse section of a pile, and a second block having projections adapted to enter the recesses.
2. \(\Lambda\) cap for sheet metal piling comprising an upper block having recesses on one face corresponding in shape to the
transverse section of a pile, and a lower block having a plain face adapted to rest on the pilc and provided on its

No. 102,688. Table Supporting Rack. Support de table.

Rinaldo Calbeck, Pratt, Kansas, U.S.A., 18th December. 1906; 6 years. Filed 23rd October, 1906. Receipt No. 140,537.
Claim.-1. A table rack comprising a base, a plurality of uprights mounted thereon and provided with a plurality of spries of onenings in the length thereof, and a plurality of horizontally arranged supporting rods, pairs of said rods having the ends threaded into openings of the uprights to adjustably connect the rods thereto, each pair of the supporting rods having adjacent ends projecting from the uprights to support a table as specified, the projecting ends of one nair of rods extending from a side of the rack opposite that from which the projecting ends of the adjacent pair of rods extend.
2. A table rack comprising a base. a plurality of uprights mounted thereon and provided with a plurality of series of onenings in the length thereof, a plurality of horizontally arranged supporting rods. pairs of said rods having the ends threaded into openings of the uprights to adjustahly connect the rods therewith, each pair of the supnorting rods having adjacent ends projecting from the uprights t" supnort rods having adjacent ends projorting from the un rights to supnort a table as snecified the profecting ends of one nair of rods extending from a siln of the rack opposite that from which the projecting ends of the adiacent pair of rods extend. and heads an․ind to the projecting cnic of the nairs of unrights aforesaid to engage table parts in the manner specifled.

No. 102.689. Gumming Machine.
Machine \(\begin{aligned} & \text { gommer. }\end{aligned}\)

Emil August Claus, Hartford, Connecticut, U.S.A., 18th December, \(1906 ; 6\) years. Filed 30th July, 1906. Receipt No. 138,264.
Claim.-1. The combination with a blank conveyer, a gumming mechanism comprising a gum supply device, of a gumming device, and means for bringing said gumming device repeatedly into contact with said supply device and a blank on the conveyer, alternately to lay a plurality of gum films on the same portion of the blank surface.
2. The combination with a blank conveyer, a gumming mechanism comprising a gumming device, and means for actuating the same for laying a plurality of gum films on each one of the blanks, of a blank retaining device cooperative with the conveyer and for holding the blanks thereon during the gumming operation.
3. The combination with a blank conveyer, a gumming mechanism comprising a gumming roller, and means for guiding the same in parallelism with said couveyer and in to contact with the blanks thereon, of a blang retaining device co-operative with the conveyer and for holding the blanks thereon during the gumming operation.
4. The combination with a blank conveyer and a gumming mechanism comprising a gum supplying device, of a gumming roller, means for guiding said gumming roller in parallelism with the conveyer and into contact with the blanks on the conveyer and a device for holding the blanks during the gumming operation.
5. The combination with a blank conveyer and a gumming mechanism comprising a gumming roller, of meas for bringing said roller into contact with the blanks on the conveyer, and a friction roller co-npArative with the conveyer and for holding the blanks thereon during the gumming operation.
6. The combinatinn with a blank conveyer and a gumming mechanism comprising a gum reservoir, a bum supplying roller co-operative therewith. and a gumming roller. of a cam for bringing said gumming roller into contact with said supplying roller and the blanks on the conveyer alternately.
7. The combination with a blank ronveyer and a gumming mechanism comprising a gum riservoir, a pum sunnlving roller and a gumming roller, of a cam for guiding said gumming roller in naralieliem with the conveyer, and for reEeatedly gumming cach blank thereon.
8. The combination with a blank conveyer, a gumming mechanism comprising a gum reservoir and a gum supplying device, and a gumming roller. of a pair of stationary cams for guiding said gumming roller in parallelism with the conveyor, and means for actuating said roller.
9. The combination with a blank conveyer, a gumming mechanism comprising a gum reservoir and a gum supplying device. and a gumming roller, of a pair of stationary cams for guiding said gumming roller in parallelism with the conveyer, and means for actuating said roller, and a device for holding the blanks on the conveyer during the gumming operation.
10. In a gumming machine the combination with a gum reservoir, a gum supplying device and a gumming roller. of means for bringing said roller into contact with said supply device and to lay a film of gum substantially on the entire surface of said gum roller.
11. In a gumming machine the combination with a gum reservoir, a gum supplying device, and a gumming roll, of a cam for bringing said roller into contact with said supply device and to lay a film of gum substantially on the entire surface of said gumming roller.
12. In a gumming machine the combination with a gum reservoir and a supply roller, of a yoke mounted for revolution around the reservoir, a gumming roll carried by said yoke, and means for controlling the movement of the yoke and for bringing said roll into contact with the supply roller.
13. In a gumming machine the combination with a gum reservoir and a supply roller, of a yoke mounted for revolution around the reservoir, a gumming roll carried by said yoke, and a cam for controlling the movement of the yok: and for bringing said roll into contact with the supply roller.
14. In a gumming machine the combination with a gum reservoir and a supply roller, of a pair of yokes mounted for simultaneous revolution around said reservoir, a gumming roll carried by said yokes. a pair of stationary cams for controlling the movement of the yokes, and means for positioning the gumming roll on said yokes.
15. In a gumming machine the combination with a gum reservoir and a gum supplying roller, of a pair of yokes mounted for revolutions around said reservoir, a gumming roll carried by said yoke, means for controlling the radial movement of said yokes, and means for positioning the gumming roller on the yokes.
16. In a gumming machine the combination with a gum reservoir, a ductor roll, and a transfer roller, of means for positioning said transfer roller relatively to the ductor roller, and means for actuating the transfer roller at a greater circumferential speed than that of the ductor roll.
17. In a gumming machine the combination with a pair of supports and a gum reservoir mounted for rotation therein. of a gum supplying device, a gum roll mounted for revolution around the reservoir, and means for controlling the movement of said roll toward and away from the supply device.
18. In a gumming machine the eombination with a gum reservoir, a ductor roll rotatable therein, a transfer roller. co-operative with the ductor roll. and means for positioning said transfer roller relatively to the ductor roll, a pair of yokes mounted for revolution around said reservoir, a gumming roll carried by said yokes, and means for posigumming roll carried by said yokes.
tioning the gumming roll on the yoke.

No. 102,690. Governor for Explosion Motors. Régulateur pour moteur à explosion.

Faul Daimler, Vinterturkheim, Wurtemburg, Germany, 18th December, 1906; 6 years. Filed 2nd November, 1906. Recelpt No. 140,852 .
Claim.-In an explosion motor of the character described, two cylinders, a governor shaft, a governor wheel on the said shaft between the said cylinders, and a casing surrounding the said wheel, all combined substantially as and for the purpose set forth.

No. 102,691. Shocker.
Appareil pour mettie les gerbes on moyette.

Alexander Dolson, Beaverton, Ontario. Canada, 18th December, 1906; 6 years. Filed 1st June, 1906. Receipt No. 136,476.
Claim.-1. In a shocker, a frame, a receiving platform attached to the frame and extending laterally therefrom underneath the end of the deck of the binder, and means located on such platform for throwing the sheaves deposited thereon outwardly off the platform, as and for the purpose syecified.
2. In a shocker, a frame, a receiving platform attached to the frame and extending laterally therefrom underneath the end of the deck of the binder, and arms extending laterally over the platform and a rod on which the arms are held journalled in suitable bearings in the platform, and means for turning the rod, as and for the purpose specified.
3. In a shocker, the combination with a frame provided with a main receiving patform for discharging the sheaves rearwardly, of a supplemental laterally extending platform designed to receive the sheaves and means for discharging the sheaves therefrom on to the main receiving platform, as and for the purpose specified.
4. In a shocker, the combination with a frame provided with a main receiving platform for discharging the sheaves rearwardly. of the supplemental laterally extending platform, L-shaped arms designed to recelve the sheaves on the platform. the rod on which the arms are held, suitable bearings for the rod, the short end of the L-shaped arms being designed. when thrown to the horizontal, to open and space between the supplemental platform and the main platform, as and for the purpose specified.
5. In a shocker, the combination with the supplemental platform and arms located on same, and a rod supporting the arms suitably journalled on the platform, of means connected to the knotter shaft for tilting the arms upon the discharge of every two sheaves from the binder deck on to the platform, as and for the purpose specified.
6. In a shocker, the combination with the supplemental platform and arms located on same, and a rod supporting the arms suitably journalled on the platform, of a crank arm on the end of the rod, a ratchet toothed disc pro-
vided with two tecth, such disc being secured on a suitable shaft journalled in bearings in the frame, a rod provided with profections designed to co-act with the teeth on the disc and supported in suitable guides at one end and connected to the crank on the rod on the supplemental platform at the opposite end, and a spring connected to the end of the crank of the rod fournalled in the platform, and to the frame, as and for the purpose specified.
7. In a shocker, the combination with a supplemental platform and arms located on same, and a rod supporting the arms suitably fournalled on the platform, of a crank arm on the end of the rod, a ratchet loothed disc provided with two teeth diametrically located, such disc being secured on a suitable shaft journalled on bearings in the irame, a rod provided with projections designed to co-act with the teeth on the disc and supported in suitable guides at one end and connected to the crank on the rod on the supplemental platform at the opposite end, a spring connected to the end of the crank of the rod journalled in the platform, and to the frame, a ratchet wheel secured on the shaft on which the toothed disc is sccured, an arm swung on the said shaft and provided with a pawl coacting with the ratchet wheel and a rod connecting sucb arm to a crank on the knotter shaft of the binder, as and for the purpose snecifled.
8. The rombination with the frame and the supplemental frame supported at one side of the frame, of the deck or platform located between the side bars of the frame. the fointed bar extending across the deck, and means connected to the ends of the bar for raising the jointed bar upon the sheaves being deposited thereupon, as and for the purpose specified.
9. The combination with the pain frame and the bottom side bars of the main frame, of the deck located between the side bars, the supporting cross bars for the same, and means located on the deck to receive the sheaves near the head and to tilt them in an upright position preparatory to the sheaves being moved rearwardly, as and for the purpose specified.
10. The combination with the main frame and the bottom side bars of the main frame, of the dock located between the side bars. supporting cross bars for the same, the longitudinal guide bars supported on the cross bars at wach side of the deck, the bars supported in the guide bars and having longitudinal movement therein, the upright supporting frame located at the front and suitably secured to the adjustable bars, the L-shaped bars pivoted on the longitudinal bars, the jointed bar extending from the portion of the L-shaped bars normally horizontally disposed across the desk, and means for swinging the normally horizontally disposed portion of the \(L\)-shaped bars forwardly upon the rearward movement of the adjustable frame carried by the longitudinally moving bars. as and for the purpose specified.
11. The combination with the main frame and the bottom side bars of the main frame, of the deck located between the side bars, supporting cross bars for the same, the longitudinal guide bars supported on the cross bars at each side of the deck, the bars supnorted on the guide bars and having longitudinal movement therein, the upright supporting frame located at the front and suitably secured to the adjustable bars, the L-shaped bars pivoted on longitudinal bars, the jointed bar extending from the portion of the L-shaped bars, normally horizontal disposed across the deck, uprights connected to the bottom side bars and provided with rollers designed to come in contact with the normally disposed upright portions of the L-shaped bars as they are being carried rearwardly, as and for the purpose specifled.
12. The combination with the frame and the side bars of the frame and deck and movable frame comprising the side bars and uprights, and cross boards secured to the uprights, of brackets secured to the rear of the top cross boards, and means extending across the deck for receiving the sheaf and raising and depositing it in an upright position between the brackets, as and for the purpose specified.
13. The combination with the frame and the side bars of the frame and deck and movable frame comprising the side bars and uprights, and cross boards secured to the uprights, of brackets secured to the rear of the top cross boards, a jointed bar extending across the deck and designed to recelve a pair of sheaves, and means for swinging such jointed bar upwardlyto deposit the pair of sheaves between the brackets aforesaid, as and for the purpose specified.
14. The combination with the frame and the side bars of the frame and deck and movable frame comprising the side bars and uprights, and cross boards secured to the uprights, of brackets secured to the rear of the top cross boards, a jointed bar extending across the deck and designed to receive a pair of sheaves, and \(L\)-shaped bars pivoted on the sliding bars and carrying the jointed cross bar, as and for the purpose specified.
15. The combination with a frame and the side bars of the frame and desk, and movable frame comprising the side bars nd uprights, and cross boards secured to the uprights, of brackets secured to the rear of the top cross boards, a jointed bar extending across the deck and designed to receive a pair of sheaves, and L-shaped bars pivoted on the sliding bars and carrying the jointed cross bars and provided with inclined upper ends, uprights secured to the uprights nd provided with pins extending to the front of the L-shaped bars, as and for the purpose specified.
16. The combination with the frame and platform at the front and the movable frame provided with side bars between which the sheaves are fed on to the Dlatform, of a cross shaft suitably journalled in the frame, arms secured to the cross shaft and pitmans connecting the arms to the sides of the movable irame, and means for rocking the cross shaft at predetermined intervals, as and for the purpose specifled.
17. The combination with the frame and platiorm at the front and the movable frame provided with side bars between which the sheaves are fed and to the platform, of a cross shaft suitably journalled in the frame, arms secured to the cross shaft and pitmans connecting the arms to the sides of the movable frame, and arms secured to the outer end of the shaft, an upper shaft journalled in bearings in the longitudinal upper bars at the outside of the frame, a swinging frame journalled thereon, a gear wheel secured to the shaft. a supplemental shaft in the swinging frame. a gear wheel secured to the same, a counter shaft journalled in bearings on the upper longitudinal bars. a gear wheel scecured on the latter shaft and provided with a long tooth, an arm secured on the same shaft as the aforesald gear wheel, and a pitman connecting the arm to the arm on the cross shaft, and means for throwing the swinging frame so as to bring the gear wheel and upper shaft of the same into engagement with the gear wheel provided with a long tooth, as and for the purpose specifled.
18. The combination with the frame and platiorm at the front and the movable frame provided with side bars between which the sheaves are fed on to the platform, of a cross shaft suitably journalled in the frame, arms secured to the outer end of the shaft. an upper shaft journalled in bearings in the longitudinal upper bars at the outside of the frame, a swinging frame journalled thereon, a gear wheel secured to the shaft, a supplemental shaft in the swinging frame, a grar wheel secured to the same, a counter shaft fournalled in bearings in the upper longitudinal bars, a gear wherl secured on the latter shaft and provided with a long tooth, an arm secured on the same shaft as the aforesald gear wheel and a pitman connecting the arm to the arm on the cross shaft, a depending arm attached lo the swinging frame and a snring connected to the lower end of the arm and to the frame, and means for controlling the action of the swinging frame. as and for the purpose specified.
19. The combination with the frame and platform at the front and the movable erame provided with sald bars between which the sheaves are fed on to the platiorm, of a cross shaft suitably journalled in the frame, arms secured to the cross shaft and pitmans connecting the arms to the sides of the movable frame. and arms secured to the outer end of the shaft, an upper shaft fournalled in bearings in the longitudinal upper bars at the outside of the frame. a swinging irame journalled thereon, a gear wheel secured to the shaft, a supplemental shaft in the swinging frame. gear wheel secured to the same, a counter shaft journalled in bearings in the upper longitudinal bars, a gear wheel secured on the latter shaft and provided with a long tooth, an arm secured on the same shaft as the aforesald gear wheel and a pitman connecting the arm to the arm on the cross shaft, a depending arm attached to the swinging frame and a spring connected to the lower end of the arm and to the frame, a longitudinal shaft supported on one of the upper bars outside of the swinging frame, and means connected to the knotter shaft and to such shaft for imparting a step-by-step movement to such shaft, a double toothed disc secured on one end of the shaft, an arm pivoted on a suitable bracket on the frame and provided with a notch designed to engage with the front end of the swing. ing frame, and an arm pivoted on the aforesaid bracket and having a notch designed to engage with the rear end of the swinging frame, and a flat end designed to be controlled by the double toothed disc on the end of the shaft operated from the knotter shaft, as and for the purpose specificd.
20. The combination with the frame and platform located between the side bars of the same, and means for receiving the pair of sheaves on the platform and for tilting them towards the front, so as to set such pair of sheaves upright, and a movable arm for carrying such frame forward. of an apron located to the rear of the platform, and means for imparting a movement to the apron, so that the top moves rearwardly, as and for the purpose specified
21. The combination with the frame and platform located between the side bars of the same anr means for receiving the pair of sheaves on the platform and for tilting it towards the front, so as to set such pair of sheaves upright, and a movable arm for carrying such frame forward, of an aprou located to the rear of the platform, endless bands extending rearwardly above the apron from a point above the platform and located parallel to each other, and means for driving such bands, as and for the purpose specified.
22. The combination with the frame and platform located between the side bars of the same, and means for receiving the pair of sheaves on the platform and for tilting it towards the front so as to set such pair of sheaves upright, and a movable arm for carrying such arm forward, of endless bands extending parallel rearwardly from a point above the platform and located parallel to each other, and means for driving such bands, as and for the purpose specifted.
23. In a machine of the class described the combination with the rear apron and rollers thereof, and means for driving one of the rollers, of the upper endless bands and means for driving them from the lower apron, as and for the purpose specifed.
24. The combination with the endless bands parallelly arranged, and means for feeding the sheaves towards the spaces between the bands, of toothed wheels secured on the forward band pulleys, as and for the purpose specifled.
25 . The combination with the lower apron and rollers thereof, and means for driving one of the rollers, of the upper endless bands parallelly located above the apron and means for driving the endless bands from the roller of the apron, as and for the purpose specifled.
26. The combination with the lower apron and rollers thereof and means for driving one of the rollers, of the upper endless bands parallelly located above the apron, the belt passing around the wheels carrying the endless bands, suitable pulleys journalled in the frame and roller of the lower apron, as and for the purpose specified.
27. In a device of the class described the combination with the frame and the front platform suitably held in the frame, of the apron extending rearwardly from the platiorm and carried by rollers sultably journalled in the frame, and means for imparting step-by-step movement to such apron to carry the sheaves rearwardly on the same to form a shock, and means for continually driving such apron after the sheaves sufficient to form a shock are located on the apron, so as to discharge the shock complete, as and for the purpose specified.
28. The combination with the apron extending to the rear of the machine, of means for feeding the tops of the sheaves simultaneously with the butts at the bottom carried by the apron, as and for the purpose specifled.
29. The combination with the apron and means for driving the same, so as to discharge the bottom of the shock located thereon, of means for discharging the top of the shock simultaneously, and a device located at the rear end of the machine and designed to retard the delivery of the top of the rear end of the shock and hasten the delivery of the top of the front end of the shock more quickly than the butt or bottom of the shock at the front ends, as and for the purpose specified.
30. In a machine of the class described the combination with the frame and the rear apron, of an arm journalled on a spindle of the roller, a ratchet wheel secured to the spindle of the roller, a pawl connected to the arm aforesaid and engaging the ratchet wheel and means for imparting rearward and forward throw to the arm, as and for the purpose specified.
31. In a machine of the class described the combination with the frame, and the rear apron, of an arm journalled on a spindle of the roller of the apron, a ratchet wheel secured to the spindle of the roller, a pawl connected to the arm aforesald and engaging the ratchet wheel, a bar supported in suitable guideways and uprights supported on the side bars of the frame and provided with a pin extending into the slot in the upper end of the arm and means for reciprocating said bar, as and for the purpose specifled.
32. In a machine of the class described the combination with the frame and the rear apron. of an arm, journalled on a spindle of the roller of the apron, a ratchet wheel secured to the spindle of the roller, a pawl connected to the arm aforesaid and engaging the ratchet wheel, a bar supported in suitable guldeways, and uprights supported on the side bars of the frame and provided with a pin extending into the slot in the upper end of the arm, rollers on the bar, an arm secured to the cross shaft journalled in the frame and from which the moving is operated, as and for the purpose specified.
35. In a machine of the class described the combination with the frame and the rear apron, of an arm journalled on a spindle of the roller of the apron, a ratchet wheel secured to the spindle of the roller, a pawl connected to the arm aforesaid and engaging the ratchet wheel, a bar supported in suitable guideways and uprights supported on the side bars of the frame and provided with a pin extending into the slot in the upper end of the arm, rollers on the bar, an arm secured to the cross shaft journalled in the frame and from which the moving frame is operated, spring arms secured to the longitudinal bars of the outside of the frame and provided with pins designed to engage in a notch in the bar aforesaid, as and for the purpose speciffed.
34. The combination with the frame, a bar supported in suitable guideways in the frame, and means for reciprocating the bar and driving the apron, of a detent pivoted on the bar and having a suitable stop pin at the front of the same and a disc having the spindle thereof journalled in suitable brackets in the frame and provided with pins with which the detent is designed to contact, as and for tho purpose specifled.
35. The combination with the frame and a bar supported in suitable guideways in the frame and the rollers on the bar, an arm secured in the cross shaft and means for oscillating the shaft so as to swing the arm between the rollers, of a counting device for determining the number of sheaves in a shock operated from the bar, as and for the purpose specifled.
30. The combination with the frame and a bar supported in suitable guldeways in the frame and the rollers on the bah, an arm secured in the cross shaft and means for iscillating the shaft so as to swing the arm between the rollers, of a disc provided with pins and suitably journalled and a detent pivoted on the bar designed to co-act with the pins on the disc, as and for the purpose specifled.
37. The combination with the frame and the bar suitably supported in the frame and means operated by same for determining the number of pairs of sheaves fed rearwardly, of the rollers on the bar and the arm designed to be swung between the rollers, the spring arms located above the bar and having laterally projecting pins designed to co-act with the notch in the bar, as and for the purposo specified.
38. The combination with the frame and the sliding bar suitably supported in the frame and means for reciprocating the same, of the disc provided with pins and means for turning the pins, and a holdfast device designed to co-act with one of the pins on the disc to hold it in position when turned, as and for the purpose specified.
39. The combination with the frame, the rear apron, and means for imparting a step-by-step movement to the same, of the disc rotatably held on the frame and means for turning the disc at pre-determined intervals, driving mechanism connecting the main shaft to a cross shaft journalled in the frame, a retarding device located to the rear of the parallelly arranged travelling bands and driving means between the cross shaft and the rotating device, clutch mechanism located on the cross shaft and means interposed between the disc and the clutch mechanism for throwing such clutch mechanism into and out of gear to throw in or out the driving gear of the retarding mechanism, as and for the purpose specified.
40. The combination with the frame, the rear apron and means for imparting a step-by-step movement to the same, of the disc rotatably held on the frame and means for turning the disc at pre-determined intervals, driving mechanism connecting the main shaft to a cross shaft journalled in the frame, a retarding device located to the rear of the parallelly arranged travelling bands and driving means between the cross shaft and the retarding device, clutch mechanism located on the cross shaft, a lever plvoted in the frame and connected to the clutch mechanism at one end and spring held at the opposite end, a slide bar to which such lever is connected provided with a notch, a lever suitably pivoted and designed to engage with the footh on the disc, such lever being spring held in the notch in the sliding bar, as and for the purpose specifled.
41. The combination with the frame, the retarding wheel and shaft carrying the same suitably journalled in the frame, of the reversely set cone-shaped pulleys provided with spiral grooves and secured on suitable cross shafts journalled in the frame, driving means connecting one of these shafts to the retarding wheel shaft and a rope drive between the cone-shaped pulleys, as and for the purpose specifled.
42. The combination with the frame, the retarding wheel and shaft carrying the same suitably journalled in the frame of the reversely set cone-shaped pulleys provided with spiral grooves and secured on suitable cross shafts journalled in the frame, driving means connecting one of these shafts to the retarding wheel shaft, a rope drive be-
tween the cone-shaped pulleys and means for throwing out the drive of the pulleys, as and for the purpose specified.
\(4:\). The combination with the frame. the retarding wheel and shaft carrying the same suitably journalled in the frame, of the reversely set cone-shaped pulleys provided with spiral grooves and secured on suitable cross shafts journalled in the frame. driving means connecting one of theso shafts to the retarding wheel shaft, a rope drive between the cone-shaped pulleys, means for throwing out the drive of the pulleys and means for causing the pulleys to rotate in the opposite direction after the drive has been thrown out. as and for the purpose specified.
45. The combination with the frame, the retarding wheel and shaft carrying the same suitably journalled in the frame, of the reversely set cone-shaped pulleys provided with spiral grooves and secured on suitable cross shafts journalled in the frame, driving means connecting one of these shafts to the retarding wheel shaft a rope drive between cone-shaped pulleys, means for throwing out the drive of the pulleys, and a spiral spring connected to the roar eross shaft and cone-pulley, as and for the purpose specified.
45. The combination with the cross shaft suitably driven, cluteh mechanism located thereon and the two reversely cone-shaped pulleys provided with spiral grooves and the drive between the shafts of one pulley and the cross shaft containing the cluteh mechamism, of the spring actuatec lever connected to the cluteh at one end, the slide bar to which the lever is connected at the opposite end, the rope drive betwren the cone pulleys provided with a knot. the liver pivoted on the frame and provided with a notch with which the knot is designed to co-act. the arm on the pivot pin of the lever, the slide provided with a pin with which the arm is designed to co-act, and means for holding the slide normally rigid, as and for the purpose specified.

4c. The combination with the cross shaft suitably driven, clutch mechanism located thereon and the two reversely cone-shaped pulleys provided with spiral grooves and the dirive between the shafts of one pulley and the cross shaft containing the clutch mechanism, of the spring actuated lever connected to the clutch at one end, the slide bar to which the clutch is connected at the opposite end, the rope driven between the cone pulleys provided with a knot. the live: pivoted on the frame and provided with a notch with which the knot is designed to co-act. the arm on the pivot pin of the lever, the slide provided with a pin with which the arm is designed to co-act, the disc suitably jourtalled on a standard on the frame and provided with a peripheral tooth, a lever pivoted on the standard of the dise and normally engaging the notch in the sliding bar and having the bottom end located in the path of the tooth of the dise, as and for the purpose specified.
47. The combination with the frame and the apron, provided with a sprocket wheed on one of the rollers. of a cono pulley suitably secured to the cross shaft and providet with a sprocket wheel at one of the ends thereof, a sprocket chain connecting the aforesaid sprocket wheels, a ratchet wheel secured on the shaft of the cone pulley and a dog connected to the sprocket wheel on such shaft and designed to engage with the ratchet wheel, as and for the purpose specified.
48. The combination with the frame and the oppositely set parallel bands suitably driven and held in the frame, of the retarding wheel located at the rear end of the bands and between the same and designed to adjust itself automatically, as and for the purpose sperified.
49. The combination with means for feeding the shock when completed rearwardly, of a retarding device located at the rear end of the machine and designed to adjust itself automatically, as and for the purpose specifted.
50. The combination with means for feeding the shock when completed rearwardly, of a retarding wheel, a shaft upon which the same is secured. a cross shaft, arms on the cross shaft or on a line with the same carrying the retarding wheel shaft, means towards the outer end for supporting the arms, and a driving means extending from the shaft from which one arm is swung on to the shaft upon which each retarding wheel is located, ats and for the purpose specified.
51. In a shocker, a retarding wheel located at the discharge end of the machine and designed to come in contact with the heads of the sheaves of the shock, as and for the purposo specifled.
52. In a shocker, a retarding wheel located at the discharge end of the machine and designed to come in contact with the heads of the sheaves of the shock, the peripheral face of the wheel being of a \(V\)-shape in form, as and for the purpose specified.

No. 102,692. Tidal Motor. Moteur à marée.

Frank Allison Harrison. Sackville. New Brunswick. Canada,
18ih December, 1906; 6 years. Filed 15th December,
1906. Receipt No. \(131,059\).

Claim.-1. In a tidal power apparatus, a power wheel comprising a shaft, a frame having radially extending braces rigidly attached to sald shaft, paddles hinged to the extremities of said braces, and means for limiting the motion of said paddles in either direction.
2. In a tidal power apparatus, a horizontal shaft having a plurality of braces rlgidly attached thereto, paddles hinged to the extremities of said braces, and chains connecting the outer extremities of said paddles.
3. In a tidal power apparatus, a horizontal shaft having a plurality of radially extending braces rigidly attached thereto. a plurality of paddles attached to the extremities of said braces. stop blocks for limiting the motion of said paddles in either direction, chains connecting the outer extremities of said paddles and means for adjusting said chains to reverse the direction of rotation of the wheels.
4. In a tidal power apparatus. a horizuntal shaft, a frame rigidly attached thereto. radially extending paddles hinged to said frame, a chain connecting the outer extremities of said paddles, said chain passing over a drum whereby the paddles are adjusted to rotate in either directions.
5. In a tidal power apparatus, a paddle wheel having a plurality of radial paddles hingedly attached thereto. chains connecting the outer extremities of said paddles. and means for adjusting the tension of said chains whereby the paddies are held in a rigid radial position on entering the water, and in a vertical position on leaving it.
6. In a device of the character described, the combination with a pair of anchor floats, of a reversible power wheel suspended between said floats, said power wheel comprising a horizontal shaft. a plurality of braces rigidly attached thereto. and a plurality of paddles hinged to the extremities of said braces, and means for transferring the power developel by the rotation of said wheel.
7 . In a device of the character described, the combination with one or more anchor floats, of a power wheel suspended from said floats, said power wheel comprising a horizontal shaft, a plurality of braces attached thereto. and a plurality of paddles hinged to said braces, and means for limiting the motion of sald paddles.

\section*{No. 102,693. Non-Refillable Bottle. \\ Boutcille non remplissable.}

Frank H. Hubbard, Kokomo. Indiana, U.S.A., 18th December. 1906; © years. Filed 16th November, 1906. Receipt No. 141,255 .
Claim.-1. A bottle having a tapered neck, a valve seated within the neck and provided at one end thereof with a plurality of longitudinally disposed grooves, and a stopper spaced from the valve and provided with discharge passages to permit the passage of the liquid when the valve is moved to open position.
2. A bottle having a tapered neck, \(s\). valve seated within the neck and provided at one end thereof with a concavity having a plurality of longitudinal grooves communicating therewith and a stopper spaced from the concaved end of the valve and provided with a plurality of angularly disposed discharge passages to permit the passage of the liquid when the valve is moved to open position.
3. A bottle having a tapered neck, a valve seated in the neck and having one end thereof provided with an enlarged head the face of which is formed with a depression and the side walls thereof provided with a plurality of longitudi-
nally disposed grooves communicating with said depression. and a plug spaced from the valve and rigidly secured to the

interior walls of the neck, said plug being provided with a plurality of peripheral angularly disposed discharge passages to permit the passage of the liquid when the valve is moved to open position.
4. A bottle having a tapered neck, a valve seated within the neck and having a plurality of longitudinal grooves formed in one end thereof, and a plug spaced from the valve and having a plurality of peripheral ogee discharge passagea formed in the walls thereof to permit the passage of the liquid when the valve is moved to open position.
5. A bottle having a tapered neck, a longitudinally movable valve seated within the neck and consisting of a shank provided at one end with a globular terminal adapted to engage the walls of said neck and at its opposite end with an enlarged head having a plurality of longitudinally disposed grooves formed therein, a plug rigidly secured to the interior walls of the neck and arranged in spaced relation to the valve, said plug being provided with a plurality of discharge passages each in the form of an ogee curve to permit the passage of liquid when the valve is moved to open position.

No. 102,694. Ventilator. Ventilateur.

Robert A. Ilg, Chicago, Illinois, U.S.A., 18th December, 1906; 6 years. Filed 15th October, 1906. Receipt No. 140,322.
Claim.-1. The combination with an electric motor and a ventilating fan mounted directly on the armature shaft thereof, cf a protective hood of less diameter than and wholly in rear of sald fan surrounding said motor with its open end adjacent to the suction side of the fan, said fan being uncovered on its suction side whereby the current induced by the fan flows over said hood, and a suction pipe leading from a point exterior to the room or chamber containing the motor and tapping said hood, substantially as described.
2. The combination with an electric motor and a ventilating fan mounted directly on the armature shaft thereof, of a protective hood of less diameter than and wholly in rear of said fan surrounding said motor with its open end adjacent to the suction side of the fan, said fan being uncov-
red on its suction side whereby the current induced by the fan flows over said hood, and a suction pipe leading from a point exterior to the room or chamber containing the motor and tapping sald hood laterally of the motor, substantially as described.
3. The combination with an annular fan casing adapted to be located in an opening in the wall of a room or chamber, of an electric motor suported by and concentrically with sald fan casing and having a ventilating fan mounted directly on the armature shaft thereof, a protective hood of less diameter than and wholly in rear of said fan covering the sides and inner end of said motor with its open end adjacent to the suction side of the fan, the spaces between the open end of said hood and sald fan casing being open whereby the current induced by the lan flows over said hood, and a suction pipe leadjug from a point exterior to the room or chamber containing the motor and tapping said hood, substantially as described.
4. The combination with a ventilating fan and a motor mounted on the shaft thereof, of a protective device for said motor comprising a cylindrical member surrounding the motor, a removable cap or cover closing the end of sald cylindrical member remote from the fan, and an annular member convergent toward the fan applied to the opposite end of said cylindrical member, substantially as described.
5. The combination with a ventilating fan and a motor mounted on the shaft thereof, of a protective device for said motor comprising a cylindrical member surrounding the same, a removable cap or cover closing that end of said cylindrical member which is remote from the fan, an annular member secured to the opposite end of said cylindrical member inwardly convergent or flaring towards the fan shaft, and a suction pipe leading from a point exterior to the room or chamber containing the motor and tapping said cylindrical member laterally to thereby induce a cocling current upon the motor, substantially as described.
6. The combination with an electric motor and a ventilating fan mounted directly on the armature shaft thereof, of a protective hood of less diameter than and wholly in rear of said fan surrounding said motor with its open end adjacent to the suction side of the fan, said fan being uncovered on its suction side whereby the current induced by the fan flows over said hood, a suction pipe leading from a point exterior 20 the room or chamber containing the motor and tapping said hood, and a strainer in said suction plpe, substantially as described.

No. 102,695. Apparatus for Producing Ozone. Apparcil d produire l'ozone.

Alexis Louis Mangin, Hull, Quebec, Canada, 18th December, 1906; 6 years. Filed 21st February, 1905. Receipt No. 122,723.
Claim.-1. In an apparatus of the character described, the combination comprising a pair of dielectric plates, an electrode of less area than the plates disposed therebetween, insulating members disposed between and around the edges
of the plates, an electrical connection to the electrode, a plurality of electrodes disposed transversely on the outer faces of the plates, and an electrical connection to the other electrodes.
2. In an apparatus of the character described the combination comprising a pair of dielectric plates, an electrode of less area than the plates provided with a projecting point, means for insulating the plates from each other and connecting the same together, an electrical connection to said projecting point, a plurality of electrodes disposed transversely around the plates, and a single electrical connection thereto.
B. In an apparatus of the character deseribed. the combination comprising a pair of glass plates, means insulating and securing said plates together, a sheet of metallic gauze disposed between the plates, an electrical connection to the metallic gauze, a plurality of transversely disposed continuous electrodes disposed around the plates, and a single connection to said electrodes.
4. In an apparatus of the character described. the combination comprising a pair of glass plates, an electrode of less area than the plates disposed therebetween, means for cocitrically separating the plates and for binding their edges together. a wire connected to the enclosed electrode, a plurality of eut strips of wire gauze disposed continuously around the plates, and a wire connected to the ends oi the wire gatuze strips.
5. In an apparatus of the character described, the combination conprising a pair of glass plates, an electrode dis posed between the plates and terminating short of the edges thetcof and having a projecting point, a wire connected to said point, insulating means disposed between the edges of the plates and adapted to bind said edges together, outer electrodes of wire gauze disposed on said plates. said gauze having its wires cut to provide a plurality of points. and a wire connected to said outer wire gauze.

No. 102,696. Paper Tarring Apparatus.
Apparcil à goullronner le papier.

Arthur Edward Millington, Espanola, Ontario, Canada, 18th December, 1906; 6 years. Filed 18th July, 1906. Receipt No. 137,948.
Claim.-1. The process of preparing tarred paper, which consists in passing a continuous web of paper through a body of tar, subjecting the coated paper to relatively high pressure to force the tar into and through the flibers of the same, winding said paper in a roll, then unwinding the paper so that it is exposed to the air and finally rewinding said paper, substantially as described.
2. In a machine for tarring paper, the combination of a tank, a guide roll in said tank, means for directing a paper web into the tank to said guide roll, and means for directing the web in a substantially vertical line from said guide roll out of the tank, a scraper or scrapers placed to engage the vertical part of the web after it emerges from the liquid in the tank, with squeeze rolls placed to engage the paper web after it has passed said scraper or scrapers, substantially as described.
3. A machine for tarring paper consisting of a tank, ? guide roll having means whereby it is retained below the level of the liquid in the tank, a guide roll for directing the paper web into the tank to said first guide roll, a second guide roll for causing the paper web to be drawn in a substantially vertical line out of the tank, squeeze rolls. a pair of scrapers placed to act upon opposite sides of the vertically extending portion of the web, and a second scraper placed to act upon the under side of the web before it passes to the squeeze rolls, substantially as described.
4. A machine for preparing tarred paper consisting of a tank. means for directing a web of paper through liquid in said tank. squeeze rolls, means for winding the paper in a roll after it passes through said squeeze rolls, with means for unwinding and subsequently rewinding the freshly tarred paper from said first roll, substantially as described.

No. 102,697. Rotary Converter. Convertisseur rotatif.

John L. Murdock. Bound Brook, New Jersey, U.S.A., 18th December. 1906; 6 years. Filed 19th April, 1906. Receipt No. 135,064 .
Cluim.-1. The combination of an armature provided with : plurality of separate windings, means for energizing said windings in a predetermined successive order, sectors conn"cted respectively with said windings, brushes engaging said sectors, and wire connections so arranged from said Windings to said sectors that currents through said brushes shall always llow in the same direction as said armature is rotated.
2. The combination of an armature provided with a plurality of separate windings, a plurality of sectors mounted lipon said armature and connected respectively with said windings, means for so energizing said windings that said sectors all attain the same sign upon reaching a predetermined point in their revolution, a brush located at this point and adapted to receive current flowing always in the same direction, and means for completing the circuit from said brush to the other windings not directly connected thereto.
3. In a rotary converter the combination of a field armature provided with a plurality of separate windings, a plurality of sectors connected directly with said windings respectively and energized thereby, a plurality of sther sectors connected with said armature and each in electrical communication with one of said first-mentioned sectors disposed diametrically opposite thereto, a brush engaging said firstmentioned sectors, another brush engaging said second-mentioned sectors, and means for energizing said windings.
4. The combination of a revoluble armature provided with a plurality of windings, means for energizing sald windings successively in dirierent phase, a plurality of positive sectors connected directly with said windings, each sector being connected with a particular winding, a plurality of negative srectors each in communication with a positive sector, said negative sectors each being diametrically opposite the positive sector connected therewith, a brush adapted to engage said positive sectors, another brush adapted to engage said negative sectors, said brushes being disposed adjacent to each other, and means for so energizing said windings in such phase that the positive sectors are energized at the instant when in contact with their brush, the negative sectors being likewise energized at he instant when they are in contact with their brush.
5. The combination with a revoluble armature provided with windings, sectors connected with said windings, brushes engaging sall sec:ors, and means for so energizing sald windings that the latter become neutral at the instant when said brushes leave said sectors connected with said windings.
6. In a three-phase rotary converter the combination of three windings. three sectors connected therewith, each of said sectors representing approximately 120 degrees of a circle, and a brush having a width representing approxi-
mately 60 degrees of a circle, said brush being adapted to rest throughout its entire length upon one or more of the sectors.
7. In a rotary converter the combination of a field, an armture revoluble in relation thereto, said armature belng built up of a plurality of separate windings, a plurality of sectors connected with said windings and built up into separate rings, one of said rings being always positive at a predetermined point relative to the horizon, the other of said rings being always negative at a predetermined point relative to the horizon, and brushes engaging said positive and negative portions of said rings.

No. 102,698. Flash Sign. Signal Lumineux.

John S. Nesbitt, Victoria, British Columbia, Canada, 18th December, 1906; 6 years. Filed 5th September, 1906. Receipt No. 139.262.
Claim.-1. In a flash sign, a general letter frame troughshaped in cross section the outline of which frame includes within it the several letters or flgures for which the sign is designed, partitions dividing this frame at the position of variation of the several letters and means for inserting an illuminant in the several sections.
2. In a flash sign, a general letter frame trough-shaped in cross section the outline of which frame includes within it the several letters or figures for which the sign is designed, partitions dividing this frame at the position of variation of the several letters, and sockets for the reception of lamp bulbs in the several sections of the letter frame so divided.
3. In a flash sign, a general letter frame trough-shaped in cross section the outline of which frame includes within it the several letters which the sign is designed to display, partitions at the positions of variation of the several letters, a cover plate over certain of the sections which plate is sten-cil-cut to show certain letters or figures, and sockets in the several sections for the reception of electric light bulbs.
4. In a flash sign, the sign frame 2 and 3 , the letter frame 6 secured to the face of 3 , the partitions 7 dividing the letter frame into the sections \(8,9,10,11,12,13,14\) and 15 , the hinged cover plate over the section 9 which plate is stencilcut with a \(C\) and the lamp bulb sockets 4 in the several sections.

\section*{No. 102,699. Bottle Closure.}

Fermerture pour boutcilles.

Henry A. Olsson, New York City. New York, U.S.A., 18th December, 1906; 6 years. Filed 15th November, 1906. Receipt No. 141,218.
Claim.-1. A bottle closure comprising two dises and means for holding them at a distance from each other, the disc being separated from each other at their edge whereby a marginal space is afforded when the closure is in position.
2. A bottle closure comprising two dises of different diameters, and means for holding them at a distance from rach other and affording a space between them, said means comprising a disc of the same shape as the first-mentioned discs, but of smaller diameter.
2. A bottle closure comprising a disc adapted to enter the mouth of a bottle and a shect secured to the disc at a distanco from the latter and adapted to cover the mouth of tho bottle.
4. A bottle closure comprising a disc adapted to enter the mouth of the bottle, a shect seoured to the disc at a distance from the latter and adapted to cover the mouth of tho bottle, and a third dise between the first two and of a smaller diameter than either.
\(\therefore\). A closure for spen-mouthed receptacles comprising a shieet adapted to project over the mouth of a receptacle, and a disc of smaller diameter than the sheet separated from the latter to provide a space therebetween, and adaptto enter the mouth of the receptacle.
6. A milk bottle closure comprising a pair of discs, one located above the other, the upper one being of larger diameter than the lower, a third disc located between the other two and of smaller diameter than either, and a strip of flexiblo material secured to the bottom of the lower disc: and adapted to project beyond the upper disc.
7. A bottle closure comprising two dises suitably connected and free of each other at their edpes.
8. A bottle closure comprising two dises having separate and free edges, and means for holding said edges at a distanca from each other.
9. A bottle closure comprising two discs centrally connerted and the edges thereof heing free and separable.
10. A bottle closure comprising two substantially parallel dises of different diameters and means for holding the edges thercof at a distance from earh other.
11. A closure for milk bottles comprising two individual parts connected together. one of said parts fitting into the neck of the bottle and the other over the mouth of the hottle.
12. A bottle closure comprising a disc adanted to enter the mouth of the bottle and a disc adapted to cover sald mouth. said discs being connected substantiolly at their central portions onls.
15. A closure for open-mouthed receptacles comprising a shent adapted to project over and cover the mouth of a receptacle and a disc of smaller diameter than the sheet adapted to enter the mouth of the receptarle. sald dise and shect being sultably connected together and separated from rach other at their edges.
14. A closure for bottles having an annular groove or reress in its neck portion. which comprises two circular parts suitably connected together. one of which parts has its edge portion fitting in said annular groove or recess and the other of which projects over the mouth of the bottle and serves as a hand hold for removing the closure from the bottle.

No. 102,700. Bottle. Bouteille.

Robert Pitt. Pinetops, North Carolina, U.S.A., 18th December, 1906; 6 years. Filed 8 th October, 1906. Receipt No. 140,151.
Claim.-1. In a bottle or similar receptacle of the class described the combination of a body section formed with a plurality of separate compartments, an outlet section provided with a central passage and also with a laterally extending outlet passage communicating therewith, a rod pivotally connecting the two sections to admit of the outlet passage being turned into registry with any one of the before-mentioned separate compartments in the body section. the said rod being disnosed in alignment with the before-mentioned central passage in the outlet section and being serewed into the body section, the head of the rod engaging with the bottom of the central passage so as to be readily accessible through the same.
2. In a bottle or similar receptacle of the class described the combination of a body section formed with a plurality of separate compartments, an outlet section provided with a central passage and also with a laterally extending outlet passage communicating therewith, a washer interposed be-
tween the two members and provided with an opening adapted to register with the before-mentioned outlet passage, and a rod pivotally connecting the two sections and admitting of the outlet passage being turned into registry with any one of the separate compartments in the body section, the said rod being disposing in alignment with the before-mentioned central opening in the outlet section and being screwed into the body section, the head of the rod engaging with the bottom of the central passage and being readily accessible therethrough.
3. In a bottle or similar receptacle of the class described the combination of a body section. a plurality of separate receptacles fitting removably within the body section. and an outlet section loosely connected to the body section and provided with an outlet passage. the said outlet section being movable to enable the outiet passage therein to be drawn into communication with any one of the beforementioned removable receptacles within the body sertion.
4. In a bottle or similar recentacle of the class described the combination of a body section. a nlurality of senarate receptacles arranged therein. an annular ring surrounding the separate receptacles and holding them against movement within the body section, and an outlet section annlied to the body section and provided with an outlet nassage. the sald outlet section heing adjustable th throw the outlet passage into registry with a selected one of the brforementioned receptacles.

No. 102,701. Engine and Air Compressor.
Moteur et machine \(d\) compression pour l'air.

Daniel Schiffbauer, Stauffer, Pennsylvania, U.S.A., 18 th December, 1906; 6 years. Filed 24th April, 1906. Receipt No. 135,221.
Claim.-1. In a comblned engine and air compressor, in combination with an engine cylinder having an inwardly extending cylinder at one end, a piston operating in the engine cylinder and having a piston rod, cylinders in the engine cylinder sceured to the niston rod movable with the piston, and having slldable telescopic connections with the firstnamed interior cylinders, a valve to admit aid to the telescopically disposed cylinder, and an air duct leading from said telescopically disposed cylinders, and having a valve, substantially as described.
2. In a combined engine and air compressor the combinalion with the cylinder, of a piston rod slidably mounted therein, a piston fixed on said rod, a pumping mechanism arranged in said cylinder, sald pumping mechanism consisting of a pair of hollow telescoping cylinders arranged on each side of said piston, one member of each of said pairs of cylinders being secured to the inner wall of ons of the cylinder heads and the other member of each of said pairs being secured to the piston rods adjacent to each side of said platon whereby when said piston rod is reciprocated said pairs of cyllnders wil be alternately opened and closed thereby pumping air to a suitable storage receptacle or reservoir, a valved inlet pipe, and a valved discharge pipe arranged in each head of said cylinder whereby the admission and discharge of air to and from said pumping cylinders will be automatically controlled, substantially as described.
3. In a comblned engine and air compressor the combination with the cylinder, of a plston rod slidably mounted therein, a piston fixed on said rod, a pumping mcehanism consisting of a pair of hollow telescoping cylinders arranged on each side of said piston, one member of each of said pairs of cyilinders being secured to the inner wall of one of the cylinder heads and the other member of each of said pairs
being secured to the piston rod adjacent to each side of said piston whereby when said piston rod is receprocated said pairs of cylinders will be alternately opened and closed thereby pumping air to a suitable storage receptacle or reservoir, a valved inlet pipe, and a valve discharge pipe arranged in each head of said cylinder whereby the admission and discharge of air to and from said pumping cylinders will be automatically controlled, an air conduit connecting said discharge pipes and a manually operated cut-off valve arranged in said conduit whereby the air may be held in said cylinders, substantially as and for the purposes described.
No. 102,702. Troliey. Trolle.

John Henry Walker, Lexington, Kentucky, U.S.A., 18th December, 1906; 6 years Filed 26th March, 1906. Receipt No. 134,293.
Clain.-1. The combination substantially as herein described, of the harp having the upper prongs provided with the inwardly projecting stiffening flanges, and the lower prongs inclining inwardly toward each other, below the upper prongs, the conduit leads held at their upper ends to the harp and extending thence downwardly and fitting agains the inner sides of the upper prongs beneath the stiffening flanges and merging at their lower ends in a terminal rest ing upon the lower prongs, the sald conduit leads being provided at their upper ends with bosses fitting within openings in the harp, and provided in their inner faces with recesses, the wheel and its shaft and rockers fitting on the shaft and within the recesses in the conduit leads, the abutting faces of the rockers and the base walls of said recesses being concavo-convex, all substantially as and for the purposes set forth.
2. The combination with the harp, the trolley wheel and its shaft, of rockers on the shaft and forming bearings between the harp and the wheel, substantially as set forth.
3. The combination with the harp. the trolley wheel and its shaft supported in the harp, of rockers on the shaft between the wheel and the harp, concavo-convex bearings being provided between the rocker and the harp, substantially as set forth.
4. The combination of the harp. the wheel. its shaft, the washers fitting against the ends of the wheel hub, and the rockers interposed between said washers and the harp, substantially as set forth.
5. The combination with the harp, the wheel, its shaft, and the rockers on the shaft, of the washers between the rockers and the wheel, and provided with projecting lugs interlocking with the harp, whereby to prevent the turning of the washers, substantially as set forth.
6. The combination of the harp, the conduit leads having bosses held to the harp, and provided with bearings for the wheel shaft, and the wheel and its shaft, substantially as set forth.
7. The combination of the harp provided with apertures. the conduit leads having bosses fitting and held in said aper tures and provided in their inner faces with recesses, the base walls of which are provided with openings for a shaft, the wheel having its shaft fitting in said openings, the wash© rs abutting against the ends of the wheel, and the rockers in the said recesses and bearing between the base walls thereof and the sald washers, substantially as set forth.
8. The combination of the harp having the upper prongs provided with inwardly projecting stifiening flanges, and with the lower prongs extending below said upper prongs, the conduit leads held at their upper ends to the harp and extending downwardly beneath the stiffening flanges of the upper prongs, and provided at their lower ends with the terminal supported upon the lower prongs, gubstantinity set forth.
9. The combination of the harp having upper and lower prongs, and the conduit leads extending alqng side the upper prongs and braced against upward movement by said upper prongs and aga nst downward movement by the lower prongs, substantially as set forth.
10. A trolley harp having upper and lower prongs and condult leads extending beneath the lower and upper prongs, the upper prongs having portions overlying the conduit leads, and the lower prongs having portions underconduit leads, and the lower prongs having port
lying the said leads, substantially as set forth.
11. The combination of the harp having the upper prongs provided with the inwardly projecting stiffening fianges, and the lower prongc inclining inwardly toward their lower ends below the said upper prongs, and the conduit leads extending along side the upper prong and bearing beneath the stiffening flanges and provided at their lower ends with the terminal resting upon the lower prongs.
12. The combination of the harp having opposite apertures, the conduit leads having bosses intting in the opposite apertures, and provided in the inner faces of said bosses with recesses, the rockers fitting in said recesses, tho wheel, its shaft held in the said bosses of the leads, and extending through the rockers, and the washers bearing between the rockers and the wheel hub.
13. The combination with the harp having openings and the conduit leads having bosses fitting in said openings, and tho wheel and its shaft supported in said bosses, of means on the harp for preventing upward and downward movement of the leads, whereby to prevent any rotation of the bosses within the openings in the harp.
14. The combination of the pole, the harp having a shank fitting within the upper end of the pole, a reinforce band fitting around the upper end of the pole, and a screw for securing said band on the pole, and the harp shank within the pole.
15. The combination of the pole. the harp having upper and lower prongs and a shank fitting within the upper end of the pole, the reinforce band fitting over the pole and having means engaging with the lower end of the harp, and devices for securing the sald reinforce band.

\section*{No. 102,703. Bathometer. Instrument de sondage.}

Eben S. Wheeler, Detroit, Michigan, U.S.A., 18 th December, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,933.
Claim.-1. In a bathometer in combination with an openended tube, a flexible tubular guard terminal thereto, a check valve at the junction of the tube and guard, and means for supplying air to said tube, substantially as described.
2. In a bathometer in combination with an air containing tube, an indicator connected thereto at the upper end, means for furnishing a continuous supply of alr under pressure to the tube at its upper end, means for preventing an inflow of water into said tube at its lower end, a flexible tubular guard extending said tube below the means for preventing an inflow of water, substantially as described.
2. In a bathometer in combination with a tube, means for supplying air under pressure to the upper end of said tube, means whereby the air may escape from the lower end of said tube, a check valve opening outwardly to prevent water frim entering said tube at its lower end, and a guard of flexible material extending beyond the check valve, substantially as described.
4. In combination with a bathometer tube, an armor for the lower end thereof, consisting of short pleces of tubular material threaded on said tube, substantially as described.
5. In a bathometer in combination with a tube provided With means for the introduction of air thereinto at one end and for the escape of air therefrom at the other end, a flexible terminal guarding the escape end of said tube, means to prevent the entrance of water into said tube, said means being located at the junction of the flexlble terminal and the main tube, and an indicator adapted to indicate the pressure of air in said tube, substantially as described.

No. 102,704. Massage Vibrator.
Vibrateur pour massage.

Edmund Hugh Pryce and De Witt Clinton Conkling, Hoboken, New Jersey, U.S.A., 25th December, 1906; 6 years. Filed 30th August, 1906. Receipt No. 139,094.
Claim.-1. A duplex massage vibrator consisting of the combination of a pair of magnets, an armature common thereto, a circuit interrupter vibratory with said armature for closing and breaking the circuits of said magnets alternately, and massage cushions actuated by sald armature.
2. A duplex massage vibrator consisting of the combination of a casing, a magnet attached to one side thereof and located inside thereof, a second magnet in said casing and having its poies facing those of the first magnet, a vibratory armature between the magnets for being attracted first to the one and then to the other magnet, a flexible interrupter, a post on the armature attached to said interrupter, a terminal in the path of said interrupter and connecting with one magnet, a second terminal on the other side of said interrupter from the first-named terminal and also in the path of said interrupter and connecting with the other magnet, a handle for the massage vibrator, a push button thereon, and in a normally open circuit with both magnets, and massage cushions actuated by said armature.
3. In a duplex, massage vibrator the combination of an armature, magnets for vibrating the same, rods extending laterally of said armature, a percussion cushion for being attached to said rods, and means by which a friction cushion may be attached to the reciprocating end of said armature.
4. In a duplex massage vibrator the combination of \(a\) cushion. a magnet for causing it to move one way, and another magnet for causing it to move the other way.
5. In a duplex massage vibrator the combination of magnets facing each other, a vibratory armature between the same and vibrated thereby, and a massage cushion carried by said armature.
6. The combination of a bowl, a diaphragm therein, to act as a pneumatic massage cushion, and an electro-magnetic device for causing said diaphragm to pulsate, to produce alternate suctions and pressures upon any part of the human body.
7. In a duplex massage vibrator the combination of an armature vibratory about one end of itself, magnets having plane poles facing opposite sides of said armature, the plane surfaces of sald magnets radiating from about the same center of vibration as that of the armature for ensuring actual contact of the armature with said doles when attracted by the respective magnets, means for causing said magnets to alternately attract said armature, and massage cushions actuated by said armature.
8. In a duplex massage vibrator the combination of a vibratory armature, a rod passing through the same, a pin holding said rod fast to said armature, and massage cushions attachable to the outer ends of said rod.

\section*{No. 102,705. Gas Chandelier. Chandelier à gaz.}

William E. Cotton and Levi C. Moore, co-inventors, both of Kansas City, Missouri, U.S.A., 25th December, 1906; 6 years. Filed 29th August, 1906. Receipt No. 139,067.
Claim.-1. In an extension gas chandelier the combination of an outer fixed pipe having an internal annular shoulder near its lower end, an inner pipe slidably fitted in the outer pipe and having an external annular shoulder extending to the wall of the outer pipe, a cushion on the internal annular shoulder of the inner pipe arranged to receive the impact of the external shoulder on the inner pipe, a longitudinally
movable cup mounted on the end of the outer pipe and encircling the inner pipe, means for moving said cup longi-

tudinally of the pipes, and an elastic ring inclosed within said cup bearing against the end of the outer pipe and arranged to frictionally embrace the inner pipe and hold the two pipes in their relative adjustment.
2. A pair of pipes fitting telescopically together, a cup fitting upon and having a sliding relation with the inner one and longitudinally adjustable on one end of the outer one, a combined gasket and clamp ring fitting between the cup, and the outer pipe and externally embracing the inner pipe, a lever suitably supported to prevent downward movement of the cup, and means for imparting vertical movement to said lever to press the cup upward or leave it free to move downward.
3. An extension gas chandeller, comprising a pair of pipes fitting telescopically together, a cup adjustable longitudinally of the outer pipe, a combined gasket and clamp ring fitting between the cup and the outer pipe and externally embracing the inner pipe, a lever supported from the outer pipe and pivotally movable only and having one end underlying the cup and its opposite end provided with a threaded passage, a rod having threads engaging said threaded passage, and means rigid with said outer pipe affording a bearing for the upper end of said rod.

\section*{wo. 102,706. Rotary Steam Engine. \\ Machine rotative d vapcur.}

Joseph Hilaire Daniel Beaucage, Pittsfield, Massachusetts, U.S.A., 25th December, 1906; 6 years. Filed 31st October, 1906. Recelpt No. 140,800 .

Claim.-1. In a reversible rotary steam engine, an engine body having a cylindrical working chamber, and having outwardly therefrom and within such body an interminately located cylindrical inlet valve bore, cylindrical cut-off-valve bores separated from and at opposite sldes of the inlet valve bore, and oppositely located exhaust valve bores separated from the cut-off valve bores, and further from the inlet valve bore, all said bores being in axial parallelism with the working cylindrical chamber, and said engine body having an inlet opening leading to the inlet valve bore, a pair of oppositely located steam ways leading from such bore to the cut-off valve bores, and ways leading from the latter bores into the working chamber at opposite sides of its median line, such ways having branched passages leading to the exhaust valve bores, and exhaust outlets leading from the exhaust valve bores, a cylindrical rotatable body mounted within the working chamber and having a main shaft as
part thereof. wings or blades carried by, and radially exlended from. said body and edgewise bearing against the working chamber wall, a roversible cylindrical inlet valve. rotary cut-off valves, and roversible exhaust valves fitted for their movements in the respective bores therefor, and moans for imparting continuous rotary motions to said cut"fi values.
\(\therefore\). In a reversible rotary steam engine, an engine body having a cylindrical working chamber, and having outwardly therefrom an intermediately located cylindrical inlet valve bore. cylindrical cut-off valve bores separated from and at opposito sides of the inlet valve bore, and oppositely located exhaust valve bores separated from the cutoff valve bores and further from the inlet valve bore. all said bores being in axial parallelism with the working cylindrical rhamber, and said engine body having an inlet opening leading to the inlet valve bore. a pair of oppositely locater steam ways leading from such bore to the cut-off valv, bores. ways leading from the latter bores into the working chamber at onposite sides of its median line. such ways having branched passages leading to the exhaust valve bores, and cxhaust outlets leading from the exhaust valvo bores, and cylindrical rotatable body eccentrically mountrd within the working chamber, peripherally in contact with one side of the chamber wall, having outwardly opening blade pockets. and having a main shaft as part thercot. blades carried by said body inwardly and outwardly movable in the nockets therein, and springs having outwardly forcing actions against said blades, a rotatively reversible cylindrical inlet valve, rotary cut-off valves, and rotatively reversiblo exhaust valves, fitted for their movements in the respectivo bores therefor, and means for imparting rotary motions to said cut-off valve.
3. In a reversible rotary steam engine, an engine body having a cylindrical working chamber, and having outwardly therefrom an intermediately located cylindrical inlet valvo bore, cylindrical cut-off valve bores separated from and at opposite sides of the inlet valve bore. and oppositely loratel exhaust valve bores separated from the cut-off ralvo bores, and further from the inlet valve bore, all said bores being in axial parallelism with the working cylindrical chamber, and said engine body having an inlet opening Irading to the inlet valve bore, a pair of oppositely located steam ways leading from such bore to the cut-off valve bores, ways leading from the latter bores into the working "hamber at opposite sides of its median line, such ways having branched passages leading to the exhaust valve bores, and exhaust passages leading from the exhaust valve bores, a cylindrical rotatable body mounted within the working: chamber and having the engine shaft as part thereof. wings or blades carried by, and radially extended from. said body and edgewise bearing against the working 'hamber wall, a reversible cylindrical inlet valve, rotary rut-off valves, and reversible exhaust valves fitted for their movements in the respective bores therefor, said inlet and rut-off valves having reversed or slabbed formations at their opposite sides, and said exhaust valves recessed or slabbed formations at one side only, a gear wheel on the ringino shaft, and gear wheels on the cut-off valves with which tho first-named gear is in mesh.
4. In a reversible rotary steam engine, an engine body having a cylindrical working chamber, and having outwardly therefrom an intermediately located cylindrical inlet valve bore, cylindrical cut-off valve bores separated from and at opposite sides of the inlet valve bore, and oppositely located exhaust valve bores separated from the cut-off valvo bores, and further from the inlet valve bore, all said bores being in axial parallelism with the working cylindrical chamber, and said engine body having an inlet opening leading to the inlet valve, bore, a pair of oppositely located steam ways leading from such bore to the cut-off valve bores, and ways leading from the latter bores into the working chamber at opposite sides of its median line, such ways having branched passages leading to the exhaust valvo bores, and exhaust outlets leading from the exhaust valvo bores, a cylindrical rotatable body mounted within the working chamber and having a main shaft as part thereoi, wings or blades carried by, and radially extended from said body and edgewise bearing against the working chamber wall, a reversible cylindrical inlet valve. rotary cut-off valves, and reversible exhaust valves fitted for their movements in the respective bores therefor. a lever having a handle connected to the inlet valve, levers connected to the exhaust valves, links connecting said exhaust valre levers with the inlet valve lever, and means for imparting continuous rotary movements to the cut-off valves.
5. In a reversible rotary steam enginc, an engine body having a cylindrical working chamber. and having outwardly therefrom an intermediately located cylindrical inlet valve bore, cylindrical cut-off valve bores separated from and at opposite sides of the inlet valve bore, and oppo-
sitely located exhaust valve bores separated from the cutoff valve bores, and further from the inlet valve bore, all said bores being in axial perallelism with the working cylindrical chamber, and said engine body having an inlet opening leading to the inlet valve bore, a pair of oppositely located steam ways leading from such bore to the cut-off valve bores, and ways leading from the latter bores into the working chamber at opposite sides of its median line, such ways having branched passages leading to the exhaust valvo bores, and exhaust outlets leading from the exhaust valve bores, a cylindrical rotatable body mounted within tho working chamber and having a main shaft as part thereot, wings or blades carried by, and radially extended therefrom, said body and edgewise bearing against the working chamber wall. a revedsible cylindrical inlet valve, rotary cut-off valves. and reversible exhaust valves fitted for their movements in the respective bores therefor, a lever having a handle, connected to the inlet valve, levers connected to the exhahst valves having a pointer, links connecting said exhaust valve levers with the inlet valve lever, reversely pointing motion indicating arrows on the face of the engine body adjacent the inlet valve and in relation to either of which said pointer may be positioned and means for imparting continuous rotary movements to the cut-off valves.
6. In a reversible rotary steam engine, an engine body having a cylindrical working chamber, having thereabove a steam chamber and therebelow an exhaust way, a passage leading from the top of the body to said steam chamber, an intermediately located cylindrical inlet valve bore below the steam chamber, cylindrical cut-off valve bores separated from and at opposite sides of the inlet valve bore, and oppositely located exhaust valve bores separated from the cutoff valve bores, and further from the inlet valve bore, all said bores being in axial parallelism with the working cylindrical chamber, and said body having an opening leading vertically from the stcam chamber to the inlet valve bore, a pair of oppositely located steam ways leading from such bore to the cut-off valve bores, and T-shaped ways connecting the latter bores with the working chamber and connecting the latter chamber with the exhaust valve bores, and having curved exhaust outlets leading within the engine body from the exhaust valve bores, downwardly and towards each other and connecting with said exhaust way, a cylindrical rotatable body mounted within the working chamber and having a main shaft as part thereof, wings or blades carried by and radially extended from said body and edgewise bearing against the working chamber wall, a reversible cylindrical inlet valve, rotary cut-off valves, and reversible exhaust valves fitted for their movements in the respective bores therefor. a gear wheel on the engine shaft and gear wheels in mesh therewith on the cut-off valves, a lever connected to the inlet valve, levers connected to the oppositely located exhaust valves, and links connecting said exhaust valve levers with the inlet valves.

No. 102,707. Burial Casket. Cercucil.

Albert Belair, Ahuntsic, Quebec, Canada. 25th December, 1906; 6 years. Filed 27th November, 1906. Receipt No. 141,581.
Claim.-1. In a device of the character described, a casket in combination with an insertible tray, and a grill disposed in the tray.
2. In a device of the character described, a casket in combination with an insertible tray, a removable grill disposed in the tray, and a body of absorbent matter disposed under the grill.
3. In a device of the character described, a casket having a removable end wall, in combination with an insertible tray and a grill disposed in the tray.
4. In a device of the character described, a casket, an insertible tray disposed in the casket, a removable grill disposed in the tray, a body of absorbent matter disposed under the grill, and said casket being provided with a removable end wall to permit the removal of the tray.

No. 102,708. Denture. Denture.

\(\underbrace{0}_{i} \underbrace{0}_{1}\)

\(a\)
\(n\)
\(n\)

Robert Meade Craig, Dennison, Ohio, U.S.A., 25th December, 1906; 6 years. Filed 25th August, 1906. Receipt No. 138,986.
Claim.-1. A denture comprising a porcelain having its posterior portion formed into a dove-tail, a backing having a recess shaped to fit the dove-tail, and a locking device for tho backing.
:. In a denture, a porcelain having its body portion dovetail in cross section, being widest at the rear, forming thereby occlusal edges and occlusal surfaces, a backing also anteriorly dove-tall in cross section, which backing fits close to the said occlusal surfaces and against said occlusal edges, and a locking device for the backing.
s. In a denture, a porcelain provided with a posterior portion dove-tail in cross section, the anterior portion of the said porcelain extending beyond the side faces of the posterior portion of the procelain, one of said side faces having a recess therein, and a backing dove-tail in cross section, which backing conforms strictly to the contour of the posterior portion of the porcelain and adheres closely thereto, the side members of the said backing engaging with the shoulders formed by the extension of the anterior portion of the porcelain beyond the sides of its posterior portion, one of the side members of the backing having an opening therein adapted to register with the recess in the porcelain, and a key passed through said opening into said recess.

No. 102,709. Dental Expander or Dilator.
Dilatateur dental.

Cleveland G. Davis, Manistee, Michigan, U.S.A., 25th December. 1906; 6 years. Filed 20th August, 1906. Recelpt. No. 138,835 .
Claim.-1. The combination with the expansible bow, of the tepth or gums engaging hooks pivoted to the ends of the bows, and rubber tubing covering the hooks.
2. The combination with the expansible bow, of the teeth or gums engaging hooks pivoted on the free ends of the bow and a lip rest and dilator frictionally engaging the base of the hooks.
3. The combination with an expansible bow, of hooks pivoted on the free ends of the bows and consisting of an angular base plate having two upturned ends, the horizontal part of the base plate being piroted to the ends of the bows.
4. A lip dilator and support consisting of a crossbar spoon-like lip support extending from each side theroof, and legs and a plate depending from sald crossbar.
5. The combination with the expansible and contractible bows and screw for controlling the same, of tecth hooks pivoted on the ends of the bows, said hooks consisting of an angular plate with two upturned ends, the horizontal part of the angular hook plate being on the ends of the hows.

\section*{No. 102,710. Insulating Compound.}

Compose isolant.
Robert L. Johnston, Glenridge, New Jersey, U.S.A., 25th December. 1:06; 6 years. Filed 29th October, 1906. Receipt , vo. \(140, \mathrm{i}: 39\).
Claim.-1. A permanently pliable and adhesive compound consisting of gutta percha. resin and a waxy substance having a relatively high melting point.
2. A permamently pliable adhesive compound consisting of gutta percha, resin and a vegetable wax having a relatively high melting point.
3. A permanently pliable adhesive compound consisting of gutta percha, resin and carnatuba wax.
No. 102,711. Advertising, Envelope.
Enveloppe-réclame.

Joshua Rudd Ritchic. Philadelphia, Pennsylvania, U.S.A., 25 th December, \(1: 06\); 6 years. Filed 21st July, 1906. Receipt No. 138,052.
Claim.-1. An envelope having on the front face therenf on an integral section thereof, a primarily concealed advertisement normally facing the interior of the envelope, said section being adapted to be released and render the advertisement visible, and means on the exposed face of said section directing attention to the back of the same, whereon said advertisement is concealed.
2. A commercial envelope having on the front face thereof, a section surrounded by perforations for release from the remaining intact portion, a primarily concealed advertisement on the back of said section, a notice on the exposed face of sald section directing attention to said back and a recess adjacent to sald perforations for the insertion of an implement to the latter whereby the envelope may be opened and sald section released.
3. A commercial envelope having on the front face thereof, a section surrounded by weakened lines for releasing from the remaining intact portion, a primarily concealed advertiscment on the back of sald section, a notice on the exposed face of said section directing attention to said back and a recess adjustment to either line for the insertion of an implement to reach the latter, wheriby sald section may be severed or releasid.
4. A commercial envelope having on the front face thereof, a section surrounded by means for releasing it from the remaining intact portion, a primarlly concealed advertisement on the back of said section, a notice on the exposed face of sald section directing attention to sald back, said means extunding a portion of the length of the envelope which they occupy, the corners of sald section being in normal condition solldly connecting said section with the adjacent intact portions.
i. A commercial envelope having on the front face thercof. a suction surrounded by means for releasing it from the remaining intact portion, a primarily concealed adveriisement on the back of said section, a notice on the exposed face of suid section dirceting attention to sald back, sald means ज. nd ndiug a portion of the length of the envilope which they woupy, the curnirs of said section heing in normal condilom solidly connecting sald section with the adjarent intart poritons, and a recess in the envelope adjacent to said weans for the Insertion and guidance of an Implement.

No. 102,712. Lamp Lishter and Dixtingiaher. Allumour et extincteur de lampes.

George Robson, Sydney. New South Wales. Australla, z:! December, 1906; 6 years. Filed 22nd August. 1906. Ke. celpt No. 13S.913.
Claim.-1. A device for lighting and extingulshing from a distance strcet and other sas lights charactarizid by an outir casing, a gas chamber in communfeation with gas \(61 ;\) ply covered by a bell with mercury seal, sald bell toring adapted to rise and fall by the variation of prissure with. the chamber and having attached thereto a hanging \(1, i\) which engages and oscillates a balanced beam carrylar, pair of small bells which overlie the gas outlets to the buraers, so as to alternately control the supply of gas ther. : 0 . substantially as described and illustrated in the drawicas
2. In a device for lighting and extinguisaing from a d:s. tance street and other gas lights the combination of a mo:-r bell adapted to rise and fall with the variation of pressis: in the gas main with a balance oscillating beam carry ins a pair of small bells which alternately concrol the gas strpiy to the burners, substantially as described and as lllusiraid. in the drawings.
3. A device for lighting and extinguishing from a dis:ann street and other gas lights having an outer casing. a \(g\) is chamber with cover adapted to rise and fall, a pair of < 1 . outlets with mercury scals, a pair of small bells suspende. from a balanced oscillating honm and overlying said mireiry seals and a link attached to the gas chamber cover for thpurpose of oscillating the beam.
4. In a device for lighting and extingnishing from a distance street and other gas lights, a balanced oscillating bean carrying a pair of small bells which are alternately immersed In the mercury seals surrounding the gas outle'e and resained in the immersed position by the pressure within the ras chamber for the purpose and substantially as described and illustrated in the drawings.

\section*{No. 102,713. Carton Making Machine.}

Machine d fabriquer le carton.

Edward A. L. Roohl, Minneapolis, Minuesuta U December, 1906; 6 years. Filedifih S. ptu:nber, 1908 . R-. ceipt No. 139,566 .
Claim.-1. In a carton making machine the comblast iz with a sultable frame, of belt wherls munntid upon asd ri.
voluble in the said frame, a belt running upon the said belt wheels, a deflecting wheel the periphery of which impinges and deflects the said belt, a pressure wheel journalled in the said frame and underlying the said deflecting wheel, a movable carriage having a head block thereon against which the carton blanks are delivered by the said belt wheels, belt and deflecting wheel, bending cam wheels journalled in the said frame and on opposite sides of the said head block, said bending cam wheels rotating in opposition to the said pressure wheel and folding cam wheels journalled in the said frame and rotating at right angles to the said pressure wheel and the said bending cam wheels, substantially as shown and described.
2. In a carton making machine bending, folding and pressing mechanism comprising a shaft jourvalled in the frame thereof, said shaft having reversely faced bevelled gear wheels mounted thereon, a pressure wheel mounted upon and revoluble with the said shaft, parallel shafts journalled in the said frame at a right angle to the first-named shaft carrying the pressure wheel, said shafts having reversely faced bevelled gear wheels mounted thereon, the teeth of one pair of which engage those of the first-named bevelled gear wheels, folding cam wheels mounted upon the said shafts between the said bevelled gear wheels, a pair of shafts journalled in the said frame parallel with the first-named shaft carrying the pressure wheel and at right angles to the last-named shafts carrying the folding cam wheels, and in longitudinal alignment one with the other, said shafts being respectively provided with bevelled gear wheels the teeth of which engage those of the bevelled gear wheels of the parallel shafts carrying the folding cam wheels, bending cam wheels mounted upon the said aligned shafts, and a carriage longitudinally movable withIn the said frame and between the oppositely faced ends of the said aligned shafts in which the bent and folded cartons are pressed, substantially as shown and described.

No. 102,714. Heat Diffuser for Steam Boiler. Répartisseur de chaleur pour chaudière d vapeur.

Alfred Smallwood, London, England, 25th December, 1906, 6 years. Filed 13th February, 1906. Receipt No. 132,882.
Claim.-1. A means for generating and diffusing heat in connection with steam boilers comprising a furnace tube, a furnace formed within and adjolning the front end thereof, an inner tube of mineral material capable of becoming incandescent centrally located within the furnace tube, supporting divisions to maintain the inner tube correctly positioned within the furnace tube and to form the space between he inner and furnace tubes into separate flues, means for passage of the gases from the inner tube at the opposite end thereof to the furnace into one of said flues, and other means for the passage of the gases from said flues into the other flue or flues at the opposite end thereof to the firstmentioned means.
2. A means for generating and diffusing heat in connection with stcam boilers comprising a furnace tube, a furnace formed within and adjoining the front end thereof, an inner tube of mineral capable of bccoming incandescent centrally located within the furnace tube, supporting divisions to maintain the inner tube correctly positioned within the furnace tube and to form the space belween the inner and furnace tubes into separate flues, means ior the passage of the gasses from the inner tube at the opposite end thereof to the furnace into one of said flues, other means for the passage of the gases from said flue into the other flue or flues at the opposite end thereof to the first-mentioned means, and a metallic casing inclosing the inner tube and having dovetails formed on its inner face to enter dovetail grooves in the outer face of the inner tube.
3 A means for generating and diffusing heat in connection with steam boilers comprising a furnace tube, a furnace formed within and adjoining the front end thereof, an inner tube of mineral material capable of becoming incandescent centrally located within the furnace tube, supporting divisions to maintain the inner tube correctly positioned within the furnace tube and to form the space between the inner and furnace tubes into separate flues, means for the passage
of the gases from the inner tube at the opposite end thereof to the furnace Into one of said flues, other means for the passage of the gases from said flue into the other flue or flues at the opposite end thereof to the first-mentioned means, and a boller inclosing the furnace tube.
4. A means for generating and oiffusing heat in connection with steam boilers comprising a furnace tube, a furnace formed with in and adjoining the front and thereof, an inner tube of mineral material capable of becoming incandescent centrally located within the furnace tube, supporting divisions to maintain the inner tube correctly poitioned within the furnace tube and to form the space between the inner and furnace tube into separate flues, means for the passage of the gases from the inner tube at the opposite end thereof to the furnace into one of said flues, other means for the passage of the gases from said flue into the other flue or flues at the opposite end therevf to the first-mentioned means, a metallic casing inclosing the inner tube and having dovetails formed on its inner face to enter dovetail grooves in the outer face of the inner tube, and a boller enclosing the furnace tube.

No. 102,715. Picture Slide for Stereopticons.
Chissis d glissière pour photographtes stéróoscoptques.

Arthur K. Wait, Roanoke, Virginia, U.S.A., 25th December, 1906; 6 years. Filed 27th August, 1906. Receipt No. 139,000.
Claim.-1. In an apparatus of the class described the combination of a rotary carrier having radial guideways provided with open outer ends for the reception of picture slides, a guard embracing the open outer ends of the guideways to retain the picture slides therein and provided with an opening with which the guideways are adapted to successively register for the outward movement of the slide through the opening, an annular series of ratchet teeth for the carrier, a lever having a dog associated with the ratchet teeth, a swinging arm carrying a crosshead aligned with the opening in the guard and working towards and away from the same, and a rotary shaft have a plurality of cams adapted to engage and operate the lever and the arm.
2. The combination with a stereopticon, of a rotary picture slide carrier mounted above the stereopticon and provided with radial guideways open at their outer ends for the reception of picture slides, said carrier having ratchet teeth, a guard embracing the lower side of the carrier to retain the picture slides in the guideways and having an opening in alignment with the picture slide guide of the stereopticon and with which the guideways are adapted to successively register for the discharge of the picture slides, a plicture slide support working in the picture gulde of the stereopticon, pivotal arms mounted at opposite sides of the stereopticon and connected to the picture slide support, a lever having a dog to engage the teeth of the picture carrier, and a shaft having a crank handle at one end and a plurality of cams adapted to engage the pivotal arms and the lever at different times for operating the same.
8. The combination of a stereopticon having a vertical slot adjacent the forward end thereof, a rotary picture slide carrier mounted above the stereopticon and provided with radial grooves, said carrier having ratchet teeth, a pair of parallel pivotal arms extending along opposite sides of the stereopticon and having longitudinal slots in their forward ends, a crosshead extending through the vertical slot in the stercopticon and having trunnions engaging the longitudinal slots of the pivotal arms, uprights for supporting the pivotal arms, an independent lever having a dog to engage the ratchet teeth of the rotary picture carrier, an upright for supporting said independent lever, a shaft supported adjacent the rear ends of the pivotal arms and independent lever, said shaft having a pair of cams for operating the pivotal arms, and a separate cam for operating the independent lever nnd a crank handle for said shaft.

No. 102,716. Gas Range. Fourneau d̀ gaz.

The Gurrey Foundry Company, assignee of William Cromwell Gurney, all of Toronto, Ontario, Canada, 25th December, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,1ss.
Claim.-1. A gas range or stove comprising a burner, an oven, a bottom for the oven opposed to the burner and a lining of refractory material interposed between the burner and oven bottom to be acted upon by the products of combustion from the burner flame and distribute the calories absarbed therefrom to the uven bottom.
2. A gas range or stove comprising a roasting oven, a burner therein, a cooking oven, a partition separating the roasting oven from the cooking oven, a non-fusible lining of refractory material interposed between the burner and the partition to be acted upon by the products of combustion from the burner flame and to absorb the calories therefrom and distribute them to the partition.
3. A gas range or stove comprising a roasting oven, a burner therein, a cooking oven, a partition separating the roasting oven from the cooking oven, a non-fusible lining of refractory material interposed between the burner and the partition to be acted upon by the products of combustion from the burner flame and to absorb the calories therefrom and distribute them to the partition, said partition and lining having an aperture therethrough and a cover to close said aperture having a lining of refractory material similar to the liuing of the partition.
4. A gas range or stove comprising a roasting oven, a burner therein, a cooking oven, a partition separatng the roastIng oven from the cooking oven, a lining of refractory material interposed between the burner and partition to be acted upon by the products of combustion from the burner flame and distribute the calories absorbed therefrom to the partition, and means to removably fasten the lining to the partition.
5. A gas range or stove comprising a roasting oven, a burner therein, a cooking oven, a partition separating the roasting oven from the cooking oven, a non-fusible lining of refractory material interposed between the burner and the partition to be acted upon by the products of combustion from the burner flame and to absorb the calories therefrom and radiate them to the partition, said partition and lining having an aperture therethrough, and a cover to close said aperture having a lining of refractory material similar to the lining of the partition, and means to removably fasten the linings to the partition cover.

No. 102,717. Vapour Lamp.
Lampc pour l’émission de vapeurs.

Landers, Frary and Clark, assignees of Alonzo Abner Warner, all of New Britain. Connecticut, U.S.A., 25th December, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,814.
Claim.-1. In a vapour lamp the combination of a lamp font with a fixed nut on the inside at the bottom of the said font,
the interior of the said nut communicating through fts lower end with the said font, a removable wick tube having a rolled thread at its lower end whereby the said lower end is both exteriorly and interiorly threaded, and a wick within the said tube bearing on the inward projections of the inner thread at the lower end of the said tube, leaving a sptral passage around the wick inside the lower end of the said passage around the wick inside the lower end of the said
tube for the fuid in the font to pass upwardly through from the lower end of ho said nut to the fluid level of the font.
2. In a vapour lamp the comblnation of a wick tube having jet nerforations at its upper end with a perforated ring mounted on the said tube below the said jet perforations for forming an annular wick chamber inside of the said ring and outside of the said wick tube, a priming wick within the sald chamber, and a shutter surrounding the wick tube and adapted to close over the said ring and jets.

\section*{No. 102,718. Mannfacture of Alnminium Hydroxide and Aluminater.}

\section*{Fabrication d'hydroxides d'aluminium et d'aluminate.}

Dr. Otto Dieffenbach, Griesheim-on-Main, Germany, 25th December, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,560.
Claim.-1. The process of manufacturing aluminium hydroxide and aluminates which consists in treating aluminiferous material with caustic alkali at atmospheric pressure and at a temperature from \(180^{\circ}\) to \(500^{\circ}\) centigrade, substantially as and for the purpose set forth.
2 The process of manufacturing aluminium hydroxide and aluminates which consists in treating the aluminiferous material with caustic alkall lye at atmospheric pressure and at a temperature of from \(180^{\circ}\) to \(500^{\circ}\) centigrade, substantially as and for the purpose set forth.
3. The process of manufacturing aluminium hydroxide and aluminates which consists in stirring aluminiferous material in a separate vessel and heating it at atmospheric pressure to a temperature from \(150^{\circ}\) to \(500^{\circ}\) centigrade and adding thereto alkali lye, as and for the purpose set forth.
4. The process of manufacturing aluminium hydroxide and aluminates which consists in stirring aluminiferous material in a separate vessel, heating it at atmospheric pressure to from \(180^{\circ}\) to \(500^{\circ}\) centigrade at atmospheric temperature, introducing into the stirred mass first as much caustic alkaline lye as will form with the aluminifersus material a stiff pulp, urging the fire until the temperature of the mass has again risen to \(180^{\circ}\) to \(500^{\circ}\) centigrade. adding then a further quantity of lye, urging again the fire and so on until the required amount of lye has been added when the contents of the vessel are further heated for some time, substantially as and for the purpose set forth.
5. The process of manufacturing aluminium hydroxide and aluminates which consists in treating aluminiferous material with caustic alkali at atmospheric pressure and at a temperature from \(180^{\circ}\) to \(500^{\circ}\) centigrade, lixiviating the melt, fltering and evaporating the aluminate lye, as and for the purpose set forth.
6. The process of manufacturing aluminium hydroxide which consists in treating aluminiferous material at atmospheric pressure and at a temperature from \(180^{\circ}\) to \(500^{\circ}\) centigrade, lixiviating the melt, fltering the aluminate lye and decomposing it by previously precipitated aluminium hydroxide, as and for the purpose set forth.

\section*{No. 102,719. Drier. Séchcur.}

The Vacumn Process Company, assignee of George Albert Cutter, Both of Boston, Massachusetts, U.S.A., 25th December, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,829.
Claim.-1. In a drying apparatus the combination with a series of drying surfaces, of feed rolls for carrying the web of material to be dried back and forth in a path adjacent to said surfaces, a feed member to engage the front portion of a web of material, and means for carrying said feed member through the machine in the path which the material is to follow in the operation.
2. In a drying apparatus the combination with a series of drying surfaces, of feed rolls for carrying the web of material to be dried back and forth in a path adjacent to said surfaces, a feed member to engage the front portion of a web of material, means for carrying said feed member through the machine in the path which the material is to follow in the operation. and means for varying the speed of movement of said feed member during its travel through the machine.
3. In a machine for drying a web of pulp the combination with a series of drying surfaces, of feed rolls to feed the material back and forth through the machine between adjacent surfaces, and means for varying the speed of different feed rolls to allow for shrinkage.
4. In a machine for drying pulp, a plurality of sections cach containing a plurality of stationary drying surfaces,

feed rolls located adjacent to the ends of said drying surfaces to feed the pulp back and forth over the same, separate driving mechanism for the feed rolls in the separate sections of the machine, and means for adjusting the speed of each driving mechanism independently of the others.
5. In a machine for drying pulp the combination with a series of drying surfaces, of feed rolls to carry the pulp back and forth over said surfaces, and a tension rolle to engage a loop of the pulp to compensate for the shrinkage thereof in drying.
6. In a machine for drying pulp the combination with a feeding member provided with driving chains at opposite sides of the machine, said feeding member being arranged to engage a web of pulp so as to carry a loop thereof, feed rolls arranged to act upon the pulp after it has been carried through the machine, and independent driving devices for said feed member and said feed rolls.
7. In a machine for drying pulp the combination with a series of stationary drying surfaces, of a feed member comprising a transverse bar arranged to engage a loop of pulp, means for causing said feed member to travel through the machine adjacent to the drying surfaces, and guides for said feed member adapted to engage each drying surface and hold the feed member out of contact therewith to prevent the loop of pulp on the feed member from being rubbed or chafed.
8. In a drying apparatus the combination with a series of drying surfaces, of feed rolls for carrying the material to be dried back and forth in a path adjacent to said surfaces, a feed member to engage a loop formed in the front portion of the material, means for carrying said feed member through the machine, and means for holding said feed member and the material thereon out of engagement with the drying surfaces.
9. In a drying apparatus the combination with a series of drying surfaces, of a feed member to engage the material to be dried and carry the same back and forth past said feed surfaces, and an endless chain to operate said member, substantially as described.
10. In a drying apparatus the combination with a series of drying surfaces, of feed rolls for carrying a web of materiap past said surfaces, a feeding device to engage the front edge of a web of material to carry the same over said feed rolls in starting the operation. and means for controlling the operation of said feeding device.

\section*{No. 102,720. Valve for Air Brakes.}

\section*{Valve pour frein a air comprimé.}

Thomas Behan. Alliquippa, Pennsylvania, U.S.A.. 25th December, 1906; 6 years. Filed 3rd December, 1906. Receipt No. \(141,765\).
Claim.-1. In a safety valve for air brakes the combination with a traln pipe of a section pipe carried by said train pipe, a plug valve revolubly mounted in said section pipe, said section of pipe having an air passage formed therein. a piston mounted in said air passage, a head carried by said piston and adapted to actuate said plug valve, sections of hose carried by said pipe and having a common connection, one section of hose being mounted within the other and forming an annular passage communicating with said air passage, substantially as described

2, In a safety valve for air brakes, the combination with 3 train pipe, of an angle cock carried by said train pipe and provided with a valve, said cock having an air passage formed therein, a piston mounted in said air passage and adapted to actuate said cock, sections of hose connecting
with said cock, and having a common connection, one section of hose being mounted within the other and forming

an annular passage adapted to communicate with said air passage, substantially as described
3. In a valve for air brakes, the combination with a traln pipe. of an angle cock carried by said pipe, and having a hose connection, a valve in said cock, said angle cock having an air passage formed thereln. a section of hose surrounding the hose connection of said cock, and forming an annular passage communicating with said air passage, and means mounted in said air passage and actuated by air entering said passage to close the valve in said cock, substantially as described.
4. In an air brake system, the combination with cocks having loose connections, and provided with valves, of hose surrounding said hose connections and forming annular air passages, and means carried by said cocks and actuated by air entering said passages to close the valves in said cocks, substantially as described.

No. 102,721. Potato Harvester.
Arracheur de pommes de terre.

Alvin F. Clarke, Edwardsville, Illinois, U.S.A., 25th December, 1906; 6 years. Filed 30th November, 1906. Receipt No. 141,695.
Claim.-1. In a potato harvester, a vertically adjustable digger carrying a frame, a vertically movable cutter carry ing frame, and a lever for the adjustment of the cutter carrying frame supported upon and connected with the adjustable digger carrying frame.
2. In a machine of the class described, a vertically adjustable digger carrying frame, elevating means permanently connected with said frame, a vertically movable cutter carrying frame, an adjustable lever fulcrumed upon.the digger carrying irame, and lugs upon the cutter carrying frame connected by a pin or roller beneath which the adjusting lever extends.
 to rotate thed.
No. 102,724. \(\begin{gathered}\text { Harness Pad Skirt. } \\ \text { Bourrelet de harnais. }\end{gathered}\)

Chicago, Illinois, U.S.A., 25th December.
Scott H. Hull, Chicago, 2rd December, 1906. Receipt No. 1906; \({ }^{6}\)
Claim.-1. In a harness having a backband, an adjustable pad skirt fixed to said backband. 2. In a harncess having a backband, a pad from said pad said backband, a skirt extension connections between said skirt and pivotal and slidin shirt extension and pad skirt,
d. In a harness, a pad skirt, a skirt extension and pivotal connections between said pad skirt and skirt extension.
4. In a harness, a pad skirt; a skirt extension and sliding connections between said pad skirt and skirt extension.
5. In a harness, a pad skirt, a skirt extension and pir otal and sliding connections between said pad skirt and skirt extension.
6. In a harness, a pad skirt formed with a slot, a skirt extension and a book on said skirt extension and sliding and pivotally mounted in said slot.
7. In a harness, a pad skirt, a skirt extension, pivotal and sliding connections between said pad skirt and skirt extension, a buckle on said skirt extension, and a billet on said pad skirt adapted to engage said buckle adjustably. 8. In a harness, a pad skirt formed of two layers of leather arranged face to face and connected, one of said layers of leather formed with a slot, a skirt extension, an engaging device on said skirt extension and extending through said slot to and between said leathers. buckle and billet connections between said extension and pad skirt and supporting devices carried by said extension.
9. In a harness, a pad skirt formed with a slot and an interior slide bearing, a skirt extension, a hook fixed to said skirt extension and a crosshead on said hook adapted for insertion through said slot into and for sliding engagement with said slide bearing.
10. In a harness, a pad skirt, a skirt extension and a connecting device composed of a stem fixed to said skirt extension, a goose neck on said stem and a crosshead on said goose neck adapted to engage said pad skirt.
11. In a harness the combination of an adjustable pad skirt comprising a plurality of members suitably connected, a billet on one member and a buckle on the other
member of sald adjustable pad skirt, a supporting device for a trace, tug or shaft carried by one member of sald adjustable pad skirt and a bellyband billet carried by the same member of the adjustable pad skirt

\section*{No. 102,725. Railway Switch.} Aiguille de chemin de fer.

Henry N. LaFlame, Waterville, Massachusetts, U.S.A., 25th December, 1906; 6 years. Filed 29th August, 1906. Receipt No. 139,062
Claim.-1. In a rallway switch, a switch stand, a semaphore standard operatively connected to throw the switch, a train operated turn post located at a distance therefrom, and operating connections between the turn-post and switch standard by means of which the standard is unlocked and turned and again locked.
2. In a rallway switch, a switch stand, a semaphore standard connected to throw the switch, a train operated turn-post at a distance therefrom. interlocking means between the switch stand and semaphore standard, and operative connections between the turn-post and standard for locking and unlocking and turning said standard.
3. In a rallway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, and means operable from a distance for throwing the standard into and out of interlocked engagement with said socket and also turning the standard and its semaphore.
4. In a railway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, and means operable from a distance for moving the standard endwise into and out of interlocked engagement with said socket and also turning the standard and its semaphore.
5. In a railway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, an oscillatory head having means to raise and lower and turn the standard and means for operating said head.
6. In a railway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, an oscillatory head having means to raise and lower and turn the standard, a train operated turn-post at a distance from the switch stand, and an operating cable connecting the turn-post and standard.
t. In a railway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, and means operated from a distance for imparting a stepped movement to the standard, imparting both vertical and axial motion thereto.
8. In a railway switch, a switch operating stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, a crosshead connected with said standard, an oscillatory head at the lower end of the standard and provided with a cam groove in which the crosshead works, and means on the oscillatory head for turning the standard axially.
9. In a railway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, an oscillatory head surrounding the lower portion of the standard and provided with a cam groove, a crosshead on the standard and working in said groove, a tappet arm projecting from the standard and a throw lever carried by the oscillatory head and co-operating with said tappet arm.
10. In a railway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with sald socket, an oscillatory head encircling said standard and provided with a cam groove, a cross head on the standard engaging said groove, a tappet arm projecting from the standard, a throw lever carried by the oscillatory head and co-operating with said tappet arm, and means for tripping the throw lever at certain points in the movement of the oscillatory head while the standard is unlocked.
11. In a rallway switch, a switch stand having a shouldered socket plate, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket plate, and a combined hasp-and-lever extension laving a pivotal connection with sald socket plate.
12. In a railway switch, a switch stand having a shouldered socket, a semaphore carrying and switch shifting standard shouldered to engage and interlock with said socket, turn posts at a distance from the switch stand, cables forming operating connections between the turn posts and standard and one or more trip levers carried by the train for operating said turn posts.

No. 102,726. Roof Flange. Bordure de toiture.

John C. Louth, Rochester, New York, U.S.A., 25th December, 1906; 6 years. Filed 1st December, 1906. Receipt No. 141,735.
Claim.-1 In a roof flange, a tapering tube having a series of hollow beads around and projecting from one of its surfaces, each bead being made in a plane corresponding to the intersection with sald tube of the plane of a roof of different pitch.
2. In a roof flange, a tapering tube having a series of beads around and projecting from its outer surface, each bead being made in a plane corresponding to the intersection with said tube of the plane of a roof of different pitch, and a recess around said tube near its top for producing a socket for packing.
3. In a roof flange, a tapering tube having a series of beads around and projecting from its outer surface, each bead being made in a plane corresponding to the intersection with sald tube of the plane of a roof of different pitch, and a plate having a perforation therethrough adapted to fit upon the upper of said beads.
4. In a roof flange, a tapering tube having a series of beads around and projecting from its outer surface, each bead being made in a plane corresponding to the intersection with said tube of the plane of a roof of different pltch, a plate having a perforation therethrough adapted to fit upon the upper of said beads, and contour lines upon said plate whereby the said plate may be cut out to fit the respective other beads.
5. In a roof flange, a tapering tube having a series of hollow beads around and projecting from one of its surfaces, each bead being made in a plane corresponding to the intersection of said tube with the plane of a roof of different pitch, and a plate having a perforation therethrough constructed to engage any one of said beads.

\section*{No. 102,7:27. Butter Packing Machine.}

Machine pour emballer le beurre.
John Maltson, Dresser Junction, Wisconsin, U.S.A., 25th December, 1906; 6 years. Filed 19th November, 1906. Receipt No. 141,335.
Claim.-1. In a press, a yieldably mounted receptacle support, a compression member in alignment therewith, an
operating means for the compression member, and a controlling device arranged under the yieldable support and

movable by engagement of the support therewith when the pressure has reached a predetermind point.
2. In a press, a yleldably mounted receptacle support. a compression member in alignment therewith, an operating means for the compression member, and a controlling device for stopping and reversing the direction of movement of the operating member, sald controlling device being arranged under the yieldable support and operable by the engagement of the support therewith.
3. In a press, a scale beam, a receptacle support connected thereto, and an operating means under the control of the scale beam.
4. In a press, a scale beam, a compression member the movement of which is transmitted to the beam, and operating means under the control of the beam.
5. In combination, a scale beam, a compression member the movement of which is resisted by the beam, and a compression member operating means under the control of the beam.
6. In combination, a scale beam, a receptacle the weight of which is imposed on the load end of the beam, a compression member for packing material in the receptacle and the movement of which is resisted by the poise end of the beam, and a compression member operating means under the control if the beam.
7. In a press, a scale beam having an adjustable poise, a compression member, a recentacle for receiving material to be acted upon by the compression member, the movement of the compression member and the weight of the receptacle and its contents being Imposed on the load end of the beam during a portion of the pressing operation, and a compression member operating means under the control of the scale beam.
8. In combination, a scale beam, a lever connected thereto, a receptacle support arranged over the lever, a plunger in the line of the support, a threaded rod carrying sald plunger, a nut engaging said threaded rod, a nut operating means, and mechanism under the control of the scale beam for determining the direction of movement of the nut.
9. The combination with a scale beam, of a yleldable receptacle support, a lever connected to the scale beam and arranged under the support. a plunger for packing material in the receptacle, a threaded rod carrying said plunger, a nut on said threaded rod, an automatic means controlled by the extent of movement of the scale beam for stopping the downward movement of the plunger when the compression has reached a predetermined stage.
10. In apparatus of the class described, a plunger, a stripper surrounding the plunger and movable therewith. the downward movement of the stripper being checked by engagement with the material being packed.
11. In apparatus of the class described, a plunger, a stripper surrounding the same and movable therewith, and means for locking the stripper for movement during the initial back stroke of the plunger.
12. In apparatus of the class described, a plunger and stripper, an operating means for effecting an initial movemena of the plunger and then a simultaneous movement of the plunger and stripper.
13. In apparatus of the class described, a plunger and stripper, means for locking the stripper from movement, and means for unlocking the stripper after initial movement of the plunger.
14. In apparatus of the class described, a plunger and stripper, a stripper locking means, a plunger operating mechanism, and means controlled by the movement of the plunger for unlocking the stripper and permitting its upward movement with the plunger.
15. The combination with an intermittently revoluble receptacle support, of a plunger, a threaded rod carrying the same, a bevel wheel the hub of which forms a unt on said threaded rod, a shaft; the bevel wheel carried thereby and intermeshing with the bevel wheel on the rod, and means controllable by the movement of the plunger for determining the stopping and direction of rotation of said shaft.
16. The combination with a revoluble receptacle support, of a plunger, a threaded rod carrying the same, a bevel wheel forming a nut on said threaded rod. a shaft having a bevel wheel intermeshing with the first bevel wheel, pulleys on the shaft, belts running over said pulleys and belt shifters controlled by the movement of the plunger in opposite directions.
17. The combination with an intermittently revoluble receptacle support, of a compression plunger, a threaded rod carrying the same, a bevel wheel forming a nut on sald rod, a shaft, the bevel gear carricd thereby and intermeshing with the bevel wheel, pulleys on said shaft, beit shifters movable on completion of the upward movement of the plunger, and means operable at the completion of the downward movement of the plunger for operating sald belt shifters.
18. The combination with a revoluble receptacle support. of a plunger, a threaded rod carrying the same. a bevel wheel mounted on the rod and forming a nut therefor. a shaft, a bevel gear carried by the shaft and intermeshing with the bevel wheels, pulleys on sald shaft, belts passing over the pulleys, a belt shifter, a lever carrying the same and operable at the completion of upward movement of the plunger. a second belt shifter, a treadle for operating the same in one direction, a locking lever for maintaining said second belt shifter in adjusted position, and means operable on downward movement of the receptacle carrier for moving said lever to released position.
10. The combination with an intermittently revoluble reerptaclo support, of a plunger, a threaded rod carrying the same, a bevel wheel forming a nut on said rod. a shaft, a bevel gear carried thereby and intermeshing with the bevel wherl, a fast pulley and a pair of loose pulleys mounted on the shaft, a pair of belts arranged to drive the pulleys, said belts running in opposite directions respectively, a pair of belt shifters engaging said belts. means tending to move the belt shifters in one direction, a locking device releasable on complete downward movement of the plunger for permitting movement of the belts to reverse the direction of rotation of the bevel wheel, a lever operable on completion of upward movement of the plunger for shifting one of the belts and a pedal actuated mechan1 sm for shifting the second belt.
21. In an apparatus of the class described, a revoluble receptacle support, a plunger, means for raising and lowering the plunger, a stripper for said plunger, a stripper carrying bar, a pawl supported thereby, a rack bar with which said pawl may engage, and means controllable by the movement of the plunger for releasing the pawl.
21. In an apparatus of the class described the combination with an intermittently revoluble receptacle support, a plunger, a threaded rod carrying the same, a revoluble nut on said rod, a vertically guided bar secured to the plunger and extending parallel with the threaded rod, a plate or irame secured to said vertically guided rod, a pawl carried by the plate, a rack bar with which said pawl may engage, a cam carried by the threaded rod and adapted to engage said pawl, said cam having a rccessed shoulder for positively engaging the threaded rod with the plate and a stripper supported by and movable with the plate.
22. The combination with an intermittently revoluble receptacle support, of a shaft carrying the same, a worm wheel on the shaft, a worm meshing with the wheel, a worm shait, a loose driving pulley arranged on the shaft and having a clutch face, a clutch member feathered to the shaft, a clutch operating lever, means for locking sald lever in clutching position, and means controlled by the revoluble movement of the receptacle support for releasing said lever.
23. The combination with a receptacle support, of a shaft carrying the same, a worm wheel on the shaft, a worm intermeshing with the worm wheel, a worm carrying shaft, a loose pulley mounted on the worm carrying shaft and having a clutch face, a clutch member feathered on the worm shaft, an operating lever engaging said clutch, a locking bar connected to the lever and having a notch, a locking lever arranged to engage said notch, means controlled by the receptacle support for moving the locking lever to released position, a pedal actuated mechanism for moving the clutch lever in one direction and a spring for moving said clutch lever in the opposite direction.
24. In an apparatus of the class described, a frame, a revoluble receptacle support comprising a plurality of yield-
able arms, a shaft to which said arms are secured, a worm wheel on said shaft, a worm intermeshing with the worm wheel, a worm carrying shaft, a loose belt wheel mounted thereon and having a clutch face, a crutching member \(f\) fathered on the worm shaft, a clutch operating lever, a spring tending to move the lever in one direction, a pedal merhanism for moving the lever in the opposite direction, a notched locking bar connected to the pedal lever, a locking lever arranged to engage in said noteh, a cam lever connected to the locking lever-and having an arm in the path of movement of the receptacle carrler, a plunger, means for operating the same, a scale beam and a lever connected to the scale beam and having a cam-shaped block arranged below the plunger and over which the receptacle carrying arms are successively moved.

No. 102,728. Collar. Col.

Hydesaburo Ohashi, New York City, New York, U.S.A., 25th December, 1906; 6 years. Filed 20th November, 1906. Receipt No. 141,360.
Claim.-1. As a new article of manufacture, a shirt collar provided at its rear with means for engagement with the shirt and with means for engagement with a coat hanger strap.
2. As a new article of manuacture, a shirt collar provided at its rear with means or engagement with a shirt and with a depending tab having openings or recesses to receive a coat hanger strap.
3. As a new article of manufacture, a shirt collar provided at its rear with means or engagement with the shirt and with depending tab having laterally projecting ears designed for engagement with the lower edge of a coat hanger strap, the collar being notched at the upper end of the tab to receive the upper edge of the strap.

No. 102,729. Washing Machine. Lessiveuse.

Adolph A. Rullman and David B. Rullman, co-inventors, both of Wattena, Kansas, U.S.A., 25th December, 1906; 6 years. Filed 30th November, 1906. Recelpt No. 141696.
Claim.-A washing machine having an angular body portion with corners which flare laterally toward their upper ends and which are slightly inwardly inclined; angular tapering members B projecting from said corners, the upper ends of said members being flush with the upper edges of the side walls of the body portion of the machine, the lower ends of said members being open and spaced a slight distance above the bottom of the body of the machine, and a pounder adapted to cause water to circulate through the perforations and ends of said members, as shown and described.

\section*{No. 102,730. Brake for Flevatora.}

Frein pour ascenceur.

Frederick Williams, Minersville, Pennsylvania, U.S.A., 25th December, 1906; 6 years. Filed 30th November, 1906. Receipt No. 141,670.
Claim.-1. In a safety brake mechanism for elevator cars or mine cages, the combination with a shaft structure provided with stationary brake members, of a car having sliding catches to engage said brake members, sets of bell crank levers having long and short arms divergently arranged and plvoted at their angle of intersection upon the car, links connecting the short arms of the levers with the sllding catches, connections between the long arms of the levers and hoisting rope to hold the levers from movement, and normally expanded springs held expanded by the levers and adapted when the levers are released upon the breakage of the hoisting rope to contract and project the catches.
2. In a safety brake mechanism for elevator cars or mine cages, the combination with a shaft structure provided with stationary brake members, of a head beam forming part of the car structure, brackets upon the ends of the head beam and provided with guides, sliding catches operating in said guides and adapted when projected to engage the adjacent stationary members, a central bracket upon the beam, sets of bell crank levers pivoted to said central bracket, said levers having divergently arranged upper long and lower short arms, the latter being pivotally connected with the catches, restraining connections between the long arms of the levers and the hoisting rope, and contractile springs connected with the end brackets and catches to project said catches when the levers are freed from movement by the breakage of the holsting rope.
3. In a safety brake mechanism for elevator cars or mine cages, the combination with a shaft structure provided with stationary brake members, of a head beam forming part of the car structure, sliding catches mounted upon said beams to engage said stationary brake members, contractile springs associated with said catches to project same, bell crank levers connected with catches to normally hold the same retracted and the springs expanded, and connections between sald levers and the hoisting rope for normally holding the levers in restraining position.
4. In a safety brake mechanism for elevator cars or mine cages, the combination with a shaft structure provided with stationaity brake members, of a head beam forming part of the car structure, brackets upon the ends of the head beam and provided with guides, sliding catches operating in said guides and adapted when projected to engage the adjacent stationary members, sets of bell crank levers pivotally mounted unon the beam between the brackets and levers having divergently arranged upper long and lower short arms, the latter being pivotally connected with the catches, restraining connections between the long arms of the levers and the hoisting rope, and contractile springs connected with the end brackets and catches to project said catches when the levers are free for movement by the breakage of the hoisting roye.

No. 102,731. Rail Joint. Assemblage pour rails.
George W. Whitman and Ernest Decker, assignee of a half interest, both of Pleasantonville, Kansas, U.S.A., 25th December, 1906; 6 years. Filed 26th September, 1906. Receipt No. 139,800.

Claim.-In a device of the class described the combination of the rails 1 , the angle bars at opposite sides of the rails and having the vertical portions \(a\) of said angle bars in contact with the under sides of the head portions of the adjacent rails 1, said vertical portions a being provided with the cut-away portions 13 extending downwardly from
their upper edges, the cut-away portions 13 being located upon opposite sides of the point at which the ends of the

rails mect and forming clearance spaces between the upper edge portions of the angle bars and the head portions of the rails, and bond wires it having their ends passing through the cut-away portions 13 of the angle bars and attached to the sides of the rails, for the purpose set forth.

No. 102,732. Draft Regulator for Furnaces. Régulateur d'air pour fournaise.

Peter Furlong, assignee of Gregory H. Scharf, co-inventors, both of Ypsilanti, Michigan, U.S.A., 25th December, 1906; 6 years. Filed 3rd December, 1906. Receipt No. 141,784.
Claim.-1. In a draft regulator for furnaces the combination of a valve or damper, means for operating the same in one direction, and a controlling device for operating the same in the reverse direction, comprising a cylinder. a plunger therein, a reservoir below the cylinder, ports permitting the fluid in the reservoir to pass into the cylinder as the plunger is lifted, and a restricted outlet from the lower part of the cylinder leading to at or near the lower end of the reservoir. for the purpose described.
2 . In a draft regulator for furnaces the combination of a valve or damper, means for operating the same in one direclion, and a timing device for controlling the reverse movement thereof comprising a cylinder, a plunger therein connected to the valve or damper, a reservoir below the cylinder, a restricted outlet from the cylinder to the reservoir, and a comparatively large inlet into the cylinder from the reservoir, a check valve controlling the same, and an air vent passage leading from the upper end of the cylinder into the reservoir.
3. In a draft regulator the combination of a valve or damper. of a controller therefor comprising a cylinder provided with a pipe \(N\), a plunger therein connected to the valve or lamper for controlling the movement of the same in one direction, a valve controlled exit from the lower end of the cylinder to the pipe \(N\), forming the exit pipe from said valve controlled exit, and a strainer in said outlet pipe.
4. In a draft regulator the combination of a valve or damper, means for operating the same in one direction, and a timing device for controlling the reverse movement thereof comprising a cylinder, a plunger therein connected to the valve or damper, a reservoir below the cylinder and a restricted outlet connection from the cylinder to the reservoir, a comparatively large inlet connection from the reservoir to the cylinder, a chick valve controlling the same and external means for opening said check valve to permit the escape of the fluid beneath the planger, to more rapidly control the opening of the valve or damper.
5. In a draft regulator the combination with the valve or damper, of means for operating the same in one direction, a timing device for controlling the reverse movement thereof comprising a cylinder, a plunger therein connected to the valve or damper, a reservoir below the cylinder, a restricled discharge from the lower end of the cylinder into the reservoir, means responsive to the upward movement of the plunger for establishing free communication between the reservoir and the cylinder and manually operable means adapted to control the aforesaid means to establish free communication between the cylinder and the reservolr.
6. In a furnace regulator the combination with a furnace
oor, means for opening the damper by the opening of the door, means for opening the damper by the opening of the door, and timing means for controlling the closing of the damper, a casing \(P^{1}\) around the damper opening, the damper N fitling on said casing, the ball \(P\) connected to the damper and the inclined bearing \(Q\) on which said damper slides in its open position.
7. In a draft regulator for furnaces the combination with a timing means, of a door, a ball pivoted on said door, a damper pivoted to said bail, and cannections between sald damper and said timing means, for the purpose described.
8. In a draft regulator the combination of a valve or damper, a controller therefor comprising a cylinder and a plunger therein connected to the valve or damper for controlling the movement of the same in one direction, a reservoir communicating with the cylinder, and a strainer arranged to purify the reservoir contents.
9 In a draft regulator for furnaces the combination of the furnace door. a damper operated in one direction by the opening of the door, a controlling plunger lifted by the opening of the door, a connection from the plunger to the damper to control the reverse operation thereof, a cylinder in which the plunger operates and a reservoir operably connected thereto.

No. 102,733. Conveyer. Transmetteur.

Isaac Peabody, St. Mary's, New Brunswick, Canada, Frank Allen Peabody and Robert Tweedie Peabody. both of Houlton, Maine, U.S.A., each an assignee of \({ }^{2}\) third interest, 25 th December, 1906; 6 years. Filed 28 th November, 1906. Receipt No. 142,639.
C'laim.-1. A conveyer belt comprising a plurality of parallel slats each having a metal strap extending across its base at each end thereof and having the ends of said straps bent to form loops and terminating in recesses in tho sides of the slats, and means connecting the loops of adjacent straps, thus securing the slats together.
2. A conveyer belt comprising a plurality of parallel slats substantially triangular in cross section, each hav ing a metal strap extending across its base at each end thereof, and having the ends of said straps bent to form loops and terminating in recesses in the sides of the slats and links connecting the loops of adjacent straps, thus securing the slats together.
3. In combination a slat for use in conveyer belts, a metal strap extending across one side of said slot and secured thereto by forcing its extremities into the opposite side of the slat, the portions of said strap adjacent its 'nds constituting means whereby one slat may be secured to the next one.
4. A conveyer belt comprising a plurality of paralle! slats substantially triangular in cross section, each having a metal strap extending across the base and secured thereto by bending its ends to form loops and forcing its extremities into the faces of the slat opposite said base. whereby no additional securing means is necessary and a link connecting the loop of each strap with that of the strap on the next adjacent slat.

No. 102,734. Railway Tie. Dormant de chemin de for.

Zachary T. Booth, James F. Bittle and Christian Smith, each an assignee of a third of the interest, all of Brunswick, Maryland, U.S.A., 25th December, 1906; 6 years. Filed 30th November, 1906. Receipt No. 141,700. Claim.-1. A metal railroad tie comprising a bottom and side walls integral with each other, blocks located between the side walls and a plurality of fenders integral with the bottom of the tie and extending up vertically to hold the ballast in place within the tie when either block is removed, substantially as and for the purpose described.
2. A metal railroad tie comprising a bottom and side walls integral with each other, blocks located between the side walls, vertically extending fenders abutting against. the inner ends of the blocks and clamping supports having downwardly extending ends to embrace the side walls of the tie and having lugs with elongated openings thereIn for suitable spikes or like fastening means to hold the rails on the supports, substantially as and for the purpose set forth.

No. 102,735. Draft Gear for Railway Cars.
\(\Delta p p a r c i l\) de traction à frottement pour wagons de chemins de fer.

The W. H. Miner Company, assignee of Frederick B. Townsend, all of Chicago, Illinois, U.S.A., 25th December, 1906; 6 years. Filed 3rd December, 1906. Receipt No. 141,783.
Claim.-1. In a friction draft rigging the combination with a drawbar and a drawbar strap or yoke, of a sliding friction shell or casing having a friction chamber and interior friction laces parallel with the drawbar, and a spring chamber of larger size or diameter than the friction chamber, sliding friction blocks within the friction chamber of said shell or casing having exterior iriction faces parallel and in sliding frictional engagement with said interior friction faces of said shell or casing, a wedge or device for spreading said blocks and a spring in the spring chamber of said sholl or casing, said friction shell or chamber having an opening in one of its sides for insertion and removal of the spring, the walls of said friction chamber being thicker and stronger

12-86
than the walls of said spring chamber, substantially as specifled.
2. In a friction draft rigging the combination with a drawbar and a draw bar strap or yoke, of a sliding friction shell or casing having a friction chamber and interior friction faces parallel with the drawbar and a spring chamber of larger size or diameter than the friction chamber, sliding friction blocks within the friction chamber of said shell or casing having exterior friction faces parallel to and in sliding frictional engagement with said interior frictional faces of sald shell or casing, a wedge or device for spreading said blocks and a spring in the spring chamber of said shell or casing, said spring being of larger size or diameter than the friction chamber, said friction shell or casing having an opening in one of its sides for insertion and removal of the spring the walls of said friction chamber being thicker and stronger than the walls of the spring chamber, substantially as specified.
3. In a friction draft rigging the combination with a car frame furnished with front and rear stops, of a draw bar and draw bar yoke or extension, a follower abutting against ons of said stops on the car frame, a sliding friction shell or casing abutting at one end against the other stop on the car frame, and having a friction chamber, and a spring chamber of larger size than the friction chamber, said sliding friction shell having interior friction faces parallel to the draw bar and said friction blocks having exterior friction faces parallej to and in frictional engagement with said interior friction faces of said friction shell or casing, sliding friction blocks in said friction chamber, a wedge for spreading said blocks and a spring, said friction shell or casing having a lateral opening for insertion and removal of the spring, the walls of said friction chamber beling thicker and stronger than the walls of said spring chamber, substantially as specified.
4. In a friction draft rigging the combination with a car frame furnished with front and rear stops, of a drawbar and drawbar yoke or extension, a follower ahutting against one of said stops on the car frame, a sliding friction shell or casing abutting at one end against the other stop on the car frame and having a friction chamber, and a spring chamber of larger size than the friction chamber, sliding friction blocks in said friction chamber, said sliding friction shell having interior friction faces parallel to the drawbar and said friction blocks having exterior friction faces parallel to and in frictional engagement with said interior friction faces of said friction shell or casing, a pair of wedges for spreading said blocks and a spring, said sliding friction shell or casing having a lateral opening through one of its sides for insertion and removal of the spring, the walls of said friction chamber being thicker and stronger than the walls of said spring chamber substantially as specifled.
5. In a friction draft rigging the combination with a drawbar and a draw-bar strap or yoke, of a sliding friction shell or casing having a friction chamber and a spring chamber and furnished with a lateral opening into the spring chamber for insertion and removal of the spring, sllding friction blocks in the friction chamber, said sliding friction shell having interior friction faces parallel to the draw-bar, and said friction blocks having exterior friction faces parallel to and in frictional engagement with sald interior friction faces of said friction shell or casing, and a spring in the spring chamber, the walls of said friction chamber being thicker and stronger than the walls of said spring chamber, substantlally as specifled.

No. 102,736. Milking Machine. Machine de trairo.

D. H. Burrell and Company, assignee of Loomis Burrell, both of Little Falls, New York, U.S.A., 25th December, 1906; 6 years. Filed 3rd December, 1906. Receipt No. 147,777.
Claim.-1. In a milking machine the combination of a receiving pail having milk compartments arranged side by
side and a milking mechanism mounted on said pail and provided with means for milking two cows simultaneously, said milking mechanism having two separate milk passages, each opening into one of said compartments, substantially as set forth.
2. In a milking machine the combination of a receiving pail having muk compartments arranged side by side and 0 . milking mechanism mounted on said pail and provided with means for milking two cows simultaneously, said milling mechanism comprising a pulsator valve having two separate milk passages, each opening into one of said compartments, substantially as set forth.
3. In a milking machine the combination of a receiving pail having an upright partition dividing the pail into two compartments, and a pulsator valve arranged above said partition and provided with separate milk passages, opening into the pail on opposite sides of said partition, substantially as set forth.
4. In a milking marhine the combination of a receiving pail having an upright partition dividing the pail into two compartments, an upright pulsator cylinder arranged above said partition and a vertically movable pulsafor piston arranged in said cylinder and provided with separate milk ports on opposite sides of said partition, substantially as set forth.
5 In a milking machine the combination of a recelving pail having milk compartments arranged side by side and a separate discharge spout for each compartment, and a milking mechanism mounted on said pail and provided with means for milking two cows simultaneously and with separate milk passages, one for each compartment, substantially as set forth.
6. In a milking machine the combination of a receiving pail having an upright partition dividing the pail into two compartments and having discharge spouts on opposite sides of said partition, and a pulsator mechanism mounted on said pail and having separate milk passages opening into said pail on opposite sides of said partition, substantially as set forth.
7. In a milking machine the combination of a receiving pail having an upright partition dividing the pail into two compartments and having discharge spouts arranged side by side on the same side of the pail near the top thereof and on opposite sides of said partition, and means for delivering the mill from two cows separately into the pail on oppsite sides of said partition, substantially as set forth.

No 202,737. Apparatus for Heating or Cooling Liquids.
Appareil pour le chauffage et le refroidissement des liquides.

D. H. Burrell \& Company, assignee of Harvey Feldmeier, both of Little Falls, New York, U.S.A., 25th December, 1906; 6 years. Filed 3rd December, 1906. Receipt No. 141,778.
Claim.-1. An apparatus for heating and cooling liquids comprising a vat, an oscillating coil arranged within the same, and a supplemental stirrer which oscillates with the coil and projects below the same, substantially as set forth.
2. The combination of a vat, an oscillating coil arranged therein, and a supplementary stirrer mounted to move eccentrically with reference to the coil, substantially as set forth.
3. The combination with a vat having a concave inner surface, an oscillating coil mounted to move eccentrically to said surface, and a supplementary stirrer mounted to move concentrically to said surface, substantially as set iorth.
4. The combination of a vat having a concave inner surface, horizontal bearings arranged above said vat and eccentric to its inner surface, an oscillating coil having trunnions which are journalled in said bearings, and a supplemental stirrer which is pivotally mounted concentric with said surface, substantially as set forth.
5. The combination of a vat having a concave inner surface, horizontal bearings arranged eccentrically to said surface, an oscillating coil having trunnions which are journalled in said bearings, and a supplementary stirrer oscillating on an axis which is arranged lower than said bearings, substantially as set forth.
6. The combination of a vat having a concave inner surface, horizontal bearings arranged eccentrically to said surface, an oscillating coil having trunnions which are journalled in said bearings, a supplementary stirrer mounted on an axis eccentric to said bearings, and means on said coil for moving said stirrer, substantially as set forth.
7. The combination of a vat having a concave inner surface, horizontal bearings arranged eccentrically to said surface, an oscillating coil having trunnions which are journalled in said bearings, a supplementary stirrer, a pivotal support for the same arranged concentric to said concave surface, and means on said coil for moving said stirrer back and forth with the coil, substantially as set forth.
8. The combination of a vat having a concave inner surface, horizontal bearings arranged eccentrically to said surface, an oscillating coil having trunnions which are journalled in said bearings, a supplementary stirrer, a cover on said vat, and a pivotal support for said stirrer secured to said cover and arranged concentric with said concave surface, substantially as set forth.
9. The combination of a vat having a concave inner surface, horizontal bearings arranged eccentrically to said surface, an oscillating coll having trunnions which are journalled in said bearings, a supplementary stirrer, a cover on said vat, a pivotal support for satd stirrer secured to said cover and arranged concentric with said concave surface, and means on said coil for oscillating said stirrer, substantially as set forth.
10. The combination of a vat provided with horizontal bearings and an oscillating coil having trunnions which are journalled in said bearings and having longitudinal circulating pipes which are arranged in groups on opposite sides of its longitudinal central plane, the groups of pipes diverging further downwardly from their outermost point, set forth.
11. The combination of a vat provided with horizontal bearings and an oscillating coil having trunnions which are journalled in said bearings and having longitudinal circulating pipes which are arranged in groups on opposite sides of its longitudinal central plane, the groups of pipes first diverging downwardly from the trunnions and then converging further downwardly from their outermost point, substantially as set forth.
12. The combination of a vat having bearings, and an oscillating coil comprising trunnions journalled in said bearings, chambered heads connected with said trunnions, and longitudinal circulating pipes connecting the chambers of said heads, substantially as set forth.
13. The combination of a vat having bearings, and an oscillating coil comprising trunnions journalled in said beafings, a chambered head connecting with the inlet trunnion, a chambered head connected with the outlet trunnion, longitudinal circulating pipes connecting the chambers of said heads, and a horizontal outlet pipe extending from the lower chamber of the inlet head to the outlet head and connected with the outlet trunnion, substantially as set forth.
No. 102,738. Refrigerator. Réfrigérateur.

The Chatham Motor Car Company, assignee of John Joseph Holmes, both of Chatham, Ontario, Canada, 25th December, 1906; 6 years. Filed 17th April, 1906. Receipt No. 131,798 .
Claim.-1. In a pump for refrigerating machipe, an afternating valve chamber, a cylinder communicating there-
with, a piston in said cylinder, a number of grooved bull rings in said piston, and a corresponding number of piston rings placed in the grooves between the bull rings, substantially as and for the purpose set forth.
2. In a pump for refrigerating machine, a cylinder, communication with an alternating valve chamber, a valve cage, having a number of holes communicating with the discharge port and containing a discharge valve and guide, the said guide forming a cushion chamber for the said discharge valve, substantially as and for the purpose specified.
3. In a pump for refrigerating machinc. a cylindor communicating with an attending valve chamber, a valve cage communicating with the discharge port and containing a discharge valve, guide and. cushion chamber, a suction valve, working in guides inside of the discharge valve. work said discharge valve alternately with said discharge valve. substantially as set forth.
4. In a pump for refrigerating machines, a cylinder communicating with an alternating valve chamber, a valve cage containing the alternative, valves, guides and cushion chamber, a flexible rubber sheave guide ring and compression springs. substantially as and for the purposes set forth.
5. In a pump for refrigerating machines, a cylinder, a piston in said cylinder, a number of grooved bull rings on said piston, and a corresponding number of piston rings placed in the grooves between the hull rings. the said cylinder communicating with an alternating valve chamber, a valve cage containing the alternating valves. guides and cushion chamber, a flexible rubber sleeve, guide. ring and compression springs, substantially as and for the purpose specified

No. 102,739. Apparatus for Separating and Refining Graphite.
Appareil pour la séparation et le raflnage du graphite.

James Francis Latimer and William Henry Matthews, both of Toronto, Ontario, Canada, 25th December, 1906, 6 years. Filed 18th January, 1906. Recetpt No. 131,979.
Claim.-1. An apparatus of the class described comprising a vessel provided with a funnel-shaped bottom having a controlled discharge opening at the apex thereof, a screen of suitable mesh supported within said vessel, a hollow shaft extending down into said vessel and having its end opening below said screen and directly above said discharge opening whereby water is introduced into said apparatis below said screen, and means secured to said hollow shaft and operated above said screen by the rotation of said shaft so as to create a centrifugal force so as to divide the graphite or similar substance from the rocky matter or gangue passed into said vessel.
2. An apparatus of the class described, comprising a vessel provided with a funnel-shaped bottom and having a controlled discharge opening at the apex thereof, and provided at its top with a discharge opening, a deflecting plate leading towards said discharge opening, and a screen of suitable mesh supported within said vessel, and a hollow shaft extending down into said vessel and having its end opening below said screen, suitable supports for said hollow shaft, and paddles secured to said hollow shaft and operating above said screen by the rotation of said shaft so as to create a centrifugal force so as to divide the graphite or similar substance from the rocky matter or gangue passed into the said vessel, the deflecting plate causing the senarated graphite or similar substance to pass out of said vessel through the discharge opening.
S. An apparatus of the class described comprising a vessel provided with a funnel-shaped bottom and having a controlled discharge opening at the apex thereof, and provided at its top with a discharge opening, a deflecting plate leading towards said discharge opening, and a screen of suitable mesh supported within said vessel, and a hollow shaft extending down into said vessel and having its end opening below said screen, suitable supports for said hollow shaft, and adjustable paddles secured to said hollow shaft and operating above said screen by the rotation of said shaft so as to create a centrifugal force so as to divide the graphite or similar substance from the rocky matter or gangue passed into the said vessel, the deflecting plate causing the separated graphite or similar substance to pass out of said vessel through the discharge opening.
4. The combination with an apparatus of the class described comprising a vessel provided with a funnel-shaped bottom and having a controlled discharge opening at the apex thercof, of a conduit held within said vessel and directly above the discharge opening in the apex of said funnel-shaped bottom.
5. In an apparatus of the class described the combination with a vessel provided with a funnel-shaped bottom and having a controlled discharge opening at the apex thereof, and a screen of suitable mesh supported within said vessel. a pipe or conduit for introducing water into said vessel below said screen, means operating within said vessel and above said screen so as to create a centrifugal force so as to divide the graphite or similar substance from the rocky matter or gangue passed into said vessel, of a second vessel held at an inclined angle and provided at its higher end with a freely open discharge opening. and provided at the lower end with a controlled discharge opening, a shaft mounted therein, a plurality of paddles or blades attached to said shaft and at a suitable angle so as to break up and work the mass of graphite or similar substance passed into said vessel at its lower end from said first-mentioned vessel, and force them out of said freely open discharge opening, means for introducing water into the higher end of said second-mentioned vessel. and a screen of suitable mesh placed over said controlled discharge opening.
6. In an apparatus of the class described, the combination with. a vessel provided with a funnel-shaped bottom and having a controlled discharge opening at the apex thereof, and provided at its top with a discharge opening. a deflecting plate leading towards said discharge opening. and a screen of suitable mesh supported within said vessel, a pipe or conduit for introducing water into said vessel below said screen, means operating within said vessel and above sald screen so as to create a centrifugal force so as to divide the graphite or similar substance from the rocky matter or ganguc nassed into the said vessel. the deflecting plate causing the separated graphite or similar substance to pass out of said vessel through the discharge opening, of a second yessel held at an inclined angle and provided at its higher end with a frcoly open discharge opening. and provided at the lower end with a controlled discharge onening, a shaft mounted therein. a plurality of paddles or blades attached to said shaft and at a suitable angle so as to break up and work the mass of granhite or similar substance passed into said vessel at its lower end from said first-mentioned vessel, and force them out of said freely onen discharge opening, means for introducing water into the higher end of said second-mentioned vessel. and a screen of suitable mesh placed over sald controlled discharge onening.

\section*{No. 102,740. Process of Separating and Refining Graphite.}

Procéde pour la séparation et le rafinage du graphite.
James Francis Latimer and William Henry Matthews, both of Toronto. Ontario, Canada, 25th December, 1906; 6 years. Filed 19th January. 1906. Receipt No. 132,006.
Claim.-1. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in thoroughly mixing the pulverized rocky matter or gangue with oil, then thinning it with water, and then subjecting the mass to the action of a centrifugal force in a vessel containing water and over a foraminate partition, recovering the graphite, the rocky matter or gangue with water passing away.
2. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in thoroughly mixing the pulverized rocky matter or gangue with oil, then thinning it with water, and then subjecting the mass to the action of a centrifugal force in a vessel containing water and over a foraminate partition. recovering the graphite, the rocky matter or gangue with water nassing away, and then working the recovered ofl provided graphite or similar substance in a stream of water so as to refine it.
3. The process of separating graphite and similar substances from their rocky matter or gangue, which consists

first in thoroughly mixing the pulverized rocky mater or gangue with oil, then thinning it with water, and then subjecting the mass to the action of a centrifugal force in a vessel containing water and over a foraminate partition, recovering the graphite, the rocky matter or gangue with water passing away then working the recovered oil provided graphite or similar substance in a stream of water so as to refine it, and then recovering the oil from said oil provided graphite or similar substance.
4. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in mixing the pulverized rocky matter or gangue with oil, then passing it into a body of water subjected to the action of a centrifugal force and above a foraminate partition which is impervious to the commingled oil and graphite but pervious to the water and gangue, maintaining a downward current of water through that body of the mixture below said foraminate partition and deflecting portion of this current causing it to pass upward through said for aminate partition, removing the residuum from below said foraminate partition, and recovering the graphite.
5. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in thoroughly mixing the pulverized rocky matter or gangue with oil, then passing it into a body of water subjected to the action of a centrifugal force and above a foraminate partition which is impervious to the commingled oil and graphite, but pervious to the water and gangue, maintaining a downward current of water through that body of the mixture below said foraminate partition and deflecting portion of this current causing it to pass upward through said foraminate partition, removing the residuum from below said foraminate partition, and recovering the graphite, and then working the recovered oil provided graphite or similar substance in a stream of water so as to refine it.
6. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in thoroughly mixing the pulverized rocky matter or gangue with oil, then passing it into a body of water subjected to the action of a centrifugal force and above a foraminate partition which is impervious to the commingled oil and graphite, but pervious to the water and gangue, maintaining a downward current of water through that body of the mixture below said foraminate partition and deflecting portion of this current causing it to pass upward through said foraminate partition, removing the residuum from below said foraminate partition, and recovering the graphite, then working the recovered oil provided graphite or similar substance in a stream of water so as to refine it, and then recovering the oil from said oil provided graphite or similar substance.
7. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in thoroughly mixing the pulverized rocky matter or gangue with oil, then thinning it with water, then passing it into a body of water subjected to the action of a centrifugal force and above a foraminate partition which is impervious to the commingled oil and graphite, but pervious to the water and gangue, maintaining a downward current of water through that body of the mixtune below said foraminate partition and deflecting portion of this current causing it to pass upward through said foraminate partition, removing the residuum from below said foraminate partition, and recovering the graphite.
8. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in thoroughly mixing the pulverized rocky matter or gangue with oil, then thinning it with water, then passing it into a body of water subjected to the action of a centrifugal force and above a foraminate partition which is impervious to the commingled oil and graphite, but previous to the water and gangue, maintaining a downward current of water through that body of the mixture below said foraminate partition and deflecting portion of this current causing it to pass upward through said foraminate partition, removing the residuum from below said foraminate partition, and recovering the graphite, and then working the recovered oil provided graphite or similar substance in a stream of water so as to refine it.
9. The process of separating graphite and similar substances from their rocky matter or gangue, which consists first in thoroughly mixing the pulverized rocky matter or sangue with oil, then thinning it with water, then passing it into a body of water subjected to the action of a centrifugal force and above a foraminate partition which is impervious to the commingled oil and graphite, but pervious to the water and gangue, maintaining a downward current of water through that body of the mixture below said foraminate partition and deflecting portion of this current causing it to pass upward through said foraminate partition, removing the residuum from below said foraminate partition, and recovering the graphite, then working the recovered oll provided graphite or similar substance in a stream of water so as to refine it, and then recovering the oil from said oil provided graphite or similar substance.
10. The process of separating graphite and similar substances from rocky matter and gangue, consisting in mingling the crushed ore with oil, delivering the oil provided mass to, and maintaining it in, an upflowing current of water, centrifugally agitating the mass to separate the components and so accelerate the current as to carry the oll provided graphite to the top of the water, flowing the so separated graphite away, settling the gangue through a current of reduced speed below the zone in which the material is fed and agitated, and removing said gangue by a downwardly flowing current.
11. The process of separating graphite and similar substances from rocky matter and gangue, consisting in mingling the crushed ore with oil, delivering the oil provided mass to and maintaining it in, an upflowing current of water, centrifugal agitating the mass to separate the components and so accelerate the current as to carry the oil provided graphite to the top of the water, flowing the so separated graphite away, settling the gangue through an upflowing current of reduced speed below the zone in which the material is fed and agitated, and removing said gangue by a downwardly flowing current.
12. The process of separating graphite and similar substances from rocky matter and gangue, consisting in ming. ling the crushed ore with oil, delivering the oil provided mass to, and maintaining it in, an upflowing current of water, centrifugally agitating the mass to separate the components and so accelerate the current as to carry the oil provided graphice to the top of the water, flowing the so separated graphite away, settling the gangue through an upflowing current of reduced speed below the zone in which the material is \(f \in d\) and agitated, and removing said ganguc, below the zone in which the material is fed and agitated, by a downwardly flowing current of greater speed than said upflowing current of reduced speed.

No. 102,741. Valve. Valve.
The Star Brass Manufacturing Company, assignee of Charles Frederick Fernald, all of Boston, Massachusetts, U.S.A., 25th December, 1906; 6 years. Filed 10th November, 1906. Receipt No. 141,089.
Claim.-1. A valve of the character specified having a valve casing with inlet and outlet passages inside the same, a partition separating said passages having therein a port or opening connecting the passages, a main valve controlling said port or opening, a piston larger than said valve, a piston rod connecting said valve with the piston, a cylinder casing for containing said piston, means for closing the end of said cylinder casing, means whereby pressure from the inlet passage may be obtained on both sides of said piston, a passage through said piston, piston rod and main valve providing outlet from the chamber in the rear thereof into the outlet passage, a valve for controlling said passage, and means for controlling said valve from a point outside the valve casing.
2. A valve of the character specified having pressure inlet and outlet passages, a main valve controlling said passages. a piston, a piston rod connecting the same with the mainvalve, a chamber on either side of said piston in communi-
cation with the pressure inlet passage, a vent passage for the chamber in the rear of the piston and leading through

the same and also through the piston rod and main valve into the pressure outlet passage, an auxiliary valve normally seated inside said vent passage for controlling the same, and means for operating said valve.
3. A valve of the character specified having pressure inlet and outlet passages, a main valve controlling said passages, a piston, a piston rod connecting the same with the main valve, a chamber on either side of said piston in communication with the pressure inlet passage, a vent passage for the chamber in the rear of the piston leading through the same and also through the piston rod and main valve into the pressure outlet passage, an auxiliary valve normally scated inside said vent passage for controlling the same, and a rod connecting with said valve and extending forward to a point outside the valve casing, whereby said auxiliary valvo may be operated.
4. A valve of the character specified having pressure inlet and outlet passages, a main valve controlling said passages, a valve stem extending forward from said main valve having bearings in the side of the valve casing. a piston larger than said valve, a piston rod connecting said piston and valve, a casing containing said piston forming a chamber on either side thereof in communication with the pressure inlet passage, means for exhausting the chamber in the rear of said piston, whereby the piston may become overbalanced to operate the main valve, the same comprising a vent passage leading out of said chamber through the piston, thence through the piston rod and main valve to exit into the pressure outlet passage, an auxiliary valve contained within the piston rod for controlling said vent passage, and a rod connecting with said valve and extending through the valve stem to project through the wall of the casing.
5. A valve of the character specified having pressure inlet and outlet passages, a main valve between said passages. a piston connecting with said main valve, a chamber formed on elther side thereof in communication with the pressure inlet passage, a vent passage leading out of one chamber through the piston and communicating with the pressure outlet passage, an auxiliary valve in said vent passage for controlling the same, a compression spring also inside said vent passage holding said valve normally seated, and means for controlling said auxiliary valve from a point outside the valve casing.
6. A valve of the character specified having a casing and inside the same a main valve controlling inlet and outlet passages, a piston located inside said casing with chambers on either side thereof, a niston rod connceting said main valve with said piston the interior of which rod is made chambered, connceting at one end with the chamber in the rear of this piston and at the other end with an exhaust passage therefrom, and which rod also has passages leading into the chambered interior thereof by which the pressuro may pass into and through the same to the chamber back of the piston, an auxiliary valve in said chambered passage for controlling said cxhaust from said chambered passage for controlling the pressure passing into the same.
7. A valve of the character specified having a casing and inside the same a main valve controlling inlet and outlet passages, a stem extending from said main valve, a piston locater inside said casing with chambers on eilher side thereoi, a piston rod connecting said main valve and piston. the interior of which rod is made chambered, connecting at one end with the chamber in the rear of the piston and
at the other end with an exhaust passage therefrom and which rod also has passages leading from the pressure inlet into the chambered interior thereof by which the pressure may pass through the same to the chamber back of the piston, an auxiliary valve in said chambered passage for controlling said exhaust from said chamber back of the piston, means operatable with and by said valve for controlling the passages entering into the chambered interior of ald piston, and a stem secured to said auxiliary valve and extending through the stem of said main valve to a point outside the valve casing.
8. A valve of the character specifled having a casing anl inside the same a main valve controlling inlet and outlet passages, a piston located inside said casing with chambers on either side therof, a piston rod connecting said main valve with said piston, which rod is made chambered, the chamberedinterior therest connecting at one end with the chamber in the rear of the piston and at its other end with an exhaust passago connecting with the outlet passage of the valve, and which rod also has passages extending through the same into the chambered interior thereof by Which the pressure may pass from the chamber forward of the piston or the inlet passage to the chamber back of the piston, an auxiliary valve located inside said chambered passage for controlling said exhaust, means for extraneously operating said valve, means for keeping the valve normally seated, and sliding gate also located inside the chambered interior of the rod, attached to and movable with sald auxiliary valve for closing the passage leading into the chambered interior of the rod at and during the time of the exhaustion of the chamber in the rear of the piston.
9. A valve of the character specified having a casing and inside the same a main valve controlling inlet and outlet passages, a piston located inside said casing with chambers on either side thereof, a piston rod connecting sald main valve with said piston, which rod is made chambered, the chambered interior thereof connecting at one end with the chamber in the rear of the piston and at its other end with an exhaust passage connecting with the outlet passage of the valve, and which rod also has passages extending through the same into the chambered interior thereof by which the pressure may pass from the chamber forward of the piston or the inlet passage to the chamber back of the piston, an auxiliary valve \(C\) located inside said chambered passage for controlling said exhaust, having agate \(\mathrm{C}^{1}\) secured thereto, which gate is adanted to slide in said chambared passage, means for extrancously operating said valve and sliding gate, and means comprising a compression spring within said chambered passage for holding sald auxiliary valve normally seated.

No. 102,742. Holder for Roll Paper Binder Strips. Porte rouleau pour papier cn bandes.

Edwin C. Eldcr, Orange, New Jersey, and George W. Herbert, assignee of a half interest, New York City, New York, both in U.S.A., 25th December, 1906; 6 years. Filed 4th August, 1906. Receipt No, 138,420.
Claint-1. In a device of the character described, the combination of a support designed to receive a roll of gummed tape or the like, a rescrvoir carried by said support and provided with a moistening device, a guide frame for the tape as it passes from the roll to the moistening device, means for rocking said guide frame as the taye is withdrawn therefrom, and means positively actuated from said frame for presenting fresh surfaces of the moistening device to the tape.
2. In a device of the character described, the combination of a support for a roll of gummed tape, a well or reservoir, a moistening band designed to turn in said reservoir, a rocker frame through which the tape is designed to pass to the moistener, and means whereby the rocking of sald frame will effect the movement of the moistening band, as and for the purpose set forth.
3. In a device of the character described, the combination of a support for a roll of gummed tape, a rescrvoir, a travelling moistening band mounted in said reservoir, a rocker frame provided with rollers around which a tape is designed to pass towards the moistening band, means whereby a pull of the taje will effect the rocking of said frame, and a connection between said frame and moistening band, said connection embodying an intermittently operating device for moving said band.
4. In a device of the character described, the combination of a support for a roll of gummed tape, a well or reservoir, a band mounted in said reservoir, a rocker frame provided with rollers around which paper is designed to pass towards the moistening band, a roller carrying said band and provided with a ratchet, and a pawl carriex by said rocker frame and arranged for engagement with said ratchet, as and for the purpose set forth.

5 . In a device of the character deseribed, the combination of a frame for a roll of gummed tane, a well or reservoir mounted thereon and provided at its upper end with a studded roller, a moistening band suspended from said roller. and means for imparting an intermittent motion to said roller.
6. In a device of the character described, the combination of a support for a roll of gummed tane, a well or reservoir, a rocker frame mounted to ride in said support, and designed to guide the tape to the moistening device, the frame being so arranged that when the tape is pulled upon to unwind it, it will rock the said frame. and a knife carried by said frame and arranged to be carried towards the tape when the later is rocked.
7. In a device of the character described, the combination of a support for a roll of gummed tape, moistening mechanism carried by said support. a frame mounted to rock in said support and provided with rollers around which the lape is designed to pass, the said frame being so arranged that when the paper is drawn from the roll, it will rock the forward end of said frame downward, and a knife carried by the forward end of said frame.
8. In a device of the character described, the combination of a support for a roll of gummed tape, a reservoir detachably connected to said support, a mnistening band vertically disposed in said reservoir, a roller mounted in said reservoir and suspended from said band, said roller being provided with a ratchet, a rocker frame designed to direct the paper to said moistening band, a crank operated pawl carried by said frame into intermittent operative engagement with said ratchet, and a knife carried at one end of said frame.
9. In a device of the character described, the combination of a support for a roll of gummed tape, moistening mechanism carried by said support, a pivoted rocker frame carried by said support and comprising two spaced apart \(U\) shaped members, upper and lower rollers 19 and 20 journalled between said members at one side of their pivot, a guide plate 21 at the ends of said members on the same side of said pivot. two horizontally aligned rollers 22 mounted between said members at the other side of the pivot, a knife carried by said members at their other ends, and a ratchet and pawl device designed to actuate the moistening mechanism when the said frame is rocked.

\section*{No. 102,743. Telegraphic Apparatus. \\ Appareil télégraphique.}

James Tarbolton, Armstrong and Alex. Orling, co-inventors, both of London, England, 25th December, 1906; 6 years. Filed 5th January, 1903. Receipt No. 101,891.
Claim.-1. In an apparatus for transmitting electric impulses, the combination of conductors constituting an electric circuit with earth connections, and means for producing low tension currents and high potential discharges toing low thersion currents and substantially, as set forth.
2. Transmitting apparatus consisting of conductors constituting an electric circuit, earth connections therewith, and means for producing low tension currents and high potential discharges through the same in combination with a distant receiver provided with earth connections cutting tho lines of current flow through the earth at points of different potential, permitting some of the transmitted energy to flow through them and actuate the recelver, substantially as set forth.
3. A source of electric energy, a self inductance coil or coils, an interrupter, a circuit closing key and conductors making circuit through said devices, in combination with ground connections from said circuit at points on each side of the saj interrupter, substantially as set forth.
4. A source of electric energy, a self inductance coil or coils. an interrupter, a circuit closing key and conductor making cirucit through these devices, in comblation with ground connections from said circult at points on each side of the interrupter, and a condenser or equivalent means for preventing sparking at the interrupter, substantially as set forth.
5. A source of electric energy, a self Inductance coll or coil:. an interrupter located in an exhausted chamber, a circuit closing key and conductor making circuit through theso devices, in combination with ground connections from said circult at points on each side of the interrupter. substantially as set forth.
f. In transmitting apparatus the combination of electric conductors constituting a divided circuit with a source of elcetric cenergy, a circuit closing key. a self inductance coil or coils in each branch of said circuit. a vibrating armature to make and break sald circuit alternately through cach branch, ground connections from said circuit at points on earh side of said circuit making and breaking devices and condensers in shunt thereto. substantlally as set forth.
i. In a transmitting apparatus the combination of electric conductors constituting a divided circuit with a source of electric energy, a circuit closing key, a self inductance coil or coils in each branch of sald circuit. a vibrating wrdge-shaped armature to make and break said circuit alternately through each branch, said armature being carried by a spring mounted on an adiustable slide. and adapt0 to co-operate with adjustable contacts. ground connections from saict circuit at points on each side of said circult making and breaking deviees and condensers in shunt thereto. substantially as set forth.
8. A source of electric energy. a self Inductance coil or coils, an interrupter, a circuit clos ing key, conductor making circuit through these devices, a condenser in shunt to the interrupter, ground connections from s aid circuit at points on each side of said interrupter, and a secondary winding to said inductance coil or colls connected in shunt at such points through a spark gap, condenser or equivalent device, substantially as set forth.
g. In combination with a receiver having two earth connections adapted to cut the lines of transmitted current flow at points of different potential, transmitting apparatus comprising electric circuit conductors, a source of electric energy, a self inductance coil or colls, and a key, earth connections from said circuit at two or more points. and an interrupter whereby extra currents are induced and discharged into the earth periodically with the battery current, whereby lines of current flow are propagated whose presence may be detected by the distant receiver, substantially as set forth.
10. In receiving apparatus the combination of a telephone receiver with means for producing a flame in proximity thereto, a conductor in proximity to said frame, and a relay \(i_{11}\) circuit with said conductor, the said apparatus being provided with two earth connections adapted to cut the lines of transmitted current flow at points of different potential, and the resistance of the said conductor varying with the vibrations of the flame which are caused by th vibrations of the diaphragm, substantially as set forth.
11. The receiving apparatus provided with a local circuit including a relay, a sensitive flame arranged in proximity to tho said circuit to vary its resistance with the vibrations oi the flame, and means responsive to transmilted electrical impuises for communicating vibrations to said flame, the said apparatus being provided with two earth connections adapted to cut the lines of transmitted current flow at points of different potential, substantially as set forth.

\section*{No. 102,744. Wire Fence Making Machine.}

\section*{Machine it fabriquer des cloturcs on fil de fer.}

Daniel F. Anthony, Tecumseh. Michigan. U.S.A., 25th December. 1906; 6 years. Filed 10th March, 1906. Receipt No. 134,046 .
Claim.-1. In a feed mechanism for wire fence machmes the combination of a revoluble wire support and a clamp-
ing member thereon rotatable about an axis radial to and parallel with the plane of movement of the support, and adapted normally to engage and grip the wire.

2. In a feed mechanism for wire fence machines the combination with a revoluble wire support, of a clamping member thereon rotatable about an axis radial to and parallel with the plane of movement of the support, and adapted normally to engage and grip the wire, and means for periodically disengaging the clamp during a determined period in the rotation of the support.
3. In a feed mechanism for wire fence machines the combination of a rotary disc having a channelled periphery to receive the fence wire, of a plurality of radially arranged spring pressed clamp members thereon mounted for rotary movement on an axis radial to and parallel with the disc and adapted to normally engage and grip the wire, and a cam in the path of the clamps adapted to successively disengage the latter at a point in rotation to the disc.
4. In a wire fence machine the combination with a drive shaft, of a shaft driven thereby an adjustably variable parial rotation at each rotation of said drive shaft, a plurality of wire supports bearing clamping members and carried by said driven shaft, a reel adapted to receive the finished feuce, and a shaft ther for.
5. In a wire fence machne the combination with a drive shaft, of a shaft driven thrreby an adjustably variable partial rotation to each rotation of said drive shaft, a plurality of wire supports bearing clamping members and carried by said drivin shaft, a reel adapted to receive the finished fence, a shaft the:pfor, and a friction drive connection between said shaft and said driven shaft.
6. In a wire fence machine the combination with a drive shaft, of a shaft driven thereby an adjustably variable partial revolution at each rotation of said drive shaft, a plurality of revoluble wire supports mounted on said driven shaft, clamping members mounted to rotate radially to the place of movement of said supports and adapted normally to engage and grip the wire, a recl adapted to receive the finished fence, a shaft therefor, and a friction drive connection between said shaft and said driven shaft for regulating the winding tension of the material on said reel.

No. 102,745. Wire Fence Making Machine.
Machine d fabriquer des colôtures en fil de fer.

John S. Barnes, Detroit, MichLgan, U.S.A., 25th December, 1906; 6 years Filed 8th October, 1906. Receipt No. 140,135..

Claim.-1. In a wire fence machine, means for putting an extended section of the line wires of a fence under tension, said means consisting of devices for gripping the line wires at one end and provided with means for producing a drag-
ging grip on the opposite end of the extended section, the construction being such as to permit the passage of wire to relieve the increasing strain caused by twisting the strands together, and means for twisting said strands together throughout the length of said extended section between and around the pickets, substantially as described.
2. In a wire fence machinc, means for gripping one end of the line wires of an extended section of fence consisting of a rocking cam roll journalled in the frame of the machine, means for rocking said cam roll, springs housed below sald rocking cam roll in the frame of the machine, the construction being such that the line wires pass between said springs and the rocking cam whereby said cam when partially rotated will grip said wires between the cam and the springs, substantially as described.
3. In a wire fence machine, means for gripping one end of the line wires consisting of a rocking cam roll journalled in the frame of the machine, means for rocking said cam roll, springs housed in the frame of the machine below said rocking cam roll adapted for lateral adjustment, the construction being such that said springs may be set so that the line wires may pass between said springs and the rocking cam whereby said cam when partially rotated will grip said wires between the cam and the springs, substantially as described.
4. In a wire fence machine, means for putting an extended section of the line wires of the fence under tension, said means consisting of devices for gripping the line wires at one end and providing a dragying grip on the opposite end of an extended section, a reciprocating carriage adapted to travel the length of said extended section provided with t.wisting gears for twisting the strands of the line wires together and around the pickets, driving gears for operating said twisting gears and also the reciprocating carriage, substantially as described.
5. In a wire fence machine, means for putting an extended section of the line wires of the fence under tension, consisting of devices for securely gripping the line wires at one end and provided with means for producing a dragging grip on the opposite end of an extended section, a reciprocating carriage on which are mounted twisting gears designed to twist the strands forming the lateral wires together, suitable driving gears to operate the twisting gears and to control the movement of said carriage, substantially as described.
6. In a wire fence machine, a reciprocating carriage on which are mounted twisting gears for twisting together the strands between and around the pickets of the fence, and means for determining the distance between pickets in said twisted section, said means being adjustable to adapt it for varying conditions, substantially as described.
7. In a wire fence machine, a reciprocating carriage on which are mounted twisting gears for twisting the strands of the line wires together between and around the pickets of the fence, means for reversing the direction of the twist betwien alternate pickets, and adjustable means for regulating the distance twisted between pickets, said means consisting of a movable stop secured to a gear driven by the driving gear, the construction being such that the movement of the gear will cause the stop to come in contact with the driving gear, thus stopping the rotation of the twisting gears and indicating the predetermined distance between pickets, substantially as described.
8. In a wire fence machine, a reciprocating carriage on which are mounted twisting gears for twisting together the strands forming the line wires of the fence, the construction being such that the gearing operating the twisting gears will control the travel of the carriage, means for stopping the movement of the twisting gears when the strands are twisted a predetermined distance between pickets consisting of an adjustable stop secured to one of the operating gears aranged to limit the movement of said gear in any one direction, substantially as described.
9. In a wire fence machine, a reciprocating carriage on which are mounted twisting gears to twist together the strands forming the line wires of the fence, the construction being such that the movement of said carriage will be regulated by the predetermined travel of the twisting gears, means for reversing the direction of the twist between alternate pickets, and means for regulating the number of times said strands are twisted together between pickets and the distance from one picket to the next, substantially as described.
10. In a wire fence machine, means for putting an extended section of the line wires of the fence under tension consisting of a gripping device at one end and a tension device at the other end of the extended section, a travelling carriage designed to reciprocate between the ends of said extended section of line wires, said carriage provided with twisting gears through which the strands of the line wires pass, suitable gearing meshing with said twisting gears and operated through a driving gear meshing with rack bars over which the carriage travels, and means consisting of a
suitable clutch mechanism for throwing the driving gear in or out of engagement, substantially as described.
11. In a wire fence machine, means for putting an extended section of the line wires of the fence under tension, consisting of devices for gripping the line wires at each end of the extended section, a reciprocating carriage adapted to travel the length of said extended section on which are mounted twisting gears for twisting the strands forming the line wires of the fence together between and around the pickets, said twisting gears operated by means of gearing engaging a rack mounted on the frame of the machine, the construction being such that the movement of the carriage along the rack is controlled by the predetermined travel of the twisting gears, substantially as described.
12. In a wire fence machine, a reciprocating carriage on which are mounted the twisting gears for twisting together the strands forming the line wires of the fence, means for holding the line wires under tension by suitable gripping devices forming part of the machine, an auxiliary carriage mounted on said travelling carriage having a comb between the teeth of which the strands of the line wires pass, said auxiliary carriage mounted on a rack and onerated by a pinion meshing with the rack on the frame of the machine and controlled by a suitable operating lever. substantially as described.
13. In a wire fence machine, means for gripping an extended length of the strands constituting the line wires of the fence, said means consisting of devices for gripping the line wires at one end and provided with means for producing a dragging grip on the opposite end of the extended section, adjustable means for twisting said strands together from picket to picket, the construction being such that the twist may be regulated to the distance between pickets and the gauges of wire employed, substantially as described.
14. In a wire fence machine in which an extended length of the lateral wires of the fence are placed under tension between the wind-up or bundling drum and the feed wire rolls of the machine, an extensible frame for said machine, whereby any predetermined length of wire may be put under tension, a reciprocating carriage on which are mounted twisting gears to twist togother the strands undor tension to form the line wires of the fence, substantially as described.
15. In a wire fence machine designed to hold extended lengths of wire strands under tension while twisting them together to form the line wires of the fence, means for producing a dragging grip on the strands of wires, the construction being such that when it becomes necessary to change the distance between the line wires they may be adjusted laterally without re-threading the machine, substantially as described.
16. In a wire fence machine designed to hold an extended section of the strands forming the line wires of the fence under tension, means for producing a dragging grip consisting of two bars mounted in adjacent relation between which the strands of the line wires pass, said bars suitably mounted whereby they may be given a rocking movement producing a dragging grip on the wires, the construction being such that the strands forming the line wires may be given a lateral adjustment without re-threading the machine, substantíally as described.
17. In a wire fence machine designed to hold an extended section of the strands forming the line wires of the fence under tension, means for producing a dragging grip on the line wires consisting of two bars mounted in adjacent relation and capable of adjustment with respect to each other between which the wires pass, said bars suitably mounted whereby they may be given a rocking movement producing a dragging grip on the wires, substantially as described.
18. In a wire fence machine, means for twisting the strands forming the line wires of the fence together consisting of suitable gears mounted in hangers adjustable with respect to each other whereby the line wires of the fence may be located nearer to or farther apart as required without re-threading the machine, substantially as described.
19. In a wire fence machine, adjustable hangers, a twisting gear mounted in each hanger, a driving gear for each twisting gear mounted in each hanger keyed to the driving shaft but free to move laterally along the same for purposes of adjustment, and said driving shaft, substantially as described.
20. In a wire fence machine, means for placing and holding the strands of wire constituting an extended section of the line wires of the fence under tension, said means consisting of devices for gripping the line wires at one end and provided with means for producing a dragging grip on the opposite end of the extended section, means for twisting said strands together from picket to picket inserted between the said strands while under tension, and means for bundling the finished product after the tension on the for bunde wires is released, substantially as described.
21. In a wire fence machine, means for gripping and patting under tension an extended length of the strands constituting the line wires of the fence, said means consisting of devices for gripping the line wires at one end and provided with means for producing a dragging grip on the opposite end of the extended section, means for twisting said strands together from picket to picket, means for reversing the direction of the twist given to sald strands between each alternate picket, and means for bundling the finished product when released by the tension mechanism, substantially as described.
22. In a wire fence machine, means located between the wind-up or building drum and the feed wire reels of the machine for putting an extended section of the line wires under tension, said means consisting of devices for securing tho line wires at one end and providing a dragging grip on the opposite end of the extended section, a reciprocating carriago on which are twisted gears to twist together the strands forming the line wires of the fence, and means for reversing the twist between alternate pickets, substantially as described.
23. In a wire fence machine in which an extended length of the lateral wires of the fence are placed under tension between the wind-up or building drum and the feed wire reels of the machine, an extensible frame for said machine whereby any predetermined length of wire may be put under tension, a reciprocating carriage on which are mounted twisted gears to twist together the strands under tension to form the line wires of the fence, substantially as described.
24. In a wire fence machine, means other than the bundling drum for putting an extended length of the strands composing the line wires of the fence under tension, means for twisting the strands together between pickets, and a suitable bundling mechanism for rolling up the finished product after being released by said tension mechanism, substantially as described.

No. 102,746. Hotel Cabinet.
Cabinet d'hôtel.

John Q. Adams, Omaha, Nebraska, U.S.A., 25th December, 1906: 6 years. Filed 4th September, 1906. Recelpt No. 139,227.
Claim.-1. An hotel cabinet comprising a base portion having a plurality of receptacles therein, a vertically arranged panel at the rear thereof having a surrounding frame grooved at the inner front edge thereof and flanged and braced at the rear, a plurality of receptacles supported behind said panel, a panel supported at the rear of said receptacles and extending upwardly therefrom and having a frame grooved at its front edge and flanged and braced at the rear edge, glass fronts arranged in said grooved front edges of the panels, and suitable adpertising matter arranged behind said glass fronts, as and for the purpose specified.
2. An hotel cabinet comprising a base portion having a plurality of receptacles and an outwardly extending portion containing an ink well, a plurality of panels arranged in tíers and receptacles arranged between said tiers and extending downwardly behind the first tier, said panels having surrounding frames formed at their front edges in substantially S-shape and flanged and braced at the rear, glass fronts arranged in said front edges and advertising matter arranged behind said glass fronts, as and for the purpose specified.
3. An hotel cabinet formed of a sheet metal frame having tiers of panels partially surrounded by a substantially S-shaped formation in said metal and flange formation to the rear of said \(S\)-shape said panels having glass fronts and

an open end for the insertion of advertising matter, a stationary receptacle centrally arranged at the foot of the upper tier of panels and sundry receptacles to each side thereof, and a base portion at the foot of the lower tier of panel having receptacles containing ink well, call bell and sundries, as and for the purpose specified.

\section*{No. 102,747. Cushion for Bicycles.}

Consxin pour birycles.

George Arlington Bennet, Winnipeg, Manitoba, Canada, 25th December, 1906; 6 years. Filed 22nd August, 1904. Receipt No. 117,915.
Claim.-In an air cushion device for bicycles, a cylinder formed of an upper section open at its lower end and provided with interior projections near said open end, a lower section open at its upper end and provided with longitudinal grooves corresponding to the projections of the upper section said groove extending into bayonet joint grooves terminating near the open end and means for connecting said cylinder section to a bicycle frame, in combination with a pneumatic cushion fitting into said cylinder and having the portion of its walls lying near the meeting ends of the cylinder section thickened and means for inflating saict cushion, substantially as described.

No. 102,748. Catter Blade. Lame de compoir.

Paul Franklin Bolton, Scarboro, Ontario, Canada, 25th December. 1906; 6 years. Filed 5th November, 1906. Receipt No. 140,928.
Claim.-1. As a new article of manufacture, inter-related cutter blades one of which has cutter blades of equal width, spaced equal distances apart and the other of which has cutter blades spaced equal distances apart and of unequal width.
2. In apparatus for cutting interlocking tongues and grooves the combination with a facing cutter blade comprising a body provided with a series of cutters separated by spaces, and a syace wider than the space between said series of cutters, at one end of said cutter blade, and two spaces, wider than the space between said series of cutters, at the other end of said cutter blade, and separated from each other by a cutter blade, of an inter-related base cutter blade comprising a body provided with a series of cutters separated by spaces, and a cutter wider than the said series of cutters at one end of said cutter blade, and two cutters wider than the said series of cutters at the other end of said cutter blade, and separated from each other by a space.

34 A cutter blade for grooving lumber having a wide cutter at one end and two wide cutters, of equal width to the first-named cutter, at the other end and a series of narrower intermediate cutters, all the cutters being spaced apart an distance equal to the width of said intermediate cutters.
4. In an apparatus for cutting interlocking tongues and grooves in lumber, the combination of two bitdes inter-related in the production of an article, one cutter blade having a plurality of teeth of equal width and an additional tooth equal in width to one of said plurality of teeth but differently spaced, the other cutter blade having a plurality of teeth of equal width spaced equal distances apart and a plurality of teeth of greater width than the first-named teeth, and spaced apart the same distance as the spacing of the first-named teeth.

No. 102,749. Machine for Stripping Tobacco. Machine pour effeuiller le tabac.

George Robert Gross, Detroit, Michigan, U.S.A., 25th December, 1906; 6 years. Filed 17th September, 1906 . Receipt No. 139,571.
Claim.-1. In a tobacco stripping machine the use of a revolving knife grooved in its periphery lying between two revolving dises which drive the knife by friction and a compressible washer separating said dises.
2. In a tobacco stripping machine the combination with a revolving grooved knife, of a pair of discs driving the said knife by friction, a pair of endless belts situate contiguously to the said dises respectively and driven upon rollers.
3. In a tobacco stripping machine the combination with a revolving knife grooved in its periphery, of a pair of discs driving the said knife by friction, and a pointed guide adapted to engage in the grooved knife.
4. In a tobacco stripping machine the combination with a revolving knife grooved in its periphery, of a pair of discs driving the same by friction, an upper guide with a point adapted to engage the groove in the revolving knife and a lower guide adapted to substantially fill the space between the two discs.
5. In a tobaces stripping machine the combination with a revolving knife grooved in its periphery, a pair of dises driving the same by friction and a pair of belts situate one on either side of the revolving knife, a pointed guide adapted to engage in the groove of the revolving knife and a lower guide with point projecting between the discs.
6. In a tobacco stripping machine the combination with a revolving knife in its periphery, of a pair of discs driving the same by friction and a guide with a point adapted to engage in the groove in the revolving knife and having a pair of shoulders situate in relation thereto in a horizontal plane and a flange situate radially with the said discs.
7. In a tobacco stripping machine the combination with \(u\) revolving knife grooved in its periphery, of an upper guide having a point adapted to engage in the groove in the revolving knife, a pair of discs driving the said knife by friction and a lower guide projecting between the said discs.
8. In a tobacco stripping machine the combination with a revolving knife grooved in its periphery, of a pair of discs driving the same by friction, an upper guide with a point adapted to engage in the groove in the said knife, and having shoulders situate relatively in a horizontal plane and a flange situate radially with the said discs and a lower guide projecting the said discs and having a pair of shoulders impinging on the circumference of the said discs.
9. In a tobacco stripping machine the combination with a revolving knife grooved in its periphery, of a pair of discs driving the same by friction, an upper guide with a point adapted to engage in the groove if the said knife and having shoulders situate relatively in a horizontal plane and a flange projecting between the said discs and having a pair of shoulders impinging on the circumference of the said discs, and a pair of endiess belts situate one on each side of the revolving knife acting as carriers for the leaf and a bar adjustable to change the tension of the belts and having adjustable collars attached thereto to act as guldes for the belts.
10. In a tobacco stripping machine the combination with a revolving knife grooved in its periphery, of a pair of discs driving the same by friction, an upper guide with a point adapted to engage in the groove of the said knife, and having shoulders suitate relatively in a horizontal plane and a flange situate radially with the said discs and a lower guide projecting between the sald discs and naving a pair of shoulders impinging on the circumference of the said discs, and a pair of endless belts situate one on each side of the revolving knife acting as carriers for the leat and a bar adjustable to change the tension of the belts and having adjustable collars attached thereto to act as guides for the belts, and a sliding clutch attached to the main shaft driving the said discs adapted to engage with the hub of the driving pulley so as to allow of throwing the discs in and out of operation and means for operating same.
11. In a tobacco stripping machine the combination with a revolving knife grooved in its periphery, of a pair of disos irictionally driving the same and a pair of endless belts upon rollers acting as carriers, an upper guide having a point adapted to engage in the groove of the said knife and a pair of removable rollers resting upon the said endless belts and tending by their weight to press out and smooth the leaf carried by the said belts.

\section*{No. 102,750. Artificial Fuel. Combustible artifciel.}

Anthon Vlastimil Hassman, Elkhart, Indiana, U.S.A., 25th December, 1906; 6 years. Filed 25th November, 1905. Receipt No. 130,441.
Claim.-A fuel containing the following ingredients in the proportions stated, to wit : carbonaceous matter, 1490 pounds; clay, 484 pounđs; lime, 5 pounds; chloride of lime, 1 pound; sodium chloride, 3 pounds; potassium chloride, 1 pound; potassium permanganate, is pounds: potassium nitrate, \(\frac{1}{2}\) pound; colophony or resin, 10 pounds; caustic soda, \(2 \frac{1}{2}\) pounds; linseed oil or its equivalent, \(1 \frac{1}{2}\) pounds; alum, 3 pounds.

No. 102,751. China Kiln. Four it porcrlaine.

Julius C. Hinz, Detroit, Michigan, U.S.A., 25th December, 1906; 6 years. Filed 12th November, 1906. Receipt No. 141,125.
Claim.-1. In a china kiln, the combination with the base portion containing the combustion chamber and having flue passages communicating therewith, of the superstructure mounted upon the base portion consisting of interchangeable blocks having inwardly extending members, and relatively thin tile pieces removably seated between said members to form one side of the flue passage ways leading from the combustion chamber, said thin tile pieces forming collectively the walls of the oven.
2. In a china kiln, the combination of a base having a combuation chamber and flue openings leading therefrom, of a superstructure consisting of tile blocks supported upon said base having projecting members, which together with the body of the blocks form three sides of the flue passages,
thin, flat tiles removably interposed between said members to form the fourth side of said filue passages, said removable tiles and said members forming the walls of the oven.
3. A china kiln having a wall with vertical flues, said wall consisting of blocks of tile provided with inwardly projecting members and relatively thin removable tiles supported between said projecting members to form the inner side of the vertical flues in said wall.
4. A tile block for china kilns having inwardly projecting members provided with vertical grooves therein and relatively thin tiles seated in said grooves to form one of the walls of a flue, the remaining walls of the flue being formed by said inwardly projecting members and the body portion of the block.

No. 102,752. Apparatus for Burning Cement.
Appareil à brûler le ciment.

Thomas Matthew Morgan, Longue Pointe, Quebec, Canada, 25th December, 1906; 6 years. Filed 6th February 1906. Receipt No. 132,654.
Claim.-1. A method of burning cement which consists in injecting a quantity of inflammable gas into a revolving cylinder, and imparting a swirling motion to said gas by means of a fet of air or steam discharge across the mouth of the cylinder.
2. A method of burning cement which consists in injecting inflammable material into a revolving cylinder, igniting said inflammable material at the mouth of the cylinder, and imparting to the flame of combustion a swirling motion by means of a pressure jet discharged across the mouth of said cylinder.
3. A method of burning cement which consists in injecting a stream of gas or finely powdered coal into a revolving kiln, igniting said stream at the mouth of the kiln, and imparting to the flame of combustion a swirling or revolving motion by discharging jets of compressed air or steam across the mouth of the cylinder at right angles to the inflow of gas.
4. A method of burning cement which consists in injecting a stream of inflammable gas into a revolving cylinder, igniting said gas at the mouth of the cylinder, and discharging a jet of compressed air or steam downwardly across the mouth of said cylinder at right angles to the infiow of gas but out of the line of impact with said gas, to thereby prevent cold air from entering the cylinder from below, and to impart a swirling motion to the flame of combustion.
5. A method of burning cement which consists in injecting a quantity of inflammable material into a revolving cylinder, and imparting a circumferentially revolving motion to said gas by means of a jet of air or steam discharged across the mouth of said cylinder.
6. A method of burning cement which consists in injecting a stream of inflammable material into a revolving cylinder. igniting said material at the mouth of the cylinder, and imparting to the flume of combustion a circumferentially revolving motion by means of a jet of air or steam discharged across the mouth of the cylinder at right angles to the inflow of gas but out of the line of impact with said gas. 7. In a cement kiln, a revolving cylinder, means for injecting inflammable material into one end of sald cylinder. and means, independent of said injecting means, for imparting a revolving motion to the flame of combustion.
8. In a cement kiln, an inclined revolving cylinder, means for discharging a stream of inflammable gas into said cylinder, means for dlscharging a stream of steam or compressed air downwardly across the mouth of said cylinder to thereby prevent cold air entering from beneath the aflasder, and to impart a swiring motion to the inflammalo gas.

No. 102,753. Machine for Making Wooden Tooth Picks.
Machine pour faire des cure-dents en bois.

John H. Nute, Portland Maine, U.S.A., 25th December, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,015.
claim.-1. In a machine for cutting tooth picks from veneer the combination with an oscillating plate, and means for feeding the veneer across the same, of a rotating cutter head, cuitters thereon adjusted to shear against the edge of the plate in its two extreme oscllated positions and means for oscillating the plate and rotating the cutter head, as and for the purpose specifled.
2. In a machine for cutting tooth picks from veneer the combination with an oscillating plate and means for feeding the material across the same, of a shear blade secured to the edge of the plate to a rotating cutter head cutters thereon, adjusted to shear against the shear blade on tho edge of the plate when the said plate is in its two extreme oscillated positions, means for oscillating the plate and rotating the head, as and for the purpose specified.
3. In a machine for cutting tooth picks from vencer the combination with an oscillating plate and means for feedIng the material across the same, of a rotating cutter head, cutters thereon adjusted to shear against the edge of the plate in its two extreme oscillated positions, means for rotating the head and means operated by the rotation of the head for oscillating the plate, as and for the purpose specifled.
4. In a machine for cutting tooth picks from veneer the combination of an oscillating plate and means for feeding the material across the same, of a rotating cutter \(h\) ?ad, outters thereon adjusted to shear against the edge of the plate in its two oscillated positions, a shaft supporting the cutter head, means for supporting the shaft, an eccentric thereon, connecting means extending between the eccentric and the plate whereby the rotation of the eccentric oscillates the plate, as and for the purpose specifled.
5. In a machine for cutting tooth picks from veneer the combination with an oscillating plate, means for feeding the material across the same of a shear blade on the end of said plate, a rotating cutter head, cutters adjustably held thereon, and arranged to shear against the shear blade on the plate in its two extreme oscillated positions, a shaft supporting the cutter head, means for supporting the shaft, an ececntric on the shaft, an arm secured to the plate and connecting means extending between the ececntric and the arm whereby rotation of the ecentric reciprocates the arm, as and for the purpose specified.

\section*{No. 102,754. Manufacture of Iron. \\ Preparation du for.}

Otto Thiel, Luitpoldstrasse No. 1 Landstuhl, Rhenish, Palatinate, Germany, 25th December, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135,468.
Claim.-1. In the manufacture of iron forming a slag
layer containing oxide of iron upon the surface of an iron
bath maintaining the slag and iron in a llquid state and reducing the iron from the slag by means of a reducing material whereupon the reduced iron is directly absorbed by the iron bath.
2. In the manufacture of iron applying a molten slag layerlayer containing oxide of iron upon the surface of an iron bath maintaining the slag and iron in a liquid state and reducing the iron from the slag by means of a reducing material whereupon the reduced iron is directly absorbed by the iron bath.
3. In the manufacture of iron forming a slag layer containing oxide of Iron upon the surface of an iron bath maintaining the slag and iron in a liquid state and reducing the iron from the slag by injecting reducing material into the molten slag whereupon the reduced iron is directly absorbed by the iron bath.
4. In the manufacture of iron forming a slag layer containing oxide of iron upon the surface of an iron bath maintaining the slag and iron in a liquid state and reducing the iron from the slag by blowing in powdered reducing material into the molten slag whereupon the reduced iron is directly absorbed by the iron bath.

No. 102,755. Safety Envelope. Enveloppe de sureté.

Robert William Vail, New York City, New York, U.S.A., 25th December, 1906; 6 years. Filed 4th July, 1906. Receipt No. 137,523.
Claim.-1. An improved safety envelope of the class described, having its back sheet and sealing flap provided with openings adapted to relatively register, and provided with a plate or strip carried at the inner side of the back sheet and having projections extending through said openings and adapted to be enclosed within the mass of a plastic sealing material and with means for securing said plate or strip to the back sheet, substantially as and for the purposo set forth.
2. An improved safety envelope of the class described. provided with a plate or strip carried by the envelope and having openings and projections, the envelope having openings through which said projections extend beyond the exterior surface and are adapted to be enclosed within the mass of a plastic sealing material, and having a strip of absorbent material underlying said plate and adapted to be adhesively engaged by said plastic material, substantially as and for the purpose set forth.
3. An improved safety envelope of the class described. provided with a plate or strip carried by the envelope and having openings and projections, the envelope having openings through which sald projections extend beyond the exterior surface and are adapted to be enclosed within the mass of a plastic sealing material, and having a strip of absorbent material underlying said plate and securing the same in connection with the envelope and adapted to be adhesively engaged by sald plastlc material, substantailly as and for the purpose set forth.
4. An improved safety envelope of the class described provided with a plate or etrip carried by the envelope, and having openings and projectlons, the envelope having openings through which said projections extend beyond the exterior surface and are adapted to be enclosed within the mass of a plastic sealing material, and having a strip underlying said plate and its openings and securing the plate in connection with the envelope and adapted to be engaged by said plastic material, substantially as and for the purpose set forth.
5. An improved safety envelope of the class described, provided with a plate or strip carried by the back sheet and having openings and projections, and provided with openings in the sealing flap through which said projections extend and are adapted to be enclosed within the mass of a plastic sealing material and with an absorbent strip secured to the back sheet and underlying said plate and its openings and adapted to be adhesively engaged by said plastic material, substantially as and for the purpose set forth.
6. An improved safety envelope of the class described. having its back sheet and sealing flap provided with openings, and provided with a plate or strip carried at the inner side of the back sheet and having openings and projections extending through the openings in the back sheet and sealing flap and adapted to be enclosed within the mass of a plastic sealing material and with a strip of absorbent material secured to the back sheet and underlying said plate and-its openings and securing the plate in position and adapted to be adhesively engaged by said plastic material, substantially as and for the purpose set forth.
7. An improved safety envelope of the class described, provided with a plate or strip having openings and profections, and having a strip of absorbent material underlying said plate and its openings, the envelope having openings through which the projections of the plate extend and are adapted to be enclosed within the mass of a plastic sealing material and which permit the passage of said sealing material to adhesive engagement with said absorbent strip, substantially as and for the purpose set forth.
8. An improved safety envelope of the class described, having openings, and provided with a plate or strip underlying said openings and having openings and projections extending through said envelope openings and with a strip of absorbent material underlying said plate and its openings, whereby the mass of a plastic sealing material is adapted to enclose said projections at the outer surface of the envelope and adhesively engage said absorbent strip, substantially as and for the purpose set forth.

ITo. 102,756. Tharbine. Turbinc.

William Arthur Waddell, Wellington, New Zealand, 25 th December, 1906; 6 years. Filed 10th October, 1906. Recelpt No. 140,195.
Claim.-1. The improved turbine engine comprising a number of helical channels or grooves arranged concentrically one outside the other, and fixed within a cylinder mounted so as to be free to revolve, such channels being in communication with each other in such a manner as to form a continuous passage through them all, means for admitting motive power fluid alternatively to the inner or outer end of such passage, and for conveying it away therefrom, and blades secured radially within the channels, and so disposed and arranged as to present obstructions to the passage of the fluid, substantially as specified.
2. The improved turbine engine, comprising a spindle, a ring secured around said spindle and provided with a helical channel extending lengthwise of said ring and open at both ends thereof, and blades secured within the channel aforesaid.
3. The improved turbine engine, comprising a rotatable cylindrical member provided with a helical groove extending lengthwise of said member and having a supply opening and an exit opening, blades secured within said groove, and a cylinder secured around and closing the groove of the cylindrical member aforesaid.
4. The improved turbine engine, comprising a rotatable cylindrical member provided with a helical channel extending lengthwise of said member and having a supply opening and a discharge opening, blades secured within the channel aforesaid, and a rotatable member driven by that first-mentioned.
5. The improved turbine engine, comprising a rotatable cylindrical member provided with a helical channel extending lengthwise of said member and having a supply opening and a discharge opening, and blades secured radially within the channels and arranged in rows at reverse angles to each other across the width thereof
6. The improved turbine engine, comprising a rotatable cylindrical member provided with a helical channel extend-
ing lengthwise of said member and having a supply opening and a discharge opening, connections for supplying motive power fluid to either opening of the channel, blades secured within the channel aforesaid, and a rotatable member driven by that first-mentioned.
7. The improved turbine engine, comprising a spindle, a number of rings secured, one outside the other, concentrically around the spindle, a helical channel formed in and extending lengthwise of each ring and in communication with that next. in order to it, blades within the helical channels, means whereby a motive power fluid may be admitted alternatively to the inmost or outmost helical channel and may be released therefrom, and a cylinder fitted around the outmost ring.
8. The improved turbine enginc, comprising a cylinder having end covers provided with sleeves, pedestals supporting said covers and provided with steam chests with which sald slecves communicate, a spindle within the cylinder and freely passing through the aforesaid sleeves. a number of rings secured, one outside the other, concentrically around said spindie, and all within the cylinder, a helical channel formed in and extending lengthwise of each ring and in communication with that next in order to it , the outmost ring communicating directly with one of the sleeves aforesald and the inmost ring communicating directly with the other of said sleeves.

No. 102,757. Production of Solid Blocks from Pulverulent Material.
Fabrication de blocs solides avcc des matériaux pulcírulents. Ludwig Weisz, Budapest, Hungary, 25th December, 1906; 6 years. Filed 7th October, 1905. Receipt No. 129,035.
Claim.-1. The berein described mothod of producing blocks from a mixture of scrap iron with a flux and fuel, consisting in moistening the mixture with lime water and then pressing the mixture under heat, substantially as described.
2. The herein described method of producing blocks from pulverulent or other material in which the material is mixed with lime water, the mixture pressed into blocks and the blocks subjected to the action o: convressed carbonic -cid gas under high pressure-preferably 8 to 25 atmospheres.
3. The herein described method of producing blocks from pulverulent or other material in which the material is mixed with slaked lime, the mixture pressed into blocks, the blocks, placed in gas tight chambers and compressed carbonic acid gas passed into said chambers.
4. The herein described method of producing blocks from pulverulent material consisting in mixing the material with slaked lime or lime and water, pressing the same into blocks and submitting them to the action of carbonic acil gas under high pressure in the form of snow and then adding heated carbonic acid gas under pressure of about 8 to 25 atmospheres to effect immediate blading action, substantially as described.

No. 102,758. Production of Interfolded Paper Packages.

a web longitudinally, folding and interfolding the partially severed web to form a connected gang of packages, and then separating the product thus formed, into a plurallty of individual packages by completing the said partial severance.
2. The herein described process of producing interfolded paper packages, tonsisting in partially severing a web longitudinally, then completely severing the web transversely into sections of predetermined lengths, then folding and interfolding the said sections to form a gang of packages connected laterally along the line of partial severance, and in finally separating the product thus formed into a plurality of individual packages by completing the said partial severance.
3. The herein described process of producing interfolded paper packages, which consists in partially severing units into a plurality of smaller units, folding and interfolding the partially severed greater units into a connected package, and then completely severing the connected package where partially severed, to constitute a plurality of smaller packages, each containing a combination of the smaller upits.

No. 102,759. Roof. Toiture.

Thomas Wilson, Ottawa, Ontario, Canada. 25th December, 1906; 6 years. Filed 5th October, 1906. Receipt No. 140,074.
Claim.-1. In an adjustable roof for the purpose specified. the combination with fixed posts at each corner of the pile to support two roof sections adapted to cover the top of the pile, of hoisting means extending between each end of the roof section and the posts and adapted to ralse and lower the roof sections, as and for the purpose specified
2. In an adjustable roof for the purpose specified, the combination of fixed posts at cach corner of the pile to support two roof sections having eyobolts at each end near the center thereof, eyebolts at the top of tach post, pulleys removably secured to the eyebolts on the posts and on the roof and ropes connecting the tackle on each post with the corresponding tackle on the roof section, the said ropes extending down alongside the posts and adapted to be operated by a person at the foot of the posts and cross member: extending between the posts at the head of the pile, as and for the purpose specified.

No. 102,760. Furnace Charging Apparatus.
Appareil à charger les fournaises.

Robins Conveying Belt Company, assignee of Edwin Henry Messiter, New York Oity, New York, U.S.A., 25th December, 1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,091.
Claim.-1. In furnace charging apparatus, the combination with means or supplying and maintaining a stream of charg-

Ing material, of deflecting devices having periodic movement in a single vertical plane for deflecting the stream of charging material to different parts of the furnace.
2. In a furnace charging apparatus, the combination with means for supplying charging material, of means for automatically effecting the distribution of the charging material to the furnace so that different amounts of material will bo supplied to different portions of the furnace.
3. In furnace charging apparatus, the combination with means for supplying charging material, of material distributing devices, and means for imparting periodic movements to said distributing devices in a single vertical plane.
4. In furnace charging apparatus, the combination with means for supplying charging material, of means for mechanically controlling the distribution of charging material to different parts of the furnace so that different amounts of material are automatically supplied to different parts of the furnace.
5. In furnace charging apparatus. the combination with means for supplying a stream of charging material, of means for shifting the point of delivery of said stream of charging material, and means for automatically controlling the movement of said point of delivery so that unequal amounts of material will be delivered to different parts of the furnace.
6. In furnace charging apparatus, the combination with means for maintaining a flow of charging material to the furnace, of means for deflecting the flow of material to different parts of the furnace and automatic devices whereby the movements of said deflecting devices may be controlled so as to effect the delivery of unequal amounts of material to different parts of the furnace.
7. In furnace charging apparatus, the conbination with means for supplying charging material, of a receptacle to receive the supply of charging material and distributing devices bencath said receptacle arranged for periodic movement in a single vertical plane, whereby a stream of material from said receptacle to the furnace is maintained and its dircction periodically changed.
8. In furnace charging apparatus, the combination with a furnace having a shifting charging opening, of means for maintaining a flow of charging material through said opening, and means for automatically controlling the rate of shifting of said charging opening so that unequal amounts of charging material will be suplied to different parts of the furnace.
9. The combination with a smelting furnace having an clongated chargling opening, of a distributor for charging material arranged to discharge through said opening and having a reciprocatory movement lengthwise of said opening. of a chute or conduit leading to said distributor and having its lower end secured thercto, the upper end of said chute or conduit being arranged to receive material discharged at a fixed point.
10. The combination with a smelting furnace having an elongated charging openings of material distribuiing devices comprising a carriage external of the furnace and arranged for reciprocatory movement lengthwise of said charging opening and an inclined chute extending downward from said carriage and through said charging opening, shields at both ends of said carriage and of sufficient length to keep said charging opening closed in any position of said carrlage, means for supplying a stream of charging material, and means for deflecting said stream of charging material from a fixed point to said carriage during the reciprocatory movement of said carriage and directing sald stream of material into said Inclined chute.
11. The combination with a smelting furnace having a charging opening on each side near the top, of a pair of material distributors arranged for reciprocatory movement at the sides of said furnace so as to effect the delivery of material into the interior of sald furnace, a material receiving hopper above said furnace having divergent discharge chutes, and means for directing the streams of material from said discharge chutes to said distributors during the reciprocatory movement of said distributors.
12. The combination with a smelting furnace having an opening at the top thereof, of a hopper arranged for horizontal travel with respect to said opening, an oscillatory chute pivotally connected at its lower end with said hopper so as to discharge thereinto, means for moving said hopper to and fro with respect to said opening, and means at the top of said chute for discharging material thereinto.
13. The combination with a smelting furnace, of a fixed hopper, a travelling hopper at a lower level than the fixed hopper and having a chute leading to the furnace, and a chute pivoted at its lower end on the travelling hopper and having its upper end supported by suitable guiding devices so that material passing from the fixed hopper will pass into the last-named chute when the travelling hopper is in any position.
14. The combination in charging apparatus for a smelting furnace, of a movable distributor for charging material and mechanism for imparting reciprocatory movement to said distributor, said mechanism comprising a heart cam and a members engaging the surface of said cam and connected with said distributor.
15. The combinaton in charging apparatus for a smelting furnace, of a movable distributor and mechanism for imparting periodic movement to said distributor, said mechanism comprising a heart cam, a travelling structure moving in guides and having a part in contact with said cam, and connections between said structure and said distributor.
16. The combination in charging apparatus for a smelting furnace, of a movable distributor for the charging material and mechanism for imparting periodic motions to said distributor and comprising a heart cam tapering from one end to the other and of the exact contour intermediate of its ends to impart uniform reciprocatory movement to a member engaging the cam. a travelling structure to which motion is imparted by the rotation of said cam, a roller carried by said travelling structure and engaged by said cam, said roller being adjustable between the ends of the cam.
17. The combination in charging apparatus for a smelting furnace, of a distributor for the charging material and mechanism for imparting periodic movement to said distributor, said mechanism comprising a cam and a structure to which reciprocatory movement is imparted by said cam, a pulley mounted on a fixed axis and a pulley carried by said structure, and a cable rove over said pulleys and connected with said distributor.
18. The combination in furnace charging apparatus, of an endless conveyer, a fixed receiving hoppor into which said conveyer delivers, a distributor arranged for recinrocatory movement adjacent to said furnace so as to deliver material thereinto throughout its movement, and shiftable members for conducting the material delivered from sald hopper to said distributor during the movoment of sald distributor.
19. In furnace charging apparatus, the combination with means for incroducing charging material within the furnace hood, of distr buting d viecs (nclosed within the ftrace hoos and arranged for periodic movement in a single vertical plane.
20. In furnace charging apparatus, the combination with a furnace hood having a hopper fixed therein and adapted to discharge matcrial within the hood. of a chute or conduit arranged to receive material from said fixed chute and having its lower cad mounted for periodic movement in a single vertical plane.
21. The combination with a furnace hood having a charging aperture therein, of means for discharging material through said aperture and aptomatic operative distributing devices within the furnace hood, said distributing devices being arranged for reciprocatory movement in a single vertical plane only and adapted to receive material from said charging aperture in all positions of said distributing devices.
22. In furnace charging apparatus, the combination with \(\Omega\) furnace hood, of a carriage arranged for transverse movement in a single vertical plane at the base of the hood, a hopper mounted on said carriage and enclosed within the hood, and means for supplying charging material to said hopper.
23. In furnace charging apparatus, the combination with a furnace hood, of a carriage arranged for reciprocatory movement transversely trrough said hovd, a condult having its lower end arranged for travel with said carriage and its upper end resting on a fixed support, and means for supplying charging material to the said conduit at its upper end,
24. In furnace changing apparatus, the combination कith a furnace hood, of a carriage arranged for reciprocatory movement transversely through the hood at its base, a hopper fixed upon said carriage, a conduit having its lower end pivoted on said hopper, a roller fixed in the upper part of said hood upon which the upper end of said conduit rests, and means for supplying charging material to said conduit at its upper end.
25 . The combination with a smelting furnace, of an endless conveyer having a fixed supporting frame, said conveyer having a movable point of discharge and being adapted to deliver material at the movabis point of discharge to the furnace.
26. In furnace charging apparatus, the combination with an endless conveyer having a fixed supporting frame and a shiftable point of discharge, of means for directing the material discharged from the conveyer into the furnace.
27. In furnace charging apparatus, the combination with an endless conveyer having a fixed supporting frame, of travelling apparatus for discharging material from said conveyer and directing it into the furnace.
28. In furnace charging apparatus, the combination with an endless conveyer having a shiftable point of discharge and
a fixed supporting irame, of a discharge spout or condult shiftable with the point of discharge for the conveyer and arranged to deliver material to said furnace.
29. In furnace charging apparatus, the combination with a conveyer having a movable point of discharge, of a discharge spout extending downwardly from said conveyer ant formed in relatively adjustable sections.
30. In furnace charging apparatus, the combination with a conveyer having a movable point of discharge, of a discharge spout extending from the conveyer toward the furnace and having its lower end adjustable toward and away from the median line of the furnace.
31. In furnace charging apparatus, the combination with a conveyer and a travelling tripper or deliverer for sald conveyer, of a discharge spout carried by said tripper or deliverer and having its lower end adjustable so as to control the delivery of material within the furnace.
32. In furnace charging apparatus, the combination with an endless conveyer and a travelling deliverer for said conveyer, of a discharge spout extending from sald deliverer and having the upper section rigidly attached to the deliverer and the lower section pivotally connected with the upper section.
83. In furnace charging apparatus, the combination with a conveyer having a shiftable point of discharge, of a discharge spout extending downwardly from the conveyer at the point of discharge and shiftable with its point of discharge, and a deflector disposed beneath the lower end of said discharge spout.
34. In furnace charging apparatus, the combination with means for supplying charging material, of a spout or conduit for conducting said material into the furnace, said discharge spout being arranged for reciprocatory movement bencath the furnace, and an adjustable deflector arranged beneath the end of said discharge spout.
35. In furnace charging apparatus, the combination with a conveyer having a fixed supporting frame and a travelling deliverer or discharger for said conveyer, of a discharge spout extending downwardly from said deliverer or discharger, and means at the lower end of said discharge spout for deflecting the material passing therethruugh.

No. 102,761. Reduction of Metallic Compounds.
Réduction des composés métalliques.

The Union Carbide Company, assignee of Edga: F. Price, all of Niagara Falls, New York, U.S.A., 25th December, 1906; 6 years. Filed 9th August, 1906. Recelpt No. 138,541.
Claim.-1. The process of smelting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, and electrically heating said body to the required temperature, as set forth. 2. The process of smelting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, removing the product and supplying fresh materials as required, as set forth.
3. The process of smelting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, alectrically heating said body to the required temperature, maintaining the smelting zone or region of highest temperature within said body, removing the product and supplying fresh materials as required, as set forth.
4. The process of melting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, maintaining the smelting zone or region of highest temperature within said body, removing the product and supplying fresh materials as required, as ret forth.
5. The process of smelting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, and heating sald body to the required temperature by an electric arc or arcs maintained within the body, as set forth.
6. The process of smelting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, callecting the showered particles into a relatively large body, heating said body to the required temperature by an electric arc or arcs maintained within the body, removing the product and supplying fresh materials as required, as set forth.
7. The process of producing calcium carbide, which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, and electrically heating said body to the required temperature, as set forth.
8. The process of producing calcium carbide, which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, removing the carbide and supplying fresh materials as required, as set forth.
y. The process of producing oalcium carbide, which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, and maintaining the smelting zone or aregion of highest temperature within said body, as set forth.
10. The process of producing calcium carbide, which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, maintaining the smelting zone or region of highest temperature within said body, removing the carbide and supplying fresh materials as required, as set forth.
11. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, and heating said body to the required temperature by an electric arc or arcs maintained within the body, as set forth.
12. The pnocess of producing calcium carbide, which consists in showerfing a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, heating said body to the required temperature by an electric arc or arcs maintained within the body, removing the carbide and supplying fresh materials as required, as set forth.
13. The process of smelting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, and burning the gases produced by the reaction to furnish the preheating atmosphere, as set forth.
14. The process of smelting a charge of divided materials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperatume, maintaining the smelting zone or region of highest tempenature within said body, and burning the gases produced by the reaction to furnish the preheating atmosphere, as set forth.
15. The process of producing calcium carbide, which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large- body, electrically heating said body to the required temperature, and burning the gases produced by the reaction to furnish the preheating atmosphere, as set forth.
16. The process of producing calicum carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, maintaining the smelting zone or region of highest temperature within said body and burning the gases produced by the reaction to furnish the preheating atmosphere, as set forth.
17. The process of smelting a charge of divided materials which consists in preheating the charge by showering
it through a hot atmosphere, collecting the showered particles into a relatively large body and electrically heating said body to the required temperature by means of electrodes the ends of which are embedded in said body, as set forth.
18. The process of smelting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature by means of electrodes the ends of which are embedded in said body, removing the product and supplying frest materials as required, as set forth.
19. The process of smelting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body and heating said body to the required temperature by an electric arc or arcs by means of electrodes the ends of which are embedded in sald body, as set forth.
20. The process of smelting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, heating said body to the required temperature by an electric arc or arcs by means of electrodes the ends of which are embedded in said body, removing the product and supplying fresh materials as required, as set forth.
21. The process of producing calicum carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body and electrically heating said body to the required temperature by means of electrodes the ends of which are embedded in said body, as set forth.
22. The process of producing callicum carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature by means of electrodes, the ends of which are embedded in said body, removing the carbide and supplying fresh materials as required, as set forth.
23. The process of producing calicum carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body;' and heating said body to the required temperature by an electric arc or arcs by means of electrodes, the ends of which are embedded in said body, as set forth.
24. The process of producing calicum carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, heating said body to the required temperature by an electric arc or arcs by means of electrodes, the ends of which are embedded in said body, removing the carbide and supplying fresh materials as required, as set forth.
25. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature, rotating and thereby removing the carbide from the heating zone and supplying fresh materials as required, as set forth.
26. The process of producing calclum carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, heating said body to the required temperature by an electric arc or arcs by means of electrodes, the ends of which are embedded in said body, rotating and thereby removing the carbide from the heating zone and supplying fresh materials as required, as set forth.

No. 102,762. Process Reducing Componnds and Producing Carbides.
Prodécé pour réduire des composés et produire des carbures.
The Union Carbide Company, assignee of Edgar F. Price, both of Niagara Falls, New York, U.S.A., 25th December 1906; 6 years. Filed 9th August, 1906. Recelpt No. 138,542.
Claim.-1. The process of smelting a charge of divided matetrials, which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a body and electrically heating the body to the required temperature by an electric current passing through a resistance conductor, as set forth.
2. The process of smelting a charge of divided materials which consists in preheating the charge by showering it
through a hot atmosphery, collecting the showered particles into a bady, electrically heating the body to the requirel

temporalure by an cloctric current or current: nasion through a resistance conductor, and increasing the heat supplied by said resistance conductor along the path of the electric current, as set forth.
3. The process of smeliting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a body, electrically heating the body to the required temperature by an electric current or currents passing through a resistance conductor and increasing the heat supplied by said resistance conductor along the path of the electric current to a point where the product becomes molten and may be tapped out, as set forth.
4. The process of smelting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a body, electrically heating the body to the required temperature by an electric current or currents passing through a resistance conductor and increasing the current density along the path of the electric current in said resistance conductor, as set forth.
5. The process of smelting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a body, electrically heating the body to the required temperature by an electric current or currents passing through a resistance conductor and increasing the current density along the path of the electric current in said resistance conductor to a point where the product becomes moltetn and may be tapped out, as set forth.
6. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a body and electrically heating the body to the required temperature by an electric current passing through a resistance conductor, as set forth.
7. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a body, electrically heating the body to the required temperature by an electric current passing through a resistance conductor, and increasing the heat supplied by said resistance conductor along the path of the electric current, as set forth.
8. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a body, electrically heating the body to the required temperature by an electric current passing through a resistance conductor, increasing the heat supplied by said resistance conductor along the path of the electric current to \(A\) point where the carbide becomes molten, and tapping out the molten carbide, as set forth.
9. The process of producing calcium carblde, which consists in showering a charee of divided lime and carbon through a hot atmosphere, collecting the showered particles into a body, electrically heating the body to the required temperature by an electric current passing through a resistance conductor, and increasing the current density along the path of the electric current in said resistance conductor, as set forth.
10. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles jnto a body, electrically heating the body to the required temperature by an electric current passing thrdough a resistance conductor, and increasing the current density along the path of the electric current in said resistance conductor to a point where the carbide becomes molten and may be tapped out, as set forth.
11. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a body, electrically heating the body to the required temperature by an electric current passing through a resist-
ance conductor, and burning the gases produced by the re-action to furnish the preheating atmosphere, as set forth. 12. The process of smelting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collectling the showered particles into a relatively large body, electrically heating sald body to the required temperature and bringing the product into a molten condition and removing the moltetn product and supplying fresh materials as required, as set iorth.
13. The process of smelting a charge of divided materals whch consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature and increasing the current density along the path of the current, thereby bringing the product into a molten condition and removing the molten product and supplying fresh materials as required, as set forth.
14. The process of smelting a charge of divided materials which consists in preheating the charge by showering it through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the required temperature and bringing the product into a molten condition, removing the molten product and supplying fresh materials as required and burning the gases produced by the reaction to furnish the preheating atmosphere, as set forth.
15. The process of producing calcium carbide which ccnsists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body to the requirid temperature and bringing the carbide into a molten condition and removing the molten carbide and supplying fresh materials as required, as set forth.
16. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating sald body to the required temperature and increasing the current density along the path of the current, thereby bringing the carbide into a molten condition and removing the molten casbide and supplying frtsh materials as required, as set forth.
17. The process of producing calcium carbide which consists in showering a charge of divided lime and carbon through a hot atmosphere, collecting the showered particles into a relatively large body, electrically heating said body t.o the required temperature and bringing the carbide into a molten condition, removing the molten carbide and supplying fresh materials as required, and burning the gases produced by the reaction to furnish the preheating atmosphere as set forth.
No. 102,763. Apparatus for Reducing Metallic Compounds.
Appareil ì réduire des composés nétalliques.

The Union Carbide Company, assignee of Edgar F. Price, all of Niagara Falle, New Yark, U.S.A., 25th December,
1906; 6 years. Filed 9th August, 1906. Receipt No. 138,543.
Claim.-1. An apparatus for smelting divided materials, comprising means for preheating the material by shower-
ing it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and means for electrically heating said body to the required temperature, as set forth.
2. An apparatus for smelting divided materials, comprising means for preheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, means for electrically heating said body to the required temperature, and means for removing the product and supplying fresh materials as required, as set forth.
3. An apparatus for smelting divided materials, comprising means for preheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and an electric furnace adanted to heat said body to the required temperature and to maintain the smetting zone or region of highest temperature within said body, as set forth.
4. An apparatus for smelting divided materials, comprising means for preheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, an electric furnace adapted to heat said body to the required temperature and to maintain the smelting zone or region of highest temperature within said body, and means for removing the product from the electric furnace and supplying fresh materials as required, as set forth.
5. An apparatus for smelting divided materials, comprising means for preheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and an electric furnace adapted to heat said body to the required temperature by an electric arc or arcs maintained within the body, as set forth.
6. An apparatus for smelting divided materials, comprising means for preheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, an electric furnace adapted to heat said body to the required temperature by an electric arc or arcs maintained within the body, and means for removing the product from the electric furnace and supplying fresh materials as required, as set forth.
7. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and an electric furnace adapted to heat said body to the required temperature by means of electrodes the ends of which are embedded in said body, as set forth.
8. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and an electric rurnace adapted to heat said body to the required temperature by means of electrodes the ends of which are embedded in said body, and means for removing the product from the electric furnace and supplying fresh materials as required, as set forth.
9. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and an electric furnace adapted to heat said body to the required temperature by an electric arc or arcs by means of electrodes the ends of which are embedded in said body, as set forth.
10. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and an electric furnace adapted to heat said body to the required temperature by an electric arc or aras by means of electrodes the ends of which are embedded in said body, and means for removing the product from the electric furnace and supplying fresh materials as required, as set forth.
11. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, means for electrically heating said body to the required temperature, and means for rotating and thereby removing the product from the heating zone, as set forth.
12. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, an electric furnace adapted to heat sald body to the required temperature by an electric arc or arcs by means of electrodes the ends of which are embedded in said body. and means for rotating and thereby removing the product from the heating zone, as set forth.
13. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, an electric furnace for heating said body to the required temperature, and means for burning the waste gases from the electric furnace to furnish the preheating atmosphere, as bet forth.
14. An apparatus for smelting divided materials, comprising means for preheating the charge by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, an electric furnace adapted to heat said body to the required temperature and to maintain the smelting zone or region of highest temperature within said body, and means for burning the waste gases from the electric furnace to furnish the preheating atmosphere, as set forth.
15. An apparatus for smelting divided materials, comprising an electric furnace, a hood extending down into the upper end of said furnace, and a preheating chamber opening into said hood, as set forth.
16. An apparatus for smelting divided materials, comprising an electric furnace having a revoluble body, a hood depending into said body, an electrode or electrodes in said hood, an a preheating chamber opening into said hood, as set forth.
17. An apparatus for smelting divided materials, comprising an electric furnace, a hood extending into said furnace, a preheating chamber opening into said hood, and a gas conduit leading from said hood into said preheating chamber, as set forth
18. An apparatus for smelting divided materials, comprising an electric furnace having a revoluble body, a hood depending into said body, an electrode or electrodes in said hood, a preheating chamber opening into said hood and a gas conduit leading from said hood into said preand a gas conduit leading iro
19. An apparatus for smelting divided materials, comprising an electric furnace, an electrade or electrodes extending into said furnace, a preheating chamber for supplying material to said furnace, a gas collecting chamber surrounding said electrode or electrodes, and a conduit leading from said gas collecting chamber into said preheating chamber, as set forth.
20. An apparatus for smelting divided materials, com prising an electric furnace, a hood extending into said furnace, a preheating chamber opening into said hood, sald chamber having a transverse passage, an electrode or electrodes extending through said hood, and electrode connections in said passage, as set forth.

No. 102,764. Apparatus for Reducing Compounds and Producing Carbides.
Appareilr à réduire des composés et à produire des carbures.

The Union Carbide Company, assignee of Edgar F. Price, both of Niagara Falls, New York, U.S.A., 25th December, 1906; 6 years. Filed 9th August, 1906. Receipt No. 138,544.
Claim.-1. An apparatus for smelting divided materials comprising means for preheating the material by showering it through a hot atmosphere, an electric resistance furnace and means for charging a body of the preheated material into said furnace, as set forth.
2. An apparatus for smelting divided materials comprising means for preheating the material by showering it through a hot atmosphere, an electric resistance furnace constructed to gradually raise the preheated materlal to the required temperature, and means for charging a body \(o_{i}\) the preheated material into said furnace, as set forth.
3. An apparatus for smelting divided materials comprising means for preheating the material by showering it through a hot atmosphere, an electric resistance furnace constructed to gradually raise the preheated material to tho required temperature and to bring the product into a molten condition, said furnace having a tap hole and means for charging a body of the preheated material into sald furnace, as set forth.
4. An apparatus for smelting divided materials compris. ing means for preheating the material by showering it through a hot atmosphere, an electric furnace having a resistance couductor and means for passing through said conductor, an clectric current of increasing density and means for charging a body of the preheated material into said furnace, as set forth.
f. An apparatus tor smelting divided materials comprising means tor preheating the material by showering it through a hot atmosphere, an electric furnace having a resistancu comlucior, means for passing through sadd conductor an electric current of increasing density and a tap hole adjacelit to the region of maximum current density. athd means for charging a body of the preheating material iltu satd furnace, as set forth.
6. An apparatus for smelting divided matorials comprising means for prehoating the material by showering it through a hot atmospere, an electric resistance furnace, means for charging a body of the preheating material into said furnace, and means for burning the waste gases from the electric furnace to iurnish the preheating atmosphere, as set forth.
i. An apparatus for smelting divided materials comprising means for preheating the material by showering it through a hot atmosphere, means for collecting the showcred particles into a relatively large body, means for electrically heating said body to the required temperature and bringing the product into a molten condition and a tap hole for tho molten product, as set forth.
B. An apparatus for smetting divided materials comprising means for preheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, and means for gradually heating said body to the required temperature by an electric current of increasing density, as set forth.
9. An apparatus for smelting divided materials comprising means for proheating the material by showering it through a hot atmophere, means for collecting the showcred particles into a relatively large body, means for gradually heating said body to the required temperature and for bringing the product into a molten condition by an electric current of increasing density and a tap hole ior the molten product adjacent to the region of maximum current density, as set forth.
10. An apparatus for smelting divided materials comprisinf: means for preheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, means for electrically heating said body to the required temperature and an electric current of increasing density and a tap hole for the molten product and means for burning the waste gases to furnish the preheating atmosphere, as set forth.
11. An apparatus for smelting divided materials comprising means for proheating the material by showering it through a hot atmosphere, means for collecting the showered particles into a relatively large body, means for gradually heating said body to the required temperature and for bringing the product into a molten condition by an electric current of increasing density, a tap hole for the molten product adjacent to the region of maximum current density and means for burning the waste gases to furnish the preheating atmosphere, as set forth.

No. 102,765. Gun Barrel. C'anon de fusil.

\footnotetext{
Charles Ross Bellamy and Phillip J. Dennig, assignee of a half interest, both of Shreveport, Louisana, U.S.A., 25 th December, 1906; 6 years. Filed 30th April, 1906. Recelpt No. 135,412.
Claim.-1. A gun barrel having a lock block near its muzzle, in combination with a sleeve to fit on the muzzle and having a bayonet slot to engage and clear said block, a choke piece and means to detachably secure the choke piece in the sleeve with the inner end engaging the muzzle piece in the sleeve with the inner end en
of the barrel, substantially as described.
}
2. In combination with a gun barrel having a lock block near its muzzle, a sleeve having a bayonet slot to engage and disengage the lock block and detachably secure the sleeve on the barrel, a choke piece having screw-threaded congagement with the sleeve and adapted to be engaged with the muzzle of the barrel, and means to lock the choke piece against reverse turning when thus engaged with the muzzlu of tho barrel, substantially as described.
i. The combination of a gun barrel having a lock block near its muzzle, a sleeve to fit on the muzzle of the barrel and having a bayonet slot to engage and disengage said lock block, a choke piece having screw-threaded engagement with the outer portion of the sleeve and adapted to bear against the muzzle of the barrel, said choke piece being further provided with ratchet teeth extending around the same, and a detent carried by the sleeve to co-act with said ratchet teeth to prevent reverse furning of the "hoku picer, for the purpose set forth.

\section*{No. 102,766. Mnsic Leaf Turner.}

Tournewi pour feuillets dr musique.

Harry L. Wilson, Portland, Oregon, and Frank H. Walgamot, Port Townsend, Washington. U.S.A., 25th December, 1906; 6 years. Filed 16th Ootober, 1906. Receipt No. 140,343.
Claim.-1. In a music leaf turner, a plurality of leaf turning elements. means for moving said elements bodily successively into active position, and means for successively operating said elements while in active position to turn the leaves.
2. In a music turner, a plurality of leaf turning elements means for moving said elements bodily successively into active position, and means for successively opera:ung said elements while in active position to turn the leaves.
3. In a music leaf turner, a plurality of leaf :uraiag ellments, means including a spring for moving sald c! 2ments bodlly sucerssively into active position, spring propelled means for suc:essively operating said elements while in active position to turn the leaves, and hand means for conirolling the operation of said elements.
4. In a music leaf turner, a leaf turning element, mean: for elevating said element bodily into active position, and means for horizontally swinging said element from its active position to turn a leaf.
5. In a music leaf turner, a leat turning element, means for elevating said element bodily into active position, means ior horizontally swinging said element from its active position to turn a leaf, and a support for said element during its swinging movement, said support terminating to permit the depression of said elem?nt at the end of its swinging movement
6. In a music leaf turner, a leaf turning element, means for including a spring for elevating said element bodily into active position, normally locked means including a spring for horizontally swinging said element from its active position to turn a leaf, hand controlled means for releasing said last-named means, and a support for said element during its swinging movement, said support terminating to permit the depression of said element as at the end of its swinging movement.
7. In a music leaf turner, a lower fixed casing, an upper spring rotated casing, hand controlled means for locking and releasing the upper casing, a plurality of leaf turning elements vertically movable in the lower casing to successively occupy a recess in the upper casing, and a spring in the lower casing to move said elements.
8. In a music leaf turner, a lower fixed casing having therein oppositely disposed vertical tubes and vertical slots in
ils walls at said tubes, leaf turning arms slidably arranged at their inner ends in one of the tubes and slots, a spring for moving said arms in sald tube.and slot, a shaft extending vertically from the lower casing, an upper casing rotatable on said shaft and moved by a spring and having in its lower end recesses normally registering with baid tubes and slots.
9. In a music leaf turner, a lower flxed casing having therein oppositely disposed vertical tubes and vertical slots in its opposite walls communicating with sald tubes, leaf turning arms slidably arranged at their inner ends in one of the lubes and slots, a spring pressed follower for vertically moving sald arms, a shaft extending vertically from the lower casing, an upper casing rotatable by spring action on said shaft and having its lower ends oppositely disposed. recesses normally registering with the tubes and slots, stops on the upper casing and a spring pressed hand controlled dog for locking and releasing said upper casing.
10. In a music leaf turner, a lower fixed casing having its opposite sides vertical, recesses having oppositely extending lateral extensions, leal turning arms slidably confined at their inner ends in said recesses, a spring pressed follower for vertically moving said arms, said follower having a handle and adapted to be turned laterally to engage one of the recess extensions to hold it in depressed position to permit the insertion of the arm ends in the opposite extension, a shaft extending vertically from the lower casing, an upper casing rotatable by spring action on said shaft and having its lower recesses normally registering with the aforesaid recesses. stops for limiting the movements of the upper casing and hand controlled means for locking and releasing said upper casing.

No. 102,767. Storage Battery.
Accumulateur d'éléctricité à plaque.

James H. Churchill, Quincy, assignee of the interest of Alfred Elmare Knight, Somerville, both in Massachusetts, U.S.A.. 25th December, 1906; 6 years. Filed 24th July, 1906. Receipt No. 138,131.
Claim.-1. In a storage battery, in combination, a battery plate provided with slots extended from one edge or side to form arms having their edges separated from one another, a guide loosely applied to the plate and extended transversely of said arms to direct said arms in their expansive movement laterally, and means to secure said - guide to said plate.
2. In a storage battery, in combination, a positive plate, a guide loosely applied to said plate and co-operating with one edge of the said plate to permit expansion of the same and yet resist buckling of said plate, and means to secure said guide to said plate.
3. In a storage battery, in combination, a battery plate suspended at its upper end and having its lower end free, and means loosely applied to said plate transversely thereof to permit free lateral movement of said plate and to guide tho same in its lateral movement, for the purpose specified.
4. In a storage battery, in combination, a plate suspended at its upper end and having its lower end free, and means loosely applied to the lower free end of said plate to permit lateral expansion yet resist buckling of said plate.
5. In a storage battery, in combination. a positive plate and a negative plate, one of the said plates being extended below the other and a guide co-operating with a portion of the plate extended below the other to permit expansion and yet resist buckling of the plate which is extended below the other, said guide being loosely applied to the plate with which it co-operates, substantially as described.
0. In a storage battery, in combination, a battery plate, supports for the opposite sides of said plate provided with slots, and means attached to said plate intermediate its ends and extended loosely into said slots to move therein and guide the plate in its expansive movement, substantially as described.
7. In a storage battery, in combination, a battery plate provided with a projection intermediate its ends, and means having a slot into which said projection is loosely extended to permit movement of said projection in said slot for guiding said plate in its expansive movement, substantially as described.
©. In a storage battery, in combination, a battery plate substantially anchored at one end and having its opposite end free to expand in one direction, and means loosely applied to said plate and co-operating with the free end thereot to permit expansion of the plate in a direction substantially at right angles to the first-mentioned direction and yet resist the buckling or distortion of the plate by the expansion in the second-mentioned direction.
9. In a storage battery. in combination. a plate, a support for one side of said plate provided with a slot, means attached to the said plate intermediate its ends and extended loosely into said slot to move therein. and a guide loosely applied to one cdge of said plate to permit expansion of the same and yet resist buckling of the said plate, substantially as described.
10. In a storage battery, in combination, a battery plate, in a substantially non-oxidized condition substantially anchored at one end and having its opposite end free, and means loosely applied to the free end of sald plate to permit free lateral movement of said plate as it is oxidized and yet resist buckling of said plate under the influence of such oxidation, substantially as described.

No. 102,768. Apparatus for Making Cellulose Vessels.
Appareil pour fabriquer des récipients en cellulose.

The Roenitz Exploiting Company, assignee of William Glader, both of Chicago, Illinois, U.S.A., 25th December, 1906; 6 years. Filed 9th June, 1906. Receipt No. 136,744.
Claim.-1. In an apparatus for forming receptacles for cellulose pulp, comprising a main frame, an upper plate, having an opening therein, secured to said frame, a base plate having an opening therein secured to the main frame below the upper plate, a plurality of concave staves, having flanges at each side thereof disposed between the upper plate and base plate, a plurality of concave segments held in contact with the flanges of the staves by means of the preseure of a spiral spring, said staves and segments forming a circular mould, flaring upwardly from the bottom, and forming a continuous pressing surface against the outer surface of the receptacle, a plunger movable in and out of the mould formed by said staves and segments. eccentric shafts, carrying pinlons disposed between the upper plate and base plate. connecting rods connecting the stave to said eccentric shafts, thus moving the staves inwardly or outwardly when the pinions are rotated, substantially as described.
2. An apparatus for forming a receptacle from cellulose pulp, comprising a main frame, an upper plate having an opening therein, secured to said frame, a base plate having an opening therein, secured to the main frame beneath the upper plate, a plurality of concave staves, having flanges on each side thereof disposed between the upper plate and base plate, a plurality of concave segments held in contact with the flanges on said staves by means of the tension of a spiral spring, said staves and segments forming a circular mould, flaring upwardly from the bottom and forming a continuous pressing surface against the outer surface of the receptacle, ribs on the under surface of the upper plate, adapted to engage the grooves in the upper and lower ends of the staves, a plunger movable in
and out of the mould formed by the staves and segments. a plurality of eccentric shafts, carrying pinions journalled in the upper plate and base plate, connecting rods connecting the eccentric shafts to the staves, means for operating said shafts, thus moving the staves inwardly and outwardly, substantially as desaribed.
3. An apparatus for forming a receptacle from cellulose pulp, comprising a main frame, an upper plate having an pulp, comprising a main frame, an upper plate and base plate having openings intermediate thereof secured \(t\) said beneath the upper plate, a plurality of staves and segments, disposed between the upper plate and base plate. forming a mould, flaring outwardly from the bottom, and forming continuous pressing surface against the outer surface of the receptacle, means for moving the staves inwardly and outwardly, a plunger movable in and out of the mould, formed by the staves and segments, an auxiliary frame secured to the lower end of the main frame, a movable sleeve disposed between the upper plate of the auxillary frame and the bearing plate, a gear wheel secured to said sleeve, screw threads in the lower portion of said sleeve, sald screw threads engaging the screw threads on the lower end of the shaft, which operates in the sleeve in sald auxiliary frame, the upper end of said shaft having a spider to which is secured the die for forming and compressing the bottom of the receptacle, gear transmission far rotating the shaft, carrying the forming die, upwards and downwards, substantially as described.
4. An apparatus for forming receptacles from cellulose pulp, comprising a main frame, an upper plate an base plate, having openings intermediate thereof, secured to said frame, a bottom forming die, a plurality of staves and segments disposed between said upper plate and base plate. forming a circular mould, a plunger operated vertically by means of a rack gear, said plunger belng adapted to fit into said mould, against which the cellulose pulp is pressed by the staves and segments, and bottom forming die, during the formation of a pail, substantially as described.
5. An apparatus for forming a receptacle from cellulose pulp comprising a main frame, an upper plate and a base plate having openings intermediate thereof secured to said frame, a bottom forming die, a plurality of staves and scgments disposed between the upper plate and base plate forming a circular mould, a plunger operated vertically by means of rack gear adapted to fit into the mould, and against which the cellulose pulp is pressed by the staves and segments and the bottom forming die during the formation of a receptacle, a flange on the head of the plunger, a releasing rim normally held in contact with said flange by means of the tension of a spiral spring, a plurality of pipes rigidly secured to the head of the plunger and extending into the plunger, the upper end of said pipes connected to a bifurcated extension, substantially as described.
O. An apparatus for forming receptacles from cellulose pulp comprising a main trame, an upper plate and base plate rigidly secured to the main frame, openings intermediate of said upper and base plate, a plurality of concave staves having flanges disposed between said plates, a plurality of eccentric shafts journalled in the upper plate and base plate and connected to sald staves by means of connecting rods, a plurality of concave segments lield in contact with the flanges on the staves by means of a spiral spring exerting lateral pressure thereon, said staves and segments forming a circular mould, pinions on the lower of the eccentric shafts meshing with the gear wheel secured by means of a collar to the under surface of the base plate, said gear wheel meshing with a pinion on the shaft operated by the driving pulleys, a plunger provided with a head, a releasing rim normally held in contact with the flange on said head by means of a spiral spring encircling a contact post, a rack bar carrying gears operated vertically by means of gear transmission connected with the driving pulleys moving the plunger upward and downward, substantially as described.
7. An apparatus for forming a receptacle from cellulose pulp comprising a main frame, an upper plate and base plate having openings intermediate thereof secured to the main frame, a plurality of staves and segments disposed between the upper plate and base plate forming a mould, means for moving the staves and segments inwardly and outwardly, a plunger movable in and out of the mould, an auxiliary frame secured to the lower end of the main frame, a movable sleeve disposed between the upper plate intermediate of the auxiliary frame and bearing plate, a cylinder secured to the upper portion of the auxiliary frame and extending into the opening in the base plate, a gear wheel secured to sald sleeve having screws threads in the lower portion thereof, a shaft, the lower end of which is provided with external screw threads which are adapted to engage the screw threads in the lower end of the mov-
able sleeve, the upper end of said shaft being provided with a spider and adapted to operate in the cylinder, a bottom forming die secured to said spider, means for operating shaft carrying the splder and die upwardly and downwardly, substantially as described.
8. An apparatus for forming a receptacle from cellulose pulp comprising a main frame, an upper plate and base plato having openings intermediate thereof secured to sald frame, a plurality of staves and segments disposed between the said upper plate and base plate, forming the sides of the mould for compressing the cellulose pulp. a bottom forming die operated vertically forming the bottom of the mould, a vertically movable plunger adapted to be placed into said mould and against which the cellulose pulp is pressed by the inward movement of the staves and segments and the upward movement of the bottom forming die. means for drawing staves and segments and the bottom forming die away from the cellulose pulp pressed against the plunger, and means for lifting the plunger with the receptacle adhering thereto out of the mould and removing the said receptacle therefrom, substantially as
dsscribed dsscribed.

No. 102,769. Musical Instrument.
Instrument de musique.

102769
The Chase and Baker Company, assignec of Joseph Herbert Chase and William Frederick Bayer, all of Buffalo, New York, U.S.A.. 25th Dec mber, 1006; 6 yenrs, Filed 11!th July, 1906. Receipt No. 137,951.
Olaim.-1. The combination with the piano action and the manual keys, of a wind chest arranged below the keys, motor pneumatics mounted on the front portion of the wind chest and having their movable boards arranged above their fixed baseboards, levers arranged between the wind chest and the keys and having their front arms connected with the respective pneumatics and stickers loosely interposed between the under sides of the keys and the rear arms of said levers, substantially as set forth.
2. The combination of the sound producing parts, a tracker board, a wind chest composed of a fixed rear section and a removable front section, motor pneumatics for the sound producing parts mounted on the removable section of the wind chest, valve mechanism in the wind chest controlling the passage of the air to and from said pneumatics, and tracker connections extending from the tracker board to the fixed action of the wind chest, substantially as set forth. 3. The combination with the piano action and the manual keys, of a tracker board, a wind chest arranged below the keys and composed of a fixed rear section and a front section removably secured to the rear section, motor pneumatics mounted on said removable section, levers also carried by sa:d removable section and operatively connected with the pneumatics and stickers interposed between said levers and the piano keys, substantially as set forth.
4. The combination with the piano action and the manual keys, of a tracker board, a wind chest arranged below the keys and composed of a flxed rear section and a front sec-
tlon removably secured to the rear section, motor pneumatics mounted on the front portion of the removable section and having their movable boards arranged above their fixed baseboards, levers carried bv said removable section and arranged between the top therenf and the rear portion of the Key tab'e. the front ar ns of said levers being connected with the respective pneumatics and stickers passing through the rear portion of the key table and bearing loosely against the undersides of the kevs and the rear arms of said levers. substantially as set forth.
5. The combination with the niano action, the keys and the key table, of a tracker board arranged above the keys, a wind chest arranged below the kev table. motor nneumatins act'n : on the keys, valve mechanism in the wind rhest controlling the passage of the air to and from the pneumatics, and a tracker frame or comb comprising an upner bar arranged on the front side of the piano action and having air passages or chambers connected with the ducts of the tracker board, a lower bar secured to the kry table in rear of the keys and having passagos connected with the wind chest, any rigid tubes secured at their ends to said bars and connecting corresponding passages thereof and passing between the stickers of the piano action, substantally as set forth.

No. 102,770. Conveyer. Transport.

John Androw Brown, Portland, Oregon, U.S.A., 25th December, 1906 ; 6 years. Filed 29th October, 1906. Receipt No. 140,724.
Claim.-1. In a portable conveyer the combination of a frame, carrier wheels under the middle part thereof. an electric motor in such middle part of the frame and having a transversely arranged projecting axle, a miter gear on such projecting axle end, a gear meshing with such miter gear and having a shaft journalled lengthwise of the frame to one end thereof, a miter gear on the extremity of such shaft, a driven drum journalled in such frame end. a gear on the axle thercof and meshing with the last mentioned miter gear and a continuous casing entircly enclosing such motor and power transmitting means, the parts being arranged on the frame to balance each other over the wheel base.
2. A conveyer comprising a frame, carrier wheels under the middle part thereof, a series of rollers fournalled in the upper part of the frame to support the carrier end of the carrier belt. rollers journalled at the ends of said middle part to support the return end of such carrier belt. a positively driven drum at one end of the frame, a longitudinally movable drum at the opposite end of the frame. a motor in the middle part of the frame. means transmitting the power of such motor to the driven drum, and a continuous casing entirely enclosing such motor and nower transmitting means, the parts being arranged on the frame to balance each other over the wheel base.
3. A conveyer comprising a frame, carrier wheels under the middle part thereof, a series of concaved rollers journalled in the upper part of the frame to support the carrier end of the carrier belt, rollers made with shoulders near the ends and journalled at the ends of said middle part to support the return end of such carrier belt, a positively driven drum at one end of the frame. a longitudinally movable drum at the opposite end of the frame. a motor in the middle part of the frame. means transmitting the power of such motor to the driven drum and a continuous casing entirely enclosing such motor and power transmitting means, the parts being arranged on the frame to balance each other over the wheel base.

No. 102,771. Connection for Pole Plates of Storage Batteries.
Raccordement pour plaques des pôles d'accumulatcurs électriqucs.

Gustav Dreidhardi, No. 1 Hinschenwey, Hamburg, Eimsbüttel, Germany, 25th December, 1906; 6 years. Filed 1st August, 1906. Receipt No. 138,324.
Claim.-1. Improved connecting means for the pole plates of the individual cells of storage batteries comprising in combination a pair of mercury cups \(c\) arranged on the lead electrodes \(a\) to be connected together, a lining \(d\). of a substance non-affected by mercury in each cup c tightly adhering thereto, a bridge piece \(f\) of variable length adapted to be dipped with its two extremities in the mercury cups of two electrodes so as to co-act with the mercury to complete the conncction, and a lid \(g\) of insulating material for covering the mercury cups, substantially as set forth.
2. Improved connecting means for the pole plates of the individual cells of storage batteries comprising in combination, a pair of mrrcury cups constructed integral with the lead electrodes \(a\) to be connected together, a lining \(d\), of a substance non-afficted by mercury in each cup ctightly adhering thereto, a bridge piece \(f\) of variable length to be dipped with its two extremities in the mercury cups of two electrodes so as to co-act with the mercury to complete the connection, and a lid \(g\) of insulating material for covering the mercury cups, substantially as set forth.
3. Improved connecting means for the pole plates of the individual cells of storage batteries comprising in combination, a pair of mercury cups carranged on the lead electrodes \(a\) to be connected together, a lining \(d\), of a substance nonaffected by mercury in each cup ctightly adhering thereto. a bridge piece \(f\) of variable length adapted to be dipped with its two extremitios in the mercury cups of two electrodes so as to co-act with the mercury to complete the connection, and a lid \(g\) of insulating material for covering the mercury cups, said lid having apertures for the penetration of the extremities of the bridge piece \(t\), substantially as set forth.

No. 102,772. Glass Melting Pot.
Chaudic̀re pour la fonte du verrc.

Henry Clay Fry, Rochester, Pennsylvania, U.S.A., 25th December, 1906; 6 years. Filed 6th August, 1906. Receipt No. 138,448 .
Claim.-1. A glass melting pot having a hollow wall above the metal line of the pat to form a charging and fusing chamber, said chamber being onen only to the pot interior and to the exterior of the pot heating furnace.
2. A glass melting pot constructed with a hollow crown above the metal line of the pot to form a charging and fusing chamber, the crown cavity being open only to the pot interior and to the exterior of the pot heating furnace.
3. A glass melting pot constructed with a hollow crown to form a charging and fusing chamber, said chamber exlonding from front to rear of the pot above the metal line thereof and open at its rear to the pot interior and at its front to the exterior of the pot heating furnace.
4. A glass melting pot wholly closed to the furnace in which it is heated, the pot crown being hollow above the metal line to form a charging and fusing chamber, said chamber sloping downwardly from front to rear with its lower end communicating with the pot interior and its front or upper end open to the exterior of the pot heating furnace.
5. A glass melting pot having a working chamber in its front and a working mouth communicating therewith, a refining chamber at the rear of the working chamber, and a charging and fusing chamber above the refining chamber and open only thereto and to the exterior of the pot heating furnace.
6. A glass melting pot having a working chamber at the front provided with a working mouth, a refining chamber at the rear of the working chamber, and a charging and fusing chamber above and extending longitudinally of the pot from front to rear, the charging chamber being wholly closed to the pot heating furnace but open to the exterior thereof, the rear portion of the charging chamber being open to the refining chamber.
7. A glass melting pot having a working chamber in the front provided with a working mouth, a refining chamber at the rear of and communicating with the working chamber, the pot crown being hollow from front to rear to form a charging and fusing chamber which at the rear communicates with the refining chamber and at the front is open to the exterior of the pot heating furnace.

\section*{No. 102,773. Manufacture of Iron and Steel.}

\section*{Préparation du fer ct de l'acier.}

Montague Moore, Melbourne, and Thomas James Heskett, Brunswick, Victoria, both in Australia, 25th December, 1906; 6 years. Filed 10th August, 1906. Receipt No. \(138,516\).
Claim.-1. In the direct process of manufacturing iron and steel. keeping the slag in the gas or other reverberatory furnace in the ferrous condition, that is, in a state in which it contains a minimum of oxygen and is prevented from absorbing oxygen from the gases of the furnace thereby preventing any oxidation of the reduced iron by contact with the slag.
2. Keeping the slag in a gas or other reverberatory furnaco in the ferrous condition by the addition thereto, or in contact therewith, of solid carbon or other suitable deoxidizing material, or an admixture of reduced íron and carbonaceous or other suitable deoxidizing material. according as to whether wrought iron or steel is to be manufactured.
No. 102,774. Process of Purifying Flnids.
Procédé de purification des liquides.

George Huntington Reynolds, Mansfield Depot, Connecticut, U.S.A., 25th December, 1906; 6 years. Filed 15th May, 1905. Receipt No. 125,209.

Claim.-1. The art of purifying fluids comprising the generation of an electric current, the translation of said current by means including electrodes in contact with a secondary liquid, and the transmission of said current to the primary liquid which is suspended in the secondary liquid out of the contact with the electrodes.
2. The art of purifying fluids comprising the generation of an electric current and the transmission of said current through two fluid bodies of different character, which bodies are mechanically separated though electrically connected so that one of said bodies will become purified to a preservative degree.
3. The art of purifying liquids comprising the generation of an electric current, and the translation of said current to and through a plurality of fluid bodies, one of said fluid bodies being in contact with electrodes in the circuit and another of sald bodies being also in the circuit but mechanically separated from the first fluid body and from the electrodes.
4. An apparatus for purifying fluids comprising a tank containing a fluid, a receptacle suspended in said fluid containing a second fluid, and means for translating an electric current 10 and through both said fluids, the said receptacle mechanically separating the fluid contained therein from the fluid contained in the tank, but affording electric connection.
5. An afparatus for purifying fiuids comprising a tank composed of insulated sections, a fluid contained therein, means whereby another fluid may be contained in the first fluid without intermixing therewith, and means for translating an electric current to the second fluid through the first fluid.
6. An apparatus for purifying fluids comprising an electric circuit two different fluids inserted in said circuit, means for translating the current through said fluids, said means comprising electrodes in contact with one of said fluids.
7. An apparatus for purifying fluids comprising an electric circuit, a tank containing a fluid inserted in the circuit, a receptacle containing another fluid inserted in the circuit, and means wher by the current may be translated through both fluids, said means including a device for forming a coagulum in one of the fluids.

\section*{No. 102,775. Apparatus for Sterlizing Liquids.}

Appareil à stériliser les liquides.

Henry Jacques Wessels, Comte de Frise, Paris, France, 25th December, 1906; 6 years. Filed 11th July, 1905. Receipt No. \(126,794\).
Claim.-1. In an apparatus of the character described the combination comprising a plurality of ozonizers, a sterilizer. means for forcing ozone into the bottom of the sterilizer, and means for maintaining a moving liquid in a plurality of different strata in the sterilizer.
2. In an apparatus of the character described the combination comprising a plurality of ozonizers, a sterilizer, a filter adapted to act on a liquid supply for the sterilizer, means for forcing the ozone into the bottom of the sterilizer, and means for maintaining a moving liquid in a plurality of different strata in the sterilizer.
3. In an apparatus of the character described, the combination comprising a plurality of ozonizers, a sterilizer, a pump, means for forcing the ozone into the bottom of the sterilizer, and means for maintaining a moving liquid in a plurality of different strata in the sterilizer.
4. In an apparatus of the character described the combination comprising a plurality of ozonizers, a sterilizer, variable resistances interposed between the ozonizers, means for forcing ozone into the bottom of the sterilizer, and means for maintaining a moving liquid in a plurality of different sitrata in the sterilizer.
5 . In an apparatus of the character described the combination comprising a plurality of ozonizers, each having a plurality of rings, plates disposed between the rings and provided with serrated edges, a conducting tube, a casing disposed around the tube, a jacket disposed around the casing, leaving a space adapted to receive a cooling medium, am insulated block disposed in the jacket and beneath the casing, glass covers for the conducting tube and the jacket, a conductor connected to the conducting tube, variable resistances disposed between the ozonizers, a sterilizer connected with the ozonizers, and means for malntaining a moving liquid In a plurality of strata in the sterilizers.
6. In an apparatus of the character described the combinstion comprising a pluraIity of ozonizers, variable resistances connected with and interposed between the ozonizers and each comprising a non-conducting vessel filled with oil, a glass tube disposed in the vessel, a conducting closure for the bottom of the closed tube, means for securing the closure
to the bottom of the vessel, a liquid body of low conductivity disposed in the tube, a cover for the vessel, and a roll adjustably disposed through the cover, and a sterilizer connected with the ozonizers and a source of water supply.
7. In a device of the character described the combination comprising a source of ozone, a receiver, a plurality of horizontal perforated shelves forming superposed compartments within the receiver, means for siphoning a liquid successively from the uppermost compartment to the bottom of the receiver, and means for distributing the ozone from the bottom of the receiver to the top thereof.
8. In a device of the character described the combination comprising a source of ozone, a receiver having an upper water inlet and a lower water inlet opening and an ozon. escape opening in its top, a plurality of horizontal perforated shelves forming superpoied compartments within thi receiver, means for siphoning a liquid successfvely from the uppermost compartment to the bottom of the receiver, and mrans for distributing the ozon from the bottom of the recelver to the top thereof.

\section*{No. 102,776. Purification of Sugar Juices.}

Lipuration de jus de sucre.
Hermann Wiëse, Detroit, Michigan, U.S.A., 25th December, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138.562.

Claim.-1. The process of purifying sugar juices, which consist in reating the difusion juices with a non-basic sub stance to coagulate the albumen, separating out the coagulated substance and subsequently treating with lime.
2. The process of purifying sugar juices which consist in treating the diffusion juices with an acid to coagulate the albumen, in removing the coagulated substance, and subsequently treating with lime.
3. The process of purifying sugar juices, which consists in treating the diffusion juices with sulphurous acid to coagulate the albumen and to prevent fermentation and inversion. removing the coagulated substance and subsequently treat ing with lime.

No. 102,777. Apparatus for Cleaning and Drying Wool, Hair, Cotton.
Appareil à nettoyer et àsécher la laine. le crin. et le coton.

Thomas Alexander Stephen Wood, 4 St. Thomas Road, London, England, 25th December, 1906; 6 years. Filed 7th August, 1906. Receipt No. 138,472.
Claim.-The improved construction of apparatus for cleaning, dyeing, or otherwise treating wool, hair, cotton, and other animal or vegetable fibrous or textile material, consisting of a fixed tank 1 having blades 14 across the bottom, steam inlet 33, water inlet 32, draw off tap 16 and manholes 17, a revolving cage 12 situate within tank 1 and operated by gear outside of said tank, a reciprocating plunger or piston 18 arranged in said washer 12 and operated by gear outside said tank 1, doors 28 and operated enclosing an opening in said plunger, angled plate 15 on bottom of cage 12 , all arranged and acting substantially as set forth.

\section*{No. 102,778. Smelting Furnace.}

\section*{Fournaise pour la fonde.}

William J. Watson, Ladysmith, British Columbia. Canada 25th December, 1906; 6 years. Filed 30th July, 1906. Receipt No. 138,268.
Claim.-1. In a smelting furnace for the reduction of sulphide ores the combination with a matting chamber pro-
vided with low pressure tuyeres and a slag spout. of a refining chamber separated from the aforementioned cham-

ber by a partition having a passage therethrough in the level of the bottom, said refining chamber having a basic lining and high pressure tuyeres relatively lower than the tuyeres of the matting chamber. and an overflow spout relatively lower than the slag spout of the matting chamber.
2. In a smelting furnace of the class discribed, the combination with a matting chamber having matting tuyeres, and a slag spout, of a bottom downwardly sloping therefrom to a relatively low passsage in the level of the bottom, a refining chamber in connection with the foregoing through said passage, said refining chamber having a basic lining. an overflow spout lower than the slag spout in the matting chamber, converting tuyeres downwardly directed inward, means for conveying away the furnace gases from both chambers, and means for charging ore into each.
3. In a smelting furnace of the class described, the combination with a matting chamber having matting tuyerew and a slag spout, a bottom downwardly sloping therefrom to a relatively low passage in the level of the bottom, a reflining chamber with which said passage connects said refining chamber having a basic lining and a relatively low arched roof, an overflow spout lower than the slag spout of the matting chamber, converting tuyeres below the level of the matting tuyeres of the other chamber, a flue to carry off the furnace gases, a tilting grate in such flue, and means for charging ore thereupon.

No. 102,779. Blast Furnace. Haut fourneav.

Hiram Weave Hixon, Victoria Mines, Ontario, Canada, 25th December, 1906; 6 years. Filed 14th August 1906. Receipt No. 138,701 .
Claim.-1. A blast furnace comprising a lining of refractory material, an alr jacket surrounding the same, the outer wall of said jacket belng curved outwardly and provided with vertical partitions betwen sald lining and said jacket thereby forming a plurality of parallel passages, means for delivering air to the top of said passages, and tuyeres in the lining communicating with the lower end of said passages.
2. A blast furnace comprising a rectangular lining of refractory material, an air jacket surrounding the same and constituting a strengthening brace for said lining, the outer wall of said jacket being curved outwardly and provided with a plurality of perforated, vertical partitions between said lining and said jacket, means for delivering air to said air jacket at the upper end thereof, and means for admitting air from said jacket through said lining at the lower end thereof.
3. A blast furnace comprising a rectangular lining of magnesite, an air jacket surrounding the same, the outer wall of said jacket being covered outwardly and constituting a strengthening brace for said lining. vertical partitions hotwern said lining and said jacket, thereby subdividing said jacket into a plurality of vertical passageways, tuyeres in the walls of said furnace communicating with the lower ends of said passageways, and ports and closures therefor in the outer wall of said air jacket and in alignment with each of said tuyeres, whereby the tuyeres may be freed from obstructions.
4. A blast furnace comprising a rectangular refractory lining, and an air jacket surrounding said lining, the outer wall of said air jacket being curved outwardly and provided with a plurality of spacing braces, whereby the air jacket and its braces constitute a truss for strengthening the walls of the furnace.
5. In a blast furnace, a lining of refractory material, an air jacket surrounding the same, vertical partitions in said air jacket, each of said partitions being provided with a plurality of perforations, tuyeres communicating with the lower end of said air jacket, and means whereby the tuyeres may be freed from obstructions and foreign matter removed from the air jacket.
6. A blast furnace comprising a lining of magnesite, an air jacket surrounding sald lining, spacing partitions in said air jacket, means for admiting air to the upper end of said jacket, means for admitting air from the lower end of said jacket through said lining. means for drawing off the contents of said furnace adjacent the lower end thereof, and a magnesite spout adjacent said draw-off.
7. In a blast furnace, a lining of refractory material, a jacket surrounding said lining. means for admitting air to the jacket at the upper end thereof, and means for admitting air from the jacket to the furnace at the lower end thereof.
8. In a blast furnace, a suitable lining having tuyeres at the lower end thereof, an air jacket surrounding said lining, and means for forcing air into said jacket through said tuyeres.
9. In combination, a blast furnace lining composed of magnesite, an air jacket surrounding said lining, and means for admiting air to the upper end of said jacket and delivering it therefrom into the furnace at the lower end.

No. 102,780. Electrical Annunciator. Avertisseur électrique.

and operating to move the said ratchet wheels forward ua the return or rebound of the said oscillating lever when the electro-magnet is de-magnetized by the opening of the clectric current, a third pawl pivotally attached to the frame of the machine and operating adversely to the other pawls, and adapted to engage the ratchet wheels and limit the movement of the ratehet wheels precisely to the movement of one ratchet at each return of the said oscillating lever, a revolving pivot attached to the frame of the machine, carrying the oscillating lever, and the ratchet wheels, and extendiing through the center of a disc or dial. a dise or dial placed loosely upon the said revolving pivot, the dial being divided into equal segments, each segment being numbered, a hand or indicator fixed to the sald revolving pivot, and extending across the face of the dial, and with a bell to announce the change indicated on the dial, cells of battery to operate the bell. and lights to illuminate the dial intermittently, substantially as described, and for the purposes specifled.
2. The combination of an electro-magnet, with an autocoil and circuit changers, of two ratchet wheels operating adversely to each other, an oscillating lever, a pawl pivoted to the frame of the machine, and operating to prevent the movement of the ratchet wheels when the lever is attached by the action of the electro-magnet, a pawl pivotally attached to the oscillating lever and operating to move the said ratchet wheels forward on the return or rebound of the said oscillating lever when the electro-magnet is de-magnetized by the opening of the electric current, a third pawl pivotally attached to the frame of the machine and operating adversely to the other pawls, and adapted to engage the ratchet wheels and limit the movement of the ratchet wheels precisely to the movement of one ratchet at each return of the sald oscillating lever, a revolving pivot attached to the frame of the machine, carrying the oscillating lever and the ratchet wheels, and extending through the center of a disc or dial, a disc or dial placed loosely upon the said revolving pivot, the dial being divided into equal segments, each segment being numbered, a hand or indicator fixed to the said revolving pivot, and extending across the face of the dial, and with a bell to announce the change indicated on the dial cells of battery to operate the bell. and lights to illumine the dial intermittently, substantially as described, and for the purposes specifed.
i. The combination of an electro-magnet, with a coil. with connecting taps or leads from the coil, at intervals throughout the coil, and circuit changers, of two ratchet wheels operating adversely to each other, an oscillating leves, a pawl pivoted to the frame of the machine, and operating to prevent the movement of the ratchet wheels when the lever is attached by the action of the electric magnet a pawl pivotally attached to the oscillating lever and operating to move the said ratchet wheels forward on the return or rebound of the said oscillating lever when the electro-magnet is de-magnetized by the opening of the electric current, a third pawl pivotally attached to the frame of the machine and operating adversely to the pawls, and adapted to engage the ratchet wheels and limit the movement of the ratchet wheels precisely to the movement of one ratchet at each return of the said oscillating lever, \& revolving pivot attached to the frame of the machine, carrying the oscillating lever and the ratchet wheels, and extending through the center of a disc or dial, a disc or dial placed loosely upon the said revolving pivot, the dial being divided into equal segments, each segment being numbered. a hand or indicator fixed to the said revolving pivot. and extending across the face of the dial, and with a bell to announce the change indicated on the dial. cells of battery to operate the bell, and lights to illumine the dial inter mittently, substantially as described and for the purposes specifled.

No. 102,781. Box for Talking Machine Needles.

\section*{Boite pour aiguilles de phonographe.}

Horace Sheble, Philadelphia, Pennsylvania and Ellsworth Adam Hawthorne, Springfield, Massachusetts, U.S.A.. 25th December, 1906; 6 years. Filed 21st September, 1900. Recelpt No. 139,668.

Claim.-1. A box or case for talking machine needles, said box or case having compartments for used and unuser ncedles, and a lid or cover having an opening communicat ing with the compartment which receives the used needles.
2. A box or case for talking machine needles, said box or case having compartments for used and unused needles, and a lid or cover chambered for the reception of unusen needles, and having an opening communicating with the compartment which receives the used needles.
3. A box or case for talking machine needles. said box or case having a plurality of compartments for the reception of unused needles, a compartment for the reception of used

Goldsmith English and Edward Jennings, co-inventors, both of Windsor, Ontario, Canada, 25th Decemb
rears. Filed
years. Filed
Claim.-1. In an electrical annunciator the combination with an electro-magnet, and circuit changes, of two ratchet wheels operating adversely to each other, an oscillating lever, a pawl pivoted to the frame of the machine, and operating to prevent the movement of the ratchet wheels when the lever is attracted by the action of the electromagnet, a pawl pivotally attached to the oscillating lever
needles, and a lid or cover having an opening communicating with the latter compartment.

4. A box or case for talking machine needles, said box or caso having a plurality of compartments for the reception of unused needles, a compartment for the reception of used needles, and a lid or cover having an opening communicating with the latter compartment, and a plurality of chambers in the top for the reception of unused needles.
5. A box or case for talking machine needles, said box or case having compartments for used and unused needles, and a lid or cover having a projecting tubular boss communicating with the compartment which receives the used needles, and serving as a handle for the manipulation of said lid or cover.
0. A box or case for talking machine needles, said box or case having a false bottom with tubular projection communicating with the compartment below said false bottom, and a lid or cover having an opening registering with said tubular projection when the lid or cover is closed.

\section*{No. 102,782. Garment Support.}
support pour vitements.

Joseph W. Stockwell and Raymond Coates, both of Jackson Michigan, U.S.A., 25th December 1906; 6 years. Filed 10th October, 1906. Receipt No. 146,188.
Claim-1. A garment supporting device comprising a main body portion, a hook projecting from one side thereof, an inverted hook on the opposite side of the body portion, adapted to suspend a garment, and means at the rear of the first-mentioned hook for rigidly securing the device to a garment or the like, said means comprising a hook resilliently mounted with respect to the body portion.
2. A garment supporting device comprising a body portion, a resilient bar substantlally parallel therewith and epaced therefrom, a hook on the bar projecting toward the body portion, a hook on the body portion on the side opposite the bar, and an inverted hook on the body portion.
3. An article of manufacture comprising a body portion having a hook at its lower end and extending to one side thereof, a top portion extending from the body portion on the opposite side from the hook, a second hook in an inverted position extending downwardly from said top portion, a bar extending downwardly from the top of said inverted hook, means for resiliently connecting said bar with the top portion, and a hook on the lower end of sald bar projecting upwardly and toward the body portion.
4. An article of manufacture composed of a single piece of wire, a bend belng formed at the center of said plece of wire, the two parts of the wire extending upwardiy from the bend to form a body portion, then rearwardly from the upper end of the body portion, thence downwardly therefrom to form an inverted hook, and from the extremity of this hook upwardly again to the upper end of the body portion, thence downwardly upon a line parallel to the body portion, but spaced therefrom, and each of the last-mentioned downwardly extending portions of the wire being provided with moans for securing it to a garment located at its lower end.
5. An article of manufacture consisting a single piece of wire, and comprising a hook formed at the center of said plece of wire, the wire belng bent upon itself at the extremity of said hook, the two parts thereof extending parallel to each other upwardly from the hook to form a body portion, rearwardly from the upper end of the body portion, thence downwardly therefrom to form an inverted hook. and from the extremity of this hook upwardly again to the upper end of the body portion, then downwardly upon a line parallel to the body portion, but spaced therefrom, and each of said portions of the wire being provided with a sharpened upwardly and inwardly inclined hook at the lower end of said last-mentioned downwardly extending portion.
6. An article of manufacture composed of a single piece of wire and comprising a bend formed at the center of said piece of wire, the two parts thereof extending upwardly from the bend to form a body portion, then rearwardly from the upper end of the body portion, thence downwardly therefrom to form an inverted hook, and from the extremity of this hook upwardly again to the upper end of the body portion, thence being bent in a reverse direction to form resilient loops above the upper end of the body portion, and then downwardly along the line parallel to the body portion, and each end of the last-mentioned downwardly extending portions of the wire being provided with means for securing it to a garment.
7. An article of manufacture comprising a body having a hook on one side thereof, a portion extending from the body on the opposite side from the hook, a second hook in a reverse position extending from said portion in a direction toward the end of the body upon which the first-mentioned hook is located, a bar extending from a point beyond said portion in a direction parallel with the body toward the first-mentioned hook, means for resiliently connecting the bar with the said portion, and a hook on the end of said bar projecting at an angle toward the body.

No. 102,783. Burglar Alarm. Alarme d cambrioleurs.

Burton S. Bell, Reo Heights, South Dakota, U.S.A., 25th December, 1906; 6 years. Filed 27th September, 1906. Recelpt No. 139,845.
Claim.-1. In a device of the class specifled, a pair of plates arranged to slide one on the other and provided with toothed end portions, one of said plates being provided with
clongated slots, bolts carried by the other member and extending through said slots, nuts arranged on the bolts to adjust the fractional contact between said plates, a battery and an alarm carried by one of the plates, and normally spaced contacts carried by said plates and movable into engagement with each other as the plates slide.
2. In combination, a pair of slidable plates provided with toothed end portions, one of said plates having an elongated slot, a standard carried by the opposite plate and extending through sald slot, a contact carried by said standard, a bell, a contact carried by one of the binding posts of the bell and arranged to engage the standard carried by contact, and a battery, one pole of which is connected to the standard carried contact, and the opposite pole to the second binding post of the bell.

No. 102,784. Clip for Ironing Board Coverm.
Pinces pour couccrture de planches d repasser.

William L. Ely and Gertrude L. Ely, co-inventors, both of Cleveland, Ohio, Li.S.A., 25th December, 1906; 6 years. Filed 10th Suptember, 1306. Receipt No. 139,385.
Claim.-1. A clip for ironing board covers, comprising a flat spring member adapted to be permanently secured to the board and provided with an angular end adapted to ensage the cover and hold the same against the board.
2. A clip for ironing board covers comprising a that spring mumber adapted to de permanently secured to the board and provided with anguiar ends formed of two pointed prongs adapted to engage the cover and retain the same "balust the board.
\(\dot{\sim}\). A cllp for aroning board covers comprising a member provined with prongs at its ends adapted to engage the cover and detachably secure the same to the board and an mintimediato laterany entarged portion adapted to be permancutly secured to the board.
t. A caip for ironing board covers comprising a flat spring memver provided with angular ends formed of a plurality of pointed prongs adapted to engage the cover and detachadiy secure the same to the board and an intermediate litcrally enlarged strengthening portion adapted to be permanently secured to the board.
o. A clip lor ironing board covers comprising a member adapted to be permanently secured to the board, and provided with an enlarged strengthening portion and angular endis formed of a plurality of pointed prongs adapted to engage the cover and detachably secure the same against the poard.
o. The combination with an ironing board and a cover therefor, of a clip comprising a spring member adapted to be secured to said board and provided with prongs at its ends adapted to engage said cover and detachably secure the same to said board.
i. The combination with an ironing board and a cover therefor, of a cilp comprising a spring member provided with a central strengthening portion adapted to be permanently secured to sald board and angular ends formed of a plurality of pointed prongs adapted to engage said cover and detachably secure the same to said board.

No. 102,785. Button Fastener. Altache pour boutons.
John S. Fissel, West Philadelphia, Pennsylvania, U.S.A., 25th December, 1906; 6 years. Filed 1st S•ptember, 1906. Receipt No. 139.154.
Claim.-The herein described button fastener dusigned to bo secured to the eye of a button prior to its attachment to a garment and consisting of a piece of wire bent to form a single strand bodkin member 1, a loop 2 for the button eye. a member 3 extending from said loop and bent upon itself to form an end seat 4 for the button eye and continued to
form an inclined spring tongue 5 extending across under the loop 2 and having an upwardly curved terminal end 6
disposed within the loop 2 for the button eye and bearlag against the inner portion of one side thercof, sald fastenmp

being formed from a single strand of wire, substantially ae described.

No. 102,786. Mnltiplex Telegraph Byiena. Système télégraphique muleiple.

Tullio Glara, Boston, Massachusetts, U.S.A., 25th December.
1906; 6 years. Filed 4th July, 1905. Receipt No. 126.616
Claim.-1. In a multiplex telegraph system, a single ma:c line, a plurality of sending devices at the sending station. each including a keyboard with a plurality of keys, a plurality of printing mechanisms at the recelving station, each printing mechanism having types corresponding to sald kess. and electrical connections including said s.agle main 1.5 between said devices and said stalions in consequence of which upon the independent manipulation of the keys in the. different keyboards electrical signals are successively :ransmitted from the sending devices to the said printing mechanism over the same line, to cause the actuation of the corresponding types in the corresponding printing mechanisms, and the printing of dinerent messages by said printing mechanisms.
2. In a multiplex telegraph system, a single main line, a plurality of inuependent heyboards at the seadiag statiua each keyboard having a pluraity of independent keys. a source of electricity for said keys, a plurality of priat.ex mechanism at the receiving stations corresponding to sa.c: keyboards, each printing mechanism having a separate morable type bar for each separate key of the correspondiad keyboard, and means for connecting the keys of the keyboards and the corresponding type bar of the correaponding printing mechanisms successively with eaid single maln lioe, whereby different messages equal in number to the keybeards may all be sent over the single main line and printed at substantially the same time.
3. In a multiplex telegraph ayetem, a main line, a ser.es of independent keyboards each haring a set of kers, a plurality of sets of koy circuits each connected to a source of electrical energy having a contact, the contacts of and sets being independent of each other but arranged succeasirely in a circle or arc thereof, a revolving contact for sucomasrely engaging the said contacts of the different sets and coenected to said main line, a plurality of independent sels of printing circuite each having an independent electro-mage. actuating a type, and a contact, the last-mentioned contac. of said sets being arranged successively in a ofrcle. or ta a" arc thereof, a second revolving contact connected to 1 source of electrical energy and adapted to succeasirels in gage said last-mentioned stationary contacts, meass coz trolled by the main line for closing the circuit through asi: second revoiving contact, and moans for revolviag said or
volving contacts, said elements being arranged as described, whereby impulses for the different sets of keys are sent successivey over the line.
4. In a multiplex telegraph system, a plurality of independent sets of key circuits at he sending station each conected to a source of electrical energy having a contact the contacts of said sets being arranged successivly in a circle or the arc thereof, a main line, a revolving contact at the sending station for successively engaging said independent sets of contacts, and connected to said main line, a plurality of independent printing mechanisms at the receiving station each having an independently movable type bar for each character. circuits equal in number to the type bars, \(\bar{a}\) nd each having an electro-magnet for controlling a type bar, and a contact, said contacts being arranged in sets successively in a circle, a revolving contact at the receiving station connected to a source of electrical energy and adapted to succesively engage the sets of contacts at the receiving station, means controlled by the line for closing the circuit through sald second revolving contact, and means for revolving said revolving contacts.
5. In a multiplex telegraph system, a main line, a plurality of key circuits each connected to a source of electrical energy and having a contact, a revolving contact for successively engaging said contacts respectively and connected to the line, so that when a key is moved to close its circuit an electrical impulse is sent over the line upon the engagement o fthe movable contact with the stationary contact in said key circuit, a plurality of printing circuits each having a printing device, and each having a contact, a second revolving contact connected with a source of electrical energy and adapted to successively engage the last-mentioned contacts, a relay in the main line for closing the circuit through said last-mentioned revolving contact and thereby through one of the printing circuits when a signal is sent over said main line by any one of the key circuits, a motor for revolving the revolving contact at the sending station, an electric motor for revolving the revolving contact at the recelving station, and means for synchronizing the movement of sald revolving contacts, by automatically varying the speed of said electric motor
6. In a multiplex telegraph system, a main line, a plurality of sets of key circuits connected to a source of electrical energy each having a contact, the contacts of said sets being arranged serially in a circle, a revolving contact for successively engaging the said contacts and connected to said main line, a plurality of sets of printing circuits each having a printing device and a contact, the last-mentioned contacts of said sets being arranged serially in a circle, a second revolving contact connected to a source of electrical energy and adapted to successively engage said last-mentioned stationary contacts, means controlled by the main line for closing the circult through said second revolving contact, means for revolving said revolving contacts, and means for preventing the closing of the key circuits of the other sets thereof when the first-mentioned revolving contact is in engagement with the contacts of the key circuits of any one set.
7. In a system of the character referred to, the combination of two revolving contacts, means for revolving one of said contacts, an electric motor for revolving the other contact, an energy varying device for the motor circuit having movable contacts, electro-magnets for actuating the movable contacts of said device, separate circuits for said elec-tro-magnets, and means controlled by both of said revolving contacts for diventing current into said electro-magnet circuits.
8. In a multiplex telegraph system, sending apparatus comprising a plurality of different series of sets of contacts, a key connected to each contact to close a circult thereto an independent line for each series of sets of contacts, and a movable element having insulated contacts electrically connected to said independent lines for engaging the contacts of said respective series of sets.
9. In a multiplox telegraph system of the character described, a plurality of independent contacts symmetrically disposed in a circle at the sending station, a source of elec tricity connected to said contacts, a multiple number of independent contacts symmetrically and identically disposed in groups in a circle at the receiving station, a revolving contact at the sending station, a motor for revolving said contact, a revolving contact at the receiving station, an electric motor for revolving said last-mentioned contact, a motor circuit, means for varying the energy of the current in said circuit, and electrical connections between said groups of contacts at the receiving station and said energy varying means, in consequence of which the speed of the electric motor is caused to vary to synchronize the revolution of said revolving contacts.
10. In a multiplex telegraph system of the character referred to, a number of independent contacts symmetrically
disposed in a circle at the sending station, a source of elec tricity connected to said contacts, a main line, a revolving contact for engaging said independent contacts and connecting them to the main line in such manner that from them electric impulses go over the line to a recelving sta tion, means for moving the revolving contact, a revolving contact at the recelving station connected to a source of electrical energy, an electric motor for revolving said re volving contact, a number of electrical resistances in series in the motor circuit, and a multiple number of independent contacts symmetrically disposed in groups in a circle at the receiving station, each contact of the groups being connected to an electro-magnet controlling one of the electrical resistances in the motor circuit, in such manner that an impulse sent by an independent contact of the sending station arrives at the receiving station at one of the con tacts of a group and energizes the corresponding electromagnet which inserts in or cuts out of the motor circuit the corresponding resistance.
No. 102,787. Method of Digging Holes.
Méthode de creuser des trous.

Ira David Kemmerer, Lincoln, Nebraska, U.S.A., 25th December, 1906; 6 years. Filed 30th November, 1906. Recelpt No. 141,679.
Claim.-The method herein described of forming holes in the earth consisting in first scooping out a portion of the earth at the point where the hole is to be made and pouring water in the said cavity, then separating the earth to be removed by a cancave tool and simultaneously forming the separated body of the earth into a core, the water in the cavity being caused to run or seep down into the cut formed in the earth around the core, this water facilitating the formation of the core into an adhering mass and making its outer surface sticky enough to cause it to adhere to the tool and be removed therewith.

No. 102,788. Tool for Digging Holes.
Outil pour creuser des trous.

Ira D. Kemmerer, Lincoln, Nebraska, U.S.A., 25th December, 1906; 6 years. Filed 30th November, 1906. Receipt No. 141,680.
Claim.-A tool for digging holes consisting of a shank provided at one end with means for handing it and at its
other end with a blade substantially crescent-shape in cross section and having its longitudinal edges parallel and sharpened and its lower or entering end brought to a point. this point having cutting edges which are continuous with the side edges, the back of the tool being convex.

No. 102,789. Production of Ferro-Alloys.
Production d'alliages ferrugincur.

Edgar F. Price, Niagara Falls. New York, U.S.A., 25th Deoembar 1906; 6 years. Filed 29th October, 1906. Receipt No. 140,719 .
Claim.-1. The process of producing low carbon ferro alloys, which consists in providing a charge containing fer-ro-silicon and a compound of a metal reducible by silicon and alloyable with iron, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, tapping the resulting slag and ferro alloy from the furnace, and supplying the charge mixture as required, as set forth.
2. The process of producing low carbon ferro alloys, which consists in providing a charge containing ferro-silicon, an oxidized compound of a metal reducible by silicon and alloyable with iron, and a basic flux, establishing an electrice arc within the charge, surrounding the zone of reduction and protecting the plectrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, tapping the resulting slag and ferm alloy from the furnare and supplying the charge mixture as required, as set forth.
3. The process of producing low carbon ferro alloys, which consists in providing a charge containing ferro-silicon, and a compound of a metal reducible by silicon and alloyable with iron, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, tapping the resulting slag and ferro alloy from the furnace at different levels, and supplying the charge mixture as required, as set forth.
4. The process of producing low carbon ferro alloys, which consists in providing a charge containing ferro-silicon, an oxidized compound of a metal reducible by silicon and alloyable with iron, and a basic flux, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, tapping the resulting slag and ferro alloy from the furnace at different levels, and supplying the charge mixture as required, as set forth.
5. The process of producing low carbon ferro alloys, which consists in providing a charge containing ferro-silicon, and a compound of a metal reducible by silicon and alloyable with iron, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, maintaining between the electrodes the minimum potential difference requisite to effect reduction, thereby stibstantially prventing loss of electric current by leakage through the charge, separately tapping the resulting slag and ferro alloy from the furnace, and supplying the charge mixture as required, as set forth. 6. The process of producing low carbon ferro alloys, which consists in providing a charge containing ferro-silicon, an oxidized compound of a metal reducible by sillicon and alloyable with Iron, and a basic flux, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, maintalning between the electrodes the minimum potential difference requisite to effect reduction, thereby substantially preventing loss of electric current by leakage through the charge, separately tapping the resulting slag and ferro alloy from the furnace, and supplying the charge mixture as required, as set forth.

The process of producing low carbon ferro chromium, which consists in providing a charge containing ferro-silicon,
and a compound of chromium, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, tapping the resulting slag and ferro alloy from the furnace, and supplying the charge mixture as required, as set forth.
8. The proctss of producing low carbon ferro-chromium, which consists in providing a charge containing ferru-silicoy. an oxidized compound of chromium, and a basic flux, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, tapping the resulting slag and ferro alloy from the furnace, and supplying the oharge mixture as required, as set forth.
9. The process of producing low carbon ferro-chromium. which consists in providing a charge containing ferro-silicon. and a compound of chromium, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge, tapping the resulting slag and ferro alloy from the furnace at different levels, and supplying the charge mixture as required. as set forth.
10. The process of producing low carbon ferro-chromium. which consists in providing a charge containing ferro-sillican, an oxidized compound of chromium, and a basic flux, establishing an clectric are within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the charge. tapping the resulting slag and ferro alloy from the furnace at different levels, and supplying the charge mixture as required, as set forth.
11. The process of producing low carbon ferro-chromium, which consists in providing a charge containing ferro-silicon, and a compound of chromium; establishing an electric arc within the charge, surrounding the zone of reduction and protecting the clectrodes from the oxidizing effect of the atmosphere by a considerable body of the charge. maintainfig between the electrodes the minimum potential difference requisite to effect reduction. thereby substantially preventing loss of electric current by leakage through the charge, separately tapping the resulting slag and ferro alloy from the furnace, and supplying the charge mixture as required, as set forth.
12. The process of producing low carbon ferro-chromium, which consists in providing a charge containing ferro-silicon, an oxidized compound of chromium, and a basic flux, establishing an electric arc within the charge, surrounding the zone of reduction and protecting the electrodes from the oxidizing effect of the atmosphere by a considerable body of the oharge, maintaining between the electrodes the mindmum potential difference requisite to effect reduction, thereby substantially preventing loss of electric current by leakage through the charge, separately tapping the resulting slag and ferro alloy from the furnace, and supplying the charge mixture as required, as set forth.

\section*{No. 102,790. Explosive. Explosif}

Berthold Gustav Reichke, Hamburg, Germany, 25th December, 1906; 6 years. Filed 12th September, 1906. Receipt No. 139,455.
Claim.-1. In the manufacture of ammonium nitrate explosives as claimed in my application for patent No. 125,378, the substitution of fennel by other suitable specimen of the family of umbelliferous plants with or without an addition of woodmeal.
2. The use in combination with ammonium nitrate sefety exphosives, of the pulverized seeds of umbelliferous plants other than fennel, substantially as hereinbefore described with reference to the examples stated.
3. A safety explosive producing a minimum of deleterious explosion gases and composed of the matorials or their chemical equivalents in substantially the proportions of the foregoing examples.

\section*{No. 102,791. Stopper for Poison Bottles. \\ Bouchon pour bouteilles renfermant du poison.}

Louis N. Ritten, Charles City, Iowa, U.S.A., 25 th December, 1906; 6 years. Filed 19th September, 1906. Receipt No. 139,626.
Claim.-1. A stopper for poison bottles having a guard placed diametrically across the stopper and projecting beyond the oppasite sides of the stopper, and spurs struck downwardly from the guard and engaging opposite sldes of the stopper.
2. The combination with a stopper or a guard baving a flat body portion and longitudinally split adjacent each end. one of said split members at each end being pointed at its
extreme end and adapted to extend outwardly beyond the stopper and in the plane of the body portion of the guard,

and the other member being bent downwardly and inwardly forming a spur adapted to engage the sides of the cork, the said spurs being offset with respect to each other.

No. 102,792. Garment Hanger.
Crochet pour vêtcments.

George S. Roberts, Oak Park, Illinois, U.S.A., 25th December, 1906; 6 years. Filed 31st October, 1906. Receipt No. 140,775.
Claim.-1. In a garment hanger, in combination with a rigid transverse bar and means for supporting it, two shoulder rockers pivoted each intermediate its ends at the two ends respectively of the transverse bar, each rocker having both ends free, for rocking over the pivot.
2. In a garment hanger, in combination with a rigid transverse bar and means extending upwardly from its middle point for suspending it, two shoulder rockers pivoted each intermediate its ends at the two ends of the transverse bar, each rocker having both ends free, for rocking over the givort.
3. In a garment hanger, in combination with a rigid transverse bar and means for supporting it, two shoulder rockers pivoted each intermediate its ends to the two ends respectively of the transverse bar, each rocker having both ends free, for rocking over the pivot, and means for limiting the downward movement of the outer ends of the rockers.
4. In a garment hanger, in combination with a coat suppont a horizontally extended eye or loop depending from such coat support having sloping upper sides and a straight. bar having its upper edge convex in cross section lodged In the eye engaged with the end thereof for a trousers hanger.
5. In a garment hanger, in combination with a rigid transverse bar \(A\). the shoulder rockers \(B\). \(B\), pivoted thereto, means for supporting the transverse bar consisting of the hook C, made of an Integral piece of wire or rod inserted through the crossbar and having below the latter the long horizontal loop offset from the lower side of the bar at the outer portions of such loop to form shoulder supports for a vest, and having the end of the wire engaged with the bar A.
6. In a garment hanger in combination with a coat support comprising a rigid transverse bar, a vest and trousers support carried by such bar below the same consisting of a wire loop or eye attached to the bar at two points and offset below the bar from said points outward to the two ends respectively, and a relatively wide bar lodged in the eye on the lower bar of the latter and engaged with the ends of the eye.

No. 102,793. Garment Fastener.
Support pour vêtements.

Daniel J. Schaeffer, Allendale, Pennsylvania, U.S.A., 25th December, 1906; 6 years. Filed 31st October, 1906. Receipt No. 140,777.
Claim.-1. A garment support, comprising two members having concavo-convex substantially sphere-shaped surfaces abutting on their convex sides, one of said members being formed with a slot extending to the center of the convex surface thereof, the other of said members carrying a pin projecting from the convex surface thereof and adapted to enter said slot in the other member.
2. In a garment support the combination of two members each having concavo-convex substantially sphere-shaped surfaces abutting on their convex sides, one member being formed with a slot having an enlarged outer end, the other of said members carrying on the convex side of its central portion a headed pin adapted to enter said slot.
3. In a garment support the combination of two members each having a concavo-convex substantially sphere-shaped surface, the convex side of the surface on one member abutting with the convex side of the surface of the other momber, one member being formed with a curved slot, the other of said members carrying on the convex side of its contral portion a headed pin adapted to enter said plot.

No. 102,794. Electro-Magnetic Traction Device and Brale.
Plan de traction électro-magnésique et frein.

Charles Allson Wells, Chicago, Illinois, U.S.A., 25th December. 1906; 6 years. Filed 31st July, 1905. Receipt No. 127,316.
Claim.-1. The combination with bearing wheels, of an electro-magnetic traction increasing device including a magnetizable member supported in proximity to the rails and provided with a shoe which forms one of the poles of the magnet, sald shoe normally supported out of direct contact with and movable toward and from said rails, and a wheel brake mechanism connected with and actuated by said shoe when the latter is attracted to the rails.
2. The combination with traction wheels, of an electromagnetic traction increasing mechanism including a suspended helically wound magnetizable member and a shoe carried thereby proximate to but normally out of direct contact with the rails, and forming one of the poles of the magnet, said shoe adapted to be moved into contact with the rail and to have a movement thereon relative thereto, and a wheel brake mechanism connected with and actuated by the movement of the shoe relative to the rall.
3. The combination with traction wheels and a wheel brake mechanism, of an electro-magnetic traction increasing mechanism including a suspended hellcally wound magnetizable member provided with a magnetizable shoe normally proximate to but out of direct contact with the rail, and forming one of the poles of the magnet, said wheel brake mechanism connected to said shoe and said shoe capable of a movement relative to the rail when moved into contact therewith, whereby the wheel brakes may be applied substantially simultaneously with the energizing of the magnet to increase the traction between the bearing wheels and ralls.
4. The combination with traction wheels and a wheel brake mechanism, of a means for increasing the traction between the wheels and rails and including a suspended magnetizable nember and a helix surrounding the same and magnetizing it and the wheels, a shoe carried by the said member and normally suspended proximate to but out of direct contact with the rils and forming one of the poles of the magnet, said shoe adapted when magnetized to be attracted to the rails and to have a limited movement relative thereto, and means connecting the shoe with the wheel brake mechanism whereby the wheel brakes are applied by the movement of the magnetized shoe on and relative to the rail.
5. The combination with traction wheels and wheel brake shoes, of electro-magnetic traction increasing devices including a suspended magnetizable member and a helix surrounding the same and magnetizing it and the wheels, a magnetizable shoe on the member and forming one of the poles of the magnet and normally proximate to but out of direct contact with the rails, and capable of being attracted to the latter, said shoe having a limited movement relative to the rails when attracted thereto, and connections between the shoe and the wheel brake shoes whereby the wheel brakes are set substantially simultaneously with the energizing of the magnet to increase adhesion between the wheels and rails.
6. The combination with bearing wheels and electromagnetic means for increasing the adhesion between the same and the rails, of a wheel brake mechanism including a magnetizable shoe forming a pole of the electro-mognet and movable toward and from the ralls, said shoe, when attracted to the rails having a limited movement on the latter to actuate the wheel brake mechanism.

No. 102,795. Lacing. Lacets.

\title{
( \\ 
} furnaces, consisting in drawing off the steel in a single continuous stream to one ladle or receptacle, cutting off the supply to said ladle, and directing this same continuously flowing stream into another ladle or receptacle, in line with said first ladle without changing the direction of fiow of said steel.
4. The method of tapping steel from an open hearth or like furnace, consisting in drawing off the steel in a contínuous stream from a single tap hole into two or more ladles or receptacles, and filling sald ladtes in succession.
5. The method of tapping steel from open hearth or like furnaces, consisting in drawing off the molten steel in a continuous stream from a single tap hole into two or more ladles or recentacles.

No. 102,797. Open Hearth Firnace.
Fournaise d foyer ouvert.

John Albert Drain, Pittsburg, Pennsylvania, U.S.A., 20th December, 1906; 6 years. Filed 22nd August, 1906. Receipt No. 138,928.
Claim.-1. In an open-hearth or like furnace, a pouring spout formed of two or more sections, one ar more of said sections being adapted to swing out of the way of the succeeding section to permit the metal to flow from sald succeeding section.
2. In an open hearth or like furnace, a eectional pouring spout formed of two or more sections, one or more of said sections being hinged in turn to the succeeding section, and means for swinging said hinged sections out of the way of the succeeding section to permit the metal to fiow from said succeeding section.
3. In an open hearth or like furnace, a pouring apout comprising two or more sections, the outer section movablo with relation to the inner one, and means for tilting or swinging the outer section whereby the metal contained therein is caused to flow from its inner end

Frank Weston Whitcher, Boston, Massachusetts, U.S.A., 25th December, 1906; 6 years. Filed 29th October, 1906. Receipt No. 140,705.
Claim.-1. A composition or stiffened tip for lacings provided with an external encircling metallic reinforcing band.
2. A composition or stiffened tip for lacings provided with external encircling metallic reinforcing bands, one of which is located at the base or inner end of said stiffened tip.

\section*{No. 102,796. Method of Tapping Steel. Methode pour couler l'acier.}

John Albert Drain, Pittsburg, Pennsylvania, U.S.A., 25th December, 1906; 6 years. Filed 22nd August, 1906. Receipt No. 138,927 .
Claim.-1. The method of tapping steel from open hearth or like furnaces, consisting in drawing off the steel in a single stream and directing it into one ladle or receptacle at one point, and then shortening said stream to direct the metal to another ladle or receptacle nearer said furnace.
ous stream into a ladle or receptacle, cutting off the supply to said ladle and directing the same in a continuously flowing stream into another ladle or receptacle, without changing the direction of flow of said steel.
3. The method of tapping steel from open hearth or like
2. The method of tapping steel from open hearth or like furnaces, consisting in drawing off steel in a single continu-

No. 102,798. Fnrnace Charging Mechanism.
Machine d charger la fournaise.

David Baker, Philadelphia, Pennsylvania, U.S.A., 25th December, 1906; 6 years. Filed 5th November, 1906. Receipt No. 140,950.
Claim.-1. In a furnace charging mechanism, the combination with a receiving chamber communicating with the interior of the furnace, of a distributing bell adapted to close the lower end of said chamber and constructed to accumulate the stock delivered to the chamber to one side of the same when the bell is in closed position, means for opening the distributing bell to discharge the contents of the chamber, and means for shifting the position of the bell to vary the point of discharge.
2. In a furnace charging mechanism, the combination with a vertical receiving cylinder, of a vertically movable distributing bell adapted to close the lower end of the cylinder, said bell being constructed with relation to the cylinder to form a receiving cavity within the cylinder extending but partly around the same, means for feeding the charging material into the top of the cylinder, means for lowering the bell to discharge the contents of the cylinder, and means for changing the position of the bell around a vertical axis.
3. In a furnace charging mechanism, the combination of a main hopper, its closure, a receiving cylinder rising therefrom, a vertically movable distributing bell closing the lower end of the receiving cylinder, means carried by the bell for accumulating the stock entering the cylinder to one side, means for lowering the bell to discharge the contents of the cylinder, and means for shifting the position of the bell between the successive discharges of the material.
4. In a furnace charging mechanism, the combination with a receiving cylinder communicating with the interior of the furnace, of a vertically movable distributing bell adapted when in raised position to close the communication of the cylinder with the furnace, means carried by the bell for accumulating the stock to one side when the bell is closed, means for lowering the bell to discharge the contents of the cylinder, means for raising the bell to close the cylinder, and means controlled by the rising movement of the bell for shifting the same around a vertical axis.
5. In a furnace charging mechanism the combination with a receiving cylinder, of a distributing bell adapted to close the lower end of the same, a vertical rotary stem to which the bell is fixed, means for raising and lowering the stem, and means controlled by the vertical movement of the stem for rotating it.
0. In combination with a receiving cylinder, a distributing bell for closing the same, a vertical rotary stem to which the bell is fixed, means for moving the stem vertically, a spiral rib on the stem, a rotary member affixed against vertical movement and formed with an opening to receive the stem and having a groove to recelve the spiral rib, and means for preventing the rotation of said member in one direction only.
i. In a furnace charging mechanism the combination with a receiving cylinder, of a distributing bell closing the same. a rotary vertically movable stem fixed to the bell, a spiral rib on said stem, a horizontal ratchet wheel formed with \(a_{n}\) opening to receive the stem and with a groove to receive the spiral rib, a pawl engaging the ratchet wheel and means for moving the stem vertically.
8. In a furnace charging mechism the combination with a receiving cylinder, of a distributing bell closing the lower end of the same, said bell having a portion only of its distributing surface exposed to the fall of the material fed into the cylinder, and means for shifting the position of into bell to adjust the exposed portion of the same to different points around the cylinder.
Y. In a furnace charging mechanism, and in combination with a receiving cylinder, a distributing bell therefor, an upright wall rising from its distributing surface, and means for directing the stock to one side of said wall.
10. In a furnace charging mechanism and in combination with a receiving cylinder, a relatively movable distributing bell for closing the same, a shield carried by the bell and acting to direct the stock fed to the chamber to one side, and means for shifting the position of the bell with reference to the chamber to vary the point of discharge of the stock.
11. In a furnace charging mechanism and in combination with a receiving cylinder, a distributing bell closing the same, an upright wall carried by the bell and extending across the cylinder, and an inclined shield extending upward and outward from the upper end of the wall, and having its edge curved to conform to the curvature of the cyninde:
12. A distributer for blast or similar furnaces consisting of a chute a distributing plate diagonally disposed in the chute, means for raising and lowering the distributing plate, and means for imparting a partial revolution thereto.

1i. In a distributer for blast or similar furnaces the combination of a discharging hopper, means for controlling the discharge from the hopper, a chute leading thereto, a discharging plate diagonally disposed in the cnute, a shaft for raising and lowering the discharging plate, and means for imparting a partial revolution to the shaft.
14. A distributer for blast or similar furnaces, consisting of a lower discharging hopper, a conical bell adapted when in raised position to close the mouth of the discharging hopper, a shaft by which the bell is supported, a chute opening into the lower or discharging hopper, a distributing piate diagonally disposed in the chute, a tubular shaft surrounding the first-mentioned shaft, to which the distributing plate is secured, means for raising and lowering the tudular shaft, means for imparting a partial revolution thereto, and means for raising and lowering the shaft supporting the lower bell.
15. A distributer for blast or similar furnaces, consisting of a discharging hopper having converging side walls, a bell adapted when raised to close the mouth of the discharging hopper, a chute opening into the discharging hopper, a bell adapted when raised to close the mouth of the chute, a distributing plate secured to the bell and extending diagonally across the chute, a tubular shaft to which the last-mentioned bell and distributing plate are secured, means for raising and lowering the tubular shaft, means for imparting a partial revolution thereto, and a second shaft passing through the tubular shaft and connected with the discharging bell and adapted to be raised and lowered.
10. In combination with a furnace, a main hopper and bell, a recelving hopper above the main hopper, a vertically movable closure controlling the discharge of the materials from the receiving hopper, a distributing plate situated in the recelving hopper and adapted to direct the materials entering the same to one side, and means for turning the distributing plate around horizontally to vary the direction of the flow of the materials.
17. In a furnace charging mechanism the combination of a receiving chute, a distributing plate therein, a closure for the chute movable vertically relatively to the same, and means controlled by the vertical movement of the closure for shifting the position of the plate around a vertical axis.
18. A distributer for blast or similar furnaces consisting of a chute, a distributing plate diagonally disposed in the chute, a bell movable vertically and adapted to control the discharge of the materials from the chute, and suitable connections between the bell and plate formed to impart a partial revolution to the plate as the bell is moved vertically.
19. In combination with the main hopper and bell, a receiving chute, a vertically movable distributing bell controlling the discharge of the materials from the receiving chute, and means dependent upon the movement of sail distributing bell for imparting a turning movement to the plate.
26. The combination of a receiving chute, a distributing plate therein, a closure for the chute movable vertically to open and closed positions, a distributing plate diagonally disposed in the chute, a source of power for operating the closure, and means controlled by said source of power for moving the plate around a vertical axis to vary the position of the same in the chute.

No. 102,799. Furnace for Smelting, Etc.
Fournaise pour la fonte, etc.

Alfred Smallwood, London, England, 25th December, 1906; 6 years. Filed 17th September, 1906. Receipt No. 139,573.
Claim.-1. In smelting. crucible, heating, annealing and like furnaces and in kilns for burning and glazing pottery and for other like purposes in which a grate, a combustion chamber and heat distributing chambers are combined, the improvements characterized by the arrangement of the horizontal heat distributing chambers, in combination with means for damping off or regulating the supply of heat to any of the working chambers, substantially as and for the purposes set forth.
2. In furnaces of the type set forth in claim 1, the improvement characterized by the combination with an annealing chamber and a horizontal heat distributing chamber, of means whereby the supply of heat to any part of the anncaling chamber can be regulated, substantially as and for the purpose herein set forth.

No. 102,800. Electric Furnace. Fournaise álertifique.

Frederick Titcomb Snyder, Oak Park, Illinois, U.S.A., 25th December, 1906; 6 years. Filed 25th August, 1906. Receipt No. 138,971.
Claim.-1. An electric furnace constructed with a preheating chamber for materials to be smelted, a smelting chamber having a feed opening to receive materials from said preheating chamber, a condensing and refining chamber, receiving gaseous products from said smelting chamber and discharging uncondensed gases into said preheating chamber, said chambers being all enclosed by the outer walls of the furnace to conserve the heat from the smelting chamber.
2. An electric furnace comprising a smelting chamber and a condensing chamber adjacent thereto and enclosed within the same outer walls, whereby the heat from the smelting is communicated to the metal condensed in said condensing chamber.
3. An electric furnace having a horizontal partition therein forming a smelting chamber in the lower portion and a preheating chamber in the upper portion, receiving heat through said partition from said smelting chamber, said partition having a feed opening therein through which preheated materials from the upper chamber may be introduced into the lower or smelting chamber.
4. An electric furnace constructed with a smelting chamber and a combined condensing and refining chamber in the lower port on thezeof, and a preheating chamb:r in the upper portion, the floor of ths preheating chamber forming the roof of the smelting chamber and having a feed opening therethrough, and means for normally closing said feed opening
against the passage of gas, passages being provided to convey the gaseous products of smelting from the smelting chamber to the condensing chamber and thence to the preheating chamber, a flue being provided for the final escape of the gases from said preheating chamber.
5. The combination with a smelting furnace having a feed opening in its roof, of a cover supported at a distance above said opening and overlapping the same, whereby materials upon the roof when pushed toward the feed opening reach up to said cover and form a seal to prevent the escape of gas.
6. A smelting furnace having a horizontally extending partition dividing the furnace into a smelting chamber in the lower portion and a preheating chamber in the upper portion thereof, said partition having a feed opening therein by which materials may be introduced into the smelting chamber, and flues adapted to conduct the gases from said smelting chamber through said preheating chamber.
7. The combination with an electric smelting furnace, of a combined condensing and refining chamber adjacent to said furnace. a connection from said furnace to said chamber, opening being provided in said condensing and refining chamber, one near the bottom and another at a distance above the bottom to withdraw the heavier and lighter metals respectively from said chamber.
8. The combination with an electric smelting furnace, of a transverse partition dividing the furnace, a smelting chamber being formed on one side of said partition, the upper part of the chamber on the other side of said partition constituting a condensing chamber and the lower portion thereof a refining chamber, said several chambers being enclosed within the same outer walls of the furnace, and receiving heat from the smelting chamber, a passage being provided from the smelting chamber to the condensing chamber, and a flue for uncondensed gases leading out of said condensing chamber.
9. An electric furnace having a smelting chamber comprisIng a transverse passage containing molten resistance maLerial, and metal receptacles at the ends of said transverse passage communicating with said transverse resistance passago and also communicating with the exterior of the furnace on the sides thereof, in combination with conductors dipping into an arm of each of said metal receptacles, leaving the other arms thereof free to permit the metal to be laddled out.
10. An electric furnace having a smelting chamber which in plan is \(H\)-shaped, the two arms of the \(H\) communicating with the exterior of the furnace and containing liquid metal, and the cross passage containing resistance material, in combination with elcetrodes dripping into the metal at the ralls of satid cross passage.
11. An electric furnace having a smelting chamber comprising a transverse passage containing resistance material, and a metal receptacle at each end of said transverse passage, cach metal receptacle communicating with wells exterior to the furnace on both sides thereof by passages under the side falls thereof, in combination with electrodes dipping into the exterior wells, one at each end of said transverse passage and upon opposite sides respectively of the furnace.
12. The combination with a closed smelting furnace, of a refining chamber having openings communicating with exterior wells, one of said openings being near the bottom and another at a distance above the botcom, through which the heavier and lighter metals may be respectively withdrawn without admitling air in said refining chamber.
13. The combination with an electric smelting furnace, of a condenser, and a collecting chamber below said condenser, said chamber being closed to the ingress of air and having an opening near the bottom thereof communicating with a well external to said chamber, so that the metal may be withdrawn from sald chamber without the admission of air.
14. The combination with a furnace having electrical means for developing heat internally therein, of an auxiliary fuel burner adapted to direct its flames through an opening in the wall of the furnace, and means for closing the burner opening and shutting off the fuel burner during the electrical operation of the furnace.
15. The combination with an electric furnace having molten resistance material and means for passing current therethrough to heat said furnace, of an auxiliary fuel burner in said furnace in position to initially heat said resistance material to a temperature which will permit the passage of a large volume of current therethrough.
16. An electric furnace comprising a smelting chamber and a combined condensing and refining chamber, both of said chambers being closed to the air, a passage being provided for conveying gaseaus products of reduction from the smelting chamber to the refining chamber, and an opening being also provided for separately withdrawing metals o different specific gravity from said refining chamber.

No. 102,801. Burial Appliance.
Accessoir pour sépulture.

Jacob W. Shull, Springehurch, Penneylvania, U.S.A., 25th December, 1906; 6 years. Filed 3rd December, 1906. Receipt No. 141,757.
Claim.-1. A burial appliance comprising a casket receptacle, a box and means carried thereon foldable within the said box and extensible from the sides and ends of the box to form a lining for the walls of the grave.
2. An attachment for burial boxes, consisting of a frame adapted to be hinged to the upper edge of the box to fold therein, said frame having a covering and adapted to be swung up over the wall of the grave to form a lining therefor.
3. An attachment for burial boxes, which comprises a frame adapted to be hinged to the box to fold therein and to be swung up against the side of the grave, said frame having extensible end portions, and a fabric covering for the said frame.
4. An attachment for burial boxes, which comprises a flexible frame hinged to the box to fold therein and to swing up against the wall of the grave, said frame having extensible end portions, means for drawing the ends inwardly, a fabric loasely mounted on the frame for the purposes described.
5. In combination with the box \(B\), the side and end frames formed of a flextble material hinged at their lower end to the inner side of the upper edges of the box, said frames having extensible end sections, spring devices for drawing the end sections normally inward and a flexible body wholly covering the said frames, and having sufficient fullness to permit of drawing out the end portions of the said end and side members for the purposes specified.

\section*{150. 102,802. Burial Vanlt. Voute mortuaire.}

William Parry, Crown Point, Indiana, U.S.A., 25th Decem-
ber, 1906; 6 years. Filed 5th December, 1906. Receipt No. 141,830.
Claim.-1. A burial vault consisting of a coffer dam or curb pontion whose sides and ends are integrally constructed of cement, but with open top and bottom, the walls of the same being made perpendicular and of uniform thickness and having along the inner side of its upper edge a continuous recess and a detachable cover fitting this recess and adapted to be hermetically sealed therein.
2. A burial vault consisting of a coffer dam or curb porthon whose sides and ends are integrally constructed of cement, but with onen top ond bottom, the walls of the same being made perpendiculor and of uniform thicknees 12-30
and having along the inner slde of its upper edge a continuous recess, a detachable cover fitting the recess, pillow

blocks arranged within the bottom of the inclosure and a platiform mounted on the pillow blocks.

No. 102,803. Support for Glaxing.
Support pour vitrage.

John Petz and Herbert Malott, assignee of a half interest, both of Detroit, Michigan, U.S.A., 25th December, 1906; 6 years. Filed 23rd November, 1906. Receipt No. 141,452.
Claim.-In a sash bar the combination of a wooden post having converging sides, a flat iron bar inserted therein from a point adjacent to the intersection of the planes of the surfaces of said sides and in a plane making substantially equal angles with said planes, said post being provided with grooves upon its sides for receiving the edges of the glass, a securing rail grooved to fit against said converging surfaces and adapted to cover the exposed portion of said bar and fit against the glass in said grooves, and securing means extending through said rail and through said converging surfaces at approximately right angles to said surfaces.

No. 102,804. Flectrical Medicinal Appliance. Articles médicaux électriques.

John Franklin Richardson and John Campbell Wardell, assignee of a half interest, both of Montreal, Quebec, Canada. 25th December, 1906; 6 years. Filed 5th December, 1905. Recelpt No. 130,699.
Claim.-A system for the electrical distribution and control in body appliances for medical purposes, comprising a battery, an induction coil having primary and secondary
winding and a vibrating reed, a switch formed of a lever pivotally mounted on a plate having a contact secured thereto co-acting with the lower end of said lever and a plurality of contacts secured thereto co-acting with the upper end of said lever respectively, wiring connecting a battery terminal to a contact co-acting with the reed of said induction coil. wirlng connecting a batttry terminal with the lowermost contact on said switch plate, wiring connecting said plurality of upper contacts on said switch plate respectively to a corresponding number of sections of said secondary windings respectively, body contacts in sets, wiring connecting one set of said body contacts with said sucondary windings, and wiring connecting the other set of body contacts with said lever and forming with the two sets of body contacts the induction coil, the wiring thereof, and the body, a circuit connected with the battery circuit and adapted to transmit through said body a faradic current, as and for the purpose specified.

No. 102,805. Firearm. Arme ì fel.

William Wilson Smith and Harry Hill, assignee of a half interest, both of Trenton, New Jersey, U.S.A., 25th December, 1906; 6 years. Filed 26th February, 1906. Receipt No. \(133,296\).
Claim.-1. A gun barrel and a plurality of muzzle sections adapted for gas-tight screw connection with the main barrel, said muzzle sections being of varied lengths and of equal or unequal bore, and devices to prevent the rotation of the sections when in operative relation to the main barrel.
2. In firearms the combination with two main barrels, of extension interchangeable muzzle sections, and means for connecting the said sections in a gas-tight manner, the said muzzle sections being adapted to be of varied lengths and of equal or unequal bore.
3. In firearms, a barrel constructed in a main section and interchangeable muzzle sections, and means for connecting the sections of the barrel in a gas-tight manner, and locking devices co-operating with the connecting means.
4. In firearms, a barrel consisting of a main section and interchangeable muzzle sections, the muzzle sections being adapted to enter the main section in a gas-tight manner, and locking devices for the sections of the barrel, as described.
5. In firearms, a barrel comprising a main section having the end thereof internally enlarged and provided with a shoulder at the junction of the enlarged portion with the main portion, interchangeable muzzle sections having a reduced portion for entering all enlarged portions of the main section and provided with a shoulder at the base of the reduced portion, the main section of the interchangeable muzzle sections each being provided with a groove near the adjacent ends thereof, said grooves registering when the muzzle section is in position, and a catch arranged within the groove for securing the parts together.
0. In firearms, a barrel comprising a main section having the end thereof internally enlarged end portion with the main portion, interchangeable muzzle sections having a reduced portion for entering the enlarged portion of the main section and provided with a shoulder at the base of the reduced portion, and a catch for securing the parts together.
7. In firearms, a barrel comprising the main section and interchangeable muzzle sections, the main section and the muzzle sections each provided with a groove at their adjacent ends, the grooves of the main section and the muzzle sections intermeshing when said muzzle sections are in position, a catch pivoted within the groove of the main section, its free end being adapted to engage the groove of
the muzzle sections, and a spring latch on the muzzle sections for engaging the end of the catch.
8. In firearms, a barrel comprising a main section and interchangeable muzzle sections, the muzzle sections being threaded into the main section, and a spring actuated catch on the main section for engaging the muzzle sections when they are in position.

No. 102,806. Tapping Jacket. Tube pour coulée.

\(\vdots\)
\(\vdots\)
\(\vdots\)
\(\vdots\)
U
U

The International Nickel Company, New York Oity, New York, U.S.A., assignee of Peter Stoddart, Copper Clifr, Ontario, Canada, 25th December. 1906; 6 years. Filed 21st September, 1906. Receipt No. 139,666.
Claim.-A case tapping jacket having a cooling pipe cast around the tap hole, and through which water is circulated. substantially as set forth.

\section*{上0. 102,807. Folding Paper Box. \\ Boite pliante en papier.}

Kilgour Brothers, assignee of Frederick G. Alexander, all of Toronto, Ontario, Canada, 25th December, 1906; 6 years. Filed 24th September, 1906. Receipt No, 139,755.
Claim.-1. A paper box provided with a bottom, sides and ends hinged on the bottom, corner infolds hinged on the ends of the sides and flaps hinged on the upper edges of the ends, a hole being formed in each end, and slits being cut in each linfold and flap extending to one edge thereof, and each whell the box is set up coincident at one part of its length with the hole, in combination with a tape passed through the hole and adapted to be drawn into the slits, substantially as described.
2. A paper box provided with a bottom, sides hinged on the bottom, corner infolds hinged on the ends of the sides and each slit downwardly a short distance from its upper edge, ends hinged on the bottom each having a hole therein, end flaps hinged on the ends and each slit upwardly a short distance from its lower edge, in combination with a tape passed through the hole, and adapted to be drawn into the slits, the latter being so placed and proportioned that a portion of each slit coincides with its adjacent hole, substantially as described.
3. A blank for a paper box formed of an integral piece of slock cut to form the bottom \(A\), the sides \(B\), the corner infolds \(C\), each having a slit \(D\) cut in its outer side, and the ends \(E\) each having a hole \(F\) formed therein, substantially as deeoribed.
4. A blank for a paper box formed of an integral plece of stock cut to form the bottom \(A\), the sides \(B\), the corner infolds \(C\), each having a slit \(D\) cut in its outer side, the ends \(E\) each having a hole \(F\) formed therein, and end flaps \(O\), eaoh having a slit \(H\) cut in its outer edge, substantially as described.
5. A blank for a paper box formed of an integral plece of stock cut to form the bottom \(A\), the sides \(B\), the corner infolds \(C\), each having a slit \(D\) cut in its outer side and one at each end having a slot \(K\) cut therein, a projection \(L\) formed on the other infold at each end, and the ends \(E\), each having a hole \(F\) formed therein, substantially as described.

No. 102,808. Etarting Device for Vapour Converters.
Apparcil pour la mise en train des convertisseurs a vapeur.

The Cooper Hewitt Electric Company, New York City, New York, assignee of Percy Holbrook Thomas, Montclair, New Jersey, both in the U.S.A., 25th December, 1906; 6 years. Filed 24th April, 1906. Receipt No. 135,217.
Claim.-1. In a system of electrical distribution, in which vapour electric apparatus having a main negative electrode and a supplemental el ctrode is utilized to supply energy against the counter electro motive force, the method of starting the vapour device into operation, which conslsts in passing current form the counter electro motive force through the main negative electrode causing it to act momentarily as a positive electrode to the supplemental electrode as a negative and subsequently connecting the main negative electrode with the supplemental electrode.
2. In a system of electrical distribution in which vapour electric apparatus having a main negative electrode and a supplemental electrode is utilized to supply energy against the counter electro motive force, the method of starting the vapour device into operation, whioh consists in utilizing the counter electro motive force to start into operation as a negative electrode and electrode other than the negative electrode and thereafter joining these electrodes.
3. In a system of electrical distribution in which vapour clectric apparatus having a main negative electrode and a supplemental electrode is utilized to supply energy against the counter electro motive force, the method of starting the vapour device into operation, which consists in causing the counter electro motive force to pass current through the container, utilizing another electrode than the main negative electrode temporarily acting as a negative electrode, substituting current from a main position electrode for the current from the counter electro motive force and connecting the temporary negative electrode with the main negalive electrode.
4. In a system of electrical distribution in which vapour electric apparatus having a main negative electrode and a supplemental electrode is utilized to supply energy against the counter electro motive force, the method of starting the vapour device into operation, which consists in utilizing the counter electro motive force to overcome the negative electrode resistance of the supplemental electrode, and subsequently transferring the negative electrode spot from the supplemental electrode to the main operating negative electrode.
5. In a system of electrical distribution in which vapour electric apparatus having a main negative electrode and a supplemental electrode is utilized to supply energy against the counter electro motive force, the method of starting the vapour device into operation, which consists in joining mechanically the main negative electrode with the supplemental electrode, passing current through the joined elec-
trodes from the counter electro motive force, separating the electrodes and thereby causing a breaking down of the negative electrode resistance of the supplemental negative electrode, subsequently joining the electrodes a second time, causing a division of current between the two electrodes, again separating the electrodes and thereby causing a breaking down of tho negative electrode of the main electrode, and cutting out of action the supplemental electrode.
6. The combination of an alternating current source, a work ciroult containing counter electro motive force, a vapour converter adapted to pass current through the work circuit, means for joining the main negative electrode with the supplemental electrode to primarily pass current from the supplemental electrode through the container, means for breaking down the negative electrode resistance and separating the electrodes so that the alternating current operates upon the supplemental electrode as a negative electrode, means for transferring the operating current from the supplemental negative electrode to the main negative electrode by means of metallically connecting the two electrodes within the chamber.
7. In a vapour converter having a plurality of positive electrodes, a main negative electrode and a supplemental negative electrode, means for starting the device with the supplemental electrode as a negative electrode, and means for transferring the current from the supplemental electrode to the main electrode as a negative electrode.
8. In a vapour converter having a plurality of positive electrodes and a main and a supplemental negative electrode, means for successively passing current to the lastnamed electrodes as negative electrodes.
9. In a vapour converter, a plurality of positive electrodes, a main and a supplemental negative electrode, in combination with means for utilizing the supplemental electrode as a negative electrode during the starting process, and means for utilizing the main negative electrode as a negative during the operating process.
10. In a vapour converter, a plurality of positive electrodes, a main and a supplemental negative electrode, in combination with means for utilizing the supplemental electrode as a negative electrode during the starting process, means for utilizing the main negative electrode as a negative, during the operating process, and means for cutting out the supplemental negative electrode.
11. In a vapour device of the tilting type having a plurality of positive electrodes and main and supplemental negative electrodes of conducting liquid, where in the device is started into operation by the rupture of a stream or layer of conducting liquid adapted to connect the main negative electrode and the supplemental electrode, means for causing a plurality of breaks during a single tilting of the device.
12. In a vapour device of the tiliting type having a plurality of positive electrodes and main and supplemental negative electrodes of conducting liquid, wherein the device is started into operation by the rupture of a stream or layer of conducting liquid adapted to connect the main negative electrode and the supplemental electrodes, means for causing a plurality of breaks during a single tilting of the device, and means for preventing the extingulshment of the device on the re-establishment of the metallic circuit through the device.
13. The combination with an exhausted container, a plurality of positive electrodes therein, main and supplemental negative electrodes of vapourizable material therein, connections between the electrodes and a source of alternating current, means for connecting the main negative eleotrode and the supplemental electrode, means for tilting the container, and means for causing a plurality of breaks in the liquid conductor during a single tilting operation.
14. The combination with an exhausted container, a plurality of positive electrodes therein, main and supplemental electrodes of vapourizable material therein, connections between the electrodes and a source of alternating current, means for connecting the main negative electrode and the supplemental electrode, means for tilting the container, means for causing a plurality of breaks in the liquid conductor during a single tilting operation, and means for preventing the extingulshment of the device on the re-establishment of the circuit through the container.
15. The combination with an exhausted container, a plurality of positive electrodes therein, main and supplemental negative electrodes of vapourizable material therein, connection between the electrodes and a source of alternating current, means for connecting the main negative electrode and the supplemental electrode, means for tilting the container, means for_causing a plurality of breaks in the Iiquid conduotar during a single tilting operation, and means for preventing the extinguishment of the device on the re-establishment of the circuit through the container, such means consisting of a cut-out in the circuit between the source of alternating current and one of the positive electrodes.
16. In a vapour converter adapted to be tilted more than once for accomplishing the starting operation, the method of obtaining successive tiltings, which consists in connecting a tilting coil in shunt between the main negative electrode and a supplemental electrodes so that the short circuiting of these two electrodes within the container withdraws current from the coil, and automatically cutting out the tilting coil after work current starts in the main negative electrode.
17. In a system of electrical distribution in which vapour electric apparatus is utilized to supply energy derived from an alternating current source against a counter electro motive force, such as a storage battery, the method of preventing the discharge of the battery upon the failure of the alternating current supply, which consists in opening the work circuit automatically when the alternating current supply ceases.
18. In a vapour converter adapted to be started by successive connections and interruptions of a circuit between the main negative electrode and a supplemental negative electrode therein, the method of securing repeated connections and interruptions, which consists in causing the tilting of the converter to be abruptly stopped, whereby undulation of the conducting liquid connecting the said electrodes is brought about.
19. In a system of electrical distribution in which vapour electric apparatus having a main negative electrode and a supplemental electrode is utilized to supply energy against the counter electro motive force, the method of removing current from the supplemental negative electrode after the starting of the current through the main negative electrode, which consists in placing the supplemental electrode in shunt to the work circuit and removing from the shunt circuit all inductance.

\section*{No. 102,809. Manufacture of Ferro-Molybdenum.} Fabrication de ferro-molybdène

The Ferro Alloys Syndicate, assignee of Henry \(W\) C Annable, both of London, England, 25th December, 1906; 6 years. Filed 30th October, 1906. Receipt No. 140,761. Claim.-The manufacture of ferro-molybdenum by preparing a solution containing molybdate of an alkali, precipitating this by means of a salt of iron, and obtaining molybdate of íron and reducing this to ferro-molybdenum, substantially as hereinbefore described.

\section*{No. 102,810. Production of Molybdenum, Etc. Préparation de molybdène, etc.}

The Electro-Metallurgical Company, Chicago, assignee of P. M. Becket, Niagara Falls, New York, 25 th December, 1906; 6 years. Filed 15th November, 1906. Receipt No. 141,233.
Claim.-1. The process of reducing molybdenum, which consists in smelting a mixture of molybdenum sulphide and a resulphurizing agent, as set forth.
2. The process of reducing molybdenum, which consists in smelting a mixture containing molybdenum sulphid and a plurality of elements capable of uniting with sulphur, as set forth.
3. The process of reducing molybdenum, which consists in smelting a mixture containing molybdenum sulphide, an alkali or alkaline earth metal compound and carbon, as set forth.
4. The process of reducing molybdenum which consists in smelting a mixture containing molybdenum sulphide, an alkali or alkaline earth metal compound and carbon, as set forth.
5. The process of reducing molybdenum, which consists in smelting a mixture of molybdenum sulphide, an oxygen compound of a metal having a relatively high affinity for sulphur and carbon, as set forth.
0. The process of reducing molybdenum, which consists in smelting a mixture of molybdenum sulphide, a calcium compound and carbon, as set forth
7. The process of reducing molybdenum, which consists in smelting a mixture of molybdenum sulphice, calcium oxide and carbon, as set forth.
8. The process of producing molybdenum alloys, which consists in smelting a mixture of molybdenum sulphide, a desulphurizing agent and source of the alloying metal, as set forth.
9. The process of producing molybdenum alloys, which consists in smelting a mixture containing molybdenum sulphide, a plurality of elements capable of uniting with sulphide, and a source of the alloying metal, as set forth.
10. The process of producing molybdenum alloys which cansists in smelting a mixture containing molybdenum sulphide, an alkali or alkaline earth metal, carbon and a source of the alloying metal, as set forth.
11. The process of producing molybdenum alloys, which consists in smelting a mixture of molybdenum sulphide, an oxygen compound of a metal having a relatively high affinity for sulphur, carbon and a source of the alloying metal, as set forth.
12. The process of producing molybdenum alloys, whish consists in smelting a mixture of molybdenum sulphide, calcium oxide, carbon and a source of the alloying metal, an set forth.

No. 102,811. Circuit Breaker. Interrupteur de circuit.

Sears B. Condit, Jr., assignee of Leonard Lord Elden, both of Boston, Massachusetts, U.S.A., 25th December, 1906; 6 years. Filed 4th April, 1901. Receipt No. 86,330.
Claim.-1. An electric switch comprising separable contacts, closing mechanism therefor, including an operating handlo automatically losing closing control of said contacts when the latter are moved to circuit closing position.
2. A switch for electric currents, comprising separable contacts to open and close the circuit, and closing mechanism therefor, including means causing the operator to loso closing control of said contacts every time they are fully closed.
3. An electric switch comprising a contact carrying membeı, means for operating said member, a toggle normally connecting said means and said member, and electro-responsive means for breaking said toggle independently of the movement of said operating means.
4. An electric switch comprising a contact carrying member, an operating handle for actuating said member, a toggle connected with said member and having detachable connection with said handle, and electro-responsive means for breaking said toggle.
5. An electric switch comprising a contact carrying mem ber, a toggle for operating said member, a lever intermittingly engaging and operating said toggle to close the switch, and electro-responsive means for breaking said toggle independently of the movement of said lever.
6. In an electric switch, automatic magnetic tripping means therefor, and an operating handle for closing the switch, having means normally maintaining inoperative relation between said handle and switch when the latter is closed.
7. An electric switch comprising a contact carrying member, manually operable means for actuating said member. electro-responsive means for automatically opening said switch, and independent mechanical tripping means for said actuating means for preventing the maintenance of the switch in circuit closing relation during the continuance of predetermined current conditions.
8. In an electric switch, the combination of separable contacts, a contact carrying member movable in one direction. an actuating member therefor movable in a different direction, an operating handle, means for disengagably connect ing the two, and a current actuated device responsive to predetermined electrical conditions in the circuit operating independently of the movement of the handle to release said member and permit the switch to open during the setting of the switch or afterward.
9. In an electric switch, the combination of separable contacts, a movable contact carrying member, hand operated actuating means therefor, a stationary contact member, a bracket and depending post rigidly supporting the latter said movable contact carrying member being mounted to move up and down on said post.
10. In an electric switch, the combination of separable contacts, a movable contact carrying member, hand operated actuating means therefor, a stationary contact member, a bracket and depending post rigidly supporting the
latter, eaid movable contact carrying momber being mounted to move up and down on said post, and binding posts leading from said depending stationary contact member and connecting with the contacts thereof, for corresponding series of circuit wires.
11. A circuit breaker, having separable co-oparative contacts, and means for separating them, said means including a longitudinally movable rod, an operating lever for moving said rod lengthwise in one direction to close a circult, and quick acting mechanism for moving the rod lengthwise in an opposite direction to break the clrcuit, said mechanism including a lever capable of swinging freely outward in one direction to permit the opening movement of said rod and moving past a dead center in an opposite dinection to hold the rod locked in closed position, and means for lifting said lever past sald dead center to permit the quick opening of the breaker.
12. A circuit breaker, having separable co-operative contacts, and means for separating them, said means including a longitudinally movable rod, an operating lever for moving said rod lengthwiee in one direction to close a circuit, and quick acting mechanism for moving the rod in an apposit. direction to break the circuit, said mechanism including means tending to forcibly move the rod quickly toward opew position, a lever capable of springing freely outward in one direction, said lever moving past a dead center in an opposite direction to hold the rod locked in closed position, and automatic means for lifting said lever past said dead center to permit the quick opening of the breaker.

\section*{No. 102,812. Apparatus for Building Submerged Concrete Worles.}

Apparcil pour la construction de travaux submergés en eiment.
Frederick Joseph Gilman and William Darling, assignee of a half interest, both of Montreal, Quebec, Canada, 25tn December, 1906; 6 years. Filed 12th July, 1901. Receipt No. 88,841 .
Claim.-1. In an apparatus of the character described, a plurality of floats, a bridge the extremities of which are connected rigidly to said floats, a plurality of sheaves disposed in opposite rows eupported by said bridge, cables passing over said sheaves, and means for lowering said cables at substantially the same speed.
2. In an apparatus of the character described, a plurality of floats, a bridge connecting said floats, a plurality of sheaves supported by said bridge and supported in opposite rows, cables passing over said sheaves, and means for lowering and raising said cables substantially the same speed.
3. In an apparatus of the character described, a plurality of floats, a bridge connecting said floats, a plurality of

sheaves disposed in opposite rows supported by said bridge said sheaves being arranged in serles, hoisting cables passing over other of said sheaves, and winding drums on and off of which said cables may be led at substantially the same speed.
4. In an apparatus of the character described, a float. a rigid extension supported thereby, a plurality of sheaves disposed in opposite rows supported by said extension, said sheaves being arranged in series, hoisting cables passing over one series and releasing cables passing over the other series of said sheaves, and hoisting drums to which said cables extend, said drums being arranged to feed said cables at substantially the same speed.
5. In apparatus of the class described, in combination a pair of oppositely disposed hulls, a bridge the extremities whereof are rigidly attached to said hulls, said bridge constituting a beam, a plurality of sheaves carried upon said beam and disposed in opposite rows, cables passing over said sheaves, lifting hooks carried repedtively by said cables, and means for taking up said cables at substantially the same rate.
6. In apparatus of the class desoribed, in combination a pair of oppositely disposed hulls, a bridge the extremities whereof are rigidly attached to said hulls said bridge constituting a beam, a plurality of sheaves carried upon said beam and disposed in opposite rows, a plurality of cables passing over said sheaves, lifting hooks respectively carried by said cables, a drum upon which said cables wind, whereby said cables may be taken in at substantially the same rate.
