7. A separator comprising a main trough, a series of parlitons therein. each being provided with a separating plate having its front end located just below the water level, each of said plates being provided with means for carrying away fine sand and mud from a point near the surface of the water and a dam located beyond the last plate and extending downwardly from a point above it.
s. A separator comprising a main trough for containing water and a series of partitions in the trough, each provided with a separating plate having its front end located just below the water level, each of said plates being provided with means for carrying away fine material from a point near the surface of the water and each of said plates being located on a lower level than the plates between it and the point at which the matcrial to be operated upon enters the main trough.

No. 101,350. Rope Fitch. \(\Delta\) ttache de corde.

Norman P. Fraser and George C. Fraser, assignees of Muchall E. Boddy, all of Carsonville, Michigan, U.S.A., 2nd October, 1906; 6 years. Filed 25th June, 1906. Recelpt No. 137,253.
Claim.-A rope fastener consisting of a shank having means at one end for connection to a draft appliance and with a laterally curved book at the other end, and a stud extending laterally of the said shank, Intermediate its length and in the same plane, and in the same direction as said hook.

\section*{No. 101,351. Hinged Paper Leaves.} Feuille de papier.
Winfleld and Barker, assignee of James Barker, all of Detroit. Michigan, U.S.A., 2nd October, 1!06; 6 years. Filed 8th September, 1905. Receipt No. 128.279.
Claim.-1. The herein described method of making hinged paper leaves which consists in forming a sheet from pulp, in Iroducing a relatively thin section therein by the removal of stock composing the sheet body, and finally calendering the thinned sheet.
2. The herein described method of making hinged paper shects, which consists in forming a plup web, in thlnning a

section of the web by the removal of stock, and finally finishing the web and calendering the sheet.
3. The herein described method of making hinged paper sheets consisting in forming a single ply pulp web of substantially uniform texture, in forming a plurality of adjacent relatively thin sections therein by the removal of stock along adjoining portions of the web, and finally finishing the thinned web and calendering the sheet.
4. The herein described method of making hinged paper consisting in forming a pulp web of uniform texture throughout, in removing stock uniformly along a continuous portion of the web, producing a relatively thin section therein and in then finising the web and calendering the sheet.
5. A leaf comprising a calendered paper sheet having a correspondingly finished hinge portion formed of a plurallty of relatively thin sections and one or more intermediate sections of the texture of the sheet body.
6. In paper making apparatus the combination of the web forming mechanism, and stock removing means arranged and adapted to operate upon a section or sections of the web.
. In paper making apparatus the combination with the pulp carrier, of web forming mechanism associated therewith, and one or more stock removing members in operative relation to the web, adapted to reduce the stock along a section or sections thereof.
8. In paper making apparatus the combination whe the pulp carrier, of web forming mechanism associated therewith, and one or more adjustable stock removing members in operative relation to the web, adapted to reduce the stock along a section or sections thereof.
9. In paper making apparatus the combination with the pulp carrier, of the coucher roll in operative relation thereto, and one or more projecting ribs or bands upon said roll, for the purpose described.
10. In paper making apparatus the combination with the pulp carrier, of the coucher roll in operative relation thereto, and one or more adjustable projecting ribs or bands upon said roll, for the purpose described.
11. In paper making apparatus the combination with the pulp carrier, of the coucher roll assoclated therewith, and a plurality of immediately adjacent and circumferentially extending ribs or bands adjustably arranged upon said roll, substantially as and for the purpose described.

\section*{No. 101,352. Ring Expander.}

\section*{Apparcil d̀ élargir les anncaux.}

The Novelty Engincering Association, assignee of Alfred M. Remington, all of Fitchbourg, Massachusetts, U.S.A., 2nd October, 1906: 6 years. Filed 15th September, 1906. Receipt No. 139,517.
Claim.-1. A ring expander comprising a pressing device adapted to be oscillated around a mandrel, said pressing device comprising a pair of levers pivoted together and having rollers designed to operate upon the ring and bear upon the mandrel, the roller of one lever being adjustable with respect to the main portion of that lever.
2. A ring expander comprising a pressing device adapted to be oscillated upon the ring. said pressing device comprising a pair of levers pivoted together, one of said levers having a plurality of rollers and the other being provided with one roller, the plurality of rollers being adapted to engage with a ring holding means and the single roller to engage with the ring and means for adjusting the single roller with ruspect to its lever.
3. A ring expander comprising a pair of levers movably 'secured together, one lever having a plate movably attached
thereto, and a roller on said plate, and the other lever having. a pair of arms each being provided with rollers.

4. A ring expander comprising a pair of levers and a plate, said levers and plate being pivoted together at the same point, a screw mounted upon one of said levers for adjusting said plate upon its pivot in respect to the lever upon which the screw is mounted, sald plate belng provided with a roller and one of sald levers being provided with a plurality of rollers located beyond the ends of the sald first-mentioned roller.
5. A ring expander comprising a pair of levers movably connected together, one lever having a plate pivoted thereto, means for adjusting said plate about its plvot, a roller on said plate and a roller on the other lever.
6. A ring expander comprising a pair of levers movably connected together, one lever having a plate movably and adjustably attached thereto, a roller on said plate and a roller on the other lever.
7. A ring expander comprising a pair of levers, a plate, said levers and plate being pivoted together, means mounted upon one of the levers for adjusting the plate upon its pivot with respect to that lever, a roller on sald plate and a plurality of rollers on the other lever, the said last-mentioned rollers being located beyond the ends of the first-mentioned roller.

No. 101,353. Telephone Exchange Eystem. Systime d'échange de téléphone.

The Bell Telephone Company of Canada, Montreal, Quebec, Canada, assignee of Albert Morrison Bullard, New York City, New York, U.S.A., 2nd October, 1906; 6 years. Filed 18th September, 1906. Receipt No. 139,597.
Claim.-In an automatic telephone exchange, the combination with a telephone line, of a selector individual to the line having a movable contact brush, a stationary contact terminals of other lines, and electro-magnetic stepping

10-9
mechanism for trailling said contact brush across said terminals, a selecting interrupter at the sub-station arranged to control said electro-magnetic mechanism to advance the contact brush to the terminals of a wanted line, a relay \(k\) in a local curcult with said stepping mechanism adapted to connect the said contact brush with the calling line, a short circuit for said relay, and a switch at the sub-station actuated in the return of the selecting interrupter to its normal position or maintaining sald circuit during the operation of said interrupter, whereby the telephone line is disconnected from the contact brush of its selector during the selecting operation and then connected with said brush, substantially as set forth.
2. In an automatic telephone exchange, the combination with a selector having a movable contact brush adapted to form the terminal of a calling line, stationary contacts of other lines with which said movable brush is adapted to be engaged, means for applying test potential to the stationary contact terminal of a busy line, a local test circuit from said movable contact brush, including the winding of a test relay, busy notification apparatus controlled by said test relay, a selecting interrupter at the substation, a switch actuated upon the return of said interrupter to its normal position after the selecting operation, means at the central office controlled by said switch for closing the test circuit. a slow acting relay \(k\) at the central office controlling said test circuit, said relay \(k\) being also controlled through the agency of sald substation switch, said relay \(k\) being adapted when excited to extend the circuit of the calling line to said movable contact brush, and means controlled in response to the test relay for blocking said slow acting relay, whereby the movable contact brush remains disconnected from the calling line when the called line is busy, but when the called line is not busy the test relay is cut off in the response of said relay \(k\).
3. In an automatic telephone exchange, the combination with a telephone line and a selector therefor comprising a selector switch arm, a stepping magnet and a retaining magnet, of a connecting relay \(k\) adapted to complete the circuit of the line to the selector switch, a selecting relay \(c\). a ringing relay \(a\), means for controlling said relay \(a\) and \(c\) independently or simultaneously from the substation, a local circuit including the stepping magnet. the retaining magnet and the connecting relay \(k\), controlled by the selecting relay \(c\), and a short circuit of the controlling relay controlled by the ringing relay \(a\).
4. In an automatic telephone exchange, the combination with the selector switch, the stepping and retaining magnets therefor, a local circuit including said magnets and means for controlling sald circuit from the substation, of a connection relay \(k\) adapted to complete connection of the line through to the selector switch, means for exciting said relay controlled at the substation in the selecting transmitter mechanism, and a short circuit of the stepping magnet established in response of said connecting relay.
5. In an automatic telephone exchange, the combination with a telephone line, of a selector comprising a switch arm stepping and retaining magnets and a slow acting connecting relay \(k\) adapted to extend the circult of the line to the selector switch, a selecting relay controling a local circuit through the stepping and retaining magnets and through the magnet of connecting relay \(k\), a test relay \(t\), said relays \(k\) and \(t\) being each adapted when excited to cut out the other, a ringing relay \(a\), a test circuit bringing the test relay into operative relation to the selector to respond to the test potential at the terminal of the wanted line, said test circuit being closed by the ringing relay \(a\) when excited, said relay being also adapted when excited to break a short circuit normally maintained thereby around the connecting relay, and selector transmitter mechanism at the substation adapted first to intermittently close the circuit of the selecting relay and finally to close the circuit of both selecting and ringing relays, whereby the selector arm is advanced by the stepping magnet of the terminal of the wanted line, the circuit of the test relay is made momentarily effective, and the connection is finally completed upon the response of the relay \(k\) if the wanted line is free, or blocked if the test relay is excited.
6. In an automatic telephone exchange, the combination with a telephone line, of the selecting and ringing celays a and \(c\), and means at the substation for controlling said relays independently and simultaneously, of the selector comprising a switch, a stepping magnet and a retaining magnet. a slow acting connecting relay and a test relay arranged to cut out each other when excited, a local circuit including said stepping and retaining magnets and said connecting relay controlled by said selecting relay, a circuit for the test relay closed by said ringing relay and a short circuit 8 of the connecting relay opened by sald ringing relay. when the same is excited, said connecting relay having contacts adapted when the relay is excited to open said
short circuit 8 at another point and to close a short circuit of the stepping magnet, whereby upon the response of rald connecting relay it is maintained excited and the selector switch maintained stationary under the control of the selecting relay alone
7. In an automatic telephone exchange, the combination Hith a telephone line, of a selector comprising connection turminals for the other telephone lines and a movable swiltch arm carrying brushes adapted to trail over sald termiuals in the movement of the arm, a stepping magnet adapted when energized to advance said arm, a retaining magnet adapted to hold said arm in its advanced position, a connecting magnet controlling the connection of said brushes with the line, a circuit for sald magnets, a normally closed shunt about said connecting magnet, switching mechanism at the substation adapted to effect the intermittent completion of sald circult to cause the stepping magnet to advance the arm to the desired terminals, and means controlled from the substation adapted to open said short circuit after said switch arm reachist the proper terminal.
8. In an automatic telephone exchange, the comblnation with a telephone line extending in two limbs 1, 2, from a subatation to the poles of a srounded source of current, of a switch at the substation controlling the circuit, a relay \(c\) at the contral office between the free pole of said battery and the live, a selector carrying connection terminals for each of the other telephone lines, a movable switch arm for said seloctor carrying brushes adapted to trail over said ierminals in the movement of the switch arm, electro-masnetic mechanism for advancing said arm, a circuit of said mechanism controlled by relay \(c\), selective mechanism at the substation adapted to open the line circuit and intermittently ground the limb of the line connected with the free pole of the battery, whereby the switch arm may be advanced into engagement with the terminals of any desired line, normally open branches leading from said limbs 1,2 , to the brushes of said arm, a relay controlling the continuiny of said branches a circuit for said relay, a relay a controlled from the substation adapted to complete said circuit as sald brushes reach the desired connection terminals. a source of ringing current, and means controlled by the substation for connecting the same with sald branches after the brushes reach the proper terminals.
9. In an automatic telephone exchange the combination with a telephone line extending in two limbs 1, 2, from a substation to the poles of a grounded central battery, \(\mathfrak{m}\) resay c between the free pole of sald battery and the limb of the line, a selector carrying connection terminals for the other telephone lines and a movable switch arm having rushes adapted to engage said terminals in the movement of said arm, normally open branches leading from said limbs 1, 2, to said brushes, a magnet for advancing said arm, a retaining magnet adapted to hold the arm in its advanced position, a magnet \(k\) controlling the continuity of suid branches, a circuit including all of said magnets controlled by relay \(c\), a normally closed shunt around magnet \(k\), selective step-by-step mechanism at the substation adapted to first open the line circuit and successively ground the limb of the line connected with the free pole of the battery, whereby relay \(c\) makes and breaks the circuit of the stepping magnet to advance the switch arm to the desired connection terminal, a relay a controlled from the substation adapted as the switch arm reaches the end of its travel to break the shunt around relay \(k\), and a shunt around the stepping magnet closed by relay \(k\) when energized.
10. In an automatic telephone exchange the combination with a telephone line, a selector at the central office comprising connection terminals for the other lines in the exchange and a movable switch arm carrying brushes adapted to engage said terminals, electro-magnetic mechanism controlled from the substation adapted to advance said switch erm, whereby said brushes may be brought into engagement with the terminals of any desired line, a sluggish acting relay \(k\) controlling the connection of said brushes with the line, a circuit for said relay, a switch at the substation udapted to complete sald alrcuit after the switch arm reaches the proper terminal, a test rolay connected during the test of the called line from earth through contacts controlled by relay \(k\) with the switch arm, a grounded source of curront associated with each of the other lines, means for connectlog the free pole of said battery with the free connection terminals of any busy line upon the different selectors, a source of tone producing current adapted to be connected with the calling line by said test relay, and normally closed contacts inctuded in the circuit of said sluggish relay controlled by said test relay, whereby if the line wanted is husy the circuit of the test relay will be completed to apply the busy test current to the line, and open the circuit of relay \(k\). but if the called line is tree, the relay \(k\) in connecting the switch arm with the calling line will disconnect the l.ast relay from the switch arm.
11. In an automatic telephone exchange the combination with a telephone line, of a selector for said line comprising connection terminals for the other lines and a movable switch arm carrying brushes adapted to engage sald terminals, a similar individual selector for each of the other arm, a retaining magnet adapted to hold the switch arm lines, a stepping magnet adapted to advance said switch in its advanced position, a circult for sald magnets, mechanism controlled from the substation adapted to successively nake-and-break said circuit to effect the advancement of said switch arm, a sluggish acting relay \(k\) controlling the connection of said brushes with the line, a circuit for said magnet, a switch at the substation adapted to complete said circuits after the brushes reach the proper terminals, a quick acting test relay connected the instant the brushes make connection with the called line from earth through contacts of relay \(k\) with one of the brushes of the switch arm, a source of grounded current connected with all the corresponding free terminals of a busy line, a source of tone test current adapted to be connected with the calling line by said relay when energized, normally closed contacts included in the circuit of said sluggish relay and controlled by the test relay, a source of ringing current, a relay a controlled from the substation adapted to connect sald source with one of the brushes when the relay \(k\) becomes ecergized, a locking winding for the test relay, and a circult for said winding controlled jointly by said relay \(c\) and the test relay. Whereby if the wanted line is busy the test relay is operated to open the circuit of relay \(k\) and apply. busy test current to the calling line, but if the called line is iree, relay \(k\) is energized, connecting the brushes with the calling line, disconnecting the test relay from the switch arm, and permitting relay \(a\) to apply ringing current to alaid orush.

No. 101,354. System of Moter Control.
syateme de controle de moteur.

The Otis Fensom Elevator Company, Jersey City, assignee of August Sundhy, Yonkers, New York, U.S.A., 2nd October, 1906; 18 years. Filed 15th February, 1906. Receipt No. 132,926.
Claim.-1. The combination with an alternating current motor, of controlling means therefor, and an electro-responsive device arranged to control a single phase circult to sald motor controlling means.
2. The combination with an alternating current motor, of controlling means therefor, and an electro-responsive device connected in a single phase circuit to mains of said motor to control a circuit to sald motor controlling means. 3. The combination with an alternating current motor, of motor controlling means, and circuits and connections of an automatic push button controlled elevator system comprising a single phase magnet and a floor controller to effect the closure of a circuit to said motor controlling means through said floor controller when said magnet is energized.
4. The combination with a multi-phase motor, of motor controliling means, and circults and connections of an automatic push button controlled elevator system comprising single phase magnets corresponding to the various floors, and a floor controller, to effect the closure of a single phase circuit when one of sald magnets is energized.
5. The combination with a multi-phase motor, of motor controlling means, and circults and connections of an automatic push button controlled elevator system comprising a single phase magnet arranged to be operated from the car to prevent interference from the landing push buttons. 6. The combination with a multi-phase motor, of motor controlling means, and circuits and connections of an automatic push button controlled elevator system arranged to be eenrgized by single phase current, said circuits and connections comprising a non-interference magnet controlled
from the car, and a holding magnet controlled by said noninterference magnet.
7. The combination with an alternating current motor, of motor controlling means, circuits and connections of an automatic push buttōn controlled elevator system comprising a single phase non-interference magnet controlled from the car, a compensating inductive resistance controlled from a landing, and floor relays controlled from either.
8. The combination with alternating current motor controlling means, a relay for automatically controlling a circuit to said motor controlling means, an inductive resistance in a normally open circuit with said relay. means for manually closing the circuit between sald relay and inductive resistance, and means for breaking the circuit to said inductive resistance upon the operation of said motor controlling means.
9. The combination with alternating currenc motor controlling means, of an electro-responsive device for controlling a circuit to said motor controlling means, an impedpnce coil in circuit with said electro-responsive device, a movable core for said impedance coll, and means for interrupting a circuit to said impedence coll as soon as the normal relation of parts of said motor controlling means are changed.
10. The combination with an alternating current motor, of motor controlling means therefor, an electro-responsive device arranged to control a circuit to said controlling means. a choke coil in circuit with said electro-responsive device, and electric circuits and connections to effect the interruption of the circuit to sald choke coil upon the operation of the motor controlling means.
11. The combination with an alternating current motor, of motor controlling means therefor, a relay arranged to control a circuit to said motor controlling means, a choke coil in a circuit in narallel with said relay, a movable core for said choke coil, and means for interrupting a circuit to sald choke coil after the circuit to said floor controlling means has been established.
12. The combination of a multi-phase motor. with a source of alternating current sunply comprising main lines. motor controlling means. an electro-responsive device for controlling a circuit to said controlling means, an inductive resistance in circuit with said electro-responsive device. a rircuit including said electro-responsive device and said inductive resistance and placed across two of the mains of the source of supply.
15. The combination of a multi-phase motor. with a source of alternating current supply of three or more nhases. sald source comprising main lines. motor controlling means. circuit controlling means for controlling a circuit to sald motor controlling means. an inductive resistance in circuit with said circuit closing means. and a circuit including said inductive resistance connected across a pair of sald mains.
14. The combination with a three-phase motor. of a source of alternating current supply comprising main lines. means romprising a single phase magnet for controlling said motor. a single phase relay magnet. means operated thereby for controlling a circuit to said motor controlling magnet. an impedance coll in circuit with said relay magnet. a movable core for said impedance coll, and a circult including the sald magnets and impedence coll and arranged to be connected across any two of sald mains.
15. The combination with a two-phase motor. of a source of alternating current supply containing three main lines. means comprising a single phase magnet for controlling sald motor, a single phase relay magnet, means operated thereby for controlling a circuit to sald motor controlling magnet. an impedance coll in circuit with said relay magnet. a movable core for said impedance coil. and a circuit including the sald magnets and impedance coil and arranged to be connected across any two of said main lines.
16. The combination with a multi-phase motor, of a source of alternating current supply comprising main lines, an electro-magnetic motor controlling means, a relay, a variable inductive resistance in circult with sald relay and circult and connections connected across any two of said main lines and so arranged that when the circuit to said relay and inductive resistance is closed, a circuit is automatically closed to said electro-magnetic motor controlling means after which the circuit to said inductive resistance is automatically interrupted.
i7. The combination with a car and its motor, of stations, motor controlling means, an electro-responsive device for controlling a circuit to said motor controlling means, an inductive resistance in a normally open circuit, and means at said stations for closing a circuit between said electroresponsive device and said inductive resistance.
18. The combination with an elevator car and its motor, of motor controlling means, a relay, a variable inductive resistance, means at the landings to close a circuit between said relay and inductive resistance, and to effect the closure of a circuit to the motor controlling means, and meaus
operating in conjunction with said motor controlling means to then break the circuit through said inductive resistance and circuit closing means at the landing.
19. The combination with an elevator car and its motor, of motor controlling means, push buttons at the various landings, an inductive resistance in a normally open circuit with said push buttons, a relay for controlling a circuit to said motor controlling means upon a landing push bution being operated to close a circuit between sald inductive resistance and said relay, and means co-acting with said motor controlling means for automatically Interrupting the circuit of said inductive resistance and landing push buttons.
20. The combination with an elevator car and its motor, of motor controlling means, a push button at each landing. push buttons In the car corresponding to the landing push buttons, an inductive resistance connected to the landing push buttons, relays connected to the landing push buttons and the car push buttons, and operable to close a circuit to the motor controlling means and apparatus co-acting With the motor controlling means for interrupting a circuit between the landing push buttons and said inductive resisiance.
21. The combination with an alternating current motor, of an elevator car, electric circuits and connections of an automatic push button controlled elevator system comprising a motor controlling means, a relay for controlling a circuit to said motor controlling means, an impedance coll, a movable core for said coll, a landing push bution arranged when operated to close a circult between said relay and impedance coll, and means mounted on said motor controlling means for interrupting the circuit through said impedance coil established by the operation of said landing yush button.
22. The combination with an alternating current motor of the multiphase type, a source of current supply therefor comprising main lines, an elevator car, electric circuits and connections of an automatic push button controlled elevator system connected to a cross, two of said mains and comprising motor controlling means, a floor controller. a relay for closing a circuit through said floor controller to sald motor controlling means, means for controlling said relay from the car or from a landing, a variable inductive resistance connected in circuit with said relay when said landing controlling means is operated, and means for interrupting the circuit to said inductive resistance after said relay has operated.
23. The combination with a two-phase motor and three supply mains therefor, of an electric car arranged to be operated thereby, electric circuits and connections of an automatic push button controlled elevator system connected across any two of said main lines and comprising motor controlling means, relays for closing circuits to said motor controlling means, a variable inductive resistance, push buttons. one at each landing for closing circuits between said relays and inductive resistance, and means for rendering said push buttons inoperative prior to the starting of said motor.
24. The combination with a motor and motor controlling means, of an electro-responsive device for closing a circuit to said motor controlling means, a variable inductive resist ance, a switch for closing a circuit between sald variable resistance and sald electro-responsive device, means connected with said motor controlling means for interrupting the circuit to said inductive resistance and additional means for interrupting said last-mentioned circuit and maintaining the same interrupted until after the motor has stopped
25. The combination with a motor controlling means, means for controlling a circuit to said motor controlling means, an inductive resistance, a switch for closing a circuit between said circuit closing means and said inductive resistance means for interrupting the circuit to said switch and closing a circuit to render sald switch inoperative until sald lastmentioned circult is interrupted.
26. The combination with an elevator car and its motor, of electric oircuits and connections of an automatic push button controlled elevator system comprising motor controlling means, means controlled from the landings or from the car to close circuits to said motor controlling means, means operated from the car for rendering the landing buttons in operative, a locking circuit closed by said last-mentioncul means so arranged that sald landing buttons remain inoperative until said locking circuit is interrupted.
27. An automatic push button controlled elevator system comprising a car anl its motor, means for controlling said motor, means controlled from any landing or from said car for closing a circuit to said motor controlling means, an rlectro-magnetic switch for interrupting the circuit to the landing buttons to render them inoperative. a second electromagnetic switch arranged to close a locking circuit, means connecting the two switches for maintaining said landing buttons Inoperative until the locking circuit is interrupted.
28. An automatic push button controlled elevator syatem comprising a car and its motor, motor controlling means means controlled from said car or any landing for operating
sall motor controlling means, a switch for interrupting the circuit to the landing buttons, a solenoid connected to the huttons in the car, a core for said solenoid, said core being connected to said switch, a locking circuit, a second switch and a second solenoid both in said locking circuit, a second core connected to sald second switch and mechanically connected to the first core, whereby when the car push button is operated the landing push buttons are rendered inoperative and maintained thus by the closing of the locking circuit until said locking circuit is interrupted.
29. In an automatic push button controlled elevator system, a car and its motor, motor controlling means, means controlled from said car or from a landing for operating said motor controlling means, a non-interference device controlled by the buttons in the car comprising two solenoids, cores for said solenoids, circuits closing means at one end of said cores. a pivoted lever pivotally connected to the other end of said cores, a locking circuit, and electric circuits and connections so arranged that when one core is in its lower position the other is in its upper position, thus opening the circult to the landing buttons and closing the locking circuit when a car button is operated, and means for locking circuit switches to normal when the locking circuit is interrupted.
36. An automatic push button controlled elevator system comprising a push button for each floor or station, push buttons for the car, motor controlling means and electric cirruits and connections therefor, a switch arranged to be oper ated as the motor is started to render the floor push buttons fnoperative during the operation of the motor, a second switch in the circult to the floor push buttons, electromagnetic means controlled by the car push button for opening said second switch, a locking circuit, means controlled by said electro-magnetic means for closing said locking circuit and means for holding said last-mentioned circuit closed so arranged as to prevent the starting of the motor after being stopped until said locking circult has been interrupted at a predetermined point.
31. An automatic push button controlled elevator system comprising an alternating current motor, circults and connections including single phase magnets for controlling the operation of said motor, a variable inductive resistance, manual means for closing a circuit through sald inductive resistance, automatic means controlled from the car for interrupting the circuit to said manual means and inductive resistance, and means controlled by sald automatic means or holding the sald circult to the manual means interrupted until after the car has came to rest.

\section*{No. 101,355. Fly Shield. Moustiquaire.}

William F. Elliott, Dekalb, Illinols, U.S.A. 9th October, 1906
6 years. Filed 30th July, 1906. Recelpt No 138,240.
Claim.-1. An insect shield comprising a body portion shaped to fit under the Jaw of the animal and having a cupshaped lower end fitting over the lips of the animal.
2. An insect shield comprising a body portion shaped to fit under the jaw of the anlmal, and having at one end a ridge extending between the jaw bones, and cup-shaped at the opposite end to fit over the lips of the animal.

No. 101,356. Lifting Device. Appareil à hisser.
Roy Everett Gipple, Williamsville, New York, U.S.A., 9th October, \(1906 ; 6\) years. Filed 19th September, 1906. Recelpt No. 139.622.
Claim.-1. A lifting device comprising a standard, a lifting bar guided on the standard, a detent clutch mounted loosely on the standard and engaging with the lifting bar, a lifting clutch engaging with the lifting bar, a hand lever pivoted on the standard, a shifting rod connecting the hand lever and lifting clutch, and a releasing lever pivoted on the standard and having two sections arranged on opposite sides of the standard and shifting rod and etch bearing at its rear and against the underside of said detent clutch and at its
front end against a shoulder on the shifting rod, substantially as set forth.

2. A' lifting device comprising a standard, a lifting bar gulded on the standard. a detent clutch mounted loosely on the standard and engaging with the lifting bar, a lifting cluch engaging with the lifting bar, a hand lever plvoted on the standard, a shifting rod connecting the hand lever and lifting clutch, and a releasing lever pivoted by a transverse pin to a lug on the standard and comprising two sections arranged on opposite sides of the standard and shifting rod, said sections being connected in front of said pivot pin by a cross bar and each section having an upturned rear arm which bears against the underside of the lifting clutch while its front arm engages with a downwardly facing shoulder on the adjacent side of the shifting rod, substantially as set forth.

No. 101,357. Sectional Tank. Réservoir on sections.

Luther C. Jacques and George Sillman. Spokane, co-inventors, Washington, U.S.A. 9th October, 1906; 6 years. Filed 27th August, 1906. Receipt No. 138,994.
Claim.-1. A sectional tank made up of series of curved segment plates having angled edges, angle irons adapted to engage said angle edges, and bolts for holding sald angle iron to said plates and together, as set forth.
2 . A sectional tank comprising serles of curved segment plates baving angled edges, circumferential angle irons bolted to said plates, vertical angle irons bolted to said curved plates and holding the angled edges of said plates together between sald vertical angle irons, and packing strips held by said vertical angle irons against the edges of the angled portions of said plates, as set forth.
3. A sectional tank made up of a series of curved segment plates having angle edges, circumferential angle irons bolted to said plates, vertical angle plates bolted to said plates at right angles to said circumerential angle irons, bolts passing through the outwardly turned portions of said angle irons and adapted to clamp the angled edges of said plates together, the lower ends of said vertical angle irons having recessed portions adapted to fit over the edges of said círcumferential angle irons, the lower ends of said recessed irons to rest upon the horizontal flanges of said circumferential angle irons, as set forth.

No. 101,358. Hormeshoe. Fer \(d\) cheval.

Charles Alfred Ready, Niagara Falls, New York, U.S.A., 9th October, 1906: 6 years. Filed 17 th September, 1906. Receipt No. 139,562 .
Claim.-A horseshoe consisting of a bar of angle shaped in cross section having one flange extending laterally outward and forming a hoof plate, and the other flange extending downward from the innermost edge of the hoof plate and forming a continuous caulk, said caulk flaring outwardly and having a sharp edge, and said hoof plate having nall holes located near its outer edge and outwardly beyond the edge of the caulk and remote from its upper portion, whereby the caulk will not interfere with the proper driving of the nails in applying the shoe, substantially as set forth.

No. 101,359. Railway Tie. Dormant de chemin de fer.

William A. Rollins, Fort Worth, Texas, U.S.A., 9th October, 1906; 6 years. Filed 14th September, 1906. Receipt No. 139,505.
Claim.-In a rallway the combination with rails having flanged faces, of ties, the upper face of one end of each tie being sloped upward and terminating abruptly to form a vertical rail engaging face, the portion of the tie underlying the sloped portion being cut away to conform to one side of the base flange of a rail, the other side of said flange having its edge abutting the opposite side wall of said cut-away nortion to hold the base flange of the rail tightly in said cut-away portion, the said side wall being of greater height than the thickness of said flange, the portion of each tie intermediate said rails being sloped upwardly and terminating abruptly to form a rail engaging face, the portion of the tie underlying the sloped portion being cut away to conform to one side of the base flange of a rail, the other side of the said flange abutting the opposite side wall of said cut-away portion to hold the base flange of the rail tightly in said cut-away portion, the said tie being placed in a series with their sloped portions extending alternately in opposite directions, the entire surface of the walls forming the recesses of each tie being in close contact with the rail flange.

\section*{No. 101,360. Air Brake Coupler.}

\section*{Joint de frein dair.}

Frank Hatfield Rutherford, Chlcago, Illinois, U.S.A., 9th October, 1906; 6 years. Filed 17th September, 1906. Receipt No. 139,552.
Claim.-1. An antomatic coupler for the train pipes of cars comprising a longitudinally ylelding body, and a spring of flat material engaging and normally keeping the same at the limit of its forward movement.
2. An automatic coupler for the train pipes of cars comprising a longitudinally yielding body, and a spring of flat material engaging the rear end of said coupler and normally keeping the same at the limit of its forward movement.
3. An automatic coupler for the train pipes of cars comprising a longitudinally yielding body, and a spring of flat

material one end of which is permanently secured and the other of which engages and normally keeps said coupler at the limit of its forward movement.
4. An automatic coupler for the train pipes of cars comprising a longitudinally yielding body, and a spring of flat material one end of which is permanently secured above the coupler and the other end of which engages and normally keeps said coupler at the limit of its forward movement.
5. An automatic coupler for the train pipes of cars, comprising a longitudinally yielding body, and a substantially C-shaped spring, one end of which is permanently secured independent of said coupler and the other end of which engages and normally keeps said coupler at the limit of its forward movement.
6. An automatic coupler for the train pipes of cars comprising a longitudinally yielding body, and havinga guide rar extending from its rear end, anda spring of fiat material one end of which is permanently secured independently of said coupler, and the other end of which presses forward acainst sald coupler and is provided with on opening through which said guide bar extends.
7. An automatic coupler for the train pipes uf cars comprising a longitudinally yielding body having a guide bar extending rearwardly therefrom, and a substantially \(C\) shaped spring one end of which is permanently secured independent of said coupler, and the other end of which engages and normally keeps said coupler at the limit of its forward movement, and is provided with an opening through which said guide bar extends.
8. An automatic coupler for the train pipes of cars comprising a longitudinally ylelding body, and having a guide bar extending from its rear end which is provided with a fin. and a spring of flat material one end of which is permanently secured independently of said coupler, and the cther end of which presses forward against said coupler and is provided with an opening through which said guide bar and its fin extends.
9. An automatic coupler for the train pipes of cars comprising a longitudinally yielding body having a guide bar extending rearwardly therefrom which is provided with a fin. and a substantially C-shaped spring one end of which is permanently secured independent of said coupler, and the other end of which engages and normally keeps said coupler at the limit of its forward movement, and is provided with an opening through which said guide bar and its fin extends.
10. An automatic coupler for train plpes of cars comprising a longitudinally yielding body, and a flat spring adapted to guide the movements and normally keep sald coupler at the limit of its forward movement.
11. An automatic coupler for the train pipes of cars comprising a longitudinally ylelding body, and a flat spring adapted to limit the rotative movement and normally keeps said coupler at the limit of its forward movement.
12. An automatic coupler for train pipes of cars comprisIng a longitudinally yielding body, and a flat spring adapted ts guide the longitudinal movement of said coupler, limit its rotative movement and normally keep the same at the limit of its forwerd movement.
13. An automatic coupler for the train pipes of cars comprising a iongitudinally yielding body, and a flat spring havirig one end permanently secured independently of said coupler and adapted to limit the rotative movement and normally keep said coupler at the limit of its forward movement.
14. An automatic coupler for the train pipes of cars comprising a longitudinally ylelding body, and a flat spring hav-

Ing one end permanently secured independently of said coupler and adapted to guide the longitudinal movement of said ccupler, limit its rotative movement, and normally keep the same at the limit of its forward movement.
15. The combination with a car, a hanger depending from the end thereof having a suitable opening therein, and a bracket projecting from sald hanger, of an automatic coupler extending through said opening, means suspended from said bracket for independently supporting the forward end of said coupler, and a spring engaging the rear of said coupler and normally keeping the same at the limit of its forward movement.
16. The combination with a car, a hanger depending from the end thereof having a suitable opening therein, and a bracket projecting from said hanger, of an automatic coupler extending through said opening, means suspended from said bracket for independently supporting the forward end of said coupler, and a substantially C-shaped spring the upper end of which is permanently secured independently oi said coupler and engages the rear end of said coupler and normally keeps the same at the limit of its forward movement.
17. The combination with a car, and hanger depending from the free end thereof having a suitable opening therein, and a bracket projecting from said hanger, of an automatic coupler extending through said opening, means suspended from said bracket for independently supporting the forward end of said coupler, and a substantially C-shaped spring the upper end of which is permanently secured independently of said coupler and engages the rear end of said coupler, guides its longitudinal movement, and normally keeps the same at the limit of its forward movement.
18. The combination with a car, a hanger depending from the end thereof having a suitable opening thorein, and a bracket projecting from said hanger, of an automatic coupler extending through said opening, means suspended from said bracket for independently supporting the forward end of said coupler, and a substantially C-shaped spring the upper end of which is permanently secured independently of said coupler and engages the rear end of said coupler, limits the rotative movement thereof, and normally keeps the same at the limit of its forward movement.
19. The combination with a car and a hanger depending therefrom having an opening in its lower end, of an automatic coupler consisting of an engaging head, a rear con-ical-shaped portion or body which passes through said opening, and a narrower central portion or waist connecting the two, and a flat spring adapted to engage the rear end of and normally keep said coupler at the limit of its forward movement.

\section*{No. 101,361. Air Brake Coupler.}

Joint de frein dair.

Frank Hatfeld Rutherford, Chicago, Illinois, U.S.A., 9th October, 1906 ; 6 years. Filed 17th September, 1906. Recelp.t No. 139,553.
Claim.-1. The combination with a car and a longitudinally yielding integral train pipe coupler, of a spring located and exerting a pressure in a plane parallel to the axis of said coupler, and means for applytag said pressure to the rear portion of the same.
2. The combination with a car and a longitudinally yielding train pipe coupler, of a longitudinally disposed spring located and exerting a pressure in a plane parallel to the axis of said coupler, and means for applying said pressure to the rear portion of the same.
3. The combinstion with a car and a longitudinally yielding integral train pipe coupler, of a longitudinally disposed coil spring locsted and exerting a pressure in a plane parallel to the axis of said coupler, and means for applying mid pressure to the rear portion of the same.
4. The combination with a car and a longitudinally yielding integral train pipe coupler, of a spring located and exerting a pressure in a plane parallel to the axis of said coupler, and an arm for transmitting and applying the pressure of said spring to the rear portion of the coupler.
5. The combination with a car and a longitudinally ylelding integral train pipe coupler, of a spring located and exertIng a pressure in a plane parallel to the axis of sald coupler, and a pivoted arm for transmitting and applying the pressure of said spring to the rear portion of the coupler.
6. The combination with a car, a longitudinally yielding train pipe coupler and a hanger having an opening in its lower part through which said coupler passes, and a horizontal portion secured in suitable manner to said car having a lug projecting down therefrom, of an arm pivoted at its upper end to said lug and having its lower end engaging the rear portion of the coupler and a spring pressing sald arm forward.
7. The combination with a car, a longiudinally yielding tirain pipe coupler and a hanger having an opening in its lower part through which said coupler passes, and a horizontal portion secured in suitable manner to said car having lugs projecting down therefrom, of an arm pivoted at its upper end to said lug and having its lower end engaging the rear portion of the coupler. and a longitudinally disposed coll expension spring interposed between the rearmost of said lugs and said arm and normally pressing sald arm forward.
8. The combination with a car and a longitudinally yieldlng integral train pipe coupler. of an arm engaging the rear portion of said coupler, a spring pressing forward against one end of sald arm and an independent spring engaging the other end of the same.
9. The combination with a car and a longitudinally yielding integral train pipe coupler, of a pivoted arm engaging the rear portion of said coupler, a spring pressing forward against one end of said arm and an independent spring engaging the other end of the same.
10. The combination with a car and a longitudinally yielding integral train pipe coupler, of an arm pivoted at one end and engaging the rear portion of said coupler at the other, a coil expansion spring engaging said arm near its pivoted end and a curved spring of flat material engaging the other end of said arm.
11. The combination with a car and a longitudinally yielding integral train pipe coupler, of an arm pivoted at one end and engaging the rear portion of the coupler at the other, a coll expansion spring engaging said arm near its pivoted end and a curved spring of flat material one end of which is secured at a point collateral to said coupler and the other and engages the movable end of sald arm.
12. The combination with a car, a longitudinally yielding train pipe coupler and a hanger therefor, of an arm pivoted at its upper end to the horlzontal part of said hanger and its lower end engaging said coupler and having an opening therein mediate its ends, a horizontally disposed coil expansion spring pressing forward against said arm above said opening, and a C-shaped spring secured at one end to the vertical portion of said hanger extending rearwardly through the opening in said arm and having its upturned lower end engaging the lower end of said arm.

No. 101,362. Harrew. Herse.

George Calvin Stanley, Belle Vernon, 9th October, 1906;6 years. Filed 17th September, 1906. Recelpt No. 139,575. Claim.-1. The combination in a rotary harrow, of a draf: beam provided on its inner end with a depending stem, \({ }^{\text {a }}\) head journalled on said depending stem, a plurality of radially disposed tooth carrying arins carried by said hesd, and teeth carried by said arms, a strap secured to the hesd and to the draft beam, a pair of brackets carried by said stem
and projecting outwardly in opposite direction therefrom and a weighted arm swivelled on the draft beam and supported when projecting to one side of the draft beam by one of said brackets, and when projecting to the opposite side of the draft beam to the other of said brackets.
2. The combination in a rotary harrow, of a rotary frame embodying a central head, rotating arms connected to the head, teeth carried by the arms, a draft beam on which the central head is rotatably mounted, a pair of supporting braces projecting in opposite directions from the head and a weighted arm swivelled on the draft beam and supported by one of said supporting braces when projecting to one side of the draft beam and by the other supporting brace when projecting to the opposite side of said draft beam.

No. 101,368. Nnt Lock. Arrête-écrou.

Frank B. Toffemire, Walkerville, Ontario, Canada, 9th October, 1906; 6 years. Filed 8th August, 1906. Reccipt No. 138,498.
Claim.-1. In a nut lock the combination of a nut, a bolt having a slot on one side longitudinally of its threaded portion with a washer of tempered metal having slashed portlons raised from its plane surface for engagement with the corners of the sald nut, and having a projection in its central aperture for engagement with the slot in the bolt, substantially as described.
2. In a nut lock the combination with a nut and a bolt, of a washer of tempered metal having slashed portions raised from its plane surfare for engagement with the corners of the said nut and having a depressed slashed portion from a part of the edge of the washer other than the raised slashed portions for engagement with the surface of the article held, substantially as described.
3. In a nut lock the combination with a nut and a bolt, of a washer of tempered metal having slashed portions raised from its plane surface for engagement with the corners of said nut and having a depressed nicked portion or portions for engagement with the surface of the article held, substautially as described.
4. In a nut lock the combination with a nut and a bolt, of a washer of tempered metal having slashes from its edges against the direction of the tightening of the nut on the bolt. said slashes forming portions of the washer which are raised from the plane surface of the washer for engagement with the corners of the nut, and a holding or gripping device projecting from the reverse side of the washer for engagement with the surface of the articles held, substantlayy as described.

\section*{No. 101,364. Receptacle for Pouriered Material. Récoptacle pour matières en poudre.}

Whliam West, Camden, New Jeraey, U.S.A., 9th October, \(1906 ; 6\) years. Filed 17 th September, 1908 . Receipt No. 139,591 .
Claim.-1. A receptacle having a cover with an inverted cup-shaped perforated projection and a perforatell cap provided with a downwardly and inwardly inclined fange, and said flange when engaging the wall of the projection adapted to hold the cap securely and movably thereon.
2. A receptacle having a cover provided with an inverted cup-shaped perforated projection surrounded by a depression formed in the receptacle and a perforated catp provided with a downwardly and inwardly Inclined fiange, sald flange When engaging the peripheral wall of the projection adapted to hold the cap securely and movably thereon.
3. A receptacle having a cover provided with a perforated shallow inverted cup-shaped projection and a perforated cap

provided with a downwardly and inwardly inclined fiange, the flange when engaging the peripheral wall of the projection adapted to hold the cap securely and movably thereon and a disc of flexible material arranged between the projection and cap adapted to normally prevent discharge of the contents of the receptacle through the perforations of the cover.
4. A receptacle having a cover consisting of an annular projection provided with a downwardly and inwardly inclined wall terminating in a depression formed in the rereptacle and surrounding said projection, a cap provided with a rib and with a downwardly and inwardly inclined flange, the flange when engaging the peripheral wall of the projection adapted to hold the cap securely thereon, and the rib of the cap adapted to permit of turning of said cap on said projection.
5. A receptacle having a cover consisting of a perforated shallow projection extending slightly above the receptacle and provided with a downwardly and inwardly inclined wall lerminating in a depression formed in the receptacle and a perforated cap provided with a rib and a downwardly and inwardly inclined flange, the flange when engaging the peripheral wall of the projection adapted to hold the cap securely thereon and the rib thereof adapted to permit of turning of the cap on said projection, and a diac of flexible materlal arranged betwern the projection and cap adapted to normally prevent discharge of the contents of the receptacle through the perforations of the cover.
6. A receptacle having a removable lld provided with an inverted cup-shaped perforated projection and a perforated cap provided with a downwardly and Inwardly inclined flange, sald flange when engaging the wall of the projection adapted to hold the cap securely and movable thereon.

No. 101,365. Pocket. Poche.

James G. Clark and Louis F. Mehder, co-inventors, both of Oskosh, Wisconsin, U.S.A., 9th October, 1906; 6 years. Filed 15th September. 1906 . Receipt No. 13y,606.
Claim.-1. In a garment the combination with a patch suitably secured thereto, produacing a pocket, said pocket having a side opening, of an upper and a lower triangular set of stitches extending inwardly only from the side provided with said opening, sald sets of stitches producing a pointed structure and leaving the entire ends and opposite side of the pocket free, said triangular sets of stitches overhanging portions of the upper and lower ends. the upper set of stitches being formed at a more acute angle than the lower set.
2. In a garment, a pocket provided with a vertical side having an entrance through said side contracting in width toward the interior of the pocket, and with receptacles formed above and below the entrance
3. In a garment, a pocket provided with a side entrance thereto, and expanding in width above and below the said estrance.

No. 101,366. Metal Protecting Soles Por Footwoar.
Apparcil de protection en métal pour semelles de chauxsures.

William J. Linwood and Jennie Bennett, co-inventors, both of Raton, New Mexico, U.S.A.. 9th October, 1906; 6 years. Filed 15th September, 1906. Receipt No. 139,538.
Claim.-1. A protecting sole for footwear comprising a skeleton sole plate, fastening devices at the sides and toe of the said plate, a heel casing at the rear of the sole plate, and spring fastening devices at the rear and at the forward portion of the said casing on opposite sides thereof.
2. A protecting sole for footwear, comprising a sole plate, fastening devices at the sides and toe of the plate, a heel casing secured to the shank portion of the heel plate, pivoted and spring pressed fastening arms pivoted at the rear portion of the heel casing and provided with outwardly extending finger pieces, and spring fastening devices at the forward portion of the casing, one on each side thereof.
3. A sole protector for footwear comprising a metal sole plate, a heel casing, oppositely extended fastening arms pivoted in the rear portion of the heel casing, said arms having their free ends extending out through their casing and provided with outwardly extended finger pleces at their pivotal ends. and springs for pressing said arms inward.
4. In a sole protector for footwear. a heel casing. oppositely extending fastening arms pivoted at the rear portion of the casing and having finger pieces at their pivoted endsf said arms having their free ends extending out through the caslog and springs on the outside of the casing and engaging the projecting ends of sald arms.
5. A sole protector for footwear comprising a sole plate, and fastening devices for securing the sole plate on a boot or shoe, said fastening devices having swinging relation to said sole plate and consisting of pivoted plates, and hookshaped keepers on the sole plate for recelving the free ends of said pivoted plates.

No. 101,367. Emut Machine. Emotteur.

Anthony H. Baenen, Jamestown, North Dakota, U.S.A., 9th October, 1906; 6 years. Filed 18th September. 1906. Receipt No. 139.601.
Claim.-1. In a sinut machiue the combination with a casing having a feed spout, of a solution tank having a discharge fancet. a mixing paddie provided in the bottom of said tank, an operating shaft geared to sald paddle, mixing troughs ar-
ranged one above another in caid casing, the upper trough having a receiving opening communicating with sald foed spout and a discharge opening in its opposite end leading to the lower trough, and sald lower trough having a discharge opening in its end opposite from said first-named discharge opening, mixing cylinders provided in said troughs having t series of spirally arranged paddles or mixers on their gurfaces and a suitable gear connecting sald mixing cylinders with said shaft, substantially as described.
2. On a smut machine the combination with a suitable frame and a hopper provided thereon having a foed spout. of a solution tank provided with a discharge faucet, a mixing paddle provided in the bottom of said tank, an operating shaft geared to said paddle, mixing troughs arranged one above another in sald casing, the upper trough having a receiving opening at one end beneath the discharge end of sald feed spout, and a discharge opening in its opposite end leading to a lower trough next beneath, and said lower trough having a discharge opening in its end opposite from said first-named discharge opening, mixing cylinders provided in sald troughs having peripheral paddles or mixers, webs provided at intervals in the bottom of sald troughs and adapted to retard the passage of the grain along said troughs and a driving mechanism connecting said cylinders with said shaft. substantially as described.
3. In a smut machine the combination with a suitable casing, of mixing troughs arranged one above another, the upper trough having a receiving opening at one end communlcating with a feed spout and a solution tank and having a discharge opening in the bottom at the other end and the lower trough receiving the grain at one end from said discharge opening and having a discharge opening in its bottom beneath the receiving end of the upper trough, oppositely revolving mixing cylinders provided in said troughs and having peripheral blades or mixing paddles, and ribs provided at intervals in the bottom of said troughs and adapted to retard the passage of the grain therethrough, and there being ribs contiguous to said discharge openings to prevent dripping and waste of the solution and means for revolving said cy:inders, substantlally as described.

No. 101,368. Hay Fork. Fourche d foin.

Silas W. Gates, Big Timber, Montana, U.S.A., 9th October, 1906; 6 years. Filed 15th September, 1906. Receipt No. 139,264.
Claim.-1. A fork of the class described comprising a rod having cross plates at its ends, end tines pivotally connected in pairs to the said cross plates, sald end tines having arms forming extensions at their upper ends, handle bars to which the said arms are attached and intermediate tines connected to the said rods and having arms secured to the said handle bars, substantially as described.
2. A hay fork of the class described comprising a rod having cross plates at its ends, pairs of end tines pivotally connected to the sald cross plates and having upwardly extending arms, handle bars to which the sald upwardly extending arms are secured, intermediate thes having arms secured to the said handle bars and further provided with protal devices connecting them to the sald rod, substantlally as described.

\section*{No. 101,369. Rack for Frying Oakes.}

Broche pour cuire des gatcaus.
Orlando G. Kelly, Jackson, Michigan, U.S.A., 9th October. 1906: 6 years. Filed 13th August, 1906. Recelpt No. 138,638 .
Claim.-1. In a fried cake frying device, a rack \(C\) provided with ventilating tubes D \(D\) which are open at each end in order to permit the circulation of fat therethrough, and slot \(F\) in combination with the cover \(E\) provided with a slot \(F^{\prime}\)
made to rest upon the tubes \(D \mathrm{D}\) without obstructing the openings of said tubes, the handle \(G\) provided with the hooks

H I to engage the slots \(\mathbf{F} \mathbf{F}^{1}\), all in combination with and for the purpose of securing said rack and cover from separation, substantially as and for the purposes shown and described.
2. In a fried cake frying device the spring handle ring \(G^{1}\) of the handle \(G\) made to engage the bail \(B\) of the kettle or pail \(A\) and in combination therewith and with said rack and cover and arranged to secure the immersion of the rack, cover and contained cakes in the hot fat contained in the kettle or pail, substantially as shown and described.

No. 101,370. Straight Edge for Circular Saws. Réglet pour scies circulaires.

Rartholemy Lafleur, Elkmouth, British Columbia, Canada, 9th October, 1906 ; 6 years. Filed 17th September, 1906. Receipt No. 139,560.
Claim.-1. A device of the class described comprising a resilient blade, a rigid member arranged adjacent the same, and adjustable means between the member and blade for crowning the latter.
2. A device of the class described comprising a resillent Hade, a stiff bar arranged at one side of the blade, and independent adjusting devices between the bar and blade for crowning or bowing the latter
3. A device of the class described comprising a resilient blade, a plurality of members riveted to the blade for preventing buckling thereof, a rigid bar, and devices connected with said members for crowning the blade with respect to the bar and for holding the blade under tension.
4. A device of the class described comprising a resilient blade, a plurality of members having jaws embracing the blade, a threaded rod rigidly connected with the members, a stifl bar having perforations through which the rods extend, and nuts on the rods and engaging the opposite sides of the bar.
J. A device of the class described comprising a resilient blade. a stiff har disposed at one side of the blade, a plurality of means for connecting the blade with the bar and arranged to hold the blade in a crowned position on the bar, and means carried by the bar for holding the blade level on a saw.
6. A device of the class described comprising a resilient blade, an unbending member arranged at one side of the blade, a plurality of means arranged to crown the blade and hold it under tension on the member, and a square adjustably connected with the member for holding the blade level or the saw.

10-10

No. 101,371. Danger Signal. Signal de danoer.

Burns S. Miller, Everett. Washington, U.S.A., 9th October, 1906; 6 years. Filed 17th September, 1906. Receipt No. 139,557.
Claim.-1. An automatic signal apparatus comprising a guard fence, a normally locked spring controlled signal device, means operated by the collapse of the fence for unlocking the device to cause its actuation, an alarm, and means operated by the actuation of the signal device for causing the sounding of said alarm.
2. An automatic signal apparatus comprising a weighted
 lever, a spring controlled signal device, carried by the lever for locking the signal device, a guard fence, and means operated by the collapse of the fence for disconnecting the countcrbalance to cause the actuation of the lever.
3. An automatic signal apparatus comprising a weighted lever, a counterbalance movably connected thereto, a signal device, means carried by the lever for locking said device against movement, an unlocking lever, the connection between said lever and the counterbalance, a guard fence, and a flexible connection between said fence and the unlocking lever adapted on the collapse of the fence to actuate the unlocking lever and relieve the first-mentioned lever of its counterbalance.
4. An automatic signal apparatus comprising a guard fence, a rotatable signal device at each end of said fence, a welghted locking lever for each signal device, a counterbalance movably connected to each locking lever, an unlocking lever connected to each counterbalance, flexible connections between the fence and the locking and unlocking lovers, and a flexible connection between the unlocking levers.
5. An automatic signal apparatus comprising a guard fence, a movable signal device, means operated by the collapse of the fence for actuating said signal device, a second signal device from the frst-mentioned device.
6. An automatic signal apparatus comprising a guard fence, a movable signal device, means operated by the collapse of the fence for actuating said signal device, a second similar device, and means for actuating said second device from the first-mentioned signal device.
7. An automatic signal apparatus comprising a guard fence, a movable signal device, means operated by the collapse of the fence for actuating said device, an alarm, and means operated by the actuation of the signal device for causing the operation of sald alarm.

No. 101,372. Storage Water Heater.

\section*{Chauffeur d'eau.}

Edwin Ruud, Pittsburg, Pennsylvania, U.S.A., 9th October, 1906; 6 years. Filed 15th September, 1906. Receipt No. 139,522.
Claim.-1. In a storage heater system the comblnation of a beating appllance, a hot water storage reservoir, a thermostatic regulator connected with said reservoir, a valve controlling the supply of fuel to the reating appliance. and means actuated by the thermostatic regulator for immediately fully opening and completely closing the controlling valve in accordance with variations of temperature in the storage reservolr.
2. In a storage water heater system the combination of a heating appliance, a hot water storage reservoir, a thermostatic regulator connected with said reservoir, a valve controlling the supply of fuel to the heating appliance, mechanism actuated by the thermostatic regulator for opening and closing the controlling valve in accordance with variations of temperature in the storage reservoir, and a device for
offecting the immediate full traverse of said valve in its opening and closing movements.

3. In a storage water heater system the combination of a heating appliance, a hot water storage reservoir, a thermostatic regulator connected with said reservoir, a valve controlling the supply of fuel to the heating appliance, means actuated by the thermostatic regulator for immediately fully opening and completely closing the controlling valve in accordance with variations in temperature in the storage reservoir, and a pilot burner for igniting the fuel when supplied to the heating appliance by the controlling valve.
4. In a storage water heater system the combination of a heating appliance, a hot water storage reservoir, a thermostatic regulator connected with said reservoir, a valve for controlling the supply of fuel to the heating appliance and a system of levers actuated by the thermostatic regulator for immediately fully opening and completely closing the controlling valve in accordance with variations of temperature in the storage reservoir.
5. In a storage water heater system the combination of a heating appliance, a hot water storage reservoir, a thermostatic regulator connected with sald reservoir, a valve for controlling the supply of fuel to the heating appllance, a system of levers actuated by the thermostatic regulator for opening and closing the controlling valve in accordance with variations of temperature in the storage reservoir, and a device for effecting the immediate full traverse of said valve in its opening and closing movements.

No. 101,373. Thermomstatic Valve for Water Heating.
Soupape thermostatique pour chanffeur d'cau.

Edwin Ruud, Pittsburg, Pennsylvania, U.S.A., 9th October, 1906; 6 years. Filed 15th September, 1906. Receipt No. 139,523
Claim.-1. In a water heater the combination with a fuel valve and thermostatic regulator therefor, of means for holding the valve in open and closed position and means gradually actuated by the thermostatic regulator for abruptly actuating said valve opening and closing means.
2. In a water heater the combination with a fuel valve and thermostatic regulator therefor, of means for holding the va!ve in open and closed position having a postive connection with sald valve but no connection with the thermostatic regulator, and means for abruptly actuating said valve opening and closing means having a positive connection with the thermostatic regulator and a loose connection with the first-named means.
3. In a water heater the combination with a fuel valve and thermostatic regulator therefor, of a spring influenced lever adapted to hold the valve in open or closed position and a similar lever gradually actuated by the thermostatic regulator for abruptly tripping the first-named lever.

4 In a water heater the combination with a fuel valve and thermostatic regulator therefor. of a spring influenced lever having a positive connection with said valve but no connec-
tion with the thermostatic regulator and a similar lever having a positive connection with the thermostatic regulator and a loose connection with the first-named lever.
4. n a water heater the combination with a fuel valve and and thermostatic regulator therefor, of a pivoted lever one arm of which is positively connected with the valve stem and the other arm acted upon by a spring, and a duplicate cranked and pivoted lever having an arm positively connected with the thermostatic regulator but loosely connected with the first-named lever and the other arm acted upon by a spring.
5. In a water heater the combination with a fuel valve and and thermostatic regulator therefor, of a pivoted lever positively connected with the valve stem and adapted to hold the valve in oper and closed position under the influence of a spring which is capable of being moved between two extreme positions so as to exert a thrust tending to movt the lever in opposite directions alternately, and a similar lever and spring positively connected with the thermostatic regulator capable of an initial movement independent of the first-named lever and adapted to substantlally trip such lever abruptly.
7. In a water heater the combination with a fuel valve and ithermostatic regulator therefor, of a cranked lever pivoted at an intermediate point in 1 ts length, ahead on one arm of said lever located between and positively engaging adjustable collar upon the valve stem, a second cranked lever, working on the pivot of the first-named lever, a head on one arm of sald second lever located between said adjustable collar but capable of engaging only one collar at a time, a connection between this arm of the second lever and one of the levers of the thermostatic regulator and springs acting upon the ends of the remaining arms of both levers adapted to be displaced from one position in which they oppose movement of the levers to a position in which the movement is assisted.
8. In a water heater the combination with a fuel valve and thermostatic regulator therefor, of means for holding the valve in open and closed position and means for abruptly actuating said valve opening and closing means having a yielding connection with the thermostatic regulator.
9. In a water heater the combination with a fuel valve and thermostatic regulator therefor, of a pivoted lever positively connected with the valve stem and adapted to hold the valve in open and closed position under the influence of a spring which is capable of being moved between two extreme positions so as to exert a thrust tending to move the lever in opposite directions alternately, a similar lever and spring capable of an initial movement independent of the first-named lever and a yielding connection between the second lever and the thermostatic regulator.
10. In a water heater the combination with a fuel valve and thermostatic regulator therefor, of a cranked lever pivoted at an intermediate point in its length, a head on one arm of said lever located between and positively engaging adjustable collars upon the valve stem, a second crank lever working on the pivot of the first-named lever, a head on one arm of said second lever located between said adjustable collars but capable of engaging only one collar at a time, a wing upon said arm of said second lever, a projection and spring provided upon the last of the system of levers of the thermostatic regulator between which said lever wing is engaged, and springs acting upon the ends of the remaining arms of both levers adapted to be displaced from one position from which they oppose movement of the levers to a position in which the movement is assisted.

\section*{No. 101,374. Electric Fumace for Making Steol. Fournaise électrique pour l'acier.}

Gustave Gin, Paris, France, 9th October, 1906; 6 years. Filed 10th May, 1906. Rceeipt No. 135,768.
Claim.-1. Form of construction of an electric furnace for the fabrication of steel by means of solid or liquid materials allowing of the operations of fusion, refining and recarburetting being continuously carried on and characterized by a series of three compartments, the first of which serves for the fusion of the metal, the second for the deoxidizing of the dissolved oxides and recarburetting, and the third for the finishing of the steel, the electric current passing in totality through the oxydizing compartment, the scoria of which is an oxidant and being distributed parallelly in the other two compartments the slag of which is neutral and scarcely reducible.
2. The arrangement of the orifices of communication on which are covered by the bath or emerge therefrom according to the side to which the furnace is tilted or Inclined so that during the running off of the finished metal, the metab of compartment 2 is prevented from entering compartment 3 , and when the furnace is inclined in a contrary dfrection
communication is established between 2 and 3 without the metal of compartment 1 being able to mix with that of No. 2.

3. The placing in the channel of communication between the compartments 1 and 2 of a bar of solid steel which prevents the mixing of the metals when in equilibrium whilst sometimes allowing of a passage from compartment 1 to compartment 2 when, after running off, a difference of level exists between the baths, the interposition of this bar being in no way an obstacle to the passage of the current.

No. 101,375. Metallic Clip for Furring. Cheoillage métallique pour cannelure.

George Henry Pedlar, Oshawa, Ontario, Canada, 9th October, 1906; 6 years. Filed 18th August, 1906. Receipt No. \(138,807\).
Claim.-1. Metal clips for furring fastened in series to a metal strip, and so formed and adapted as to engage in studs, substantially as and for the purposes described.
2. The combination of metal clips for furring fastened in the wall and shaped so as to enter a groove or valley in a metal stud, and with a shoulder with metal studs having a groove or valley to receive the shaped ends of the clips, substantially as end for the purposes described.

No. 101,376. Metallic Lathing Stad. Etaí pour lattes métalliques.

George Henry Pedlar, Oshawa, Ontario, Canada, 9th October 1906. 6 years. Filed 18th August, 1906. Recelpt No 138,808.
Claim.-1. For use in buildings metal studs formed from sheet metal of a \(T\) shape in combination with projecting sheet metal of a la she lathing, substantially as and for the hooks to hang meta
2. Metal studs formed from sheet metal of a \(T\) shape with projecting hooks for metal lathing, in combination with the pronnecting clip \(C\) for connecting the same in pairs, substanconnectially and for the purposes described.
3. Metal studs formed from sheet metal. of a \(T\) shape with projecting hooks for metal lathing, in combination with the attaching clip \(K\) for attaching the ends, substantially as and for the purposes described.
for the purposes described.
4. Metal studs formed from sheet metal, of a E shape with projecting hooks for metal lathing, in combination with the attaching clip \(C\) and the top and bottom rails \(P\) and \(R\), subattaching clip C and the purposes described.
stantially as and for the purposhioned with recesses to re-
5. The connecting clip C fashioned with recesses to re-
eive the studs and with lugs to be clamped in the studs, ceive the studs and with the purposes described.
6. The attaching clip \(K\) formed of sheet metal to envelope the ends of studs with lugs to be clamped therein, substantlally as and for the purposes describer.
No. 101,377. Centrifugal Cream Separator.
Séparateur à crême centrifuge.

Jules Persoons and Alphonso Persoons, Thildonck, Belgium, 9th October, 1906; 6 years. Flled 24th November, 1905. Receipt No. 130,386.
Claim.-1. In a centrifugal cream separater, a frame, a driving mechanism supported by said frame, a centrifugal drum rotated by said driving mechanism, a rod at the end of
which the centrifugal drum is ireely suspended, a movable guide for the said rod, said guide comprising a block, a band to which said block is fixed, and means for tensioning the band during the action of the machine and a collecting casing surrounding the centrifugal drum, substantially as described and for the purpose set forth.
2. In a centrifugal cream separator, a frame, a driving mechanism supported by said irame, a centrifugal drum rotated by said driving mechanism, a rod at the end of which the centrifugal drum is freely suspended. a movable guide for the said rod, said guide comprising a splitted block, a band having a certain elasticity end to which said block is fixed at one slde and means for tensioning the band and a collecting casing surrounding the centrifugal drum, substantially as desoribed and for the purpose set forth.
3. In a centrifugal cream separator, a frame, a driving mechanism supported by said frame, a hollow shaft rotated by said driving mechanism, a rod extending through sald hollow shaft, a friction sleeve acting on the upper end of the hollow shaft, a nut fixed to the end of the rod, a spring connecting the said nut to the friction sleeve, a centrifugal drum freely suspended at the end of the rod, a movable guide for the sald rod and a collecting casing surrounding the centrifugal drum, substantially as described and for the purpose set forth.
4. In a centrifugal cream separator. a frame, a driving mechanism supported by said frame, a hollow shaft rotated by said driving mechanism, a rod extending through said hollow shaft, a friction sleeve acting on the upper end of the hollow shaft, a nut fixed to the end of the rod, a spring connecting the sald nut to the friction sleeve. a centrifugal drum freely suspended at the end of the rod. a movable guide for the said rod, sald guide comprising a block. a band to which said block is fixed and means for tensioning the band and a collecting casing surrounding the centrifugal drum, substantially as described and for the purpose set forth.
5. In a centrifugal cream separator, a frame, a driving mechanism supported by said frame, a centrifugal drum being formed of a drum body, a cover and a bolt connecting the drum body and the cover, a rod at the end of which tha, centrifugal drum is freely suspended and through which the sald drum is rotated. a movable gulde for sald rod and a collecting casing surrounding the centrifugal drum, substantially as described and for the purpose set forth.
6. In a centrifugal cream separator, a frame. a driving mechanism supported by said frame. a hollow shaft rotated by said driving mechanism. a rod extending through sald hollow shaft. a iriction sleeve acting on the upper end of the hollow shaft. a nut fixed to the end of the rod. a spring connecting the sald nut to the friction slecve, a centrifugal drum freely suspended at the end of the rod. said drum comprising a drum body. a cover and a bolt connecting the drum body and the cover a movable guide for the drum carrying rod and a collecting casing surrounding the.centrifugal drum. substantially as described and for the purpose set forth.
7. In a centrifugal cream separator, a frame, a driving mechanlsm supported by said frame. a hollow shaft rotated by sald driving mechanism. a rod extending through said hollow shaft, a friction sleeve acting on the upper end of the hollow shaft, a nut flxed to the end of the rod, a spring connecting the said nut to the friction sleeve, a centrifugal drum freely suspended at the end of the rod, sald drum comprising a drum body, a cover and a bolt connecting the drum body and the cover, a movable gulde for the drum carrying rod, said gulde comprising a block, a band to which said block is fixed and means for tensloning the band, and a collecting casing surrounding the centrifugal drum, substatially as described and for the purpose set forth.
8. In a centrifugal cream separator, a frame, a driving mechanism supported by said frame, a centrifugal drum rotated by said driving mechanism, a false bottom placed in sald drum. the said bottom being provided with stamped ribs, a rod at the end of which the centrifugal drum is freeis suspended, a movable guide for the said rod and a collecting casing surrounding the centrifugal drum, substantially as described and for the purpose set forth.
9. In a centrifugal cream separator, a frame, a driving mechanism supported by said frame, a centrifugal drum rotated by said driving mechanism, a rod at the end of which the centrifugal drum is freely suspended, a movable guide for the said rod and a collecting casing surrounding the centrifugal drum, said casing comprising an upper part integral with the frame, a lower part, a pivot connecting the lower part to the upper part in such a manner that the casing is adapted to be open horizontally and a flange formed on the upper part for securing a tight connection of the upper and lower parts, substantially as described.
10. In a centrifugal separater, a irame, a closed casing formed at the upper part of said frame, a driving mechanism located in the sald closed casing, a hollow shaft rotated by
sald driving mechanism, a rod extending through said hol low shaft, a friction sleeve acting on the hollow shaft and connected to the rod passing through sald shaft, a centrifugal drum suspended at the end of the rod, a movable fuide for the said rod, said guide being arranged immediately below the driving mechanism, a vessel in which said guide is placed, the sald vessel being in communication with the closed casing of the frame so as to return the oil back into the closed casing of the frame and a collecting casing surrounding the centrifugal drum, substantially as described.

No. 101,378. Steam Turbine. Turbine d vapeur.

The Honourable Charles Algernon Parsons, Heaton Works,
Newcastle-on-Tyne, England, 9th October, 1906; 18 years. Filed 17th July, 1906. Receipt No. 137,896.
Claim.-1. In combination with an axial flow turbine, means for controlling the expansion of fixed and moving parts so as to simultaneously maintain the predetermined clearances at the packings, substantially as described.
2. In combination with an axial flow steam turbine, means for equalizing and controlling the expansions of fixed and moving parts relative to a fixed point such as a thrust block, substantially as described.
3. In combination in an axial flow steam turbine, a thrust block on the turbine shaft, packings arranged at various distances along the turbine shaft and arms, means for equalizing the expansions of fixed and moving parts from said thrust block, substantially as described.
1. In combination in an axial flow steam turbine, a thrust block on the turbine shaft, packing arranged at various distances along the turbine shaft and drum, chambers in the fixed or moving parts for the circulation of fluid, substantially as and for the purposes described.
5. In combination in an axlal flow steam turbine, a thrust block on the turbine shaft, packing arranged at various distances along the turbine shaft, fluid circulating chambers in these parts of the turbine removed for the heating action of the working fluid, substantially as and for the purposes described.
6. In combination in an axial flow steam turbine, a thrust block on the turbine shaft, packings larrangad at various distances along the shaft and turbine drum, heat ing chambers in the turbine casing arranged to cause equal expansion of fixed and rotating parts relative to said thrust block, substantially as described.
7. In combination with an axial flow steam turbine, a thrust block on the turbine shaft, labyrinth packings arranged at various distances along the shaft or turbine drum, a fluid circulating chamber on the end of the turbine case, the fluid circulating through which maintains a uniform temperature throughout the case shaft and drum, substantially as described.
8. In a turbine of the axial flow type, means for malntaining the predetermined clearances at the packings arranged at various distances apart along the turbine drum and shaft, comprising a steam jacket on the end casing, a lantern space \(h\) around the gland packing, a communicating passage between said lantern space and said jacket, substantially as described.
9. In a turbine of the axial flow type, means for mainraining the predetermined clearances at the packings arranged at various distances apart along the turbine drum and shaft comprising a steam jacket on part of the end casing, a lantern space \(h\) around the gland packing. a communicating passage between said lantern space and said jacket, substantially as described.
10. In a turbine of the axial fiow type, means for maintaining the predetermined clearances at the packings arranged at various distances apart along the turbine drum and shaft comprising a steam jacket on the lower part of the end casing where the metal is thick, a lantern space \(h\) around the gland packing, a communicating passage between sald lantern space and said jacket, substantially as described.
11. In a turbine of the axial flow type, means for maintaining the predetermined clearances at the packings arranged at various distances apart along the turbine drum and shaft comprising near the packing gland when the shaft passes out of the turbine case, a steam jacket on the casing, a steam connection to said jacket, an independent steam connection to the lantern space \(h\) around the packing gland, substantially as described.
12. In combination on a turbine of the axial flow type, a thrust block, a hollow shaft having radial holes formed therein, a turbine drum with hollow spokes, said hollow spokes communicating with the steam space, a hub having radial holes registering with the radial holes in the shafts and with the hollow spokes whereby steam may be passed to the turbine shaft, substantially as and for the purposes

\section*{No. 101,379. Apparatus for Shredding Leather.} Appareil pour couper le cuir en lambeaux.

The Fibered Leather Manufacturing Company, Boston, assignee of OtIs Moody Cutler, Wakefield, all in Massachusetts, U.S.A., 9th October, 1906 ; 6 years. Filed 14th May, 1306. Receipt No. 135,872.
Claim.-1. A leather shredding machine comprising a shredding member and a scrap carrying member, means for positively moving one of said members relatively to and past the other member to cause the shredding member to act progressively on the leather scraps, the teeth of the shredding member being distributed to act on all portions of the upper surface of the scraps.
2. In a leather shredding machine the combination of leather shredding means, a rigid continuous support for scrap leather, and means for feeding said support to the action of the leather shredding means, the teeth of the shredding means being distributed to act on all portions of the upper surface of the leather.
3. In a leather shredding machine the combination of leather shredding means, a support having means for positively securing and carrying scraps of leather and means for feeding sald support to the action of the leather shredding means, the teeth of the shredding means being distributed to act on all portions of the surface of the leather.
4. In a leather shredding machine the combination of a rotary leather shredder having equally distributed teeth, and means for feeding the leather positively in a direction tangent to the acting portion of said shredder.
5. In a leather shredding machine the combination of a shredder composed of a revolving series of equally distributed leather shredding teeth, and means for leeding the leather positively in a direction tangent to the acting portion of said shredder.
6. In a leather shredding machine the combination of a shredder comprising a cylindrical series of equally distributed leather shredding teeth, means for rotating said shredder, an elongated board having means for securing leather scraps thereto, and means including a pair of opposed feed rolls for propelling said board in a direction tangent to the shredder.
7. The process of dry shredding leather which consists in rigidly supporting leather scraps and subjecting them to the
progressive action of equally distributed shredding teeth in a direction lengthwise of the plane or surface of the leather. 8. The process of dry shredding of leather which consists in subjecting the leather to the action of a multiplicity of equally distributed shredding teeth applied simultaneously over an area of the flesh side of the leather.
9. The process of dry shredding of leather which consists in shredding a series of scraps of leather by positively feeding them successively to a shredding device having equally distributed teeth acting in a direction parallel to the planes of the scraps.
10. The process of dry shredding of leather which consists in securing scraps of leather to a support, subjecting said scraps to the action of shredding means having equally distributed teeth by relative feeding movement of said support and said moans, and rigidly holding sald support to the action of said shredding means.
No. 101,380. Photo-Mechanical Printing.
Imprimerie photomécanique.

Albert Henry Walser, New York City. New York, U.S.A., 9th October, 1906 ; 6 years. Filed 20th July, 1906. Receipt No. 138,010.
Claim.-1. The following process of photo mechanical printing, making a sensitive surface on a stone slab or metal plate, exposing that sensitive surface to light througb a sheet which is partly transparent and partly opaque, developing that exposed surface into a condition in which some of its areas will receive ink, while some of its areas remaln free from ink, applying ink to those areas which are to recoive it, transferring ink from that inked surface to the periphery of a soft and receptive transfer roller, trangfer ing from that periphery to the periphery of a metal roller. etching away the uninked parts of that periphery applying printing ink or colour to the printing parts thus proluced on that periphery and transferring ink or colour from those printing parts to the surface of whatever cloth or other material constitutes the base of the picture or other print which results from the process, all substantially as described.
2 . The following process in photo mechanical printing., making a sensitive surface on a stone slab or metal plate, exposing that sensitive surface to light through a sheet which is partly transparent and partly opaque, developing that exposed surface into a condition in which some of its areas will receive ink, while some of its areas remain free from ink. applying ink to those areas which are to receive it. transferring ink from that inked surface to the periphery of a soft and receptive transfer roller, transferring ink from that periphery to the periphery of a metal roller and etching away the uninked parts of that periphery, all substantlally as described.

\section*{No. 101,381. Apparatus for Making Bisalphitc Liquorm.}

\section*{Appareil pour la fabrication de liqueurs bisulphurés.}

Elliott R. Barker, Berlin, New Hampshire, U.S.A., 9th October, 1906; 6 years. Filed 14th May, 1906. Receipt No. 135,879.
Claim.-1. An apparatus of the character described comprising a tank, a plurality of perforated partitions extonding across the exterior of said tank and dividing the same into a plurality of compartments, the lowermost of said partitions located at a distance from the bottom of said tank substantially less than the height of any of said compartments, and forming a gas distributing chamber, means connecting said chamber to gas receptacles, overflow pipes ccnnccting each of said compartments to the compartment therebelow, the overfiow pipe of the lowermost compartment leading to a receptacle for acid, an exhaust pipe, and a supply pipe connected to the uppermost compartment, and means to agitate the contents of said compartments.
2. An apparatus of the character described comprising a tank, a plurality of perforated partitions extending across

the interior of said tank and dividing the same into a plurality of compartments, the lowermost of said partitions located at a distance from the bot tom of said tank substantially less than the height of any of said compartments, and forming a gas distributing chamber, means connecting said chamber to gas receptacles, overflow pipes connecting each of said compartments to the compartment therebelow, the overflow pipe of the lowermost compartment leading to a receptacle for acid, an exhaust pipe, a supply pipe connected to the uppermost compartment, a shaft extending longitudinally of said tank through said compartments, agitator blades fast to said shaft in each of sald compartments, and mechanism to impart a rotary motion to said shaft.
3. An apparatus of the character described comprising a tank, a plurality of perforated partitions extending across the interior of said tank and dividing the same into a plurality of compartments, the lowermost of said partitions located at a distance from the bottom of said tank substantially less than the height of any of said compartments and forming a gas distributing chamber, a pipe connecting said chamber to a gas receptacle, said pipe extending upward from the bottom of said tank to a distance sufficient te prevent the liquor therein from flowing into the said gas reerptacle. overflow pipes connecting each of said compartments to the compartment therebelow, the overflow pipe of the lowermost compartment leading to a receptacle for acid, an exhaust pipe, and a supply pipe connected to the uppermost compartment, and means to agitate the contents of said compartments.

No. 101,382 . Photographic Device for Fire Arms.
Appareil photographique pour armes ì feu.

Delbert Leroy Laur, Indian River. Michigan, U.S.A., 9th October. 1906; 6 years. Filed 10th May, 1906. Receipt No. 135, i 55.
Claim.-1. The combination in a magazine gun of the class described, of a photographic camera secured to the barrel of said gun, a cord fastened at one end to the shutter of said camera and at the other end to the hammer of said gun. together with a second cord connecting the film operating mechanism of the camera to the magazine lever of said gun, and means for guiding said cords, for the purpose set forth.
2. The combination in a magazine gun of a photographic camera sccured to the barrel of said gun, a cord fastened at one end of the shutter of said camera and at the other end 10 the cartridge firing merhanism of the gun, togother with a second cord connecting the flim operating merhanism of the camera to the magazine operating mechanism of the gun, and means for guiding said cords.

No. 101,383. Radinm Surface. Surface de radium.

Hugo Lieber, New York City, New York, U.S.A.. 9th October, 1906; 6 years. Filed 22nd May, 1905. Recelpt No. 125,378.
Claim.-1. A surface of solld material provided with an adhering coating of an exceedingly thin film of radium in a finely divided state, substantially as described.
2. A surface of solid material provided with an adhering coating of an exceedingly thin film of radium in a finely divided state and an exceedingly thin coating of suitable protecting material upon the film of radium, substantially as described.
3. A surface of solid material provided with an adhering coating of paste containing radium in a finely divided state, substantially as described.
4. A surface of solid material provided with an adhering coating of paste containing radium in a finely divided state and an exceedingly thin coating of suitable protecting material upon the coating of pasto, substantially as described.
5. A surface of solid material provided with an adhering coating of suitable protecting material containing radium in a finely divided state, substantially as described.
6. Solid material penetrable by a radium ray having embodied within it radium in a finely divided state, substantially as described.
7 Solid materlal penetrable by radium emanations having embodied within it radium in a finely divided state, substantially as described.
8. Solid material penetrable by radium rays and emanations, having embodied within it radium in a finely divided state, substantially as described.
9. A surface of celluloid provided with an adhering coating of an exceedingly thin film of radium in a finely divided state, substantially as described.
10. A surface of celluloid provided with an adhering coating of an exceedingly thin film of radium in a finely divided state. and an exceedingly thin coating of suitable material protecting the film of radium, substantially as described.
11. A support provided with a radio-active surface, carrying a radio-active substance protected by a film of suitable protecting material, substantially as described.
12. Solld material penetrable by radium alpha rays, having embodied within it radium in a finely divided state, substantially as described.

No. 101,384. Tnrbine. Turbinc.

The Honourable Charles Algernon Parsons, assignee of George Gerald Stoney, both of Heaton Works, Newcastle-onTyne, England, 9th October, 1906; 18 years. Filed 16th May, 1906. Receipt No. 135,957.
Claim.-1. In turbo-machinery, a rotary baffe packing device having an opening in a baffle part thereof, substantially as and for the purpose described.
2. In turbo-machinery, a rotary baffe packing device having openings in baffle parts thereof, substantially as and for the purpose described.
3. In turbo-machinery, a rotary bafle packing device having openings in baffing parts of fixed and rotating parts, substantially as and for the purpose described.
4. In turbo-machinery, a rotary baffle packing device, having baffle strips ledged near the root, substantially as and for the purpose described.
5. In turbo-machinery, a rotary baffe packing device having strips ledged on one side near the root, substantially as and for the purpose described.
6. In turbo-machinery, a rotary baffle packing device having baffle strips ledged on both sides, substantially as and for the purpose described.
7. In turbo-machinery, a rotary baffle packing device having an opening in a bafle part thereof and a ledged strip, substantially as and for the purposes described.
8. In turbo-machinery, a rotary baffle packing device having openings in baffe portions thereof and caulking ledges on strips thereof, substantially as and for the purpose described.
9. In turbo-machinery, a rotary baffle packing device having openings in baffing parts of fixed and rotating members and strips with caulking ledges substantially as and for the purposes described.
10. In turbo-machinery, a rotary baffle packing device havgin openings in baffing parts of fixed and rotating members and strips having a caulking ledge on one side, substantially as and for the purposes described.

No. 101,385. Counter Sale Check Book.
Lioret d contre-épreuve.

Joseph Oscar Lalonde and Victor Guertin, assignee of twothirds of the interest, both of Montreal, Quebec, Canada, 9th October, 1906: 6 years. Filed 15th January, 1906. Receipt No. 131,842.
Claim.-1. A counter sales check book comprising a pair of stiff covers and an intermediate limp connection between the stiff covers, an open ended pocket carried by one of the stifi covers, a guide plate carried by the same stiff cover, and means carried by th limp connection for holding the sheet of manifolding material.
2. A counter sales check book comprising a pair of covers, a pocket carried by one of the covers, two continuous sheets carried in the pocket, a plate secured to one of the covers, and provided with a hooked end adapted to guide the continuous sheets as they are drawn from the pocket, and means for holding a sheet of manifolding material between the sheets as they are removed.
3. In a counter sales check book, covers, a pocket carried by one of the covers, two continuous sheets carried in the pocket, a plate secured to one of the covers and provided with a hooked end adapted to guide the continuous sheets as they are drawn from the pocket, and removable means for holding a sheet of manifolding material between the sheets as they are removed.
4. In a counter sales check book, covers, a pocket carried by one of the covers, two continuous sheets carried in the pocket, a bar provided with pointed lugs secured intermediate of the covers and provided with flanges at its opposite ends, one of said flanges having an opening and the other a slot, and a rod having a rounded end and a resilient bifurcated end, said polnted end being disposed in said opening and said bifurcated end being disposed in said slot.
5. In a counter sales check book, covers, a pocket carried by one if the covers, two continuous sheets carried in the pocket, a bar connected with the covers, a rod detachably mounted on the bar, a plate on said bar, and a sheet of manifolding material secured to the plate.
6. In a counter sales check book, covers comprising a pair of boards and an intermediate limp connection, an open-
ended pocket carried by one board, a manifolding sheet holding member carried by the limp connection, a cutting member and a resilient clip carried by the other board, a manifolding sheet secured to the holding member, and a supply of continuous sheets carried by the pocket, one of said sheets extending above the other below the mainfolding sheet.
7. In a counter sales check book, covers comprising a pair of boards and an intermediate limp connection, a pocket carried by one board, a guide plate carried by the same bcard and provided with a hooked end, a removable manifolding element carried by the limp connection, a cutter piate carried by the other board, and a clip carried by the latter board.

No. 101,386. Credit Accounting Device.
Appareil de compte de crédit.

The Bennett Register Company, assignee of Joseph James Bennett, all of Lisbon, Ohio, U.S.A., 9th October, 1906 : 6 years. Filed 23 rd July, 1906. Receipt No. 138,10s.
Claim.-1. Credit accounting appliances comprising a receptacle provided with a covering, a card index carried by the cover, a removable fit base mounted in said receptacle, and a series of bill holders or racks designated to associate with said card index, hinged to the base and bodily removable with the base from the receptacle.
2. Credit accounting appliances comprising iz receptacle having a cover and a series of compartments, certain of which are provided with covers, a card index carried by the cover, a removable flat base mounted in one of said ccmpartments, and a series of bill holders or racks designated to associate with said index, hinged to the base and bedily removable with the base from the said compartment.
3. Credit accounting appliances comprising a receptacle provided with a cover, an index carried by the cover, a sheet of transparent material suitably connected to the cover and adapted to protect the index, a removable base mounted in said receptacle. and a series of bill holders or racks dseignated to associate with sald index, hinged to the base and bodily removable with the base from the receptacle.
4. Credit accounting appliances comprising the combination with a detached flat base, of means for receiving accounts connected with the base, said means consisting of a stries of bill holders or racks, each consisting of a body portion having side flanges forming pockets, a combined supporting and retaining arm having its lower end extending at right angles and connected to the body portion, and a transverscly extending eye at the lower end of the body pcrtion, combined with means engaging in the eye for hinging the holder to the base.
5. Credit accounting appliances comprising the combination with a detached flat base, of means for receiving accounts connected with the base, said means consisting of a scries of bill holders or racks, each conisting of a body portion having side flanges forming pockets, a coinbined supporting and retaining arm having its lower end extending at right angles and connected to the body portion, and a transversely extending eye at the lower end of the uody portion, ccmbined with means engaging in the eye for permanently hinging the holder to the base.
6. Credit accounting appliances comprising a receptacle provided with a cover and a compartment, a pair of end rests in said compartment, means to constitute an index carried by the cover, a removable flat detached base mountef in said compartment, and a series of bill holders or racks designated to associate with said index hinged to the base and bodily removable with the base from said compartment.
7. Credit accounting appliances comprising a receptacle provided with a cover and a compartment, a pair of end rests in said compariment, means to constitute an index carried by the cover, a removable flat detached base mount ed in said compartment, a series of bill holders or racks
designated to associate with said index. hinged to the base and bodily removable with the base from said compartment, and means connected with the cover for protecting the index and to permit of access being had to the index.
8. Credit acounting appliances comprising a receptacle having a cover and a series of compartments, a pair of end rests in each of said compartments, and means to constitute an index carried by the receptacle cover, a detached rimovable flat base mounted in each of two or more of said compartments, and a series of bill holders or racks hinged to each of the said bases and bodily removable with their respective bases from said compartment, each of said bill holders or racks of each series of bill holders or racks sultably designated to associate with said index.
9. Credit accounting appliances comprising a receptacle provided with a cover, a card index carried by the cover, a removable base mounted in said receptacle, and a series of bill holders or racks designated to associate with said card index, connected to the base and bodily removable with the base from the receptacle.

No. 101,387. Fireproof Structure.
Construction d̀ l'épreuce du fcu.

The New Jersey Wire Cord Company, Trenton, New Jersey, assignee of Abraham L. A. Himmelwrignt. New York City, New York, both in U.S.A., 9th October, 1906; 6 years. Filed 21st August, 1906. Receipt No. 138.875.
claim.-1. The combination with beams or the like, of metal bars extending between the beams and supported thereby, metal strips extending longitudinally of the beams between and supported by said bars, thin strlps of wood or equivalent material extending transversely to the beams and supported on sald metal bars and strips, and a flling of concrete or similar plastic material supported by said bars and strips.
2. The combination with flanged beams, of bars extending between the beams and supported thereby, thin strips of wood or equivalent material supported by the bars and arlanged to cover the space between the bars and termin. ating to leave this space uncovered near the beams, a metallic concrete support extending downward from the cnds of the strips and about the bottom flanges of the beams, and a flling of concrete or similar plastic material supported by the bars and strips and fllling the space about the bottom flanges of the beamis within the concrete support.
3. The combination with tlanged beams, of T bars extending between the beams and supported thereby, metal strips extending over the bars and between the bars in substantially the same plane as the bar flanges, thin strips of wood or equivalent material supported by said flanges and metal strips, and a flling of concrete or similar plastic material supported by sald bars and strips.
4. The combination with flanged beams. of \(T\) bars extending between the beams and supported thereby, metal strips cxtending over the bars and between the bars in substanflally the same plane as the bar flanges. thin strips of wood or equivalent material of a length substantially that of the distance between the beams and laid transversely to the beams on said flanges and metal strips, and a fllling of concrete or similar plastic material supported by said bars and strips.

\section*{No. 101,388. Loose Leaf Binder.}

\section*{Reliure a fewilles volantrs.}

James C. Dawson. Webster Groves. Missouri. V.S.A.. !th October. 190t; 6 years. Filed 15th August, 1:06. Receipt No. 138,718.
Claim.-1. In a lonse leaf binder, in combination a back member. a pair of laturally movable side members. a pair of levers imirpendently pivoted to the back member and forh slidingly engasing ond of the side members, and a movable erosshead slidingly engaging the levers.
2. In a loose leaf binder, in combination a back member, a pair o laterally movable side members, a pair of obllquely

slotted levers independently plyoted to the back member and each slidingly engaging one of the side members, and a movable crosshead in engagement with the lever slots.
3. In a loose leaf binder, in combination a back member. a pair of laterally movable side members, a pair of levers independently pivoted to the back member and each slidingly engaging one of the side members, a crosshead slidingly engaging the levers, and a rod journalled in the back member and in threaded engagement with the crosshead.
4. In a loose leaf binder, in combination a back member. a pair of laterally movable side members, a pair of obliquely slotted levers independently pivoted to the back member and each slidingly engaging one of the side members, a crosshead in engagement with the lever slots, and a rod journalled in the back member and in threaded engagement with the crosshead.

No. 101,389. Indezing Ledger. Grand livre.

Harry Hugh Herrick. Owatonna, Minnesota, U.S.A., 9th October. 1:1ti: 6 years. Filed 23rd July, 1906. Receipt No. 138,097.
C'laim.-1. In an account book, a group of leaves, the opposite faces of each leaf being divided into a number of account spaces. a designating eharacter for each account space, a projection extending upward from each leaf and having ach of its two paces divided into a number of index spaces equal to the number of account spaces on the leat and provided with designating charactead corresponding to thosir of the arcount opaces, the sum of the widths of all of the projections of a group being approximately equal to the width of each page of the group, said projections being so arranged that all of those velonging to a group will be visible at the same time when viewed from either side of the group, and side tabs dividing groups or numbers of groups in alphabetical order.
2. In an account book. leaves each divided into a number of account sraces. a ds siguating character for each account spare. a frojection extending upward from each leaf and divided into ind of account spares on the leaf and bearing corresponding dusignating characirs, and protecting leaves extending approximately to the top ef the index projections and dividing the entire number of leaves in the book into small groups. fach of the protecting leaves bearing an alphabet or similar tab.

No. 101,390. Indexing Ledger. Grand livre.

Harry H. Herrick, Owatonna, Minnesota, U.S.A., 9th October,
1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,098.
Claim.-In an account book, a subdivision comprising a number of leaves divided into groups, each leaf having at its upper edge an upwardly projecting tab having a blank space of sufficient size for the entry of a name, the tab and the margin of the leaf being provided with identical index symbols, the index tabs of each group being of the same width and those of successive leaves of each group being of successively increased height, and the width of the tabs of successive groups being of successively increased width.

No. 101,391. Filing Cabinet. Cabinet de classement.

John F. Huber, Buffalo, New York, U.S.A., 9th October, 1906 6 years. Filed 16th July, 1906. Receipt No. 137,873.
Claim.-1. The combination of a holder, a series of movable leaves thereon, and one or more flexible extensible connecting members attached to said holder and having sliding conyections with said leaves, whereby the connecting members o: members can move relative to said leaves in the direction of the planes thereof, substantially as set forth.
2. The combination of a holder, a series of movable leaves thereon, and one or more flexible elastic connecting members attached to said holder and passing through elongated slots in said leaves, whereby the connecting member or members can move relative to said leaves in the direction of the planes thereof, substantially as set forth.
3. The combination of a holder, a series of movable leaves thereon, and one or more flexible extensible connecting members detachably secured to said holder and having sliding connections with said leaves whereby the connecting member or members can move relative to said leaves in the direction of the planes thereof, substantially as set forth.
4. The combination of a holder, a series of movable leaves thereon, flexible elastic connecting members passing through elongated slots in said leaves, crossbars atached to the opposite ends of said connecting members, and means for detachably securing said crossbars to sald holder, substantially as set forth.
5. The combination of a holder, a slotted sliding shelf therein, a series of movable leaves on said holder, and one or more flexible extensible connecting members attached to said holder and having sliding connections with said leaves, sald connecting member or members passing through the slot or slots of said shelf, substantially as set forth.

10-11

No. 101,392. Concrete Block. Bloo de beton.

Walter D. Johnston, New York City, New York, U.S.A., 9th October, 1906; 6 years. Filed 25th August, 1906. Receipt No. 138,970.
Claim.-1. An improved block for concrete construction comprising a body portion having a plurality of outwardly protruding tenon lugs adapted to lock within recesses in adjacent blocks and a plurality of recesses in other parts of the block into which the tenon lugs of adjacent blocks are adapted to fit and a plurality of passages through the block adapted to be filled with a suitable filling material, substantially as described.
2. The herein described means for buiding submarine constructions comprising a plurallty of horizontal series of blocks locked together by means of tenon lugs in each block extending into recesses in the adjacent blocks the said blocks having a plurality of vertical bores or passageways therethrough which register with the passages of the superposed sections and a filling extending throlugh all the vertical passages and locking the horizontal series together, substantially as described.
3. The herein described means for building submarine constructions which consists of a plurality of blocks arranged in a number of horizontal series, each block being provided with two outwardly extending tenon lugs and with two dovetailed recesses, the tenons in each block fitting into the slots in the adjacent block and each block also being provided with vertical passageways, the vertical passageways in all the superposed blocks being adapted to register and a filling material placed in the vertical passageways and locking all the horizontal series together, as and for the purpose specified.

No. 101,393. Binding Machine for Way Bills, Etc. Reliure de feuilles volantes, etc.

Charles Forrest McBee, Athens, Ohio, U.S.A., 9th October, 1906; 6 years. Filed 18th July, 1906. Receipt No. 137,945. Olaim.-1. A binding machine for paper or other sheets, comprising a receiver and a pressure device for the sheets, and means to gulde an implement for forming holes through the sheets adjacent to one of their edges, said receiver having a base and opposite sides, and a swinging evener for one of the edges of the sheets.
2. A binding machine for paper or other sheets, comprising a receiver and a pressure device for the sheets, and means to guide an implement for forming holes through the sheets adjacent to one of thelr edges, sald recelver having a base, opposite sides, and a swinging evener for one of the edges of the sheets, and said pressure device being constructed of a yoke supported by said sides, and a screw working in the yoke and against the platen.
3. A binding machine for paper or other sheets, comprising a recelver and a pressure device for the sheets, and means to guide an implement for forming holes through the sheets adjacent to one of their edges, said receiver having a base and opposite sides, the latter having eyes at their edges, and said pressure device belng constructed of a removable platen, platen, each end of the yoke having separated eyes recelving between them an eye of one of said sides, with a device detachably securing the eyes together.
4. A binding machine for paper or other sheets, comprising a receiver and a pressure device for the shects, and means to guide an implement for forming holes through the sheets adjucent to one of their edges, sald receiver having a base, opposite sides, and a swinging evener for one of the edges of the sheets, the sides being provided with eyes at their edges, and said pressure device being censtructed of a removable platen, a yoke and a screw working in the yoke and against the platen, each end of the yoke having separated eyes receiving between them an cye of one of said sides, with a device detachably securing the eyes together.
5. A binding machine for paper or other shects, comprising a receiver and a pressure device for the sheets, said receiver having a base and opposite sides, a block hinged to the rearward edge of the base, having holes therein. and a strip hinged above said block, having corresponding holes therethrough, and sald pressure device having a removable platen with a block binged to its rearward edge, having holes therethrough corresponding to the previously mentioned holes, and means for holding this block down upon the shects
6. A binding machine for paper or other shects, comprisIng a receiver and a pressure device for the sheets, said receiver having a base and opposite sides, a block hinged to the rearward edge of the base, having holes therein, and a strip hinged atove said block, having corresponding holes therethrough, and said pressure device having a removable platen with a block hinged to its rearward edge, having holes therethrough corresponding to the previously mentloned holes, and rotatable arms on the platen for holding this block down upon the sheets.
7. A binding machine for paper or other sheets, comprising a receiver and a pressure device for the sheets, sald receiver having a base and opposite sides, a block hinged to the rearward edge of the base, having vertical holes therein and provided in its outer surface with recesses, a hinged strip above said block having corresponding boles thereethrough, and a swinging evener for the sheets having projections for entering said recesses, and said pressure device including a removable platen with a block hinged to its rearward end having holes therethrough corresponding to the previously mentioned holes.
8. A binding machine for paper or other sheets, comprising a receiver and a pressure device for the sheets, and means to guide an implement for successively forming holes through the sheets, adjacent to one of their edges, said receiver having a base and opposite sides, and provided with a hinged evener for the sheets, having means for securing the same in closed position with reference to said sides.

No. 101,394. Account File. Fil pour comptes.

James O. Wllhelm, Limaville, Ohio. U.S.A., 9th October, 1906; 6 years. Filed 22nd August, 1906. Receipt No 138,911.
Claim.-1. An account fle consisting of inclined side pieces connected at each end by crossbars and intermediate of
their ends by a series of spaced crossbars, legs hinged to the upper ends of the side pieces, hooks hinged to the side pieces and engaging the legs to hold them in position, and pins having angular shanks secured to the intermediate crossbars, whereby the pins will occupy an oblique position relative to the said crossbars, the pins being arranged in rows.
2. An account file, comprising inclined side pieces connected together at their upper ends and supported at said end by legs, a series of spaced crossbars arranged in parallel vertical planes between the inclined side pleces with their upper edges a short distance below the upper edges of said side pleces, and pins having angular shanks secured to said crossbars, whereby the pins will stand at right angles to the inclined side pleces.
3. An account file comprising inclined side pleces connected together at their ends by crossbars and intermediate of their ends by a series of spaced crossbars arranged in parallel vertical planes, a plurality of pins secured to each crossbar and standing at angles thereto, legs hinged to the upper ends of the side pleces, and means for holding the legs in a vertical position.

No. 101,395. Epool or Reel. Fuseau ou bobine.

Fiugene Bradley Crocker, Providence, Rhode Island, U.S.A., 9th October, 1906; 6 years. Filed 24th August, 1906. Recelpt No. 138,961.
Claim.-1. In a spool or reel, a body portion, two heads, a bushing inserted into each end of said body and having a flange turned back upon itself and inclosed within said body, a head retaining bushing passing through each head, and means for securing sald retaining bushing to said first-named bushing to hold the heads firmly in place.
2. In a spool or reel, a body portion, two heads, a bushing inserted into each end of said body portion, and having a flange turned back upon itself and inclosed within said body a head retaining bushing having a hub to pass through the head, a flange on sald retaining bushing for supporting the outer face of said head, and means for securing said retalning bushing to said first-mentioned bushing.
3. In a spool or reel, a body portion, two heads, a bushing inserted into each end of said body portion, and having a flange turned back upon itself and inclosed within said body, a central hub in said bushing, a head retaining bushing also provided with a hub, and means whereby said latter hub may be passed through said head and secured to the hub of said first-mentioned bushing to secure sald head in position.
4. In a spool or reel, a body portion, two heads, a bushing inserted into each end of said body portion, and having a fiange turned back upon itself and inclosed within said body. an inwardly projecting central hub in said bushing, a head retaining bushing also provided with a hub to it into said first-mentioned hub, and means whereby sald latter hub may be passed through said head and secured to the hub of sald first-mentioned bushing to secure said head in position.
5. In a spool or reel, a body portion, two heads, a bushing inserted into each end of sald body portion and having a tlange turned back upon itself and inclosed within said body. an inwardly projecting screw-threaded central hub in said bushing, a head retaining bushing having a hub also screwthreaded and arranged to be passed through sald head and screwed into the hub of said first-mentioned bushing to secure said head in position.
6. In a spool or reel, a body portion, two heads, a bushing inserted into each end of sald body, and having a flange turned back upon itself and inclosed within said body, a central hub in said bushing, a head retaining bushing alsc provided with a hub arranged to pass through sald head and fit into the head of said first-mentioned bushing to secure said head in position and a spindle bearing or sleeve projecting centrally within the hub of a said retalning bushing.
7. In a spool or reel, a body portion, two heads, a bushing inserted into each end of said body portion, and having a flange turned back upon itself and inclosed within said body, an inwardly projecting screw-threaded central hub in said bushing, a head retaining bushing having a hub also screwthreaded and arranged to be passed through said head and screwed into the hub of sald first-mentioned bushing to secure said head in position, and a spindle bearing hub or gleeve projecting centrally within the hub of said retaining bushing.
8. In a spool or reel, a body portion, two heads, a bushing inserted into each end of said body and having a flange turned back upon itself and inclosed within said body, sald bushing being provided with an inwardly bevelled head, a head retaining bushing, and means for uniting said bushings.
9. A spool or reel comprising a body portion, two heads, a bushing inserted into each end of said body and having a fiange inclosed within and secured to said body, a head retaining bushing provided with a hub passing through each head, means for uniting said bushing, and a plug secured within said retaining bushing and provided with a spindle bearing sleeve extended centrally within the hub of said retaining bushing.
10. A spool or reel comprising a body portion, two heads, a bushing inserted into each end of said body and having a flange inclosed within and secured to said body, a head retaining bushing provided with a hub passing through each head, means for uniting said bushings, and a plug provided with a flange turned back upon itself and secured within said retaining bushing, said plug being also provided with a centrally projecting spindle bearing sleeve.
11. A spool or reel comprising a body portion, two heads, a bushing inserted into each end of said body and having a flange inclosed within and secured to said body, a head retaining bushing, means for uniting said bushings, and a plug secured within said retaining bushing and provided with a ecntrally arranged bearing sleeve, said plug being also provided with a raised annular shoulder surrounding said sleeve.
12. A spool or reel comprising a body portion, two heads, a bushing inserted into each end of said body and having a flange inclosed within and secured to said body, said bushing being provided with an inwardly bevelled head having a central opening, a head retaining bushing, means for uniting said bushings, and a plug secured within said retaining bushing and provided with a bearing sleeve terminating adjacent said inwardly bevelled head, the bore of said sleeve coinciding with the opening in said bevelled head.

No. 101,396. Log Eolder. Porte-bille de bois.

Robert Andrew Harris, Halleybury, Ontario, Canada, 9th October, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,676 .
Claim.-1. A \(\log\) holder comprising a head having a plurality of prongs, and means secured on the said prongs for engaging the log, substantially as described.
2. In a log holder, a head having a plurality of prongs, an arm, and means secured to the said prongs to engage the log, substantially as described.
3. In a \(10 g\) holder, in combination a head, an arm extending therefrom, a plurality of prongs formed on the said head, and a grab hook pivotally mounted on one of the prongs, substantially as described.
4. In a log holder in combination a head, an arm extending therefrom, a plurality of prongs formed on the said head, a grab hook pivotally mounted on one of the prongs and auxiliary holding means secured to one or more of the said remaining prongs, substantially as described.
5. In a log holder, in combination a head, an arm extending therefrom, three prongs formed on the said head, a grab hook pivotally mounted on the central prong, and spiked holders secured on the outer arms co-operating with the said grab hook, substantially as described.
6. In a log holder, a head formed with a plurality of prongs, the central one being shortened and provided with a hook pivotally secured thereto, the outer prongs being provided with spiked means arranged to slip over the log when turning in one direction and become ombedded thereir when turned in the opposite direction, substantially as described.

No. 101,397. Fence Post. Poteau do olfture.

Hubert E. Hillman, Lockwood, Ohio, U.S.A., 9th October,
1906; 6 years. Filed 23rd July, 1906. Receipt No. 138,081.
Claim.-1. A post for wire fences, composed of cement, and having a metallic core, a series of loops arranged upon face of said post, a wire holding bar having inclined faces inserted in said loops, and means to prevent vertical play thereof, substantially as described.
2. A fence post comprising a body portion and a plurality of loops, a wire holding bar having inclined taces thereon, and means to prevent vertical play thereof.
3. A fence post comprising a body portion and loops thereon, a wire holding bar to engage therewith, having -inclined faces, means thereon to engage the line wires, and means to prevent vertical play of said bar.
4. A fence post comprising a body portion and loops thereon, a wire holding bar to co-operate therewith, a notch at the upper end of sald bar, means to engage therewith, and means to prevent displacement of the first-named means and prevent a vertical play of said wire holding bar.
5. A post for wire fences composed of cement, and having a metallic core, a series of loops arranged on sald post, a wire holding bar having inclined faces inserted in said loops, means top revent vertical play thereof, said core being provided with a plurality of projections, said projections being formed with wings, substantially as described.
6. A fence post, comprising a body portion and core therefor, a plurality of projections thereon, said projections being formed with wings, a series of loops upon one face of said post, a wire holding bar to be inserted therethrough, said faces having tecth to engage the line wires, a notch at the upper end of sald bar, a spring lever to engage therewith, and a spring catch to hold the spring lever in place to prevent vertical play of said wire holding bar, substantially as specified.

No. 101,398. Fence Stay. Etai de cloture.

Robert Lee Horsley. Fort Worth, Texas, U.S.A., 9th October, 1906; 6 years. Filed 14th August, 1306. Receipt No. 138687.

Olaim.-1. A stay for fences comprising a wire formed into a spiral and bent upon itself and the two parts twisted to gether and meshing with each other and having a clamp formed of the two parts at a distance from the bent portion of said wire.
2. The combination of the line wires of a fence and a stay therefor, said stay consisting of a wire formed into a spiral and bent upon itself and the two parts meshed together and having a clamp formed of the two parts at a distance from the bent part thereof, said stay being screwed on the said line wires and said clamp being sprung on the top line wire of the fence.

No. 101,399. Dough Kneading Machine. Machine a petrir la pate.

Johann Philipp Klein, Offenbach, O.M., Germany, 9th October, 1906; 6 years. Filed 14th October, 1904. Receipt No. 119,194.
Claim.-1. In a dough kneading machine the combination of kneaders with a gear of pantograph form, operated by a crank disc, substantially as and for the purpose set forth.
2. In a dough kneading machine the combination of kneaders with a gear of pantograph form operated by a crank disc, one arm \(b\) of said gear being prolongated over the parallelogram of sald gear and formed as kneaders, the other arm a prolongated over the parallelogram being laterally pivoted to a projection of the frame, substantially as and for the purpose set forth.
3. In a dough kneading machine the combination of kneaders operated by a gear of pantograph form, and a crank disc, and a single trough of a seml-cylindrical shape corresponding to the circular movement of the kneaders, substantially as and for the purpose set forth.
4. In a dough kneading machine the combination of kneaders operated by a gear of pantograpb form and a crank disc, and a single trough of a semi-cylindrical shape corresponding to the circular movement of the kneaders, said trough being mounted on wheels and adapted to roll to and from under the machine without detaching any part of the machine, substantially as and for the purpose set forth.

\section*{No. 101,400. Sectional Furnaces for Hot Water Heating. \\ Fournaise pour chauffage d eau chaude.}

Benjamin F. Rogers, Buffalo, New York, U.S.A., 9th October, 1906; 6 years. Filed 29th November, 1905. Receipt No. 130,534.
Claim.-1. A boiler of the character described, comprising a plurality of hollow sections, each having top and side wall elements, and an intermediate water containing leg depending from the top element between the side wall elements, the side wall elements of the different sections being located together, forming furnace side walls, and the legs being located against each other, forming a continuous intermediate furnace partition between the side walls.
2. A boller of the character described, comprising a plurality of hollow sections, each having top and side wall ele-
ments, and an intermediate water containing leg depending from the top element between the side wall elements the side wall elements of the different sections being located together, forming furnace side walls, and the legs being located against each other, forming a continuous intermediate furnace partition between the side walls, tie devices and water conducting means connecting the side wall elements, and tie devices and water conducting means connecting the abutted legs.
3. A boller of the character described, comprising a plurality of hollow sections, each having top and side wall elements, and an intermediate water containing leg depending from the top element between the side wall elements, the side wall elements of the different sections being located together, forming furnace side walls, and the legs having opposite flat sides abutted against each other, forming a con tinuous intermediate furnace partition between the side walls, tie bolts passing through the side wall elements, nipples connecting the adjacent side wall elements, a tle bolt passing through the legs, and nipples connecting the adjacent legs.
4. In a boller of the character described the combination with a grate, of a boiler body comprising abutted sections, said sections each consisting of a top, independent water containing side wall elements depending from the top to the sides of the grate, and intermediate water containing legs depending from the top towards an intermediate portion of the grate, said side wall elements and intermediate legs being independent at their lower ends and forming separate combustion compartments over the grate.
5. In a boiler of the character described, the combination with a grate, of a boiler body comprising abutted sections, said sections each consisting of a top, independent water containing side wall elements depending from the top to the side of the grate, and intermediate water containing legs depending from the top towards an intermediate portion of the grate, sald side wall elements being abutted, and said intermediate legs being abutted, forming separate combustion compartments over the grate, tie rods passing through the side walls and through the intermediate legs, and water ronducting means connecting the abutted side wall elements and the abutted legs to permit the circulation of water through the side walls and through the intermediate partitiol formed by the depending legs.
6. A boiler of the character described, comprising sections, fach section including top and depending side wall element, and flue openings formed through the top, said boller sec tions being abutted with the flue elements in alignment.
7. A boller of the character described, having top, side walls, and an intermediate water leg partition depending from the top and forming separate combustion compartments, and separate flues extending longitudinally through the top, and communicating respectively with the diferent combustion compartments.
8. In a boiler of the character described, the combination with a water containing top, water containing side walls, and an intermediate water containing partition forming separate combustion chambers within the boller, of a smoke outlet, and separate flues connecting the diferent compartments to the smoke outlet.
9. In a boiler of the character described, the combination with a water containing top, water containing side walls, and an intermediate water containing partition forming separate combustion chamber within the boiler, of a smoks outlet, and separate indirect flues extending longitudinally through the top and independently connecting the diferent compartments to the smoke outlet.
10. In a boller of the character described, the comblnstion with a base, of a furnace grate located thereon and extending from end to end thereof, and a boller body mounted on the base and comprising end and Intermediate sections, said sections each comprising a water containing top, independent outwardly bulged side wall elements extending to the opposite sides of the base, intermediate depending water containing legs, the side wall elements and intermediate legs of the different sections being abutted, forming outer side walls, and an intermediate partition dividing the space within the body into separate combustion compartments over the grate, a smoke outlet at one end of the boiler, and independent indirect flues extending longitudinally through the water containing top of the furnace and separately connecting the different combustion compartments with the smoke outlet.

No. 101,401. Photographic Apparatur.
Apparell photographique.
Young Shannon, Norwich, Connecticut, U.S.A., 9th October 1906; 6 years. Filed 16th May, 1906. Receipt No. 135.959 Claim.-In an enlarging camera the comblnation with the negative holder and the lens located behind the same and the sensitized sheet located on the opposite side of the lens, of
a ray filter plate having a translucent mat surface interposed between the lens and the negative and means for adjusting

the ray filter plate relatively to the negative, as and for the purpose specified.

\section*{No. 101,402. Apparatus for Magnifying and Illustrating Micrographic Representations.}

Apparell a grossir et illustrer les representations micrograpMiques.

Otto H. F. Vollbehr, Helensee, Berlin, Germany, 9th October, 1906; 6 years. Filed 19th June, 1905. Receipt No. 126,177.
Claim.-1. In a device for magnifying microphotographic lllustrations the combination with the carrying frame, of a lens adjustable over the diapositive, and a source of light detachably connected with the frame and serving to render the lllustration placed beneath the objective transparent, substantially as set forth.
2. In a device for magnifying microphotographic ilustrations the combination with the carrying frame, of a lens adjustable over the diapositive, a source of light detachably connected with the frame and serving to render the llustration placed beneath the objective transparent, and a ground glass plate located between the source of light and the fllustration, substantiaily as set forth.
3. In a device for magnifying microphotograplic illustrations the combination with the carrying frame, a source of light detachably connected with the frame and serving to render the illustration placed beneath the objective transparent, and a ground glass plate located between the source of light and the illustration, substantially as set forth.
4. In a device of magnifying microphotographic illustrations the combination of the carrying frame, the adjustable lens, the detachable casing with electric lamp battery and means for controlling the current from the battery, the ground glass plate located between the electric light and the illustration, substantially as set forth.

\section*{No. 101,403. Sash Fastener. Arrête-croisée.}

Thomas Wertz, Saint Louis, Missourl, U.S.A., 9th October, 1906; 6 years. Filad 3rd August, 1906. Receipt No. 138,403. Claim.-A sash fastener, consisting of a pawl having arranged on one end a laterally projecting pintle adapted to be mounted in a recess formed in the top rail of a lower window sash, bearing plates arranged in said recess to recelve the ends of said pintle, an aperture retaining plate arranged above the latter to hold the same in place, a rack
bar secured to the mid-rail of the upper sash, a spring arranged on said pintle to normally engage said pawl with the

teeth of said rack and means whereby said pawl may be held disengaged from the same, substantially as described.

No. 101,404. Sash Balance and Fastener.
Contre-potds et arrete-orotsé.

William W. Klima, Hutchenson Minnesota, U.S.A., 9th October, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,081 .
Claim.-1. In a device of the class described, the combination with a window frame and a sash slidably mounted therein, of rollers carried by the sash and contacting with the frame and being arranged for rotation in opposite directions, and means whereby one or the other of said rollers may be moved out of such engagement.
2. In a device of the class described, the combination with a window frame and a sash slidably mounted therein, of rollers carried by the sash and being arranged for rotation in opposite directions means for holding said rollers normally in engagement with said frame, and means whereby one or the other of said rollers may be moved out of said engagement.
3. In a device of the c.ass described, the combination with a window frame and a sash slidably mounted therein, of rollers carried by the sash, means for holding the roller against rotation in the same direction, means for holding said rollers normally in engagement with said frame, and means whereby one or the other of sald rollers may be moved out of said engagement.
4. In a device of the class described, the combination with a window frame and a sash slidably mounted therein, of rollers carried by the sash and being arranged for rotation in opposite directions, means for holding sald rollers normally in engagement with said irame, and a lever arranged for movement to disengage one or the other of said rollers from sald frame.

\section*{No. 101,405. Door Releasing Meohanism. \\ Mécanisme de désembrayage.}

Edward Kauntze, Hanford, California, U.S.A., 9th October. 1906; 6 years. Filed 28th July, 1906. Receipt No. 138,237.
Claim.-1. A door releasing device, said device consisting of a pivoted latch turnable upon one member of a door structure, a vertically slotted keeper upon the other member, bolts by which the door leaves are independently secured, and connections between the pivoted latch and sald bolts whereby the latch and bolts are movable in unison.
2. In a door releasing device, a pivoted vertically turnable latch carried upon one leaf of the door, a keeper upon the other leaf in which the latch engages, bolts by which the leaves of the door are independently locked when closed, connections between said bolts and the latch whereby the unlocking movement of the latch is transmitted to simultancously disengage the bolts.
3. In a door releasing device, a pivoted latch carried upon one leaf of the door, and a vertically slotted keeper upon

the other leaf, said latch having a rearward extension, a link pivoted to said extension having a rod with a stop upon the lower end, a weight slidable upon tile rod acting when released to disengage the latch, a vertically movable locking bolt carried upon the door and adapted to engage the door casing, and a flexible connection between said bolt and the weight actuated link.
4. In a door locking and releasing device, a pivoted turnable bolt upon one leaf of the door and a keeper therefor upon the other leaf, a link with which the inner end of the latch connects, a rod connected with the link having a stop at its lower end, a normally suspended weight slidable upon the rod, and arrested by the stop at the lower end, whereby the link is pulled down and the latch turned and disengaged. bolts extending upwardly an downward upon the door leaves to engage with the top and bottom of the casing and connections between the said bolts and the link and latch, whereby the bolts are disengaged in unison with the latch.
5. In a door releasing device, a pivoted latch and keeper located respectively upon the contiguous edges of the door leaves, a slidable weight actuated link, an upwardly extending bolt connected therewith and normally locking one leaf of the door, an arm pivoted with relation to the latch, extending inwardly, a bolt connected with the inner end of said arm and normally engaging the bottom of the door casing, a cam pivoted with the latch and adapted to engage with the pivoted arm when the latch is turned to disengage. whereby the locking bolts are withdrawn.
6. A door locking and releasing device including a latch pivoted to one leaf, and the keeper upon the other leaf, bolts slidable upwardly and downwardly upon the door leaves to engage with the top and bottom of the door casing respectively, connections by which the latch find boits are simultaneously disengaged, said connections including a slidable link connection with the rear of the latch, a rod having a stop at its lower end, a weight slidable upon said rod and acting to move said rod and link downward when it contacts with the stop, a flexible connection between the ling and the upwardly extending bolt, an arm pivoted contiguous to the latch having its inner end connected with the downwardly extending bolt, a cam carried by the latch acting to tilt said arm and withdraw the bolt in unison with the disengaging of the lateh and the upper bolt.
7. In a door releasing device, a pivoted latch carried upon one leaf of the door, and a keeper upon the other leaf, a link with which the inner end of the latch is connected, a rod connected with the link having a stop upon its lower end. a weight slidable upon the rod, vertically movable bolts by which the top and bottom of the door are locked, connections between said bolts and the latch whereby they are disengaged in unison therewith, a destructible cord by which the weight is normally suspended and an electrically lieated part with which the cord is maintained in contact, means for completing an electric circuit whereby the heating of said part destroys the cord and releases the weight.
8. In a door releasing device, means carried upon the doors whereby sald doors are secured in a closed position, a weight normally suspended with relation to said locking means, a destructible cord connected with the weight and means controlled from a distant point to desuoy the cord and release the weight to disengage the latch.
9. In a door releasing device, latching mechanism by which the door is secured in a closed position, a weight connected with the inner end of the latch, a cord by which the weight is normally suspended out of action, an electrically heated part with which the cord contacts and means for completing an electrical circuit whereby said part is heated, the cord destroyed, the weight released to fall and disengage the latch.

No. 101,406. Door Cheok and Clower.
Fermeture et arrete-porte.

Joseph Bardsley, Montclair, and Albert John Rosentrater, Boonton, both in New Jersey, U.S.A., 9th October, 1906; 6 years. Filed 4th June, 1906. Receipt No. 136,524.
Claim.-1. The checking cylinder containing the piston and piston rod, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the connecting rod pivoted at one end to the outer end of said lever and at its other end to a fixed point, a closing spring exterior to said cylinder and confined at one end, and means connecting the other end of said spring to the inner end of said lever adjacent to its pivot point, whereby said end of said lever while turning on its pivot operates as a crank on and is operated by said spring, substantially as set forth.
2. The checking cylinder containing the piston and piston red, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the connecting rod pivoted at one end to the outer end of said lever and at its other end to a fixed point, a closing spring exterior to said cylinder and confined at one end, a rod in engagement with and acted on and acting against the other end of said spring, and means engaging sald rod with the inner end of sald lever adjacent to its pivot point, whereby said end of said lever while turning on its pivot operates as a crank on and is operated by said rod and spring, substantially as set forth.
3. The checking cylinder containing the piston and piston rod, the double ended lever pivoted to one end at a axed point and at an intermediate point to said rod, the connecting rod pivoted at one end to the outer end of said lever and at its cther end to a fixed point, a closing spring exterlor to sald cylinder and confined at one end, a rod in engagement with and acted on and acting against the other end of said spring. and means engaging said rod with the inner end of said lever Inwardly beyond its pivot point, whereby said end of sald lever while turning on its pivot operates as a crank arm against sald rod and spring, substantially as set forth.
4. The checking cylinder containing the piston and piston rod, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the connecting rod pivoted at one end to the outer end of said lever and at its other end to a fixed point, a closing spring exterior to said cylinder and confined at one end, a rod extending through said spring and having a collar to engage the otherwise unconfined end of said spring, and pivotal means engaging sald rod with the inner end of said lever beyond its pivot point, whereby said end of said lever constitutes a short crank which while said lever is turning on its pivot operates on and is operated against by said rod and spring, substantially as set forth.
5. The checking cylinder containing the piston and piston rod, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the connecting rod piroted at one end to the outer end of sald lever and at lts other end to a fixed point, a closing spring exterior to said cylinder and confined at one end, means for adjusting the tension of said spring, and means connecting the other end of said spring to the inner end of said lever adjacent to its pivot point, whereby said end of said lever while turning on its pivot operates as a crank on and is operated by sald spring, substantially as set forth.
6. The checking cylinder containing the piston and piston rod. the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the securing bracket to which sald cylinder and lever are connected, the connecting rod pivoted at one end to the outer end of said lever and at its other end to a fixed point, a closing spring mounted in said bracket and confined at one end, and means connecting the other end of sald spring to the inner end of said lever adjacent to its pivot point, substantially as set forth.
7. The checking cylinder containing the piston and piston rad, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the securing bracket to which said cylinder and lever are connected, the connecting rod pivoted at one end to the outer end of said lever and at its other end to a fixed point, a closing spring mounted in said bracket and confined at one end, and means connecting the other end of said spring to the inner end of said lever adjacent to fts pivot point, said bracket having means for the adjustment of said spring, substantially as set forth.
8. The checking cylinder containing the piston and piston rod, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the securing bracket to which said cylinder and lever are connected, the connecting rod pivoted at one end to the outer end of said lever and at its other end to a fixed point, a closing spring mounted in said bracket, a slide mounted in said bracket and confining said spring at onc end, a screw for adjusting said slide to regulate the tension of said spring, a rod extending through said spring and guided at its outer end in a portion of said slide, and means engaging said rod with the inner end of said lever adjacent to its pivot polnt, substantially as set forth.
9. The checking cylinder containing the piston and piston rod, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod, the securing bracket to which said cylinder and lever are connected, the connecting rod pivoted at one end to the outer end of said lever and at its other end to a fixed point, a closing spring mounted ir. sald bracket, a slide mounted in said bracket and confining said spring at one end, means for adjusting said slide for regulating the tension of said spring, a rod extending through sald spring and guided in a portion of said slide, and means engaging said rod with the inner end of sad lever adjacent to its pivot point, said bracket having the notches 64 and undercut recesses, and said slide having the flanges 61 to pass through said notches and seat and move in said recesses, substantially as set forth.
10. The checking cylinder containing the piston and piston rod, the double ended lever plvoted at one end at a fixed puint and at an intermediate point to said rod, the securing bracket to which said cylinder and lever are connected, the connecting rod pivoted at one enis to the outer end of said lever and at its other end to a fixed point, a closing spring mounted in said bracket and confincd at one end, a rod extending through said spring and engaged by the same, and means engaging said rod with the inner end of said lever, said means comprising a short crank arm 49 having a bearing 50 on said lever and a bearing recess 51 on sald rod and engaging said bearing 50 on said lever, substantially as set forth.
11. The checking cylinder containing a piston and piston rod, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod and thence extending along the front of sald cylinder toward its outer end and about on a horizontal plane with the piston rod, a connecting rod pivoted to the outer end of said lever and thence returning along the same to a fixed point where it is pivoted, a securing bracket to which said cylinder and lever are secured, a closing spring mounted in said bracket, a plunger rod extending through said spring, and means engaging the end of said rod with the end of said lever inwardly beyond the pivot point of same, substantially as set forth.
12. In a door closer, a securing bracket, an operating lever pivoted thereto and having a crank arm at its inner end, a connecting rod pivoted at its outer end to the outer end of said lever and at its other end to a fixed point, a closing spring mounted in said bracket, and a rod extending through sald spring and acted upon by the same, said rod and said crank arm being pivotally connected, substantially as set forth.
13. In a door closer, a securing bracket, an operating lever pivoted thereto and having a crank arm at its inner end, a connecting rod pivoted at its outer end in the outer end of said lever and at its other end to a fixed point, a slide mounted in said bracket, a screw for adjusting the position of same, a closing spring mounted in said bracket and confined by said slide, and a rod extending through said spring and guided by sald slide, said rod and crank arm being pirotally connected, substantially as set forth.
14. In a door closer, a securing bracket, and operating lever pivoted thereto and having a crank arm at its inner end, a connecting rod pivoted at its outer end to the outer end of said lever and at its other end to a fixed point, a slide mounted in said bracket, a screw for adjusting the position of same, a closing spring mounted in said bracket and confined by said slide, and a rod extending through said spring and guided by said slide, said rod and crank arm being pivotally connected, and said bracket being formed With the notches 64 and undercut recesses, and said slide teing formed with flanges 61 to pass through said notches and seat in said recesses. substantially as set forth.
15. A door check comprising the cylinder, operating lever and connecting rod, said cylinder containing the piston and
piston rod, the latter being pivoted to said lever, and sald cylinder having on its end a cap 24 and provided with a wire furnishing pins at its ends passing through apertures in the sides of the cap and cylinder, for detachably locking said cap in position, substantially as set forth.
16. A door check comprising the cylinder, operating lever, connecting rod, piston and piston rod, said cylinder having a threaded escape aperture for air, a controlling screw therefor, and a spring arm containing a threaded aperture for said screw and adapted to exert a binding tension on said screw when the:latter is engaged by the wall of said escape aperture, substantially as set forth.
17. A door check comprising the cylinder, operating lever, connecting rod, piston and piston rod, said cylinder having on its outer end a metal cap provided with an arm of Ushape containing a threaded aperture in line with a threaded aperture for the escape of air from said cylinder, and the regulating screw carried by said arm, substantially as sot forth.
18. The hinged checking cylinder containing the piston and piston rod, the double ended lever pivoted at one end at a fixed point and at an intermediate point to said rod and thence extending toward the outer end of said cylinder and being bifurcated to form the upper and lower members, and the connecting rod pivoted to the outer end of said lever and disposed between said members and thence returning to a fixed point where it is pivoted, substantially as set forth.
19. In a door check, the checking cylinder, an operating lever therefor and a connecting rod at one end fastened to said lever, combined with the securing bracket to receive the other end of said rod, said bracket comprising a supporting member 41, an adjustable member 40 seated thereon and means for binding said members together, one of said members having side flanges to preserve the alignment of the adjustable member with its support, substantially as set forth
20. In a door check, the checking cylinder, an operating lever therefor and a connecting rod at one end fastened to said lever, combined with the securing bracket to receive the other end of said rod, said bracket comprising a supporting member 41 having a head 42, an adjustable member 41 seated on said head and having a recess 43 and slot 44 , and a screw and nut for binding said members together, said nut being disposed in said recess, and said screw extending through said head and slot and engaging said nut, substantially as set forth.

No. 101,407. Door Riveting Device. Appareil d pivoter les portes.

James Edward Huey and Welcome C. Lovejoy, assignee of a half interest, both of Charlotte, North Carolina, U.S.A.. 19th October, 1906; 6 years. Filed 11th April, 1906. Receipt No. 134,857.
Claim.-1. Door pivoting devices comprising an upper member, and a lower member, one movable toward and from the other, said members having co-acting cam devices for the purpose set forth.
2. Door pivoting devices comprising an upper member, and a lower member having segmental cam or wedge surfaced grooves in their opposing sides, and bearing balls co-acting with said grooves, for the purpose set forth.
3. Door pivoting devices comprising an upper member, and a lower member having segmental cam or wedge surfaced grooves in their opposing sides, bearing balls co-acting with sald grooves, for the purpose set forth, and a spring to press one of said members toward the other.
4. Door pivoting devices comprising an upper member, and a lower member, one movable toward and from the other
having co-acting guide and aligning devices, and cam devices operative to turn one angularly with reference to the other, for the purpose set forth.
5. Door pivoting devices comprising an upper member having a web to enter a recess in a door, and further provided with a lower surface having segmental cam or wedge surfaced grooves, a lower member having an upper surface provided with similar grooves, and bearing balls to operate in the said grooves of the eald members, substantlally as described.
6. A swinging door having devices to move the same vertlcally while being closed and opened, combined with a frame, said door and frame having oppositely bevelled stop devices on their opposing sides to clear the door and prevent the formation of a wide crack between them when the door is closed.
i. Door pivoting and automatically closing devices comprising a member having a plate provided with parallel side edges, and a cylindrical boss on the center of said plate and having segmental cam or wedge surfaced grooves in its upper side, an upper member having a socket for the reception of said boss and similar grooves in its under side, and bearing balls co-acting with the sald grooves of the upper and lower members, for the purpose set forth.
8. In combination with a fixed lower door pivoting member, an upper door pivoting member having a web provided with an inclined upper side and a clearance notch or recess, a door having a recess in its lower inner corner for the reception of the said web, plates on opposite sides of the door, and a clamping device for the said plates, cleared by said notch or recess in said web, substantially as described.

\section*{No. 101,408. Cigarette Making Machine.} Machine d faire des cigarettes.

The New York Cigarette Machine Company, assignee of Arthur L. Boucher, all of New York City, New York, U.S.A., 9th October, 1906; 6 years. Filed 23rd August, 1906. Receipt No. 138,948 .

Claion.-1. In a machine of the class described, means for feeding a paper web, means for feeding a cork web, and means for severing and securing the cork web to the paper web at intervals.
2. In a machine of the class described, means for feeding a paper web continuously, means for feeding a cork web intermittently, means for severing the cork web and means for securing the cork web to the paper web.
3. In a machine of the class described, means for feeding a paper web continuously, means for feeding a cork web intermittently and laterally, means for severing and securing the severed sections of the cork web to the paper web.
4. In a machine of the class described, means for feeding a paper web continuously, means for supplying the same with paste at intervals, means for feeding a cork web intermittently both transversely of the direction of movement of the paper web also in the direction of the movement of said paper web, means for severing and pressing said cork web against the paste on the paper web.
5. In a machine of the class described, means for feeding a paper web continuously, means for supplying sald web with parallel lines of paste running in the direction of movement of the web, means for supporting said web between said lines of paste, means for feeding a cork web intermittently both transversely and in the direction of movement of the paper web, and means for severing and pressing said cork web against the paste carrying parts of said paper web.
6. In a machine of the class described, means for feeding a paper web, means for supplying the same at regular intervals with parallel lines of paste running in the direction of the fech of said web, means for supporting said web between the
paste lines so that no paste comes in contact with the machine, means for feeding intermittently a cork web, means for suvering and pressing the same against the paste lines on said paper web.
7. In a machine of the class described, a carriage having a reciprocating movement longitudinally of the machine, a cam block having a vertical reciprocating movement in said carliage, cutters, a bent lever connecting said cam block and cutters, feed mechanism, and means connecting said feed mechanism with said cam block.
8. In a machine of the class described. a carriage having a reciprocating movement longitudinally of the machine, a cam block mounted to reciprocate in said carriage, cutters and means for connecting them with said cam block so as to be actuated thereby, grippers mounted on said carriage, feed rollers also mounted on said carriage and means connected with said cam block and connecting said grippers and feed rollers whereby the reciprocation of said cam block operates the cutters, grippers and feed rollers in proper relation, one to another.
9. In a machine of the class described, a reciprocating carriage, a cam block mounted to reciprocate therein, cutters, grippers and feed rollers carried by said carriage and means for operating each of them from said cam block, and a crank for reciprocating said carriage and cam block simultancously.
10. In a machine of the cluss described, a trough pivotally nounted at one end and adjustably supported at the other, a paste wheel on a shaft jourualled in sald trough, a shaft in the frame of the machine and adjustable connections between said shafts.
11. In a machine of the class described, a trough pivotally mounted at one end and adjustably supported at the other, a paste wheel on a shaft journalled in said trough, a disc with a pin fixed to said shaft, is 3econd shaft journalled in the frame of the machine, a disc on said second shaft and means in said disc to receive and hold the said pin.
12. In a machine of the class described, means for supporting a cork web, means for supporting grippers, and grippers composed of two stirrups, one fixed to said supporting means and one pivoted thereto, actuating means pivotally connected tc said pivoted stirrup, and a stop on said actutaing means adapted to move this pivoted stirrup in one direction.
13. In a machine of the class described, a lever, a fulcrum for said lever, an arm fixed to said lever, a standard pivoted on said fulcrum and provided with two stirrups one fixed and one pivoted, means for connecting the pivoted stirrup with said arm and a stop on said arm adapted to engage said standard when the arm is moved in one direction.
14. In a machine of the class described, a lever, a fulcrum for said lever, an arm fixed to sald lever, a standard pivoted on sald fulcrum, stirrups on said standard and means on said arm for operating said stirrups, a link connected with said lever, a rocker arm connected to said link and feed rollers and means connecting said rocker arm and feed rollers.
15. In a machine of the class described, a lever, a fulcrum for said lever, an arm fixed to said lever, a standard mounted on said fulcrum, stirrups on said standard and means on said arm for operating said stirrups, a gulde, a link, feed rollers and means connecting said link and feed rollers whereby they are positively driven by said link in unison with sald grippers.

\section*{No. 101,409. Cigaretto Making Machino.}

Machine d faire des cigarettes.

The New York Cigarette Machine Company, assignee of Arthur L. Boucher, all of New York City, New York, U.S.A.. 9th October, 1906; 6 years. Filed 23rd August. 1906. Receipt No. 138,949 .

Claim.-1. In a clgarette machine, means for pasting a cigarette rod, heated and rotary means for smoothing and pressing the pasted seam, and means for heating sald heated and rotary means.
2. In a eigarette machine, means for pasting a cigarette rod, heated and rotary means for pressing and smoothing the pasted seam of said rod.
3. In a cigarette machine, means for pasting a cigarette rod, a heated roller, means for heating said roller, means for supporting the roller above said rod, and means for revolving seid roller in contact with said rod.
4. In a cigarette machine, means for pasting a cigarette rod, a roller, means for supporting the roller above said rod, means for revolving said roller and means for heating the roller while it is revolved.
5. In a machine of the class described, means for pasting a cigarette rod. a roller, a pivoted frame for supporting said roller, means for revolving sald roller, and means for heating the same while it is revolved.
6. In a machine of the class described, a belt adapted to receive a web with tobacco resting thereon, a funnel for compressing this web and tobacco into a tube, means for pasting the edges of the web together, and heated and rotary means for pressing the edges of the tube together.
7. In a cigarette machine, means for pasting a cigarette rod, a roller, means for supporting the roller above said rod, and means for revolving said roller at a hlgh speed and in contact with the seam of said rod.
8. In a cigarette machine, means for pasting a cigarette rod, a heated roller. means for supporting the roller above said rod and means for revolving said roller in contact with the seam of said rod and running in the direction of the exterior lapping of the paper of the same.

No. 101,410 . Folding Axe. Hache pliante.

Andrew E. Veon and Albert Angel, assignee of a half interest, both of Brainerd, Minnesota, U.S.A., 9th October, 1906; 6 years. Filed 21st August, 1906. Receipt No. 138,888 .
Claim.-1. In a folding axe, a single piece of sheet metal bent to form a tubular handle and a wide flattened sheath adjacent thereto, one edge and the end of said sheath being open, ears extending from the ends of said sheath, and an axe head pivotally mounted between said ears, the butt thereof, when in an operative position adapted to rest against the closed edge of the sheath, the edge of the axe head adapted to be folded into the sheath through the open edge thercof, substantially as shown and described.
2. In a folding axe, a single plece of sheet metal bent to form a tubular handle and a wide flattened sheath adjacent thereto, the end and one side of said sheath being open, ears extending from the end of said sheath, teats on the inner side of said sheath, and the axe head pirotally secured between said ears. said axe head, when in an operative position, resting against the closed edge of the sheath and said teats, and. When in a closed position, the edge of the blade polding into the sheath and being held therein, said sheath being capable of expansion to permit the head to pass the teats, aforesaid in opening and closing it substantially as shown and described.

\section*{1. 101,411. Photography. Photographie.}

Albert Henry Walker, assignee of John W. Ippers both of New York Clty, New York, U.S.A., 9th October, 1906; 6 years. Filed 2nd May, 1906. Recelpt No. 135,460.
Claim.-1. The following process in photography, making a thin photograph, having a tinted area and a clear area, making a counterpart dense photograph, having a clear area and an opaque area, uniting those photographs into one structure, with their films separated by an effective distance, and with the clear area of its thin part, opposite to the

10-12
opaque area of its dense part, placing and holding that compound photograph before a camera, with its thin side near-

fst the camera, and with its dense side exposed to moderate light, but shielded from direct sunlight and from excessive light, exposing a photographic plate in the camera to subdued light coming from that compound photograph, developing that exposed plate into an intaglio photograph, and making a rellef photograph from that developed intaglio photograph, all substantially as described.
2. The following process in photography, making a thin photograph, having a tinted area and a clear area, making a counterpart dense photograph, having a clear area and an opaque area, uniting those photographs into one structure, with their films separated by an effective distance, and with the clear area of its thin part opposite to thip opaque area of its dense part, placing and holding that compound photograph before a camera, with its thin side nearest the camera, and with its dense side exposed to moderate light, but shlelded from direct sunlight and from excessive light, exposing a photographic plate in the camern to subdued light coming from that compound photograph, and developing that exposed plate into an intaglio photograph, all substantially as described.
3. A compound photograph composed of a thin photograph having a tented area and a clear area, and of a counterpart dense photograph having a clear area and an opaque area, the two photographs being placed flatwise together with the clear area of the thin photograph opposite to the opaque area of the dense photograph, and with the fllms of the two parts of the compound photograph separated by an effective distance, all substantially as described.

No. 101,412. Fence Post. Potcau de oldture.

Christopher Charles Dolan and Albert Lampitt, assignee of a half interest, both of Columbus, Ohio, U.S.A., 9th October, 1906; 6 years. Filed 27th August, 1906. Receipt No. 139,025.
Claim.-A fence post comprising a metallic body T-shaped in cross section and pointed at the lower end, said body being formed above the pointed end to provide shoulders, the web of the post adjacent said shoulders being formed with an opening, in combination with an anchor plate formed with an opening corresponding in contour to the sectional shape of the post and arranged to receive the post adjacent the shoulders, spurs formed integral with and depending from sald plate, said spurs being extended from the corners, of the plate to leave projecting members arranged intermediate and extending beyond the plane of the spurs, and a wedge key adapted to be passed through the opening in the web and bear against the under surface of the anchor plate and against the body of the post on each side of the operning.

No. 101,418. Fence. Ulôture.

Richard Leonard Myers and Nelson H. Elgar, assignee of a half interest, both of Winnipeg. Manitoba, Canada, 9th October, 1906 ; 6 years. Filed 10th August, 1906. Receipt No. 138,560.
Claim.-1. A flat fence picket having an extension at an angle to fts body, and having its central portion turned at an angle to its ends, which ends terminate in bows.
2. A fence comprising plckets inclined in one direction, intersecting pickets inclined at an angle thereto, and means for permanently securing together the plckets at their central point of interseotion.
3. A fence comprising pickets inclined in one direction, intersecting pickets inclined in the opposite direction, each of said pickets being provided with a central portion turned at an angle to the remainder of its body, and rivets disposed through the turned portions of the intersecting pickets.
4. A fence comprising pickets inclined in one direction, intersecting pickets inclined in the opposite direction, each of said pickets being provided with notches, and means for permanently securing together the pickets at their central point of intersection.
5. A fence comprising standards, upper and lower ralls carried by the standards, pickets provided with notches on their edges and arranged between the rails to interlock with each other, and means for eecuring together the pickets centrally against a lateral stress.
6. A fence comprising standards, upper and lower rails carried by the standards, pickets provided with notches on their edges and arranged between the rails to interlock with each other, and rivets disposed through the pickets centrally of their length.
7. A fence comprising standards, upper and lower rails carrled by the standards, pickets provided with notches on their edges, and each provided with a turned portion centrally of its length and arranged between the rails to interlock with each other so that said turned portions abut against each other, and rivets disposed through the turned portions of adjacent pickets.

No. 101,414. Hinge for Screens. Penture d'écran.

Richard McKnight, assignee of James F. Ware, both of Denver, Colorado, U.S.A., 9th October, 1906 ; 6 years. Filed 8th'June, 1906. Receipt No. 136,675.
Claim.-1. A driven tenon consisting of a flat sheet of metal having a series of flared wings upturned at each side edge, sald wings standing in lines which diverge from the driving edge of the tenon, substantially as described.
2. A driven tenon consisting of a flat sheet of metal having wings upturned in opposite directions at each side edge, sald wings being longer at their upturned edge than at thelr bended edge whereby to form cutting points, substantially as duscribed.
3. A driven tenon consisting of a flat sheet of metal having flared wings upturned in opposite directions at each side edge, said wings standing in lines which diverge from the driving edge of the tenon, and an integral slottod hanging lip projecting at one end of the driving edge of the tenon, substantially as tescribed.
4. A driven tenon connecting of a flat sheet of metal having fiared wings upturned in opposite directions at each side edge, said wings standing in lines which diverge from the driving edge of the tenon, an integral slotted hanging lip projecting at one end of the driving edge of the tenon and an integral clinch strip projecting from the opposite edge of the tenon, substantially as described.
5. A driven hanging tenon consisting of a flat sheat of metal having flared wings upturned in opposite directions at each side edge, said wings standing in lines which diverge from the driving edge of the tenon, an integral slotted hanging lip projecting at one end of the driving edge of the tenon and a suitable hook member for the purpose, substantially as described.

No. 101,415. Sectionsl Weight. Pese.

The Sectional Weight Company, assignee of John Thomas Brant, Jr., both of Coldspring, New York, U.S.A., 9th October, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,989.
Claim.-1. A sectional weight comprising a succession of separable units each provided with a curved dovetail end rib extending widthwise of the unit, and the adjacent dovetail iribs of successive units curbed in the same direction and grippingly engaging and interfitting.
2. A sectional weight comprising a plurality of separable units provided with dovetall end ribs, and the adjacent dovetail ribs of successive units grippingly engaging and interfitting, in combination with means for limiting the extent of sliding engagement of the units.
3. A sectional weight comprising a succession of separable units each having a curved end and provided with an end piece offset from the curved end, the end pieces lapping and each provided with a curved rib formed upon and extending widthwise of said offset end piece, the adjacent rib of each of the successive units grippingly engaging and fitting between the curved end of the adjacent unit and curved rib carried by the offset end piece thereof.

\section*{No. 101,416. Weight. Pesée.}

The Sectional Weight Company, assignee of John Thomas Brent, Coldspring, New York, U.S.A., 9th October, 1906; 6 years. Filed 19th July, 1906. Recelpt No. 137,990.
Claim.-1. A sectional weight comprising successive units slidably engaged end to end, one of said units having a curved end rib having an overhanging part and extending centrally widthwise of the unit, and the other of sald units provided with a curved end groove and extending centrally widthwise of the unit end conforming to, engaging and interfitting the rib aforesaid.
2. A sectional weight comprising successive units slldably engaged end to end. one of sald units having a curved end rib having an overianging part and extending centrally widthwise of the unit, and the other of said units provided with a curved end groove into and extending centrally width-
wise of the unit and conforming to engagius and interfitting the rib aforesald, the successive units provided with directly

No. 101,418. Cattle Guard. Gardo-bétail.

William Krauth and George Sargeant, assignee of a onefourth interest, both of Owen Sound, Ontario, Canada, 9th October, 1906; 6 years. Filed 4th August, 1906. Receipt No. 138,418.
Claim.-1. A cattle guard comprising a plurality of rockable crank shafts, gates carried by the crank shafts, a plurality of other crank shafts, actuating cam levers on the latter crank shafts. links operatively connecting all of the crank shafts, and means normally maintaining the gates in an upright position.
2. In combination with a rallway crossing, crank shafts disposed on each side of the crossing, gates on the crank shafts, crank shafts on each side of the crossing between the gates, a link connecting the latter crank shafts, links connecting the former and the latter crank shafts, a plurality of crank shafts on each side of the gates, links connecting the last-named crank shaits to each other and to the first-named crank shafts, means normally maintaining the gates upright, and means for rocking the crank shafts by the passage of a train.
3. In combination with a railway crossing, arank shafts disposed on each side of the crossing, gates on the crank shafts, crank shafts on each side of the crossing between the gates, a link connecting the latter crank shafts, links connecting the former and the latter crank shafts, a plurality of crank shafts on each side of the gates, links connecting the last-named crank shafts to each other and to the first-named crank shafts, springs secured to the firstnamed crank shafts and adapted to normally maintain the gates upright, and means for rocking the crank shafts by the passage of a train.
4. In combination with a railroad crossing, a cattle guard comprising the combination of a plurality of crank shafts journalled adjacent the track, links connecting the crank shafts, cam levers on some of the crank shafts, sleeves on some of the crank shafts, yokes carried in the sleeves, bars on the yokes, and means adapted to normally maintain the crank shafts in one position.
5. In combination with a railroad crossing, a cattle guard comprising the combination of a plurality of crank shafts rockably connected to the track, yokes secured to the crank shafts, links connected to the yokes, cam levers on some of the crank shafts, gates on some of the crank shafts, and means adapted to normally maintain the crank shaft in one nosition.

No. 101,419. Shntter Worker. Ferrure de coptrevent.
Heman Osborne, New York City, New York, U.S.A., 9th October, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,056.
Claim.-1. In a shutter worker, the bracket plate A, having supporting members at opposite sides and the combined
worm and sprocket wheel journalled at one side of the plate and the worm wheel journalled at the other side of the plate

and extending through the plate to mesh with the worm, means for rotating the worm, and a removable casing for inclosing the worm wheel and its supporting members, said casing consisting of two sections, each having a shell portion and a base provided with a marginal groove disposed at a right angle to the shell portion, the said two sections having their grooved portions slidably engaging the marginal edges of the bracket plate at opposite sides thereof and their shell portiong inclosing the worm wheel, substantially as described.
2. In a shutter worker, the combination of the supporting bracket having mounted thereon a united worm sprocket wheel and a worm wheel in mesh with the worm, a shutter operating lever carried by the worm wheel, and a chain having an intermediate portion thereol running around the sprocket wheel, and window casing fittings for guiding the extremities of the sprocket wheel chain each consisting of a split tube having separated depending ears, the journal pins supported by and extending from one to the other of said ears, and a roller on the pin.
10. 101,420. Grain Cleaner. Nettoyeur de grain.

James M. Akers, Matoon, Illinois, U.S.A., 9th October, 1906; 6 years. Filed 5th March, 1906. Receipt No. 133,540.
Claim.-1. The herein described method of cleaning grain which consists in producing a partially choked main current of air of sufficient velocity to transport grain, feeding grain into the choked portion of the main current so that it is transported away by said main current, and causing a back current away from the choked portion of the main current to carry off the dust which is unable to pass through the choked portion of said main current.
2. The herein described method of cleaning grain which congists in producing a main current of sufficient velocity to transport grain and a back current of sufficient velocity to transport dust, and feeding grain through the back current into the main current, whereby the dust is retained in and carried off by the back current and the grain is carried off by the main current.
8. The herein described method of cleaning grain which consists in producing a main current, setting up a back current away from said maln current, throwing dust-laden grain through the back current and into the main current, whereby the grain is carried off by the main current and the dust is carried off by the back current without penetrating into the main current.
4. The herein described method of cleaning grain which consists in producing a main current, setting up a back current away from sald main current, casting dust-laden grain through the back current into the main current, whereby the grain is carried off by the main current and the dust is car-
ried off by the back current and regulating the back current.
5. An apparatus for cleaning grain having means for producing an air blast, means for setting up a back current in the air blast, and means for throwing dust-laden grain through the back current into the blast, the back current constituting a cushion to prevent injury to the grain, and said back current being sufficient to arrest and carry off the dust from the grain.
6. An apparatus for cleaning grain, having means for producing an air blast, means for setting a back current in the blast, and centrifugal means for throwing dust-laden grain through the back curent into the blast. the back current being sufficient to arrest and carry off the dust from the grain.
7. An apparatus for cleaning grain, having means for producing an air blast, a feed passage leading to the air blast passage, a dust passage, means for setting up a back pressure from the air blast passage to the dust passage, and means operating in the feed passage to throw dust-laden grain through the back current into the air blast, said back current being sufficient to arrest and carry off the dust through the dust passage.
8. An apparatus for cleaning grain having an air blast passage, means for producing a blast of air through the passage, a feeder case in communication with the blast passage, a feed passage for the feeder case, a dust passage leading from the feeder case, and a rotary feeder working in the feeder case to throw dust-laden air into the blast passage, a portion of the feeder case being adjustable toward and away from the feeder to set up a back current from the alr blast passage through the feeder case into the dust passage.

No. 101,421. Wire Fence. Cloture de all de fer.

Edward Branch, Moosejaw, Saskatchewan, Canada, 9th October, 1906; 6 years. Filed 6th June, 1906. Receipt No. 136,600.
claim.-1. In a fence the combination with the corner posts and the longitudinal strands, of a winding post consisting of two opposing upright supports having extending transversely across and bearing therein independent drums and means for independently rotating the individual drums and securing in any fixed position, as and for the purpose specifled.
2. In a fence the combination with the corner posts and the longitudinal strands, of an invert \(\mathbf{U}\)-shaped winding post, a base secured to the ends of the extending arms, opposing downwardly extending sets of slots passing inwardly from the outer face of each arm, spindles removably supported within the slots, drums rigid with the spindies. drums revolvable upon the spindles and means whereby said drums may be individually revolved and constrained, as and for the purpose specified.
3. In a fence the combination with the corner posts and the longitudinal strands, of an invert \(U\)-shaped winding post, a base secured to the outstanding ends, downwardly extending sets of slots passing inwardly from the outer face of each arm, spindles extending transversely and bearing within the slots, said spindles having an end extend ing beyond the post and squared, drums rigid with the spindles, drums revolvable on the spindle and having an end extending beyond the post and squared, a ratchet wheel integral with the outer face of each individual drum and g:avity pawls bearing upon the inner face of the post and designed to co-operate with the ratchet wheels, as and for the purpose specified.
4. In a fence the combination with the winding post and the longitudinals of a corner post, said corner post con sisting of a tubular metallic upright having slots extending inwardly from the face designed to receive the longitudinals, a rod extending downwardly between successive
longitudinals and the inner face of the tube and designed to restrain the longitudinals within the slots, as and for the purpose specified.
5 . In a fence the combination with a winding post and the longitudinals, of a corner post consisting of a base, a tubular metallic upright secured thereto, a get of inwardly extending slots designed to receive the longitudinals, a cap removably secured to the top of the tubular body, a rod extending downwardly between the longitudinals and the inner face of the upright to hold the longitudinals within the slots and a collar enveloping the upper portion of the upright, as and for the purpose specifled.
6. In a fence the combination with a centrally disposed winding post having a ratchet drum for each of the individuals longitudinals, of corner posts having slots to receive the longitudinals and reinforcing guide posts secured to the longitudinals and between the corner posts, as and for the purpose specifled.

No. 101,422. Reflector Por Magnifying Glasses. Reflecteur pour verre grossissant.

.arey E. Bunker, Oregon, Missouri, U.S.A., 9th October, 1906; 6 years. Filed 14 th May, 1906. Receipt No. 135,920.
Claim.-1. The combination with the eye plece of a monocular magnifying glass, of a reflector held frictionally combined therewith and comprising a tubular ungulaform holder, and a reflecting surface disposed at the oblique side of the holder and having its center permeable by light.
2. The combination with the eye plece of a monocular magnifying glass, of a reflector held frictionally combined therewith and comprising a tubular ungulaform holder of substantially the same cross diameter from end to end, and a reflecting surface disposed at the oblique side of the holder and having its center permeable by light.
3. The combination with the eye piece of a monocular nagnlifing glass, of a reflector held frictionally combined therewith and adjustable relatively thereto, and comprising a tubular ungulaform holder, and a reflecting surface disposed at the oblique side of the holder and having its center permeable by light.

No. 101,423. Apparatus for Straining and Splicing Wire.
Appareil pour tendre et épisser.

William Nepean Hutchison, 57 Peckham Road, Camberwell, London, England, 9th October, 1906;6 years. Filed 7th February, 1906. Receipt No. 132,704.
Claim.-In a wire tightener the combination with a bar having claws at its ends and a winding spool projecting from the midle portion of the said bar and provided with means for engaging the wire, of an operating lever having cranked handles at its ends and two clips secured to the middle part of the said lever and holding the said bar between them crosswise of the said lever, as described.

No. 101,424. Pole. Perche.

Diedrich William Krellwitz, St. Catharines, Ontario, 9th October, 1906; 6 years. Filed 20th July, 1906. Receipt No. 137,997.
Claim.-In poles the combination with the main body of concrete, of reinforcing uprights of the same cross sectional area throughout the entire length of pole, each upright being made in proportion of different grades of carbon steel and each successive portion from the bottom of the pole decreasing from a high carbon steel to the top of the pole, as specified.

No. 101,425. Grain Door. Porte d̀ graine.

Robert R. Tichenor and Andrew Johnson, assignee of a half interest, both of Feeley, Minnesota, U.S.A., 9th October, 1906:6 ycars. Filed 4th September, 1906. Receipt No. 139,248 .
flaim.-1. The combination with a freight car, of casings provided upon each side of the door openings and having transverse slots at intervals arranged one above another, guides mounted on said casings, links pivotally connected with said guldes through said slots, a bar connecting said links. means for moving said bar lengthwise to move said guides toward or from each other, and a door vertically movable between sald guides.
2. The combination with a frelght car, of casings provided on each side of the door opening. guides mounted on said casings, links pivotally connected at one end with said filldes and having a sliding connection with said casings. a vertically movable bar connecting the free ends of said links, means for raising and lowering said bar to move said guides toward or from each other, and a door vertically movable between said guides.
3. The combination with a freight car, of casings provided nn each side of the door opening and having transverse slots 10 , guides provided on said casings, links 12 having pivot pins 11 extending through said slots and secured to said guides, a bar 13 connecting said links, means for raising or lowering said bars to move said guldes toward or from sach other and a door provided between said guides.
4. The combination with a freight car, of casings provided in each side of the door opening, guides provided on said casings, vertically movable bars, means connecting said bars and said guides for imparting horizontal movement to said guides when said bars are raised or lowered, bell crank levers 14 pivoted on said casings and connected with sald hars and a door vertically movable between said guides.
5. The combination with a freight car, of casings provided on each side of the door opening, guides carried by said casings and substantially V-shaped in cross section, links a slidably mounted in said casings and secured at one end to said guides, vertically movable bars pivotally connected

With the opposite ends of said links, means for raising and lowering said bars to move said guldes tolward or from each other and a door having bevelled ends provided between sald guides.
6. The combination with a freight car, of casings provided upon each side of the door opening, guides mounted on said casings, links 12 pivotally secured to said guides through transverve slots 10 in said casings, vertically sliding bars 13 connecting said links, bell crank levers 14 pivoted on said casings and having one arm pivotally connected with said bars 13 , the other arms of said bell crank levers extending vertically upon each side of the door opening when the guides are in their locked position and a door arranged to slide vertically between said guides, substantlally as described.

No. 101,426. Varnishing Machine. Machine à vernir.

William Charles Phillips, assignee of Thomas H. Donaldson, both of Toronto, Ontario, Canada, 9th October, 1906 ; 6 years. Filed 28th May, 1906. Receipt No. 136,311.
Claim.-1. In a varnishing machine the combination with the table and varnish receptacle underneath the same, of a guiding means, a varnish spreading means and a feeding means for the moulding, a cover board and brushes located beneath the cover board and above the receptacle with which the varnished surface is designed to come in contact, as and for the purpose specified.
2. In a varnishing machine the combination with the varnishing receptacle, of a table top extending over the front end of the receptacle, a spreading roller extending upwardly through an opening in the table top and downwardly into the varnish, and means for feeding the moulding over the roller, as and for the purpose specified.
3. In a varnishing machine the combination with the varnishing receptacle, of a table top extending over the front end of the receptacle, a spreading roller extending upwardly through an opening in the table top and downwardly into the varnish, a toothed wheel located over the roller, designed to come in contact with the back of the moulding. and suitably driven, as and for the purpose specifled.
4. In a varnishing machine the combination with the varnishing receptacle, of a table top extending over the front end of the receptacle, a spreading roller extending upwardly through an opening in the table top and downwardly into the varnish, a toothed wheel located over the roller designed to come in contact with the back of the moulding and suitably driven, and means for adjusting the toothed wheel vertically, as and for the purpose specifled.
5. In a varnishing machine the combination with the varnishing receptacle, of a table top extending over the front and of the receptacle, a spreading roller extending upwardly through an opening in the table top and downwardly into the varnish, a toothed wheel located over the roller designed to come in contact with the back of the moulding and suitably driven, a frame carrying suitable bearings for the shaft of the toothed wheel and vertically slidable upon suitable standards, and means for adjusting the frame, as and for the purpose specified.
6. In a varnishing machine the combination with the varnishing receptacle, of a table top extending over the front end of the receptacle, a spreading roller extending upwardly through an opening in the table top and downwardly into the varnish, a toothed wheel located over the roller designed to come in contact with the back of the moulding and suitably driven, a irame carrying suitable bearings for the shaft of the toothed wheel and vertically slidable upon suitable standards, a bracket attached to the standard, a screw spindle freely rotatable in the bracket and a bracket
attached to the adjustable frame into which the lower end of the screw spindle extends; as and for the purpose specifled.
7. The combination with the table top and receptacle and roller extending through an opening in the table top, of a toothed feeding wheel vertically adjustable in relation to the roller, as and for the purpose specified.
8. The combination with the table top and receptacle and roller extending through an opening in the table top, of a feeding wheel located above the roller and guiding strips located on each side of the roller, as and for the purpose specifled.
9. The combination with the varnish receptacle and varnish spreading means and the feeding means, of the vertically adjustable brushes located at the discharge end of the machine over the varnish receptacle and a cover board under which the moulding is fed, as and for the purpose specifled.
10. The combination with the varnish receptacle and varnish spreading means and the feeding means, of the vertically adjustable brushes located at the discharge end of the machine over the varnish recoptacle and a cover board under which the moulding is fed and adjustable side boards extending laterally underneath the cover board, as and for the purpose specified.
11. In a varnishing machine the combination with the cover board and varnish receptacle, of the brushes having end flanges and screw spindles extending through such flanges and designed to form a means for vertically adjusting the brushes in relation to the cover board, as and for the purpose specified.
12. In a device of the class described, a feeding roller comprising discs of suitable material placed adjacent to each other and having the combined peripheral face thereof adapted to fit the face side of the moulding, as and for the purpose specified.

No. 101,427. Die Stock. Filière brisée.

The Low Supply and Manufacturing Company, assignee of Otto Fred Kadow, all of Cleveland, Ohio, U.S.A., 9th October, 1906; 6 years. Filed 17th December, 1904. Receipt No. 120,843 .
Claim.-1. In a die stock, the combination of guideways. dies mounted on said guideways and adjustable toward and from each other, bearings above the guideways, one of said bearings having an upwardly and inwardly inclined surface, an adjusting plate engaging said bearings and having an inclined edge corresponding to the inclined surface of the bearing, a clamp, the inner face of which forms i: effect a portion of said inclined bearing, and means for adjusting said clamp to lock the adjusting plate in position, substantially as specified.
2. In a die stock, the combination of a body portion. guideways in said body portion, dies mounted on said guideways and adjustable toward and from each other, an adjusting plate mounted in said body portion and having an upwardly inclined portion, and an adjustable clamp mounted in said body portion and having an inclined overhanging portion positioned to engage the inclined portion of the plate, substantially as specifed.
3. In a die stock, the combination of the body thereol, guideways in said body, dies on said guldeways and adjustable toward and from each other, bearings in said body, an adjusting glate for said dies mounted in sald bearings, said body having a recess therein adjacent the said bearings and inclining a portion thereof, a clamp in the recess in the body arranged to be reciprocated transversely of said bearing and having an overhanging portion in the recess in the bearing, substantially as specifed.
4. In a die stock, the combination of guides, dies mounted on said guides and adjustable toward and from each other, a plate for adjusting said dies, bearings for said plate. one of said bearings having a recess therein, a reciprocating clamp in said recess, said clamp having a portion forming a portion of the bearing and overhanging the portion of
the plate adjacent thereto, and means for securing said clamp in engagement with said plate, substantially as specified.
5. In an integral die stock consisting of a body adapted to hold dies, longitudinal guides for said dies, a hollow arch on the under side of said body, and a tubular work guide member depending centrally from the under side of the hollow arch, the arch having side portions constituting extensions of the work guide member and extending to and reinforcing the longitudinal guides, substantially as specified.
6. A die stock consisting of a body adapted to hold dies, longitudinal guides for said dies, a hollow arch on the under side of sald body, a tubular work guide member depending centrally from the under side of such arch, the arch having side portions constituting extensions of the work guide member and extending to said guides, such extensions having each an opening therethrough adjacent its die guide, substantially as specified.
7. A die stock consisting of a body adapted to hold dise, longitudinal guides in said body for the dies, a hollow arch on the under side of said body, and a tubular work guide member depending centrally from the under side of such arch. said arch having its side portions constituting extensions for said work guide member and extending to the longitudinal die guides and provided with openings adjacent said guides and also having longituinally arched end portions extending from said work guide member to the ends of the body, substantially as specified.

No. 101,428. Die Stock. Filière brisée.

The Borden Company, assigner of Bradford Borden, both of Warren, Ohio, U.S.A., 9th October, 1906; 6 years. Fited 9th April, 1906. Receipt No. 134,738 .
Claim.-1. The combination with a die stock having an open front housing. and a work guide at one side thereof, of sectional dies within the housing constructed and arranged to bs reversed face for face to enable the threading to be done from the front or rear of the housing, and a free sliding adjuster for said dies fitted within said housing and having means for engaging either face of each die to effect the adjustment by the sliding of the adjuster.
2. The combination with a die stock having an open front housing, and a work guide at one side thereof, of sectional dies within the housing, sald dies being reversible face for face, and having corresponding grooves in their inner and outer faces, and an adjuster having portions overlapping the dies provided with tongues for fitting the outer grooves thereof.
3. In a die stock having an open front housing and a work guide at one side thereof, sectional dies within the housing capable of beling reversed facc for face to enable the threading to be done from the front or rear of the housing, an' adjuster for said dies for effecting the moving thereof, and means for preventing the outward deflection of the adjuster and dies.
4. A die stock comprising an open front housing, sectional dies within the housing, a free sliding adjuster, a locking plate secured at fts ends to said housing and extended transversely of the dies and adjuster, and means carried by said plate for limiting the outward movements of the adjuster.
5. A die stock comprising an open front housing, sectional dies within the housing, free sliding adjuster having a groove in its outer face adjacent one side thereof, a locking plate secured at its ends to said housing and extended transversely of the dies and adjuster, and a lug carried by said plate extending into said groove for limiting the outward movements of the adjuster.
6. A die stock comprising an open front housing, sectional dies within the housing, said dies being reversible, a free sliding adjuster having means for engaging said dle blocks for moving the same outwardly, said adjuster being also re-
versible, and a locking plate pivotally secured at one end to the housing and designed to extend transversely of said dies and adjuster, and means for engaging and holding the free end of said locking plate.

No. 101,429. Water Cooled Grate. Grille.

The Johnson Furnace and Engineering Company, Colorado Springs, assignee of Alfred E. Johnson, Denver, both in Colorado, U.S.A., 9th October, 1906; 6 years. Flled 16th June, 1906. Recelpt No. 136,963.
Claim.-1. A grate composed of hollow revoluble bars, long open ended stationary water pipes located within the bars, means for introducing water to one of sald pipes, and short stationary pipes each entering the extremity of a hollow grate bar at one end of the grate and surrounding the corresponding extremity of the water pipe therein, the sald short pipes having lateral extensions, each long water pipe after the one through which the water enters the grate communicating at one end with the corresponding lateral extension of one of said short pipes, and at its other end with the interior of the grate box.
2. A grate composed of a number of hollow revoluble bars, long open ended water pipes within the bars and protruding from their extremities at one end of the grate, short stationary pipes each entering the end of a grate bar at one end of the grate and surrounding the extremity of the watey pipe therein, and means for introducing water to one of the pipes within the hollow bars, the short pipes having lateral extensions, each long water pipe after the one through which the water enters the grate communicating at one end with the adjacent lateral extension of one of said short pipes and at its other end with the interior of the grate bar.
3. A grate composed of a number of hollow revoluble bars, long open ended water pipes located within the bars and protruding therefrom at one end of the grate, short stationary pipes each entering the extremity of a grate bar at one end of the grate, surrounding the protruding extremity of the water pipe therein and communicating with the grate bar, means for forming a water tight joint between the short pipes and the hollow revoluble bars, the short pipes having lateral extensions, each long water pipe after the one through which the water enters the grate communicating at one end with the adjacent lateral extension of one of said short pipes and at its other end with the interior of the grate bar.
4. A grate bar composed of a number of hollow revoluble bars, short stationary pipes entering the forward extremities of the respective bars and communicating with the latter, long open ended pipes located in the hollow bars, and means for dellvering cooling fluid to the forward extremity of one of the pipes within the bars under sufflcient pressure to cause the fluid to flow through a numy ber of open ended pipes in succession, and back toward the hollow bars, the short stationary pipes having lateral extensions each long open ended pipe after the one through which the water enters the grate communicating at one end with the adjacent lateral extension of one of said short pipes, and at its other end with the interior of the grate bar.
5. A grate composed of a number of hollow revoluble bars, short stationary pipes entering the forward extremities of the bars and communicating therewith, the short pipes having lateral extensions, long pipes located within the hollow bars, and means for delivering a cooling fluld to one of the pipes within the hollow bars under suffcient pressure to cause the fluid to circulate through the bars. each long pipe within a hollow bar after the one through which the fiuld enters the grate, communicating at one end with the adjacent lateral extension of one of
said short pipes, and at its other end with the interior of the grate bar.
6. A grate composed of a number of hollow revoluble bars, short stationary pipes each entering the forward extremity of a bar and communicating therewith, the short pipes being provided with protruding lateral extensions, long open ended water pipes located within the hollow bars, and means for delivering water under pressure to one or more of the water pipes within the hollow bar, each long water pipe after the one through which the water enters the grate communicating at one end with the adjacent lateral extension of one of said short pipes and at its other end with the interior of the grate bar.
7. A grate composed of a number of hollow revoluble bars. short stationary pipes each entering the forward extremity of a bar and communicating therewith, the short pipes being provided with protruding lateral extensions, long open ended pipes located within the hollow bars, means for introducing water to one of the long open ended pipes under such pressure that the water is made to travel through the grate bars, each long water pipe after the one through which the water enters the grate communicating at one end with the adjacent lateral extension of one of said short pipes, and at jts other end with the interior of the grate bar.
8. A grate composed of hollow revoluble bars, long stationary water pipes located within the bars and protruding therefrom at one end of the grate, short stationary pipes cach entering a grate bar at one end of the grate and surrounding the protruding extremity of the water pipe therein, the outer extremity of each short pipe being expanded to form a plate, the short pipes having lateral extensions connected with the plates of the adjacent short pipes, the said plates having openings to allow the lateral extensions to communicate with the long water pipes of the grate bars, the short pipes communicating with the grate bars which they enter, each long water pipe after the one through which the water enters the grate communicating at one cnd with the adjacent lateral extension of one of said short pipes and at its other end with the interior of the grate bar.
9. A grate composed of a number of hollow revoluble bars, long water pipes located within the grate bars. their forward extremities protruding from the grate bars, short stationary pipes each entering the forwarrd extremity of a grate bar surrounding the protruding extremity of the long wrate bar surrounding the protruding extrem therein, and communicating with the grate bar, the short pipes having plates to enter their forward extremities, the short pipes being also provided with lateral extensions connected with the plates of adjacent short pipes except where the water is originally introduced, the plates of the last-named pipes having openings forming a communication between the lateral extensions of the short pipes and the forward extremities of the long water pipes within the hollow bars, the extensions of the short pipes having closable openings in line with openings of the plates with which they are connected, and a number of supply pipes for introducing water to a corresponding number of the water pipes within the hollow bars, hollow plates attached to the plates of the stationary pipes and surrounding the long water pipes where the water is introduced, the supply pipes being connected with the hollow plates, each long water pipe after the one through which the water enters the grate communicating at one end with the adjacent lateral extension of one of said short pipes and at its other end with the interior of the grate bar.
10. A grate composed of a number of sets or series of hollow grate bars, a long open ended fluid pipe extending into each bar of the grate, means for introducing cooling fluid to one pipe of each series of grate bars, short pipes each entering a hollow grate bar at one end of the grate and surrounding the corresponding extremity of the fluid pipe thercin, each long fluid pipe of each set or serjes of hollow bars after the one through which the water enters the grate communicating at one end with the adjacent lateral extension of one of said short pipes of the same set or series of grate bars and at its other end with the interior of the grate bar.

\section*{No. 101,430. Machine for Rolling Finger Rings. Laminoir pour joncs.}

I R. Wood and Sons, assignee of Henry Henrich, both of New York City, New York, U.S.A., 9th October, 1906 ; 6 years. Filed 18th July, 1906. Recelpt No. 137,943.
claim.-1. In a machine for rolling rings the combination of a mandrel, and a roller which are adapted to roll a ring between them, and gearing for driving the ring ensaging surfaces of said mandrel and roller at substantially the same speed.
2. In a machine for rolling rings the comblnation of a mandrel, a shaft supporting sald mandrel, a ring form-

Ing rollar. of much larger diameter than said mandrel, a shaft supporting said roller, sald shafts extending in oppo-

site directions, and gearing for transmitting motion from cne of said shafts to the other, said gearing being so proportioned as to drive the ring engaging surfaces of sald mandrel and roller at substantially the same speed.
3. In a machine for rolling rings the combination of a shaft, a mandrel mounted on said shaft, a second shaft, a ring forming roller mounted on said second shaft, said shafts extending in opposite directions from the ring engaging parts and a third shaft parallel to said first-mentioned shafts and geared to each of the same, sald gearing being so proportioned that the ring engaging surfaces sball travel at substantially the same speed.
4. In a machine for rolling rings the combination of a shaft, a mandrel mounted thereon and a pivoted frame, a shaft having bearings in said frame, a ring forming roller mounted on said second shaft, and means for swinging said frame to carry said roller toward and from said mandrel.

5 . In a machine for rolling rings the combination of a shaft, a mandrel mounted thereon and a plvoted frame, a shaft having bearings in said frame a ring forming roller mounted on said second shaft, and means for swinging said frame to carry said roller toward and from said mandrel, said means consisting of a cam enga
gearing for turning said cam by hand.
6. In a machine for rolling rings the combination of a shaft, a mandrel mounted thereon and a pivoted frame, a shaft having bearings in said frame, a ring forming roller mounted on said second shaft, and means for swinging said frame to carry said roller toward and from said mandrel, said means consisting of a cam engaging said irame, a gearing for turning said cam by hand gnd a stop connected to said cam to limit its movements.
7. In a machine for rolling rings the combination of a mandrel shaft mounted in stationary bearings, a mandre mounted thereon, a pivoted frame a second shaft mounted in stationary bearings. a frame pivoted on said second shaft, a shaft journalled in said pivoted frame, a ring forming roller mounted on said last-mentioned shaft, gearing for driving said second shaft, a gear on said second shall and a gear on said ring shaft, said last-mentioned gear driven from said first-mentioned gear, and means for raising and lowering said frame to sarry said ring forming roller toward or away from said mandrel.
8. In a machine for rolling rings the combination of a mandrel shaft mounted in stationary bearings, a mandrel mounted thereon, a pivoted frame, a shaft journalled in said frame, a ring forming roller mounted on said shaft, a second shaft mounted in stationary bearings upon which shaft said irame is pivoted, and means for adjusting said frame to adjust said roller with reference to said mandrel, said means cousisting of a sleeve journalled on said second shaft between sald frame and a stationary part, a nut threaded on said sleeve, and a sleeve on the end of said stationary ghaft, and a bolt threaded into the end of said shaft and bearing on said sleeve, said sleeve bearing against the ond of sald Fivoted frame opposite to that engaged by sald screw Bleeve whereby when said bolt is turned, said sleeve is moved along said shaft and carries with the said pivoted frame.
9. In a machine for rolling rings the combination of a mandrel shaft mounted in stationary bearings, a mandrel mounted thereon, a pivoted frame, a shaft journalled in said trame, a ring forming roller mounted in stationary bearings upon which shaft said frame is pivoted, and means for ad justing said frame to adjust said roller with reference to said mandrel, said means consisting of a sleeve journalled on said shaft between said frame and a stationary part, a nut threaded on said sleeve, a pinion on the end of said stationary shaft, and a bolt threaded into the end of said shaft and bearing on said pinion, said pinon bearing against the end of said pivoted frame opposite to that engaged by said screw sleeve whereby when said bolt is turned, sald pinion is moved along said shaft and carries with the sald pivoted
frame and a gear on said roller shaft and driven from said pinion.
10. In a machine for rolling rings the combination of a mandrel, a ring forming roller, shafts upon which said parts are mounted, and means for adjusting said shafts longitudinally relative to each other to adjust said mandrel and roller so that the ring forming surfaces shall bear proper relation to each other.
11. In a machine for rolling rings the combination of a mandrel, a ring forming roller, means for causing said mandrel and roller to relatively approach each other, and auxilary rollers having axis above the center of said mandrel, and means for moving said rollers toward and from said mandrel.
12. A machine for forming rings the combination of a mandrel, a ring forming roller, the ring engaging surfaces of said mandrel and roller having substantially the same speed and auxiliary rollers, and means for moving said auxiliary rollers toward and from said mandrel.
13. In a machine for rolling rings the combination of a mandrel, a ring forming roller, means for moving said parts relatively toward and from each other, auxiliary rollers having axis parallel to said mandrel, the axis of said auxiliary rollers being above that of the mandrel, means for moving sadd auxiliary rollers toward or from said mandrel, gearing for driving the ring engaging surfaces of said mandrel and ring forming roller at substantially the same speed.
14. In a machine for rolling rings the combination of a mandrel, ring forming roller, means for causing sald parts to approach or recede from each other, auxiliary rollers movable toward and from said mandrel, an dautomatic and adjustable means for moving said auxiliary rollers toward and from sald mandrel.
15. In a machine for rolling rings the combination of a mandrel, a ring forming roller, means for causing said parts to approach or recede from each other, auxiliary rollers uovable toward and from said mandrel, and automatic and adjustable means for moving said auxiliary rollers toward and from said mandrel, sald means comprising a weight.
16. In a machine for rolling rings the combination of a mandrel, a ring forming roller, auxiliary rollers, pivoted arms on which sald auxiliary rollers are mounted, a weighted arm, and means for transmitting motion from said weighted arm to said pivoted arms.
17. In a machine for rolling rings the combination of a mandrel, a ring forming roller, auxiliary rollers, pivoted arms on which said auxiliary rollers are mounted, a weighted arm, and means for transmitting motion from said weighted crm to said pivoted arms, said means comprising a slide movable by said weighted arm, and a wedge adapted to ensage bevelled surfaces on said arms.
18. In a machine for rolling rings the combination of a mandrel, a ring forming roller, auxiliary rollers, pivoted arms on which sald auxiliary rollers are mounted, a weighted arm, and means for transmitting motion from said weighted arms to said pivoted arms, said means comprising a slide movable by said weighted arm, and a wedge carried by said slide, said wedge being adapted to engage bevelled surfaces on said arms, said arms being connected by a spring tending tc hold them againgt said wedge.
19. In a machine for rolling rings the combination of a mandrel, and a ring forming roller, gearing for driving them so that their ring engaging surfaces shall travel at substantially the same speed, pivoted arms, auxiliary rollers carrled by one end of said arms, a slide movable toward and from said mandrel, a wedge on said slide engaging said arms, a spring connecting said arms, and holding them, against said wedge, a lever engaging said slide, and a series of varying weights to be attached to said lever and tending to force said slide toward said mandrel to move said auxiliary rollers toward sald mandrel.
20. In a machine for rolling rings the combination of a mandrel, a ring forming roller, means for driving the ring engaging surfaces of said mandrel, and roller at substantially the same speed, auxiliary rollers, and automatic means for moving said auxiliary rollers toward and from said mandrel under a predetermined pressure.
21. In a machine for rolling rings the combination of a mandrel, a ring forming roller, means for driving their ring engaging surfaces at substantially the same speed, auxiliary rollers provided with ring engaging grooves that are deeper than the ring forming grooves in the roller, whereby said auxiliary rollers engage the ring near its edges, and automatic means for forcing said suxillary rollers toward said mandrel at a predetermined pressure.
22. In a machine for forming rings the combination with mechanism for rolling a ring, and mechanism for trimming the edges thereof.
23. In a machine for forming rings the combination with means for rolling a ring, and means for simultaneously turning the edges of the ring.

10-13
24. In a machine for forming rings the combination of means for rolling a ring, and two tools for turning the edges thereof, said tools being mounted on slides movable parallel to the axis of the ring, and a right-and-left screw for adjusting said slides.
25. In a machine for forming rings the combination of means for rolling a ring, and two tools for turning the edges thereof, said tools being mounted on slides movable parallel to the axis of the ring, a right-and-left screw for adjusting said slides, said slides being mounted on a transverse slide, and means for adjusting said transverse slide.
26. In a machine for forming rings the combination of a stationary shaft, a mandrel mounted thereon, a frame movable toward and from said mandrel, a shaft journalled in said frame, a ring forming roller mounted on said lastmentioned shaft, and tools mounted on said frame for turning the edges of the ring.
27. In a machine for forming rings the combination of a stationary shaft, a mandrel mounted thereon, a frame movable toward and from said mandrel, a shaft journalled in said frame, a ring forming roller mounted on said lastmentioned shaft, and tools mounted on said frame for turning the edges of the ring, each of said tools being mounted on a slide adjustably parallel to the axis of the ring.
28. In a machine for forming rings the combination of a stationary shaft, a mandrel mounted thereon, a frame movable toward and from said mandrel, a shaft journalled in said frame, a ring forming roller mounted on said last-mentioned shaft, and tools mounted on said frame for turning the edges of the ring, each of said tools being mounted on a slide adjustable parallel to the axis of the ring, said slide being mounted on a slide adjustable transversely to the axis of the ring.
29. In a machine for forming rings the combination of a relatively movable mandrel and ring forming roller, tools for turning the edges of the ring and a guard overlying the ring forming groove in the roller.
30. In a machine for forming rings the combination of a relatively movable, mandrel and ring forming roller, tools for turning the edges of the ring and a guard overlying the ring forming groove in the roller, said guard having vertical surfaces parallel to said groove to catch the turnings.
31. In a machine for forming rings the combination of a relatively movable mandrel and ring forming roller, tools for turning the edges of the ring, a guard overlying the ring forming groove in the roller and flbrous material secured under said guard.
32. In a machine for forming rings the combination of ring iorming means, a finger engaging the inside of the ring, a dial and a pointer movable over said dial and geared to said finger.
33. In a machine for forming rings the combination of ring forming means. a flnger adapted to engage the inside of the ring, and means for indicating the positions of said finger to show the size of the ring.
34. In a machine for forming rings the combination of ring forming means, a finger adapted to engage the inside of the ring, means for yieldingly holding said finger against the inside of the ring, a dial and a pointer geared to said finger and movable over said dial.
35. In a machine for forming rings the combination of ring forming means, a finger adapted to engage the inside of the ring, a slide upon which said finger is mounted, means for yieldingly moving said slide to hold said finger against the inside of the ring, a dial, a pivoted pointer mounted over said dial and a rack on said slide and a pinion on the pivot of said pointer.
30. In a machine for forming rings the combination of a mandrel, a ring forming roller, means for moving said parts toward and from each other, a finger adapted to engage against the inside of the ring, means normally drawing said finger against the inside of the ring and connections whereby when said mandrel and roller are moved apart, said finger shall be moved toward said mandrel.
37. In a machine for forming rings the combination of a mandrel, a ring forming roller, means for moving said parts toward and from each other, a finger adapted to engage the inside of the ring, a cord and weight connected to said finger and tending to move it against the inside of the ring, and a support connected to said means for moving the mandrel and roller relative to each other, said support engaging sald weight when said mandrel and roller are moved apart, whereby said finger is permitted to return toward said mandrel in position to engage the inside of another ring blank.
38. In a machine for forming rings the combination of a mandrel, a ring forming roller, auxillary rollers and means for mechanically forcing sald auxiliary rollers toward said mandrel at a predetermined pressure and connections whereby when said mandrel and roller are forced together sald means for operating the auxiliary rollers are permitted to act. and whereby when said mandrel and rollers are separated, said auxiliary are retracted.
39. In a machine for forming rings the combination of a mandrel and ring forming roller, a frame movable toward sald mandredl and carrying sald roller, auxiliary rollers moved toward and from sald mandrel, means comprising a weighted arm for moving said auxlliary rollers toward sald mandrel, a cam for raising said frame and an arm so connected to said cam that when said frame moves from said maudrel said weight is raised.

No. 101,431. Bearing for Cream Separators. Coussinct pour séparatcur d crème.

Lauchlan Allan McLean, Toronto, Ontario, Canada, 9th October, 1906;6 years. Filed 7th December, 1905. Receipt No. 130,778.
Claim.-1. A bearing for cream separators comprising a step box having an opening through the bottom thereof, a cushion spring enconsed in said bex, a cup resting on sald spring having a sultable ball race, balls arranged in said lace, a spindle supporting a bowl at the tup thereof and having a vertical orifice therethrough and a cone bearing surface at the bottom thereof turning on said balls, as and :or the purpose specified.
2. A bearing far cream separators comprising a step box having a cylindrical body portion and an opening through the bottom thereof, a spiral spring within said cylindrical !ortion and resting on the bottom thereof, a cup resting on the top of said spring having a suitable ball race, balls arranged in said race, a spindle enlarged at the upper end and forming the bottom of a bowl having a vertical orifice therethrough and a cone bearing surface at the bottom thereof turning on said balls as and for the purpose speciffed.
3. A bearing for cream separators comprising a step box raving a cylindrical body portion and an opening in the bottom and holes in the wall thereof. a spiral spring having flattened ends and resting on the bottom of suid eylindrical hody portion, a cup bearing slidably arranged in said body porion having a ball race therein and resting on said spring and having an opening through the center thereof, a spindle cnlarged at the upper end and forming the bottom of a bowl having a vertical orifice therethrough and a cone bearing surface at the bottom thereof turning on said balls. as and for the purpose specified.
4. A bearing for cream separators comprising a step, box having a threaded portion to secure it in the frame of the machine and a vertical cylindrical wall extending upwardly from said threaded portion and holes therethrough and an opening through the bottom thereof, a spiral spring having fattened ends and resting in said step box, a cup-shaped bearing slidably arranged in said step box having an opening in the bottom thereof and resting on said spring and supported thereby, balls arranged in said ball cup. a ball retainer engaging said balls, a spindle having a cone-shaped lower end engaging said balls and turning thereto and an enlarged upper end forming the bottom of a separator bowl and a central vertical orlfice through sald spindle, as and for the purpose specified.

No. 101,432. Ball Bearing. Coussinet d boules.
Mllo Harris and John F. Dearing, Jamestown, New York, U.S.A., 9th October. \(1906 ; 6\) years. Filed 21 st February, 1906. Receipt No. 133,128 .
claim.-1. A roller bearing ring consisting of a hardened steel race ring and a housing of substantially unlform thickness for said race ring having extensions beyond the edges of the race ring.
2. A roller bearing ring consisting of a hardened cleft steel race ring and a housing of substantially uniform thickness for the edges and ungrooved side of said race ring.
3. A roller bearing ring consisting of a hardened steel race ring and cornered housing bands of substantially unl-
form thicknoss for the edges and the ungrooved side of sald race rine.

4. In ball bearings hardened steel casing and journal rings, housings for said rings consisting of untempered bands around the outer face of the casing ring and the inner face of the journal ring and extending beyond the edges thereof and balls between the rings, substantially as described.
5. In ball bearings, a series of hardened steel casing and journal race rings, balls between said casing and journal race rings, housings covering the outer faces of the casing tace rings and the inner faces of the journal race rings and extending beyond the edges of said race rings to form bearings by their continuous extension.
b. In ball bearings hardened cleft steel casing and journal lace rings, balls between said journal and casing rings, uniempered housings covering the outer faces of the casing rings and the inner faces of the journal rings, said housings xtending beyond the edges of the rings, and means to secure the journal housings to the shaft.
T. In ball bearings, a series of hardened steel casing and journal race rings, balls between sald casing and journal rings, bands around the outer face of the casing rings and extending beyond the edges thereof, bands around the inner iace of the journal rings and extending beyond the edges thereof, and means for interlocking the adjacent journal bands.
8. In ball bearings, a serles of hardened steel casing and journal rings, balls between said rings, bands around the outer face of the casing rings and extending beyond the dges thereof and bands around the inner face of the journal rings and extending beyond the edges thereof to form a bearing between contiguous extensions, there being a tongue and groove joint between said contiguous extensions, substantially as and for the purpose specifled.
9. In ball bearing, a series of steel casing rings, metallic bands enclosing the outer faces and edges thereof, a series of steel journal rings, metallic bands enclosing the inner faces and edges thereof, balls between the steel rings and a ball'retainer to space the balls between the rings having absorbent material in the retainer for olling the balls, as shown and described.
10. In ball bearings, a ball retainer composed of flat tubular rings having holes in the same to seat the balls, absorbent material in said tubes to lubricate the balls, and studs to hold the retainer on the balls.
11. In ball bearings, a ball retainer composed of flat metal rings having holes to seat the balls, absorbent material secured to said rings, a backing for holding the absorbent material against the balls and studs to hold the retainer against the balls, as shown and for the purpose specified.

No. 101,433 . Gate. Barrière.

Harry H. Gorton, Wallace, Missouri, US.A.. 9th October. 1906; 6 years. Filed 9th July, 190¢. Receipt No. 137,666.
Claim.-1. The combination with a gate, of oscillatory bars pivotally connected with the gate and provided at their lower portions with tapering extensions arranged to engage the gate when the same is open or closed, and means for actuating the gate, substantially as described.
2. The combination of a gate, oscillatory bars connected with the gate, operating levers provided with inner and outer links connected thereto at different points and arranged at an angle, and connections extending from the links to the oscillatory bars, substantially as described.
3. The combination of a gate, oscillatory bars connected with the same, plates connected with the oscillatory bars and provided with perforations, stays connected with the bars and with the plates, operating levers, and connections between the plates and the operating levers, said connections being adjustable through the said perforations, substantially as described.
4. The combination of a gate, oscillatory bars, plates pivotally connected with the bars, flexible stays extending from the plates to the bars, operating levers provided with inner and outer links arranged at an angle, and connections between the plates ad the links, substantially as described.
5. The combination of a gate, oscillatory bars, means for pivotally connecting the oscillatory bars with the gate and for permitting the gate to have a limited upward and downward movement independent of the oscillatory bars, and means for actuating the gate, substantially as described.
6. The combination of a gate, oscillatory bars, blocks pivotally connected with and interposed between the bars, and fastening means connected with the gate and slidable on the blocks, substantially as described.
7. The combination of a gate, oscillatory bars, blocks pivotally connected with the oscillatory bars, and fastening devices connected with the gate and extending through the blocks and provided with means for engaging the same, the said fastening devices being of sufficient length to permit the gate to have a limited upward and downward movement independent of the oscillatory bars, substantially as described.
8. The combination of a gate, oscillatory bars, blocks pivotally connected with the oscillatory bars and secured to the gate, the latter having a limited upward and downward movement independent of the oscillatory bars, and side bars connecting the upper ends of the oscillatory bars, substantially as described.
9. The combination of a gate, oscillatory bars having upper and lower pivots and connected with the gate, a bottom catch mounted on the gate and arranged to engage the lower pivot when the gate is closed, and a latch carried by the front of the gate, substantially as described.
10. The combination of a gate, oscillatory bars pivoted at the lower ends and connected with the gate, and a fixed catch carried by the gate and arranged to extend beneath the lower pivot of the oscillatory bars for holding the gate against upward movement, substantially as described.
11. The combination of a gate, oscillatory bars connected with the gate, and a fixed L-shaped catch carried by the rear end of the gate for holding the same against upward movement when the gate is closed, substantially as described.
12. The combination of a fixed abutment, a keeper arranged beneath the same, a gate, means for moving the gate through an arc of a circle for opening and closing it, and a substantially \(S\)-shaped latch pivoted between its ends at the front of the gate, the upper portion of the latch
being carried by the closing movement of the gate into contact with the fixed abutment to swing the lower portion of the latch into engagement with the keeper, and the opening movement of the gate being adapted to carry the upper portion of the latch away from the fixed abutment to permit the lower portion of the latch to swing out of engagement with the keeper, whereby the latch is automatically operated by the movement of the gate, substantially as described.
13. The combination of a fixed abutment, a keeper arranged beneath the same and consisting of a horizontal loop, a gate, means for moving the gate through an arc of a circle for opening and closing it, a substantially \(S\)-shaped latch pivoted between its ends at the front of the gate, the upper portion of the latch being carried by the closing movement of the gate into contact with the fixed abutment to swing the lower portion of the latch into engagement with the keeper, and the opening movement of the gate being adapted to carry the upper portion of the latch away from the fixed abutment to permit the lower portion of the latch to swing out of engagement with the, keeper, whereby the latch is automatically onerated by the movement of the gate, and stops mounted on the gate and arranged to be engaged by the upper and lower portions of the latch for limiting the movement thereof, substantially as described.
14. The combination of a gate, oscillatory bars, a catch arranged at the back of the gate, a latch located at the front of the gate, a keeper, and a catch also located at the front of the gate and arranged normally out of engagement with the keeper and adapted to be carried into engagement with the same when the front end of the gate is depressed, substantially as described.
15. The combination of a gate, oscillatory bars connected with the gate, a latch arranged at the front of the gate and with the gate, a latch arranged at the front of the gate, a keeper and a catch also located at the front of the gate, and adapted to be carried into engagement with the same when the front end of the gate is depressed, substantially as described.
16. The combination of a gate, oscillatory bars connected with the gate, a catch mounted on the back of the gate and arranged to engage the pivot of the oscillatory bars, keepers located adjacent to the front of the gate, a latch having a hook-shaped portion for engaging one of the keepers, and a catch also mounted on the front of the gate and arranged to engage the other keeper and being normally out of engagement with the same when the gate is closed, substantially as described.
17. The combination of a gate, an operating lever connected with the gate, an arm extending from the lever and yieldably connected with the same, and means depending from the arm for operating the lever, substantially as described.
18. The combination with a gate, and an operating lever connected with the same, of an arm extending outward from the operating lever and provided at its inner end with a spring coil secured to the lever, and a flexible connection attached to the lever and extending therefrom to the outer portion of the arm and depending from the latter, substantially as described.

No. 101,434. Hand Loom. Métier à main.

Mary Permellia C. Hooper, New York City, U.S.A., 9th October, 1906 ; 6 years. Filed 28th August, 1902. Receipt No. 98,672.
Claim.-1. A portable hand loom comprising warp holding means and a pair of weft holders of substantially rigid material movable in opposite directions with the warp threads as each is formed and adapted to be withdrawn from the material woven, substantially as described.
2. A portable hand loom comprising warp holding means and a pair of relatively adjustable weft holders of substantially rigid material movable in opposite directions with the warp threads as each shed is formed and adapted to be withdrawn from the material woven, substantlally as described.
3. A portable hand loom comprising warp holding means, a toothed lay and a pair of weft holders of substantially rigid matorial adapted to be withdrawn from the material woven, substantially as described.
4. A portable hand loom comprising warp holding means, a heddle and a pair of weft holders of substantially rigid malirial adapted to be withdrawn from the material woven, substantially as described.
5. A portable hand loom comprising warp holding means, a toothed lay, a heddle and a pair of weft holders of substantially rigid material adapted to be withdrawn from the material woven, substantially as described.
6. A hand loom comprising warp hoiding means, a heddle and weft holders of substantially rigid material movable by the heddle in opposite directions with the warp threads as cach shed is formed and adapted to be withdrawn from the material woven, substantially as described.
7. A hand loom comprising warp holding means, a toothed lay, a heddie and weft holders of substantially rigid material movable by the heddle in opposite directions with the warp threads as each shed is formed and adapted to be withdrawn from the material woven, substantially as described.
8. A shuttle for hand looms consisting of a member having an elongated slot or opening of substantially the length of said member for the weft thread and adapted to enter the warp threads at either end whereby the shuttle may be passed back and forth without reversal, substantially as described.
9. A loom of the class described comprising a body portion or frame having a transverse slot, a warp holder detachably secured in said slot, and a second warp holder adjustably secured to said body portion or frame, substantially as described.
10. A loom of the class described comprising a body portion or frame having a transverse slot, a warp holder detachably secured in satd slot, and a second warp holder adjustably secured to sald body portion or frame by a slot in the warp holder through which the body portion or frame passes, substantially as described.
11. A loom of the class described comprising a body portion or frame and suitable detachable warp holders also serving as suports for the body portion or frame, substantially as describe.
12. A loom of the class described comprising a body portion or frame and suitable detachable warp holders also serving as supports for the body portion or frame, the supporting portions of the warp holders being different heights porting portio:ns of the warp holders being of different heights stantially as described.
13. A loom of the class described comprising a body portion or frame, a pair of suitable detachable warp holders. and means outside one of the warp holders adapted to engage and hold the warp threads when of greater length than the distance between the warp holders, substantially as described.
14. A loom of the class described comprising a body pot tion or frame, a pair of suitable detachable warp holders and means outside each of the warp holders adapted to engage and hold the warp threads when of greater length thas the distance between the warp holders. substantially as des. cribed.
15. A loom of the class described comprising a body portion or frame, a pair of suitable detachable warp holders. and means outside one of the warp holders adapted to engage and hold the warp threads when of greater length tha: the disance between the warp holders, such means consist ing of slits in the body portion or frame, substantially as lescribed.
16. A loom of the class described romprising a body portion or frame, a pair of suitable detathable warp holders. and means outside each of the warn holders adanted to engage and hold the warp threads when of greater length that the listance between the warp holders. surh means consisting of slits in the boly portion or frame, substantially as described.

\section*{No. 101,435. Sight Feed Labricator. Gruissrur}

Frederick Leonhardt, Sheboygan, Wisconsin. U.S.A., sth October. \(1306 ; 6\) years. Filed 10th April, 1906. Receipt No. 134,811.
r/ailn.-1. A slght peed tube for a lubricator comprising an outer metallic jacket having the ends theronf interiorly serew threaded, a glass shell within the jackot visible through apertures in the same, packing gaskets opposing this of the shell, and hollow nuts that engage the serew throads of sald jacket against the gaskets and have hollow
shanks extending through said gaskets to bush the same and project into said shell.

2. A lubricator having packing rings opposing ends of its feed tube holders, sleeve nuts in connection with said holders aganst the packing rings and a sight feed tube comprising an outer metallic jacket extending in opposite directions through said rings and having its ends interiorly screw threaded, a glass shell within the jacket visible through apertures in the same, packing gaskets opposing ends of the shell and hollow nuts that engage the screw threads of sald jacket against the gaskets and have hollow shanks extending through said gaskets to bush the same and project into said shell.

No. 101,436. Grip for Guys. Griffes d'état.

George F. Swortfiger, New York City, New York, U.S.A., 9th October, 1906; 6 years. Filed 21st May, 1906. Receipt No. 136,105 .
Claim.-1. A combined guy hook, stretcher and clamp comprising two plates, one end of the plates grooved and forming a clamp to be united by bolts, the other end of the plates interlocking and forming a hook, the intermediate parts of the plates forming a loop with a winding drum therein for holding and winding in the guy through the clamps and locking means to prevent a reverse movement of the drum.
2. The combination in a single device of means for attachment to an eyebolt, means for clamping the guy wire, and means between the two and united therewith for winding in the end of the guy and secoring it against unwinding when wound comprising a drum to which the guy is attached, a head on the drum for the application of a wrench, a chamber in one of the plates contiguous to one of the bearings of the drum, and a cam in the chamber having contact on one end with a bearing of the drum and its other end having lodgement in a socket in the chamber.
3. A combination guy hook, stretcher and clamp comprising two plates adapted to interlock at one end and constituting a hook, the other end forming a clamp secured to gether by bolts, the intermediate portions forming an open loop with a winding drum therein for holding and winding in the guy through the clamps.
4. A combination guy hook, stretcher and clamp compris ing two plates forming a clamp at one end, a loop for a fuy winding drum in the middle and interlockng hooks for joining the plates and an anchor hook at the other end, a guy winding drum through the two plates, a chamber for a friction cam one on one slde of one of the drum bearings, a can in said chamber, the head on the drum serving as a closure over the chamber.
\(\overline{5}\). A combination guy hook, stretcher and clamp comprising two plates. the tuo plates forming a clamp at one end to be secured by bolts, a loop for and a guy winding drum

In the middle, with means for interlocking the plates at the other end comprising a hook on one of the plates extended into a hook wth a transversely rounded end to fit a curve in the second plate, a rounded notch back of said end to receive the correspondingly rounded end of the second plate and a recess at the base of said rounded notch to recelve the curved projection on the ends of the second plate, and a bearing part on the second plate to retain these interlocking parts together when the clamp ends of the plates are brought together.
6. In a combined guy hook, stretcher and clamp the combination with the anchor hook and guy clamp of a winding drum having bearings in the combined plates, a head or heads on the drum adapted for the use of a wrench, a hole through the drum in which to secure the guy, a chamber contiguous to one of the bearings of the drum to contain a locking cam and a cam in sald chamber to engage with a bearing of the drum.
7. In a combined guy hook, stretcher and clamp the combination with the anchor hook and guy clamp of a winding drum having bearings in the combined plates, a head or heads on the drum adapted for the use of a wrench, a hole through the drum in which to secure the guy, a chamber contiguous to one of the bearings of the drum to contain a locking cam, and a locking cam in said chamber, the head of the drum adapted to cover the head of the chamber.
8. In a combined guy hook, stretcher and clamp as shown, the combination with the guy winding drum of a chamber contiguous to one of the bearings of the drum to contain a locking cam, a cam in said chamber adapted to engage with and lock the drum, and a channel to said chamber to give access to the cam.
9. In a combined anchor hook, guy siretcher and clamp the combination with the guy winding drum of one of the bearings in the plates for the drum expanded into a chamber to receive a drum locking means.
10. In a device as described, a lock for the drum comprising a cam having a bearing at one end and a curved and notched face to engage with the plain surface of the drum, the curve of the gripping face conforming in part to the periphery of the drum
11. The combination with the winding drum of a locking means for the drum consisting of a cam having a socket bearing at one end and a face at the other end for engagement with the plain surface of the drum or the bearing of the the drum, the face of the cam notched and curved to approximately the curve of the drum.

No. 101,437. Steam Blower. Souffet à vapeur.

Clarkson M. Thompson, Portland, Maine, U.S.A., 9th October, 1906 ; 6 years. Filed 10th September, 1906. Receipt No. 139,367.
Claim.-1. In a device of the class described and in combination with a boiler furnace having a combustion chamber, of a tubular draft member communicating with the latter, an injector device disposed at the forward end of the member, sald device comprising a plurality of distinct sections or coils of relatively varying sizes spaced apart in a direction longitudinally of the member and with the smaller section innermost, tubular couplings connecting the sections for communication one with another, a steam duct communicating with the injector device, and means controlled by the pressure in the boller for automatically controlling the supply of steam to the injector.
2. In a device of the class described and in combination With a boiler furnace having a combustion chamber, of a tubular draft member communicating with the latter, an injector device disposed in the draft member, sald device comprising a plurality of sections or coils connected for communlcation one with another, a steam duct leading from the boller to one of. the coils for supplying steam thereto, a cutoff valve arranged in the duct, a weighted lever connected with sald valve and adapted for maintaining the same normally in open condition, and means controlled by an increased pressure in the boller for operating the lever to close the valve.

No. 101,438. Smoke Consumer and Cinder Arrester. Foyer fumivore ct arrête-étincelles.

Samuel M. Walker, Los Angles, California, U.S.A., 9th October, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136.582.

Claim.-1. The combination with a smoke flue, of a vortex chamber communicating therewith to receive the smoke therefrom, deflecting means in said chamber to impart vertical movement to the smoke, peripheral outlet means from said chamber to receive solid particles, central outward means from said chamber to receive he gaseous part of the smoke, and an annular flange extending into said vortex chamber to guide the solid articles toward the outlet means. 2. The combination with a smoke flue, of a casing forming a vortex chamber and having perforations around said chamber and a central outlet, of deflecting means in said chamber to impart vertical movement to the smoke, and annular inclined flanges extending into the vortex chamber to guide the solid particles toward said perforations.
3. The combination with a smoke flue, of a casing forming a vortex chamber and having perforations around said chamber and a central outlet, a smoke deflector in said chamber to impart vertical movement to the smoke, an annular flange extending in the vortex chamber to direct the solid particles at the periphery of said chamber into said perforations, and a chamber surrounding the vortex chamber and communicating therewith through said perforations.
4. The combination with a smoke flue, of a casing forming a vortex chamber and having perforations around said chamber and a central outlet, a smoke deflector in said chamber to impart vertical movement to the smoke, an annular flange extending in the vortex chamber to direct the solid particles at the perlphery of said chamber into sald perforations, an outer chamber surrounding the vortex chamber and communicating therewith through said perforations and a conduit leading from such outer chamber.
5. The combination with a smoke flue, of a casing forming a vortex chamber and having perforations around said chamber and a central outlet, of a deflector in said chamber to impart vertical movement to the smoke, an annular flange extending in the vortex chamber to direct the solid particles at the periphery of said chamber into said perforations, a chamber surrounding the vortex chamber and communicating therewith through said perforations and having an inclined bottom and a conduit leading from the lower part of said bottom.
6. The combination with a smoke stack, of a vertical casing thercon forming a vortex chaber, a deflector therein in the form of an inverted cone having spiral blades, said casing having perforations and having an inclined annular flange above said perforations and an outer chamber surrounding said casing communicating therewith through said perforations.
7. The combination with a smoke stack. of a vertical casing forming a vortex chamber having perforations around said chamber and a central outlet. annular downwardly inclined flanges nxtending in sairl chamber above said perforations and deflecting means in sa'd chamber to impart vertical movement to the smoke.

No. 101,439. Key Connection Between Shafts and Naves.
Clemens F. Von Bechtolsheim, Munich, Germany, 9th October. 1906: 6 years. Filed 29th November, 1905. Receipt No. 130,555.
Claim.-1. A key connection comprising a shaft having a key groove of tapering cross section, a nave having a key groove of semi-circular cross section, the grooves extending inclined to cach other, and a key fitting said grooves.
2. A key connection comprising a shaft having a key groove of tapering cross section, a nave having a key groove of
semi-circular cross section, the grooves extending inclined to each other, and a key fitting said grooves, the cylindrical part of the key being flattened.

No. 101,440 . Furnace for Steam Boilers.
Iownaise pour chaudières à vapeur.

John Franklin Van Tuyl, Saw Pit. Colorado, U.S.A., 9th October, 1906; 6 years. Filed 7th September, 1906. Receipt No. \(139,325\).
Claim.-1. In a steam boiler, the combination of two water facketed furnaces arranged one above the other, the upper furnace having its side water spaces terminating near the edges of the grate, whereby the space below the upper furnace is left uninclosed by the water jacket.
2. In a steam boiler, the combination of two water jacketed furnaces arranged one above the other, the upper furnace having its side water spaces terminating near the edges of the grate, whereby the space below the upper furnace is left uninclosed by the water jacket, and the lower furnace having its top sloping towards the sides from its middle line.
3. In a steam boiler, the combination of two water jackcted furnaces arranged one above the other, the upper furnace having its side water spaces terminating near the edges of its grate, and a casing sloping inward from said water spaces to carry the ashes from the upper grate toward the center of the boller.
4. In a steam boiler, the combination of two water jacketed furnaces arranged one above the other. with the upper furnace extending below the lower furnace at the sides, the upper furnace having its side water spaces terminating near the edges of its grate, a casing sloping inward from said water spaces to carry the ashes from the upper grate toward the center of the boiler, and ast pas. sages extending from the inner rdge of said casing downward outside the lower furnace.
5. In a steam boiler, the combination of two water jackHed furnaces arranged one above the other, the upper furnace having its side water spaces terminating near the ?dges of its grate, and a casing sloping inward from said Nater spaces to carry the ashes from the upper grate toward the center of the boiler, and the lower furnace having its ton sloping toward the sides from its middle line.
6. In a steam boiler, the combination of two water jacketed furnaces arranged one above the other, with the upper furnace extending below the lower furnace at the sides, the upper furnace having its side water spaces terminating near the edges of the grate, a casing sloping inward from the water spaces to carry the ashes from the upper grate toward the center of the boiler, and the ash passages extendiug from the inner edge of said casing downward outside the lower furnace, the lower furnace having its top sloping toward the sides from its middle line.

No. 101,441. Fimnace. Fournaise.

Joseph W. Hays, Chicago, Illinois, U.S.A., 9th October, 1906 ;
6 years. Filed 24th July, 1905. Receipt No. 127,135.
Claim.-1. In a furnace the combination of a grate, a fire box over sald grate, a combustion chamber, a bridge wall separating sald fire box and combustion chamber, an arch disposed over said bridge wall, the opposed face of said arch and bridge being constructed of heat retaining material and bring spaced apart to form a passage between said fire box and combustion chamber, and means for admitting alr to said fire box near said arch and causing the same to flow in a direction opposite to the draft so as to mix with the fases in the fire box before such gases arrive at sald passage.
2. In a furnace the combination of a grate, a fire box over said grate, a combustion chamber, a bridge wall separating said fire box and combustion chamber, an arch disposed orer said bridge wall, the opposed faces of said arch and tridge being constructed of heat retaining material and being of suitable shape to form a tortuous passage between said fire box and combustion chamber, and means for directing jets of heated air above said grates and causing. same to mix with the gases in the fire box before such gases arrive at said passage.
3. In a furnace the combination of a grate, a fire box over said grate, a combustion chamber, a boiler above said fire box and combustion chamber, a bridge wall separating said fire box and combustion chamber, an arch disposed over said bridge wall, the opposed faces of said arch and bridge being constructed of heat retaining material and being of suitable shape to form a tortuous passage between said fire box and combustion chamber, said arch being of sultable form to cause the gases delivered through sald passage to be diffused into said çombustion chamber before striking the boiler shell, and means for directing jets of heated alr above said grates and causing same to mix with the gases in the fire box before such gases arrive at said passage.
4. In a furnace the combination of a grate, a fire box over said grate, a combustion chamber, a bridge wall separating said fire box and combustion chamber, an arch disposed over said bridge wall, the opposed faces of said arch and bridge being constructed of heat retaining material and being spaced apart to form a passage between said fire box and combustion chamber, and means for directing jets of heated air above said grates and causing same to mix with the gases in the fire box before such gases arrive at sald passage.
5 . In a furnace the combination of a grate, a bridge wall 3t the rear of the grate, an arch disposed directly above the bridge wall and spaced therefrom, sald arch having an air passage extending through the same, a plurallty of air inects communicating. with said alr passage and extending through the front of said arch so as to discharge alr from said passage in a forward direction above the grate.
6. In a furnace the combination of a grate, a fire box over said grate, a combustion chamber, a boiler above said fire box and combustion chamber, a bridge wall separating said fire box and combustion chamber, an arch disposed directly over sald brldge wall, the opposed faces of said arch and
bridge being constructed of heat retaining material and being of suitable shape to form a tortuous passage between said fire box anci combustion chamber, said arch being of suitable form to cause the gases delivered through said passage to be diffused into said combustion chamber before striking the boiler shell.
7. In a furnace the combination of a grate, a fire box above said grate, an alr inlet for discharging air into said fire box above the grate, adjustable means for controlling the maximum amount of air delivered by said air inlet, a damper adjustable independently of said means and adapted to partly obstruct the passage of air through said air inlet, means for opening said damper after the fring of the furnace, and a tlming device adapted to automatically close said damper in a certain predetermined interval of time after the opening of same.
8. In a furnace the combination of a grate, a fire box above sald grate, an air inlet for discharging air into said fire box above the grate, adjustable means for controlling the maximum amount of air delivered by said air inlet, a damper operated independently of said means and adapted to control the passage of air through the said air inlet, said damper having an aperture through the same for determining the minimum quantity of air passing through said inlet, a slide for adjusting the area of the opening in said damper, means controlled by the movement of the door of the furnace for opening said damper, and a timing device adapted to automatically close said damper in a predetermined interval of time after the opening of the same.
9. In a furnace the combination of a grate, a fire box above said grate, a bridge wall of heat retaining material at the rear of the grate, an arch of heat retaining material disposed directly above said bridge wall. with a passage for gases between the arch and bridge wall, an air inlet above the grate adapted to admit air and cause said alr to mix with the gases in the fire box before arriving at said passage, means connected with the door to said fire box and adapted to control the passage of air through said inlet, and means for automatically reducing the flow of air through said inlet from a certain maximum amount to a certain minimum amount in a certain predetermined interval of time after the opening of said door.
10. In a furnace the combination of a grate, a fire box orer said grate, a combustion chamber, an arch overhanging the bridge wall, the opposed face of the arch and bridge leing constructed of heat retaining material and being spaced apart to form a passage from the fire box to the combustion chamber, and means for admitting air through the arch toward the forward side thereof.
11. In a furnace, the combustion of a grate, a firr box over said grate, a combustion chamber, a bridge wall separating said fire box and combustion chamber. an arch disposed over the bridge wall, the opposed face of said arch and bridge being constructed of heat retaining material and hoing spaced apart to form a passage between said fire box and combustion chamber, means for admitting air to said fire box near the forward side of said arch for conmingling with the products of combustion passing rearward under the arch, the top of the bridge wall opposed to the under side of the ach being sloped downward from the combustion chamber back toward the fire box.
12. In a furnace, the combination of ag rate, a fire box above the grate, an air inlet for discharging air into said fre box above the grate, means for controlling the passag. of air through said inlet, operating devices for said controlling means and connections therefrom to the fuel door acapted to operate them for increasing the air inlet whin the fuel door is opened.
13. In a furnace, the combination of a grate, a fire box above the grate, an air inlet for discharging air into the fire box above the grate, means for controlling the delivery of air through said inlet, operating devices for said controlling means, connections from said operating devices extending to the fuel door adapted to be operated when the fuel door is opened for firing to increase the air inlet, and means for operating the same to reduce the air inlet when the fuel door is closed.
14. In a furnace, the combination with a grate, a fire box above the grate, an air inlet for discharging air into the fire box above the grate, means for controlling the passage of air through said inlet, connections from the fuel door for opening said controlling means to enlarge the inlet upon the opening of the fuel door for firing, and automatic means for diminishing the air inlet after the closing of the fuel door.
15. In a furnace, the combination of a grate, a fire box above said grate, an air inlet for discharging air into said fire box above the grate, means for controlling the maximum amount of air delivered by said air inlet, a damper adjustable for obstructing the passage of air through said air inlet, means operated by the fuel door for causing said damper to be opened when the furnace is fired, and means
operated by connection with the fuel door for causing the damper to be closed after the door is closed.
16. In a furnace, the combination of a grate, a fire boy above the grate. an air inlet for discharging air into the fire box above the grate. means for controlling the delivery of air through said air inlet, operating devices for sald controlling means, connections therefrom extending to the fuel door and adapted to be operated for increasing the air inlet when the fuel door is opened, and automatic means for reversing the action of said operating devices when the fuel door is closed.
17. In a furnace, in combination with a grate, a fire box above the grate, an air inlet for discharging air into the fire box above the grate, means for controlling the delivery of air through said inlet, operating devices for said controlling means consisting of a cylinder and piston therein, connections for supplying water to the cylinder to operate the piston and for permitting waste of water from the cylinder, the piston being operatively connected to said controlling means for increasing the alr inlet when the piston is actuated by the water supply and for diminishing it when the piston is moved in the opposite direction, a valve controlling the admission of the water supply to the cylinder, connections from the fuel door for opening and closing such valve by the opening and closing of the fuel door, and a valve in the waste pipe from the cylinder adapted to regulate the rate of escape of the water from the latter.
18. In a furnace, in combination with a combustion chamber and an air inlet thereto, a damper in the air inlet for regulating the air supply, a cylinder and piston therein having water supply and waste connections, said piston being operatively connected to the damper for opening and closing the latter, a valve which controls the water supply and operating connections from the fuel door for opening and closing the valve when the door is opened and - losed, and a valve in the waste connection adjustable at will to govern the rate of waste of water from the cylinder.
19. In a furnace, in combination with the combustion chamber, an air inlet for supplying water thereto, a damper in such air inlet for regulating the air supply. a cylinder and piston therein, the cylinder having water supply and waste connections, the piston being operatively connected with the damper for opening and closing the latter, a valve which controls the water supply and operative connections from the fuel door to such valve for opening and closing the valve when the door is opened and closed, a valve in the wast" connection, and operating connections from the fuel coor for closing it when the door is opened and oprning it hen the door is closed.
20 . In a furnace, the combination with the combustion l lamber, an air inlet for supplying air thereto, a damper lor controlling the air supply through such inlet, a cylinder and a piston therein. the cylinder having water supply and waste connections, the piston being opiratively connected with the damper for opeing and closing the latter, a valve in the waste connection adjustable at will to regulate the rate of waste, a by-pass pipe leading around such valve, a sicond value in the by-pass pipe, and means for opening and closing such second valve.
21. In a furnace, in combination with the combustion chamber, an air inlet for supplying air thereto, a damper for controlling the air supply through such lniet. a cylinder and a piston therein, the cylinder having water supply and Waste connections, the piston being oprratively connected with the damper for opeting and closing the latter, a valve in the waste connection adjustable at will to regulate the rate of waste. a by pas pipe eading around such valve. a sccond valve in the by-pass pipe, and connections thereto from the fuel door for closing the valve when the door opens and onening it when the door closes.

\section*{No. 101,442. Apparatus for Burning Fuel.}

\section*{Apparcil à brûler du combustible.}

John B. Areher, Kensington, Maryland, U.S.A., 9th October, 1906: 6 years. Filed 25th May, 1906. Receipt No. 136,211. Claim.-1. The process of burning solid fuel, which consists in delivering streams of air into an unobstructed space above a bed of the ignited fuel, the air being introduced from different directions and along lines substantially tansent to a circle, thereby producing a cyclonic movement of the gases rises from the fuel and throwing unburned parlicles outward against the hot walls of the firebox, and renoving the products of combustion at one side of the firebox.
2. The process of burning solid fuel, which consists in passing air up through a bed of the ignited fuel, simultaneously forcing streams of air into the gases rising from the fuel. from different directions and along lines substantially langent to a circle, and regulating the amount of air delivered from different directions in prevent the escape o! any unburned gases.
3. A furnace comprising a firebox, an air supply conduit inroumding said firebox and having openings whirh are sub-

stantially tangent to a circle means for forcing air into said conduit, and a lateral outlet from said firebox over one side of said conduit.
4. A furnace comprising a firebox, an air supply conduit surrounding said firebox and having openings which are substantially taugent to a circle. means for forcing air into said conduit, and means for controlling the amount of air delivered from different directions.
5. A furnace comprising a firebos, an air supply conduit surrounding said firebox and having openings which are substantially tangent to a circle, means for forcing air into caid conduit, a plurality of test pipes extending from different portions of said conduit through the furnace wall, and means for controlling the amount of air delivered to different portions of said conduit.
6. A furnace comprising a firebox, an air supply conduit surrounding said firebox and having an arched front. and tuyeres extending inwardly from said conduit, the tuyeres of said arched front inclined downward with reference to the other tuyeres so that all the tuyeres deliver streams of air in lines substantially tangent to a horizontal circle.
7. A furnace comprising a firebox, an air supply conduit surrounding said firebox and having openings which are substantially tangent to a circle, and a shelf which is preferably perforated and extends rearwardly from the front wall of the firebox a short distance over the grate.
S. A furnace comprising a firebox, an air supply conduit surrounding said frebox and having openings which are substantially tangent to a circle. and projections extending irom the sides of the firebos, said projections preferably consisting of a mixture of graphite and fire clay.

\section*{No. 101,443. Fuel Feeding Apparatus.}

\section*{Apparcil d'alimentation de combustible.}

Emro Harcharick. Wilkesbarre, Pennsylvania, U.S.A., 9th October. 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,395.
Claim.-1. In a furnace the combination with a rotatable grate, of a conveyer adapted to move fuel radially of said grate, and a rotatable conc arranged to carry fuel between said conveyer and grate, substantially as described.
2. In a furnace the combination with a rotatable grate, of a conveyer adapted to move fuel radially of said grate, a fluted feeder arranzed to carry fuel between the conveyer and grate. and a water jacket surrounding said conveyer and feeder, substantially as described.
3. In a furnace the combiuation with a rotatable grate, of a conveger adapted to move fuel radially of the grate, a rotatable cone arranged between and adapted to deliver fuel trom the conveyer to the grate, and a water jacket extending about said conveyer and cone, substantially as described.
4. In a furnace the combination with a rotatable grate, of conveger adapted to move fuel radially of the grate, and

a fluted cone mounted to rotate between the conveyer and grate and to carry fuel from the conveyer to the grate, substantially as described.
5 . The combination with a grate, of a stoker extending thereover and a water jacket surrounding said stoker having openings through which fuel is fed to the grate, substantially as described.
6. In a furnace the combination with a grate, of a conveyer adapted to move fuel toward the center of the grate, a water jacket arranged above the grate into which said couveyer extends, said jacket having a plurality of passages through which fuel may pass to the grate, and a feeder arranged between and adapted to carry fuel from the conveyer to said passages in the water jacket, substantially as described.
7. In a furnace the combination with a rotatable grate, of a water jacket extending radially of said grate and open at its outer end, said jacket having formed in its lower wall passages through which fuel may pass to the grate, and a stoker adapted to be removably inserted in said jacket through the outer end thereof and comprising means for conducting fuel from outside of said jacket to the fuel passages in the lower side thereof, substantially as described.

8 . In a furnace the combination with a rotatable grate, of a rasing supported above the grate, a water jacket enclosing the inner end of said casing and provided with passages throush which fuel can pass to the grate, means for conveying fucl through said casing to said passages. and means arranged at the sxis of the grate for supplying water to the wator jachel. substantially as described.
9. In a furnace the combination with a grate, of a water jacket arranged above said grate, and having formed in its lower side passages for conducting fuel to the grate, a casing adapted to be removably supported within said rater jacket, and having passages communicating with the fuel passages in said jacket, and means within said casing for conveying fuel from the outer end thercof to sald fuel passares, substantially as described.
10. The combination with a stoker having its parts so joined as to form a unit, of a water jacket inclosing the stokir. said stoker as a unit being detachably supported within said watur jacket, substantially as described.
11. The combination with a water jacket having longitudinally extending brackets on its interior, of a stoker inclosed by said water jacket and having longitudinally extending projections resting upon said brackets.
12. In a furnace the combination with a grate, of a cunveyer adapted to positively move fuel toward the center of said grate, a feeder mounted to rotate between and convey fuel from said conveyer to the grate, an apertured plate between the feeder and grate, and means for varying the distance between the feeder and the apertured plate, substantially as described.
13. In a furnace the combination with a grate, of a conveyer adapted to move fuel toward the center of the grate, a feeder mounted to rotate between and carry fuel from the conveyer to the grate, an apertured plate between the feeder and grate, and means for independently adjusting either end of the apertured plate relative to the feeder, substantially as discribed.
14. In a furnace the combination with a grate, of a coureyer adapted to move fuel toward the center of the grate, \({ }^{3}\) feeder mounted to rotate between and carry fuel from the conveyer to the grate, an apertured plate adjustably supported between the grate and feeder, and means extending beyond one end of the feeder for independently adjusting either end of said plate, relatively to the feeder, substanti ally as described.

No. 101,444. Air Feeding Device.
Apparell d'alimentation d'alr.
Fig. 1.

Emro Harcharick, Wllkesbarre, Pennsylvania, U.S.A., 9th October, 1906; 6 years. Filed 21st September, 1906. Receipt No. 139,692.
Claim.-1. In a furnace, the combination of a frame having its interior divided into a central nir chamber and an ash chamber arranged about and over snid air chamber, a grate supported above said air chamber, and means for controlling the passage of air from the air chamber to the ash chamber, substantially as described.
2. In a furnace, the combination of a frame having its interior divided into a central air chamber and a plurality of ash chambers arranged about and over sald air chamber, a sectional grate supported by said frame and having each of its sections arranged over one of the ash chambers, and independent means for controlling the passage of alr from the air chamber to each of the ash chambers, substantially as described.
3. In a furnace, the combination of a frame having its interior divided into a central air chamber and a plurality of ash chambers arranged about and over said air chamber, a sectional grate supported by sald frame and having each of its sections arranged over one of the ash chambers, means for controlling the admission of air to the air chamber, and independent means for controlling the passage of air from the air chamber to each of the ash chambers, substantially as described.
4. In a furnace, the combination of an enclosed frame or support having its interior divided into a central air chamber and a plurality of ash chambers arranged over said air chamber, and having apertures formed in their walls, a grate supported by sald frame, and means for opening and closing the apertures in the walls of said ash chambers to control the passage of air to sald chsmbers, substantially as described.
5. In a furnace, the combination of a rotatable frame having its interior divided into a central air chamber and an ash chamber arranged about and over said air chamber, a sectional grate supported by said frame above the ash chamber, means for revolving sald frame; and means for controlling the passage of air from the air chamber into the ash chamber below the grate, substantially as described.
6. In a furnace, the combination of a rotatable frame, having its interior divided to provide a central air chamber, and a plurality of ash chambers arranged about and over said air chambers, a sectional grate carried by sald frame above the ash chambers, each section of sald grate being arranged above one of the ash chambers, means for revolving said frame, and means for independently controlling the admission of air to each of the ash chambers, substantially as described.
7. In a furnace, the combination with a suitable chamber, of a frame arranged in and separated from the side walls of said chamber, the interior of said frame being divided into a central air chamber and an ash chamber arranged above said aif chamber, a grate supported by said frame, means for supplying air to sald central air chamber, means for supplying fluld under pressure to the furnace chamber outside of sald frame, and independent means for controlling the passage of air to the ash chamber and grate, substantially as described.
No. 101,445. Bull Wheel. Roue.
The Canadian White Company, Montreal, Quebec, Canada, assignee of Thomas Kennard Thomson, Lowerre, Yonkers, New York, U.S.A., 9th October, 1906; 6 years. Filed 20th October, 1905. Receipt No. 129,431.
Olaim.-1. A two part bull wheel, each part of which has a
aubtantially semi-circular piece for the rope, cross pieces, 10-14
and a substantially semi-circular upright plece, the two parts being adapted to be secured to each other on opposite sides of a mast

2. A two part bull wheel, each part of which has a substantially semi-circular channel fron for the rope, angle iron cross pieces and a substantially semi-circular angle iron upright piece, the two parts being adapted to be secured to each other on opposite sides of a mast.

No. 101,446. Engine. Machine d vapeur.

The New Century Engine Company, assignee of Edward Field, all of London, England, 9th October, 1908; 6 years. Filed 22nd December, 1905. Receipt No. 131,238.
Claim.-1. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a steam boiler, a smoke box through which hot gases from the boller furnace pass, a mixing and heating chamber located in the upper part of sald smoke box so as to be heated by the furnace gases passing therethrough, means for conveying hot gases from the boller furnace to the smoke box adjacent to said mixing and heating chamber at a temperature higher than that of the gases ordinarily passing to the smoke box, means for supplying steam from the boiler to said chamber, means for supplying air pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
2. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a multitubular steam boiler having one of its upper tubes larger than the other tubes, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of sald smoke box adjacent to the outlet end of said larger tube, means for supplying steam from the boiler to sald chamber, means for supplying air under pressure to said chamber, and an engine to
which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
3. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air comprising a multitubular steam boller having a number of its upper fire tubes larger than the other tubes, a smoke box through which bot gases from the boller furnace pass by way of the tubes, a mixing and heating chamber located in the upper part of said smoke box adjacent to the outlet ends of said larger tubes, means for supplying steam from the boller to sald chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
4. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air comprising a multitubular steam boiler having the uppermost row of fire tubes larger than the other tubes, a smoke box through which hot gases from the boiler furnace pass by way of the tubes, a mixing and heating chamber located in the upper part of sald smoke box adjacent to the outlet ends of said larger tubes, means for supplying steam from the boiler to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
5. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a steam boiler, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, means for causing the hot gases to flow around and over said mixing and heating chamber, means for supplying steam from the boiler to sald chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
6. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a steam boller, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, means for inducing hot gases to flow around and over said mixing and heating chamber, means for supplying steam from the boiler to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is suppled from the said chamber, substantially as set forth.
7. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a steain boiler, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, a blast pipe for the exhaust steam, means for causing the steam blast to induce hot gases to flow around and over the surface of said mixing and heating chamber, means for supplying steam from the boller to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
8. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a steam boiler, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, passages extending through said chamber and through which hot gases can flow, means for supplying steam from the boller to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and alr is supplied from the said chamber, substantially as set forth.
9. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a steam boiler, a smoke box through which hot gases from the boller furnace pass, a mixing and heating chamber located in the upper part of sald smoke box so as to be heated by the furnace gases passing therethrough, passages extending through said chamber, means for inducing hot gases to flow through said passages, means for supplying steam from the boiler to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
10. Apparatus for preparing and supplying as motive fluid a heated mixture of steam and air, comprising a steam bofler, a smoke box through which hot gases from the boller furnace pass, a mixing and heating chamber located in the upper part of safd smoke box so as to be heated by the furnaces, gases passing therethrough, passages extending through said chamber, a blast plpe for the exhaust steam,
means for causing the steam blast to induce hot gases to flow through said passages, means for supplying steam from the boller to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
11. Apparatus for preparing and applying as motive fuid a heated mixture of steam and air. comprising a steam boiler, a smoke box through which hot gases from the boller furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, passages extending through said chamber, means for causing hot gases to flow around and over the said mixing and heating chamber and through the passages therein, means for supplying steam from the boller to said chamber, means for supplying air under pressure to said chamber, and an. engine to which the heated mixture of steam and air is supplied from the sald chamber, substantially as set forth.
12. Apparatus for preparing and applying as motive fuld a heated mixture of steam and air, comprising a steam boiler, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, passages extending through said chamber, a blast pipe for exhaust steam, means for causing the steam blast to induce hot gases to flow over and around said chamber and through the passage therein, means for supplying steam from the boiler to sald chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
13. Apparatus for preparing and applying us motive fuid a heated mixture of steam and air, comprising a steam boiler, a smoke through which hot gases from the boller furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, means for conveying hot gases from the boiler furnace to the smoke box adjacent to said mixing and heating chamber at a temporature highor than that of the gases ordinarily passing to the smoke box, means for causing said higher temperature gases to flow over and around said chamber, means for supplying steam from the boiler to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
14. Apparatus for preparing and applying as motive fuid a heated mixture of steam and air, comprising a steam boiler, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the tuper part of said smoke box so as to be heated by the furnace gases passing therethrough, means for conveying hot gases from the boiler furnace to the smoke box adjacent to said mixing and heating chamber at a temperature higher than that of the gases ordinarily passing to the smoke bor, passages extending through said chamber, means for causing some of said higher temperature gases to flow through sald passages, means for supplying steam from the boiler to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
15. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a steam boiler, a smoke box through which hot gases from the boller furnace pass, a mixing and heating chamber located in the upper part of said smoke box so as to be heated by the furnace gases passing therethrough, means for convering hot gases from the boiler furnace to the smoke box adjacent to said mixing and heating chamber at a temperature higher than that of the gases ordinarily passing to the smoke box passages extending through said chamber, means for causing said higher temperature gases to flow over and around said chamber and through the passages therein, means for supplying steam from the boller to said chamber, means for supplying air under pressure to said chamber, and an engine to whicn the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
16. Apparatus for proparing and applying as motive fluld a heated mixture of steam and air, comprising a multitubular steam boller having one of its upper tubes larger than the other tubes, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of said smoke box adjacent to the outlet end of said larger tube, means for causing the hot gases irom said larger boller tube to flow over and around said chamber, means for supplying steam from the boiler to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth. 17. Apparatus for preparing and applying as motive fuld a
heated mixture of steam and air comprising a multitubular
steam boiler having one of its upper tubes larger than the ather tubes, a smoke box through which hot gases from the boiler furnace pass, a mixing and heating chamber located in the upper part of sald smoke box adjacent to the outlet end of said larger tube, passages extending through said chamber, means for causing the hot gases from sald larger boller tube to flow through gald passages, means for supplying steam from the boller to sald chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
18. Apparatus for preparing and applying as motive fluld a heated mixture of steam and air, comprising a multitubular steam boiler having one of its upper tubes larger than the other tubes, a smoke box through which hot gases from the boller furnace pass, a mixing and heating chamber located in the upper part of sald smoke box adjacent to the outlet end of said larger tube, passages extending through said chamber, means for causing hot gases from said larger boiler tube to flow over and around sald chamber and through said passages, means for supplying steam from the boller to said chamber, means for supplying alr under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the sald chamber, substantially as set forth.
19. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a multitubular steam boller having a number of its upper ine tubes larger than the other tubes, a smoke box through which hot gases from the bofler furnace pass by way of tubes, a mixing and heating chamber located in the upper part of said smoke box adjacent to the outlet ends of said larger tubes, means for causing the hot gases from sald larger boiler tubes to flow over and around sald chamber, means for supplying steam from the boller to sald chamber, means for supplying air under pressure to sald chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
20. Apparatus for preparing and applying as motive fluid a heated mixtrue of steam and air comprising a multitubular steam boller having a number of its upper fire tubes larger than the other tubes, a smoke box through which hot gases from the boiler furnace pass by way of the tubes, a mixing and heating chamber located in the upper part of said smoke box adjacent to the outlet ends of said larger tubes, passages extending through said chamber, means for causing hot gases from sald larger boller tubes to flow through said passages, means for supplying steam from the boller to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantlally as set forth.
21. Apparatus for preparing and applying as motive fluid a heated mixture of gteam and air comprising a multitubular steam boiler having a number of its upper fire tubes larger than the other tubes, a smoke box through which hot gases from the boller furnace pass by way of the tubes, a mixing and heating chamber located in the upper part of sald smoke box edjacent to the outlet ends of said larger tubes, passages extending through said chamber, means for causing hot gases from sald larger boller tubes to flow over and around said chamber and through the passages therein, means for supplying steam from the boller to said chamber, means for supplying air under pressure to said chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
22. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air comprising a multitubular steam boiler, a smoke box through which the hot gases from the boiler furnace pass, a mixing and heating chamber of saddle or arch-shape in end view, located within the upper part of sald smoke box, means for conveying hot gases from the boller furnace to the smoRe box adjacent to said mixing and heating chamber at a temperature higher than that of the gases ordinarly passing to the smoke box, means for supplying steam from the boller to said chamber, means for supplying air under pressure to sald chamber, and an engine to which the heated mixture of steam and air is supplied from the said chamber, substantially as set forth.
23. Apparatus for preparing and applying as motive fluid a heated mixture of eteam and air comprising a multitubular steam boller, a smoke box through which the hot gases from the boller furnace pass, a mixing or heating chamber of saddle or arch-shape in end view located within the upper part of sald smoke box, means for conveying hot gases from the boller furnace to the smoke box adjacent to sald mixing and heating chamber at a temperature higher than that of the gases ordinarily passing to the smoke box, a steam pipe connecting the boller to sair chamber, an air inlet pipe connected to one of the depending ends of said chamber, an alr compressor connected to said pipe, a mixture outlet pipe connected to the other depending end of said chamber. and an engine connected to the latter plpe and to which the heated mixture is supplied, substantially as described.
24. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a multitubular steam roller, a smoke box through which the hot gases from the boiler furnace pass, a mixing and heating chamber of saddle or arch-shape in end view, located within the upper part of said smoke box. means for conveying hot gases from the boller furnace to the smoke box adjacent to said mixing and heating chamber at a temperature higher than that of the gases ordinarily passing to the smoke box, a steam pipe connecting the boiler to said chamber, an air inlet plpe connected to one of the depending ends of said chamber, an alr ccmpressor connected to sald pipe, a perforated pipe located within said chamber and connected to sald air inlet pipe, a mixture outlet pipe connected to the other depending end of s.aid chamber and an engine connected to the latter pipe and to which the heated mixture is supplied, substantially as described.
25. Apparatus for preparing and applying as motive fluld a heated mixture of steam and air, comprising a multitubular steam boiler, a smoke box through which the hot gases from the boiler furnace pass, a mixing and heating chamber of saddle or arch-shape in end view, located within the upper part of said smoke box, means for conveying hot gases from the boiler furnace to the smoke box adjacent to sald mixing and heating chamber at a temperature higher than that of the gases ordinarily passing to the smoke box, pipes extending through said chamber for the passage of furnace gases, a steam pipe connecting the boiler to sald chamber, an air inlet pipe connected to one of the depending ends of said chamber, an air compressor connected to sald pipe, a mixture outlet pipe connected to the other depending end of sald chamber and an engine connected to the latter plpe and to which the heated mixture is supplied, substantially as described.
26. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a multitubular steam boller, a smoke box through which the hot gases from the boiler furnace pass, a mixing and heating chamber or saddle or arch shape in end view, located within the upper part of said smoke box. means for conveying hot gases from the boiler furnace to the smoke box adjacent to sald mixing and heating chamber at a temperature higher than that of the gases ordinarlly passing to the smoke box. plpes extending through sald chamber, a steam plpe connecting the boller to sald chamber, an air inlet plpe connected to one of the depending ends of said chamber, an air compressor connected to said pipe, a mixture outlet plpe connected to the othen depending end of said chamber and an engine connected to the latter pipe and to which the heated mixture is supplied, and means for causing hot gases to flow over and around sald chamber and through the pipes extending through it, substantially as described.
27. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air. comprising a multitubular steam boiler, a smoke box through which the hot gases from the boiler furnace pass, a mixing and heating chamber of saddle or arch shape in end view, located within the upper nart of said smoke box, some of the upper boller fire tubes being larger than the others, a steam pipe connecting the boiler to said chamber, an air inlet pipe connected to one of the depending ends of said chamber, an air compressor connected to sald pipe, a mixture outlet pipe connected to the other depending end of sald chamber and an engine connected to the latter pipe and to which the heated mixture is supnlied. and an adjustable defiector for deflecting the hot gases from the upper larger boller fire tubes over and around the said chamber.
28. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air. comprising a multitubular steam boller, a smoke box through which the hot gases from the boller furnace pass, a mixing and heating chamber of saddle or arch shape in end view. located within the upper part of sald smoke box. some of the upper fire tubes of said boiler being larger than the others, pipes extending through sald chamber. a steam pipe connecting the boller to sald chamber, an air inlet pipe connected to one of the depending ends of sald chamber, an air compressor connected to said pipe, a mixture outlet pipe connected to the other depending end of said chamber and an engine connected to the latter pipe and to which the heated mixture is supplled, an adjust able deflector for deflecting the hot gases from the upper larger boller fire tubes over and around sald chamber. a blast pipe for the exhaust steam, and means for causing the steam blast to induce hot gases to flow over and around said chamber and through the pipes extending therethrough.
29. Apparatus for preparing and applying as motive fluid a heated mixture of steam and air, comprising a multitubular steam boiler, a smoke box through which the hot gases from the boiler furnace pass, a mixing and heating chamber of saddle or arch shape in end view, located within the upper part of said smoke box, some of the upper boller fire tubes being larger than the others, pipes extending through said
chamber, a steam pipe connecting the boiler to said cham ber, an air inlet pipe connected to one of the depending ends of said chamber, an air compressor connected to said pipe, a mixture outlet pipe connected to the other depending end of sald chamber, and an engine connected to the latter pipe and to which the heated mixture is supplied, an adjustable defiector for deflecting hot gases from the upper nad larger boller fire tubes over and around said chamber, a blast pipe for the exhaust steam, and a louvre device for causing the steam blast to induce the fiow of hot gases over and around sald chamber and through the pipes extending through it.

No. 101,447. Method of Making Metal Axles. Methode de faire des cessieus de fer.

The Bettendorf Metal Wheel Company, assignee of Emil Einfeldt, both of Davenport, Iowa, U.S.A., 9th October, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,310.
Olaim.-1. The method of shaping flanged bars which conaists in subjecting the bar to a lateral pressure to reduce its height locally, and rounding the flanges of the reduced portion.
2. The method of shaping flanged bars which consists in subjecting the same to lateral pressure at the end to reduce its height, rounding the flanges of the reduced portion of the bar, and subjecting the same to endwise pressure to form a shoulder.
3. The method of making metal axles which consists in selecting a bar having longitudinal flanges and a connecting web, reducing the height of the web at the end of the bar and thereby increasing the thickness of said web, and bending the flanges of the thickened portion of the web inward to form a rounded surface and to leave longitudinal spaces between the web and the bent flanges.

\section*{No. 101,448. Wire Drawing Machine. Machine detirer le Al de fer.}

The Iroquis Machine Company, New York City, New York, assignee of James Alexander Horton, Providence, Rhode Island, 9th October, 1906; 6 years. Filed 17th September, 1906. Recelpt No. 139,544.
Clatm.-1. In a wire drawing machine, the combination of a body having a fluid containing chamber one wall of which Is composed of heat absorbing material, with a separate wire engaging member having a surface for engaging the wire and another surface in parallel juxtaposition to the external surface of the heat absorbing wall of the said fluid containing chamber, substantlally as described.
2. In a wire drawing machine, the combination of a body having a cooling chamber one wall of which is circular in section, a separate member having a wire engaging surface adapted to become heated by the friction of the wire, and another surface heated against the outer surface wall of the cooling chamber, substantially as described.
3. In a wire drawing machine, the combination of a body having a fluld containing chamber one wall of which

is composed of heat absorbing material, with a separate wire engaging member having a surface for engaging the wire and another substantially continuous extended surface of the heat absorbing wall of the sald fuid containing chamber, substantially as described.
4. In a wire drawing machine, the combination of a body having a fluid containing chamber one wall of which is composed of heat absorbing material, with a separate wire engaging member having a surface for engaging the wire and another substantially continuous extended surface in contact with the external surface of the leat absorbing wall of the said fluid containing chamber, sald heat absorbing wall being composed of a relatively thin soft metal, substantially as described.
6. In a wire drawing machine, a drum, a die, and a wire a substantially vertical axis, and pivoted fingers yieldingly pressed toward the wire forwarding surfaces of the drums, whereby the dronping \(n\) • onvolution of wire from one drum to anothar is prevented.
6. In a wire drawing machine, a drum, a die, and a wire clamp adjacent to the path of the wire passing from the drum to the die and adapted to engage and hold a portion of the wire during the operation of threading the leading end of the wire through the die, said clamp having its mouth directed toward the die. whereby it is adapted to deliver the wire toward the die.

\section*{No. 101,449. Machine for Forming Wire Drasing} Dies.

\section*{Machine d faire les Alières détirer le all de fer.}

The Iroquis Machine Company, New York Gity, New York, assignee of James Alexander Horton, Providence, Rhode Island. U.S.A., 9th October, 1906; 6 years. Flled 17th September, 1906. Receipt No. 139,545.
Claim.-1. A machine for re-making wire drawing dies, comprising compressing means adapted to act on the exterior of the die to compress the metal of the die inwardly, toward the die orifice, and thus contract the latter, expanding means, and means for causing said expanding means to act simultaneously with the compressing means and within the die, to enlarge and re-form the die orifice.
2. A machine for re-making wire drawing dies, comprising compressing means adapted to act on the exterior of the die to compress the mecal of the die inwardly, toward the die orifice, and thus contract the latter, a reciprocable forming tool movable within the die to enlarge and re-form the die orifice, and means for operating simultaneously with said pressing means for reciprocating sald forming tool.
3. A machine for re-making wire drawing dies, comprising relatively movable opposed pressing members adapted to exert compressive pressure in opposite directions on opposite ends of a die, one of said members having means for translating or directing the compressive pressure radially inward, toward the center of the die orifice, and moans for operating simultaneously with the said pressing members and within the pressure directing means, to enlarge and roo form the die orifice.
4. A machine for re-making wire drawing dies, comprising a fixed die support formed to contract the die orifice, a

press having a movable member opposed to said die support, a reciprocable forming tool adapted to act within the die support to enlarge and re-form the die orifice, and means for causing the simultaneous action of said press and forming tool.
5. A machine for re-making wire drawing dies, comprisIng a die support having a tapered die seat adapted to recelve the orifice containing portion of the die, a member for applying pressure to a die on said support to cause the compression of the said portion by the said seat, a forming tool adapted to act within the die seat to enlarge and re-form the die orifice, and means for causing the simultaneous action of said parts.
6. In a machine for re-making wire drawing dies, a die support having a tapered die seat adapted to receive the orifioe containing portion of the die, raeans for applying pressure to the die, a reciprocable forming tool adapted to act within the die seat, and means for adjusting said support longitudinally of the forming tool to determine the size of the die orifice.
7. In a machine for re-making wire drawing dies, a die support having a tapered die seat formed to contract the die orifice, a die presser opposed to the die support and having a central opening, means for decreasing the distance between the presser and the die support, and a die forming tool extending through the opening in the presser and adapted to act within the die contracting means of the die support, and means for operating the die forming tool independently of the presser.
8. A machine for re-making wire drawing dies, comprisIng a die support formed to contract the die orifice, a die presser opposed to the support, a press having a fixed inverted cylinder, and a piston movable outwardly therein, said piston having an extension, a yoke engaged with the said extension and presser, and having a tool receiving cpening, and a forming tool movable through the sald opening and acting within the die contracting means of the die support.
9. A machine for re-making wire drawing dies, comprising a die support formed to contract the die orifice, a die presser opposed to the support, a press having a cylinder, and a piston movable therein, connections between the said piston and presser, a die forming tool adapted to act within the die contracting means of the die support, a crank shaft for reciprocating the tool, a clutch for arresting and releasing the shaft, and connections between the piston and the clutch, whereby outward movement of the piston makes the slutch operative, while inward movement of the piston makes the clutch inoperative.
10. In a machine for re-making wire drawing dies, a die forming tool, a holder for the same, means for reciprocating the holder, and means for positively limiting the die formIng movement of the holder at a predetermined point, to compensate for factors of uncertainty.
11. In a machine for re-making wire drawing dies, a forming tool carrier having a shoulder or enlargement, means for reciprocating sald carrier, and a rigidly supported stop or abutment adapted to arrest the die forming movement of the said shoulder and tool.
12. In a machine for re-making wire drawing dies, a forming tool carrier having a shoulder or enlargement, means for reciprocating said carrier, an adjustable rigidly supported stop or abutment adapted to arrest the outward movement of said shoulder and tool, and means for adjusting said stop.
13. A machine for re-marking wire drawing dies, comprising a fixed die support having a die compressing seat, a movable die presser opposed to the support, a press including a fixed cylinder having a closed end sustaining the die support, and a piston movable in said cylinder, a yoke connecting said piston with the die presser and extending across the latter, said yoke having an opening colnciding with the orifice of a die supported by the die support, a longitudinally movable die forming tool movable in said opening to act on the orifice of the die, and means for reciprocating said tool.
14. A die compressing machine comprising two relatively movable opposed members, one having a die compressing seat adapted to displace the metal of the die wholly toward the die orifice when the distance between the members is decreased, the said members having openings in alignment with each other and with the said seat, means for decreasing the distance between the members, a longitudinally movable tapered die forming tool movable in said openings, and means for reciprocating sald tool.

No. 101,450. Wire Drawing Machine.

The Iroquois Machine Company, New York City, New York, assignee of James Alexander Horton, Providence, Rhode Island, U.S.A., 9th October, 1906; 6 years. Filed 17th September, 1906. Recelpt No. 139.546.
Olaim.-1. In a wire drawing machine, a rotary drum having a peripheral seat, a wire forwarding device adapted to slip clrcumferentially on said seat, and riven by frictional contact with the seat at the speed required by the call or tension of the wire, the drum having capillary ducts opening into said seat, and means carried by the drum for supplying lnbricant to said ducts, said capillary ducts serving to effect a predetermined restriction or regulation of tho movement of lubricant to prevent free flowage of the lubricant through said ducts, and overfiow or escape of the lubricant from the crevice between the contacting surfaces of the geat and the wire forwarding device.
2. In a wire drawing machine, a rotary drum having a peripheral seat, a wire forwarding device adapted to slip circumferentially on said seat, and driven by frictional contact with the seat at the speed required by the call or tension of the wire, an oil reservoir carrled by the drum, ducts extending from the drum to the seat. and capillary filling in said ducts, the outer ends of said fillings contacting with the inner surface of the wire forwarding device.
3. A wire drawing drum having a loose incompressible ring to recelve the initial convolutions of the wire, and a compressible wire forwarding device beside sald ring adapted to slip circumferentially on the drum and frictionally driven at the speed required by the call or tension of the wire.

No. 101,451. Head Etock for Engine Lathes.
Porte-outils pour tours mu par une machine.

The Lodge and Shipley Machine Tool Company, assignee of William Lodge and Nicholas Daniel Chard, all of Cincinnati, Ohio, U.S.A., 9th October, 1906; 6 years. Filed 15th May, 1905. Receipt No. 125,173.
Claim.-1. In combination with the head stock of an engine lathe, two sets of bearings in axial alignment, a driving sleeve journalled in the intermediate bearings, a spindle of lesser diameter than the internal diameter of said sleeve, passing through said sleeve without substantial contact, and journalled at each end of the sleeve in the end bearings, means for directly clutching the driving sleeve to the spindie, and means for back gearing from the sleeve to the spindle, substantially as described.
2. In an engine lathe, a head stock having independent bearings in line axially for the purpose of independently supporting a driving member and spindle, a driving member fournalled in one of the bearings, a spindle journalled in the other, said spindle and driving member being supported by their respective bearings substantially free from frctional contact with each other, a clutch member between said spindle and driving member adapted to fix them to rotate together, means for throwing the clutch, back gearing from the driving member to the spindle, and means for throwing said back gear wheels into or out of train, whereby when the said back gears are in commission the spindle and driving member rotate substantially free from frictional contact with one another.

No. 101,45\%. Monld For Bricks. Moule pour briqucs.
The South Bend Machine Mig. Co., South Bend, Indiana, assignee of George Brown, Niles, Michigan, U.S.A., 9th October, 1906: 6 years. Filed 13th January, 1906. Receipt No. 131.838.
Claim.-1. A moulding machine comprising a mold embracing side walls, one of which is slotted and the other of which is hinged to swing downwardly and outwardly, a removable nattet between said walls, and partition plates sliding through the slots of the slotted wall, across the pallet and towards and from the hinged wall.
2. A moulding machine comprising a support and a mould comprising a mould bed, side walls, a hinged top wall, and partition plates, one of said side walls hinged so as to be swung downwardly an doutwardly below the level of the mould bed and the other wall being slotted, sald partition plates being slidable through the slots of said latter wall, across the bed and towards and from the movable wall.
3. A moulding machine comprising a mould having a mould bed. a fixed wall irvolded with vertical slots at suitable distances apart, and a wall opposite the slotted wall hinged
to the machine below the level of the mould bed so as to swing downwardly and outwardly below the level of the

mould bed, longitudinally movable partition plates in said slots adapted to be moved inwardly across the bed and to be moved outwardly to clear the bed, guldes for sald partition plates and means to simultaneously operate said partition plate.
4. A moulding machine comprising a mould having a mould bed. side walls, one of which is movably mounted so as to be lowered below the level of the mould bed, and the other of which is slotted, and partition plates slidable through the slots of the latter wall, across the bed and towards and from the movable wall, a shaft movable with gaid partition plates and provided with a pinion, snd a fixed rack engaged by sald pinion and co-acting therewith to move the partition plates endwise when the shaft is rotated.
5. A moulding machine comprising two moulds, two sets of partition plates slidable into and out of the moulds, and a single actuating device located between said moulds for operation both sets of partition plates.
6. A moulding machine comprising two moulds located side by side, two sets of sliding partition plates movable into and out of the moulds, the partition plates of said two sets comprising the opposite ends of rigid plates that extend between the moulds, and a single actuating device between the moulds for operating both sets of plates.
7. A moulding machine comprising two moulds, partition plates movable into and out of the moulds, and a single actuating device for operating both sets of partition plates, constructed to withdraw one set of partition plates from its mould while inserting the other set of plates in its mould.
8. A moulding machine comprising a mould consisting of a mould bed and enclosing side and top walls, one of the side walls being slotted and partition plates slidable through the slots of sald slotted wall, across the mould bed towards the opposite side wall, said partition plates having sliding. interlocking engagement with said top wall and mould bed in a manner to prevent lateral displacement of the plates.
9. A moulding machine comprising a mould embracing a mould bed, side walls, one of which is slotted and the other of which is hinged to swing downwardly and outwardly, partition plates sliding through the slots of the slotted wall. across the bed and towards and from the hinged wall. swinging locking bars adapted to engage the hinged wall to lock the latter in its closed position, and a hinged top wall.

No. 101,453. Mould Ior Brichs. Moule pour briques.
The South Bend Machine Mig. Co., South Bend, Indiana, assignee of George Brown, Niles, Michigan, U.S.A., 9th October. 1906; 6 years. Filed 13th January, 1906. Receint No. 131.839.
Claim.-1. A moulding machine embracing a mould bed enclosed by side and top walls, and wherein one of the side walls is movably mounted so as to be lowered below the level of the mould bed, and partition plates movable into and out of the mould chamber and co-acting with said side walls and mould bed to form a plurality of mould spaces, the top wall being hinged to said movable wall.
2. A moulding machine embracing a mould bed enclosed by side and top walls, and whereln one of sald side walls is

No. 101,454. Vohicle Enpport. Support de ofhcules.

Berton Herbert Sills, Belleville, and Henry George Ketchum, assignee of a half interest, Ottawa, both in Ontario, Canada, 9th October, 1906; 6 years. Filed 19th May, 1905. Receipt No. 125,343 .
Claim.-1. An improved cushioning device for vehicles comprising two longitudinal members hinged together and extending at right angles to the upward thrust on' the vehicle and resilient means for normally holding said members apart, as and for the purpose specified.
2. An improved cushioning device for vehicles comprising two longitudinal members extending at right angles to the upward thrust on the vehicle, a rule joint connecting the two members, resilient means for normally holding said members in the farthest position apart permitted by the rule joint, as and for the purpose specified.
3. An improved cushioning device for vehicles comprising two hinged members, a plunger slidably held in one member, a compression spring forcing the plunger against the opposing member, and adjustable means for varying the degree of compression of the spring, as and for the purpose specified.
4. An improved cushioning supporting device for vehicles comprising two members, a rule joint connecting the same, a recess in one of the members, a hollow cylindrical socket screwed therein, a plunger slidably held in the socket, and a compression spring forcing said plunger outwardly to contact with the opposing member, as and for the purpose specifed.
5. An improved cushioning device for vehicles comprising two substantlally horizontally extending members, off-sets integral with each, pivoting means connecting the off-sets, means for limiting the tilting movement of the members with regard to each other, a plunger slldably held in one member, a compression spring pressing the same against the opposing member, and adjustable means for varying the degree of compression of the spring, as and for the purpose specified
6. An improved cushioning supporting device for vehicles comprising two sdbstantially horizontally extending members, off-sets integral with eash, a rule joint connecting the off-sets, an internally screw-threaded hollow socket fitting within said recess, a plunger slidably held in the socket, a compression spring abutting the under side of the plunger in the end of the socket and adapted to press the plunger against the opposing member, as and for the purpose specifled.
7. In a bicycle irame an improved resilient member comprising two parts, off-sets integral with each, a rule joint connecting the off-sets, a plunger resiliently held in one part and abutting the opposite parts, as and for the purpose specifled.
8. An improved resilient member for a blcycle frame comprising two parts pivoted together and tiltable in relation to each other, and resilient means for normally holding said parts in alignment with each other.

\section*{No. 101,455. Try and Bovel Square.}

Equerre simple et fausse.
Edwin H. Horton and Bennett W. Donaldson, assignee of a half interest, both of Pontiac, Michigan, U.S.A., 9th October, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,621.
Claim.-1. In a combined try and bevel square, the combination of a two-part handle, a plate in the form of a right angle triangle pivoted between the sides of the handle, said plate being adapted to swing from side to side, means for arresting the movement of the plate in either direction, and means for indicating the angle at which the plate may be set.
2. In a device for the purpose set forth, the combination of the angular plate, a two-part handle between the sides of

which the plate is pivoted, a tightening screw seated in the handle to lock the plate against movement, and means for indicating the angle at which the plate is set.
3. In a device for the purpose set forth, the combination of the triangular plate, a two-part handle embracing the opposite sides of the plate and pivoted thereto, said plate having \(a\) central opening one of whose margins is curved in the arc of a circle, the parts of the handle being united through said opening, and means for arresting the movement of the plate between the sides of the handle so as to cause its right angle sides to stand parallel with the sides of said handle.
4. In a device for the purpose set forth, the combination of a triangular plate, a two-part handle embracing the plate and plvoted thereto at the corner between the right angle sides thereof, said plate having a central opening, means jolning the opposite sides of the handle through said opening and means mounted on the handle engaging the margins of the opening through the plate to limit the movement thereof through the handle in opposite directions.
5. In a try and bevel square, the combination of the triangular plate having an opening therethrough, the two-part handle embracing the plate, said plate having an annular opening at the corner thereof, a rotatable washer in said opening a pivot passing through the sides of the handle and through said washer, and means for joining the outer ends of the sides of the handies through the opening in said plate to tie them together and allow the plate or blade to swing therethrough upon said pivot.
6. In a device for the purpose set forth the combination with the square, of a slotted handle embracing the opposite sides of the square and pivoted thereto to have movement only on said pivot, a set-screw in one side of the handle, a disc set into the inner face of that side of the handle carrying the set-screw lying upon the face of the square and engaged by said screw, whereby by tightening the screw the handle and the square may be locked together.
7. In a device for the purpose set forth the combination of the triangular plate having a central opening, the two-part handle pivoted thereto to embrace the opposite sides thereof and through which the plate is adapted to swing in the arc of a circle, and means at the outer end of the handle for locking the handle and plate together to prevent independent movement of sald parts.

\section*{No. 101,456. Pump. Pompe.}

James Alston, South Melbourne, Victoria, asslgnee of Charles Cannell, St. Mary's, Tasmania, both in Australla, 9th October, 1906; 6 Jears. Flled 26th March, 1906. Recelpt No. 134,260.
Claim.-1. Improved gear for increasing the stroke of pumps comprising a pinion mounted on the power shaft and geared with a rack bar provided with an endless series of teeth attached to a guide casing having seml-circular ends and detachably connected to the pump rod.
2. In a pump gearing the combination with the operating pinion on the power shaft, and a guide casing detachably connected to the pump rod and containing a rack bar provided with an endless series of teeth, of one or more friction rollers mounted on elther or both sides of the pinion between the rack bar and the sides of the casing, substantially as set forth.
2. In a pump gearing the combination with the operating pinion on the power shaft, and a guide casing detachably containing a rack bar provided with an endless serles of teeth, of vertical friction rollers mounted on elther side of the pinion between the rack bar and the sides of the casing
and projecting on elther side of the teeth of sald bar, substantially as eet forth.

4. In pump gearing the combination with the operating pinion on the power shaft, and a guide casing detachably connected to the pump rod and containing a rack bar provided with an endless series of teeth, and having vertical guides formed thereon, of one or more vertical friction rollers mounted on either cir both sides of the pinion between the rack bar and the sides of the casing and on either side of the teeth of caid bar, and horizontal rollers mounted on the gear frame and situated between the face of the casing and the vertical guides formed thereon, substantially as set forth.
6. In pump gearing the combination with the operating pinion on the power shaft, and a guide casing detachably connected to the pump rod and containiag a rack bar provided with an endless series of teeth, of means forming a part of the pump rod connections to allow of a emall vertical and horizontal movement independent of the pump itself, substantially as set forth.
6. In gear for increasing the stroke of pumps, a pinion mounted on the power shaft gearing with a rack bar attached to a casing having semi-circular ends and detachably connected to the pump rod and also provided with means to allow of a small vertical and horizontal movement independent of the pump itself, said rack bar having an endless series of teeth down the centers of its sides and ends, roller tracks on either side thereof, one or more vertical iriction rollers on either or both sides of said pinion fitting on either or both sides of the teeth of the bar and between the latter and the sides of said casing, and a pair of horizontal rollers mounted in a bracket on the gear frame and fitting between the face of the casing, and vertical guldes attached thereto, substantially as set forth and as lllustrated.

No. 101,457. Rotary Bngine. Machine rotatotre.

James Frederick Reilly, Seattle, Washington, U.S.A., and Thomas R. E. McInnes, assignee of a haif interest, Vancouver, British Columbia. Canada, 9th October. 1906; 6 years. Filed 16th May, 1906. Rceipt No. 135,978 .
Claim.-1. An improved internal rotary engine comprising two concentric rotors, abutments on each having sliding contact with the opposite rotor, means for intermittently causing an expansive fluid to act against the abutment of each rotor, a shaft, means for communicating the motion of the rotors to the shaft in one direction and means for preventing the backward rotation to each rotor, as and for the purpose specifled.
2. An improved internal combustion rotary engine comprising two concentric rotors, means for intermittently rotating the same, a shaft, a cylinderical block thereon, a plurality
of ratchet teeth on the periphery of the block, two series of rollers thereon and connecting means extending between each series of rollers and each of the rotors, as and for the purpose specifled.
3. An improved internal combustion rotary engine comprising two concentric rotors, means for intermittently rotating the same, a shaft, a cylindrical block on the shaft, a plurality of ratchet teeth on the periphery thereof, two series of rollers located in the ratchet teeth, a plate supporting the same, cylindrical members bearing respectively against each of the series of rollers and connecting means extending between the cylindrical members and each of the rotors, as and for the purpose specified.
4. An improved internal combustion rotary engine comprising two concentric rotors, abutments on each having sliding contact with the opposite rotor, means for preventing the backward motion of each rator, means for introducing an explosive mixture between the abutments of opposite rotors, means for exploding the same at predetermined times, a shaft and means for communicating the motion of the rotors explosions, as and for the purpose specified.
5. An improved internal combustion rotary engine comprising two concentric rotors \({ }^{3}\), abubments on each having sliding contact with the opposite rotor. means for preventing the backward rotation of each rotor, means for introducing an explosive mixture between the abutments of opposite rotors, means for exploding the same at predetermined times, a shaft, mêans for communicating the motion of the rotors to the shaft and means operated by the rotation of the rotors for exhausting the products of the explosions as and for the purpose specified.
6. An improved internal combustion rotary engine comprising two concentric intermittently fotating rotors, abutments on each rotor having sliding contact with the opposite rotor, means for introducing an explosive mixture between two abutments of opposite rotors, means for exploding said mixture after compression by rotation of the moving rotor, a shaft, and means for communicating the rotation of the rotors to the shaft, as and for the purpose specified.
7. An improved internal combustion rotary engine comprising two concentric intermittently rotating rotors, two abutments on the inner rotor baving sliding contact with the inner side of the outer rotor, two abutments on the outer rotor having sliding contact with the periphery of the inner rotor, means for introducing an explosive mixture between the two abutments of the opposite rotor when a predetermined distance apart, means for exploding said mixture when compressed, means operated by the rotation of the rotor for exhausting the waste products of the explosion, a shaft, and means for communicating the rotation of the rotors to the shaft, as and for the purpose specified.
8. An improved internal combustion rotary engine comprising two concentric intermittently rotating rotors, a plurality of abutments on the inner rotor having sliding conlact with the inner side of the outer rotor, a plurality of abutments on the outer rotor having sliding contact with the periphery of the inner rotor, means for successfully introducing an explosive charge between each pair of abutments on opposite rotors, means for exploding said charge when compressed, a suitably mounted shaft, and means for communicating the rotation of the rotors to the shaft, as and for the purpose specified.
9. An improved internal combustion rotary engine comprising two concentric intermittently rotating rotors, a plurality of abutments on the inner rotor having sliding contact with the inner side of the outer rotor, a plurality of abutments on the outer rotor having sliding contact with the periphery of the inner rotor, means for successfully introducing an explosive mixture between each pair of abutments of opposite rotors, means for exploding the same when compressed, and means operated by the rotor moving after each explosion for exhausting the gases of the preceding explosion, a shaft, and means for communicating the motion of the rotors to the shaft, as and for the purpose specified.
10. In an internal combustion rotary engine in combinaLion a fixed core, a rotor supported thereon, a plurality of outwardly protruding abutments thereon arranged symmetrically about the periphery, a second rotor concentric with the first, a plurality of abutments thereon symmetrically disposed around the inner surface having sliding contact with the first rotor, means for successfully introducing an explosive mixture between the abutments of opposite rotors when a predetermined distance apart, means for preventing the rotation of the rotors except in one direction, a shaft, and means for communicating the rotation of the rotors to the shaft, as and for the purpose specified.
11. In an internal combustion rotary engine in combination a fixed cylindrical core, a rotor supported thereon, a plurality of outwardly protruding abutments thereon, symmetrically arranged around the periphery, a second rotor concentric with the first, a plurality of abutments on the

Inner side thereof symmetrically arranged around the same having sliding contact with the periphery of the first rotor, an admission port in the core for the explosive fluid, a valve controlling the same, an ignition chamber in the periphery of the fixed core, a plurality of ports in the irst rotor adapted to afford communication between the admission port, the ignition chamber and the space between the rotors, an exhaust port in the periphery of the fixed core, a shaft and means for communicating the rotation of the rotors to the shaft as and for the purpose specified.

No. 101,458. Bngino. Machine d vapour.

Theodore Shade and John Wilson Griffin, assignee of a half Interest, both of Greensburg, Pennsylvania, U.S.A., 9th October, 1906; 6 years. Filed 3rd March, 1906. Receipt No. 133,519
Claim.-1. In an engine the combination with the cylinder and ports therethrough of a cylindrical valve seat in the cylinder traversing the port, a cylindrical valve fitting in said valve seat, a transverse port therethrough adapted when the valve is moved to a certain position to permit the passage of steam through the valve and port and means operated by the rotation of the engine for moving the valve into position to permit the passage of steam through the port, as and for the purpose specified.
2. In a reciprocating engine the combination with the cylinder and steam ports located at each end thereof extending therethrough, of a plurality of longitudinally extending cylindrical valve seats formed in the cylinder transversing the steam ports at each end, cylindrical valves therein and transzerse ports through said valves opposite the steam ports permitting the free passage of steam through the ports and valves when the Latter are moved into predetermined positions, as and for the purpose specifled.
3. In a reciprocating engine the combination with the cylinder and steam and exhaust ports at each end thereof, of two longitudinally extending cylindrical valve seats formed in the cylinder transversing respectively the steam and exhaust ports, two cylindrical valves located in sald valve seats, ports therein opposite the steam and exhaust ports adapted to permit the passage of the steam through the ports when the valves are in predetermined positions and means operated by the rotation of the engine for simultaneously oscillating both valves, as and for the purpose specifed.
4. In a reciprocating engine the combination with the cylinder and steam and exhaust ports at each end thereof of two longitudinally extending cylindrical valve seats formed in the cylinder transversing respectively the steam and exhaust ports, two cylindrical valves located in sald valve seats, ports therein opposite the steam and exhaust ports adapted to permit the passage of the stean through the ports when the valves are in predetermined positions, radial pins secured to said valves extending through slots in the cylinder, a transversely slidable plate connected to said pins and means operated by the rotation of the engine for reciprocating said plate, as and for the purpose specified.

10-15
5. In an engine the combination with the cylinder and steam and exhaust ports at each end thereof, of a four-way throttle valve connected respectively to the steam and exhaust ports and to the supply of steam and the exhaust of the engine and a lever for operating sald valve, as and for the purpose specified.

No. 101,459. Window Frame and Sash. Cadre ct chissis de fenstre.

Ester Hodgson. Ottawa, Ontario, Canada, 9th October, 1906; 6 years. Filed 4th July, 1906. Recelpt No. 137,519.
Claim.-1. In a window, an upper sash of less width than the lower sash, a guideway in the frame for sald upper sash, . parting strip of the length of the upper sash less the width of the lower bar of sald upper sash, and a lower bar for said upper sash being oi a thickness to correspond to the width or space occupied by the guideway and the parting strip, substantially as shown and described.
2. In a window, a lower sash of greater widih than the upper sash, a guldeway in the iname for sald lower sash, the outside rail of said guldeway consisting partly of the side of the upper sash guideway, and partly of the parting strip and a sectional stop for the inner guide, as shown and described.
3. In a window, a frame, sash guideways in said frame adapted to receive sashes of unequal width and a parting strip for the upper sash only, said strip being of less length than said upper sash.
4. In a window, an upper sash of less width than the lower sash, a guideway in the frame for sald upper sash, a parting strip of the length of the upper sash legs the width of the lower bar of sald upper sash. a lower bar for said uppar sasb nf a chlckness to correspond to the width or space occupled by the guideway and parting strip, a lower sash of greater width than the upper sash, a guideway in the frame for sald lower sash, the outside rall of said guideway consisting partiy of the side of the upper sash guideway and partly of the parting strip and a sectional stop for the inner guide, as shown and described.

\section*{No. 101,460. Elagtic Flaid Truphimp.}

\section*{Turbine d fuide ciastique.}

The Canadian General Electric Company, Toronto, Ontario,
Canada, assignee of Richard H. Rice, Swampscott, Massachusetts, U.S.A., 9th October, 1906; 6 years. Filed 2nd May, 1906. Recelpt No. 135,464.
Claim.-1. In an elastic fluid turblne of the multi-stage type, the combination of a member containing an exhaust chamber, a ring having opposed flanges belted thereto, a fecond flanged ring at the opposite end of the turbine, an intermediate casing section between said rinss, a diaphragm Cormed integral with the section, shoulders between the inge and the section, and a plurailty of longitudinal bolts sltuated outside of the casing section which. pass through the opposed flanges on the range for securing the rings and easing section together.
2. In an elastlc fuld turbine, the combination of a casIng made up of sections, the plane of division being at right

angles to the axis, a diaphragm for dividing the casing into Wheel compartments, wheels for the compartments having cight rows of buckets for extracting the energy of the motive fluid by successive fractions, Intermediate buchets beiween the rows of buckets for reversing the direotion of fow of the mative fiuid, and a support for the intermediate buckets carrled by the diaphragm on the exhaust side of the wheel so that they can be aligned with the wheel buckets before the enclosing casing is mounted in place.
3. In a multi-stage turbine, the combination of a casing comprising a plurality of sections arranged to be mounted in place one after the other, the plane of division being at right angles to the wheel shaft, wheels for the sections, rows of buckets on the wheels for abstracting the energy of the motive fluld by successive fractions, intermediate buckets for reversing the direction of flow of the motive fluld between wheel buckets, diaphragms supported by the casing sections for supporting the wheels and forming stages of expansiop, devices discharging motive fluld to the buckets, and supports for the intermediate buckets of each stage that are supported by the dlaphragms on the lower pressure side of the wheels so that they can be successively aligped and the turbine assembled by alternately mounting the wheels and casing sections in place.
4. In a turbine, the combination of a casing arranged in sections, a diaphragm between sections, a wheel having rows of buckets for abstracting the energy of the motive guld by successive iractions, intermediate buckets between the rows of the wheel buckets for reversing the direction of the mptive fiuld, and a support for the intermediate buckets which is mounted on a diaphragm and extends longitudinally of the turbine axis to permit alignment of the intermediate and wheel buckets before one of the casing sections is mounted in place.
5. In a turbine, the combination of a casing. arranged in sections, a diaphragm between sections, a wheel having rows of buckets for abstracting the energy of, the motive fluld by successive.iractions, intermediate buckets between the rows of wheel buckets for reversing the direction of the mative fluld, a blank wall located between the wheel bucketa in the space not occupied by. the intermediate buckets to reduce rotation losses and a support common to the walis and the intermediates which is mpunted on.a diaphragmiand extonds longitudinally of the turbine axis to permit alignment of the buckets and walls before one of the casing sections is maunted in place.
6. In a multi-stage turbine, the, combluation of a caging made in sections, a diaphragm ca-operating with tha sections to form wheel chambers, wheela for the compartments having rows of buckets, Intermediate buckets between the rows of wheel bucketa, a blank. wall, located between the wheel buckets in, the space not occupied.hy. the intermadiate tuckets to reduce rotatiop, losses, mesns for supporting the
intermediate buckets and blank wall carried by a diaphragm, the said means being provided with passages communicating with the wheel chamber through which motive fluid leaking from the clearances is free to pass to a wheel chamber.
7. In a multi-stage turbine, the combination of a casing made in sections, a diaphragm co-operating with the sections to form wheel chambers, wheels for the compartments having rows of buckets, intermediate buckets between the rows of wheel buckets, a blank wall located between the wheel buckets in the space not occupied by the intermediate buckets to reduce rotation losses, a ring mounted on the diaphragm, projections on the ring to which the intermediate buckets and the wall are secured, and passages between the frojections on the ring to which the intermediate buckets and the wall are secured and passing between the projections communicating with a wheel chamber to discharge leakage from the clearances thereto.
8. In a multi-stage turbine, the combination of a casing made in sections, a diaphragm co-operating with the sections to form wheel chambers, wheels for the compartments having rows of buckets, intermediate buckets between the rows of wheel buckets, a blank wall located between the wheel buckets in the space not occupied by the intermediate buckets to reduce rotation losses, a nozzle having passages arranged to discharge motive fluid against a portion only of the wheel buckets, a blank wall forming a continuation of the nozzle and covering the idle wheel buckets and situated between the wheel buckets in line with the nozzle, a blank wall situated betwen the rows of idle wheel buckets and in line with the first-mentioned wall to further decrease the rotation losses, and a means for supporting the intermediate buckets and their adjacent blank wall from a diaphragm on the low pressure side of the wheel to permit alignment of the buckets before a casing section is mounted in place.
9. In an elastic fluid turbine, the combination of a wheel, rows of buckets on the wheel, a casing for the wheel comprising a surrounding wall, a wall on the high pressure side, and a wall on the low pressure side o fthe wheel, a nozzle located on the high pressure side o fthe wheel, intermediate buekets between the rows of wheel buckets, and a support for the intermediate buckets which is carried by the wall on the low pressure side, substantially as and for the purpose described.
10. In an elastic fluid turbine, the combination of a wheel, rows of buckets on the wheels, a casing for the wheel comprising a surrounding wall, a wall on the high pressure side, and a wall on the low pressure side of the wheel, a nozzle located on the high pressure side of the wheel, intermediate buckets between the rows of wheel buckets, a groove formed in the wall on the low pressure side of the wheel, support mounted in the groove, a groove in the support to receive the base portion of the intermediate buckets, and means for attaching the buckets to the support.
11. In a multi-stage turbine, the combination of a plurality of casing sections, each comprising a cylindrical portion and a diaphragm, the said sections being arranged to fit loosely on the other, retaining bolts that extend longitudinally of the casing for clamping them together, fluid discharging devices for the sections and a projection on each of the sections which engage a bolt to insure the proper angular alignment of the discharge devices when the sections are assembled.

No. 101,461. Loose Leaf Binder.
Reliure à feuilles volantes.

The Business Systems, Toronto, Ontario, Canada, assignee of Arthur A. Tate, Winnipeg, Manitoba, Ganada, 9th October, 1906. 6 years. Filed 19th June, 1906. Receipt No. 137,049. Claim.-1. A binder for loose leaves comprising a bottom board, posts projecting from the inner surface of the bottom
board, a top board having apertures therein to receive the posts, lock cases connected to the outer surface of the top board and enclosing the apertures, locking bars contained between the sldes of the lock cases having their outer ends to be depressed within the lock cases and their inner ends to engage the posts, fulorum pins inserted through the sides of the lock cases and through the locking bars between the inner and outer ends of the latter, and springs mounted on the fulcrum pins to hold the inner ends of the locking bars normally in engagement with the posts.
2. A binder for loose leaves comprising a bottom board, posts projecting from the inner surface of the bottom board, a top board having apertures therein to receive the posts, lock cases connected to the outer surface of the top board and enclosing the apertures, locking bars contained between the sides of the lock cases having their outer ends to be depressed within the lock cases and their inner ends to engage the posts, side fianges depending from the locking bars, fulcrum pins inserted through the sides of the lock cases and through the side flanges of the locking bars between the inner and outer ends of the latter, and springs mounted upon the fulcrum pins to maintain the locking bars normally in engagement with the posts.
3. A binder for loose leaves comprising a bottom board, posts projecting from the inner surfaces of the bottom board a top board having apertures therein to receive the posts, a plate secured to the outer surface of the top board having apertures therein aligned with the apertures in the top board, lock cases connected to the plate, locking bars contained between the sides of the lock cases having their outer ends to be depressed within the lock cases and their inner ends to engage the posts, flanges extending downwardly from the locking bars, fulcrum pins inserted through the sides of the lock cases and flanges between the inner and the outer ends of the locking bears, and springs mounted on the fulcrum pin to engage the bottom of the lock cases and the under surface of the locking bars adjacent to the outer ends thereof.
No. 101,468. Gromid Anchor. Anere de terre.

Oharles McLean Stinson, Montreal, Quebec, Canada, 9th October, 1906; 6 years. Filed 25th August, 1906. Receipt No. 138,969.
Claim.-1. A ground anchor comprising a foot member provided with inclined end portions extending in opposite directions, a pair of integral lugs mounted on the upper face of said anchor, an integral stop bar uniting said lugs, an integral strengthening rod in the lower face of said ancho, an integral counterpoise on one end of the upper face of said anchor, and a guy rod pivotally attached to the upper face of the anchor and nearer to one end than the other.
2. A ground anchor comprising a foot member having one end curved upwardly and the opposite end downwardly, a pair of integral lugs mounted on the upper face of sald anchor, an integral etop bar uniting said lugs, a strengthening rib on the lower face of said foot member, a counterpoise integrally mounted on one end of the upper face of said foot member, and a guy rod pivotally attached to said foot member slightly nearer to one end than the other.

Messrs. Kutnow Brothers, assignee of Timothy Bernard Powers, both of New York City, New York, U.S.A., 9th October, 1906; 6 years. Filed 22nd August, 1906. Receipt No. 138,926.
Olaim.-1. A moving display sign comprising a base board, a hollow standard centrally mounted thereon, an extensible display rack mounted on sald standard, one roller on each end of the display rack, two guides each secured under an angle of \(45^{\circ}\) above the hollow standard, and an endless tape provided with intelligible characters passing from the right
to the left over the display rack, Its end rollers and the central gutdes down and up within the hollow standard, and a tape actuating motor mechanism.

2. A moving display sign comprising a base board, a hollow standard centrally mounted thereon, an extensible harizontal display rack mounted on said standard one roller on each end of the display rack, two guldes under an angle of \(45^{\circ}\) above the hollow standard in reverse position to each other, an ondless tape provided with intelligible characters passing from the right to the left over the display rack, its ond rollers and the central guides down and up within the hollow standard, a tape actuating motor mechanism and means for transmitting the motion of the motor to the tape.
3. A moving display sign comprising a base board, a hollow standard centrally mounted thereon, an extensible horizontal display rack mounted on said standard, one vertical roller on each end of the display rack, two guides each secured under au angle of \(45^{\circ}\) above the hollow standard in reverse position to each other, two rollers mounted in different planes below said standard, an endless tape provided with intelligible characters passing from the right to the left over the front surface of the display rack. Its left-hand vertical end roller. one central gulde down through the standard, between the two rollers below said standard, up through the standard over a second central guide and around the right-hand vertical roller, and a tape actuating motor driving the rollers below the standard.
4. In a moving display sign a hollow central standard and an angular ring at its top end, an extensible horizontal disclay rack mounted on said standard and ring, supporting scrolls secured to the standard, vertical rollers one on each end of the display rack, and an endless tape passing from the right to the left over the front surface of the display rack. Its rear surface and down and up within the hollow standard, and means for actuating said endless tape.
5. In a moving display sign, a base board, a hollow standard mounted centrally thereon and having a strengthening angular ring at its botiom end and a like ring at the top end. an extensible display rack mounted on said standard and top ring, supporting scrolls secured to the standard, two Ruides each secured under an angle of \(45^{\circ}\) above the standard in reverse position to each other, an endless tape with Intelligible characters, and means for passing said tape continually over the display rack.
6. In a moving display sign an extensible display rack, one vertical roller on each end of same, two central guides under an angle of \(45^{\circ}\) in the rear of the said display rack in reverse position to each other, an endless tape, passing from the right to the left over the front surface of the display rack and successively over the central guldes, and means for actuating said tapr.

No. 101,464. Vohicle Wheel. Roue de vehicules.
Thomas Appleton, New York City, New York, U.S.A., 9th October. 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135.485.
Chatm.-1. In vehicle wheels. a rim, a soltd rubber tire sccured to the rim, having transverse slots therein extend-
ing through from side to side, metal braces at the sides of the tire, and pins secured to the sald braces and passed

through the said slots, normally engaging their outer end walls.
2. In a vehicle wheel, a tire of resilient material presenting outwardly diverging cheeks nears the tread thereof, and having transverse slots, brace rods abutting sald cheeks, and transverse bolts lying in said slots and connecting sadd rings.
3. In vehicle wheels, a rim, a solid rubber tire secured to said rim, said tires having curved side faces adjacent to the rim, straight faces adjacent to the concaved faces and outwardly fiaring faces extending from the outer edges of the stralght faces to the tread of the tire, metal braces located in close engagement with the straight and out wardly fiared side faces of the tire, said tire boing provided with a series of transverse slots extending through from side to side, the outer ends of the slots being adjacent to the outwardly flared side faces of the tire, and pins secured to the said braces, which pins are passed through the slots in the tire, being normally adjacent to the outer end walls of said slots.

No. 101,465. Map Case. Fourreau pour cartes.

Clinton E. Case, Brockville, Indiana, U.S.A., 9th October, 1906; 6 years. Filed 27th August, 1906. Receipt No. 139,009.
Claim.-1. A map case comprising a supporting bracket. a series of map carrying sections having their rear walls engaging sald bracket, each section except the lowermost resting upon and supported by the section immediately below it, and means for securing the lowermost section.
2. A map case comprising a supporting bracket having bevelled edges, a series of map carrying sections provided on their backs with dovetalled recesses, adapted to engage sald bevelled edges, and means for securing the lowermost section.
3. A map case comprising a series of superpased sectlons. each section having its front wall fitting between the end walls of the next section above and its rear wall fitting between the end walls of the next section below.
4. A map case comprising a series of superposed sections, each having its front wall fitting between the end walls of the next section above, the front face of said front wall presenting a convex surface and the inner face of the same presenting a concave groove.
5. A map case comprising a serles of superposed sections, the front wall of each section projecting up betwern the end walls of the next section above and terminating short
of and out of contact with the lower edge of the front wall of said upper section.
6. In a map case, the combination of two sections, one resting on the other, map carrying rollers withln the sections, and supporting rollers within the upper section near the front of the same, the lower section having its front wall projecting up near the lower supporting roller and provided with a concave groove in its inner face.
7. In a map case, the combination of two sections, one superposed on the other, the end walls of the lower section projecting above the lower edge of the back wall of the upper section.

No. 101,466. Gas Manufacture. Fabrication du gaz.

Ellen Gertrude Elworthy, Battlefield Road, St. Albans, England, administratrix of the estate of Herbert Samuel Elworthy; deceased, 9th October, 1906; 6 years. Filed 30th May, 1905. Receipt No. 125,607.
Claim.-1. A process for the manufacture of gas for illuminating, heating or power purposes, said process comprising production of a gas produced by destructive distillation of carbonaceous material, separating therefrom hy-dro-carbons other than methane and afterwards passing the gas over metallic nickel at a suitable temperature to produce methane and water, the methane produced becoming mixed with the residue of the gas.
2. A process for the manufacture of gas for Hluminating. heating or power purposes, said process comprising the production of a gas produced by destructive distillation of carbonaceous material, separating therefrom hydro-carbons other than methane and afterwards passing the gas over metallic nickel in the presence of hydrogen in substantially theoretical proportion for the conversion of oxide of carbon present into methane and water, and at a suitable temperature for such conversion.
3. A process for the manufacture of gas for illuminating, heating or power purposes, sald process comprising the production of a gas produced by destructive distillation of carbonaceous material, separating therefrom hydro-carbons other than methane, mixing therewith a combustible gas rich in oxide of carbon and passing the mixture of gases over metallic ntckel at a suitable temperature for the production of methane and water, the methane produced becoming mixed with the residue of the gas.
4. A process for the manufacture of gas for illuminating. heating or power purposes, said process comprising the production of a gas by destructively distilling carbonaceous material, separating therefrom hydro-carbons other than methane, blending therewith any form of water gas and passing the mixture of gases over metallic nickel at a suitable temperature to convert oxide of carbon and hydrogen present therein into methane and water.
5. A process for the manufacture of gas for llluminating, heating or power purposes, said process comprising the production, by destructively distilling carbonaceous material, of a gas containing carbon monoxide and carbon dioxide,
separating therefrom hydro-carbons other than methane and afterwards passing the gas first over metallic nickel at a suitable temperature to convert the monoxide and a portion of the hydrogen present into methane and water and passing the resulting gas over a further quantity of nickel at a suitable temperature for the conversion of the dioxide and a further quantity of hydrogen, substantially as described.
6. A process for the manufacture of gas for Illuminating. heating or power purnoses, said process comprising the production, by destructively distllling carbonaceous material of a gas containing carbon monoxide and carbon dioxide, separating therefrom hydro-carbons other than methane, and afterwards passing the gas, in presence of hydrogen in substantially theoretical proportion for the conversion into methane and water of the monoxide and dioxide present, first over metallic nickel at a sultable temperature for the conversion of the monoxide and a portion of the hydrogen, and then over a further quantity of nickel at a suitable temperature for the conversion of the dioxide and a further quantlity of hydrogen, substantially as described.
7. A process for the manufacture of gas for illuminating, heating or power purposes, said process comprising the production of a gas by destructively distilling carbonaceous material, separating therefrom hydro-carbons other than methane, mixing therewith a combustible gas rich in oxide of carbon,the resulting mixture containing both carbon monoxide and carbon dioxide. and passing sald mixture first over metallic nickel at a sultable temperature for the conversion into methane and water of one of said oxides and a portion of the hydrogen present. and then over a further quantlty of nickel at a sultable temperature for the conversion of the other oxlde and a further quantity of the hydrogen, substantlally as described.
8. A process for the manufacture of gas for illuminating. heating or power purposes, said process comprising the production of a gas by destructively distilling carbonaceous material, separating therefrom hydro-carbons other than methane mixing therewith any form of water gas, the resulting mixture containing carbon monoxide and carbon dioxide, and passing said mixture in presence of hydrogen in substantially theoretical proportion for the conversion of both oxides into methane and water. first over metallic nickel at a suitable temperature to effect the conversion of the monoxide and then over a further quantity of nickel at a suitable temperature for the conversion of the dioxide, substantially as described:
9. A process for the manufacture of gas for illuminating, heating or power purposes. sald process comprising the production br destructively distilling carbonaceous material, of a gas containing carbon monoxide and carbon doxide. separating therefrom one of said oxides and hydro-carbons other than methave, and afterwards passing the gas over metallic nickel at a suitable temperature to convert the other oxide and hydrogen present into methane and water, substantially as described.
10. A process for the manufacture of gas for fllumirating; heating or power purposes, sald process comprising the production of a gas by destructively distiling carbonaceous material. mixing with said, gas a combustible gas rich in oxide o? carbon, as water gas, the resulting mixture containing carbon monoxide and carbon dioxide. separating therefrom one of said oxides and hydro-carbons other than methane, and afterwards passing the gas in presence of hydrogen in substantially theoretical proportion for the conversion into methane and water of the other oxide, over metallic nickel at a suitable temperature for such conversion, substantlally as described.
11. A process for the manufacture of gas for illurainating, heating or power purposes, said process comprising the production of a gas by destructively distiling carbonaceous material, said gas containing carbon monoxide and carbon dioxide, separating therefrom carbon dioxide and hydro-carbons other than methane and afterwards pasing che gas over metallic nickel at a suitable temperature to convert the other cxide and hydrogen present into methane and water, substantially as described.
12. In the manufacture of gas for llluminating. heating or power purposes by the passage in contact with hot nickel of a gas obtained by destructively distilling carbonaceous material, the process which consists in collecting the gas evolved at earlier and later stages of the distiliation separately, and subjecting the later portion to the action of the nickel for the production of methane. the methane formed mixing with the residue of the gas, substantlally as described.
13. In the manufacture of gas for illuminating, heating or power purposes by the passage in contact with hot nickel of a gas obtained by destructively distilling carbonaceous material, the process which consists in collecting the gas evolved at earlier and later stages of the distillation separately, mixing the later portion of the distillate with a combustible gas rich in oxide of carbon, and subjecting the resulting.gas to the action of the nickel for the production of
methane, the methane formed mixture with the residue of the gas, substantially as described.
14. A process for the manufacture of gas for illuminating, heating or other power purposes, said process comprising the production of a comblned coal and water gas, separating therefrom hydro-carbons other than methane, and afterwards passing the gas over metallic nickel at a sultable temperature to convert hydrogen and oxide of carbon into methane and water, substantially as described.
15. A process of the manufacture of gas for illuminating, heating or power purposes, sald process comprising the production of a combined coal and water gas, separating therefrom hydro-carbons other than methane, and afterwards passing the gas, in presence of hydrogen in substantially theoretical proportion for the conversion of oxide of carbon contained therein, over metallic nickel at a suitable temperautre to effect such conversion, substantially as described.
16. A process for the manufacture of gas for illuminating, heating or power purposes, said process comprising the production of a combined coal and water gas, containing carbon monoxide and carbon dioxide. separating therefrom hydro-carbons other than methane, and afterwards pasaing the gas in pressure of hydrogen in substantially theoretical proportion for the conversion of said oxides into methane and water, first over metallic nickel at a suitable temperature for the conversion of the monoxide and then over a further quantity of nickel at a suitable temperature for the conversion of the dioxide, substantially as described.
17. A process for the manufacture of gas for illuminating, heating or power purposes, said process comprising the produotion of a combined coal and water gas containing carbon monoxide and carbon dioxide, separating therefrom one of said oxides and hydro-carbons other than methane and afterwards passing the gas over metallic nickel at a suitable temperature to convert the other oxide and hydrogen present into methane and water. substantially as described.
18. In the manufacture of gas for illuminating, heating or power purposes by the passage in contact with hot nickel of a gas obtained by destructively distilling carbonaceous material, the process which consists in producing water gas, superheating the same and passing such superheated water gas through a chamber charged with gas coal. Whereby the coal is subjected to destructive distillation and the coal gas formed mixes with the water gas to form a combined coal and water gas, substantially as described.
19. In the manufacture of gas for illuminating, heating or power purposes by the passare in contact with hot nickel of a gas obtained by destructively distilling carbonaceous material, the sub-process which comprises passing the gas before it is subjected to the nickel, through a solvent of its hydro-carbons other than methane, as hydro-carbon oll, whereby sald hydro-carbons are removed, substantially as described.
20. In the manufacture of gas for illuminating, heating or pewer purposes, by the passage in contact with hot nickel of a gas obtained by destructively distilling carbonaceous material, the sub-process which comprises passing the gas, before it is subjected to the nickel, through a solvent of its hydro-carbons other than methane, as hydro-carbon oll, whereby said hydro-carbons are removed, and enriching the gas after subjection to the nickel, by restoration of the extracted hydro-carbons, substantialigy as described.
21. An apparatus for the manufacture of gas for illuminating, heating or power purposes, comprising in combination, (a)a plant for the destructive distillation of carbonaceous material, (b) scrubing apparatus for removing hydro-carbons other than methane of the gas produced in said distllation plant, (c) a conversion chamber charged with nickle in divided form and (d) suitable connections between sald plant., scrubing aparatus and converston chamber, and means for regulating the operation of sald plant, scrubbing aparatus and conversion chamber.
22. An apparatus for the manufacture of gas for illuminating, heating or power purposes comprising in combination (a) a coal gas plant, (b) scrubbing apparatus for removing hydro-carbons other than methane of the coal gas. (c) a conversion chamber charged with nickel in divided form and (d) uuitable connections between said plant scrubbing apparatus and conversion chamber, and means for regulating the operation of said plant, scrubbing apparatus and conversion chamber.
23. An apparatus for the manufacture of gas for flluminating, heating or power purposes comprising in combination. (a) plant for the destructive distillation of carbonaceous material, (b) scrubbing apparatus for removing hyrdo-carbons other than methase of the gas produced in said distilation plant, (c) plant for the production of a combustible gas rich in oxide carbon, (d) a conversion chamber for combining said gases in contact with nickel and (c) suitable connections between said plants, scrubbing apparatus and conversion chamber, and means for regulating the operation of eaid plant, scrubbing apparatus and conversion ohamber.
24. An apparatus for the manufacture of gas for Illuminating. heating or power purposes comprising in combination, (a) a coal gas plant, (b) scrubbing apparatus for removing hydro-carbons other than methane of the coal gas, ( \((\) ) a water gas plant, ( \(d\) ) a conversion chamber for combining said gas in contact with nickel and (e) suitable connections betwen said plant. scrubbing apparatus and conversion chamber, and means for regulating the operation of sald plants. scrubbing apparatus and convermion chamber.
25. An apparatus for the manufacture of gas for fllumiaaing, heating or power purposes comprising in combination (a) plant for the destructive distillation of carbonaceous material, (b) scrubbing apparatus for removing hydro-carbons other than methane, of the gas produced in sald distillation plant. (c) a conversion chamber for combining carbon mon-oxide of said gas with hydrogen in contact with nickel, (d) a second conversion chamber for combining carbon dioxide of said gas with hydrogen in contact with nickel and (e) suitable connections and means for regulating the operation of said parts.
26. An apparatus for the manufacture of gas for Illuminating, heating or power purposes comprising in combination (a) plant for the destructive distillation of carbonaceous material. (b) scrubbing apparatus for removing hydro-carhnns other than methane of the gas produced in sald distillation plant. (c) plant for the production of a gas rich in nxide of carbon, as water gas, (d) means for mixing said gases, (e) conversion chamber for combining carbon monoxide of said gases wih hydrogen in contact with nickel, ( \(f\) ) a second conversion chamber for combining carbon diozide of said cases with hydrogen in contact with nickel and (6) suitable connections, and means for regulating the operation of said parts.
27. In apparatus for the manufacture of gas for illuminating. heating or power purposes by the passage in contact with hot nickel of a bas obtained by destructively distilling carbonaceous material, a combined coal and water gas producer comprising in combination (a) a water gas producer, (b) a superheater for said water gas, (c) a coal gas producer and (d) suitable means for connecting said producers and superheater for passing the water gas through the superheater and thence through the coal gas producer to effect the destructive distillation of the material in said coal gas producer and form the combined coal and water gas.
28. In apparatus for the manufacture of gas for illumfating, heating or power purposes, by the passage in contact With hot nickel of a gas obtained by destructively distilling carbonaceous material, a combined coal and water gas producer comprising three furnaces each adapted to be worked in rotation as a water gas producer. water gas superheater and coal gas producer respectively, in combination with passages between said furnaces and valves in sald passages whereby the water gas producd in the furnace serving as the water gas producer can be ofrected through the furnace serving as the superheater and thence through that serving as the coal gas producer, substantally as descirbed.
29. In apparatus for the manafacture of gas for thtumanting, heating or power purposes by the passage in coataet with hot nickel of a gas obtained by destructively alstilfing carbonaceous material, a conversion chamber charged with metallic nickel and a heater for the gas to be converted, aaid heater being arranged to deliver satd gas fato sald conversion chamber in combination with a by-pass aad vaives whereby any desired quantity of the gas to be converted can be passed direct to said conversion chamber without passing be passed direct to said conversion chamber w
through the heater. for the purpose speclied.
30. In apparatus for the manutacture of gas for thanifrating, heating or power purposes, by the passage to contact with hot nickel of gas obtained by destructively distilling carbonaceous materiai, a conversion chamber comprising a series of pipes for containing nioker in divided form, said pipes each communicating at one end with a common inlet pipe for the gas to be converted and at the other end with a common outlet pipe for the converted gas, whereby the gas to be converted is caused to pass through said pipes in intimate contact with the nickel. 31. In apparatus for the manafacture of gas for flluminating, heating or power purposes, by the passage in con tact with hot nickel of a gas obtained by destructively distiling carbonaceous material, a conversion chamber comprising a structure fitted internally with a series of pipes for containing nickel in divided form, said pipes each communicating at one end with a common infet pipe for the gas to be converted and at the other with a com mon outlet pipe for the converted gas, in combination with a combustion chamber in the base of the sald structur and a series of gas jets in sald combustion chamber. salid conversion chamber being provided with valve controile air and steam inlets and a vaive controlled outlet
products of combustion. substantially as describor inuminating, heating or power purposes by the passage in contact with hot sickel of a gas ontamed by destructively
distilling carbonaceous material, a scrubber for the removal from said gas of hydro-carbons other than methane, said scrubber consisting of a closed chamber provided with inlet and outlet for the gas and fitted in its upper portion with bafles adajted to cause the gas to take a sinuous course therethroush, in combination with means for passing a solvent as hydro-carbon oil through said chamber and a brush adapted to be rotated in the base of sald chamber and to spray said solvent up into the spaces between the said bafles, substantially as described.

\section*{No. 101,467. Gas Mannfacture. Fabrication du gaz.}

Ellen Gertrude Elworthy, Battlefield Road, St. Albans, Eng-
land, administratrix of the estate of Herbert Samuel Elworthy, deceased, 9th October, 1906 ; 6 years. Filed 30th May, 1905. Receipt No. 125,608.
Claim.-1. A process for the manufacture of a gas for lighting, heating or power purposes, comprising the passage of a combustible gas containing oxide of carbon and hydrogen in contact wioh nickel at a suitable temperature for the conversion of said oxide and hydrogen into methane and water, and in the presence of a combustible gas inert to the nickel and conversion products.
2. A process for the manufacture of a gas for lighting, heating or power process comprising the production of a combustible gas containing carbon monoxide, carbon dioxide and hydrogen, removing one of sald oxides and pussing the remaining gas in contact with nickel at a suitable temperature for the conversion of the remaining oxide and hydrogen into methane and water in the presence of a combustible gas inert to the nickel and conversion products.
3. A process for the manufacture of a gas for Hghting, heating or power purposes comprising the production of a combustible gas contalining carbon monoxide, carbon dioxide and hydrogen and passing said gas in the presence of a combustible gas inert to the conversion products first over nickel at a suitable temperature for the conversion of the monoside and then over further nickel at a suitable temperature for the conversion of the dioxide.
4. A process for the manufacture of a gas for lighting, heating or power purposes comprising the passage in contact with nickel of a gas containing oxide of carbon in the presence of hydrogen in considerable excess above the propontion theoretically required for the conversion of said oxide of carbon into methane and water and at a suitable temperature for suah conversion.
5. A process for the manufacture of a gas for lighting, heating or power purposes comprising the passage in contact with nlckel of any form of water gas in the presence of hydrogen in considerable excess above the proportion theoretically required for the conversion into methane and water of oxide of carbon present therein and at a suitable temperature for such conversion.
6. A process for the manufacture of a gas for lighting, heating or power purposes comprising the passage in contact with nickel of water consisting practically of carbon manoxide and hydrogen in the presence of hydrogen in considerable excess above the proportion theoretically required for the conversion into methane and water of the monoxide and at a suitable temperature for such conversion.
I. A process for the manufacture of a gas for lighting. heating or power purposes comprising the production of water gas containing monoxide and dioxide of carbon, removing one of said oxides and passing the remaining gas in contact with nickel in the presence of hydrogen in considerable excess at a suitable temperature for the production of methane.
8. A process for the manufacture of a gas for lighting, heating or power purposes comprising the production of water gas containing monoxide and dioxide of carbon, and passing said gas in presence of hydrogen in considerable excess above the theoretically necessary for the conversion of said oxides into methane and water, first over nickel at a suitable temperature for the conversion of the monoxide and then over further nickel at a suitable temperature for the conversion of the dioxide.
9. A process for the manufacture of a gas for lighting, heating or power purposes comprising the passage in contact with nickel of any form of water gas in the presence of added methane and at a suitable temperature for the conversion of oxide of carbon and hydrogen present in the water gas into methane and water.
10. A process for the manufacture of a gas for lighting, heating or power purposes comprising the passage in contact with nickel of any form of coal gas in the presence of hydrogen in considerable excess above the proportion theoretically required for the conversion into methane and water of oxide of carbon present in the coal gas and at a suitable tempersture for such conversion.
11. A process for the mannfacture of a gas for lighting, heating or power purposes comprising the produotion of any
form of coal gas and paesing sait gas in contact with niokel In the presence of added methane and at a suitable temperature for the conversion of oxide of carbon and hydrogen present in said gas into methane and water.
12. A process for the manufacture of a gas for lighting, heating or power purposes comprising the production of any form of coal gas, adding thereto a combustible gas rich in oxide of carbon as water gas, and passing the mixture over nickel in the preeence of hydrogen in considerable excess above the proportion theoretrically required for the conversion into methane and water of oxide of carbon present in the mixture and at a suitable temperature for such conversion.
13. A process for the manufacture of a gas for lightiog, heating or power purposes comprising the production of any form of coal gas containing carbon monoxide and carbon dioxide, removing one of said oxides and passing the remaining gas over nickel in the presence of hydrogen in considerable excess above the proportion theoretically requilred for the conversion into methane and water of the remaining oxide of carbon and at a suitable temperature for such conversion.
14. A process for the manufacture of a gas for lighting. heating or power purposes comprising the production of any form of coal gas containing carbon monoxide and carboll dioxide and passing such gas in the presence of hydrogen in considerable excess above the proportion theoretically required for the conversion of said oxides into methane and water, first over nickel at a sultable temperature for the conversion of the monoxide and then over further ntckel at a suitable temperature for the conversion of the dioxide.
15. A process for the manufacture of a gas for lighting, heating or power purposes, comprising the production of any form of coal gas adding thereto a combustible gas rich in oxide of carbon as water gas, the resulting mixture containing both oxides of carbon, removing one of alid oxides and passing the mixture over nickel in the presence of hydrogen In considerable excess above the proportion theortically required into methane and water of the remaining oxide of carbon and at a sultable temperature for such conversion.
16. A process for the manufacture of a gas for lighting, heating or power purposes, comprising the production of a combined coal and water gas and passing said gas in contact with nickel in the presence of hydrogen in considerable excess above the proportion theoretically required for the conversion into methane and water of oxlde of carbon present in the gas and at a suitable temperature for such conversion.
17. A process for the manufacture of a gas for lighting, heating or power purposes, comprising the production of a combined coal and water gas containing carbon monoxide and carbon dioxide, removing one of said oxides and passing the remaining gas over nickel in the presence of hydrogen in considerable excess above the proportion theoratically required for the conversion of the remaining oxide into methane and water and at a suitable temperature for such conversion.
18. A process for the manufacture of a gas for lighting, heating or power purposes, comprising the production of a combined coal and water gas containing carbon monoxide and oarbon dioxide, and passing such gas in the presence of hydrogen in considerable excess above the proportion theoretically required for the conversion of said oxides into methane and water first over nickel at a suitable temperature for the conversion of the monoxide and then over nickel at a suitable itemperature for the conversion of the dioxide.
19. A process for the manufacture of a gas for lighting, heating or power purposes, comprising the production of a comblned coal and water gas and passing said gas in contact with nickel in the presence of added methane at a suitable temperature for the conversion of oxide of carbon nd hydrogen present into methane and water.
20. A process for the manufacture of gas for illuminating, heating or power purposes, comprising the passage of a combustible gas containing oxide of carbon and hydrogen in contact with nickel at a suitable temperature for the conversion of said oxide of carbon and hydrogen into methane and water and mixing hydrogen with the resulting gas.
21. A process for the manufacture of gas for illuminating, heating or power purposes, comprising the passage of any form of water gas in contact with nickel at a suitable-temperature for the convorsion of oxide of carbon and hydrogen into methane and water and mixing hydrogen with the resulting gas.
22. A process for the manufacture of gas for llluminating, heating or power purposes, comprising the passage of any form of coal gas in contact with nickel at a suitable temperature for the conversion of oxide of carbon and hydrogen into methane and water and mixing hydrogen with tho resulting gas.
23. A process for the manufacture of gas for illaminating, heating or power purposes, comprising the passage of a coms. bined coal and water gas in contact with nickel at a suitabje temperature for the converston of oxfle of carbon and hydro-
gen into methane and water and mixing hydrogen with the resulting gas.
24. A process for the manufacture of a gas for lighting, heating or power purposes, comprising the passage of a combustible gas containing oxide of carbon and hydrogen in contact with nickel at a suitable temperature for the conversion of sald oxide and hydrogen into methane and water, and in the presence of a combustible gas inert to the nickel and conversion products and thereafter carburetting the gas by passing the same through retorts wherein coal is undergoing distillation.
25. A process for the manufacture of a gas for lighting, heating or Dower purposes, comprising the passage of any form of water gas in contact with nickel in the presence of a considerable excess of hydrogen over that theoretically required for the conversion of oxide of carbon present In said gas into methane and water and at a suitable temperature for such conversion, and thereafter carburetting the gas by passing the same through retorts wherein coal is undergoing distillation.
28. As a new article of manufacture, a gas suitable for lighting, heating or power purposes composed substantially entirely of methane and hydrogen and substantially free from carbon monoxide.
27. As a new article of manufacture, a gas suitable for lighting, heating or power purposes composed substantially entirely of methane, hydrogen and a carburetting constituent.

No. 101,468. Acetylene Gas Generator. Générateur de gaz acêtylène.

Jacob Kuljls, Portland, Oregon, U.S.A., 9th October, 1906; 6 years. Filed 31st August, 1904. Recelpt No. 118,128.
Clalm.-1. A carbide receptacle for gravity feed acetylene gas generator consisting of a pan made with concentric inner walls \(n, 0\) and radial partitions \(p, p^{1}\) providing a series of padially tisposed carbide cells \(q\), a central water chamber and intermediate wells \(q^{1}\), the portions of the wall \(n\) between said radial partitions having perforations, the portions of the wall o between sald partitions having a series of perforations arranged in upwardly progressing steps, and that portion of the bottom of the pan enclosed by the wall \(o\) being also perforated, substantially as set forth.
2. A carbide receptacle for gravity feed acetylene gas generator consisting of a pan made with concentric inner walls \(\boldsymbol{n}, \boldsymbol{o}\) and radial partitions \(p, \boldsymbol{p}^{1}\) providing a series of radially disposed carbide cells \(p\), a central water chamber and intermediate walls \(g^{2}\), the portions of the wall \(n\) between said radial partitions having perforations vertically aligned, the portions of the wall o between said radial partitions having a series of perforations arranged in upwardly progressing
steps, and that portion of the bottom of the pan enclosed by the wall o being also perforated and a cover enclosing the space interior of the wall \(n\) and provided with sultable perforations, substantially as set forth.

\section*{No. 101,469. Tablet and Pencil Box. \\ Tablette de boite de crayons.}

Addison B. Corbett, Waldo, Wisconsin, U.S.A., 9th October, 1906;6 years. Filed 2nd August, 1906. Receipt No. 138,362.

Claim.-1. A combined writing tablet support and receptacle, consisting of a base upon which the writing tablet is adapted to be gecured and having a receptacle transversely disposed at one end, a closure to said receptacle, a blotter sheet extending from said closure, and means for morably connecting said closure to said receptacle.
2. A combined writing tablet support and receptacle consisting of a base upon which the writing tablet is adapted tc be secured and having a receptacle transversely disposed at one end, a closure for said receptacle, a blotter sheet extending from said closure, a flexible element secured to the outer face of said closure and extending over the rear wall of the receptacle and beneath the same and extending for a distance beneath sald base.
3. A combined writing tablet support and receptacle, consisting of a base upon which the writing tablet is adapted to be secured and having a receptacle transversely disposed at one end, a closure to sald receptacle, a blotter sheet extending from said closure and foldable thereover, and means for movably connecting said closure to said receptacle.
4. A combined writing tablet support and receptacle consisting of a base upon which the writing tablet is adapted to bc secured and having a receptacle transversely disposed at one end, a closure to sald receptacle, a blotter sheet extending from said closure and foldable thereover, and a flexible element secured to the outer face of said closure and extending over the rear and bottom portions of said receptacle and for a distance beneath the base.
No. 101,470. Holder for Pens and Pencils. Porte-plume et crayon.

Whlliam I. Ferris, Stamford, Connecticut, U.S.A., 9th October, 1906; 6 years. Filed 5th June, 1905. Recelpt No. 125,749.
Claim.-1. In a safety holder or clip for pen holders or pencils the combination with a pencil or pen holder of a spring having one end thereof abuting the pencil or pen holder, and non-rotatably secured thereto, and projecting in
a direction substantially parallel with the long axis of the pencil or pen holder, a ball point on the flat end of the spring adapted normally to bear on the pencil or pen holder and so related thereto as to form in conjunction therewith a clip or clamp to engage the pocket, substantially as described.
2. In a gafety holder or cllp for pen holders or pencils the combination with a pencil or pen holder of a spring extending parallel with the long axis thereof, an attaching means located within the width of the spring for securing ore end of the spring to the pencil or pen holder, substantially as and for the purpose specified. 1
3. In a safety holder or clip for pen holders or pencils the combination with the pencil or pen holder of a spring projecting in the direction parallel with the long axis thereof, attaching means located within the width of said spring for securing one end of the same to the pencil or pen holder and a ball on the free end of the spring adapted normally to bear upon the pencll or pen holder and so related thereto as to form in conjunction therewith a clip or clamp to engage the pocket, substantially as shown and described.
4. In a safety holder or clip for pen holders or pencils, the combination with the pencil or pen holder of a spring projecting in the direction substantially parallel to the long axis thereof, attaching means extending through one end of the spring and into the pencil or pen holder and a ball point on the free end of the spring adapted normally to bear upon the pencil or pen holder and so related thereto as to form in conjunction therewith a clip or clamp to engage the pocket, substantially as shown and described.
5. In a safety holder or clip for pen holders or pencils the combination with the pencil or pen holder of a spring projecting in a direction substantially parallel to the long axis thereof, attaching means for securing one end of the spring directly to the pencil or pen holder, extending slightly on the same side as the spring whereby the remainder of the surface of the pen or pencil will be left free and smooth and a ball point on the free end of the spring adapted to uormally bear on the pencil or pen holder and so related thereto as to form in conjunction therewith a clip or clamp to engage the pocket, substantially as shown and descrbed.

No. 101,471. Holder for Ribbon. Porte-ruban.

Almon H. Gardyne, Brownington Center, Vermont, U.S.A., 9th October, 1906; 6 years. Filed 18th August, 1906. Receipt No. 138,786 .
Claim.-1. A ribbon holder comprising spaced links having journal terminals at corresponding ends, spring pressed arms carried by the other ends of the links, and endwise adjustable crossbar members carried by the free ends of the arms.
2. A ribbon holder comprising spaced links having journal terminals at corresponding ends, spring pressed arms carried by the other ends of the links, and telescoped crossbar members carried by the arms.
3. A ribbon holder comprising a pair of spaced links having corresponding terminal transversely disposed journals, spring pressed arms carried by the other ends of the links and having inturned extensions, and telescoped crossbar members recelving the respective extensions of the arms, the outer crossbar member having a longitudinal slot, and that arm extension which intersects the inner crossbar having its inner end provided with a shoulder lying across said member and working in the slot of the outer crossbar member.

10-16

No. 101,472. Tire. Bandage.

Raymond Healey, Brooklyn, New York, U.S.A., 9th October, 1906; 6 years. Filed 1st April, 1905. Receipt No. 123.896. Claim.-A detachable leather tire having a tread and edges of one plece of leather, said edges being crimped and provided with clamping strips, as and for the purpose described.

No. 101,473. Brick Manufacture.
Fabrication de briques.

Thomas Henderson, Renirew, Ontario, Canada, 9th October, 1906. 6 years. Filed 9th August, 1906. Recelpt No. 138,538.
Claim.-1. The herein described process of treating clay for brick making purposes which consists in first mixing iron oxide and water together and then injecting the mixture into the mass of clay at some stage during the preparation of the clay for moulding, substantially as described.
2. The herein process of treating white clay for brick making purposes which consists in mixing one part of iron oxide with water and then injecting the mixture into twelve hundred parts or thereabouts of clay at some stage during the preparation of the clay for moulding, substantially as described.

\section*{No. 101,474. Loose Leaf Holder.}

\section*{Reliure à teuilles volantes.}

Wilber H. Horner, Toronto, Ontario, Canada, 9th October, 1906; 6 years. Filed 22nd May. 1906. Recelpt No. 136,141.
Claim.-1. A loose leaf holder, comprising a bar, a hinged portion connected to the end thereof, and cords secured to the end of the bar and to the end of the hinged portion in alignment with the major portion of the bar, as and for the purpose specified.
2. A loose leaf holder, comprising a bar, a hinged portion connected to the end thereof, cross pleces secured

to the ends of the bar and to the end of the hinged portion, cords secured to the ends of the bar and hinged portion and means for locking the hinged portion in alignment with the major portion, as and for the purpose specified.
3. A loose leaf holder comprising a dovetall bar formIng a way, a longitudinal movable bar designed to fit the way and provided with a hinged portion at one end and cords secured to the ends of the slidable bar and to the end of the way, as and for the purpose specified.
4. A loose leal holder comprising a dovetail bar forming a way, a longitudinal movable bar designed to fit the way and provided with a hinged piece at one end, cross pieces secured to the outer end of the hinged portion and cords secured beneath the cross pleces to the bar and hinged portion, as and ior the purpose specifled.
b. A loose leal holder, the combination with the cover and a bar forming a way rivetted to the back of the cover and dovetail in cross sectional form, of a slidable piece designed to fit the way and provided with a hinged end portion, cross pleces secured to the ends of the slidable plece, loops fromed beneath the cross pleces to the slidable portion and endless cords or bands held in such loops and designed to pass over the cross pleces parallel with the slidable portion, as and for the purpose specified.
6. A loose leaf holder, comprising a bar, an end portion retractably secured thereto, and cords connected to one and of the bar, and to the retractable portion, as and for the purpose specified.
No. 101,475. Adding Machine. Machine d additionner.

Andrew Rawson, Jennings, London, England, 9th October, 1906; 6 years. Filed 12th February, 1906. Recelpt No. 132.838.

Claim.-1. An adding machine comprising a pair of quadrants, and means for moving said quadrants in unison in the same parallel plane for each column of figures.
2. An adding machine comprising a plurallty of key quadrants for setting the items, a plurality of type quadrants, said type quadrants arranged in pairs, one pair for each column and means for operating the key and type quadrants.
3. An adding machine comprising a plurality of key quadrants for setting the items, a plurality of type quadrants, sald type quadrants arranged in palrs, one palr for each column, means for operating the key and type quadrants. levers for shifting certain of the type quadrants and operating means for said levers.
4. In an adding machine a total lever, toothed wheels, a locking bar and detent for the toothed wheels and a tension releasing means, for the purpose set forth.
5. In an adding machine a purality of shifting levers and mechanism co-acting with said shifting levers for causing the carrying forward of the aggregate of the columns added.
6. An adding machine comprising a plurality of toothed wheels, pawls assoclating with said wheels, key quadrants, type quadrants, a bar associating with said wheels for the purpose set forth, a clearing lever and a clearing lever arm.
7. An adding machine comprising an operating bandle, a printing mechanism, a connection between the handle and the printing mechanism for operating the lever, a paper feeding mechanism, connections between the handle and the papor feeding mechanism for operating the lever, an inking ribbon. mechanism for shifting the ribbon and a connection between said shifting mechanism and the handle for operating the shifting mechanism.
8. An adding machine comprising the combination with a plurality of type quadrants embodying cypher carrying elemonts, of means for shifting said cypher carrying elements. said means consisting of a sliding arm adapted to be moved in the direction of its length at right angles to the plane of the quadrants for shitting the cypher carrying elements from normal position with regard to the other type quadrants when the cypher carrying elements are not required to be grinted form.
9. An adding machine comprising the combination with a plurality of type quadrants embodying cypher carrying elements, of means for shifting sald cypher carrying elements, said means consisting of a sliding arm adapted to be moved in the direction of its length at right angles to the plane of the quadrants for shifting the cypher carrying elements from normal position with regard to the other type quadrants when the cypher carrying elements are not required to be printed form. a record mechanism embodying an inking ribbon and a recording sheet associating with said quadrants. and a common operating means for said quadrants, sliding arm and recording mechanism.
10. An adding machine comprising a plurality of cypher levers and means for shifting the same, for the purpose set forth.
11. An adding machine comprising a total lever, a tension releasing means operated by said lever and a clearing lever. for the purpose set forth.
12. An adding machine comprising a plurality of key quadrants for setting the items, a plurality of type quadrants, a shiftable cypher carrying element connected to each of the type quadrants and shiftable independently of the type quadrants, a connection between the type quadrants and the key quadirants for operating the type quadrants when the key quadrants are operated, means for shifting the cypher carrying elements Independently of the type quadrants, and operating means for the means for operating the cypher carrying elements.
13. An adding machine comprising a plurality of key quadrants for setting the items, a plurality of type quadrants, a shiftable cypher carrying element connected to each of the type quadrants and shiftable independently of the type quadrants, a connection between the type quadrants and the key quadrants when the key quadrants are operated, means for shifting the cypher carrying elements independently of the type quadrants, operating means for the means for operating the cypher carrying elements and a recording mechanlsm associating with the type quadrants.
14. An adding machine comprising a plurality of key quadrants for setting the items, a plurally of type quadrants, a shiftable cypher carrying element connected to each of the type quadrants and shiftable independently of the type quadrants, a connection between the type quadrants and the key quadrants for operating the type quadrants when the key quadrants are operated. a plurality of toothed wheels, means for shifting the cypher carrying elements independently of the type quadrants, means engaging the wheels for retaining the type quadrants in shifted position, operating means for the means fov operating the cypher carrying elements, a recording mechanism associating with the type quadrants, and means for carrying forward figures when a wheel passes the ninth tonth from a zero point.
15. An adding machine comprising a plurality of key quadrants for setting the items, a plurallty of type quadrants. a shiftable cypher carrying element connected to each of the
type quadrants, a connection between the type quadrants and the key quadrants for operating the type quadrants when the key quadrants are operated, a plurality of toothed wheeds, means for shifting the cypher carrying elements independently of the type quadrants, means engaging the wheels for retaining the type quadrants in shifted position, operating means for the means for operating the cypher carrying elements, a recording mechanism associating with the type quadrants, means for carrying forward figures when a wheel passes the ninth tooth from a zero point, a total lever, a tension releasing means operated by saild lever and a clearing lever.

No. 101,476. Pump. Pompe.

Hugh Johnston, Ottawa, Ontario, Canada, 19th October, \(1 * 06 ; 6\) years. Filed 18th December, 1905. Receipt No. 131,155.
Claim.-In a pupap the combination with a wooden pump barrel having the inner diameter greater at the top than at the bottom of a metal cylinder provided with an outwardly flared end extending around the lower end of the pump barrel, the inner diameter of the cylinder being the same as that of the pump barrel, a pump bucket reciprocating in the cylinder comprising a lower portion having a central liquid passage way therethrough, an upper portion of reduced diameter integral therewith, a flapper valve in the liquid passageway, conducting channels extending from the central passageway to the sides of the bucket and a sealing ring of impervous flexible material extending around the upper portion and abutting the shoulder formed at the junction of the lower portion adapted to contact with the wahs of the pump cylinder and a front slide for admitting air to the pump cylinder intermediate of the length of the barrel comprising a slidably supported rod having a lower bevelled edge adapted normally to close an aperture in the pump barrel and a bracket having the under surface thereof bevelled, substantially as described.

1No. 101,477. Turbine Pump. Pompe-turbine.
Albert Mainot Damplerre. Jura, France. 9th October, 1906; 6 years. Filed 12th December, 1905. Receipt No. 130,927.
Claim.-1. In apparatus of the character herein described. the combination of a turbine having a movable annular diffuser formed by the extensions of the cheeks of the blades with a fixed diffuser.
2. In apparatus of the character herein described, the arrangement in two parts along a diametrical joint situated in the plane of the longitudinal joint of the pump casing, of partitions or diaphragms that separate consecutive turbines, as also of flxed discs with guide blades interposed between the rear tace of each turbine and said partitions.
3. In apparatus of the kind herein described, means for reutralizing one or more of the cells comprising discs havgutde blades removably fixed to partitions or diaphragms separating successive turbines, substantially as described.
4. In apparatus of the character described, the baffle joint arranged at the rear of the turbine in direct communication with the pump casing. said joint being combined with a chamber, passages and a duct for this purpose, and means
for placing said chamber in communication with the suction casing, and regulating the intensity and the direction

of the axial reaction on the shaft and of obviating an undue tightening of the stuff box when the controlling of the pump is effected from the delivery side, substantially as described.
5. In a multicellular centrifugal turbine the combination comprising a plurality of annular movable dimusers, formed by the extensions of the blade of the turbines, which extensions constitute the lips of said diffusers and a plurality of fixed annular diffusers, arranged to operate in connection with the movable diffusers and adapted to utilize the residual absolute velocity pressed by the fluid on leaving the said movable diffusers and to convert the said speed into pressure.
6. In a multicellular centrifugal turbine in combination with a shaft, fixed diffusers on the shaft, movably diffusers on the shaft, said parts being divided along a horizontal plane and secured on the shaft.
No. 101,478. Refrigerating Machine. Machine réfrigórante.

Maurice Leblanc, Paris, France, 9th October, 1906; 6 years. Filed 30th November, 1905. Recelpt No. 130,581.
Claim.-1. A freezing machine comprising a vacuum chamber, a fluld actuating ejector communicating with said chamber, a jet condenser communicating with the exhaust of said ejector, and a liquid actuated ejector communicating with said condenser and arranged to discharge the liquid therefrom.
2. A freezing machine comprising a vacuum chamber, a lluid actuated primary ejector communicating with said
vacuum chamber, an auxiliary fluid actuated ejector communicating with the exhaust of the said auxiliary efector, and a liquid actuated ejector communicating with the exhaust of sald auxiliary ejector and arranged to recelve and discharge the liquid from said condenser.
3. A freezing machine comprising a vacuum chamber, a fluid actuated ejector communicating with the exhaust of sald fluid actuated ejector.

4 A freezing machine comprising a vacuum chamber, a fluid actuated primary ejector communicating with sald chamber, an auxiliary fluid actuated ejector communicating with the exhaust of said primary ejector, and a liquid actuated chamber communicating with the exhaust of said auxlllary ejector.
5. A freezing machine comprising a vacuum chamber, the inlet of the first ejector communicating with said vacuum chamber, the inlet of the first ejector communicating with sald chamber and the outlet of each ejector of the serics. with the exception of the last, communlcating with the inint of the next ejector of the series, a condenser communicating with the outlet of the last ejector of the series, and a iiquid actuated ejector communicating with said condenser and arranged to discharge the liquid therefrom.
6. A freezing machine comprising a vacuum chamber, a series of ejectors communicating with said vacuum chamber, the inlet of the first ejector communicating with said chamber and the outlet of each ejector of the series. With the exception of the last, communicating with the inlet of the next ejector in series, and a liquid actuated ejector communicating with the exhaust of the last fluid actuated ejector and arranged to discharge the liquid therefrom.
7. A refrigerating machine comprising a vacuum chamber, a series of ejectors for producing and maintaining a desired degree of vacuum in said chamber, the inlet of the first ojector connecting with said chamber and the outlet of each ejector of the series, with the exception of the last. connecting with the inlet of the next ejector of the series, a condenser in connection with the outlet of the last ejector of the series, a source of fluid pressure for the series of ejectors, and means for gradually introducing a liquid into said chamber during the maintaining of the degired vacuum. 8. A refrigerating machine comprising a vacuum chamber, n series of ejectors for producing and maintaining a desired degree of vacuum in said chamber, the inlet to the first ejector connecting with said chamber and the outlet of each ejector of the series. with the exception of the last, connecting with the inlet of the next ejector in the series, a condenser in connection with the outlet of the last ejector In the series, a source of fluld pressure for the serles of efectors, a source of liquild supply and means for introducing the liquid in the form of spray into said chamber durIng the malntenance of the desired vacuum.
9. A refrigerating machine comprising a removable mould, a stationary head for sald mould. means for making a fluid t!ght joint between said head and said mould, a serics of ejectors for producing and maintaining the desired degree of vacuum in sald mould and hrad, the inlet of the first ejector connecting with sald head and the outlet of each ejector of the series. With the exception of the last, connecting with the inlet of the next ejector of the series, a vacuum condenser in connection with the outlet of the last ejector of the scries, a source of fluid pressure for the series of ejectors, a source of liquid supply and means for introducing the liquid in the form of spray into sald mould during the maintenance of the desired varuum.
10. A refrigerating machine comprising a vacuum chamber provided with a removable head, means for making a fluid tight joint between said head and sald chamber, a removable receptacle located in sald chamber, a series of ejectors for producing and maintaining the desired degree of vacuum In said chamber. the inlet of the first ejector connecting with said chamber, and the outlet of each ejector of the series. with the exception of the last, connecting with the inlet of the next ejector in the serles, a vacuum condenser in connection with the outlet of the last ejector of the series, a source of fluid pressure for the series of ejectors, and means for gradually introducing a liquid into said chamber during the maintenance of the desired vacuum.
11. A refrigerating machine comprising a vacuum chamher provided with a removable head, means for making a fluid tight joint between said head and said chamber, a removable receptacle located in said chamber, a series of ejectors for producing and maintaining the desired degree of vacuum in said chamber. the inlet of the first ejector connecting with the said chamber and the outlet of each ejecttor of the series, with the exception of the last, connecting with the inlet of the next ejector of the series, a vacuum condenser in connection with the outlet of the last ejector of the series, a source of fluid pressure for the series of efectors, a source of liquid supply and means for introducing the liquid in the form of spray into said chamber during the maintenance of the desired vacuum.

No. 101,479. Furnace. Fournaise.

Fig. 1.
James Lees, Aontreal. Quebec, Canada, 9th October, 1906; 6 yciars. Filed 2ith April, 1906. Receipt No. 135,233.
Claim.-1. In a furnace the combination with an outer wall or casing having supporting ledges arranged in the sides thereof, and suitable passages from said ledges to the lower interior portion and a bridge wall adjacent to said ledges and grate forming a firebox and ash pit within said outer wall, of a hollow arch supported on sald ledges having inlet openings registering with said passages and a plurality of radially arranged ports through its under arched wall and forming the means of communication between the interior thereof and said firebox, as and for the purpose specified.
2. In a furnace the combination with an outer wall or casing having supporting ledges arranged in the sides thereof and sultable passages from said ledges to the lower interior rortion and a bridge wall adjacent to said ledges and grate forming a fircbox and ash pit within said outer wall, of a hollow arch resting on said ledges and having inlet openings registering with said passages and a row of ports arranged in a cresent through its under arched wall. and forming the means of communication between the interior thereof and the firebox, a boiler sultably supported within the outer walls, and a baftle wall formed above said arch and partlally encircling said boiler, as and for the purpose specifled.
3. In a furnace the combination with an outer wall or casing having supporting ledges arranged in the sides thereof and suitable passages from sald ledges to the lower interior portion and a bridge wall adjacent to said ledges and grate forming a firebox and ash pit within sald outer wall, of a hollow arch formed in sections, said sections having openings registering with the openings in the adjoining section and inlet openings in the outer sections registering with caid passages, said outer sections resting on said ledges and having radially arranged ports through the under and arched wall forming the means of communlcation between the interior thereof and said firebox, as and for the purpose specifled.
4. In a furnace the combination with an outer wall or casing having supporting ledges arranged in the sides thereof and suitable passages from said ledges to the lower interior portion and a bridge wall adjacent to said ledges and grate forming a firehox and ash pit within said outer wall. or a hollow arch formed of three sections. the outer sections resting on said ledges and having inlet openings registering with said passages, the middle section having convergent onds supported and fitting on correspondingly shaped surfaces on said outer ends and having openings to the interlor thereof registering with the openings to the interior of sald outer sections, sald sections in the under and arched wall having a row of ports arranged in a cresent and forming the means of communication between the interior thereof and said flrebox, as and for the purpose specifed. 5. In a furnace the combination with an outer wall or casing having supporting ledges arranged in the sides thercof and sultable passages from sald ledges to the lower interior portion and a bridge wall adjacent to said ledges and grate forming a firebox and ash pit within sald outer wall, of a hollow arch formed in three sections, the outer section restfing on said lodges and having inlet openings registering with said passag s, the middle section having convergent ruds and tongues projecting from the faces of said ends fitting into corresponding grooves in the correspondingly shaped surfares of the outer ends, said middle section having openiags to the interior thereof registering with openings to the interior of sald outer sections and a plurality of radial ports through the under and arched wall and forming the means of communication between the interior thereof and said firebox. as and for the purpose specified.
6. In a furnace the combination with an outer wall or casIng having supporting ledges arranged in the sides thereof. and suitable passages from said ledges to the lower interior
portion and a bridge wall adjacent to said ledges and grate forming a firebox and ash pit within said outer wall, of a hollow arched wall formed in tongued and grooved sections, the outer section thereof resting on sald ledges and having inlets registering with said passages, and a groove in the upper and side walls of said arch from the outer surface thereof and a plurality of ports through the under and arched wall forming the means of communication between the interior thereof and said firebox, and a tie rod of angular formation and introduced into said groove in the upper and side walls of said arch, as and for the purpose specified.
7. In a furnace the combination with an outer wall or casing having supporting ledges arranged in the sides thereof and suitable passages from said ledges to the lower interior portion and a bridge wall adjacent to said ledges and grate forming a firebox and ash plt within said outer wall, of a hollow arch formed in sections tongued and grooved. the outer sections resting on said ledges and having inlets registering with said passages and a plurality of ports through the under and arched wall forming means of communication between the interior and the fire box, a tie rod of angular formation surrounding the outer walls of said arch, a boiler suitably supparted within said outer wall and a baffe wall supported on said arch and partially encircling said boiler, as and for the purpose specified.
8. In a device of the class described, in combination, an outer wall or casing forming an enclosure, a bridge wall and grate extending across said enclosure and forming a firebox and ash pit, sald outer wall having ledges at the sides thereof and communicating passages from said ledges to the ash pit beneath said firebox. a hollow clay arch supported on said ledges and having inlets communicating with sald passages and formed of tongue and grooved sections and located to the rear of said firebox in proximity to said bridge wall said sections having communicating openings from one to the other and radially arranged ports through the under and arched wall, forming the means of communication with said firebox, a boiler supported within said outer wall or casing, and a baffle wall extending from the top of said arch and partially surrounding said boiler, as and for the purpose specified.

No. 101,480. Sheep Shears. Forces.

Mary A. Lipscomb, Eureka, California, U.S.A., 9th October 1906; 6 years. Filed 27th September, 1906. Receipt No. 139,839.
Olatm.-1. In sheep shears, the combination with handles, of blades pivotally mounted on the handles and having the effective portions of their cutting edges lying beyond the pivotal points, whereby the blades are adapted to swing inward on their pivotal points to compensate for the wear of the effective portions of the cutting edges, and means for securing the blades in their adjustment.
2. In sheep shears, the combination with handles, of blades pivotally mounted on the handles and having the effective portions of their cutting edges lying beyond the pivotal points, whereby the blades are adapted to swing inward on their pivotal points to compensate for the wear of the effective portions of the cutting edges, and means for securing the blades in their adjustment, said means embodying an arcuate slot, and a fastening device operating in the slot.
3. In shears, the combination with handles provided at their front ends with longitudinal shanks and having lateral extensions projecting inwardly from the inner ends of the shanks, and blades pivoted at their inner portions to the front or outer ends of the shanks and having longitudinal
extensions projecting from the inner ends of the blades and adjustable on the lateral extensions of the handies.
4. In shears, the combination with handles provided at their front ends with longitudinal shanks and baving lateral extensions projecting inwardly and curved longitudinally of the shears, blades pivoted at their inner portions to the outer edges of the shanks and provided at their inner ends with longitudinal extensions curved to fit the lateral extensions, and means for adjustably connecting the extensions.

\section*{No. 101,481. Street or Station Indicator.}

Indicatcur de rues ou stations.

Stewart Percival McMordie, Niagara Falls, Ontario, Canada, 9th October, 1906; 6 years. Filed 17th August, 1906. Receipt No. 138,762
Claim.-1. In a street or station indicator, the combination with the casing and the shaft journalled therein, of a drum located on the shaft provided with supporting eyelets and flaps pivotally connected to the same, a spring secured to the end of the drum and to the shaft, a pinion secured on the end of the shaft and a pawl engaging the same, a pin gear wheel at the opposite end of the shaft, a lever provided with a double escapement pocket engaging the gear pin and the means for restraining the dropping of the flaps, so that they fall one at a time, as and for the purpose specified.
2. In a street or station indicator, the combination with the casing and a shaft journalled therein, of a drum located on the shaft provided with supporting eyelets and flaps pivotally connected to the same, a spring secured to the end of the drum of the shaft, a pinion secured on the end of the shaft and a pawl engaging the same, a pin gear wheel at the opposite end of the shaft, a lever provided with a double escapement pocket engaging the gear pin, and a ledge against which the flaps fall previous to their dropping to expose the name of them, as and for the purpose specifled.

No. 101,482. Road Locomotive. Locomotive de routes.
David Roberts, Grantham, England, 9th October, 1906; 6 years. Filed 14th October, 1905. Recelpt Na. 129,238.
Claim.-1. In a road locomotive or other chain vehlcle the combination with the body, of a pitched chain track upon which the whole of the weight of the body is supported through the medium of lateral rollers forming a curved bearing surface, the said chain track being composed of a number of sections interlocking at the upper and lower eiges so as to form a solid girder track, substantially as described.
2. In a road locomotive or other vehicle wherein the propulsion is effected by one or more pitched chain tracks upon which the body of the vehicle rolls, the arrangement
wherein the steering is controlled by means of brakes applied to the bevel wheels of the differential gear or to one of the

sprocket wheels upon which the pitched chain track is mounted, substantially as hereinbefore described.

No. 101,488. Controlling Epming for Vohicles. Ressort de contrôle pour véhicules.

James H. Sager, Rochester, New York, U.S.A., 9th October, 1906; 6 years. Filed 13th February, 1906. Recelpt No. 132,889.
Claim.-1. In combination with the main supporting spring of the body of a wheeled vehicle, an endwise compressible secondary spring disposed at right angles to and connected at its ends with said main spring, each spring having a form of inaction, satd forms occurring in succession during the movements of the springs and lateral rests for the auxillary spring, with means connecting the ends of the spring with the rests.
2. In combination with the main supporting spring, of the body of a wheeled vehicle, an endwise compressible secondary spring disposed at right angles to and connected at its ends with said main spring, said secondary spring acting at intervals with the load to compress the main spring and lateral rests for the auxiliary spring. with means connecting the ends of the spring with the rests.

No. 101,484. Folder for Tires, Eta.
Porte-dormants, etc.

Charles E. Schilling, Los Angeles, California, U.SA, 9th ber, 1906; 6 years Filed 27th August, 1906. Receipt No. 139,032.
Claim.-1. A display rack and holder comprising side members with retaining standards thereon extending above such side members, lazy tongs connecting said side members, said lazy tongs comprising two links with one of their ends pivoted together and their other ends pivotally and permanently attached to their respective side members near the ends of such side members, and two other links pivoted together at their ends and crossing the first-named two links and plvoted thereto at the points of crossing, their other ends projecting beyond such points of crossing. being pivotally and slidably connected to the side members intermediate their length.
2. The display rack and holder comprising side members with retaining standards thereon extending above such side members, sald standards being bent to form handles, lazy tongs connecting said side members and each comprising links of equal length crossing and pivoted to one another, two of said links being pivotally connected together at one erd, and extend!ng beyond the points at which they cross the other links and pivotally connected at such extended parts to fixed parts of the sald respective side members ntar the ends thereof. and the other two links being pivoted together at one end, and pivotally and slidably connected at their other ends to the side members intermediate the onds thereof, the space above the lazy tongs being unobstructed at each end.
3. A display rack and holder comprising side members with retaining standards thereon extending above such side members, said standards being bent in U-shape to form handles, lazy tongs connecting said side members and consisting of links of equal length crossing and pivoted to one another, two of said links extending beyond the crossing points of the members and being pivotally and permancontly connected at such externded portions to the sa!d side members near the ends thereof, two other links extending beyond the crossing points and pivotally and slidably conrected at such extיnded portions to the side members intermediate the ends theroof. the space above the lazy tongs heing unobstructed at cach end. and rubber feet attached to the side members near the ends thereof.
4. A display rack and holder comprising side members. each formed of a bar having its ends bent up over and dewn in C'shape to form a combined standard and handle at each end of each side member, the inner end of each 1 -
shaped handle being attached to the side member, fixtures attached to each side member near the end thereof, sleeves sliding on each side member at a point between the end fixtures and the middle of the side member, a link pivotally connected to each end fixture of each side member, and two said links at each end of the device being pivotally connected together at their inner ends, other links pivotally connected at their middle portions to the middle portion of the aforesaid links and having their outer ends pivotally connected together and their inner ends pivotally connected tc the sliding sleeves aforesaid, the said links forming lazy tongs to enable lateral adjustment of the base without variation in the length thereof.
5. A display rack and holder comprising side members, each formed of a bar having its ends bent up over and down in U-shape to form a combined standard and handle at each end of each side member, fixtures attached to each side member near the end thereof, sleeves sliding on each side member at a point between the end fixtures and the middle of the side members, a link pivotally connected to each end fixture of each side member, the two said links at each end of the device being pivotally connected together at their inner ends, other links pivotally connected at their middle portions to the middle portions of the aforesaid links and having their outer ends pivotally connected together, and their inner ends pivotally connected to the sliding sleeves aforesald at the corresponding end of the device, the said links forming lazy tongs to enable lateral adjustment of the base without variation in the length thereof, and feet of cushioning material secured to the said end fixtures.
6. A display rack and holder comprising side members, each formed of a bar having standards rising therefrom, fixtures attached to each side member near the end thereof, sleeves sliding on each side member at a point between the end fixtures and the middle of the side members, a link pivotally connected to each end fixture of each side member, the two said links at each end of the device being plvotally connected together at their inner ends, other links pivotally connected at their middle portions to the middle portions of the aforesald links and having their outer ends pivotally connected together and their inner ends pivotally connected to the sliding sleeves aforesaid at the corresponding end of the device, the said links being of equal length and forming lazy tongs to enable lateral adjustment of the base without variation in the length thereof.
7. A display rack and holder comprising side members, each formed of a bar having standards rising therefrom, fixtures attached to each side member near the end thereof, sleeves sliding on each side member at a point between: the end fixtures and the middle of the side members, a link pivotally connected to each end fixture of each side member, the two said links at each end of the device being of equal length and pivotally connected together at their inner ends, other links of equal length pivotally connected at their middle portions to the middle portions of the aforesaid links and having their outer ends pivotally connected together and ther inner ends pivotally connected to the sliding sleeves aforesaid at the corresponding end of the device, the said links forming lazy tongs to enable lateral adjustment of the base without variation in the length thereof, and feet of cushioning material secured to the said end fixtures.
8. A display rack and holder comprising side members with retaining standards thereon extending above such side nembers, each side member having pivot bearings fixed at their respective ends and two sleeves slidably mounted on the side members between said fixed bearings, and a base connecting the side members and consisting of lazy tongs, each lazy tongs having link portions projecting beyond the pivotal connection of the links, one such projecting link portion being connected to one of the fixed bearings on the side member and the other projecting link portion being pivoted at its end to one of the sliding sleeves, so as to maintain an invariable length for the base of the rack, while providing for variation in width thereof.

\section*{No. 101,485. Folder for Razor Bladea. Porte-lames de rasoirs.}

Joseph Leonard Stewart, Chanute, Kansas, U.S.A., 9th October, 1906 ; 6 years. Filed 21st September, 1906. Receipt No. 139.696.
Claim.-1. A holder for razor blades consisting of a body, a movable side for the body and a handle detachable from the body and arranged to co-act with the movable side to clamp the latter to cause clamping action of the latter with reference to the body.
2. A holder for blades of safety razors consisting of a body including a movable side, sald body being formed with a small threaded tang and a detachable handle having threaded connection with the tang aforesald and engageable with the
movable side to effect clamping action of the latter with respect to the body.

3. As a new article of manufacture, a holder for blades of safety razors consisting of a body including a movable side connected at one end therewith, opposite ends of the body being provided with handles, one integral and the other deItachable, the detachable handle being engageable.with the movable side, as specified.
4. As a new article of manufacture, a holder for blades of safety razors consisting of a body formed with an integral handle at one end, a movable side connected at one ond with the body and having the opposite end free with respect thereto, said body being formed adjacent to the free extremity of the movable side with a threaded tang, and a detachable handle having a threaded socket to recelve the threaded tang and the free extremity of the movable side to cause clamping action of the latter with respect to the body.
5. A holder for blades of safety razors consisting of a body having a handle at an end thereof, a movable side between which and the body a razor blade is adapted to be clamped, and means for effecting clamping action of the movable side with respect to the body.

No. 101,486. Meang of Diseharging rivinis from Drging Cylinderg.
Moyen de décharger le fluide des cylindres àsécher.

Robert Daniel Tackaberry, Lewiston, Maine, U.S.A., 9th October, 1906 ; 6 years. Filed 24th December, 1904. Receipt No. 121,030. .
Claim.-1. A steam trap comprising means controlling the outlet therefrom, such means including a lever, a link pivot. od to the lever, a slide to which the link is pivoted, means for mounting the slide within the case or shell of the steam trap, and an adjusting device extending from the slde to the extremity of the shell or case.
2. A steam trap comprising a shell, a dome mounted thereon, a valve commanding the dome for the purpose specifled, a stem attached to the valve and extending to the dome, a diaphragm case communicating with the dome, a dlaphragm in the case and engaged by the said stem, a second stem engaging the opposite side of the diaphragm, means for operating the second stem, and means for conducting the outfiow from the trap to the dome.
3. A steam trap comprising a shell, a dome mounted thereon, a valve commanding the dome for the purpose specified, a stem engaged with the valve and extending to the dome, a diaphragm case communicating with the dome, a diaphragm in the case and engaged by the said stem, a second stem engaging the opposite side of the diaphragm, means for operating the second stem, and means for conducting the outflow from the trap to the dome, such means including a plpe running from the bottom of the shell or case upward out of the same and into the dome inward of the valve.
4. A steam trap comprising a shell or case having a dome rising therefrom and a diaphragm case communicating with the base of the dome, a valve in the dome for the purpose specified, a diaphragm in the diaphragm case, means for placing the dome in communication with the interior of the trap, and means for operating the valve, said means compris ing elements bearing on opposite sides of the diaphragm.
5. A steam trap comprising means for controlling the out let from the trap, sald means including a pivoted member means for movably mounting the pivot of sa:d member, and a device connected with said means and extending to the outside of the case or shell of the trap. whereby to impart an adjusting movement to the pivot.
6. A steam trap comprising means for controlling the outlet therefrom, such means Including a pivoted member, means movably mounting the pivot of said member, and a device in connection with the latter means and extending to the out side of the case or shell of the trap and capable of imparting a back and forth movement to the sald plvot mounting means.
7. A steam trap comprising means for controlling the outlet therefrom, sald means including a plvoted member, means movably mounting the pivot of said member, and a device in connection with the latter means and extending to the outside of the case or shell of the trap and capable of imparting a back and forth movement to the said plvot mounting means, said device comprising a screw mounted to turn in the case and having threaded connection with the said pivot mounting means.
8. A steam trap comprising means controlling the outlet therefrom, such means including a pivoted member, a slide on which the pivot of said member is maunted, and a device connected with the slide and extending to the outside of the shell or case of the slide to impart a back and forth adjusting movement to the slide.
9. A steam trap comprising means controlling the outlet therefrom, such means including a pivoted member, a link to which said pivot is connected, a slide on which the link is plvoted, and a device connected with the slide and exlending to the outside of the shell or case of the trap, to impart an adjusting movement to the slide.
10. A steam trap comprising a shell or case having a dome rising therefrom and a diaphragm and a case, the latter communicating with the base of the dome, a valve in the dome for the purpose spectifed, means for yieldingly seating the valve, means for placing the dome in communication with the interior of the trap, and means for opening the valve against the action of cue said means for fieldingly seating the same, said means for opening the valve comprising elements bearing on opposite sides of the diaphragm.
11. A steam trap comprising a shell or case, a dome mounted thereon and having communication with the interiar of the shell or case at a point outward from the base of the dome, a valve mounted in the frame, a diaphragm case at the base of the dome, a diaphragm in the diaphragm case, and means for automatically operating the valve through the medium of the diaphragm, said means comprising elements bearing on opposite sides of the diaphragm.
12. A steam trap comprising a shell or case, a dome juxtaposed thereto, a valve mounted in the dome to control the outlet therefrom, a diaphragm closing communication between the dome and the shell or case, means for operating the valve through the medium of the diaphragm, and means establishing communlcation between the shell and dome at a point in the dome outward from the diaphragm.
13. A steam trap comprising a shell or case, a valve exterior of the shell or case and controlling the outlet therefrom, and means for operating the valve from the interior of the case, sald means including a diaphragm closing an opening in the shell or case, reciprocating elements bearing on opposite sides of the diaphragm to transmit move-
ment through the diaphragm, and means for operating said reciprocating elements.
14. A steam trap comprising a shell or case, a dome juxtaposed thereto, a diaphragm closing communication between the dome and the interior of the shell or case, a valve mounted in the dome outward from the diaphragm to control the outlet from the dome, means for operating the valve from the interior of the case through the diaphragm, and means establishing communication between the shell and dome at a point in the dome intermediate the diaphragm and valve.
15. A steam trap comprising a shell or chamber, means for leading the steam and water of condensation to the shell or chamber, means controlling the exit thereirom, and an additional means, said additional means establishing a communication between the interior of the shell or chamber and the source of steam and water of condensation whereby to equalize the pressure, substantially as described.

No. 101,487. Means of Discharging Fluids from Drying Cylinders.
Moyen de décharger le fluide des cylindres d sécher.

Kobert Daniel Tackaberry, Lewiston, Maine, U.S.A., 9th October, 1906; 6 years. Filed 1st March, 1906. Recelpt No. 133,471.
Claim.-1. The combination with a drying cylinder, of means for withdrawing the air and water therefrom, a trap to which the same means discharges and devices for venting the air from the trap.
2. The combination with a drying cylinder, of means for discharging the air and water therefrom, a trap to which said means lead, a pipe passing from the upper part of the trap and an alr vent valve in said pipe.
3. The combination with a drying cylinder, of means for discharging the air and water therefrom, a trap to which said means lead and an air vent valve communicating with the trap, for the purpose specifled.
4. The combination with a drying cylinder, of means for conducting the water and air therefrom, a trap to which said means discharge, an equalizing plpe establishing communicaton between the trap and the cylinder for the purpose specifled, and an air vent device in said equalizing dine.
5. The combination with a drying cylinder having a steam supply pipe communicating therewith, of means for withdrawing the water from the cylinder, a trap to which said means lead, an equalizing pipe extending from the upper part of the trap to the steam supply pipe of the cyllnder directly adjacent to the cylinder, for the purpose specified, and an air vent device in the equalizing pipe.
6. The combination with a drying cylinder having a steam supply pipe communicating therewith, of means for withdrawing the water from the cylinder, a trap to which said means lead, an equalizing pipe extending from the upper part of the trap to the steam supply pipe of the cylinder directly adjacent to the cylinder for the purpose specifed.
an air vent valve in said equalizing pipe and a stop cock In said pipe between the air vent valve and the steam supply pipe of the drying cylinder.
7. The combination with a drying cylinder, of means for withdrawing the air and water therefrom, a trap to which said means discharge, the discharge of said means to the trap being located above the normal water line thereof, whereby to permit air to enter the trap and devices for venting the air from the trap.
8. The combination with a drying cylinder, of means for conducting the air and water therefrom, a trap to which said means discharge at a point above the normal water line of the trap whereby to permit the air to pass into the trap, an equalizing plpe establishing communication between the trap and clyinder and an air vent device in said equalizing pipe.

No. 101,488. Transmission Mochanism.
Mécanisme de transmission.

Alaxander Winton, Cleveland, Ohio, U.S.A., 9th October, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,327.

Claim.-1. In a motor carriage the combination of an explosive engine having its power cylinder transversely arranged and provided with a crank shaft extending longtudinal the vehicle, a propelling wheel shaft provided with a compensating gear, a driven shaft extending longitudinal the vehicle, one end of which is operatively connected with the compensating gear, and clutch members connecting the opposite end of the driven gear with the said engine shaft, whereby the crank shaft is directly connected with the compensating gear.
2. In a motor vehicle the comblnation of an explosive engine having a crank shaft extending longitudinal the vehicle. a vehicle driving shaft provided with a compensating gear, springs connecting the vehicle driving shaft with the vehicle, and a flexible shaft having one end connected with the compensating gear, a clutch member carried by the opposite end of the flexible shaft, and a co-acting clutch member carried by said crank shaft.
3. In a motor vehicle the combination of an explosive engine provided with a balance wheel, a vehicle drive shaft, a connecting shaft having one end provided with a clutch member adapted to co-act with the inner surface of the rim of the balance wheel, the opposite end of the connecting shaft operatively connected with the vehicle drive shaft.
4. In a motor vehicle the combination of an explosive engine, a balance wheel therefor, a transmission mechanism including a clutch adapted to co-act directly with the balance wheel, and a reversing mechanlsm adapted to co-jointly co-act with the balance wheel and one of the clutch, members.
5. In a motor vehicle the combination of an explosive engine having a crank shaft, a driving axle for the vehicle, a connecting shaft having one end operatively connected with the driving axle of the vehicle, the crank shaft and the adjacent end of the connecting shaft having respectively a flange or collar and a co-acting transversely movable clutch member.
6. In a motor vehicle the combination of an explosive engine provided with a crank shaft, a connecting shaft, a motor shaft operatively connected with one end of the connecting shaft, the opposite end of the connecting shaft and crank shaft having respectively a gear and a flange or collar, one of said latter members provided with a co-acting movable clutch member, and a reversing mechanism including a gear reshing with the aforesaid gear, and a friction roller adapted to engage said collar.
7. In a motor vehicle the combination of an explosive engine having a crank shaft, a vehicle driving shaft, a conr necting shaft having one end operatively connected with the vehicle driving shaft, a transmission mechanism including two clutch members, a reversing mechanism adapted to engage both of said clutch members and provided with intermediate gears to transmit a reverse motion to the connecting shaft.
8. In a motor vehicle the combination of an explosive engine having a crank shaft provided with a collar or sleeve, a connecting shaft, a vehicle drive shaft operatively connected with one end of said connecting shaft, the opposite end of the connecting shaft having a clutch membtr adapted tc co-act with the inner surface of said collar, the adjacent end of the connecting shaft having a gear wheel and a reversing mechanism including a gear adapted to engage the aforesaid gear, and a friction roller adapted to engage the outer surface of the collar and co-acting with the said gears to impart a reverse motion to the connecting shaft
9. In a motor vehicle the combination of an explosive engine having a crank shaft. a vehicle drive shaft, a connect ing shaft having one end operatively connected with the vehicle drive shaft, the adjacent ends of the crank shaft and connecting shafts having respectively a gear and a friction collar, a clutching mechanism between the collar and the adjacent end of the connecting shaft, and a reversing mechanism including a movable frame having a friction roller adapted to be carried in engagement with the said collar the friction roller provided with a pinion, and a gear between said. pinion and the gear carried by the connecting shaft, whereby the reversing mechanism may be thrown into operation or entirely out of operation when not in use.

\section*{No. 101,489. Cufi Folder. Attache powr poignete.}

Charles Joseph Warwick, Kingston, Ontario, Canada; 9th October, 1906 ; 6 years. Filed 14th April, 1906. Recelpt No. 134,893.
Claim.-1. A cuff holder comprising a member adapted to be attached to the inside of the lining of the coat sleeve and a member provided with jaws designed to have the outer ends sprung past the shank of the connecting stud of the cuff, whereby the shank is held securely within the jaws, as and for the purpose specified.
2. A cuff holder comprising a plate, a curled loop at one end and a staple-like pin held therein and lips at the opposite end within which the ends of such pins are designed to be held after having been passed through the lining, the latter end being bent upwardly and backwardly, and spring
wire faws each member of which is held within the bent end of the plate and converge near their outer ends from which point the members diverge or flare to their extremities, as and far the purpose specifled.

No. 101,490. Cuff Holder. Attache pour poignets.

Matthias P. Zindorf, Connell, Washington, U.S.A., 9th October, 1006 ; 6 years. Filed 25th June, 1906. Receipt No. 131,239.
Claim.-1. In a cuff bolder the combination with a framo having a spring tongue, of a pad holder underlying said tongue, said holder being formed with clamping parts to engage said frame and secure the pad.
2. In a cuff holder the combination with a frame having a spring tongue, of a holder having its side edges bent to overlie the base of said holder and further bent to receive and engage the frame, and a pad having its side edges pressed between said holder base and sald overlying edges.
3. In a cuff holder the combination with a frame having a spring tongue, of a holder secured to the frame, a pad secured to the holder and having a flap extending outwardly to engage the cuff.
4. In a cuff holder, a frame having a spring tongue, a pad holder clamped to said irame and a pad carried by sald holder and having its outer face projecting teyond said irame to co-operate with said tongue.
5. In a cuff holder, a frame having a spring tongue and a pad co-operating therewith, prongs carried by the frame, and a pointed prong struck out from said frame and being disposed with the point in an opposite direction to the direction o? disposition of the points of said first-named prongs.
6. In a cuff holder a frame having a spring tongue, a pait holder clamped to said frame, a pad carried by said holder, and an extension carried by said holder and bent to embrace said pad and underlie the surface thereof.

\section*{No. 101,491. Grain Elevator. Elévateur d grain.}

The John S. Metcalf Company, Chicago, Illinois, U.S.A., assignee of John Sanborn Metcalf, of the same place, 16th October, \(1906 ; 6\) years. Filed 15 th September, 1906. Receipt No. \(13!, 535\).
Claim.-1. In a grain elevator equipment of the character described the combination of a series of bins provided with discharge openings, valves for opening and closing sald discharge openings, interlocking mechanism operatively connected with the several valves for opening and closing them, and a conveyer supported to travel across the series of bin discharge openings and leading to an inlet way of the elevator bullding. for the purpose set forth.
2. In a grain elevator equipment of the character described, the combination of a serles of bins provided with discharge openings, horizontally swinging valve for opening and closing said discharge openings, interlocking mechanism operatively connected with the several valves for swinging them to open and close said bin openings, and a conveyer supported to travel across the series of bin discharge openings and leading to an inlet way of the elevator building, for the purpose set forth.
3. In a grain elevator equipment of the character described. the combination of a series of bins provided with discharge openings, horizontally swinging double valves for opening and closing said discharge openings, stops for limiting the movement of sail valves, interlocking lever actuated mechanism operatively connectod with the several valves for
swinging them to open and. close said bln openings, and a conveyer supported to travel across the series of bin dis-

charge openings and leading to an inlet way of the elevator building, for the purpose set forth.
4. In a grain elevator equipment of the character described the combination of a series of bins, each provided with discharge openings, horizontally swinging valves for opening aud closing said discharge openings, each comprising a shutter pivotally supported near its center between adjacent discharge openings, interiocking lever actuated mechanism operatively connected with the several valves, for swinging them to open and close said bin openings, and a conveyer supported to travel across the serles of bin discharge openings, and leading to an inlet way of the elevator building, for the purdose set forth.
5. In a grain elevator equipment of the character described, ihe combination of a series of bins, each provided with a plurality of hoppers in its bottom having discharge openings, horizontally swinging valves for opening and closing said discharge openings, each comprising a shutter pivotally supported between its ends between adjacent discharge openings, interlocking lever actuated mechanism operatively connected with the several shutters for swinging them to open and close said hopper openings, and including horizontally movable rods each connected with all the valves of a different bin, and a conveyer supported to travel across the series of bin discharge openings and leading to an inlet-way of the elevator building, for the purpose set forth.
6. In a grain elevator equipment of the character described, the combination with a plurality of rallway tracks extending along one side of the elevator building, of bins provided at intervals along and beneath each track and forming series of bins extending across the tracks, said bins being provided with discharge openings, valves for opening and closing said discharge openings, interlocking mechanism opratively connected with the several valves of each transverse series of bins for opening and closing them, and conveyers supported to travel across the discharge openings of said series of bins and leading to inlet ways of th.. elevator building, for the purpose set forth.
\%. In a grain elevator equipment of the character described. the combination with a plurality of rallway tracks extending along one side of the elevator building. of a series of bins provided with discharge openings, horizontally swinging double valves for opening aud closing said discharge openings, stops for limiting the movement of said valves, interlocking lever actuated mechanism operatively connected with the several valves for swinging them to open and close said bin oponings, and a conveyer supported to travel across the series of bin discharge openlugs and leading to an inlet way of the elevator building. for the purpose set forth.
8. In a grain elevator equipment of the character described, the combination with a plurality of rallway tracks extending along one side of the elevator building, of a series of bins each provided with a plurality of hoppers in its bottom having discharge openings, horizontally swinging valves for oprning and closing said discharge openings, earh comprising a shutter pivotally supported betwern its ends between adjacent discharge openings. intorlocking liver actuated mechanism operatively connected with the suveral shutters for swinging them to open and closy said hopper openings. and including longitudinally movable rods cach connected with the valves of a different bin, and a conveyer supported to travel across the series of bin discharge openings, and leading to an inlet way of the elevator builling, for the purpose set forth.

No. 101,492. Cà Wheel. Roue de chars.

The Davies Car Wheel and Machine Company, Chicago, as signee of John Rees Davies, Waukegan, Illinols, U.S.A., 16th October, 1906; 6 years. Filed 15th September, 1906 Recelpt No. 139,536.
claim.-1. The combination with a wheel center and tire having registering recesses, of a dowl pin joining said parts having its inner end equipped with a bearing through which pressure may be exerted in drawing the dowel pin inwardly to free it from engagement with the tire, for the purpose set forth.
2. The combination with a tire having internal recesses, and a center having registering recesses and transverse channels intersecting the same, of dowel pins having stems provided with transverse channels, and means entered in said transverse channels and securing the dowel pins in place, for the purpose set forth.
3. The combination with a tire having internal recesses, and a center registering recesses and transverse channels intersecting the same, of dowels having transverse key receiving channels and narrower wedge recelving channels opening thereinto, and keys securing sald dowels in place, the wedge receiving channels serving to accommodate a relatively narrow wedge in the operation of withdrawing the dowel. for the purpose set forth.
4. The combination of a tire having at one edge an external rail engaging flange and at the opposite edge an internal center engaging flange, a wheel center engaging said secondnamed flange, normally projected radial dowels connecting the tire and center and provided within the center with transverse channels, and dowel locking keys entered in said transverse channels, for the purpose set forth.
5. The combination of a tire having in integral formation at one edge an external rall engaging flange and at the opposite edge an internal center engaging flange, a wheel center engaging said second-named flange, normally projected radial dowel pins connecting the tire and center and provided within the center with bearings through which force may be exerted to retract the dowel pins, and transverse dowel locking keys carried by the wheel center, for the purpose set forth.

\section*{No. 101,493. Car Bolster. Traversin de chars.}

Edwin Harry Benners, Elizabeth, New Jersey, assignee of John Green, St. Louis, Missouri, U.S.A., 16 th October, 1906; 6 years. Filed 11th September, 1906. Recelpt No. 139,431.
Claim.-1. An integral car bolster comprising a top member. a bottom member, and side members connecting the top and bottom members to form a substantially triangular cross section.
2. An integral car bolster comprising a wide top member. a narrow bottom member, and side members converging from the sides of said top member down to said bottom member.
3. A car bolster comprising a top member, a bottom member, and side members connecting said top and bottom members, said side members being externally convex at their upper portions and externally concave at their lower portions.
4. A car bolster comprising a top member, a bottom member, and substantially ogee-shaped side members connecting said top and bottom members.
5. A car bolster comprising a top member, a bottom member, downwardly converging side members connecting sald top and bottom members, and a king pin post extending from said top member to said bottom member and arranged to distribute load over the entire width of said bottom member.
6. A car bolster comprising a wide top member and side members connected to the side of said top members and

downwardly converging to form a substantially triangular cross section.
7. The combination of a car truck, having separated cross ties, and a bolster having a wide top member, a narrow bottom member and downwardly converging side members connecting said top and bottom members, said bolster being narrow enough at its lower edge to enter between said cross ties.
8. The combination of a car truck, transoms therein, a truck holsttr of substantially triangular cross section the middle lower portions of said bolster extending between and below the lower flange of said transoms, and a body bolster of substantially triangular cross section, the middle lower portions of said bolster extending between and below the tops of said transoms.
9. A cast metal bolster, comprising a top plate having a center and end bearings thereon, a bottom plate, inclined side webs connecting the top and bottom plates and enlarged ends on the bolster integrar with the top and bottom plates and side webs.
10. In a bolster the combination with a top plate throughcut the greater portion of its length, a bottom plate inclining or curving upward from its center toward the ends of the top plate, and inclined webs connecting side edges of the top and bottom plates.
11. A bolster of one integral casting, comprising a top plate, a bottom plate, inclined side webs connecting them, enlarged ribbed ends on the bolster having recesses in their sides, integral center and end bearings on the top plate, and a hollow post in the center of center bearing and depending therefrom.

No. 101,494. Soot Catcher. Attrappe-sute.

Joseph Kleinand Eugene J. Schoolcraft, assignee of a half interest, both of Port Huron, Michigan, U.S.A., 16th October, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,500 .
Claim.-A soot catcher for smoke conduits, comprising a casing having an inlet in its lower portion and an outlet in its upper portion, whereby it is adapted to form part of an uptake, a bearing fixed at the inner side of one of the upupight walls of the casing, a shaft journalled in the other
upright wall thereof and having a crank disposed outside of the casing. a framie having a trunnion journalled in the bearing, a frame fixed on the crank shaft, a cylindrical screen surrounding and connected to the said frames and located between the inlet and the outiet of the casing, and a device arranged to engage the outer side of the said screen, whereby when the screen is rotated it will be cleared of collected soot.

No. 101,495. Ash sifter. Tamis d cendres.

Thomas P. Bolger, Gloucester. Massachusetts, U.S.A., 16th October, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139.222.
Claim.-1. A sifter comprising a cap provided with a casing having a sliding top, a hopper secured to one end of said casing and a sieve slidably mounted under said hopper and top. for the purpose set forth.
2. A sifter comprising a cap provided with a casing having flanged sides, a hopper secured to one end of sald casing. a spout secured to the other end of said casing, a sieve slidably mounted in said casing and a top slidably mounted on the flanged sides of the casing, for the purpose described.
3. A sifter comprising a cap provided with a casing having an inclined end, a hopper arranged over said end having a hinged top, a sieve mounted in the casing, a top slidably mounted on the side of the casing having an opening, at one end, and a spring provided with a bowed portion carried by the hopper adapted to fit in the opening in the top, for the purpose described.
4. A sifter comprising a casing having flanged sides, a hopper secured at one end, a spout secured to the other end, a sifter slidably mounted in said casing on brackets, a top provided with guides at its side mounted on the flanged sides and a spring carried by the hopper adapted to engage said top, for the purpose described.
5. A sleve comprising a top having a casing securtd thereon provided with flanged sides, a hopper formed on one end of said casing, a spout secured to the other end, a hook secured to the end adjacent the spout, brackets secured to the sides, a sieve mounted on said brackets provided with a handle extending out through an opening in the hopper, a top provided with guide edges adapted to fit over the flanged edges of the sides having an-opening adjacent one end and a spring carried by the hopper provided with a bowed portlon adapted to at in said opening, for the purpose set forth.
6. A sifter comprising a cap having a casing sccured thereto provided with flanged sides, a hopper formed at one end of said casing. provided with a hinged top, a spout secured In the bottom and in tht other end, a hook secured to said end. a top having flanged ends and guldes formed on its sides. adapted to slide on the flanges of the sides, spring actuated locking means secured to the casing adapted to ongage sald tod and sieve slidably mounted in said casing under sald top and hoppre provided with a handlo extruding out through an opening in the hopper, for the purpose

No. 101,496. Washing Machine. Machine d laver.

William George Burns, Boston, Massachusetts, U.S.A., 16th October, 1906; 6 years. Filed 20th September, 1906. Receipt No. 139,645.
Claim.-1. A washing apparatus a chamber open at both ends, a piston movable longitudinally in said chamber. a cover extending over one end of the chamber and connected thereto, the cover and chamber being formed to permit a practically unobstructed movement of water between the cover and the chamber.
2. A washing apparatus comprising a chamber open at both ends, a piston movable longitudinally in said chamber. a cover extending over one end of the chamber and having a flange surrounding the same and connected thereto. the lower edge of sald flange being located above the upper end of the chamber to permit a practically unobstructed movement of water between the cover and chamber.
3. A washing apparatus comprising a chamber open at both ends, a cover or head extending over one end and surrounding the same, connections joining the upper end of the chamber casing to the cover, the latter being separated on all sides from the casing except at the point of connection, said cover and chamber having provisions for a practically unobstructed flow between them, a piston movable longitudinally in the chamber. and means for moving the same extending through the cover or head.
4. A washing apparatus comprising a chamber open at both ends, a cover or head extending over one end and suprounding the same, connections joining the upper end of the chamber casing to the cover, the latter being separated on all sides from the casing except at the point of connection, said cover and chamber having provisions for a practically unobstructed fiow between them, a piston movable longitudinally in the chamber, a rod for actuating the same extending through the cciel, and hand engagiug means excured to the roi.
5. A washing apparatus comprising a chamber open at both ends, a cover or head extending over one end and surrounding the same, connections joining the upper end of the chamber casing to the cover, the latter being separated on all sides from the casing except at the point of connection, sald cover and chamber having provisions for a practically unobstructed flow between them, a piston movable longitudinally in the chamber, a rod for actuatiug the same extending through the cover, and a spring connected to the rod and abutting against the cover tending to retain the piston adjacent the inner end of the chamber.

\section*{No. 101,497. Glove. Gant.}

Hamilton Carhartt, Jr., Detroit. Michigan, C.S.A., 16th October, 1906; 6 years. Filed 17th Scptombor. 1906. Receipt No. 139,572.
Claim.-1. In a glove, a reinforcement section extending from the back of the glove, and covering the palm of th. glove only below the first two fingers and having narrowed extension passing down across the base of the thumb nor ticn of the glove.
2. In a glove, a reinforcement section extending over the palm of the glove only below the first two fingers and cover-

ing the crotch of the thumb, and having an elongated narrow extension passing across the base of the thumb, and a wrist section having a line of stitching at its upper edge where it is joined to the body of the glove, sald narrow exiension being carried under said upper edge of said wrist section.
3. In a glove, a reinforcement section extending across the palm below the first two fingers and terminating in a rounded corner below the middle finger and from thence extending lengitudinally toward the base of the glove in a narrow extension or tongue, and extending along the crotch of the thumb, said glove having a stitched wrist section and said extension secured under the upper edge of said wrist section.

\section*{No. 101,488. Hoof Pad.}

Bourrelet pour cornes d'animatkx.

Joseph M. Doke, Fostoria, Ohio, U.S.A., 16th October, 1906 6 years. Filed 20th September, 1906. Receipt No. 139,654.
Claim.-A hoof pad comprising an inner portion formed of layers of leather secured together and shaped to conform to the curvature of the inner edge of the shoe within which it fits, an outer ring of rubber secured to the edges of said inner portion, and extending beyond the same under the face o: the shoe, and a wire fastener embedded between said layers of leather and having a projecting loop at the front en-
gaging under the toe of the shoe and projecting ends at the rear engaging in compression under the heels of the shoe at the extremities thereof and bearing outwardly on the hecls of the hoof, to expand the same.

No. 101,499. Milk Pail Folder. Porte-seau d lait.

William Wilfred Edmanson, Melita, Manitoba, Canada, 16th October, 1906 ; 6 years. Filed 27th January, 1906. Receipt No. 132,319.
Claim.-1. In a device of the class described the combination with ear, of an extending adjustable arm, as and for the purpose specifled.
2. In a device of the class described the combination with the ear, of an extending adjustable arm, and a spring cooperating with the arm, as and for the purpose specified.
3. In a device of the class described the combination with the car, having a centrally disposed vertical slot, of an arm pivoted within the slot and extending therefrom, and a spring engaging the arm, as and for the purpose specified.
4. In a device of the class described the combination with the pail, of an ear, an extending curvilinear arm pivotally supported within a slot. within the car, said arm having the end and the lower rear face flat, and a fiat spring secured to the base of the ear and extending within the slot and bearing upon the arm, as and for the purpose specifled.
5. In a milk pail holder the combination with the pall and ears thereof, of arms adjustably connected one to each ear and adapted to extend substantially horizontal when in use as and for the purpose specified.

No. 101,500. Conveyer for Peat Collecting Machines.
Transport pout machine a ramasser la tourbe.

William Atkinson Milne, Brown's Corners, Untario, Canada, 16th October, 1906; 6 years. Filed 12th September, 1906. Receipt No. 139,448.
Claim.-1. In a tubular conveyer for peat collecting machines and the like, the combination with the tube, of a spiral wing secured to the interior periphery thereof, as and for the purpose specified.
2. In a tubular conveyor for peat collecting machines and the like. the combination with the tube, of two oppositely set wings secured to the interior periphery thereof, as and for the purpose specified.
8. In a tubular conveyer for peat collecting machines and the like, the combination with the tube, of a plurality of sets of spiral wings spcured to the interior periphery of the tube and located at desired distances apart, as and for the purpose specified.

No. 101,501. Colter. Coutre.

John Moeller, Bay Port, Michigan, U.S.A., 16th October, 1906; 6 years. Filed 19th September, 1006. Recelpt No. 139,630.
Claim.-1. In a device of the class described, a tubular bearing member adapted for connection thereto and provided with projecting lugs having inclined lower faces, clip plates having correspondingly inclined upper faces designed to bear on the inclined faces of the lugs, connecting bolts engaged with the clip plates and operatively engaged with the beam for attaching the bearing member thereto, a colter shank arranged for longitudinal adjustment in said member, and means for fixing the shank in its adjusted positions.
2. In a device of the class described, a beam, a tubular bearing member connected therewith and having a longitudinal groove, an operating lever pivoted to said bearing member, a locking key extended transversely through the latter and connected with the lever, a shank arranged for longltudinal movement in the bearing member and provisioned with a plurality of openings to receive the locking key, a spring seated in the groove and designed to act on the lever for maintaining the key normally in locking position, and a spring retaining pin extended transversely of the groove and terminally engaged with the wheels thereof.

No. 101,50\%. Hay Fork. Fourche.

Ifeinrich H. Pofahl, Vivian, Waseca. Minnesota. L.S.A.. 16th October. 1906; 6 years. Filed 13th August. 1:91t. Receipt No. 1:38.620.
Claim. The combination with the socketed ferrule provided with the side toothed jaw, of the tool having a shank provided with a co-operatiug side toothed jaw, a bolt having
a squared portion, and a quick screw-threaded end to engage the first-mentioned jaw, a wrench lever provided with a square hole to fit on the squared portion of the bolt, the latter being provided with a finer screw thread on the end opposite that bearing the quick thread, a milled nut turned on the fine screw thread of the bolt, and toothed bar fixed on the ferrule to engage the handle of the wrench lever.

No. 101,503. Fertilizer Distributor. Distributcur d'engrais.

Richard J. Taylor, Murireeboro, North Carolina, 16th October, 1906. 6 years. Filed 25th September, 1906. Receipt No. 139,766.
Claim.-In a fertilizer distributer, the combination with a sulky frame, pivot ears depending from the frame, the hop pers. a toothed rack seclured to the back of each hopper, and the T-shaped hangers, of the chutes pivoted in said ears and each having a pivot bolt connection with the hangers, a separate and independent hand lever attached to each chute and laving said bolts extending therethrough, and a pawl carried Wv each lever to hold the chutes in independent lateral adjustment.

No. 101,504. Caltivator and Planter.
Cultitateur et planteur.

Henry Warfleld, Topeka, Kansas, U.S.A., 16th October, 1906 6 years. Filed 14 th September, 1906. Receipt No. 139,506 Claim.-1. In an implement of the class described the combination with a central member including a head and vertically spaced plates projecting rearwardly from the head. of transwrse members secured between the plates forwardly of the rearward ends thereof and projecting there beyond in both dircctions, the sald transverse member.: having outwardly extending pins at their outer ends, said members having passages formed therein in which the plas. ar, removahly engaged, said members having other pas. arges adapted for the reception of pins. ground treating devices carried by the side members and arranged to lie
in operative position when certain of the passages of the side members are engaged by the pins and out of operative position when other of the passages are engaged by the pins, a transverse member removably engaged between the rearward ends of the plates, sald member having passages formed therethrough at right angles to each other. said plates having perforations formed therein adapted for registration with the passages of the last-named member interchangeably, said perforations and passages being adapted for the reception of a pin, and ground treating teeth carried by the last-named transverse member and extendtherefrom, said ground treating teeth lying in planes parallel with one of the passages of the members.
2. In an implement of the class described, the combination with a central member including a head, vertically spaced plates projecting from the head, and transverse members secured between the plates and projecting therebeyond in both directions, said transverse members having outwardly extending pins at their outer ends, of side members having passages formed therein in which the pins are removably engaged, said side members having other passages therein adapted for the reception of the pins, and ground treating devices carried by the side members, said side members being adapted to lie with their ground treating devices in operative position when certain of their passages are engaged by the pins, and to lle with their ground treating devices in inoperative position when their other passages are engaged by the pins.

\section*{No. 101,505. Disc Land Cultivator, Harrow Road Machine and Farm Wagon. \\ Cultivateur d disques, machine de route et wagon.}

Abram L. Foote, Fayette, Iowa, U.S.A., 16th October, 1906; 6 years. Filed 24th September, \(1906 . \quad\) Receipt No. 139,735.
Claim.-1. In a machine of the class described, the combination of a main frame, a bolster supporting the main frame and provided with a depending tapered portion, an axle receiving the tapered portion of the bolster, and a pivot composed of upper and lower sections mounted respectively on the bolster and on the axle and provided at their adjacent ends with eyes linked into each other and forming a flexible connection to permit the axle to swing transversely of the machine, whereby a wheel may drop into a rut or hole without straining the machine, or disturbing the horizontality of the frame.
2. A machine of the class described having a main frame and provided at opposite sides thereof with levers arranged in pairs, the levers at one side of the frame being provided with lower arms arranged in diagonal relation with and also at points diametrically opposite the lower arms of the levers at the opposite side of the frame, whereby cultivating devices may be hung from the frame either in a diagonal position or in parallelism with the median line of the machine.
3. In a machine of the class described, the combination with a frame and cultivating devices, of levers arranged In pairs at opposite sides of the frame and located in diagonal relation, the levers at one side of the frame being provided with supplemental arms arranged diametrically opposite the levers at the opposite side of the frame, and means for suspending the cultivating devices from the levers either in a diagonal position or in parallellsm with the median line of the machine.
4. In a machine of the class described, the combination with a frame and cultivating means, of front and rear operating levers arranged in pairs at opposite sides of the frame and having lower arms arranged in diagonal relation. the front lever at one side of the frame being also provided with a forwardly extending supplemental arm. and the corresponding rear lever having a supplemental rearwardiy
extending arm, the supplemental arms being disposed diametrically opposite the arms of the levers at the opposite side of the frame, and means for connecting the opposite levers with the cultivating menns.
5. In a machine of the class described, the combination of a wheeled irame, operating levers located at opposite sides of the main frame in diagonal relation, the levers at one side having supplemental arms arranged diametrically opposite the levers at the opposite side, and a harrow suspended from the supplemental arms and the levers from the opposite side of the frame.
6. In a machine of the class described, the combination of a wheeled frame, operating levers located at opposite sides of the main frame in diagonal relation, the levers at one side having supplemental arms arranged diametrically opposite the levers at the opposite side, and a harrow suspended from the supplemental arms and from the levers from the opposite side of the frame, and crossed inclined chains extending from the sides of the main frame to the opposite sides of the harrow.
7. In a machine of the class described, the combination of a wheeled frame provided with links, a harrow adjustably suspended from the frame and provided at its front with a draft attachment having a transverse rod arranged in spaced relation with the front of the harrow, and links provided at their rear ends with eyes slidable on the draft attachment, the front ends of the latter links being provided with hooks for detachably engaging the links of the frame.
8. In a machine of the class described, the combination of a wheeled frame, cultivating devices, means for suspending the cultivating devices either in diagonal or parallel relation with the machine, a seed box or hopper having feed mechanism and mounted on the frame in advance of the cultivating devices, and gearing for operating the feed mechanism of the seed box or hopper.

No. 101,506. Car Coupler. Attache de chars.

Landis G. Daniels and William B. Kirkpatrick, Highspire, Pennsylvania, U.S.A., 16th October, 1906; 6 years. Flled 10th September, 1906. Receipt No. 139,392.
Claim.-1. In a car coupler of the class described, the combination with a car body, of a drawbar, arms secured to the free end of said drawbar and having knuckles at their outer ends, and means to direct said arms toward or from each other wheneby a set of said arms will be interlocked with each other.
2. A car coupler of the class described, comprising a drawbar proper. locking arms at one end of said drawbar, and means carrled by said drawbar to dispose said arms toward or away from each other.
3. A car coupler of the class described comprising a drawbar proper, arms pivotally secured to one end thereof, controlling arms pivotally secured together and mounted upon sald drawbar and having one of their ends pivotally secured to the locking arms, and means at the opposite ends thereof to operate said controlling arms.
4. A car coupler of the class described comprising a drawhead proper, locking arms pivotally secured to one end of said drawbar, controlling arms pivotally mounted upon the drawbar, said arms having one of their ends pivotally secured to the locking arms, a controlling member secured to the opposite ends of said controlling arms, and means to operate said controlling member whereby the locking arms will be operated.
5 The herein described car coupler comprising a drawbar, locking arms pivotally secured to one end thereof, knuckles carried by the outer ends of said arms, controlling arms for said locking arms, a rod extending through said
irawbar, controlling member upon the upper end thereof and connected to the controlling arms, a cortrolling lever secured to said rod. a housing for said drawbar. and means carried thereby to engage the lever and operate the locking arms.
6. A car coupler of the class described comprising a drawhar. locking arms pivotally secured thereto, controlling levers for said arms. a controlling member operatively conucried to said levers, a rod carrying said controlling member, and means connected to the lower end of said rod Whereby said rod and controlling member may be manualls operated to operate the locking arms.
7. A car coupler of the class described comprising the combination with a drawbar having locking arms at one end thereof and means to operate sald locking arms, of a housing for sald drawbar and arms, supporting rods secured to the car body and extending through one end of the housing ind springs around said rods between the housing and car body.
8 . In a car coupler, the combination with the body of a car, of a drawbar to interlock the same with the adjoining urawbar, a housing for said drawbar. supporting rods secured to the car body and extending through one end of the housing, springs around said rods between the housing and car body. and means carried by the housing to operate said interlocking means.
9. In a car coupler the combination with a drawbar havling interlocking members at one end, of a housing for said drawbar and interlocking members, and means carried by said housing to automatically operate said locking members.
10. A car coupler having interlocking members at one end. levers to operate said interlocking members. a controlling members secured to said levers, a rod to control said memher, a housing for sald drawbar, a latch carried by said housing. a projection on said latch, a lever secured to said rod, and means carried by the drawbar to disengage said latch from said lever.

No. 101,507. Nnt Lock. Arríte-ér rou.

Poter Liberty. Warren. Pennsylvania, U.S.A., lith October, 1906; \(t\) years. Filed 31st July. 1906. Receipt No. 138,299. Claim.-1. In a nut lock the combination with a washer, and means for preventing it from turning, said washer havling its horn formed on different dlameters, and an orifier 'xoconding from the intermediate bore, of a spiral spring lawl soated in the intermediate bore, and having a lug al in:le rad whleh enters the inner end of the orifice, and the. obposite ond bent inward to constitute a pawl, of a nut havilig a shank which is fitted to turn in the smaller bore of tine washer. and is provided with ratchet tewth with which the end of the pawl engage, whereby to lock the nut to the washer. against turning in a reverse direction.
2. In a nut lork the combination with a washer, the bore of which is formed on several diameters, and provided with a radial orffer externing from the intermediate dlameter to the surfa:" of th. washer, and means for preventing the washor from turning, of a nut having a threaded bore and - ratcher toothed shank with a roduced portion, the shank filtal to firn in the smaller diameter of the bore of the washor and the reduced portion is the largest bore of the
washer, and a chamber being formed between the toothed , ortion of the shank and the wall of the intermediate bore of the washer, and a spring pawl seated in this chamber, and provided at one end with a lug adapted to enter the inner end of the orifice, while the opposite end engages the teeth of the nut and lock the latter against turning in the reverse direction.

No. 101,508. Mnt Look. Arrête ecrou.

Walter R. Mecherle, Bloomington, Illinois, U.S.A., 16th October, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,394.
Claim.-1. The combination with a plate having an aperture therein, of a bolt within the aperture, a nut upon the bolt. a dog pivoted to the plate and normally seated by gravity upon the bolt between the nut and plate, and means upon the nut adapted to overlap and contact with the dog at a point between fts ends.
2. The combination with a plate having an aperture therein, of a bolt within the aperture, a nut upon the bolt, a dog pivoted to the plate and normally seated by gravity upon the bolt between the nut and plate, and a lug extending from one face of the nut and overlapping the dog, said lug and dog adapted to contact at a point between the ends of the dog tc blad the dog upon the bolt.

No. 101,509. Lath Folder. Porte-Latte.

John Lynes. Fort William, Ontario, Canada, 16th October, 1906: 6 years. Filed 30th August, 1906. Recrlpt No. 1:3,100.
I'laim.-1. In a lath holdre the combination comprising a arapple. a body carried by the grapple, and holding elements -ivotally secured to the body.
2. In a lath holding device the combination comprising a Lrapole. a body carrind by the grapple, holding elements pivotally serured to the body, and means for locking the holding elements in position.
3. In a lath holding device the combination comprising a grapple, a body carried by the grapple, holding elements pivotally secured to the body and provided with hooks adapted to engage a portion thereof.
4. In a lath bolding device the combination comprising a grapple, a body secured to the grapple and provided with a flattened portion, and hooks pivotally secured to the body and provided with extensions having hooks adapted to engage said flattened portion of the body.
5. In a lath holding device the combination comprising a body provided with a bifurcated extremity terminating in eyes, lath holding elements provided with eyes in engagement with said eyes on said bifurcations and provided with hooks adapted to engage said body, and means for attaching the upper end of the body to a support.
6. In a lath holding device the combination comprising a body, lath! supporting elements pivotally secured to sald body and provided with locking means, and gripping members pivoted to the upper end of said body and provided with downwardly extending extensions.

No. 101,510. Composition Railwav Tie. Dormant artifioiel de chomin de fer.

Felix Jas. Baivier, Velva, North Dakota, U.S.A., 16th October, 1906: 6 years. Filed 26th September, 1906. Receipt No. 139.788.
Claim.-1. A railway tie formed of artificial stone having transverse grooves in its upper face, and bolt holes on opposite sides of said grooves, said bolt holes being made square in their lower portions and round in their upper part or portions.
2. A railway tie formed of artificial stone having a substantially rectangular body in cross section excepting as to its bottom which is given a form approaching the shape of a V.
3. A railway tie formed of artificial stone having a brace on one end to engage the top of the flange on the base of the rail and stay the web, and a clamp under the brace to engage the edge of the rail flange and keep the rails from spreading.
4. A railway tie formed of artificial stone composed of cement, sand, gravel and water, set and hardened.
5. A rallway tie comprising a body having its lower portion gradually reduced transversely.
6. A railway tie comprising a body portion having its lower portion gradually reduced transversely and having a longltudinal chamber therewithin, and longitudinally extending strengthening devices embodied in the tie.
7. A railway tie comprising a body portion having the lower portion of its side faces converged downwardly to give the lower portion of the tie a \(V\)-shape and having a longitudinal chamber therewithin, and strengthening devices embodied in the body portion at the upper portion thereof.

\section*{No. 101,511. Railway. Rail de croisemont.}

William Johnston Eicher, Smithton, Pennsylvania, U.S.A., 16th October, 1906: 6 years. Filed 20th September, 1906. Recelpt No. 139,652.
Claim.-1. A rallway frog comprising a frog plate provided centrally of its upper face with a groove extending from end to end of the plate, the said groove widening outward in a gradual taper from a point intermediate the ends of the plate to both ends, and being divided at one end by a V-shapet: frog point, the sald frog plate having notches in its upper face at one end forming rail seats, and ribs on the upper \(10-18\)
face of the plate extending from one end thereof to the inner wall of the notches at the other end in unbroken form

and conforming in outline to the side walls of the central groove.

No. 101,512. Railway Rail and Tie. Rail et dormant de chemin de fer.

David E. Lindsay, Etna, Pennsvivania, U.S.A., 16th October, 1906; 6 years. Filed 19th September, 1906. Receipt No. 139,633.
Claim.-1. The combination with ties having dovetail tongues, of a rall adapted to engage the tongues of said ties, said rail consisting of two parts, a head carried by one of said parts and common to both parts, a base fiange carried by each part and forming a dovetail groove when said parts are secured together, substantally as described.
2. The combination with ties having dovetail tongues, of a rail engaged by said tongues, said rall consisting of two parts alternately arranged together, base fianges carried by sald parts and forming a dovetail groove to receive the tongues of said ties, substantially as described.
3. The combination with ties having tongues, of a rail adapted to engage sald tongues, said rail consisting of two parts, the ends of one part being arranged centrally of the other part, base flanges carried by said parts and engaging said tongues, means to secure said parts together, substantially ás described.
4. A tie provided on its upper face with a tongue having inclined side edges, combined with a rail having base flanges resting on said tongue, and depending side franges carried by said base flanges, said depending side flanges having inclined inner faces enaging the inclined side edges of said tongue.
5. A rall formed in two members adapted to be secured together, each member having a base flange provided with a groove, and a tie having a tongue adapted to fit in said grooves in the base flanges of the rail members.
6. A rail provided in its base with a groove, combined with a tie, and means carried by the tie engaging in the groove of the rail and securing the rail to the tie.
7. A two-part rail provided in its base with a groove, combined with a tie, and means carried by the tle engaging in the groove of the rail securing said rail to the tle.
8. A rail provided with a base, and depending side flanges carried by said base, combined with a tie, and means locking the tie to said side flanges of the rall.

No. 101,513. Railway Slooper.
Dormant de chemin de fer.

Martin E. McGrath, Rio Grande, Ohio, U.S.A., 16th October, 1906; 6 years. Filed 25th September, 1906. Receipt No. 139,769.
Claim.-1. A sleeper for railroads comprising a hollow Work for pastic material adapted to extend lengthwise under ithe rail and having a longitudinal recess in the top in which the rail rests, and ground engaging ribs.
\(\because\) A sleeper comprising a hollow block having a longitudinal depression in the top in which the rail rests and ground angaging ribs and grooves in the bottom and sides, and bolt holes extending upwardly from the hollow through the top of the block.

\section*{No. 101,514. Railway System.}

Système de chemin de fer.

Henry Roy. Ottawa, Ontarlo. Canada. 16th October, 1906; 6
years. Filed 15th September, 1906. Receipt No. 139.519.
Cluin.-1. In a safety rallroad device the combination with a pair of parallel rails of a wheel adapted to bear on both ratls and means for preventing the lateral displacement of the same, as and for the purpose specified.
2. In a safety railroad device the combination with a pair of parallel rails of a wheel adarted to bear on each and
means extending between the two rails for preventing the Lateral displacement of the wheel, as and for the purpose perifled.
3. In a safety railroad device the combination with a psir of paralel rails of a wheel adapted to bear on both rails and an outwardly extending annular flange formed on the periphery thereof extending between the two ralls, as and for the purpose specifled.
4. In a safety railroad device the combination with a pair of parallel rails, a car wheel adapted to bear on each rail. and means on the periphery of the car wheel and outwardly extending therefrom for preventing the lateral displacement of the wheel, as and for the purpose specifled.
5. In a safety railroad device the combination with a pair of double rails having the individual rails breaking joint with each other, of a two-wheeled truck having the wheels thereof bearing simultancously on the four rails and means for proventing the lateral movement of the truck on the rails, as and for the purpose specified.
6. In a safety railroad device the combination with a double rail having the individual rails thereon breaking joint, of a wheel bearing on the rails and means for preventing the lateral displacement thereof, as and for the purpose syecifled.
7. An improved car wheel having two bearing surfaces adapted to bear simultaneously on the rails and dividing means between, as and for the purpose specifled.
8. An improved car wheel having two bearing surfaces adapted to bear simultaneously on the rails, and an outwardly extending annular flange between the said bearing surfaces, as and for the purpose speclfied.
9. An improved car wheel provided with an annular flange outwardly extending from the center of the periphery thereof, as and for the purpose specified.

No. 101,515. Selector Por Antomatic Telephone Exehange.
Sclcctewr pour échange automatique de téléphone.

The Bell Telephone Company of Canada, Montreal, Quebec. Canada, assignee of James L. McQuarrie, 16th October. 1906: \(\dot{b}\) years. Filed 1sth September, 1906. Receipt No. 139, 548.
Claim.-1. In a selector for an automatic telephone exchange the combination with a ratchet carrying a selector arm, of a plate upon which said ratchet is mounted an elec-tro-magnet for actuating said ratchet. said magent being disposed upon the rear of the plate with its core piece projecting through an opening in the same, and a bracket mounted upon the front of the plate and providing a support for the said core plece and magnet.
2. In a selector for an automatic telephone exchange, the combination with a ratchet carrying a selector arm, of a plate upon which said ratchet is mounted, an electro-magnet disposed upon the rear of said plate and having a cor, piren profecting through an opening in the same. a bracket noounted unon the front of the plate and providing a support for sald core piece and magnet, an armature for sald makn. pivotally secured to said bracket, and means controlled by said armature for actuating sald ratchet.
3. In a selector for an automatic exchange, the combination with a ratchet carrying a selector arm, of a plate upon which said ratchet is mounted, an electro-magnet for actuating said ratchet, said magnet being aisposed upon the rear of the plate with its core pleces projecting through openings in the same, a bracket mounted upon the front of the plate to which said core pieces are secured, a rod having a pivotal bearing in the yoke of the electro-magnet and extending through an opening in the plate, an armature secured to said rod above the plate and between the poles of the magnet, and mechanism actuated by said armature for controlling the movement of said ratchet.
4. The combination with a selector frame provided with a series of circularly arranged contact terminals, of a plate secured to said frame within the circle of said terminals, ratchet wheel rotatably mounted above said plate, a selector arm carried by said wheel and provided with contact brushes adapted to trail over said terminals, two electromagnets disposed upon the rear of the plate, each having its core pieces extending through openings in said plate, brackets mounted upon the front of the plate to which said core pleces are secured, an armature for each magnet pivoted to said brackets between the opposite poles of the magnet, and pawls controlled by said armature for advancing the ratchet wheel and for holding said wheel in its advanced position.
5. In an automatic telephone exchange system, the combination with a selector frame provided with a series of circularly arranged line terminals, of a plate secured to said frame within the circle of said terminals, a ratchet wheel rotatably mounted above said plate, a selector arm radially secured to said wheel and provided with contact brushes adapted to trail over said terminals, electro-magnets disposed upon the bottom of the plate having core pieces extending through openings in the same, a bracket for each magnet mounted upon the top of the plate and to which said core pieces are secured, rods pivotally mounted in adjustable bearings carried by the yokes of the electromagnets, an enlarged slotted head for each rod extending through an opening in the plate, an armature for each magnet secured within said slotted head and provided with a pin extending through an opening in the corresponding bracket. and means actuated by said armature for controlling the movement of said ratchet wheel and selector arm.
6. In a selector for an automatic telephone exchange, the combination with a ratchet carrying a selector arm. of a plate upon which said ratchet is mounted, an electro-magnet disposed upon the rear of the plate with its core pieces projecting through an opening in the same, an armature pivoted above the plate, and means controlled by the movement of said armature to control the movement of said ratchet.

No. 101,516. Controller for Machinery.
Controleur de machines.

The Pike Adding Machine Company assignee of William Henry Pike, Jr., all of Orange, New Jersey, U.S.A., 16th October, 1906; 6 years. Filed 7th March, 1906. Receipt No. 133,603.
Cltim.-1. The combination with the working shaft of an apparatus, of a motor, clutch device, yielding connections
between the driven member of the clutch device and the working shaft, a dash pot connected to regulate the speed of movement of the working shaft, and two stop devices for engaging the connecting means of the clutch device, one of said members connected to be held in stop position until the working shaft has completed its movement.
2. The combination with the working shaft of an apparatus, of a motor, clutch device, ylelding connections between the driven member of the clutch device and the working shaft, a dash pot connected to regulate the speed of movement of the working shaft, and two stop devices for engaging the connecting means of the clutch device, one of said members being connected to be held out of stop position only when the working shaft has completed its movement.
3. The combination with the working shaft of an apparatus, of a motor. clutch device, yielding connections between the driven member of the clutch device and the working shaft, a dash pot connected to regulate the speed of mover ment of the working shaft, two stop devices for engaging the connecting means of the clutch device, one of said members being connected to be held out of stop position only when the working shaft has completed its movement, a band key, and connections for shifting the other stop device.
4. The combination with the working shaft of an apparatus, of a motor, clutch device, yielding connections between the driven member of the clutch device and the working shaft, a dash pot connected to regulate the speed of movement of the working shaft, and two stop devices each arranged to engage the connecting means of the clutch, one of the said stop devices connected to be shifted by a hand key. the other combined with means actuated by the driven member of the clutch to shift said device to stop position as said driven member begins its rotation and hold it in such positign until the rotaton is completed.
j. The combination with the work shaft, dash pot, actuating shaft, and flexible connections, of a motor, clutch device, a shaft connected with the driven member of the clutch device and carrying a crank arm and crank pin, a link connected with the actuating shaft and provided with a shoulder and recelving the crank pin, a rock shaft carrying a stop arm for engaging the connecting means of the clutch device, and an arm for ongaging said shoulder.
6. The combination with the working shaft, dash pot and the driven member of a clutch device, of yielding connections between said member and said working shaft constructed to permit the work shaft to move to a limited extent independently of the said member, and a stop device and contacting parts arranged to carry the stop device out of stop position only when the working shaft is at the end of its movement.
7. The combination with the working shaft, dash pot, clutch device, motor, and yielding connections between the driven member of the clutch device and working shaft, of two stop devices arranged to engage the connecting means of the clutch device, one normally in stop position and a hand key for shifting it , the other normally out of stop position, and means for carrying it into stop position so long as the working shaft has not completed its movement.

No. 101,517. Controller for Machinery.
Contrôleur de machines.

The Pike Adding Machine Company, assignee of William Henry Pike, Jr., Orange, New Jersey, U.S.A., 16th October. 1906; 6 years. Filed 7th March, 1906. Receipt No. 133,604.
Claim.-1. The combination with a shaft for moving the operating parts of a machine and a dash pot connected to
limit the speed of movement of said shaft, of a clutch device having one part connected with a continuonsly operating motor and the other connected by yielding conncetions with said shaft, a stop device for arresting the rotation of the driven member of the clutch at the end of each rotation, and means for preventing the shifting of said stop device out oi stop position untll the working shaft has resumed its normal stop position.
2. The combination with a shaft for moving the operating parts of a machine and a dash pot connected to limit the speed of movement of said shaft, of a clutch device having une part connected with a continuously operating motor and the other connected by yie!ding conbections with said shaft, : stop device for arresting the rotation of the driven member of the clutch at the end of each rotation, a key and conrections for shifting the stop device, and means for preventing the shifting of said stop device by the key out of stop position until the working shaft has resumed its normal stop position.
3. The combination with the driving shaft. driven shaft, and intermediate clutch device, of a stop device for arresting the driven member, a key for shifting the stop device. out of stop position, means for restorng it to stop position before the completion of one rotation of the driven member, and means for operatively disconnecting the key and stop device until the key returns to starting position.
4. The combination with the driving shaft, driven shaft, and intermediate clutch device, of a working shaft for actutaing the working parts of a machine, yielding connecions between the driven member of the clutch and the working shaft, a stop device for arresting the driven member, a key for shifting the stop device out of stop position, means for restoring it to stop position before the completion of one rotation of the driven member, and means for operatively disconnecting the key and stop device until the key returns to starting position.
5. The combination with the working shaft, means for restricting the speed of said shaft, a motor an intermediate, clutch, and glelding connections between the driven member of the clutch and sald shaft, of a stop device for arresting the sald driven member on completion of each rotation, means for shifting the stop device to connect the clutich members, means for automatically restoring the stop device to stop position after the driven member begins its rotation, and means for preventing the action of the shifting means co the stop device until the rotation of the driven member is completed.
6. The combination with the working shaft, means for restricting the speed of said shaft, a motor, an intermediate -Hutch, and yielding connections between the driven member of the clutch and said shaft. of a stop device for arrest ing the sald driven member on completion of each rotation. means for shifting the stop device to conncet the clutch members, means for automatically reatoring the stop device to stop position after the driven member jegins its rotation. means for preventing the action of the shifting means \(c=\) the stop device untll the rotation of the dri;en member is completed, and means for preventing a second shisting of the stop device by the shifting means until after the later is restored to normal position.
7. The combination with a working shaft, and means restricting its speed, of a motor, a clutch having its driving member connected with the motor and its driven member yicldingly connected with the working shaft, a stop for arresting the movement of the driven member of the clutch on the completion of each rotation, key actuated means for shifting the stop from stop position when the working shaft is at rest, and means adapted to adjust the key actuated means to inoperative position on the commencement of each actuation of the working shaft and to maintain the parts in such position throughout the movement of said shaft.
8. The combination with a working shaft, and means for restricting its speed, of a motor. a clutch having its driving member connected with the motor, and its driven member yleldingly connected with the working shaft, a swinging stop for arresting the movement of the driven member of the clutch on the completion of each rotalion, a key, means adapted to be reciprocated by said key to swing said stop from operative position, and means for automatically disengaging said key actuated means from the stop as the rotation of the driven clutch begins.
9. The combination with a working shaft. and means for restricting its speed, of a motor, a clutch having its driving member connected with the motor and its driven member yleldingly connected with the working shaft. a stop carried by a rock shaft for arresting the movement of the driven clutch member on the completion of each rotation, a key, means operated by the key for rocking the stop shaft to move the step from engagement with the driven clutch member, and means actuated by the rotation of the driven clutch member for shifting sald key actuated means out of operative position relative to the stop shaft.

No. 101,518. Alidade for 8hip Compasses. Alidade pour compas de vaisseave.

Isabel B. Kilham, Allston, assignee of Harry Peyton Arbecam, Boston, both in Massachusetts, U.S.A., 16th October, 1906; 6 years. Filed 31st May, 1906. Receipt No. 100,437.
Claim.-1. The binnacle with its hood or top inclosing the compass, a rotatable vertical shaft section 16 formed with a concentric collar 17 by which it is supported centrally in the binnacle top, an adjustable extension thereof above the binnacle top, and a sighting tube or pointer pivoted to the lop of sald extension, for rotation with said shaft section and for movement independently thereof only in a vertical plane, in combination with an axial prolongation of sald shaft section within and wholly supported by the binnacle, such prolongation extending down almost to the compass dial, and with a transverse indicator having a short vertical stem 33 concentric with such prolongation, adapted to rest upon but not connected with the compass plate, and formed with a lateral lug 34 moving in a slot in the prolonged shaft. said indicator and stem having a limited vertical movement independent of the prolonged shaft, the indicator normally maintaining the same radial position as the sighting tube, substantially as set forth.
2. The binnacle and its hood or top inclosing the compass, \(\therefore\) central tubular shaft section 16 , mounted for rotation in the binnacle top and extending above and below it, a tubular upward extension 20 secured to sald section by screw 23 , and an inclosed adjustable member 25 , connected thereto hy a binding screw 27, these parts forming the upper shaft section, and a downward prolongation extending from the central part and forming the lower section of the shaft, said section being longitudinally grooved or slotted to receive a binding screw, whereby the parts are adjustable vertically without radial variation, in combination with the sighting tube pivoted to the top of the upper section, and the transverse indicator connected to the foot of the lower section by a vertical stem concentric therewith resting loosely on the compass dial, such tube and indicator having independent vertical movements, but normally maintained in the same radial plane, substantially as set forth.
3. The binnacle with its hood or top inclosing the compass. a vertical rotatable shaft extending above and supported by the binnacle top, and a sighting tube secured to the upper end thereof. in combination with a downward prolongation of the shaft formed in a single plece, having an open or ring-like portion spread in a plane at right angles to the sighting tube, so that the shaft will be removed from the line of vision and the compass dial will be unobstru ted where bearings are being taken, and with an indicator mounted over the face of the diel, loosely connected to the foot of sald shaft and maintained in radial alignment with said tube, substantially as set forth.
4. The described compass indicator and deviation corrector, comprising a sectional vertical shaft mounted rotatably in a supporting bearing in the binnacle top and pro vided at opposite termini with a sighting device and radial indteator normally maintained \(n\) the same vertical planc, the upper section of said shaft being rxtensible and consisting of an inner axial member having the sighting de. vice pivoted to its upper end and a deviation pointer projreting rigidly in the same vertical plane from a noint near its lower end, and of an oute: tubular momber surrounding said axial member, slotted lengthwise and crosswise to permit longitudinal and radial adjustment of the member and its protruding pointer, and with a terminally graduated sictor plate fixed to and extending horizontally from sald tubular member at the foot of said slots, for the purpose set forth.

No. 101,519. Miners' Candlestick and Match Safe. Chandelier et porte-allumettes de sûreté pour mineurs.

John B. Lindahl and Charles Phillips, assignee of a interest, both of Denver, Colorado, U.S.A., 16th October, 1906; 6 years. Filed 15th May, 1906. Receipt No 135,926.
Claim.-1. In a miner's candlestick, the combination of a hollow handle, constituting a match case, a removable cap inclosing one end of said handle, the opposite end of said handle provided with a threaded recess, a spear removably positioned within sald recess, a hook carried by the spear and a candle supporting member carried by said spear comprising a folded sheet of material provided with a slitted end producing tongues of different lengths and of substantially the same width, one of said tongues provided with an aperture, the opposite end of said sheet provided with a tongue having a tapering end and a body portion of the same width as the unapertured tongue formed upon the opposite end.
2. In a miner's candlestick, the combination of a hollow handle, constituting a match safe, a removable cap inclosing one end of said handle, the opposite end of said handle reduced in thickness and provided with a threaded recess, a removable spear positioned within said recess, a hook supported by said spear and handle, a candle supporting member carried by said spear and handle, said member comprising a body portion provided with an apertured tongue extending at right angles from the lower portion of said body portion, and said body portion provided with overlapping upper tongues, one of said tongues provided with an end extending at an angle to said apertured tongue.
3. In a miner's candlestick, the combination of a hollow handle provided with a penetrating point, said handle constituting a match safe. a cap closing one end of said handle, a removable hook supported upon said handle, and a candle supporting member carried by said handle, sald member comprising a single sheet of metallic material, said sheet provided with tongues of different lengths formed upon one end, and a single tongue formed upon the other end of the same width as one of said tongues.
4. In a miner's candlestick. the combination of a match receiving receptacle provided with a penetrating point. a removable hook assembled with said receptacle, and a candle supporting member carried by said receptacle, comprising a body portion provided with tongues of different lengths, some of said tongues overlapping and lying in substantially parallel position, and anothes tongue profecting at substantially right angles from said body portion and the other tongues.

\section*{No. 101,520. Furnace for Burning Producer Gas.} Fournaise à gaz.
The Harder Gas Furnace Company, ssignee of William \(L\). Harder, both of Birmingham, Alabama, U.S.A., 16 th October, 1906; 6 years. Filed 23rd May, 1906. Receipt No. 136,165.
Claim.-1. In a boiler furnace, a main casing, a combus'ion chamber, an auxiliary casing, an ignition chamber, said chambers having a continuous substantially horizontal flooring formed of heat radiating material and having an air admission opening or openings only at or near the outer end of sald ignition chamber, a port or ports for the admission of gas adjacent to the point of air admission. said ports being so arranged that the air and gas mix freely in ignition chamber and flow in a substantially straight course through both of said chambers.
2. In a boiler furnace, a casing in which the boiler is mounted, a bridge wall within the casing to the front of

which extends a heat radiating floor for the combustion rhamber disposed beneath the front end of the boiler, an auxiliary casing disposed to the front of the boiler, an ignition chamber therein the floor of which is iormed by an uninterrupted continuation of the heat radiating floor of sald combustion chamber, said flooring and chambers being without openings except at or near the outer end of said ignition chamber, and means to admit air and gas through said openings so that they commingle and flow in a substantially undeflected course through said chambers to the bridge wall.
3. In a furnace for burning producer gas, a combustion chamber, an ignition chamber which opens into the outer end of said combustion chamber and forms a free and unobstructed continuation thereof, a gas supply entering the front end of said ignition chamber and adapted to discharge the gas in a thin sheet so that it fiows in a substantially straight course through both of said chambers, whereby the draft is not obstructed, and valve controlled conduits disposed so as to be heated by the burning gas, which admit a regulated volume of highly heated air into said ignition chamber at a point adjacent to said nozzle.
4. In a furnace, a combustion chamber formed with an extension constituting an ignition chamber, a bridge wall air flues formed beneath said chambers and leading back toward said bridge wall, then forward to said ignition chamber, a foraminous plate through which said air enters said latter chamber, and means to introduce gas at a proper point for admixture with said air.
5. The combination with a steam boiler furnace and its casing, of a combustion chamber beneath said boiler, an ignition chamber formed in an extension of said casing forward of the boller and constituting a continuation of said combustion chamber, said chambers having a substantially continuous horizontal flooring formed of refractory material, means to admit air and gas only at the outer end of said ignition chamber, means to cause the air and gas to become highly heated before admission to said ignition chamber by conducting them through conduits within the rxtension of said furnace and communicating with said ignition chamber.
6. In a furnace for burning produce gas, the combination with the main casing and a combustion chamber therein, of an auxillary casing having an ignition chamber forming a continuation of said combustion chamber and having direct and trobstructed communication therewith, said ignition chamber having walls of refractory material and disposed without the main casing, means to heat the gas in said casing and to convey it in a highly hrated condition to the outer end of said ignition chamber, vilve means to control the flow of heated gas, and means io heat air in said casings and introduce it into the ignition chamber to rommingle therein with the heated gas.
50. 101,521. Lens. Lentille.

The Corning Glass Works. Corning. New York, assignee of Willian Churchill, New Britain. Connecticut, C.S.A., 16th October, 1906; 6 years. Filed 25th May, 1906. Heceipt No. 136,201.
Chim.-1. A lens of the type described having a series of zones, each element of which is focused upon a different point in the axis of the lens, substantially as set forth.
2. A lens of the character described having a series of zones, each clement of which is focused upon a different point in the axis of the lens and in front of a focal plane. substantially as set forth.
3. A lens of the character described having a series of zones, each element of which is focused upon a different point in the axis of the lens, the focal lines of said zones when projected across said axis converging on a definite plane or surface parallel to the plane or surface of the lens, substantially as set forth.
4. A lens in which the various parts or zones are focused upon various points of a definite luminous area whereby a maximum proportion of the light is thrown in a beam of parallel rays from the lens in the direction of its axis, and a maximum of the remaining rays are refracted convergently within the parallel beam. substantially as set forth.
5. An improvement in the art of signalling by light rays which consists in focusing the several parts or zones of a lens upon various points of a definite luminous area of the source of illumination. whereby a large proportion of the flame is thrown in a beam of approximately parallel rays from the lens in the direction of its axis or the axes of its various segments. substantially as set forth.

\section*{No. 101,522. Ingnlator. Isoloir.}

The Lock Insulator Manufacturing Company, assignce of Walter T. Goddard, both of Victor, New York, U.S.A.. 16th October, 1906: 6 years. Filed 7th August, 1905. Receipt No. 127.485.
Claim.-1. An insulator having a cap piece of substantially uniform thickness throughout, and a separate conductor seat secured to said cap piece, substantially as set forth.
2. An insulator having a porcelain cap plece of substantially uniform thickness throughout, and a separate conductor seat secured to said cap piece and consisting of a narrow strip having a retaining groove for the conductor, susbtantially as set forth.
3. An insulator comprising a cap piece of substantially uniform thickness throughout, a separate condurtor ses 1 having a retaining groove for the conductor, and a split sccuring band for the conductor seat clamped about the crown of the cap plecesubstantially as set forth.
4. An insulator provided with an insulating cap piece, a separate conductor seat, and a securing band for said con-

ductor seat clamped about said cap plece, substantially as set forth.
5. An insulator comprising a non-conducting body, a separate substantially trough-shaped conductor seat secured directly to said non-conducting body with its ends projecting beyond the body to form securing extensions for the conductor, said conductor seat being materially narrower than said body, and a narrow securing band for said conductor seat encircling said body and connected to said seat at separated parts thereof, whereby said seat and securing band cover only a relatively small portion of the bods, substantially as set forth.
6. An insulator comprising a non-conducting body having an insulating cap plece, a separate conductor seat extending across the crown of said cap piece, and a narrow securing band for said conductor seat secured about said crown, substantially as set forth.

No. 101,523. Press for Extracting Oil from Soeds. procédé pour ertraire l'huile des graincs.

The Sherwin Williams Company, assignee of Albert D. Anderson, both of Cleveland, Ohio, U.S.A.. 16th October. 1906; 6 years. Filed 19th May, 1906. Receipt No. 136,095.
Claim.-1. In comblation with a press, a strainer to recoive the oll therefrom, and means for returning the solid matter withdrawn from the oll to the press.
2. In combination with a press, means for separating the solid matter from the oil passing from the press and returning such solid matter to the press for further treatment.
3. In combination with a press, a strainer to receive the oil therefrom. means working within the strainer to with. draw the solid matter from the same, and means for returning the solid matter to the press for further treatment.
t. In combination with a press, a strainer to receive the oil therefrom, a screw working within the stralner and acting to remove the solld mattor from the oll, and a conveyer for returaing the solid matter thus removed to the press for further treatmont.
5. In combination with a press, a strainer to receive the oil therefrom, a screw working in the strainer, and means for maintaining the strainer in olose contact with said screw.
6. In combination with a press, a strainer to receive the oil therefrom, a screw working in the strainer, means for maintaining the strainer in close contact with said screw. and means for returning the solid matter withdrawn from the strainer by the screw to the press for further treatment.
7. In combination with a press, a strainer to receive the oll therefrom. a screw working in the strainer, sald screw having an independent section or flight adjacent to the discharge end of the strainer, a cover fitting over said section or flight, and means for maintaining the strainelin close contact with the screw.
8. In combination with a press, a strainer to receive the oil therefrom, means contained within the strainer for removing the solid matter therefrom in a relatively dry state, and means for returning said matter to the press for further treatment.
9. In combination with a press, a strainer mounted below the same, said strainer being inclined away from the head of the press, means contained within the strainer for removing the solid matter therefrom and discharging the same from the elevated end of the strainer, and means for returning said matter to the press for further treatment.
10. In combination with a press, a pan below the same, a strainer located beneath the pan and receiving the oil therefrom, means contained within the strainer for withdrawing the solid matter therefrom, and means for returning the solid matter to the press for further treatment.
11. In combination with a press, a pan below the same, said pan being provided with a discharge opening at or near one end thereof, a strainer located beneath the pan and inclining upwardly away from the opening, means for withdrawing the solid matter from the upper end of the strainer, and means for returning said matter to the press.
12. In combination with a press, a pan below the same, a stralner recelving the oil from the pan, means for withdrawing the solid matter from the strainer and returning the same to the press, a trough located beneath the strainer, and means for holding the strainer in close contact with the means working therein which removes the solid matter.
13. In combination with a press, a strainer to receive oil therefrom, a screw working in the strainer, a pan below the strainer, and means interposed between the pan and the strainer for maintaining the strainer in close contact with the screw.
14. In combination with a press, a strainer located beneath the same, a screw working in the strainer, a pan beneath the strainer, a series of \(U\)-shaped supports for the strainer, and means for securing adjustment of said supports.
15. In comblination with a press, a strainer comprising a substantially U-shaped foraminous body, members secured co the upper edges of said body, a head plece at the upper end of the foraminous body, andi a tail piece at the opposite end, a series eof \(U\)-shaped supports pivotally connected to the members secured to the body of the strainer, and means for adjusting said supports.
16. In combination with a press, a strainer comprising a substantially U-shaped body, a series of adjustable supports therefor, a screw conveyer working in said strainer, and adjustable bearings for the opposite ends of said conveyer, whereby the inclination of the U-shaped body and sorew may be varied as desired and the strainer held in close contact with the screw, substantially as described.
17. In combination with a press, a strainer comprising a substantially U-shaped foraminous body, a head casting, a tail casting, an angle plate and a bar sacured to each upper edge of the foraminous body, said plates and bars being seated at their ends in the head and tail castings, a series of U-shaped supports pivotally connected to said angle plates, a series of adjustable elbow levers pivoted below said supports, an adjustable pin mounted in one end of each of said levers and bearing against the under face of the U shaped supports, and a screw working in the strainer.
18. In combination with a press, a strainer, means for removing the solid matter therefrom and returning the same to the press, means for effecting a further separation of the solld matter from the oil which passes from the strainer, and means for returning to the press the solid matter thus recovered.
19. In combination with a press, a primary mechanism for receiving the oil directly therefrom, effecting a substantial separation of the foots from the oil and returning such foots to the press, and a secondary mechanism receiving the oil from the primary mechanism, said secondary mechanism effecting a final separation and returning the foots to the press.
20. In combination with a press, means for effecting a substantially complete separation of the foots from the oil after
the oll has passed from the press, and means for returning he foots to the press.
21. In combination with a press, a strainer, means for removing the solid matter therefrom and returning it to the press, a settling tank receiving the oil from the strainer, and means for withdrawing the solid matter from the tank.
22. In combination with a press, a strainer. means for removing the solid matter therefrom and returning it to the fress, a settling tank receiving the oll from the strainer, and means for removing the solid matter from the tank and returing it to the press.
23. In combination with a press, a strainer, means for removing the solid matter therefrom and returning it to the press, a settling tank receiving the oil from the strainer. means for heating said tank, and means for withdrawling the solid matter from the tank and returning it to the press.
24. In combination with a press, a strainer, means for removing the solid matter therefrom and returning it to the press, a settling tank receiving the oil from the strainer, means for heating said tank, and a sorew mounted in the tank. said screw serving to withdraw the solid matter from the tank.
25. In combination with a press, a strainer, means for removing the solid matter therefrom, a settling tank receiving the oil from said strainer, said tank being provided at one end with an oil outlet and at its oppos!te end with an elerated mouthpiece, and a screw mounted in said tank and serving to feed the solid matter toward the elevated mouthplece.
26. In combination with a press, a strainer, means for removing the solid matter therefrom, a settling tank receiving the oil from said strainer. said tank being provided at one end with an oll outlet and at its opposite end with an elevated mouthpiece. a screw mounted in sald tank and serving to feed the solid matter toward the mouthplece, and means for heating the tank.
27. In combination with a press, having a feed hopper, means for effecting a separation of the foots from the oil which passes from the press, an endless conveyer serving to return the foots thus separated to the hopper, and means for removing the material from the conveyer.
28 In combination with a press having a feed hopper, means for effecting a separation of the foots from the oil which passes from the press, an endless bucket conveyer serving to return the foots thus separated to the hopper, and means for withdrawing any adhering matter from the buckets and causing its discharge into the hopper.
29. In combination with a press having a feed hopper. means for effecting a separation of the foots from the oil which passes from the press, an endless bucket conveyer receiving the foots thus recovered, said conveyer having a spout which discharges into the hopper, and means working in line with said spout to clear the buckets and throw the matter thus removed into the spout.
30. In combination with a press having a feed hopper, means for effecting a separation of the foots from the oll which passes from the press, an endless bucket conveyer recelving the foots thus recovered, said conveyer having a spout which discharges into the hopper, a pivoted scraper standing in line with the spout and with the buckets, and spring actuated mechanism for throwing the scraper rearvardly as it passes out of contact with each of the buckets, whereby adhering matter will be removed from the buckets and directed into the spout.
31. In combination with a continuously operating press, a strainer to receive the oil therefrom, and means for returning the solid matter withdrawn from the oil to the press.
32. In combination with a continuously operating press, means for separating the solid matter from the oil passing from the press and returning such solid matter to the press for further treatment.
33. In combination with a continuously operating press, a strainer to receive the oll therefrom, means working within the strainer to withdraw the solid matter from the same, and means for returning the solld matter to the press for further treatment.
34. In combination with a continuously operating press, a strainer to receive the oil therefrom, a screw working within the strainer and acting to remove the solld matter from the oil, and a conveyer for returning the solid matter thus removed to the press for further treatment.
35. In combination with a continuously operating press. a strainer to receive the oll therefrom, a screw working in the strainer, and means for maintaining the strainer in close contact with said screw.
36. In combination with a continuously operating press, a strainer to receive the oil therefrom, a screw working in the strainer, means for maintaining the strainer in close contact with said screw, and means for returning the solid matter withdrawn from the strainer by the screw to the press for further treatment.
37. In combination with a continuously operating press, a stralner to receive the oil therefrom, a screw working in the
strainer, said screw having an independent section or filght adjacent to the discharge end of the strainer, a cover fitting over said section or flight. and means for maintaining the strainer in clos. contact with the serew.
38. In combination with a continuously operating press. a sirainer to receive the oil therefrom, means contained within the strainer for removing the solid matter therefrom in a relatively dry state, and means for returning said matter to the press for further treatment.
39. In combination with a continuously operating press, a strainer mounted below the same, said strainer being inclined away from the head of the press, means contained within the strainer for removing the solld matter therefrom and discharging the same from the elevated end of the strainer, and means for returning said matter to the press for further treatment.
40. In combination with a continuously operating press, a pan below the same, a strainer located beneath the pan and recelving the oil therefrom, means contained within the strainer for withdrawing the solid matter therefrom. and means for returning the solid matter to the press for further treatment.
41. In combination with a continuously operating press having a feed hopper, means for effecting a separation of the foots from the oll which passes from the press, and endless conveyer serving to return the foots thus separated to the hopper, and means for removing the material from the conveyer.

No. 101,524. Set Ring. Collet dessieur.

George H. Best, Hampton, New Brunswick, Canada, 16th October, 1906; 6 years. Filed 11th June, 1906. Receip: No. 136,785.
Claim.-1. A set ring for shafts comprising two separable sections, each of which is in two parts or nalves, one of said sections having an externally threaded portion and the other section having an internal thread to receive the externally threaded portion to force the same agains' the shaft, to grip the same, substantially as set forth.
2. A set ring for shafts comprising two separable sections. each of which is in two parts or halves. one of said sections having a projecting hollow stem externally threaded and tapered, in each half of which stem is a saw cut, and the other section interlocked or joined together by dovetailed ribs bearing in dovetalled channels and having an internal thread to receive the threaded stem, to force the same against the shaft, all substantially as set forth.
3. A set ring for shafts comprising a split ring having on one side a projecting hollow stem. externally threaded and tapered, fitting on the shaft, and having an annular groove or channel adapted to receive the annular shoulder of the nut, a spllt nut screwed on the stem for forcing it against the shaft to grip the same, and means for fastening the nut sections together, all substantially as set forth.

\section*{No. 101,525. Gas Bmrner. Brûleur d gaz.}

Frederick Egge, Bridg.port. Connecticut, U.S.A., 16th October. 1906; 6 years. Filed 2Jth May, 1906. Receipt No 136.229.

Claim.-1. In a device of the character described, the combication of the lower faction having a tubular passage, a diaphragm which by gravity normally closes the upper end of sald passage, a valve supported by sald diaphrasm and rapable of displacement. the upper section secured to the lower section and having a gas duct immediately above
sald valve whereby the upward movement of the diaphragm will cause the valve to close sald duct, and means for dis-

placing said valve thereby opening the duct and establishing a free passageway for the gas.
2. In a device of the character described, the combination of the lower section having a tubular passage, a diaphragm which by gravity normally closes the upper end of said passage, a valve supported by said diaphragm and capable of displacement, the upper section secured to the lower section an dhaving a horizontal partition through which extends a duct and whose lower central portion forms a depending valve seat surrounding said duct and immediately above said valve, and means for thrusting sald valve from its seated position.
3. In a device of the character described, the combination of the two sections one having a tubular passage while the other has a horizontal partition provided with a duct imin diately above the upper end of said passage, a gravity diaphragm which normally closes said end, a valve supported by said diaphragm whereby the gas pressure will clevate the diaphragm and cause the valve to close sald duct, and means for thrusting the valve away from the duct into a position between the diaphragm and the partition whereby said diaphragm will be prevented from closing the duct and a free passageway for the gas will thereby be afforded.
4. A gas burner comprising complementary section: concaining lower and upper gas passages separated from each other by an intervening space, a diaphragm which normally closes the lower passage, a mechanically displaceable valve supported by said diaphragm immediately below the upper passage whereby the diaphragm is elevated by gas pressure said passage will be closed by said valve, and means for thrusting said valve away from said passage and into a position where it will prevent the diaphragm from closing said upper passage.
5. A gas burner comprising complementary sections containing lower and upper gas passages separated from each other by an intervening space, a diaphragm which normally closes the lower passages and has a concave upper surface. a ball valve which normally rests frecly upon the center of said suriace immediately below the upper passage, a partition which horizontally divides the upper section and through which the upper gas passage is plerced said partition being recessed near sald passage, and means for forcing said ball into the recessed portion of said partition.
6. In a device of the character described, the combination of the lower section having a tube extending upward therethrough and an air space around said tube the latter being open at top and bottom and coustituting the Inlet passage for the gas, a cap shaped gravity diaphragm which normally rests upon the top of said thbe and whose sides extend loosely within said air space, a valve supported by said diaphragm and capable of displacement, the upper section secured to the lower section and having a gas duct immediately above sald valve whereby the upward movement of the diaphragm will cause the valve to close said duct, and means for displacing said valve thereby opening the duct and establishing a free pasageway for the gas.
7. In a device of the character described, the combination of the lower section having a tube extending upwardly therethrough and an air space around said tube the latter being op'n at top and bottom and constituting the inlet passag. for the gas. a cap-shaped gravity diaphragm which normally rosts upon the top of said tube and whose sides extenl looscly within said air space, a valve supported by suid dia phragm and capable of displacement, the upper section
secured to the lower section and having a horizontal partition through which extends a duct and whose lower central portion forms a depending valve seat surrounding said duct and immediately above said valve, and means for thrusting said valve from its seated position.
8. In a device of the character described, the combination of the two sections, one having a tubular passage and a surrounding air space while the other has a horizontal partition provided with a duct immediately above the upper end of sald passage, a cap-shaped gravity diaphragm whose upper face is concave and which normally closes the top of said passage and whose sides extend loosely within said alr space, and a ball valve loosely supported by said diaphragm.

No. 101,526. Truss. Bandage herniaire.

William S. Hobson, Grenada, Mississippi, U.S.A., 16th October, 1906; 6 years. Filed 16th May, 1906. Receipt No. 135,981 .
Claim-In a truss, a pad comprising a cup baving one face provided with a cavity and with a centrally disposed orifice, a colled spring seated in the orifice and having one terminal disposed along the back of the pad and secured thereto, a pressure knob having a stem secured between the coils of the outer end of the spring, and a plate secured to the back of the pad and subserving the double function of an abutment for the spring, and a means of connection with the truss belt.

\section*{No. 101,527. Bracket for Electric Lights. Console pour lumières électriques.}

Eugene Feodor Hug, Elgin, Oregon, U.S.A., 16th October, 1906; 6 years. Filed 26th May, 1906. Receipt No. 136,278.
Claim.-1. An electric light support or fixture comprising an arm pivotally supported to swing in an approximately 10-19
horizontal plane and constituting a conductor, and an electric lamp mounted to travel upon said arm and deriving current therefrom by direct contact in any adjusted position.
2. An electric light fixture comprising a pivotally mounted arm composed of longitudinally arranged bars electrically insulated from each other and forming conductors, an electric lamp mounted to travel upon the members of said arm and receiving current therefrom in any adjusted position, and means for adjustably connecting the lamp with the said arm.
3. An electric light fixture comprising a swinging arm embodying longitudinal sections electrically insulated from each other, means for supplying an electric current to said sections, and an electric lamp mounted to travel upon the arm and in electric connection with the respective sections thereof.
4. An electric light fixture comprising a pivotally mounted arm comprising longitudinal sections electrically insulated from each other, a carrier mounted to travel upon said arm and having electrically insulated parts in electrical connection with corresponding sections of the arm, an electric lamp, an electric cord connecting said lamp with the respective parts of the carrier, and a take-up in the length of said electric cord to admit of lengthening and shortening it.

No. 101,528. Process of Preparing Skins and Furg. Procédé pour la préparation des peaux.

Jacob Klugmann, Riga, Russia, 16th October, 1906; 6 years. Filed 17th May, 1906. Receipt No. 136,005.
Claim.-1. The process for the treatment of skins and furs, consisting of the application of a coating of rubber or caoutchouc with the addition of oxide of zinc, chalk and liquid hydro-carbons to the tanned flesh side of the hide, such coating being fixed thereon by vulcanization.
2. In the treatment of skins and furs, applying a mixture of caoutchouc, oxide of zinc, chalk, and liquid hydro-carbons, and vulcanizing such mixture by means of bisulphide of carbon and chloride of sulphur.
3. In the treatment of skins and furs, applying a mixture of caoutchouc, oxide of zinc, chalk, and liquid hydro-carbons with the addition of mineral colours or the like, and vulcanizing such mixture by means bisulphide of carbon and chloride of sulphur.

No. 101,529. Lamp Burner. Bec de lampe.

FIG 3

FIG 5

Roy H. Maple, Minneapolis, Minnesota, U.S.A., 16th October, 1906; 6 years. Filed 25th May, 1906. Recelpt No. 136,218. Claim.-1. The combination with a burner having a wick tube. of a retaining band having means for attachment to said burner, and a series of inwardly turned prongs on its upper edge, and a glass cone inserted into sald band from the under side and having a flame opening to coincide with said tube and an annular groove near its lower edge to receive said prongs, substantially as described.
2. The combination with a lamp burner having a wick tube and an air inlet plate, of a retaining band having means for attachment to said burner and provided on its upper edge with a series of inwardly turned prongs having outwardly turned tips, a glass cone inserted into said band from the under side, and having an annular groove near its base to receive said prongs, and said groove having a square upper face or shoulder, substantially as described.
3. The combination of a burner having a wick tube, of a retaining band having means for attachment to said burner and having a cone locking means and upwardly projecting caps, a glass cone inserted into said band from the under side and having a flame opening to coincide with said tube and held by said locking means, and shoulders or bosses provided on said cone and adapted to enter said caps and lock said cone against rotation, substantially as described.
4. The combination of a burner having a wick tube, and a band having means for attachment to said burner, and a glass cone fitting in said band, and having a flame opening to colncide with said tube, the lower diameter of said cone being greater than the diameter of the opening in the upper portion of said band and the upper portion of said band: grasping the cone and constituting a seat and holder therefor, whereby the cone may be inserted through the band and brought to position on its seat from beneath the band and be held by the seat against accidental displacement therefrom, substantially as described.
\(\overline{5}\). The combination with a burner having a wick tube, of a bend, and glass cone inserted into said band from the under side and having a flame opening to coincide with said tube and said band having means for attachment to said burner, and a retaining means for said cone, and said band being also provided with means to prevent the accidental rotation of said cone therein.
6. The combination with a burner having a wick tube, of a band having means for attachment to said burner, and a glass cone composed of two sections fitting in said band and having a flame opening to coincide with said tube, the lower diameter of the cone being greater than the diameter of the opening in the upper portion of the band, and the upper portion of the band grasping the cone and constituting a seat and holder therefor, whereby the cone may be inserted through the band and brought to its seat from beneath the band and be held by the seat against accidental displacement tharefrom, substantially as described.

No. 101,530. Type Casting Machine.
Machine pour la fonte des caractères.

Sylvester J. Sennett, Chicago, Illinois, U.S.A., 16th October, 1906: 6 years. Filed 11th August, 1906. Recelpt No. 138,608.
Claim.-1. In an automatic type casting and finishing machine, the combination with a casting pot having a piston chamber and piston, a discharge nozzle, a valve chamber and choker and nozzle valves, of a reciprocating bottom mould member, laterally movable side mould members, a recipro-
cating plunger or extractor blade having a head furnished with a type set stop shoulder and adapted to slide between said side mould members and move laterally therewith and iorming the upper face of the mould, and an adjustable type set stop or finger adapted to engage said type set stop or shoulder on the head of sald plunger or extractor blade, a rocking carrier upon which said side mould members and said extractor blade are mounted, a matrix and matrix holder mounted on said rocking carrier and independently morable to and from said side and bottom mould members, said matrix forming the face end of the mould, an end plate forming the opposite end of the mould and interposed between said side mould members F F and said nozzle, a guide for the cast type, a sprue or jet removing device, a grooving tool for the sprue or jet end of the type, and one or more rotary nicking tools for nicking the body face of the type as the same are forced along the guide by the extractor plunger or blade, substantially as specified.
2. In a type casting machine the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members. a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members. substantially as specified.
3. In a type casting machine, the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould nember, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members. and a type guide to receive the type as they are discharged from said side mould members by the extractor blade, substantially as specified.
4. In a type casting machine, the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members, a type guide to receive the types as they are discharged from said mould members by the extractor blade, and a sprue or jet removing device, substantially as specifed.
5. In a type casting machine, the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom membery, a type guide to receive the type as they are discharged from said side mould members by the extractor blade, a sprue or jet removing device, and a finishing tool for the sprue or jet end of the type, substantially as specified.
6. In a type casting machine the combination with a casting pot and piston and discharging nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix nolder movable to and from said side and bottom members. a type guide to receive the type as they are discharged from said side mould members by the extractor blade, a sprue or jet removing device, a finishing tool for the sprue or jet end of the type, and a rotary nicking tool, substantially as srecifled.
7. In a type casting machine the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members, a type gulde to receive the type as they are discharged from sald side mould members by the extractor blade, and a rocking carrier upon which said side mould members, extractor blade, matrix and matrix holder are mounted, substantially as specified.
8. In a type casting machine the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extrartor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members, a type guide to receive the type as they are discharged from said side mould members by the extractor blade, a rocking carrier upon which said side mould members, extractor blade matrix and matrix holder are mounted, and a finishing tool for the sprue or jet end of the type, substantially as speciffed.
9. In a type casting machine the combination with a castin pot and piston and discharge nozzle, of a reciprocating bottom mould member. laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and matrix holder movable to and from said side and bottom mould members,
a type guide to receive the type as they are discharged from sald side mould members by the extractor blade, a rocking carrier upon which said side moulds, extractor blade, matrix and matrix holder are mounted, and a rotary nicking tool, substantially as specified
10. In a type casting machine the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding be tween said side mould members, a matrix and matrix holder movable to and from said side and bottom mould members, a movable carrier upon which said side mould members, plunger or extractor blade, matrix and matrix holder are mounted, and an end plate interposed between said discharge nozzle and said side and bottom mould members, substan tially as specifed.
11. In a type casting machine the combination with a cast ing pot and piston and discharge nozzle, of a reciprocating hottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding be tween sald side mould members, a matrix and matrix holder movable to and from said side and bottom mould members. a movable carrier on which said side mould members, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge nozzle and said side and bottom mould members, and a type guide to receive the type as they are discharged from said side mould members, substantially as specifled.
12. In a type casting machine the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sllding hetween said side mould members. and a type set finger or stop, said plunger or extractor blade having a head furnished with a stop shoulder to engage sald type set stop or finger, a matrix and a matrix holder movable to and from sald side and bottom mould members. a movable carrier on which said side mould members. plunger or extractor blade. matrix and matrix holder are mounted, an end plate interposed between said discharge nozzle and said side and bottom mould members, a type guide to receive the type as they are discharged from said side mould members, substantially as specified.
13. In a type casting machine the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members. a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and matrix holder movable to and from said side and bottom mould members. a movable carrier on which said side mould members, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge nozzle and sald side and bottom mould members. a type guide to receive the type as they are discharged from said side mould members. and nicking tools engaging the type as they are pushed along the type gulde by said plunger or extractor blade, substantlally as specified.
14. In a type casting machine the combination with a casting pot and piston and discharge nozzle. of a reciprocating bottom mould member, laterally movable side mould memters, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and matrix holder movable to and from said side and bottom mould members, a movable carrier on which said side mould members, plunger or extractor blade, matrix and matrix holder are mounted. an end plate interposed between said discharge nozzle and said side and bottom mould members, a type guide to receive the type as they are discharged from said side mould members, and a finishing tool or the sprue or neck end of the type engaging the type as they are pushed along said guide by said plunger or extractor blade, substantially as specified.
15. In a type casting machine the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and matrix holder movable to and from said side and bottom mould members, movable carrier on which said side mould members, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge nozzle and said side and bottom mould members, a type guide to recelve the type as they are discharged from said mould members, a grooving tool for the sprue or neck end of the type engaging the type as they are pushed along the type guide by said plunger or extractor blade, and a spring actuated type holding finger or device for pressing or holding the type endwise against said grooving tool, substantially as specifled.
16. In a type casting machine, the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, \(a\) reclprocating plunger or extractor blade sliding
hetween said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members, a movable carrier on which sald side mould members, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge vozzle and said side and bottom mould members. a type suide to receive the type as they are discharged from said mould members, nicking tools engaging the type as they are pushed along the type guide by said plunger or extractor blade, said type guide having a spring pressed back plate, substantially as specified.
17. In a type casting machine. the combination with a cast ing pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members. a matrix and a matrix hold er movable to and from said slde and bottom mould members, a movable carrier on which said side mould members plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge rozzle and said side and bottom mould members. a type guide to receive the type as they are discharged from said side mould members, and a sprue or jet removing device, substantially as specified.
18. In a type casting machine, the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members, a movable carrier on which said side mould membors, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge nozzle and said alde and bottom mould members, a type guide ts receive the type as they are discharged from said side mould members, a sprue or jet removing device, and a finishing tool for the sprue or jet end of the type, substantially as specified.
19. In a type casting machine, the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a member and a matrix holder moving to and from said side and bottom mould memhers, a movable carrier on which said side mould members plunger or extractor blade, matrix and matrix holder are rounted, an end plate interposed between said discharge nozzle and said side and bottom mould members, a type guide to receive the type as they are discharged from sald side mould members, a sprue or jet removing device, a finishing tool for the sprue or jet end of the type, and a spring actuated type holding or pressing device for pushing the type endwise against said finishing tool, substantially as specified
20. In a type casting machine, the combination with a cast irg pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between sald side mould members, a matrix and a matrix lolder movable to and from said side and bottom mould members, a movable carrier on which said side mould members, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge riczzle and said side and bottom mould members, a type guide to recelve the type as they are discharged from said mould members, a sprue or jet removing device, a finishing tool for the sprue or jet end of the type, and a rotary nicking tool substantially as specified.
21. In a type casting machine, the combination with a cast ing pot and piston and discharge nozzle. of a reclprocatng bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould. m:embers, a movable carrier on which said side and bottom mould members, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge nozzle and said side and bottom members, a type guide to receive the type as they are discharged from said side mould members, a sprue or jet removing device, a finish ing tool for the sprue or jet end of the type, a spring actuated type holding or pressing device for pushing the type endwise against said finishing tool, and a rotary nicking tool, substantially as specified.
22. In a type casting machine, the combination with a casting pot and piston and discharge nozzle, of a reciprocating bottom mould member, laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and a matrix holder movable to and from said side and bottom mould members, a movable carrier on which said side mould member, plunger or extractor blade, matrix and matrix holder are mounted, an end plate interposed between said discharge
nozzle and said side and bottom mould members, a type guide to receive the type as they are discharged from said side mould members and provided with a spring held back plate, a sprue or jet removing device, a finishing or grooving tool for the sprue or jet end of the type, a spring actuated type kolding or pressing device for pushing the type endwise against said grooving or finishing tool, and a rotary nicking tool, substantially as specified.
23. In a type casting machine, the combination with a reciprocating bottom mould member, of laterally movable side mould members, a reciprocating plunger or extractor blade sllding between said side mould members, a matrix and an independently movable matrix holder, and a movable carrier upon which said side mould members, extractor blade and matrix and matrix holder are mounted, substantially as, specified.
24. In a type casting machine, the combination with a reciprocating bottom mould member, of laterally movable side mould members, a rectprocating plunger or extractor blade sliding between said side mould members, a matrix and an Independently movable matrix holder, a movable carrier upon which said side mould members, extractor blade, and matrix and matrix holder are mounted, and a type guide, substantially as specifled.
25. In a type casting machine the combination with a reciprocating bottom mould member, of laterally movable side mould members. a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and an indepenfently movable matrix holder, a movable carrier upon which sald side mould members, extractor blade and matrix and matrix holder are mounted. a type guide. and means for operating said carrier, substantially as specified.
26. In a type casting machine the combination with a reciprocating bottom mould member, of laterally movable side mould members, a reciprocating pluncer or extractor blade sliding between said side mould members, a matrix and matrix holder movable indenendently of said side mould members, a movable carrier upon which said side mould members. extractor blade and matrix and matriy helfer are mounted, means for operating said carricr. means for moving sald bottom mould member to and from said side mould members, and a type guide. substantially as specifled.
27. In a type casting machine the combination with a reciprocating bottom mould member of laterally movable side mould members, a reciprocating plunger or extractor blade sliding between said side mould members, a matrix and matrix holder movable independently of said side mould members, a movable carrier upon which said side mould members, extractor blade and matrix and matrix holder are mounted. means for onerating said carricr, means for moving sald bottom mould member to and from said side mould members. means for moving said matrix and matrix holder to and from said side mould members, and a type guide, substantially as specified.
28. In a type casting machine the combination with a reciprocating bottom mould member, of laterally movable side mould members, a reciprocating plunger or extractor blade sliding between sald side mould members, a matrix and matrix holder movable independently of sald side mould members, a movable carrier upon which sald side mould members. extractor blade and matrix and matrix holder are mounted. means for operating said carrier, means for movIng said bottom mould member to and from said side mould members, means for moving said matrix holder to and from said side mould members. means for operating said plunger or extractor blade to discharge the cast type, and a type gulde, substantfally as specified.
29. In a type casting machine the combination with a reciprocating bottom mould member, of laterally movable side mould members a reciprocating plunger or extractor blade sliding between said side mould members, an adjustable type set finger or stop, said plunger or extractor blade having a type set shoulder engaging said adjustable type set finger or stop, a matrix and matrix holder movable independently of said side mould members, a movable carrier upon which said side mould members, extractor blade and matrix and matrix bolder are mounted, means for operating sald carrier, means for moving said bottom mould member to and from sald side mould members, means for moving sald matrix and matrix holder to and from said side mould members, means for operating said plunger or extractor blade to discharge the cast type into a type guide, and a type gulde. substantially as specified.
30. In a type casting machine the combination with a reciprocating bottom mould member. of laterally movable side mould members, a reciprocating plunger or extractor blade sliding between sald side mould members, a matrix and matrix holder movable independently of said side mould members, a movable carrier upon which said side mould members, extractor blade and matrix and matrix holder are mounted, means for operating said carrier, means for moving said bottom mould member to and from said side
mould members, means for moving said matrix and matrix holder to and from said side mould members, means for operating said plunger or extractor blade to discharge the cast type into a type guide, a casting pot having a piston chamber, discharge nozzle and valve chamber, a piston and a valve, means for operating sald piston, means for operating said valve, and a type guide, substantially as specifled.
31. The combination with a type casting mechanism having an ejector blade or plunger, of a laterally movable carricr on which said casting mechanism is mounted, a stationary guide for the cast type, and a device for removing or ireaking off the sprue as the type are forced along the type suide by said ejector blade or plunger, substantially as \(\because e c i f i e d\).
32. The combination with a type casting mechanism having an ejector blade or plunger, of a laterally movable carrier upon which said casting mechanism is mounted, a stationary guide for the cast type, and a device for removing or breaking off the sprue as the type are forced along the type guide by said ejector blade or plunger, and a finishing tool for finishing the sprue or fet end of the type, substantlally as specified.
33. The combination with a type casting mechanism having an ejector blade or plunger, a laterally movable carrier upon which said casting mechanism is mounted, a stationary guide for the cast type, a device for removing of breaking off the sprue as the type are forced along the type guide by said ejector blade or plunger, a finishing tool for finishing the sprue or jet of the type, and a spring actuated device for pushing the type endwise against said tool, substantially as specified.
34. The combination with a type casting mechanism having an ejector blade or plunger, of a laterally movable carrier upon which said casting mechanism is mounted, a guide for the cast type, a device for removing or breaking off the sprue as the type are forced along the type guide by sald ejector blade or plunger, a grooving tool for grooving the sprue or jet fnd of the type. a spring actuated device for pushing the type cndwise against said tool, and a rotary nicking tool. substantially as specified.
35. The combination with a type casting mechanism havIng an ejector blade or plunger, of a laterally movable carrier upon which said casting mechanism is mounted, a sta1.ionary guide for the cast type, a device for removing or breaking off the sprue as the type are forced along the type guide by said ejector blade or plunger, a grooving tool for grnoving the sprue or jet end of the type, a spring actuated device for pushing the type endwise against said tool, a rotary nicking tool, and a spring pressed plate for said type guide. substantially as specifled.
36. The combination with a type casting mechanism having an ejector blade or plunger. of a guide for the cast type. a rotary nicking tool for nickng the type as they are forced along the guide by said ejector blade or plunger, and a spring pressed back for said guide, substantially as specified.
37. In a type casting machine the combination with a bottom mould member, of a reciprocating holder for said bottom mould member, a rocking carrier, mould members mounted thereon, a matrix and a movable matrix holder mounted on said rocking carrier, substantially as specifled. 38. In a type casting machine the combination with a bottom mould member. of a reciprocating holder for sald bottom mould member. a rocking carrier, mould members mounted thereon, a matrix, a movable matrix holder mounted on said rocking carrier. and an extractor blade or plunger forming the top face of the mould, substantially as specifled.

No. 101,531. Stove, Range, Etc. Poêlcs, etc.
Frederick J. Willock, New York City. U.S.A., 16th October,
1906; 6 years. Filed 14th May, 1906. Receipt No. 135,904.
Claim.-1. As a new article of manufacture, a portable attachment for stoves, ranges and furnaces, adapted to fit within or below the frebox or combustion chamber thereof. comprising a pipe and a burner connected therewith, and provided with means for retaining the burner in a vertics! or a horizontal position as desired, while within or below the firebox or combustion chamber thereof, substantially as described.
2. As a new article of manufacture. a portable attachment for stoves, ranges and furnaces, adapted to fit within or below the firebox or combustion chamber thercof, comprising a pipe and a burner connected therewith, and provided with plates carried upon said pipe, at opposite sides of the burner, for retaining the latter in a vertical or \({ }^{2}\) horizontal position as desired, while within or below the firebox or combustion chamber aforesaid, substantially as described.
3. As a new article of manufacture, a portable attachment for stoves, ranges and furnaces, adapted to fit within or below the fire box or combustion chamber thereof, com-
prising a pipe and a burner connected therewith, the attachment being provided with a handle for moving the

same as desired and with means for retaining the burner in a vertical or a horizontal position as. desired while within or below the frebox or combustion chambe, aforesaid, substantially as described.
4. As a new article of manufacture, a portable attachment for stoves, ranges and furnaces, adapted to fit within the frebox or combustion chamber thereof, comprising a pipe provided with a rotatable supply connection having a projecting tubular end, a burner connected with said pipe and means for retalning the burner, while within the fire box or combustion chamber aforesaid, in position to direct the flames therefrom forwardly, upwardly or rearwardly as desired, substantially as described.
5. The combination with the fire box or combustion chamber of a stove, range or furnace, of an attachment adjustably fitted thereinto and above the grate, and provided with a burner and means for retaining the same in positlon to direct the flames therefrom forwardly, upwardly or rearwardly as desired, and a tubular connection pivoted upon and leading into the attachment and projecting through the grate aforesaid to the exterior of the stove, substantially as described.

No. 101,532. Gas Making Apparatus.
Apparedl pour la fabrication du gaz.

Adolph Schwartz, Minneapolis, Minnesota, assignce of Louis Aljerne Watts, Spokane, Washington, U.S.A., 16th October, 1906; 6 years. Filed 18th September, 1906. Recelpt No. 139,595.
Claim.-1. An apparatus of the class described, comprising a storage tank, a gasometer connected therewith consisting of a water receptacle being provided with inner and outer chambers, means for soparately supplying gas and air to the chambers, controlling valves arranged in the gas inlet and outlet pipes of the chambers, a connection between said valves, a pivotally supported tripping lever
arranged in conncction with one of said valves, and a lever connecting the tripping lever with the bell of the gasometer.
2. In an apparatus of the class described, the combination with a storage tank comprising a water receptacle and a telescoping bell. of a similar gasometer provided with separate chambers, air inlet and outlet pipes for one chamber, gas inlet and outlet pipes for the other chamber, valves arranged in the gas inlet and outlet pipes, a rod connecting said valves, a handle carried by one of the valves, a lever having fulcrum support adjacent to the handle, and a connection between the outer end of the lever and the bell of the gosometer.
3. In an apparatus of the class described, the combination with a storage tank comprising a water receptacle and telescoping bell, of a similar gasometer provided with separate chambers, air inlet and outlet pipes for one chamber, valves arranged in the gas inlet and outlet pipes, a connection between said valves, a triangular lever having fulcrum support adjacent to one of the valves, a connection between the outer end of the lever and the bell of the gasometer, and an operative connection between the outer and inner ends of the lever and valve.

No. 101,533. Knitted Fabric. Tissu tricoté.

Frederick Conde, Oswego, New York. U.S.A., 16th October 1906; 6 years. Filed 22nd August. 1906. Receipt No. 138.907.

Claim.-A knitted fabric having a transferred stitch and immediatoly below the space caused by such transferred stitch, a loop in tre first course thereafter, and a loop in the second course thereafter. substantially as described.
No. 101,534. Cattle Stanchion. Etançon pour bétail.

Henry 1). Elliott, Morgan Center. Vermont, U.S.A., 16th October, 1906; 6 years. Filed 18 th August, 1906. Receipt No. \(138,787\).

Claim.-1. In a cattle stanchion structure, a head frame including longitudinal ralls spaced apart and disposed above the stall floor, pins spaced apart and extending transversely through said head rails, a plurality of neck bars arranged in pairs and extending at one end between said head frame members, one bar of each of said pairs of neck bars swinging upon said pins transversely of said head frame and the other of each of siid pairs of neek bars movable at one end longitudinally or the head frame and movable at the other end transversely of the head frame, and means carried by the head frame for operating the bars which are movabla, iongitudinally of the head frame.
2. In a cattle stanchion structure including a stall space floor and a head frame spaced from the floor, said floor having spaced sockets extending longitndinally of the same, weck bars swinging from said head frame and movably engaging said sockets, and one of said bars also swinging transversely of said floor, and means carried by said head frame for actuating said transversely movable bar.
3. In a cattle stanchion structure including a stall floor, a head frame formed with rails spaced apart, and likewise spaced above the floor, said floor having spaced sockets extending longitudinally of the same, a neck bar swinging at one end between said rails and with the free end movably rengaging one of said sockets, a neck bar movable longltudinally of said ralls at one end and with the other end movably engaging the other of said sockets, and means for locking said longitudinally movable bar in position between said rails
4. In a cattle stanchion structure including a stall floor and a head frame spaced above the floor, said floor having sockets arranged in pairs spaced apart centrally of each stall space, a plurality of neck bars arranged in pairs, one bar of each pair swinging at one end from said head frame and with the free end movably engaging one socket of each pair of the same, and the other bar of each pair movable at one end longitudinally of said head frame and with the other end movably engaging the other socket of each pair of the same, means for simultaneously actuating said longitudinally movable bars, and means for independently releasing sald longitudinally movable bars.
5. In a cattle stanchion structure including a stall floor and a head frame spaced above the floor, said floor having sockets arranged in pairs spaced apart centrally of each stall space, a plurality of neck bars arranged in pairs, one bar of each pair swinging at one end from said head frame and with the frec end movably engaging one socket of each pair of the same, and the other bar of each pair extending at one end above said head frame and movable longitudinally ihereof and with the other end movably engaging the other socket of each pair of the same, a shlpper member movably bearing upon said head frame and through which the extended ends of said longitudinally movable bars project, and means for actuating said shipper member.
6. In a cattle stanchion structure including a stall floor and a head frame spaced above the floor, said floor having sockets arranged in pairs spaced apart centrally of each stall space, a plurality of neck bars arranged in pairs, one bar of each pair swinging at one end from said head frame and with the free end movably engaging one socket of each pair of the same, and the other bar of each pair extending at one end above said head frame and movable longitudinally thereof and with the other end movably engaging the other socket of each pair of the same, a shipper member movably bearing upon said head frame and provided with slots corresponding to and adapted to receive the extended ends of said longitudinally movable bars, means for actuating said shipper member, and locking members adapted to maintain said extended bars at one end of said slots and independently releasable from the same.

\section*{No. 101,535. Mould for Stone. Moule pour picrre.}

Willie Herman Fisher, Baltimore, Maryland, U.S.A., 16th October, 1906; 6 years. Filed 28 th March, 1906. Recelpt No. 134,360 .
Claim.-1. In a press the combination with supports, of a movable platen guided by said supports, means for moving said platen, a head supported by said supports, a mould box frame, means for adjusting said frame, and cushion means for said frame.
2. In a press the combination with supports, a movable platen, means for moving said platen, a head supoprted by said supoprts, a mould box frame provided with guides engaging the supports and cushioning means carried by the guides.
3. In a press the combination with supports, of a movable platen, means for moving sald platen, a head supported by said supports, a mould box frame, guides for the mould box frame engaging the supports, means for permitting the frame to be moved in relation to its guides to permit the sides of the mould box frame to be drawn together and means to draw the sides thereof together.
4. In a press the combination with supports, of a movable platen, means for moving said platen, a head supported by said supports, a mould box frame. guides for the mould frame engaging the supports and yielding means connecting the guides and the frame.
5. In a press. the combination with supports, of a movable platen, means for moving said platen, a head supported by said supports, a mould box frame, guides.encircling the supports, a bolt projecting form one side of the guides, a projection on the frame through which the bolt passes and a spring mounted on the bolt and adapted to be put under innsion by the movement of the frame in one direction.
6. In a press the combination with supports, of a movable platen, means for moving said platen, a head supported by

said supports, a mould box frame, a guide mounted upon the supports, a bolt pivoted at one end to the guide, a projection on the frame through which the bolt passes, and means for permitting movement between the bolt and projection on the frame.
7. In a press the combination with operating means, of a vertically movable platen connected thereto, sald platen being adapted to receive a wheeled truck, openings in the platen, crickets projecting through the openings and normally engaging the whecis of the truck for supporting the body of the same above the platen, but allowing the wheels of the truck to project into the openings and the body of the truck to contact with the platen when the platen is raised.
8. In a press the combination with operating means, of a vertically moving platen connected thereto and provided with tracks and openings in the tracks, said platen belag adapted to recelve a wheeled truck, crickets projecting through the openings normally engaging the wheels of the truck for supporting the body of the same above the plates, but allowing the wheels of the truck to project into the openings and the body to contact with the platen when the platen is raised.
9. In a press, the combination with a platen, means for operating the platen, a head, a mould box frame comprising two sides and two end gates pivoted to the sides. means for adjusting the sides toward and away from each other, latching means transversely of the end gates.
10. In a press the combination with a movable platen, means for operating the same, of a head, a mould box frame supported by the platen comprising two side plates and end gates hinged to the side plates, means for adjusting the side plates toward and away from each other, a latching means carried by the end gates adapted to engage cooperating parts carried by the sides for securing the free ends of the gates to the sides and means for moving the latching means transversely of the end gates.
11. In a press the combination with a platen and a head, a mould box frame supported upon the platen consisting of two sldes and two ends hinged to the sides, means for adjusting the sides toward and away from each other, 2 plate adjustably mounted upon the ends and means for securing the ends and sides together carried by the plate.
12. In a press the combination with a platen and a head. of a mould box frame supported upon the platen, consisting of two sides and two ends hinged to the sides. means for adjusting the sides toward and away from each other. \({ }^{8}\) nlate adjustably mounted upon the ends and latching means for the ends mounted upon the plate.
13. In a press the combination with a platen and a hesd, of a mould box frame supported upnn the platen, consisting of two sides and two ends hinged to the sides. means for adjusting the sides toward and away from each other, latch hooks projecting from the slde plates, a plate adiustablv mounted upon the end gates and a latch carrad by said plate whereby said latch can engage the latel hooks when the side plates are in different positions of adjustment.
14. In a press, the combination with a moving platen, operating means in connection therewith and a head, of a mould frame supported by the platen, comprising side plates, end gates pivotally supported from the side plates, latching means carried upon the end gates, and pivoted rack bars engaging the latching means and adapted to release the same when the mould frame is moved in one direction.
15. In a press, the combination with a morable platen, means for operating the same, a head a mould box irame supported by the platen comprising side plates and end gates hinged to the side plates, latching means carried by the end gates, pivoted rack bars engaging the latching means and adapted to release the same when the mould frame is moved in one direction and means independent of the bars for causing the gates to swing after they have been released and started by the rack bars.
16. In a press the combination with supports, and a movable platen, of a mould irame adjustably supported from the platen, stiffening and strengthening means projecting on the frame, and means for adjusting the frame connected to the supports and arranged on the stiffening means.
17. In a press the combination with a movable platen and means to operate the same, of a head, a mould box frame comprising two sides and two ends, and means for automatically causing the sides to move toward and away from each other by the opening and closing of the ends.
18. In a press, the combination with a movable platen, of a mould box composed of two sides. end gates hinged to the sides and automatic means for moving the sides toward each other to decrease the size of the frame to clamp a mould, said means being operated by the closing of the gates.
19. In a press the combination with supports and a moving platen, of a mould frame having adjustable sides, end gates mounted upon the frame, and adapted to draw the sides together when they are closed, and resilient means for withdrawing the sides when the gates are opened.
20. In a press the combination with a platen, and a head, of a mould box adapted to be pressed by the platen against the head, a frame having two sides movable toward and away trom each other in parallel planes and ends hinged to the sides to open and close the frame, said frame being provide with means to cause the sides to move toward each other when the ends are closed.
21. In a press the combination with a platen and a head, of a mould box adapted to be pressed by the platen against the head, a frame having two sides movable toward and away from each other in parallel planes and ends adapted to close the frame and means actuated by the motion of the ends to move the sides toward each other.
22. In a press the combination with a platen and a head, of a mould box adapted to be pressed by the platen against the head, a frame having two sides and two ends, one end and one side being hinged together and automatic means for moving the sides toward each other to decrease the size of the frame to clamp a mould box, said means being operated by the closing of the ends, and means tor locking the ends and sides together.
23. In a press the combination with a platen and a head, of a mould box adapted to be pressed by the platen against the bead, a frame having two sides and two ends, one side and one end being hinged together, means for securing the free ends of the sides and ends tolgather and simultaneously causing the sldes to approach each other in parallel planes.
24. In a press the combination with a platen and a head, a mould box adapted to be pressed by the platen against the head, a frame having two sides and two ends, means for automatically moving the sides away from each other when the frame is opened and means for causing them to approach each other when the irame is closed.
25 . In a press the combination with a platen and a head, of a mould box adapted to be pressed by the platen against the head, a frame having two sides and two ends, means for adjusting the sides toward and away from each other, means independent of the adjusting means for causing the sides to approach each other and means for moving the sides away from each other.
26. In a press the combination with a platen, and a head, of a mould box adapted to be pressed by the platen against the head, a frame having two sides and two ends, the sides being adapted to move toward and away from each other in parallel planes, means for moving the sides toward each other when the frame is closed and automatic means for moving the sides away from each other when the frame is opened.

\section*{No. 101,536. Rnitted Fabric. Tissu tricoté.}

Josiah Johnson, Leicester. England, 16th October. 1906; 6 years. Filed 28th August, 1906. Receipt No. 139,043.
Claim.-1. A machine knitted seamless tubular ribbed fabric having a uniform number of ribs throughout its
length and a uniform number of loops in each course, and the diameter of which is contracted or expanded by chang-

ing the position of certain ribs from one side of the fabric to the other side thercof for the purpose of shaping or fashioning such fabric, substantially as described.
2. A machine made seamless ribbed stocking or sock, the leg of which is shaped or fashioned by changing at intervals ribs from one side of the fabric to the opposite thereof the number of loops in each course remaining uniform throughout, substantially as descibed.
3. The method of shaping or fashioning machine knitted seamless ribbed fabrics consisting in knitting the fabric upon the full complement of needles throughout and in changing a rib on one face or side of the fabric to the opposite face thereof, then knitting a few courses and repeating these operations at intervals, substantlally as described.

No. 101,537. Horse Controller. Contrôleur de cheval.

Albert M. McGeary, Canon City, Colorado, U.S.A., 16th October, 1906 ; 6 years. Filed 13th August, 1906. Receipt No. 138,630.
Cluim.-1. The combination with a vehicle provided with two bearings one on each side of the reach, of a device composed of two parts one being hollow to receive the other, the latter being provided with a tee-head engaging the said bearings whereby the upper end of the device is plvotally connected with the vehicle, a coil spring located within the hollow member of the device and acting on the other member which is freely movable therein. the spring actuated member having a collar, and the hollow member a stop at its outer extremity to limit the outward movement of the spring actuated member, the length of the device being such that its spring actuated member is adapted to engage
and eatch in the surface forward of the pivot, and a connection between the device and the animal to be checked or hitched.
2. In a horse hitching attachment for vehicle, the combination with a vehicle provided with two bearings centrally located, and a device having a tee-head engaging the said bearings, the said device being composed of a hollow member, and a second member engaging the hollow member and moving frecly therein. a coil spring located within the hollow member and acting to throw the telescoping member outwardly. the members heing constructed to limit the outward movement of the telescoping member, the free extremity of the telescoping member being adapted to engage and catch in the surface engaged by the vebicle, and means for connecting the device with the animal to be hitched.
3. The combination with a vehicle, of a clip secured thereto and provided with two bearings located on opposite sides of the longitudinal center of the vehicle, a hitching device having a tee-head engaging the bearings of the clip at one extremity, its opposite extremity being pointed and adapted to catch in the surface which forms a stop for the engaging extremity of the device, the said device consisting of two members having a telescoping connection, a coil spring being located within the one member and acting to throw the other member outwardly, for the purpose set forth.

\section*{No. 101,538. Calf Weaner.}

Appareil d sevrer les veaux.

Samuel Parry, Clay Center. Kansas. U.S.A., 16th October, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,866.
Claim.-1. The calf weaner consisting of the sack suspended beneath the udders of the mother animal, a girth attached to the forward end of said sack, a pair of straps attached to the rear end thereof extending out between the rear legs and up over the rump and secured to said girth and a crossstrap connecting such suspension-straps, all substantially as shown and described.
2. The call weaner consisting of the sack provided with vent boles, a girth attached to the forward end of said sack, straps attached to the rear end thereof and passing between the hind legs and up over the rump and secured to said girth and a cross strap connecting such suspension straps, all substantially as shown and described.
3. A device as described consisting of a triangular shaped and perforated sack having rings secured at its corners, a girth having hooks attached at its ends and sald hooks connected each to a ring at the front of the sack, a pair of straps having hooks attached thereto connected at the rear of the sack to the third ring and their other ends號 pair of straps.

No. 101,539. Binder. Liellse.
William J. Rhorles, Elizabeth, Indiana, U.S.A., 16th October, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,476.
Claim.-1. A tension device of the character described, comprising a stem, a non-rotatable bracket mounted thereon, a crossbar engaging the bracket and slidably mounted on the stem, a spool section rotatably mounted on the on the stemaring a grooved tubular extension, another stem and having a coor mounted on the extension and rotaspool section slidably moth of the spool sections being interposed table therewith, both ond by the bracket and crossbar, and hetween and contacted tensioning means contacting with and adapted to actuate the crossbar.
2. A tension device comprising a stem, a bracket fixediy mounted thereon, a spring pressed crossbar slidsbly

mounted on the stem and engaging the bracket and a sectional spool interposed between the bracket and crossbar, one of said sections constituting a support for the cther section and said sections being normally clamped together by the bracket and crossbar.
3. A tension device comprising a stem, a bracket fixedly connccted thereto and having guide spools thereon, a crosshar slidably mounted on the stem and engaging the bracket, a tension spring upon the stem and bearing on the crossbar and a sectional spool rotatably mounted on the stem and interposed between the bracket and crossbar, one of the sections of the spool being slidably mounted on, but rotatable with the other section and both sections being normally clamped together by the bracket and crossbar.

No. 101,540. Wire Stretcher. Tendeur de al de fer.

Joseph Savage, Kingsley Falls, Quebec, Canada, 16th Octo ber, 1906; 6 years. Filed 8th August, 1906. Recelpt No. 138,489.
Claim.-1. In a whre stretcher, the combination com prising a handle provided with a solid jaw, a movable jav pivoted to the solid jaw and provided with means for rock ing the same, and a clamping block secured adjacent movable jaw.
2. A wis stretcher comprising a handle provided with a. solid jaw a stretcher comprivoted to the solld jaw, and pro vided with means for rocking the same, recessed clampustteeth carried by the jaws, and a clampio
ably secured adjacent the morable jaw. with a solid jam
3. In a wire stretcher, a hancule provided with a solded with a movable jaw pivoted to the solid jaw and proviad the an extension, and a block adjustably secured adjacent movable jaw.
4. In a wire stretcher. a handle provided with a solid jaw, a movable jaw pivoted to the solid jaw and provided with a lever and with a cam shoulder, a block provided with a slot and with a bevelled face disposed adjacent the palth of movement of the cam shovider on the movable jaw, ant a bolt disposed through the slot and secured to the handle. 5. In a wire stretcher, a handle provided with a solid jaw, a clamping jaw pivotally secured to the solid jaw and provided with an extension, a clamping block adjustably secured adjacent the clamping jaw, and a cutting member on the handle.

\section*{No. 101,541. Mould for Building Blocks. Moule pour blocs de construction.}

Frank McMurray Sawyer, Charlotte, North Carolina, 'U.S.
A., 16th October, 1906; 6 years. Filed 20th August. 1906. Receipt No. 138,834.
Claim.-1. A mould box having removable mould plates. each provided on one side with a spacer and core iormer, to space such plate from the next adjacent mould plate and form an opening, recess or core in the moulded aci.cic.
2. A mould box having a bottom and sides, partition plates between the sides subdividing the mould box into mould spaces. and mould plates between such partition plates and subdividing the mould spaces into individual mould chambers, each of such mould plates having a spacer and core former on one side, to bear against the next adjacent mould plate, for the purpose set forth.
3. A mould box having removable mould plates, and a spacer and core former between them to space said plates apart and form an opening, recess or core in the moulded article.

\section*{No. 101,542. Check Printer and Protector.} Appareil pour imprimer et protéger les chèques.
Alfred J. Ware, Seattle, Washington, U.S.A., 16th October, 1906; 6 years. Flled 25th July, 1906. Recelpt No. 138,156.
Claim.-1. In an apparatus of the class described, in combination, marking mechanism including type wheels and inking devices for said type wheels, a movable platen for supporting the article to be marked, spring pressed devices for holding the article upon the platen, locking devices for the type wheels, and means for successively operating the inking mechanism and elevating the platen, and means automatically operating to release the type wheels when the printing operation is completed.
2. In a check printer, a plurality of type wheels mounted tos be rotated, and means for individually moving said wheels, inking devices for said wheels, a platen on which the article to be printed is supported, means for successively actuating the inking devices and the platen, means for locking said type wheels in the set position comprising spring pressed brake wheels normally held in engagement with the type wheels, substantially as described.
3. In a check printer, a plurality of type wheels mounted te be rotated, and means for individually moving said wheels, fuking devices for said wheels, a platen on which the article
ti be printed is supported, means for successively actuating the inking devices and the platen, means for locking said

type wheels in the set position comprising spring pressed brake wheels normally held in engagement with the type wheels, and means operating automatically with the return movement of the platen to release said brake wheels, substantially as described.
4. In a check protector, a plurality of type wheels, means for individually setting the wheels in marking position, a vertically movable platen, means for actuating said platen to elevate article being marked into enogemen. with the typ. wheels, spring pressed brake wheels engaging the type wheels to hold the same in the set position, means operating automatically with the return of the platen to its normal position to release said brake wheels, and means for returning the type wheels to their initial position when the brake wheels are released.
5. In a marking machine in combination, marking mechanism including type wheels and inking devices for sald type wheels, brake devices for the type wheels, the vertically movable platen for supporting the article to be marked, spring pressed devices for holding the article to be marked upon the platen, means for successively operating the inking devices and elevating the platen and likewise release said brake devices from their engagement with the type wheels.
6. In a marking machine the combination with the type Wheels rotatably mounted, the platen, the brake devices for locking the wheels in adjusted positions, and means for elevating the platen, and devices co-acting with the platen and adapted to disengage sald brake devices.
7. In a marking machine the combination with the containing case, a shaft, a plurality of adjustable type wheels, springs connecting the shaft with the type wheels, and rods connected with said wheels and extending exteriorly through the case for individually setting said wheels, of inking devices for the wheels, a vertically movable platen for supporting the article to be marked, a presser foot for holding such article firmly upon the platen, means for locking the type wheels in set positions during the printing operation, and means whereby the type wheels may be predeterminately retained in their set positions or automatically released to be acted upon by said springs and returned to their inltial positions.

\section*{No. 101,543. Stock and Freight Car. Char à bétail et marchandises.}

Everett Wyatt, Fort Worth, Texas, U.S.A., 16th October, 1906; 6 years. Filed 18th September, 1906. Receipt No. 139,607.
Claim.-1. A stock car having permanent side and end walls and a permanent floor, a temporary floor movable vertically therein and means for lowering said floor and means for simultaneously forming temporary side and end walls.
2. In a stock car provided with permanent floor and side atd end walls, means for converting said car into a freight
car comprising a temporary floor movable vertically therein side and end walls capable of being rolled up or unrolled attached to said temporary floor, and means for rolling up or unrolling said side and end walls and simultaneously \(\cdot 1\). vating said temporary Hoor or lowering said floor.
3. In a stock car provided with permanent end and sid walls, and a permanent floor, a temporary floor, rollable sheets attached to said floor and capable of forming side and end walls for sadd car, and means for rolling or unrolliut satd sheets whereby said temporary floor is elevated or lowered.
4. In a stock car provided with a permanent floor and end and side walls, a temporary floor, sneets attached to said floor and capable of forming und and side walls, roller shates engaged by said sheets, and gearing for operating said shafts.
5. In a stock car provided with a permanent floor and ent and side walls, a temporary floor, sheets attached to said fleor and capable of forming end and side walls, roller shafts ungaged by said sheets, guides for said sheets, and gearing for operating said shafts.
6. In a stock ear provided with a permanent floor and end and side walls, a temporary floor, sheets attached to said floor and capable of forming end and side walls, roller shafts engaged by said sheets, spring actuated roller sheet metal oors co-operating with said sheets, and gearing for actuat ing said roller shafts.
T. In a stock car provided with a permanent floor and end and side walls, a temporary floor, sheets attached to saiu floor and capable of forming end and side walls, roller shafts ngaged by said sheets, spring actuated roller sheet metal oors with said sheets, guides for said sheets and doors, and gearing for actuating said shafts.
S. In a stock car provided with a permanent floor and end and side walls, a temporary floor, rollable sheets attached to said floor and capable of forming end and side walls for said car, spring actuated roller sheet metal doors co-operating with said sheets, and means for rolling or unrolling said sheets whereby said temporary floor is elevated or lowered.
9. In a stock car provided with a permanent floor and end nd side walls roller shafts, gearing mounted on said shafts for rotating the same, and rollable sheets attached to said shafts for forming temporary side and end walls within safd ear and flush with said permanent end and side walls.

\section*{No. 101,544. Dust Pan. Porte-orlwcs.}

Jehiel F. Wynkood, Minneapolis. Minnesota, U.S.A.. 16th October, 1906; 6 years. Filed \(1 / \mathrm{th}\) September, 1906. Recejpt No. 139,558.
Claim.-A blank adapted to be folded upon itself to form a onc plece dust pan, said blank consisting of a rectangular shent of metal having a depiession adjaennt the center
of one edge thereof and openings adjacent the ends of said edge, opposite portions of said edge adapted to inter-

lock and form a seam between the 'openings, said openings being surrounded by angular beads.

\section*{No. 101,545. Method of Making Nuts.}

Metrode de faire des écrous.

Otto Briede, Benrath, near Dusseldorf, Germany, 16th (i. tober, 1906; 18 years. Filed 29th May, 1905. Receipt No. 125,573.
C'laim.-1. As an improvement in the art of manufacturing nuts the method herein described which consists in peripherally grooving a rod or bar thereby forming a series onpreliminary blanks connected by necks of metal, and enlarging said blanks by forcing thereinto a portion of the metal of the adjacent blank and the neck of metal connecting said blanks, substantially as set forth.
2. As an improvement in the art of manufacturing nuts the method herein described which consists in forming \({ }^{8}\) series of blanks smaller than the desired article and then laterally enlarging said blanks, by forcing into one blank a portion of the metal of an adjacent blank.
3. As an improvement in the art of manufacturing nuts. the method herein described which consists in forming \({ }^{2}\) serics of connected blanks having reduced connecting neck and separating one of the blanks from the succeeding blank by forcing the connecting neck into the succeeding blank
4. As an improvement in the art of manufacturing nuts, the method herein described which consists in transversely grooving a rod or bar thereby forming a series of connected blanks, and by a single punch stroke punching out the metal at the center of one blank and forcing the metal so removed into the next blank.
5. As an improvement in the art of manufacturing nuts. the method herein described which consists in transversely grooving a bar or rod thereby forming a series of connected blanks, punching out the metal at the center of one blank and forcing the metal so removed and the connecting neck into the next blank. thereby severing the first blank from the next adjacent blank
6. As an improvement in the art of manufacturing nuts, the method of oneration herein described which consists of completing the perforation of a previously formed and partially perforated nut blank, severing the same from the parent rod, and effecting the partial or preliminary perforation of another blank, and all at and by a single punch stroke, substantially as described.

No. 101,546. Fastener Por 8tair Carpet. Attache pour tapis d'escaliers.

Ephraim Corbett, Toronto, Ontario, Canada, 16th October, 1906; 6 years. Filed 9th August, 1906. Receipt No. 133,525.
Claim.-1. A stair carpet fastener comprising a clip substantially triangular in cross section, having two of its sides adapted to engage the tread and riser of the step respectively, and having in its other side a slot extending lengthwise of the clip to permit of the entry of the stair carpet therein, and form two resilient carpet holding jaws to engage and hold the carpet within the clip.
2. A stair carpet fastener comprising a clip substantially triangular in cross section, having two of its sides adapted to engage the trear and riser of the step respectively, and having in its other side a slot extending lengthWise of the clip to permit of the entry of the stair carpet therein, and form two resilient carpet holding jaws to engage and hold the carpet within the clip, and a removable locking member co-acting with the elip and engaging the face side of the carpet within the loop contained in the elip.
3. A stair carpet fastener comprising a clip substantially triangular in cross section, having two of its sides adapted to engage the tread and raiser of the step respectively, and having in its other side a slot exterding lengthwise of the clip to permit of the entry of the stair carpet therein, and form two resilient carpet holding jaws to engage and hold the carpet within the clip, and a screw nail inserted through the clip, and having an innular groove to receive the edge of the aperture through which it is inserted.
4. A. stair carpet fastener comprising a clip substantially triangular in cross section, having two of its sides adapted to engage the tread and raiser of the step respectively, and having in fts other side a slot extonding lengthwise of
the clip to permit of the entry of the stair carpet therein, and form two resilient carpet holding jaws to engage and hold the carpet within the clip, a removable locking member co-acting with the clip and engaging the face side of the carpet within the loon contained in the clip, and a serew nail inserted through the clip, and having an onnular groove to receive the edge of the aperture through which it is inserted.

No. 101,547. Motion Reversing Mechanism.
Mécanisme de remersement.

Dugald Calcb Jackson. Madison, Wisconsin, U.S.A., 16th October, 1906; 6 years. Filed 12th September, 1904. Receipt No. 118,358.
Claim.-1. In electric motor driven machinery the combination with a moving member thereof, of means controlled by the position of said member whereby the electric votor driving said machincry is controlled to alternate the direcdion of motion of said moving member, and means whereby the forward and reverse speeds of said motor may be caused to differ from each other, substantially as described.

2 In electric motor driven machinery the combination with a moving member thereof, of switching means adapted to be controlled by the position of said member whereby the electric motor driving said machinery is controlled to alternate the direction of motion of said moving membir. and means whereby the forward and reverse speeds of said motor and said member may be caused to differ from each other substantially as described.
3. In electric motor driven machinery the combination with a moving member thereof, of switching means, the operation of said switching means being controlled by thi position of said member to change the connections of said motor to alternate the direction of rotation thereof, and to vary the resistance of the feld circuit of said motor, thereby to cause a difference between the forward and reverse speeds of said motor and said member, substantially as described.
4. In combination an electric motor, machinery driven theroby, a moving member of said machinery, switching means controlled and operated by the motion of said member alternately co reverse the direction of a supply current through the armature of said motor and alternately to increase and d.erease the resistance of the fleld circuit of said motor to causc a difference between the forward and reverse speeds of said motor and of said member, substantially as described.
5. In combication an electric motor, machinery driven thereby. a moving member of sald machinery, means controlled by the position of said member whereby the clectric driving motor is gradually connected into a supply circuit, and means whercby said motor is controlled to alternate the direction of motion of said moving member, substantially as described.
6. In combination an electric motor, machinery driven thereby, a moving member of sald machinery. and means controlled by the position of said member whereby the electric driving motor s gradually connected into a supply circuit. whercby said motor is controlled to alternate the direction of motion of said moving member, and whereby the forward and reverse speeds may be caused to differ from each other, substantially as described.
i. In combination an clectric motor, machinery driven thereby, a moving member of said machinery, switch blades, and switch terminals suitably connected to a current supply source and to the electric driving motor, said blades being adapted to be controlled by the position of sald moving member to engage said switch terminals to change the electrical
connections thereby to alternate the direction of motion of said motor and said member and to cause a difference between the forward and reverse speeds of said motor, substantially as described.
S. In combination an electric motor, machinery driven thereby, a moving member of said machinery, a switch arm, switch blades, and switch terminals suitably connected to a current supply circuit and to said motor, said arm being adapted to be operated by the position of said member to carry sald blades to engage said switch terminals to reverse the direction of current therethrough, whereby the direction of motion of said motor and said moving member may be alternated, and of controlling means operatively associated with said member whereby said motor may be gradually connected into said supply circuit, substantially as described.
9. In combination an electric motor, machinery driven thereby, a moving member of said machinery, a switch arm, switch blades, and switch terminals suitably connected to a current supply circuit and to said motor, said arm being adapted to be operated by the position of said member to carry said blades to engage said switch terminals to reverse the direction of current therethrough, whereby the direction of motion of said motor and said moving member may be alternated, of controlling means operatively assoclated with said switch arm whereby said motor may be gradually connected into said supply circuit, and of further means operatively associated with said switch arm whereby the forward and reverse speeds may be caused to differ from each other, substantially as described.
10. In combination an eltetric motor, machinery driven thereby, a moving member of said machinery, a switch arm and switch blades, said switch arm being adapted to be operated by said member to carry said blades to alternately engage two sets of switch terminals suitably connected to a current supply source and to the electric driving motor whereby to change connections of said motor to alternate the direction of motion thereof and of said moving member, and whereby reslstance may alternately be cut out of and into the fleld circuit thereby to cause the forward and reverse speeds to be different from each other, substantially as described.
11. In combination an electric motor, machinery driven thereby, a moving member of said machinery, switch mechanism controlled by the position of said member to govern the operative condition of said motor, cam mechanism also controlled by the position of said member, rheostat mechanism co-operating with said cam mechanism, and means whereby said rheostat mechanism may be controlled to gradually start said motor, substantially as described.
12. In combination, an elentric motor, machinery driven thereby, a moving member of said machinery, a switch arm controlled by the position of said moving member to engage switch terminals whereby to control the operative condition of said motor, cam mechanism controlled by the position of said member, and rheostat mechanism cooperating with said cam mechanism and governed thereby to cause current to be gradually supplied to said motor. substantially as described.
13. In combination an electric motor. machinery driven thereby, a moving member of sald machinery, a switch arm controlled by the position of said moving member to engage switch terminals whereby to conirol the operative condition of said motor, cam mechanism associated with said switch arm, a rheostat resistance, a rheostat lever, the actuation of said lever being controlled by the position of sald calm mechanism, and means whereby said rheostat lever may be actuated to gradually cut said resis. tance out of circuit thereby to allow current to be gradually supplied to said motor, substantially as described.
14. In comblation an electric motor, machinery driven thereby, a moving member of said machinery, a switch arm controlled by the position of said moving member to engage switch terminals whereby to control the operative condition of said motor, cam mechanlsm associated with said switch arm, a rheostat resistance, a rheostat lever, the actuation of sald lever being controlled by the position of said cam mechanism, means for actuating said lever to engage said resistance, and means whereby the motion of said lever may be retarded whereby sald resistance is gradually cut out of circuit thereby to allow current to be gradually supplled to said motor, substantially as described.
15. In combination an electric motor, machinery driven thereby, a moving member of said machinery, switch mechanism controlled by the position of said member to ism also controlled by the position of said member, a rheostat mechanism co-operating with said cam mechanism, and dash pot mechanism whereby the actuation of said rheostat mechanism may be retarded to gradually start said motor, substantially as described.
16. In a device of the class described, the combination with a moving member, of switching means adapted to be
controlled by the position of said member, an electric motor for driving said moving member, means controlled by said switching means for causing reciprocation of said moving member, and means whereby said electric motor is gradually connected with a supply circult, substantlaily as described.
17. In a device of the class described, the combination with a moving member, of switching mechanism adapted to be controlled by the position of sald member, an electric motor for driving said moving member, reversing mechanism controlled by said switching mechanism for causing a reciprocation of said moving member, and means whereby the electric motor is gradually connected with a suppiy circuit.
18. In a device of the class described the combination with a moving member thereof, of switching means adapted to be controlled by the position of said member. an electric motor for driving said member, means controlled by said switching means for causing a reciprocating of said moring member, and means for causing the forward and reverse speeds to differ from each other, substantially as described. 19. In a device of the class described the combination with a moving member thereof, of switching mechaniem adapted to be controlled by the position of said member. an electric motor for driving said moving member, reverse mechanism controlled by sald switching mechanism for causing a reciprocation of said moving member, and means for causing the forward reverse speeds of said motor to differ from each other, substantailly as described.
20. In a device of the class described the combination with a moving member thereof, of switching mechanism adapted to be controlled by the position of said member, an electric motor for driving said moving member, reverse mechanism controlled by said switching mechanism for causing a reciprocation of said moving member, means for causing the forward and reverse speeds to differ from each other and means whereby the electric motor is gradually connected with a supply current, substantially as described.
21. In a device of the class described the comblation with a moving member thereof, of switching mechanism adapted to be controlled by the position of sald member, an electric motor for driving said moving member, reverse mechanism controlled by said switching mechanism for causing a reciprocation of said moving member. means for causing the forward and reverse spenis to differ from each other anyl rhcostat mechanism controlled by said switching mechanism whereby said motor may be gradually connected with a supply circuit. substantlally as described.

No. 101,548. Method of Printing Music.
Méthode d'imprimer de la musique.

William Emmanuel Nanton, No. 6 Rae St., North Fitzroy, near Melbourne, Victoria, Australia, 16th October, 1906: 6 years. Filed 2nd February, 1905. Recelpt No. 122.1:0.
Claim.-1. The herein described method of printing music consisting in placing the musical characters on or between lines or groups of lines corresponding with the black keys of the piano, the two center black keys being represented by two heavy black lines, whilst the spaces between indlcate the white keys, substantially as and for the purposes specified.
2. The herein described method of printing music consisting in placing the musical characters on or between lines or groups of lines coresponding with the black keys of the piano. the two center black keys being represented by two heavy black lines and the other black keys by light lines, whilst the spaces between indicate the white keys, substantially as and for the purposes specifed.
2. Music printed or otherwise delineated upon a staff in which the two central black keys of the piano are specially represented by two black lines, substantially as and for the purposes specified.
4, Music in which the staff is printed with two heavy black lines corresponding with the two central black keys of the piano, and in which the horizontal lines of the staff are ruled to a certain proportional length corresponding with the exact duration of sound of each musical character, substantially as and for the purposes specified.
5. Music in which the staff is printed with two heavy black lines corresponding with the two central black keys of the piano with other light lines in groups of three and two above and below said central lines, said lines representing the black keys of the piano and the part of the staff above the central notes representing the treble and that beneath the bass, substantially as and for the purposes specified.

No. 101,549. Wrench. clé décrou.

Joseph N. Noyer, Gould City, Washington, U.S.A.. 16th October, 1906 ; 6 years. Filed 25th June, 1906. Receipt No. 137,248.
Claim.-The herein described wrench comprising the handle having a cylindrical socket in one side at one end, the bearing opening concentric and communicating with said socket and extending to the other side of the handle, and the longitudinal opening extending to said socket, the spring pressed pawl in said opening, the revoluble head having the circular ratchet element on one side in the said socket, the cylindrical boss in the said bearing opening, and provided on the opposite side with the transverse passage and guide grooves in the opposing walls thereof, a pair of jaws, each having an arm movable in said passage and provided on its outer side with a rib engaging one of the guide grooves and provided nith gear teeth. worm gears mounted for revolution in said head on the outer sides of the said jaws an each cogaging the gear teeth of one of said jaws, a can ou the side of the handle in which the head has its bearing, and the screw conbecting the center of said cap to the center of the said head.

\section*{No. 101,550. Door Hinge and Check. Charnière et arrêt de porte.}

Charles E. Treadwell, Denver, Colorado, U.S.A., 16th October, 1906; 6 years. Filed 29th August, 1906. Receipt No. 139,086.
Claim.-1. A hinge embodying a stationary leaf having a barrel diametrically enlarged in its lower portion which is liosely mounted upon the exterior unper surface of the other barrel, a pintle rod hung loosely from the upper portion of the mounted barrel and pendant therein, and means intervening between the spiral channel and the pendant pintle rod, adapted for communicating a combined rising and turning movement to the mounted barrel when the leaf thereon is swung from the stationary leaf.
2. A hinge comprising two leaves, each having a barrel, one barrel having a spiral groove extending longitudinally therein, the other barrel being loosely mounted upon and ercasing the first-named barrel, a pintle rod pendant from the upper end of the mounted barrel and depending in both barrels, and a male spiral connection between the pintle rod and spiral groove.
3. A door hinge and check, comprising twa leaves, cach having a barrel a spiral connection between the harrels adapting one barrel to rise when turned on the other barrel, a hollow piston reciprocal in one burrel helow said spiral connection, and having a slot or port in its botiom wall, : gate valve seated over the port when the door is closed, and means actuated by opening the door and thus turning
one barrel on the other one, adapted to lift the gate valve from its seat and simultaneously turn it away from

the port, the closure of the door seating the gate valve, and gradually closing the port.
4. A hinge and check, embodying a pair of hinge leaves, a spiral connection between said leaves adapting one leaf to turn and rise on the other leaf, a chamber below the spiral connection and carried by one leaf, a piston slidable in said chamber and having a port in its bottom wall, a gate valve movably seated on said wall and mounted to turn thercon, and a lazy tongs device actuated by the turning movement of one leal on the other ono, and adapted for lifting and turning the gate valve.
5. In a door hinge and check, the combination with two rotably connected hinge leaves, each having a barrel on one side edge thereof, a pintle rod, and means for giving a turning and rising movement to said pintle rod when the barrels are turned one upon the other by divergence of the leaves, of a chamber in the lower portion of one barrel, a piston having a bottom wall with an arcuate slotted port therein. said piston being slidable in the chamber, a gate valve seated upon the bottom wall, and a lazy tongs device connecting the lower portion of the pintle rod with the piston, said device giving lifting movement to the piston and simultancously turning the gate valve when the pintle rod is flevated and turned.
6. In a hinge, the combination with a hinge leaf having a barrel on one side edge, and an internal spirally grooved nut block mounted upon and extended upward from said barrel, of a mating hinge leaf, a barrel thereon having the lower end thereof swivelly connected with the upper end of the other barrel, a pintle rod hung from the upper barrel and extended centrally down into the nut block, and a spiral formation on the pintle rod having a loose engagement within the grooved nut block, the loose engagement of the upper end of the pintle rod with the barrel that supports it preventing improper friction between the spiral formation and walls of the spiral channel.
7. In a hinge and check, the combination with a .hinge leaf having a barrel on one side edge thercof, a chamber in said barrel, and an internally splrally grooved nut block extended unward from the barrel, of a mating hinge leaf. a barrel thereon which is swivelly connected with the upper end of the lower barrel and loosely encases the nut block, a pintle rod engaged loosely at its upper end within the upper end of the upper barrel, and extended down through the spirally grooved bore of the next block into the chambet. a piston working in said chamber, neans for connecting said piston with the pintle rod at its lower end, and means carried by the pintle rod for engaging said rod with the spiral groove in the nut block, said means causing the rod to travirse and turn in the chamber for actuating the piston.
S. A hinge and check embodying two leaves, a spiral connowtion betwern the laves adapting one to turn on the olhor loaf, a chamber below said spiral connection, a piston shilable in said chamber and having a port in its botom "all. a gate valve held to turn laterally over and from the port. and means actuated by turning one leaf on the other one ada!ted for lifting the gate valve from its seat and simultaneously turning it from the port.
!. In a hinge, the combination with a stationary hinge l-af having a barrel on one side edge of the leaf forming a chamber. a closure at the lower end of said chamber, and an internally spirally grooved nut block mounted on the upper end of the fixed chambered barrel, of a cylindrical barrel on a like edge of a mating hinge leaf, said barrel having a diametrically enlarged lower end that is mounted to turn upon the upper end of the lower barrel, a pintle rod loosely connected with the upper barrel by a transverse crossheall, said rod passing down through the nut block and having means engaging grooves in the nut block. which means causes the pintle rod to longitudinally and -pirally traverse the nut block when the upper barrel is turned on the lower one.
10. In a door hinge and check, the combination with a leaf having a barrel, and a spiral channel longitudinally therein, another leaf having a barrel mounted upon the first-mentioned barrel, a pintle rod hung from the upper portion of the mounted barrel and a pendant in both barrels, and means intervening between the spiral channel and said rod adapted for traversing said channel and giving the upper barrel an upward trend when turned by divergence of the hinge leaves, of a piston having a slotted bottom wall, a gate valve, and a lazy tongs device connecting the piston and said gate valve with the lower portion of the pintle rod, comprising a yoke. two links pivoted at their upper ends on depending members of the yoke, a foot block on the lower end of the pintle rod, two short links loosely connecting the foot block with the upper porlions of the other links, and two long depending links, said links being pivoted at their upper ends on the lower ends of the last-mentioned links. and at their lower ends loosely connected with a stem which engages the piston and gate valve.
11. In a door hinge and cheek of the character diseribed the combination with two hinge laves supported to turn one in the other, and a chamber on the lower portion of oue liaf, of a piston having an arcuate port in its bottom wall, a flat kate valve ragaging said bottom wall, and means for turning and simultanously lifting the gate.
12. In a door hinge and eheck of the character described, the combination with two hinge leaves and soiral connertions therefor, of a chamber formed in a barrel on one of said leaves, a piston slidable in said chamber and having a port in its botion wall, a gate valve seated in said piston and allapted \(10 \mathrm{~h} . \mathrm{turned}\) upon and lifted from said botom wall, and means for turning and lifting said gate valve.
13. In a door hinge and check of the character described. the combination with wo hinge leaves each having a barrel, one harrel having a chamber in its lower portion, and the other barrel turning on the last-mentioned barrel, of a piston fitted liquid tight in said chamber, a pin and grooved connection between the side wall of the chamber and corresponding wall of the piston, sald piston having a bottom wall and a port therein. a gate valve, and means for turning and lifting said gate valve.
14. In a door hinge and check of the character described, the combination with two hinge leaves, each having a harrel on one edge. one barrel being mounted upon the other one. and a cylindrical nut block on the lower barrel having a ientral bore, and a spiral channel in the wall of :aid bore, of a pintle rod having a male thread formed Hereon that engages the spiral channel, a crosshead loosely mounted on the upper end of the pintle rod and having trunnions on its ends which loosely engage opposite perforations in the side wall of the mounted barrel, thus adtating the rotatable movement of said barrel to corresboudingly turn the pintle rod and cause it to traverse the nut block upwardly.

No. 101,551. Window Hinge. Charniere de fenctirs.
Kobert Southgage Dana. Hampton Falls. New Hampshire. and Edwin L. Sprague, assignee of a half interest, Newton. Massachusetts, U'S.A.. 16th October, 1946; 6 years. Filod 13th August, 1:00t. Receipt No. 138.675.
Floim..-1. In combination with a window frame and sash. -o-opratine hinge anl socket members on the frame and sash adapted to be detachatly engased and whereon the tash may swing inwardy, and interlocking members on the Hamb and sash arrangel to enkage when the sash is swung in. To assist in supporting and steadying the same.

II combination with a window frame and sash. coopriatilig hinge. and socket members on the frame
and sash adapted to be detachably engaged and whereon the sash may swing inwardly. plates or the frame and sash res.

pertively, one having a recess and the other a tongue adapted to project into the recess and engage the plate containing the same when the sash is connected with the hinge and swung inwardly.
3. In combination with a window frame and sash, co-operating hinge and socket members on the frame and sash adapted to be detachably engaged and whereon the sash may swing inwardly, a member having a lateral shoulder and an upward bar, and a curved co-operating tongue member. one of said last-named members being secured to the irame and the other to the sash and arranged for inter-- ngagement when the sash has been swung in.
4. In combination with a window frame and sash, cooperating hinge and socket members on the frame and sash adapted to be detachably engaged and whereon the sash may swing inwardly, a plate having an inturned edge and a recess within such edge and above the bottom end thereof and a blate having a curved tongue adapted to enter such recess and embrace said edge, one of the plates being on the sash and the other on the frame in position to engage when the sash is swung inward about the hinge:
5. In combination with a window frame and sash, discimilar engaging couples at the upper and lower portions of the sash. one of said couples constituting a hinge adapted for detachable connection and on which the sach may swing after such connection and the other couple being normally unconnceted and adapted to engage after the sash has been swung laterally to assist in supporting and steadyfing the same
6. In combination with a window frame and sash. a detachable hinge consisting of a ductile metal plate having a central recess and wings on either side of such recess, in the adjacent edges of which wings are narrow offsets forming open sided sockets, a piate having a notch in an edge thereof. one of said plates being fastened to the sash and the other to the frame. and a swinging connecting plece having two lateral projections forming pintles on one end contained within the sockets of the firsa plate and having its other end bent over to form a head, the connecting plece when swung back lying between the wings of the first plate and its bent end adapted when swung forward and the sash is moved down from a raised portion to enter the noteh of the second plate and support the sash whereby the latter may be swung laterally inward from the frame.
7. In combination with a window frame and sash, a detachable hinge consisting of a ductile metal plate having a contral recess and wings on either side of such recess, in the adjacent edges of which wings are narrow offsets forming open sided sockets, a plate of sheet metal having its side and edges bent over to form an inclosure and offset the central portion. said portion having a notch in an edge therrof. one of said plates being fastened to the sash and the other to the frame and a swinging connecting piece havthit two lateral projections forming platles on one end conlained within the sockets of the first plate and having its other end bent over to form a head, the connecting plece when swung back lying between the wings of the first plate and its bent end adapted when swung forward and the sash
is moved down from a ralsed position to enter the notch of the second plate and support the sash whereby the noteh may be swung laterally inward from the frame.
8. In combination with a window frame and sash. a detachable hinge consisting of a ductile metal plate having a central recess and wings on either side of such recess in the adjacent edges of which wings are narrow offsets forming open sided sockets, a face plate lying against said plate and extending over the sockets, a plate having a notch in an edge thereof, one of sald plates being fastened to the sash and the other to the frame and a swinging connecting piece having two lateral projections forming pintles on one end contained within the sockets of the first plate and baving its other end bent over to form a head, the connecting piece when swung back lying between the wings of the first plate and its bent end adapted when swung forward and the sash is moved down from a raised position to enter the notch of the second plate and support the sash whereby the latter may be swung laterally inward from the frame.
9. In combination with a window frame, sash, sash suspenders and pulleys, detachable hinge means whereby the sash may be swung inward, and a catch for a detached suspender mounted adjacent the guide pulley to grip the suspender between itself and a flange of the pulley.
10. In combination with a window frame, sash, sash suspenders and pulleys, detachable hinge means whereby the sash may be swung inward, and a catch for a detached suspender having a tongue projecting adjacent the groove of the pulley over which such suspender is carried, arranged to confline the suspender between said tongue and a flange of the pulley when the suspender is deflected sidewise.
11. In combination with a window frame, sash, sash suspenders and pulleys, detachable hinge means whereby the sash may be swung inward, and a catch for a detached suspender consisting of a plate adjustably mounted above the pulleys and having a tongue projecting over the groove therein, said tongue being adapted to confine and hold between itself and a rim of the pulley of the suspender when laterally deflected.
12. In connection with a window having sashes adapted to slide in parallel paths, a hinge detachably engaging the inner sash with the frame, whereby said sash may be swung and displaced inwardly, a removable parting bead between the sashes, a plate having an upturned flange on the tod of the inner sash, and a hook on the outer sash adapted to engage said flange when said bead is removed, and normally held by said bead away from the flange.
13. The combination with the hinge member and socketed plate, of a resilient wear plate interposed between the platr. and the canice and forming a bearing for the end of th: hinge sum:jber

No. 101,552. Clipper. Cisailles.

Glles Bowler, Cavendisk, Joseph A. Walker and John Bigley, both of Peck, each an assignee of a third interest, all in Idaho, U.S.A., 16th October. 1906; 6 years. Filed 27th April, 1906. Receipt No. 135,318.
Claim.-1. A cutting implement consisting of shanks pivotally connected and provided with cutting jaws at their upper end portions, a lever arranged at the outer side of one shank, a means in which said lever is pivoted flxed to the other shank and projecting beyond said first shank, the upper end portion of said lever being formed with a cam engaging the adjacent shank, a pin on said last shank and a link pivoted to said lever below its fulcrum, said link being formed with a slot and having said pin arranged therein, for the purpose specified.
2. A cutting implement embodying shanks pivotally connected and provided with cutting jaws, a lever pivotally
supported on one shank, a pin on the other shank, means on said lever for closing said jaws and a link pivoted to said lever and formed with a slot in which said pin is arranged. for the gurpose specified.

\section*{No. 101,553. Car Door Bracket.}

Comsole powr porte de chars.

The Chicago Grain Door Company, Chicago, assignee of James L. Mallory, Evanston, Illinois, U.S.A., 16th October, 1906 ; 6 years. Filed 30 th May, 19:6. Receipt No. \(136,425\).
claim.-1. The combination with a car, of a one piece car door bracket, retaining members passing through said bracket on each side thereof and secured to said car, the heads of said members engaging said bracket and being protected by said bracket against operative access by a removing instrument.
2. The combination with a car, of a one piece car door bracket secured thereto by a plurality of attaching members adapted to be passed through said bracket and driven into the side of said car, the heads of said retaining members engaging said bracket and being protected thereby against operative access by a removing instrument.
3. The combination with a car, of a car door bracket and a plurality of attaching members passed through said bracket, said attaching members being pointed and provided with a plurality of annular barbs tapering toward the pointed end of said members, whereby said members are adapted to be driven into said car, the heads of said members engaging said bracket and being protected by said bracket against operative access by a removing tool.
4. The combination with a car, of a bracket, a plurality of attaching members adapted to be driven into said car, said attaching members being provided with circular heads and said bracket being provided with a plurality of circular sockets adapted and proportioned to said circular heads so as to receive the same and protect them against operative access by a removing tool.
5 . The combination with a car having a projecting post, of a car door bracket secured to the side of said car and adapted to engage said post whereby lateral movement of the bracket is prevented, and an attaching member adapted to secure said bracket in position, the head of said attaching member engaging said bracket and being protected thereby against operative access for the purpose of removal.
6. The combination with a car provided with a projecting post, of a car door bracket secured to the side of said car and adapted to engage said post so as to prevent lateral movement of said bracket, and an attaching member adapted to pass through said bracket at one side of said post and \(t_{1}\) ) be driven into said car, the head of said attaching member being protected by the bracket against operative accoss by any tool whereby said attaching member might otherwise be removed.
7. The combination with a car, of abracket, a plurality of attaching members, said attaching members being provided with circular heads and said bracket being provided with a plurality of circular sockets adapted and proportioned to said circular heads so as to receive the same and protect them against operative access by a removing tool.

8 . The combination with a car, of a one piece car door bracket and a plurality of attaching members passed through said bracket and embedded in the side of said car, said attaching members being tapered toward their inner ends and being barbed, whereby said members are adapted to be driven into said car, the heads of said members en-
saging said bracket and being protected by said bracket against operative access by a removing tool.
9. The combination with a car. of a one piece bracket, a piurality of retaining members passing through said bracket and secured to said car, said retaining members having :uch engagement with said bracket as to prevent the turning of the retaining members so as to detach the same from the car.
10. The combination with a car, of a one piece car door bracket, retaining members passing through said bracket on each side thereof and embedded in said car, said retaining members having such engagement with said bracket as to prevent the turning of said retaining members.
11. The combination with a car having a projecting post, of a car door bracket formed to fit over said post and to be secured to the side of said car and an attaching member adapted to secure said bracket in position, the head of said attaching member engaging said bracket and being protected thereby against operative access by a removing tool.
12. The combination with a car, of a car door bracket and a plurality of attaching members passing through said bracket, a portion of said attactring members being pro. vided with a plurality of annular barbs and being adapted to be driven into the side of said car, said attaching members being provided with circular heads and said bracket being provided with circular sockets adapted and proportioned to receive said circular heads so as to protect them against operative access by a removing tool.

No. 101,554. Antomatic Piano. Piano automatique.

The Reliable Self-Playing Piano Company, assignee of Frederick R. Goolman, both of Binghamptom, New York, U.S.A., 16 th October, 1906; 6 years. Filed 4th December, 1905. Receipt No. 130,667.
Claim.-1. In automatic pianos, a duct bridge having horizontal and vertical connecting ports, a series of pncumatics, a vacuum chest connected with the pneumatics, a pump connected with the vacuum chest, and flexible connections between the pneumatics and the various ports in the duct bridge, as described.
2. In an automatic piano, a swing duct bridge provided with horizontal and with vertical intersecting ports, a series of pneumatics, a vacuum chest in communication with the said pneumatics, trigger bars operated by the pneumatics and operating upon the keys of the instrument, a pump connected with the vacuum chest, means for driving the pump, a controlling device for the driving mechanism of the pump, and flexible connections between the pneumatics and the ports in the duct bridge, as set forth.
3. In automatic pianos, a double vacuum chest, a pump having a vacuum tube connected with the double chest, a double set of nneumatics, each set being in connection with a section of the vacuum chest, a duct bridge, and connections between the duct bridge and the pneumatics, as described.
4. In automatic pianos, a double row of pneumatics, a dual vacuum chest, connections between corresponding rows of pneumatics and corresponding sections of the vacuum chest. and a duct bridge common to all of the pneumatics and connected therewith, as described.
5. In automatic pianos, a double row of pneumatics alternately arranged one above the other, a vacuum sheet in two connected sections, connections between one row of pneumatics and one section of the vacuum chest, connec-
tions between the other section of the vacuum chest and the second row of pneumatics, a duct bridge, and connections between all of the pneumatics and the duct bridge. as described.
6. In automatic pianos, a double row of pneumatics alternately arranged one above the other, striking kess. track bars operated by the pneumatics and operating upon the keys, a vacuum chest in two connected sections, connections betweon each row of pneumatics and a section of the vacuum chest, a vacuum pump connected with the vacuum chest, common to both of its sections, 3 swinging duct bridge, and yielding connections between the duct bridge and the various pneumatics, as described.
7. In automatic pianos, a double set of pneumatics, the pneumatics in the sets being alternately arranged, a tracker bar for each pneumatic, keys upon which the said tracker bars have action, striking mechanisms for the keys, oper'ted thereby, a double vacuum chest, each section being in communication with a set of pneumatics, a duct bridge, and connections between all of the pneumatics and the duct bridge, as set forth.
8. A striking pneumatic for automatic instruments, comprising a body section having a vacuum chamber provided with an end outlet, a bellows below the body, a partition between the bellows and the body, being provided with a communicating opening and an opening to the atmosphere together with an end opening adapted for communication with the duct bridge of the instrument, an apertured cup over the communicating atmospheric opening, a valve held to play in the said cup to and from the opening in the (1) \(\because\) and the atmospheric opening, and means for operating the saic valve through the conditions of the air at the end opening in the partition, as described.
9. A striking pneumatic for automatic instruments, comprising a body portion having a vacuum chamber therein, provided with an end outlet adapted for communication with the vacuum chest of the instrument, and a bellows below the body section, the partition operating the two parts having a communicating opening, an opening to the atmosphere and an end opening in communication with the duct bridge of the instrument, a duct sieve in the said end opening, a valve controlling the opening to the atmosphere, and means for controlling the said valve from the end opening in the partition, as described.
10. In pneumatics for automatic instruments, a body portion having a vacuum chamber therein provided with an end cutlet adapted for communication with a vacuum chest, a bellows below the said chamber, provided with a finger, a tracker carried by said finger, the partition dividing the two sections of the striking pneumatic being provided with a communicating opening and an opening in communication with the atmosphere extending up through the top of the partition, the said partition being also provided with an cond opening adapted for communication with the duct bridge of the instrument, and a channel from the said opening leading into the vacuum chamber, a cup located over the communicating opening and the opening in communication with the atmosphere, which cup is provided with an opening communicating with the vacuum chamber, a valve having play. t", and from the opening in the cup and the opening in communication with the atmosphere, to alternately close one or the other of said openings, a diaphragm closing the upper jortion of the end opening in the partition of the said paeumatic, and means for controlling the sald valve from the said diaphragm, as described.
11. In striking pneumatics for automatic instruments, \({ }^{3}\) body portion having a vacuum chamber therein provided with an end outlet adapted for communication with a vacuum chest, a bellows below the sald chamber, provided With a finger, a tracker bar carried by the finger, the partition dividing the two sections of the striking pneumatic being provided with a communicating opening and an opening in communication with the atmosphere extending up througb the top of the partition, the said partition being also provided with an end opening adapted for communication with the duct bridge of the instrument and a channel from the seid opening leading into the vacuum chamber, a cup 10 cated over the communicating opening and the opening is communication with the atmosphere, which cup is provided with an opening communicating with the vacuum chamber. a valve having play to and from the opening in the cup and the opening in communication with the atmosphere to alternately close one or the other, a diaphragm closing the upper portion of the end opening in the partition of the said pneumatic, a dust sieve located at the outer end portion of the end opening in said partition, a spring serving normally to hold the said valve in an upper position, and a device for forcing the valve downward at the upward movement of the said diaphragm, as described.
12. In striking pneumaties for automatic instruments, \(3^{3}\) body portion provided with a vacuum chamber having an opening at one end adapted for communication with vacuum chest, a bellows located below the vacuum chamber,
having a finger adapted to support a tracker bar, a partition between the bellows and vacuum chamber, provided with a communicating opening and an opening in communication with the atmosphere leading out through the upper portion of the partition, and said partition being likewise provided with an end opening, an air duct connecting the said opening with the vacuum chamber, a diaphragm otherwise closing the said end opening with relation to the vacuum chamber, a projection from the diaphragm, a cup located on the partition, covering the communicating opening in communication with the atmosphere, which cup is provided with an opening communicating with the vacuum chamber, located over the opening in communication with the atmosphere, a spring controlled valve mounted within the cup, adapted to alternately close the opening in the cup, and the opening communicating with the atmosphere, and a rider having bearing on the said valve, pivoted on the partition between its ends, one end of which rider rests upon the projection from the said diaphragm, as described.
13. In striking pneumatics for automatic instruments, a body portion provided with a vacuum chamber having an opening at one end adapted for communication with \(a^{a}\) vacuum chest, a bellows located below the vacuum chamber, having a finger adapted to support a tracker bar, the partition between the bellows and vacuum chamber being provided with a communicating opening and an opening in communication with the atmosphere leading out through the upper portion of the partition, the said partition being likewise provided with an end opening, an air duct connecting the said opening with the vacuum chamber, a diaphragm otherwise closing the said end opening with relation to the vacuum chamber, a projection from the diaphragm, a cup located on the partition, covering the communicating opening and the opening in communication with the atmosphere, which cup is provided with an opening communicating with the vacuum chamber, located over the opening in communi cation with the atmosphere, a spring controlled valve mount ed within the cup, adapted to alternately close the opening in the cup and the opening communicating with the atmosphere, a rider having bearing on the said valve, pivoted on the partition between its ends, one end of which rider rests upon the projection from the said diaphragm, a dust sieve located at the end portion of the end opening in the partition, a duct bridge, and a communication between the end opening in the partition and the said duct bridge, for thr purposes set forth.
14. In striking pneumatics for automatic instruments, a duct bridge, a communication between the duct bridge and the striking pneumatic, and a dust sieve located in the striking pneumatic where the said communication is made as set forth
15. In pneumatic pianos, a swinging hammer rail, an expression bellows in connection with the swinging hammer rail, a valve box for the expression bellows in conenction therewith, an equalizing bellows in communication with the said valve box a duct bridge, a connection between the duct bridge and the said valve box, a vacuum pump, a vacuum chest, and a connection between the vacuum and the equalizing bellows, as set forth.
16. In an automatic piano, a sustaining pedal bellows, a duct bridge, a connection between said bellows and the duct bridge, a vacuum chest, means for producing a vacuum in the said chest and a communication between the vacuum chest and the said sustaining pedal bellows, as set forth.
17. In an automatic piano, a damper rod, a pedal lever, a connecting rod extending from the damper rod to the pedal lever, the said connecting rod having an eye formed thereon, a lever fulcrumed on a fixed support passed through the eye of the said connecting rod, a stop for the said lever, a duct bridge, a vacuum chest in two parallel compartments, one located above the other, the said compartments of the said vacuum chest being closed at their ends a pump for creating a vacuum in the said chest, a sustaining pedal bellows provided with a finger adapted to engage with the said lever, a communication between the said pedal sustaining lever and the vacuum chest and a second communication between the pedal sustaining lever and the duct bridge, all operating as described.
18. In an automatic piano the combination with the duct bride, an equalizing bellows and expression bellows, of a valve box for the expression bellows which valve box is provided with two chambers, one closed at both ends and the other closed at the lower end and open at the top, each chamber being provided with a transverse partition, the partition separating the two chambers being provided with an upper and a lower opening and with an intermediate opening, spring controlled valves normally closing the upper and the lower openings in the dividing partitions being located in that chamber which is open at the top, one above and the other below the transverse partitions therein, the other chamber being provided with recesses in the inner face of its outer wall, diaphragms closing the said recesses,

10-21
valves carried by the said diaphragms having stems adapted for engagement with the spring controlled valves in the opposite chamber, the wall of the chamber in which the diaphragm valves are located being provided at its upper portion with a port in communication with the chamber and with an outlet leading from the said recess to the outside of the box, the lower portion of the same partition being provided with a second port communicating with the recess for the lower diaphragm valve, which lower port likewise extends out through the box, the said lower port being provided with a vent which extends from the said port into the said chamber in which the diaphragm valves are located, a tubular connection between the chamber for the diaphragm valves and expression bellows, a vacuum pump, a connection between the same chamber at its lower end and the said vacuum pump and a connection between the lower port in the valve box and the duct bridge and between the upper outlet port and the duct bridge, for the purpose set forth.
19. In automatic pianos a casing containing tone producing elements, a swinging duct bridge within the instrument, a drawer removable from the instrument and drums or reels carrying the controlling sheet for the instrument located within the said drawer, which drums or reels when the drawer is connected with the instrument are beneath the duct bridge and a controlling device for a controlling sheet when placed on the drums or reels, as described.
20. In automatic pianos a casing containing tone producing elements, a swinging duct bridge within the instrument, a drawer removable from the instrument, drums or reels for carrying the controlling sheet for the instrument and mounted to revolve within the drawer, which drums or reels when the drawer is in place are below the duct bridge and a guiding spider located between the drums or reels, as described.
21. In automatic instruments, drums or reels for the controlling sheet for the instrument, a spider located between the drums or reels having guiding influence upon the material passed over them, as described.
22. In automatic instruments, a receptacle bearings carried thereby, drums or reels mounted in said bearings and a fixed guide spider located between the drums or reels having guiding relation to the material passed over sald drums or reels, as described.
23. In automatic instruments, a receptacle, bearings carried thereby, drums or reels mounted in said bearings, a fixed guide spider located between the drums or reels having guiding relation to the material passed over said drums or reels and a cramp roller which has bearing against one of the drums or reels, for the purpose described.
24. In automatic instruments, a receptacle, bearings carried thereby, drums or reels mounted in said bearings. a fixed guide spider located between the drums or reels having guiding relation to the material passed over said drums or reels, a cramp roller which has bearing over one of the drums or reels, a spring controlling the said cramp roller, and means for limiting the movement of the cramp roller in connection with the drum or reel with which it is adapted to engage, as described.
25. In automatic instruments, a receptacle, bearings carried therebp, drums or reels mounted in said bearings, a fixed guide spider docater between the drums or reels having guiding relation to the material passed over said drum or reels, a cramp roller which has bearing over one of the drums or reels, a spring controlling the said clamp roller. means for limiting the movement of the cramp roller in connection with the drum or reel with which it is adapted to engage, and a shifting locking device arranged to hold the cramp roller in predetermined frictional relation to the drum or reel adjacent to which it is located, as set forth.
26. In automatic pianos and like instruments, drums or reels adapted to carry the controlling sheet for the instrument, a driven shaft in gear connection with one of the drums or reels which shaft is in telescopic sections, a lever for shifting one of the sections of the shaft, means whereby the two sections of the shaft turn together, a driving shaft, a disc on the driving shaft and a friction wheel on the sectional shaft in adjustment connection with the said disc, as described.
27. In automatic pianos and like instruments, drums or reels for carrying a controlling sheet for the instrument, a driven shaft in gear connection with one of the drums or reels constructed in telescopic sections arranged to turn one with the other, a shifting device for one section of said shaft, spring controlled hangers for the sectional shaft, a friction wheel at the outer end of the shifting section of the sectional shaft, a driving shaft and a disc carried thereby with which the friction wheel on the sectional shaft engages, as described.
28. In automatic pianos and similar instruments, a duct bridge, a swinging support for the duct bridge, the said duct bridge having end adjustment on its support and means for holding the duct bridge in end adjustment, as described,

No. 101,555. Pamp. Pompc.

The Steel Ball Company. assignce of Clothilde Barclay Hill, administratrix of the estate of Christian Charles Hill, deceased, both of Chicago, Illinois, U'S..S., 16th October, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,767
Claim.-1. A pumping apparatus comprising a pump casing having a piston chamber and suitable inlet and outlet passages, a piston in said chamber, and means for imparting reciprocation to said piston, the same comprising a spring and intermediate lever adapted to move said piston in one direction, a cam engaging said lever for moving said piston ir the other direction, and means for varying the position cf said lever with relation to the cam, substantially as set ferth.
2. A pumping apparatus comprising a pump casing having a piston chamber and suitable inlet and outlet passages, a piston in said chamber, and means for imparting reciprocalon to said piston, the same comprising a yoke on said piston, a lever engaging said yoke, an adjustable abutment at the upper end of said yoke, a spring for moving said lever in one direction, and a cam mechanism for moving said lever in the other direction, substantially as set forth.
3. A pumping apparatus comprising a base provided with a convave seat and suitable inlet and outlet passages, a iump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber, and means for imparting reciprocation to said piston, the same comprising a spring for moving said piston in one direction, and a cam mechanism for moving said piston in the other direction and for imparting oscillation to thelump casing. substantially as set forth.
4. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a pump casing adapted to oscillate on said seat and provided With a piston chamber, a piston moving in said chamber, and meaus for imparting reciprocation to said piston, the same comprising a spring and intermediate lever for moving said piston in one direction and a cam mechanism for moving said piston in the other direction and for imparting oscillation to the pump casing, substantially as set forth.
5. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, ia. pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber. and means for imparting reciprocation to said piston, the same comprising a yoke on said piston, a lever engaging said yoke, an adjustable abutment at the upper end of said yoke, a spring for moving said lever in one direction, and a cam mechanism for moving said lever in the other direction, and for imparting oscillation to the pump casing, substantially as set forth.
6. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber. means for imparting reciprocation to said piston, the same comprising a spring for moving said piston in one direction and a cam mechanism for moving said piston in the other direction and for imparting oscillation to the pump casing, and a casing attached to the base aforesaid and adapted to enclose the pump mechanism and form a containing chamber for the fluid to be pumped, substantially as set forth.
7. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, apump casing adapted to oscillate on sald seat and provided with a piston chamber, a piston moving in said chamber, means for imparting reciprocation to sald piston, and means for imparting intermittent oscillation to said pump casing. the same comprising a cam yoke on the pump casing and a the samengaging said yoke, substantially as set forth.
8. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber. means for imparting reciprocation to sald piston, the same comprising a spring for moving said piston in the other drrection, and means for imparting intermittent oscillation to said pump casing, substantially as set forth
9. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber, means for imparting reciprocation to said piston, the same comprising a spring and intermediate lever for moving said piston in one direction, and a cam mechanism for moring said piston in the other direction, and means for imparting intermitten oscillation to said pump casing, substantially as set forth.
10. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages a pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber, means for imparting intermittent oscillation to the pump casing the same comprising a cam yoke on the pump casing and an operating cam engaging said yoke, and means for imparting reciprocation to the piston, substantially as set forth.
11. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber, means for imparting intermittent oscillation to the pump casing. the same comprising a cam yoke on the pump casing and an operating cam engaging said yoke, and means for imparting reciprocation to the plston, the same comprising a spring for moving said piston in one direction and a cam mechanism for moving the said piston in the other direction, substantially as set forth.
12. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a pump adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber, means for imparting intermittent oscillation to the pump casing the same comprising a cam yoke on the pump casing and an operating cam engaging said yoke, and means for imparting reciprocation to the piston, the same comprising a spring and intermediate lever for moving said piston in the other direction, substantially as set forth.
13. A puinping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a pump casing adapted to oscillate on said seat and provided with a piston chamber. a piston moving in said chamber, means for imparting intermittent oscillation to the pump casing the same comprising a cam yoke on the pump casing and an operating cam engaging said yoke, and means for imparting reciprocation to the piston, thi same comprising a yoke on said piston, a levor engaging said yoke, an adjustable abutment at the upper end of said yoke, a spring for moving said lever in one direction and a cam mechanism for moving said
direction, substantially as set forth.
14. A pumping apparatus comprising a base providel with a concave seat and suitable inlet and outlet passages. a pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber, means for yieldingly holding the pump casing to thr seat. means for imparting intermittent oscillation to the pump casing. the same comprising a cam yoke on the pump casing and a cam engaging sald yoke, and means for imparting reciprocation to the piston, substantially as set forth.
15. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a pump casing adapted to oscillate on said seat and provided with a piston chamber, a piston moving in said chamber, means for yieldingly holding the pump casing to the seat, means for imparting intermittent oscllation the pump casing, and means for imparting reciprocataid to the piston, the same comprising a spring for moving aing piston in one direction and a cam mechanism for mor set said piston in the other direction, substantially as sat forth.
16. A pumping apparatus comprising a base provided with a concave seat and sultable inlet and outlet passages, a pump casing adapted to oscillate on sald seat and pro vided with a piston chamber, a piston moving in salidg chamber, means for yieldingly holding the pump casiag to the seat. means for imparting intermittent oscillation to the pump casing. and means for imparting reciprocsmedto the piston, the same comprising a spring and intermed a iate lever for moving said piston in one direction, andeccam mechanism for moving said piston in the other direction, substantially as set forth.
17. A pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a pump casing adapted to oscillate on said seal and provided with a piston chamber, a piston moving in said chamber, means for yieldingly holding the pump casing to the scat, means for imparting intermittent oscillation to the pump casing, and means for imparting reciprocation to the piston, the same comprising a yoke on said piston. a lever engaging said yoke, an adjustable abutment at the upper end of said yoke, a spring for moving said lever in one direction and a cam mechanism for moving said levor in the other direction. substantially as set forth.
18. A multiple pumping apparatus comprising a single pump casing having a series of piston chambers and suitable inlet and outlet passages, individual gistons in said chambers, and means for imparting reciprocation to said pistons, the same comprising individual levers and springs for moving said pistons in one direction and a cam engaging said levers for moving sald pistons in the other direction, substantially as set forth.
19. A multiple pumping apparatus comprising a single pump casing having a series of piston chambers and suitable inlet and outlet pasages, individual pistons in said chambers, and means for imparting reciprocation to said pistons, the same comprising individual yokes on said pistons, levers engaging said yokes, adjustable abutments at the uyper ends of said yokes. springs for moving said levers in one direction, and a cam moving said levers in the other direction, substantially as set forth.
20. A multiple pumping apparatus comprising a single oscillating pump casing having a series of piston chambers and suitable inlet and outlet pasages, individual pistons is said chambers, means for imparting reciprocating to said pistons, the same comprising individual springs moving said pistons in the other direction, a supporting base for mechanism having a concave seat for the pump casing. and a casing attached to sald base and adapted to enclose the pump mechanism and to form a containing chamber for the fluid to be pumped. substantially as set forth.
21. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a single pump casing adapted to oscillate on said seat and having a series of piston chambers. individual pistons in said chambers and means for imparting reciprocation to said pistons, substantlally as set forth.
22. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers and means for imparting reciprocation to such pistons. the same comprising individual springs moving sald pistons in one drection and a cam mechanism moving said pistons in the other direction. substantially as set forth.
23. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers and means for imparting reciprocation to such pistons, the same comprising individual levers and springs for moving said plstons in one direction and a cam engaging said levers for moving said pistons in the other direction, substantlally as set forth.
24. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on asid seat and having a series of piston chambers, individual pistons in said chambers and means for imparting reciprocation to such pistons, the same comprising individual yokes on said pistons, levers engaging said yokes, adjustable abutments at the upper ends of said yokes, springs for moving said levers in one direction and a cam moving said levers in the other direction, substantially as set forth.
25. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a eingle pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers. means for imparting reciprocation to said pistons and a casing attached to the pump base and adapted to enclose the pump mechanism and form a containing chamber for the fluid to be pumped. substantially as set forth.
26. A multiple pumping apparatus comprising a base provided with a concare seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers, means for imparting intermittent oscillation to said pump casing and means for imparting reciprocation to said plstons, substantially as set forth.
27. A multiple pumping apparatus comprising a base proVided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat
and having a series of piston chambers, Individual pistons in said chambers, means for imparting intermittent oscillation to said pump casing and means for imparting reciprocation to said pistons, the same comprising individual springs moving said pistons in one direction and a cam mechanism moving said pistons in the other direction, substantially as set forth.
28. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said scat and having a series of piston chambers. individual pistons in said chambers. means for imparting intermittent oscillation to said pump casing and means for imparting reciprocation to said pistons, the same comprising individual levers and springs for moving said pistons in one direction and a cam engaging said levers for moving the pistons in the other direction, substantially as set forth.
29. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a single pump casing adapted to oscillate on said seal and having a series of piston chambers, individual plstons in said chambers, means for imparting intermittent oscillation to said pump casing and means for imparting reciprocation to said pistons, the same comprising individual yokes on said pistons, levers engaging said yokes, springs for moving said levers in one direction and a cam moving said levers in the other direction, substantially as set forth.
30. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscllate on said seat and having a series of piston chambers, individual pistons in said chambers, means for imparting intermittent oscillation to said pump casing and means for imparting reciprocation to said piston, and a casing attached to the pump base and adapted to enclose the pump mechanism and to form a containlng chamber for the fluid to be pumped. substantially as set forth.
31. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers. means for imparting intermittent oscillation to sald pump casing. the same comprising a cam yoke on said casing and an operating cam engaging eaid yoke and means for imparting reciprocation to sald pistons. substantially as set forth.
32. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casinp adapted to oscillate on eaid seat and having a series of piston chambers, individual pistons in said chambers. means for imparting intermittent oscillation to said pump casing. the same comprising a cam yoke on said casing and an operating cam engaging said yoke. and means for imparting reciprocation to sald pistons. the same comprising individual springs moving said pistons in one direction and a cam mechanism moving said pistons in the other direction, substantially as set forth.
83. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages. a single nump casing adaptod to oscillate on said seat and having a series of piston chambers. Individual pistons in said chambers. means for imparting intermittent oscillation to said pump casing the same romprising a cam yokel on said casing and an operating am engagiug sald: yoke, and means for imparting reciprocation to sald pistons, the same comprising individual levers and springs for mov: ing said pistons in one direction and a cam engaging sald levers for moving the pistons in the other direction, substantially as set forth.
34. A multip!e pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on sald geat and having a series of piston chambers. individual pistons ir: said chambers, means for imparting intermittent oscillation to said pump casing the same comprising a cam yoke cr said casing and an operating cam engaging said yoke. and means for imparting reciprocation to said pistons, the same momprising individual yokes on said pistons. levers engaging said yokes, adjustable abutments at the upper cads of said yokes. springs for moving said levers in one direction. substantially as set forth.
35. A multiple pumping apparatus comprising a base provided with a concave seat and sultable inlet and outlet passages, a single casing adapted to oscillate on said seat and liaving a serics of piston chambers, individual pistons in said chambers. means for imparting intermittent oscillation to said pump casing, the same comprising a cam yoke on said casing and an operating cam engaging said yoke, means for imparting reclprocation to said pistons, and a casing attached to the pump base and adapted to enclos: the punp nuechanism and form a containing chamber for the fluid to nupehanism and form a coutaining cha
be pumped. substantially as set forth.
36. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a piston chambers, individual pistons in said chambers, means for yieldingly holding the pump casing to the seat, and means for imparting intermittent oscillation to the pump casing, and means for imparting reciprocation to the pistons, substantially as set forth.
37. A mutiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers, means for yieldingly holding the wump casing to the seat, means for mparting intermittent ascillation to the pump casing the same comprising a cam yoke on the pump casing and an operating cam engaging said yoke, and means for imparting recinrocation to the piston. substantially as set forth
38. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pis tons in said chambers. means for yieldingly holding the jump casing to the seat, means for imparting intermittent oscillation to the pump casing, and means for imparting reciprocation to the pistons, the same comprising individual springs moving said pistons in one direction and a cam mechanism moving said pistons in the other direction, substantially as set forth.
39. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers, means for yieldingly holding the pump casing to the seat, means for imparting intermittent oscillation to the pump casing, the same comprising a cam yoke on the pump casing and an operating cam engaging the same, and means for imparting reciprocation to the pistons. the same comprising individual springs moving said pistons is one direction and a cam mechanism moving said pistons in the other direction, substantially as set forth.
40. A multíple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said geat and having a series of piston chambers, individual pistons in said chambers, means for yieldingly holding the pump casing to the seat, the same comprising a pair of pivoted end beams engaging said pump casing, a spring equalizer bar engaging the free ends of said beams and a central tension adjusting bolt engaging the equalizer hor means for imparting intermittent oscillations to the pump casing and means for imparting reciprocation to the pistons. substantially as set forth.
41. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passares, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers, means for yieldingly holding the pump casing to the seat, the same comprising a pair of pivoted end beams engaging said pump casing, a spring equalizer bar engaging the free ends of said beams and a central tension adiusting bolt engaging the equalizer bar, means for imparting intermittent oscillation to the pump casing, the same comprising a cam yoke on the pump casing and an operating cam engaging said yoke, and means for imparting reciprocation to the pistons, substantially as set forth.
42. A multiple pumping apparatus comprising a base provided with a concave seat and suitable inlet and outlet passages, a single pump casing adapted to oscillate on said seat and having a series of piston chambers, individual pistons in said chambers, means for yieldingly holding the pump casing to the seat, the same comprising a pair of pivoted end beams engaging said pump casing, a spring equalizer bar engaging the free ends of said beams and a central tension adjusting bolt engaging the equalizer bar, means for imparting intermittent oscillation to the pump casing and means for imparting reciprocation to the pistons, the same comprising individual springs moving the pistons in one direction and a cam mechanism moving said pistons in the other direction, substantially as set forth.

\section*{No. 101,556. Pump. Pompe.}

The Steel Ball Company, assignee of Clothilde Barclay Hill, administratrix of the estate of Christian Charles Hill, deceased, both of Chicago. Illinois. U.S.A.. 16th October, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,768.
Claim.-1. A pumping apparatus comprising a stationary member carrying a circular cluster of bearing ings in bearing faces, a revoluble head having bearing at one end bearing faces, a revoluble beare being a pump cylinder carried
o said head and having an inlet-outlet passage adapted (a)
and with the outlet passages therein, means for revolving said head, a pump plunger in said cylinder, and means for reciprocating said plunger, substantially as set forth.
2. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, there being a pump cylinder carried by said head and having an inlet-outlet passage adapted to serially register with the series of outlet pasages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams equal in number to the series of outlet passages, means for effecting an individual adjustment of said cams, and an intermediate operative connection between the said cams and the pump plunger, substantially as set forth.
3. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, there being a pump cylinder carried by said head having an inlet-outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder, and means for reciprocating said plunger, the same comprising a circular series of cams equal in number to the series of outlet passages, a series of individual screws for effecting independent adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
4. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member. there being a pump cylinder carried by said head and having an inlet-outlet passage adanted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams equal in number to the series of outlet passages, a series of individual screws for effecting independent adjustment of said cams, a yoke piece provided with a series of resilient eyes having frictional en gagement with the shanks of said screws, and an inter mediate operative connection between said cams and the pump plunger, substantially as set forth.
5. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, revoluble head having bearing at one end on said member a stationary spider forming a bearing for the other end o the head, there being a pump cylinder carried by said had and having an inlet-outlet passage adapted to serially reg ister with the seriez of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same com prising a circular series of cams on said spider equal in number to the series of outlet passages, means for effecting an individual adjustment of said cams, and an int the mediate operative connection between st
pump plunger, substantially as set forth. 6. A pumping apparatus, comprising a stationary a revoluble with a circular at one end on said mem ber, a head having forming a bearing for the other end of the hald head and having an inlet outlet passage adaped to serial head and having an inlet outlet passage adaped ly register with the series of outlet passages aforesaid
cylinder and means for reciprocating said plunger, the same comprising a circular series of cams on said spider equal in number to the series of outlet passages, a series of individual screws for effecting individual adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
7. A pumping apparatus, comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the head, there being a pump cylinder carried by said head and having an inlet outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams on said spider equal in number to the series of outlet passages, a series of individual screws for effecting individual adjustment of said cams, a yoke piece provided with resilient eyes for frictional engagement with the shanks of said screws, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
8. A pumping apparatus comprising a stationary member carrying a circular cluster of bearing lugs in spaced relation and formed with outlet passages in their bearing spaces a revoluble head having bearing at one end of said bearing lugs, there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet and outlet passage adapted to alternately register with the spaces between said lugs and with the outlet passages therein, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, substantially as set forth.
9. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end in said member. there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passage adapted to serially register with the outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams equal in number to the series of outlet passages, means for effecting an individual adjustment of said cams, and an intermediate operative connection betwren said cams and the pump plunger, substantially as set forth.
10. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages. a revoluble head having bearing at one end in said member, there being a pump cylinder arranged at one side of the ax's of rotation of sald head and having an inlet-outlet passage adapted to serially register with the outlet passages aforesaid. means for revolving said heart. a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams equal in number to the series of outlet passages, a series of individual screws for effecting independent adjustment of said cams and an intermediate operative connection between sald cams and the pump plunger, substantially as set forth.
11. A pumping apparatus. comprising a stationary member provided with a circular series of outlet passages. a revoluble head having bearing at one end in aid member, there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passage adapted to serially register with the outlet passages aforesaid, means for revolving said head. a pumpplunger in said cylinder, and means for reciprocating said plunger the same comprising a circular series equal in number to the series of outlet passages, a series of individual screws for effecting indenendent adjustment of said cams, a yoke piece provided with a series of resilient eyes having frictional engagement with the shanks of said screw, and an intermediate operative connection between said cams and the pump plunger. substantially as set forth. 12. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for we other end of the head, there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams on said spider equal in number to the series of outlet passages, means for effecting an individual adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth. 13. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the
head, there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams on said spider equal in number to the series of outlet passages, a series of individual screws for effecting independent adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
14. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the head, there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outhet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder and means for reciprocating said plunger, the same comprising a circular series of cams on said spider equal in number to the series of outlet passages, a series of individual screws for effecting independent adjustment of said cams, a yoke piece provided with resilient eyes for frictional engagement with the shanks of said screws, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
15. A pumping apparatus comprising a stationary member carrying a circular cluster of bearing lugs in spaced relation and formed with outlet passages in their bearing faces, a revoluble head having bearing at one end on said bearing lugs, there being a pump cylinder carried by said head and having an inlet-outlet passage adapted to altornately register with the spaces between said lugs and with the outlet passages therein, means for revolving said head, a pump plunger in said cylinder, a spring for moving said plunger in one direction and a cam mechanism for moving said plunger in the other direction, substantially as set forth.
16. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member. there being a pump cylinder carried by said head and hav ing an inlet-out passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder, a spring for moving said plunger in one direction and a cam mechanism for moving said plunger in the other direction, the same comprising a circular series of cams equal in number to the series of outlet passages, means for effecting an individual adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
17. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, there being a pump cylinder carried by said head and having inlet-outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder, a spring for moving said plunger in one direction and a cam mechanism for moving said plunger in the other direction, the same comprising series of cams equal in number to the series of out let passages, a series of individual screws for effecting independent adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
18. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the head, there being a pump cylinder carried by said head and having an inlet outlet passage edapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump plunger in said cylinder, a spring for moving said plunger in one direction, and a cam mechanism for moving said plunger in the other direction, the same comprising a circular series of cams equal in number to the series of outlet passages, means for effecting an individual adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
19. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the head. there being a pump cylinder carried by said head and having an inlet-outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a nump plunger in said cylinder, a spriug for moving said plunger in one direction, and a cam mechanism for moving said plunger in the other direction, the same comprisifg a circular series of cams equal in number to the series of outlet passages, a series individual screws
for effecting said independent adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger. substantially as set forth.
20. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end in said member, there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passage adapted to serially register with the outlet passages sforeonif. means for revolving said head, a spring for moving said plunger in one direction, and a cam mechanism for moving said plunger in the other direction, the same comprising a circular series of cams equal in number to the series of outlet passages, means for effecting an intermediate operative connection between said cams and the pump phunger. substantially as set forth.
21. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages. a revoluble head having bearing at one end in said member, there heing a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passage adapted to serially register with the outlet passages aforesaid, means for revolving said head, a spring for moving said plunger in one direction, and a cam mechanism for moving said plunger in the other direction, the same comprising a circular series of cams equal in number to the series of outlet passages. a series of individual screws for effecting independent adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger, substantially as set forth.
22. A pumping apparatus comprising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the head. there being a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head, a pump blunger in said cylinder, a spring for moving said plunger in one direction, and a cam mechanism for moving said plunger in the other direction, the same comprising a circular series of cams on said spider equal in number to the series of outIft passages, means for effecting an individual adjustment of said cams. and an intermediatr operative connection between said cams and the pump plunger. substantially as set forth.
23. A pumping apparatus comprising a stationary member frovided with a circular series of outlet passages. a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the head. there bring a pump cylinder arranged at one side of the axis of rotation of said head and having an inlet-outlet passagr adapted to serlally register with the series of outlet passages aforesaid. means for revolving said head. a pump plunger in said cylinder, a spring for moving said plunger in one direction. and a cam mechanism for moving said plunger in the other direction, the same comprising a circular erries of cams on said spider equal in number to the series of outlet passages, a series of individual screws for effecting independent adjustment of said cams, and an intermediate operative connection between said cams and the pump plunger. substantially as set forth.
24. A pumping apparatus comrrising a stationary member provided with a circular series of outlet passages, a revoluble head having bearing at one end on said member, a stationary spider forming a bearing for the other end of the head. there being a pump cylinder carried by said head and having an inlet-outlet passage adapted to serially register with the series of outlet passages aforesaid, means for revolving said head. a pump plunger in said cylinder and means for reciprocating said plunger, and a spring arranged between said spider and a collar on the revoluble head and adaoted to hold sald head to its bearing on the stationary member. substantially as set forth.

\section*{No. 101,557. Paper Making Machine. \\ Hachine a faire du papier.}

The Eichhorn-Campbell Company, assignee of Carl Eichhorn and Clarence W. Campbell, all of Dexter. New York, U.S.A. 16th October, 1906; 6 years. Filed 4th May. 1505. Receipt No. 124.857.
Claim.-1. In a device of the character described, a feed box. a means of carrying stock therefrom through a paper machine, a feed box pivotally mounted transverse the said means, condult means for supplying said feed, substantially a: described.
2. In a deviec of the character described, a feed box, and a ccreen adapted to rarry stock therefrom, through the paper making machinery. a plurality of independent feed boxes, pivotally mounted and extending substantially transverse the screen and means for applying pressure to the feed from said boxes, substantially as described.
3. In a device of the character described. a plurality of feed boxes located substantially transverse the screen, each

pivotally mounted and each provided with a close cover and each being adapted to receive atmospheric or other pressure therein to drive the contents thereof on to stock passing beneath the boxes, substantially as described.
4. In a paper making machine having as an element thereof means for carrying paper stock through the machine, a feed box mounted substantially transverse of the screen having its sides converging at the bottom into a longitudial opening, means for limiting the extent of said opening, and means for altering the direction of the fluid discharged therefrom. substantially as shown.
5. In a device of the character described, a transverse feed, conduits for supplying paper stock thereto, means for efecting the paper stock therefrom under pressure, means for governing the direction and extent of the discharge of stock therefrom and means in said box for agitating the contents thereof, substantially as shown.
6. In a device of the character described, a plurality of feeds located to discharge the contents thereof onto stock passing thereunder in the manufacture of the same, the said feeds being adjustably axially mounted thereor, mesns for discharging the contents of said feeds, means for limit ing the direction and force of said discharge, means for placing the contents thereof under pressure.
7. In a device of the character described, a feed box mounted substantially across the screen. and corstructed of compartments and being longitudinally extensible and having a shaft running therethrough with spoon members thereon. whereby different coloured material can be ejected therefrom to the stock passing thereunder, substantially as described.
8. In a device of the character described, a feed box mounted substantlally across the screen and constructed of compartments and being longitudinally extensible and having a shaft running therethrough with spoon members thereon, whereby different coloured material can be ejected therefrom to the stock passing thereunder, and mesns of placing the contents of said feeds under pressure, substantially as deseribed.
3. In a naper making machine, a plurallty of means for feeding stock, means for controlling the said feeds to regulate the pressure and volume and means for feeding regulate the pressure and volume, and meas
the same in currents of different directions.
10. In a paper making machine, a plurality of means for foeding stock, and means for feeding the stock in currents of different directions.
11. In a paper making machine having stock feeding means therewith. secondary feeds and means for regulating the volume, pressure and direction of the current from said feeds.
12. In a paper making machine, means for feeding ma terial thereto, the said means being adjustable to the widt of the fabric being manufactured in the machine.
13. In a paper making machine, means for feeding material to the stock being manufactured, the said means being adapted to be supported independent of the mathine 0 os to be supported thereon.
14. In a paper making machine. a plurality of secondary feeding means, each provided with means for regulation the output therefrom, and each being provided with means for ejecting the output under pressure.
15. In a paper making machine. means mounted thereon to feed separate material to the stock passing thereon and comprising means to regulate the amount and tistribution of said feed.

No. 101,558. Mixing Machine for Concrete, Etc. Vuchine à mélat!!rr.

Frederick C. Austin, assignee of Charles E. Bathrick, Chicago, Illinois, U.S.A., 16th October, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,636,
Claim.-1. In a mixing machine, a rotary mixing receptacle, a tilting frame upon which the mixing receptacle is revolubly mounted, a mouth piece secured upon the tilting frame and arranged for directing materials into the mixing receptacle, a hopper, and a valve for opening and closing the hopper, said valve being arranged to direct material into the mouth piece when it is open, and being arranged to be swung back and closed by the mouth piece when the frame is tilted, and a guard \(r\) for the purpose set forth.
2. The combination with a stationary hopper and with a tilting receptacle provided at the rear with a spout adapted to be carried to and from the hopper by the tilting of the receptacle, of a chute pivoted to the hopper to close and seal the mouth thereof in one position and to swing into the said spout and act as a chute between the hopper and the spout when the receptacle is in the other position.
3. In a mixing machine, a rotary mixing receptacle provided with an annular gear, a tilting frame upon which the mixing receptacle is mounted to revolve, a rotary main driving shaft gear connected with the annular gear on the mixing receptacle as means for revolving the latter, a rotary counter shaft gear connerted with said main driving shaft, a clutch having one of its members provided with a worm, and adapted for connecting and disconnecting said member with and from the counter shaft, a rotary worm wheel engaged by sald worm. a crank rigid with the worm wheel and connected with one ram of a vibratory bell crank by a link or pitman. a link connecting the other arm of the bell crank with the mixing receptacle support as a means for tilting the latter, a cam disc 16 rigid with the worm wheel and having peripheral notshes 17 and 18 , a vibratory clutch shifter \(k\) pivoted to the shifting clutch member and weighted at one side of such clutch member, and a locking arm 19 pivoted to the cluteh shifter and having at one end an idfer roll adapted to engage in one and the other of notehes 17 and 18 of the disc 16 , and to ride upnn the periphery of said dise when not in engagement in the sald notches.
4. In a mixing machine, a rotary mixing receptacle. a tiltIng support upon which the mixing receptacle is mounted to revolve, a vibratory bell crank arranged below the mixing receptacle support, a link or pltman connecting one arm of the bell crank with one end portion of the tilting mixing receptacle support. a rotary crank, power transmitting connection between said crank and the remaining arm of the bell crank, and means for revolving the crank.
5. In a mixing machine, a rotary mixing receptacle. a tilting support for the rotary mixing receptacle, a shaft rotatable in one direction and means for rotating the receptacle therefrom, a toggle comprising a vibratory arm 26 and a link 27 connecting said arm with the tiling mixing receptacle support, and a rank operated from said shaft for vibrating the arm 26.
6. In a mixing machine, a rotary mixing receptacle, a tilting support for the rotary mixing receptacle. mechanism for tilting the support for the rotary mixing receptacle, a rotary cam device for automatically limiting the extent to which the mixing receptacle support cam be tilted in each direction. means for driving said cam device and means for shifting the connection between the rotary cam device and the tilting device and the driving means therefor.
7. In a mixing machine, a rotary mixing receptarle provided with a ring gear, a tilting; frame upon which the mix-
ing receptacle is supported to revolve, a power driven shaft gear connected with the ring gear on the mixing receptacle, a counter shaft gear connected with the said power driven shaft. a device for tilting the mixing receptacle support. a clutch for connecting the counter shaft with the device for tilting the mixing receptacle support, and a rotary cam deviee for automatically disconnecting the tilting device from the counter shaft and a member of the clutch device for engaging the high portion of the cam device and maintaining the clutch mombers in temporary relative engagement.

The combination with the tilting receptacle having a spout at the rear. of a stationary hopper with a neck at the bottom and a rombined tilting valve and chute having sides outside of said neck and pivoted to close against and seal the peck of the hopper when the receptacle is in one position, and adapted to enter the spout when the receptacle in brought to a position opposite the chute. with means for :winging the clute into the spout as the latter is brought opnosite the chute.
!. In a mixing machine, a rotary mixing receptacle, a tilting frame upon which the mixing receptacle is supported to revolve, a mouth piece supported upon the tilting frame and registoring with an opering in the mixing receptacle, a suitably supported hopper, a hinged gate \(n\) for opening and closing the lower end of the support, said gate being arranged to project within the said mouth piece when the mixing receptacle is in charging position, and a toggle device for locking the said gate in position to close the discharge orifice of the hopper.
10. In a mixing machine, a rotary mixing receptacle 1 rovided with a ring gear. a power driven shaft gear connectad with said ring gear. a tilting support upon which the mixing receptacle is arranged to revolve, idier rolls 5 engaging the glane back face of the ring gear. an uprights counter shaft gear conn-cted with sald driving shaft. a rotary gear wheel rigid with a cam device and means for connecting and disconnecting said gear wheel with and from the counter shaft. said rotary cam device being provided with a high and low portion, a vibratory clutch shifter for operating the clutch, an arin 19 engaging the cam. and a weight on the clutch shifter fo" causing said arm to angage in the low portions of the cam.
11. In a mixing machine, a rotary mixing recoptacle, a tilting support upon which the mixing recentacle is arranged to revolve, mechanism for tilting said mixing receptacle support and means for limiting the extent of movement on the part of sald tilting device and comprising a rotary cam having high and low portions.
12. In a mixing machine, a rotary mixing receptacle, a tilting support upon which the mixing receptacle is mounted, a rotary cam, means adapted for operating the rotary cam and comprising a cluteh. a clutch shifter for operating the clutch, a latch engaged by the cam, and a spring arranged to hold the latch in engagement with the cam with a yielding spring pressure.
13. In a mixing machine. a rotary mixing receptacle, a tilting support upon which the rotary mixing receptacle is mounted, a rotary power driven shaft, a rotary cam, means for connecting and disconnecting said cam with and from said shaft, a lever for shifting one of the clutch members, a latch l:ung to swing about the pivotal axis for the lever, and arranged to engage the cam, and means for tilting the mixing receptacle support connecting the latter with the rotary cam. 14. In a mixing machine. a rotary mixing receptacle, a tilting support upon which the rotary mixing receptacle is mounted, a rotary cam 16, a clutch shifting lever K, a lateh 19 engaging the cam, a spring between the latch and lever, a rod connecting the latch and lever and having a limited sliding connection with one of such members, means for operating the cam, and a clutch for controlling such operating means.
15. The combination with the rotatable receptacle and tilt ing support therefor. of a driving shaft and connections for rotating said receptacle, a rotatable cam and means for driving the same. devices operable from said cam for tilting the support, and means for automatically disconnecting the cam from its driving means when the receptacle is in its terminal positions.
16. The combination with the rotatable receptacle and tilting suport therefor, of a driving shaft and connections for rctating said receptacle, a rotatable cam and means for drivirg the same. devices operable from said cam for tilting the support, and means for automatically disconnecting the cam ficm its driving means when the receptacle is in its terminal positions, said means including yielding connections to perm!t the positive disconnection of the cam and driving means with the receptacle in any position.
17. In a machine for mixing concrete, and the like, a cubiform or substantially cubiform mixing receptacle mounted upon a tilting support and aranged to revolve about the axis of rotation, the breakers in conjunction with intersecting

Dlanes or sides of the receptacle forming a series of triangles.
18. In a machine for mixing concrete, and the like, a cubi furm or substantially cubiform mixing receptacle mounted mon a tilting support and arranged to revolve about a diagonal axis and having a discharge opening in alignment therewith, and breaker rods secured to the sides of the receptacle and arranged in annular series about the axis of rotation, these rods in conjunction with intersecting planes of said sides of the receptacle forming a series of triangles.

No. 101,559 . Heater for Oil Wells.

> Chauffeur pour puits à huile.

Edward Wenning, Cincinnati, assignee of Fred. B. Waring. Hartwell. both in Ohio, U.S.A., 16th October, 1906; 6 years. Filed fth September, 1906. Receipt No. 139,208.
Claim.-1. In a heater for oll wells the combination of a pump tubing having an intake portion at its lower end, a leater mounted above said intake upon the pump tubing so as to be adjustable thereon to a point adjacent to the prodwetive strata, and a means of pumping the fluid from the well through the pump tubing.
2. In a heater for wells the combination of an insulating casing surrounding the pump tubing, a series of heating coils surrounding the insulating casing, said coils being connected in parallel at their upper ends to a source of electrical energy and being connected at their lower ends to a return circuit.
3. In a heater for ofl wells the combination of a pump tubing having an intake portion at its lower end, a heater mounted upon the pump tubing so as to be adjustable thereon to a point adjacent to the productive strata, a means of pumping the fluid from the well through the pump tubing. and a damper located on the pump tubing above the heater and above the productive strata of the well.
4. A heater for oil wells consisting of an insulating casing adapted to surround the pump tubing, a series of coils surrounding the casing insulated at their upper ends from the tu:bing and connected in parallel, and at their lower ends in electrical communication with the pump tubing and likewise connected in parallel, a perforated casing surrounding the coils and adjusting clamps at the upper and lower ends of the perforated casing for adjusting it upon the pump tubing.

\section*{No. 101,560. Machine for Making Wire Chains.}

\section*{Machine à faire des chaines de fil de fer.}

Michael Bartholomew Ryan, Boston, Massachusetts, assignee of James Coulter, Bridgeport, Connecticut, U.S.A., 16th October, 1906: 6 years. Filed 12th July, 1906. Receipt No. 137,736.
Claim.-1. In a machine of the character described, independently reciprocating supports, link forming levers pivotguides for said levers, and a former, as and for the purpose specified.
2. In a machine of the character described, independently reciprocating supports, link forming levers operatively mounted thereon, guide rolls carried by said levers, guides with which said rolls engage, forming rolls on said levers, and a former, as and for the purpose specified.
3. In a machine of the character described, independently reciprocating supports, link forming levers operatively mounted thereon, guide rolls on said levers, guides engaged by said rolls, forming rolls on said levers, a vertically operating former or anvil, as and for the purpose specified.
4. In a machine of the character described, independently reciprocating supports, link forming levers operatively

mounted thereon, guide rolls and forming rolls on said levers, guides engaged by said guide rolls, a former or anvil about which the link is bent, means for operating said link forming lever supports so that both levers will be moved together to U up the blank, of which the link is formed, means for temporarily halting one lever, means for advancing the other lever to complete one side of the link, and means of \({ }^{\prime}\) said guides to force the guide rolls toward the former or anvil to give a final bend, means for retreating said link forming levers and advancing the other link forming lever to complete the opposite side of the link, as and for the purpose specified.
5. In a machine of the character described, link forming levers, guide and forming rolls mounted thereon, independently reciprocating supports on which said levers are operatively mounted, a former or anvil about which a link is formed, a track or guide engaged by the guide rolls to guide the link forming levers in the Iink bending operation, means whereby the final bends are given to a link by the alternate operation of the link forming levers, as and for the purpose specified.
6. In a machine of the character described, link forming levers, guide and forming rolls mounted thereon, independently reciprocating supports on which said levers are operatively mounted, a former or anvil about which a link is formed, a guide or track engaged by the guide rolls to guide the link forming levers in the link bending operation, wire feeding mechanism, means on one of said link forming levers for severing a blank from the wire while a link is being formed from the previous blank, as and for the purpose specified.
7. In a machine of the character described, a reciprocating support, combined wire guide and pinch fingers operatively mounted thereon, a former against which a link blank is held by said fingers, as and for the purpose specified.
8. In a machine of the character described, a reciprocatino support, pinch fingers operatively mounted thereon, \({ }^{2}\) former against which a link blank is held by said fingers, as and for the purpose specified.
9. In a machine of the character described, pinch fingers. a reciprocating support on which said fingers are operatively mounted, a movable former against which a link biank is held by said fingers, as and for the purpose specified.
10. In a machine of the character described, a former about which a link is formed, pinch fingers adapted to hold a link blank against said former, a reciprocating support on which said fingers are operatively mounted, means for imparting a lateral movement to said fingers, as and for the purpose specified.
11. In a machine of the character described, link forming levers, guide and forming rolls mounted thereon, independently reciprocating supports on which said levers are operatively mounted, a guide or track engaged by the guide rolls to guide the forming rolls in the link bending operation. means for imparting an outward lateral movement to the free ends of said link forming levers on their retreat, as and for the purpose specified.
12. In a machine of the character described, link forming levers, independently reciprocating supports on which said levers are operatively mounted, a former, a wire feeding mechanism, a swinging stop for the end of the wire adapted to be swung around out of the feeding line of the wire by one of said link forming levers during the operation of form ing a link, means to effect a return of said stop to its normal position, as and for the purpose specified.
13. In a machine of the character described, link forming levers, independently reciprocating supports on which said
lurers are operatively mounted, a movable former, wire freding mechanism, a swinging stop for the end of the wire, is and for the purpose specified.
14. In a machine of the character described, link forming levers, independently reciprocating supports on which said levers are operatively mounted, a guide or track for said levers, a movable former, wire feeding mechanism. a support for the wire, a cut-off bushing die mounted on one of the link forming lever supports so that the forward movement of said support will cut off a blank while a previous blank is being formed into a link, combined guide and pinch fingers, a reciprocating support therefor adapted to bring sald fingers in the feeding line of the wire to serve as a guide therefor, and when the wire is agalnst the movable stop to exert a further pressure against the wire, jaws adapted to grasp a completed link, a rotatable and longitudinally operating holder for said jaws, as and for the purpose specified.
15. In a machine of the character described, link forming levers, guide and forming rolls thereon, said forming rolls having grooved faces adapted to serve as wire guides, independently reciprocating supports on which sald levers are operatively mounted, a track for guiding the link forming levers during the link bending operation, a former or anvil, wire feeding mechanism, a swing stop for the wire, means for severing a link carried by one of the link forming lever supports, combined guide and pinch fingers, means for operating the same, link holding jaws, a rotatable and longitudinally operating holders for said jaws, as and for the burpose specified.
16. In a machine of the character described, link forming levers, independently reciprocating supports on which said lefers are operatively mounted, wire fecding mechanism, means carried by one of the link forming lever supports for severing a section from the wire while a link is being foriued from a previously serered section, as and for the purpose specified.

No. 101,561. Pump. Pompe.

Charles W. Schaus, assignee of Solomon S. Whipps, both of S.oux Falls, South Dakota, U.S.A., 16:h Oclober, iudu; 6 years. Filed 9th August, 1906 . Receipt No. 13s, 549.
Claim.-1. A pumping mechanism comprising a plurality of cylinders, pistons disposed within the cylinders, a shaft slidably engaged in the cylinders and connected with the pistons for reciprocation of the latter when the shaft is reciprocated, brackets in which the shaft is slidably engaged, collars carried by the shaft, a pitman extending parallel to the shaft, and having an eye in which the shaft is slldably engaged between the collars,, springs disposed between the eye and the collars an elongated yoke pivotally connected to the pitman at its end opposite to the eye, a plate extending longitudinally of the yoke centrally thereot, spaced rack pins carried by the plate, a power shaft disposed at one end within the enclosure of the yoke, a pinion carried by this power shaft and meshed with the rack pins, a plate carried by the yoke at its ends and having a slot therein extending transversciy ot we yoke, a pin carried by the pitman and engaged in the slot for movement longitudinally thereof, and laterally extending wings carried by the pitman and resting against the plate to prevent twisting of the pitman with respect to the Foke.
2. The combination with a pump. of means connected therewith for operation thereof, a said means comprising a slidably mounted rod, a pitman pivotally connected with the rod a yoke pivoted to the pitman, a plurality of rack pins carried by the yoke, a revolubly mounted power shaft, a pinion carried by the power shaft and meshing with the 10-22
pins. a plate having an arc-shaped slot carripd by the yoke, a pin carried by the pitman and engaged in the slot, and laterally extending wings carried by the pitman and lying against the slotted plate to prevent twisting of the pitman with respect to the yoke.

\section*{No. 101,562. Water Wheel. Roue hydraulique.}

Frederick Morgan Keller and William Smith Heiges, assignee of one-fourth of the interest, both of York, Pennsylvania, U.S.A., 16th October, 1906; 6 years. Fileu 24th August, 1906. Receipt No. 133.959.
Claim.-1. In combination with a water wheel having peripheral buckets, a shell or casing. open in its upper side, having a cylindrical chamber in which said wheel is concentrically mounted for revolution and further provided with a supply chamber on one side of the cylindrical chamber and opening into the bucket on one side of the wheel, and a discharge opening below and spaced from the said supply chamber and immediately below the wheel, that portion of the casing between the lower end of the supply chamber and the discharge opening being in close proximity to the periphery of the wheel to prevent the water other than that carried by the wheel from passing from the supply chamber to the discharge opening. substantially as described.
2. In combination with a water wheel having peripheral buckets, a shell or casing open at its upper side and having a cylindrical chamber in which the said wheel is concentrically motnted for revolution, said shell or casing being further provided with a supply chamber contracted downwardly, disposed on one side of the cylindrical casing. and opening into the bucket on one side \(u\) the wheel, and a discharge opening below, and spaced from said supply chamber and immediately below the wheel, that portion of the casing between the lower end of the supply chamber and the discharge opening being in close proximity to the periphery of the wheel to prevent the water, other than that carricd by the wheel, from passing from the supply chamber to the dischurge opening. substantially as described.
3. In combination with a water wheel having peripheral buckets, a shell or casing open in its upper side, having a cylindrical chamber in which said wheel is concentrically mounted for revolution, and further provided with a supply chamber at its upper end. disposed on one side of the cylindrical chamber, and opening into the buckets on one side of the wheel, and a discharge opening below and spaced from the said supply chamber and immediately below the wheel, that portion of the casing between the lower end of the supply chamber and the discharge opening being in close proximity to the periphery of the wheel, a flume discharging into the opening in the upper side of the casing, a frame in and removable from said opening and disposed above the wheel, and distributing wings in said frame to divide the head of water in the casing and flume into a plurality of streams and direct such streams against the respective buckets of the wheels on the upper and working si le thereos.
4. A water wheel of the class described comprising a cylindrical hub member, heads connected thereto and provided in their opposing sides with outwardly extending. inwardly contracted, wedge shaped grooves, open at their outer ends, and blades or buckets having their ends provided with wedge-shaped flanges seated in said grooves and adapting the buckets to be separately removed from the wheel by drawing them outwardly from the hub
5. In combination with an overshot wheel. a shell or casing in which the same is enclosed, and a distributing gate
comprising a frame in and removable from the shell or casing, and a plurality of wings mounted in said frame. to divide the head of water in the casing into a plurality of streams and direct such streams against the respective burkets of the wheel, on the upper and working side thereof.
if. In combination with an ovrrshot wheel, a shell or casing in which the wheel is enclosed, open on fts lower slde to discharge from the wheel, and a distributing gate in and removable from the shell or casing and comprising a frame and wings to divide the head of water in the casing into a plurality of streams and direct such streams against cerlaill of the buckets of the wheel.
i. A water wheel comprising a hub, heads having central openings to receive the hub and provided in their opposing sides with outwardly extending grooves, open at their outpr ends. and blades or buckets having their ends provided with flanges seated in said grooves and adapting the same to be separately removed from the wheel by draw ing outwardly from the hub.
8. A water wheel of the class described, comprising a cylindrical hub member, heads connected thereto and provided in their opposing sides with outwardly extending grooves, open at their outer ends, and blades or buckets having their ends provided with flanges seated in sald grooves and adapting the buckets to be separately removed from the wheel by drawing them outawrdly from the hub.

No. 101,563. Current Motor. Moteur à courant.

Havilah G. Brown, Webster Park, and David C. Edwards, St. Louis, both of Missouri. C.S.A.. 16th October, 1906; 6 years. Filed 4th July, 1906. Receipt No. 137,506.
daim.-1. In a current motor the combination of travelling water impact receiving members. means by which said members are carried, and means whereby said members and carrying means are ralsed. said raising means consisting of bed slabs by which said carrying means are supported, and means for lifting said slabs, substantially as sot forth.
2. In a current motor the combination of travelling water impact receiving members, means by which said members are carried, and means whereby said members and carrying means are raised, said raising means consisting of bed slabs by which said carrying means are supported. yokes connected to said slabs, and means for lifting said yokns. substantially as set forth.
3. In a current motor the combination of travelling water impact receiving members. means by which said members are carried, and means whereby said members and carrying means are raised. sald raising means consisting of bed slabs by which said carrying means are supported, yokes connected to said slabs. lift screws fitted to said yokes and means for operating said lift screws, substantially as set forth.
4. In a current motor the combination of a pair of vertical shaft. sleeves slidably fitted to said shafts, endiess blade carrying members operating on said sleeves, and means for lifting said sleeves and the pndless blade carriers operating thereon. substantially as set forth.
b. In a current motor the combination of endless chains. hades carried by sald chains, shafts to which said chains are geared, boxes in which the lower ends of said shafts are stepped, said shafts being provided at their lower ends within said boxes with spiral grooves, substantially as set forth.

No. 101,564. Pump. l'ompe.

Charles W. McGonigle and John Sawbridge, assignee of a hall interest, both of North Yokima, Washington, U.S.A., 16th October, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,641.
Claim.-1. In pumping mechanism, a pumping chamber, liquid inlet and discharge openings, means for admitting an explosive charge thereinto, a float controlled means for ig. niting the charge, and means for retarding the movement of the float.
2. In pumping mechanism, a pumping chamber having liquid inlet and discharge openings, means for admitting an explosive charge to the chamber, means for igniting the charge, and a float for controlling the operation of the explosive charge inlet and lgniting means.
3. In a pumping mechanism, a chamber having liquid inlet and discharge openings means for admitting an explosive charge to the chamber, means for igniting the charge. and a float for controlling the operation of the explosive charge inlet and igniting means.
4. In pumping mechanism, a pumping chamber having liquid itulet and discharge openings, a fluid fuel injector, a float for operating the same, a vapourizer into which the fuel is injected, means controlled by the float for admitting air into the chamber, and means controlled by the float for igniting the explosive charge.
5. In a pumping mechanism the combination with a chamber having inlet and discharge openings, of a float, means uormally restraining the float until the water has reached a predetermined level, a fluid fuel injector controlled by the flcat, a vapourizer for the fluid fuel, an inlet controlled by the float, and an igniting device also controlled by the fiost.
6. In a pumping mechanism the combination with a chamter having liquid inlet and discharge openings, of a normally restrained float, a fluid fuel inlet, an air inlet, and an igniting device, and means for connecting all of such mechanism to the float, whereby on upward movement of the latter the fuel will be injected, the air admitted, and the charge exploded in successive order.
\(\therefore\). In a pumping mechanism the combination with a chamber having liquid inlet and outlet openings, of a nozzle for injecting fluid fuel into the chamber, a supply tank connected to the nozzle. a spring closed valve for the nozzle, a plunger arranged in the rear portion of the nozzle, means for adjusting the position of the plunger, and a float arranged within the chamber and to which said plunger is connected.
8. In pumping mechanism the combination with a pumping chamber having liquid inlet and outlet openings, of an injecting nozzle having a spring closed valve, a tank to which said nozzle is conne.ted. a plunger arranged within the rear end of the nozale, a spring tending to restore the plunger to the normally open position and permit closing movement of the valve. and a float arranged within the chamber and to which said plunger is connected, whereby on upward movement the plunger and valve will be opened, and a predetermined quantity of fuel will be forced through the nozzle.
9. In a pumping mechanism the combination with a chamber having liquid inlet and discharge openings, of a fluld fuel injecting nozzle, a pipe connecting the same to a source of fuel supply, a spring closed valve in the nozzle, a plunger mounted on the rear portion of the nozzle, a threaded stell carried by the plunger. nuts adjustable on the stem. a float. and a lever mechanism connected to the float and adapied ti make contact with said nuts, and thereby force the plunger forward within the nozale to open the valve and dischars a prodetermined quantity of fuel from the nozzle.
10. In a pumping mechanism, the combination with a pumping chamber having liquid inlet and outlet openings, of a fluid fuel injector, a vapourizer disposed in alignment with the injector, and in the form of an inwardly projecting open ended cylinder, means for admitting air to the chamber to mingle with the vapour, means for igniting the explosive charge, and a float for controlling the operation of said mechanisms.
11. In a pumping mechanism, the combination with a chamber having liquid inlet and outlet openings, a fluid tuel injector, an air port, a pair of inclined arms adjacent thereto, a wedge shaped valve slidable between said arms. and the wall of the chamber and serving to close said port, a lug projecting from the valve, and a float operatively connected to said lug.
12. In a pumping mechanism, the combination with a pumping chamber, having liquid inlet and outlet openings. of means for admitting an explosive charge to the upper portion of the chamber, means for exploding the charge a normally locked valve for controlling the exhaust of a portion of the products of combustion, and a float for locking and unlocking said valve.
13. In a pumping mechanism, the combination with a pumping chamber having liquid inlet and outlet openings, of means for admitting an explosive charge to the upper portion of the chamber, an igniting means, an exhaust port for a portion of the products of combustion, a valve normally closing said port a locking rod for the valve, an inclined arm forming a cam for engagement with said rod, and a float having a recess or groove for engaging the end of the rod to effect locking and unlocking of sald valve.
14. In a pumping mechanism of the class described, the combination with a pumping chamber having fuid inlet and outlet openings, of a dash pot disposed within the chamber and having an opening at its lower end. a float arranged within the dash pot, a float restraining means, means for admiting en explosive charge to the upper portion of the chamber means for lgniting said charge, and means connecting the float to the explosive crarge inlet devices, the dash pot and restraining means serving to retard movement of the float in both directions.
15. In mechanism of the class deseribed. the combination with a pumping chamber having inlet and discharge openings, of a dash pot disposed within the chamber, a float within the dash pot. said float being provided with a groove or recess havng tapered walls, a fluid fuel injector, an air port. a valve controlling the same. means for connecting the thid fuel injector and valve to the float, a valve for controlling the exhaust of a portion of the products of combustion, a stem on said valve, a spring pressed locking rod for -ngaging the stem and provided with a pin or lug. and a rod arranged to engage the groove or recess and provided with a cam shaped portion to engage with said lug.

\section*{No. 101,565. Cut-Off for Pumps.}

Détente pour pompes.

Charles Tingley Carnahan, assignee of Jeremiah Murphy, both of Denver, Colorado, U.S.A., 16th October. 1906; 6 years. Flled 10th May, 1906. Receipt No. 135,781.
" \(/ 11 \mathrm{in}\).-1. An automatic cut-off for motive fluid. comprising means operated by a jar, of a pump or engine for throwing the eut-off into operation thereby closing the supply of motive Guid.
2. An automatic cut-off for motive fluids, comprising a vertically movable and gravity operable mechanism operated by a jar. of a pump or engine for throwing the cut-off into operation thereby closing the supply of motive fluld.
3. An automatic cut-off for motive fluid, comprising the combination with a motive fluid supply pipe, of a valve for opening and closing said pipe, and mechanism operated by a jar of a pump or engine and connected with said valve for automatically operating it, thereby closing the said pipe.
4. An automatic cut-off for motive fluid, comprising the combination of a supply pipe and a valve for opening and closing said pipe. of mechanism connected with said valve for closing it, and a gravity operable trip bar operated by a jar of a pump or engine and connected with said mechanism for operating it, thereby closing said valve.
5. An automatic cut-off for motive fluid, comprising the combination of a supply pipe and a valve for opening and closing said pipe, of a lever connected with said valve for closing it. a latch mechanism for retaining the lever in an elevated position. thereby retaining the valve oper and mechanism operated by a jar of a pump or engine and connected with said latch mechanism and adapted when operated to operate the latch mechanism, thereby permitting the lever to fall. thereby closing the valve.
6. An automatic cut-off comprising a support provided with a pair of indentations. a gravity operating bar having a pair of barbs adapted to be seated in said indentations and suspended by said support, said bar thrown off the support by a jar. a motive fluid supply pipe, a valve for opening and closing said plpe, a lever for retaining said valve in its open josition, a latch for supporting said lever, thereby retaining the valve open, and mechanism connected with the bar and with the latch and adapted when the bar is operated to shift the said latch, thereby permitting the lever to fall and the valve to close.
7. The combination with a pump and a motive fluid supply pipe therefor, of a valve for opening and closing said pipe, and means connected with the valve and operated when the pump jars for automatically closing said valve.
8. An automatic cut-off comprising a support provided with a pair of indentations. an automatically displaceable gravity operating bar having a pair of barbs adapted to be seated in said indentations and susponded by said support. a motive fluid supply pipe, a valye for opening and closing said pipe, a lever for retaining sail valve in its open position. a latch for supporting sald lever. thereby retnining the valve open, and merhanism connocted with the bal and with the latch and adapted when the bar is displaced to shift the latch. thereby permitting the lever to fall and the valve to close.
9. An automatic cut-off comnrising a support, a vertically movable and automatically displacrable gravity operating bar suspended by said support. a motive fuid supply pipe. a valve for operating and closing said pipe. a lever for retaining said valve in its open position, a lateh for supporting said lever. thereby retaining the valve open, and mechanism connected with the bar and with the latch and adapted when the bar is displaced to shift the latch, thereby permitting the lever to fall and the valse to close.
10. An automatic cut-off for motive fluids. comprising the combination of a supply pipe, and a valve for opening and closing said pipe. of a lever connected with said valve for closing it , a mechanism for retaining the lever in an elevated position, thereby retaining the valve open, and a vertically movable and automatically displaceable gravity operating bar connected with sald mechanism and adapted when displaced to operate the said mechanism, thereby permitting the lever to fall and the valve to close.
11. An automatic cut-off for motive fluids, comprising the combination of a supply pipe and a valve for opening and closing said biye, of a mechanism connected with said valve for closing \(i t\). and a vertically movable automatically displaceable gravity operable trip bar connected with said mechanism and adapted when displaced to operate the mechanism. thereby closing said valve.
12. The combination with a pump or engine and a mative fluid supply pipe therefor, of a valve for opening and closing said pipe. of a support, a gravity operable bar having a barb seated upon sald support, thereby suspending the bar. and means connected with the bar and with the valve and adapted when the bar is displaced off of said support in close the valve.

\section*{No. 101,566. Hydraulic Motor. Motcur hylranlique.}

William sambert Walter. Pontiac, Michigan. I.S.A., 16th October, 1906; 6 years. Flled 1st May, 1906. Receipt No. 135.413.
rlaim.-1. The combination with a hydraulic motor, of a pump for delivering water thereto, an intermediately plvotad operating lever, connected at one end to the pung, a bucket attached to the other end of the lever. a countorbalancing bucket also connected to said other end of the
lever, and means for alternately filling and emptying the buckets to reciprocatc the lever.

2. The combination with a hydraulic motor, of a pump for delivering water thereto, an operating lever for the pump, a bucket attached to one end of the lever. a counterbalancing bucket having a cable connection with the same end of the lever and operating in opposite direction to the first-mentioned bucket, and means for alternately filling and emptying the buckets to reciprocate the lever.
3. The comblnation with a hydraulic motor of a pump connected thereto, and means for operating the pump, said means including a bucket having openings in its opposite side walls, a bottom that inclines from substantially the central portion of the bucket downwardly in opposite directions toward sald side walls and below the openings thereof, and gates slidably mounted in said side walls anl movable across the openings.
4. The combination with a pump, of a lever connected thereto, a bucket surrounding the lever, and having a bottom provided with offset flanges that engage the opposite faces of the lever and are secured thereto, and means for supplying water to the bucket.
5. The combination of a pump, of a lever connected thereto, a bucket surrounding a portion of the lever and having side walls provided with openings, a bottom that inclins downwardly in opposite directions towards said side walls, the intermediate portion of said bottom having upturned flanges that embrace the lever and are secured thereto, and gates mounted on the side walls and movable across the openings.
6. The combination with an elevated raceway, of a hydraulic motor discharging into the raceway, a plurality of pumps connected with the motor, and means for actuating the pumps, said means comprising levers connected respectively to the pumps, a bucket fastened to the free end of each lever, and a counterbalancing bucket having a cable connection with the same end of each lever to which the bucket is fastened, said buckets being simultaneously movable in opposite directions and alternately receiving water from the raceway.
7. The combination with a raceway having a well thercin, a reservoir located beneath the raceway, a hydraulic motor arranged over the raceway and discharging thereinto, a plurality of pumps submerged in the reservoir and connected with the motor, levers connected with the pumps, and oppositely moving buckets connected with the same ends of the levers and rising and falling within the well, said buckets receiving water from the raceway.
8. The combination with a raceway having a well, of a pump, a lever connected to the pump and having one end projecting into line with the well, a bucket attached to said end and operating in the well, means for supplying water to the bucket from the raceway at one side of the well, another also operating in the well, and means for supplying water to the latter bucket from the side of the well opposite that supplying water to the first-mentioned bucket.
9. The combination with a raceway having a well provided with spaced inner side walls, of a pump, a lever pivotally supported between its ends and having one end connected to the pump, the other end projecting into line with the well, oppositely moving buckets connected to said latter end, and means for alternately supplying water thereto through opposite side walls of the well.
10. The combination with an elevated raceway, of a reservoir located beneath the same, a pier arranged in the reservoir, guides extending from the pier to the raceway, a pump, a lever pivotally supported between its ends and having a conncction at one end with the pump, a bucket con-
nected at one end to the lever and movable between the guides. said bucket being movable between the pler and raceway, and means for automatically supplying water from the bucket to the raceway.

No. 101,567. Rotary Pump. Pompe rotative.

Iiarry Retzer Comly, San Dlego, Californla, U.S.A., 16th October, 1906: 6 years. Filed 11th September, 1306. Receipt No. 139,434.
Claim.-1. In a rotary pump of the class indicated, the combination with the cylinder having opposite induction and eduction ports on one side, of a rotary piston mounted eccentrically threin, an abutment which is slidable radially between the sald ports and provided at its inner end with a groove and the oscillating device \(\mathrm{H}^{1}\), having a practically cylindrical body held but adapted to rotate in the sald groove of the abutment and provided with a removable wear piece which works in contact with the piston, substantially as described.
2 . In a rotary pump of the class indicated, the combination with the cylinder having induction and eduction ports, a rotary piston mounted eccentrically therein, a sliding abutment arranged between the ports and reciprocating in sultable guides. and a device working in rontact with the piston and pivotally attached to the abutment, the same comprising a sheet metal tube having a longitudinal slot and flanges or wings extending outwardly from the edges of the slot, and macking arranged in the tube and filling the spaces between the flanges, substantially as described.

No. 101,568. Pump. Pompe.

Gcorge J. Murdock, Newark, New Jerscy, U.S.A., 16th October, 1906; 6 years. Filed 27th April, 1906. Reccipt io. 135,345.
Claim.-1. In pumping apparatus such as described, an air chamber provided with an inlet and with an outlet for the fluid to be pumped, in combination with a source of supply of pulsations of fluid under pressure, and means connecting the same to the interior of said chamber at a point below the top thereof.
2. In pumping apparatus such as described, an air chamber provided with an inlet and with an outlet for the fluid to bo pumped, the chamber being contracted between said inlet and outlet. in combination with a source of supply of pulsations of fluid under pressure, and means connecting the ssmic to the interior of said chamber at a point below the \(t p^{\prime}\) thereof.
3. In pumping apparatus such as described, an alr chamber provided with an inlet and with an outlet for the fuid to be
pumped. and provided further with a passage adapted for ccnnection with a source of supply of fluid under pressure, said passage directed to deliver its contents past said inlet toward said outlet.
4. In pumping apparatus such as described, an air chamber provided with an inlet and with an outlet for the fluid to be pumped, the chamber being contracted between said inlet and outlet, and provided further with a passage adapted for cennection with a source of supply of fluid under pressure, said passage directed to deliver its contents through the contracted portion of said chamber past the said inlet to the sald outlet.
5. In pumping apparatus such as described, an air chamber provided with an inlet and with an outlet for the fluid to be pumped, and with a passage directed to deliver its contents past said inlet toward sald outlet, said inlet arranged obliquely with respect to such direction of delivery, there being a closed air space above such inlet and point of delivery.
6. In pumping apparatus such as described, an air chamber provided with an inlet and with an outlet for the fluid to be pumped, and with a passage directed to dellver its contents past said inlet toward said outlet, there being a closed air space above such inlet and point of delivery.
7. In pumping apparatus such as described, an air chamber provided with an outlet, with an internal passage adapted for connection to a source of supply of motive fluid, and with an inlet for fluid to be pumped. there belng a closed air space above the mouth of said internal passage.
8. In pumping apparatus such as described, an air chamber provided with an outlet, with an internal passage adapted for connection to a source of supply of motive fluid and arranged to direct its contents toward sald outlet and with anl inlet for fluld to be pumped, said chamber being tapered between said inlet and outlet, there being a closed air space above the inlet.
9. In pumping apparatus such as described, an air chamber provided at one end with an outlet and provided with an inicrnal passage projecting from the opposite end of said chamber toward said outlet and arranged to discharge its contents in the direction of such outlet, said chamber further provided at onc side with an inlet for fluid to be pumped, and having a closed annular air space above sald inlet and surrcunding said passage.
10. In pumping apparatus such as described, an air chambur provided at one end with an outlet and provided with an icternal passage projecting from the opposite end of said chamber and directed to discharge its contents in the direction of such outlet, sald chamber further provided at one side with an inlet for fluid to be pumped, and having a closed annular air space above said inlet and surrounding said pass. age, the chamber being tapered between said inlet and said butlet.
11. In pumping apparatus such as described, an air cham ber tapering from one end toward an outlet at the other end and provided with an internal passage projecting from such liarger end toward such outlet and directed to discharge its contents in the direction of such outlet, said chamber provided at one side with an inlet for fluid to be pumped, the at nular space above said inlet and surrounding said passage rristituting a closed air space.
12. In pumping apparatus such as deseribed, an air chamber provided with an inlet passage projecting from one end toward an outlet in the other end and directed to discharge its contents in the direction of such outlets, said chamber further provided at one side with an inlet for fluid to be pumped arranged obliquely with respect to the direction of discharge of contents of said passage, the annular space atove said inlet and surrounding said passage constituting a closed air spacc.
13. In pumping apparatus such as described, an air chamber provided with an outlet and with an internal passage adapted for connection to a source of supply of motive fluid, and directed to discharge its contents toward said outlet, an inlet for liquid to be pumped at the side of said chamber, and an inwardly opening check valve for said inlct.
14. In pumping apparatus such as described, an air chamter provided with an outlet and with an internal passage adapted for connection to a source of supply of motive fluid, and directed to discharge its contents toward said outlet, an inlet for liquid to be pumped at the side of said chamber, and an inwardly opening swinging check valve for said inlet, the clapper of said valve substantially horizontal in the closed pesition.
15. In a pumping apparatus such as described, and air chamber provided with an outlet and with an internal passage adapted for connection to a source of supply of motive luid and directed to discharge its contents towards said outlet, said chamber provided at one side with an inlet opening. arranged obliquely with respect to such direction of discharge, in combination with an inwardly opening swinging check valve for said inlet, the clapper of said valve being substantially horizontal in its closed position.
16. In pumping apparatus such as described, an air chamber provided with an inlet opening and with an outlet opening, and with an internal passage adapted for connection to a source of supply of motive fluid and directed to discharge its contenis toward said outlet and past said inlet, said passage cut away obliquely opposite said inlet.
17. In pumping apparatus such as described, an air chamber, having an inlet and an outlet, the portion of said chamber between said inlet and outlet tapered, said chamber further having an internal passage adapted for connection to a source of sudpply of motive fluid and projecting into the said contracted portion of said chamber, said passage cut away obliquely opposite said inlet opening.
18. An apparatus for pumping liquids, adapted to ho operated by pulsating fluid pressure, comprising a chamber having air and liquid spaces and separate inlet and discharge means including means for preventing or reducing back flow of liquid through the inlet, in combination with the pulsating pressure passage terminating within the portion of said chamber normally containing liquid, as and for the purpose set forth.
No. 101,569. Pump. Pompe.

George J. Murdock, Newark, New Jersey, U.S.A., 16th October, 1006; 6 years. Filed 7th May, 1906. Receipt No. 135,610.
Claim.-1. In pumping apparatus such as described, \(a\) chamber having a relatively free outlet and one or more relatively restricted inlets, and means for transmitting pulsating pressure from an engine exhaust or other source of pulsating fluid pressure to liquid within said chamber.
2. In pumping apparatus such as described, a chamber having a relatively free outlet and one or more relatively restricted inlets, the upper portion of said chamber closed and forming an air chamber, and means for transmitting pulsating pressure from an engine exhaust or other source of pulsating fluid pressure to liquid within said chamber.
3. In pumping apparatus such as described, a chamber having a relatively free outlet and one or more relatively restricted inlets, and a passage within said chamber adapted for connecting to an engine exhaust or other source of pulsating fluld pressure, and opening toward sald outlet.
4. In pumping apparatus such as described, a chamber other source of pulsating fluid pressure, and opening torestricted inlets, the upper portion of said chamber closed and forming an air chamber, and a passage within said chamber adapted for connection to an engine exhaust or other source of pulsating fluid pressure, and opening toward said outlet.
5. In pumping apparatus such as described, a chamber having an air space at one end and an outlet at the other, and a passage within said chamber udapted for connection to a source of supply of motive fluid and opening toward said outlet said chamber having a neck portion surrounding said passage and connecting said air space and outlet, and having one or more inlet openings in said neck portion.
6. In pumping apparatus such as described, a chamber having an air space at one end and an outlet at the other. a passage within said chamber adapted for connection to a source of supply of motive fluid, said chamber having a contracted portion between said outlet and the mouth of said passage, and having a neck portion connecting said contracted portion and air spacr, and having one or moro inlet openings in said neek portion.
7. In pumping apparatus such as described. a chamber forming at one end an air space and having an outlet at the other end and one or more inlet openings in its sides, said
chamber provided with a passage having a mouth directed toward said outlet, said passage adapted for connection to a source of supply of motive fluid.
s. In pumping apparatus such as described, a chamber comprising an air space and a liquid space and having an outlet, onr or more lateral inlets, and a passage adapted for connection to external operating means and having a mouth direted toward said outlet, in combination with a supply chamber surrounding said first chamber and communicating therewith through said inlets.
9. In pumping apparatus such as described, the combination oi a main chamber, a supply chamber surrounding the same, and an operating passage within said main chamber, said main chamber having an outlet and having also one or more inlet openings connecting it with said supply chamber.
10. In a liquid circulating system, the combination with a scurce of supply of liquid. a liquid conveying circuit comprising outgoing and return conduits. and pumping means in sueh circuit consisting of a chamber receiving liquid from the circuit and having an outlet connected to such circuit and a closed air space, said chamber having also a passage irojecting into the liquid space of said chamber toward said olitlet and ndapted for connection to an engine exhaust or the like.
11. In a liquid circulating system, the combination of a source of supply of liquid, a liquid conveying circult comprising outgoing and return conduits, and pumping means in such circuit consisting of a chamber receiving liquid from the circuit and having an outlet connected to such circuit and a closed air space. said chamber having also a passage projecting into the liquid space of said chamber toward said nitlet and adapted for connection to an engine exhaust or the like, and an automatic valve for said outlet.
12. In pumping apparatus such as described, a chamber having a relatively free outlet and one or more relatively restricted inlets, and means for transmitting pulstaing pressure from an engine exhaust or other source of plusating fleid pressure to liquid within said chamber, and an automatic valve for said outlet.
13. In pumping apparatus such as described, a chamber having a relatively free outlet and one or more relatively restricted inlots. and means for transmitting pulsating pressure from an engine exhaust or other source of pulsating Hitid pressure to liquid within said chamber. and an outwardly operning automatic check valve for said outlet.
14. In pumping apparatus such as deseribed, a chamber. having an air space at one end and an outlet at the other, and a passage within said chamber adapted for connection to source of supply of motive fluid and opening toward said nullo. said chamber having a neek portion surrounding said pessage and connecting said air space and outlet. and having one or more inlet openings in said nerk portion, and an outwardly opening automatic check valve for said outlet.

No. 101,570. Pump. Pompe.

John W. Park, Excelsior Springs, Missourl, U.S.A., 16th October. 1906; 6 years. Filed 26th March, 1906. Receipt No. 134.296.
f'lnill.-1. The combination with a cylinder of a check valve asing having a ring transversely arranged therein, a puppet valve therefor having depending spring arms adapted to extend through said ring. said arms having projecting portions at their lower ends whereby said puppet is heId normally in position, and a grappling device for said puppet and casing, co-acting for the purnose specified.
2 . In a pump the combination of a piston or plunger, a puppet valve for said plunger. a rod transversely arranged \(i_{1}\) said plunger, and a trip for said valve having upwardly projecting corrugated spring arms engaging said rod, for the purpose specified.

\section*{No. 101,571. Pump. Pompr.}

Hiram Torry. Hereford, Texas, U.S.A.. 16th October, 1906: i ypars. Filed 17th September, 1906. Receipt No. 139,561.
clrim.-1. In a pump the combination with a walking beam, of a submerged stationary cylinder, a vertically movable dis-
charge pipe having a flexible connection with the discharg. port of the cylinder. a plunger rod having a plunger workiog

in the cylinder, and operative connections between the plunger rod and one end of the walking beam and between the discharge pipe and the other cad of the walking beam for counterbalancing the plunger rod by the discharge pipe.
2. In a pump the combination with a walking beam and a stationary submerged cylinder. of a plunger rod connected 10 and actuated by one end of the walking beam, a plunger carried by the plunger rod and working in the cylinder, vertically movable discharge pipe connected to and actuated by the othre end of the walking beam. and a flexible connection between the discharge pipe and the discharge port of the cylinder. the plunger rod being weighted to counterbalarce the discharge pipe.
3. In a pump the combination of a stationary submerged ylinder, a walking beam. a plunger rod actuated by one ond oi the walking beam and provided with a plunger working in the cylinder, an endwise movable discharge pipe actuated by the other end of the walking beam, and a flexible pipe connecting the discharge pipe with the outlet port of the cylinder and exceeding in length the maximum space between the discharge pipe and the cylinder to permit of endwise movement of the discharge pipe.
4. In a pump the combination of a walking beam, a stationary submerged cylinder. a plunger rod actuated by one end of the walking beam and provided with a plunger working in the cylinder. an endwise movable discharge pipe actuated by the other end of the walking beam, and a flexible coiled pipe connecting the discharge of the cylinder with the discharge pipe, the length of the coil exceeding the maximum space between the cylinder and the discharge pipe.
5. In a pump the combination of a walking beam. a staitonary cylinder, a pair of levers fulcrumed independently of the walking beam, connections between the levers and the respective ends of the walking beam, a plunger rod bung from one of the levers and provided with a plunger working in the cylinder, a discharge pipe hung from the other lever, and a flexible connection between the cylinder and the discharge pipe, the plunger rod and the discharge ripe being counterbalanced.
16. In a pump the combination of a support. a walking beam fulcrumed thereon, a crosshead fixed to the support. levers intermediately fulcrumed upon opposite end portions of the crosshead, links connecting the levers with the walking beam, a plunger rod hung from one of the levers and provided with a plunger, a submerged stationary cylinder in which the plunger works, a discharge pipe hung from the other lever. and a flexible conneotion between the cylinder and the discharge pipe.
7. In a pump the combination of a walking beam, levers fulcrumed intermediate of their ends at opposite sides of the fulcrum of the walking beam and independently of the atter. links connecting the outer ends of the levers with he respective ends of the walking beam, a plunger rod hump from the innur end of nue of the levers and provided with a plunger, a stationary submerged cylinder in which the plunger works, a discharge pipe hung from the inner end ol the other lever, and a flexible connection between the dis-
charge pipe and the cylinder, the plunger rod and the discharge pipe being counterbalanced.
8. In a pump the combination with a walking beam, of a submerged cylinder. a vartically movable discharge pipe hung from the walking beam and connected to the cylinder. a plunger rod hung from the other end of the walkitig beam anil provided with a plunger working in the eylinder, the lischarge pipe and the plunger rod being counterbalanced, and a weight carried by the walking heam and supported vertically above the fulcrum thereof in the horizontal position of the beam.
9. In a pump the combination with a walking beau, of a submerged cylinder, a vertically movable discharge pipe hung from one end of the walking beam and connected with the cylinder, a plunger rod hung from the other end of the walking beam and provided with a plunger working in the rylinder, the discharge pipe and the plunger rod being counterbalanced and a vertically adjustable welght carried by the walking beam and located vertically above the fulcrum thereof in the horizontal position of the beam.
10. In a pump the combination with a walking beam, of a submerged cylinder, a discharge pipe hung from one end of the walking beam and connected to the cylinder, a plunger rod hung from the other end of the walking beam and provided with a plunger working in the cylinder, the discharge pipe and the plunger rod being counterbalanced. a weight disposed centrally above the walking beam and supporting arms connected to the weight and to the walking beam at opposite sides of its fulcrums.
11. In a pump the combination with a walking beam, of a submerged cylinder, a discharge pipe hung from one end of the walking beam and connected to the cylinder, a plunger rod hung from the other end of the walking beam and provided with a plunger working in the cylinder, the discharge pipe and the plunger rod being counterbalanced, a weight disposed centrally above the walking beam and weight supporting arms having their lower ends connected to the walking beam at opposite sides of its fulcrum and adjustable longitudinally thereon to raise and lower the weight.

No. 101,572. Pump Ior Oil. Pompe ì huile.

Emile Lacroix and Charles J. Creran, co-inventors, both of Holyoke, Massachusetts. I.S.A., 16th October. 1906; 6 years. Filed 29th May, 1306. Receipt No. 136,3ad.
Claim.-1. In an oil pumping apparatus, in combination. an oil supply tank, a cylinder below and pipe connected therewith, a piston in said cylinder. and means for imparting reciprocatory movement thereto, a distributing lank located above the cylinder and pipe connected therewith. and having one or more oil distributing conduits leading therefrom, and an overflow pipe leading from the distributing tank back back to the supply tank.
2. In an oil pumping apparatus, in combination, an oil supply tank, a cylinder below and pipe connected theriewith, a piston in said cylinder, and means for imparting reciproeatory movement thereto, a distributing tank located above the cylinder and pipe connected therewith, and having one or more oil distributing conduits leading therefrom, and an overfow pipe leading from the distributing tank back to the supply tank and a yielding valve therein.
3. In an oil pumping apparatus, in combination, an oil supply tank, a cylinder below and pipe connected therewith, a niston in said cylinder, and means for imparting reciprocatory movement thereto, a distributing tank located above the rylinder and pipe connected therewith, and having one or more oil distributing conduits leading therefrom. and an overflow pipe leading from the distributing tank back to the supply tank, a spring closed valve therein,
and means for adjusting the compression of the spring ior such valve.
4. In an oil pumping apparatus, in combination, an oil supply tank, a cylinder below and pipe connected therewith, a piston in said cyliuder, and means for imparting reciprocatory movement thereto. a distributing tank located above the cylinder and pipe connected therewith. and having one or more oil distributing conduits leading therefrom, and an overflow pipe leading from the top of the distributing tank bark to the supply tank, a check valve in said overflow pipe, a spring applied for a closing pressure to said valve, and a screw plug adjustably operable against the said spring.

No. 101,573. Current Motor. Moteur ì courant.

Charles E. Hultgreen and Harold L. Clements, co-inventors, both of Dawson, Yukon Territory, Canada. 16th October, 1906; 6 years. Filed fth September, 1906. Receipt No. 139,218.
Claim.-1. A current motor comprising in combination, a pair of scows and a connecting framework, a transverse shaft mounted on each scow, a sprocket wheel mounted on each shaft, double sprocket chains connecting said sprocket wheels, rods connecting the members of each chain, vane shafts connecting said sprocket chains, a vane mounted on each vane shaft, tracks mounted on the framework, and means mounted intermediate the ends of each vane shaft for travel upon said tracks.
2. A current motor comprising in combination a pair of scows and connecting framework, a transverse shaft mounted on each scow, a sprocket wheel mounted on each shaft, double sprocket chains connecting said sprocket wheels, rods connecting the members of each chain, vane shafts connecting said sprocket chains, a vane mounted on each vane shaft. tracks mounted on the framework, and a roller mounted intermediate the ends of each vane shaft for travel upon said tracks.
3. A current motor comprising in combination a pair of scows and connecting framework, a transverse shaft mounted on each scow, a sprocket wheel mounted on each shaft, double sprocket chains connecting said sprocket wheels. rods connecting the members of each chain, vane shafts connecting said sprocket chains, a vane mounted on each vane shaft. tracks mounted on the framework, and a roller mounted intermediate the ends of each vane shaft for travel unon said tracks. and horizontally arranged with rospect thereto.
4. A current motor comprising in combination a pair of scows and a connecting framework, a transverse shaft mounted on each scow, a sprocket wheel mounted on each shaft, double sprocket chains connecting said sprocket whwels, rods connecting the members of each chain, vane shafis connerting said sprocket chains. a vane mounted on each vane shaft, tracks mounted on the framework. means mounted woon the ends of each vant shaft. and means mounted intermediate the ends thereof for travel upon said tracks.
5. A current motor comprising in combination a pair of scows and a connecting framework, a transverse shaft mounted on each scow, a sprocket wheel mounted on each shaft, double sprocket chains connecting said sprocket wheels, rods connecting the members of each chain. vane shafts connecting said sprocket chains, a vane mounted on each vane shaft, tracks mounted on the framework, a roller mounted upon the ends of each vane shaft, and a roller mounted intermediate the ends thereof for travel upon said tracks.
6. A current motor comprising in combination a pair of scows and a connecting framework, a transverse shaft mount. ed on pach scow, a sprocket wheel mounted on each shaft,
double sprocket chains connecting said sprocket wheels, rods connecting the members of (arh chain, vane shafts connect ing sald sprocket chains, a vane mounted on each vane shaft. tracks mounted on the framework, a roller mounted lpon the ends of each vane shaft, and a roller horizontally mounted intermediate the ends thereof for travel upon said tracks.
7. A current motor comprising in combination a pair of scows and a connecting framework, a transverse shaft mount(cl on each scow, a sprocket wheel mounted on each shaft. sprocket chains connecting said sprocket wheels, vane shafts connecting said sprocket chains and extending therebeyond at each end, a grooved wheel mounted on each end of said vane shafts, a vane carried by each vane shaft, a grooved wheel horizontally mounted intermediate the ends of each vane shaft, and tracks mounted in said framework, and upon which said wheels travel.
8. A current motor comprising in combination a pair of scows and a connecting framework, a transverse shaft mounted on each scow, a sprocket wheel mounted on each shaft, sprocket chains connecting said sprocket wheels. vane shafts carried by said chains. vanes mounted on said vane shafts, tracks mounted in said framework, wheels mounted on said vane shafts, and adapted to travel on said tracks. and pairs of links connecting succeeding vane shafts and hinged together, the forward end of each front link being fcrmed with a slot to receive the end of the adjacent vane shaft.

No. 101,574. Weighing Device. Bascule.

Camille Gauvin and Henri Cartier, Brussels, Belgium, and Edouard Brunel, Paris, France, co-inventors, 16th October, 1906; 6 years. Filed 1st June, 1906. Recelpt No. 136,463 .
Claim.-1. The combination of an indicating mechanism, a potary shaft controlling said mechanism, means normally acting to rotate said shaft, a detent mechanism for said means, said mechanism being manually actuative to release said means but normally movable to restrain the same, means comprising a load actuated part directly controlling said detent mechanism, for hoding the latter out of restralning engagement with said first-named when manually retracted, means operatively connected with the load actuated fart, for balancing said load actuated part and thereby regloring said part to its position of inactivity with respect tn said detent mechanism and means, operative from said shaft, for causing said balancing means to assume the balancing relation, substantially as described.
2. The combination of an indicating mechanism, a rotary slaft controlling said mechanism, means normally aoting to rotate said shaft, a detent mechanism for said means, said micchanism being manually actuative to release said means but normally movable to restrain the same, means comprising a load actuated part directly controlling sald detent mechanism. for holding the latter out of restraining engagemont with said first-named means when manually retracted, a lever, operative connecting means between said lever and the load actuated part, a weight slidable on sald lever, and means for moving said weight operatively connected with said shaft. substantially as described.
3. The combination of an indicating mechanism, a rotary shaft controlling said mechanism, means normally acting to retate said shaft, a detent mechanism for said means, said mechanism belng manually actuative to release said means but normally movable to restrain the same, means comprising a load actuated lever directly controlling sald detent mechanism, for holding the latter out of restraining engagement with said first-named means when manually retracted. arother lever, operative connecting means between said
levers, a woight slidable on said last-named lever. and mans for moving said weight operatively connected wilh sain shaft, substantially as described.
4. The combination of an indicating mechanism, a rotary shaft controlling said mechanism, means normally acting to rotate said shaft, a detent mechanism for sald means. said mechanism being manually actuative to release said means but normally movable to restrain the same, means ccmprising a load actuated part directly controlling sald detont mechanism, for holding the latter out of restraining er.gagement with said first-named means when manually retracted, means operatively connected with the load actuated part and thereby restoring said part to its position of inactivity with respect to said detent mechanism, means operative from said shaft for causing said balancing means to assume the balancing relation, a crank, and means controlled by said crank, for resetting sald shaft and the indicatir:g mechanism, substantially as described.
5. The combination of an indicating mechanism, a rotary shaft controlling said mechanism, means normally acting to rotate said shaft, a detent mechanism for said means, said mechanism being manually actuative to release sald means but normally movable to restrain the same, means comprising a load actuated part directly controlling said detent niechanism, for holding the latter out of restraining engagement with said first-named means when manually retracted, means operatively connected with the load actuated part, for balancing said load actuated part and thereby restoring said part to its position of inactivity with respect to said detent mechanism, means operative from said shaft. for causing said balancing means to assume the balancing relation, a printing mechanism, a crank, and means controlled by the crank for resetting said shaft and the indicating mechanism and for actuating the printing mechanism, substantially as described.

No. 101,575. Mould. Moule.

George Leon Bartlett, Boston, Massachusetts, U.S.A., 16th October, 1906 ; 6 years. Filed 6th August, 1906. Receipt No. 138,447 .
Claim.-1. An angular mould member comprising a central portion and end portions projecting therefrom and integrall! and flexibly connected therewith
2. An angular mould member comprising a central por tion and end portions projecting therefrom and fexibly connected therewith, said portions having edge flanges corstituting narrow extensions of the moulding surfaces.
3. An anular mould member composed of a resilient strip having a central portion and end portions projecting therefrom, the said portions being flexibly connected.
4. An angular mould member composed of a resilient strip having a flanged central portion and flanged end portions projecting therefrom, and flexibly connected there with, the flanges of said portions having bevelled ends which meet when the end portions are in their operative positions 5. A mould comprising a series of angular mould members. each having a flanged central portion and flanged end por tions flexibly connected therewith, a series of flat mouli members adapted to be interposed between adjacent angll lar members, and a holder adapted to receive the two serles of members and provided with means for clamping the nuembers together.
6. A mould comprising alternating angular and flat mould members separable from each other, and means for detachabiy securing said members in their operative positions. 7. A mould comprising alternating angular and fat mould members separable from each other, and a frame formed to receive said members, and having means for pressing the members together.

Ne. 101,576. Combination Teol. Outil à mmbinaison.

Thomas H. Bradley, Watertown, New York, U.S.A., 16th October, 1906; 6 years. Filed 1st October, 1906. Recelpt No. 139,959.
Claim.-The within lever tool consisting of the bar cormed at one end with a plurality of shouldered sections increasing in length and diameter as they extend toward the central portion of said bar, substantially as shown and described.

No. 101,577. Carbureter. Carburateur.

William Brown, Vancouver, British Columbia, Canada, 16th October, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137,710 .
Claim.-1. As a means for generating a hydro-carbon gas, a closed tank having a small cylindrical well in the bottom, a casing adapted to fit the cylindrical well which casing has a helical passage charged with fibrous material, means for delivering air to the lower end of the hellcal passage, and means for delivering the generated gas from the upper part of the tank.
2. As a means for generating a hydro-carbon gas, a closed tank having in its bottom a cylindrical well, a casing adapted to fit the cylindrical well, in the bottom of the tank, a helical passage in such casing charged with an absorbent materisl, an air pipe passing downward through the tank and delivering within the casing at the lower end of the helical passage, a gauze screen upwardly convex over the top of the well and its enclosed casing, and means for delivering the generated gas from the upper part of the oll tank.
3. As a means for generating hydro-carbon gas, a closed oil tank having a small cylindrical well in the bottom, a casing adapted to fit the cylindrical well, a thin flattened helix within the casing forming a helical passage from top to bottom of it, a gauze screen across the lower end of the helical passage, a central air pipe passing downward through the oil tank and delivering at the lower end of the helical passage in the casing, an upwardly convex gauze screen sectred to the air pipe and having its outside edge resting on the bottom of the tank outside of the well, a gas delivery
pipe from the upper part of the tank, an elongated vessel to the opposite ends of which the delivery pipe is connected, divisions across the pipe having fine apertures therethrough, a check valve to prevent backward movement of the gas towards the generator, and an air suction valve having means for regulating the pressure at which the valve opens.

No. 101,578. Turbine. Turbine.

Hiram Burrill, Grenville. Maine. U.S.A., 16th October, 1906; 6 years. Filed 14th September, 1906. Receipt No. 139,504.
Claim.-A turbine comprising a casing, a wheel mounted therein and formed with an annular cyma-recta flange and blades spaced apart on the outer surface of the flange, said flange and blades forming passages, each of which is of the same width throughout its length and of gradually increasing depth from the upper to the lower end.

Ko. 101,579. Measure, Record and Vending Device for Mauide.
Mesure record et appareil de vente pour liquides.

William Miller Davidson, Government Road, Port Pirle, South Australia, Australia. 16th October, 1906 ; 6 years. Filed 27 th March, 1906. Receipt No. \(134,344\).
Claim.-1. A liquid measuring and registering device comprising a hollow body provided with tubular inlet and outlet a measuring chamber with separate inlet and outlet openings contained within such hollow body, air holes adapted to coincide respectlvely with an air hole in the body, and a registering mechanism mounted within a cap or cover upon the end of such body and operated by a pawl carried by such measuring chamber, substantially as described.
2. In a liquid measuring and registering device a chamber constructed to contain a predetermined quantity of liquid prising a hollow body provided with tubular inlet and outlet, having (a) separate inlet and outlet openings adapted ta coincide with inlet and outlet openings respectively in the body of the device, (b) air holes adapted to coincide respectively with an air tube leading into the vessel and with an air hole in the body, and (c) a pawl engaging the teeth of a ratchet wheel attached to the unit wheel of a registering mechanism mounted within the cap of cover upon the body of the device. substantially as described.
3. In a liquid measuring and registering device a registering mechanism comprising a series of numbered dises

With a train of spur wheels and operating fingers mounted within a suitable portion of the casing, outside the chamber, the unit wheel of the series having a ratchet wheel operated by a pawl carried by the measuring chamber, substantially a: described.

\section*{No. 101,580 . Stopper for Tobacco Sacks.}

Fermeture de sac à tabac.

William L. Fross, Seattle, Washington, U.S.A., 16th October, 1906: 6 years. Filed 28th September, 1905. Receipt No. 128,800.
Claim.-1. A stopper attachment for tobacco sacks, consisting of a thimble having a peripheral groove adjacent one of its ends, and formed with a vertical notch in its outer edge, a stopper, and an elastic connection secured at one end to the stopper and at its opposite end passing over the inner end of the thimble and secured in the groove thereof at a point in alignment with sald notch.
2. A stopper attachment for tobacco sacks consisting of a thimble having a peripheral groove adjacent one of its ends, a stopper, and an elastic connection having one end passing over the inner end of the thimble and secured in said groove thereof, and its upper end secured to said stopper.
topper. thimble having its interior flared at the end portions thereof. a stopper, and an elastic convection having one end of. a stoped to said stopper and the opposite end engaging the inner wall of the thimble and rigidly fixed to said thimble.

\section*{No. 101,581. Refrigerating Box.}

Boite ì réfrigeration.

Byron Smith Fryer, Sumner, Washington. U.S.A., 16th October, 1906; 6 years. Filed 1st June, 1906 . Receipt No. 136.478.

Claime.-1. A refrigerator having an ice chamber provided with a door and an ice guide attached to the door and free to move over a portion of the floor of the ice chamber when the door is being closed, said guide adapted to project into the jce chamber an appreciable distance beyond the doorway when the door is open and guides the ice into
the ice chamber to a point inwardly beyond the doorwas. 2. A portable refrigerator box having an ice chamber, a door hinged at its lower edge at one end of said ice chamber, and an ice guide pivotally attached at its upper edge to the door at the upper edge of the latter and morable at its free edge on the bottom of the ice chamber.
3. A portable refrigerator box having an ice chamber, a door hinged at one end of said chamber, and an ice guide hinged at its upper edge to the inner face of the door, said ice guide comprising a metal plate movable on the bottom of the ice chamber and sides movable parallel with the sides of the ice chamber.
4. A portable refrigerator box provided in its upper portion with an ice chamber having a closed bottom, grooved horizontal bars disposed below the closed bottom of the ice chamber, uprights having grooves communicating with the grooves of the horizontal bars, and convex pieces over the horizontal bars and below the bottom of the ice chamber for directing water of condensation into the grooves of the horizontal bars.

No. 101,582. Drier. Séchoir.

Francis T. Johnson, Chicago, Illinois, U.S.A., 16th October, 1906; 6 years. Filed 30th March, 1906. Receipt No. 134,465.
Claim.-1. In a dryer, the combination of a drying chamber, with means for causing said chamber to be heated. an air intake in the upper part of the chamber, and means for preventing the escape of heated air through such inlake. such means comprising a relatively extended chamber open at the lower end to the atmosphere and communi cating near its upper end with the drying chamber.
2. In a dryer, the combination of a drying chamber, with means for causing said chamber to be heated,the wall of said chamber having a plurality of apertures, and a hood device extending over and below such apertures.
3. In a dryer, the combination of a drying chamber with muans for causing said chamber to be heated, an inlet into aid chamber and an inverted hood over such inlet.
4. In a dryer, the combination of a drying chamber with a heater connected so as to supply heat thereto, and a duct leading from the chamber into the heater, said duct movable so as to discharge at different places in the heater.
5. In a dryer, the combination of a drying chamber with a heater connected so as to supply heat thereto. and a sliding duct leading from the chamber into the heater. 6. In a clothes dryer, the combination of a drying chamber with a plurality of clothes racks in said drying chamber, an air intake at the upper part of the chamber. and means for admitting heat to the chamber at a point below said racks, and means for conducting the air out of said chamber from the bottom thereof.
7. In a clothes dryer, the combination of a drying chamber with a plurality of clothes racks in said chamber, a gas stove, a flue leading from the gas stove and discharging below the racks, means for admitting a ventilating drat into the chamber above the racks, and means for discharging the air out of said chamber from below the hot air flue.
8. In a clothes dryer the combination of a drylng chamber with a plurality of clothes racks in sald drying chamber, ad air intake at the upper part of said chamber, and means for admitting heat to the chamber below the racks.
9. In a clothes dryer the combination of a drying chamber. a plurality of clothes racks in said chamber, a heater out-
side of said drying chamber, a flue to conduct heat from the heater to the drying chamber below the racks, and means for admitting a ventilating draft into the chamber above the racks.
10. In a clothes dryer the combination of a drying cham ber, a plurality of clothes racks in said chamber. a heater nutside of said drying chamber, a flue to conduct heat from the heater to the drying chambeer below the racks, means for admitting a ventilating draft into the chamber above the racks, and a device for discharging the vapour laden air from the lower part of said chamber.
11. In a drying apparatus the combination of a casing forming a drying chamber, with means for supporting the articles to be dried in said chamber, means for introducing heat below said supporting means. means for introducing a volume of cold air directly to the upper part of the chamber, and means for discharging air from the lower part of said chamber.
12. In a drying apparatus the combination of a casing forming a drying chamber, means for supporting the articles to be dried in said chamber, means for introducing heat below said supporting means, means for introducing a volume of cold air into said chamber, said means comprising air passageways leading from outside the dryer directly into the upper part of said chamber, and means for discharging air form the lower part of said chamber.
13. In a drying apparatus the combination of a casing forming a drying chamber, means for supporting the articles to be dried in said chamber, means for introducing heat below said supporting means, means for introducing a volume of cold air into said chamber, said means comprising air passageways leading from outside the dryer directly into the upper part of said chamber, means for discharging air from the lower part of said chamber, and means assoclated with said air passageways for preventing the escape of hot air through the same.
14. In a drying apparatus the combination of a casing forming a drying chamber and having apertures in the upper part to admit a volume of cold air directly into the upper part of the drying chamber, with means for supporting the articles to be dried, means for introducing heat below said supporting means, hood devices on the outside of the casing extending over said apertures, and means for discharging air from the lower part of said chamber.
15. In a drying apparatus the combination of a casing forming a drying chamber, the lower part of said casing being closed and the upper part provided with air passageways to admit a volume of cold air directly to the upper part of said chamber, means for supporting the aritcles to be dried within the drying chamber, a heater outside of said casing and connected with the same so as to introduce heat into the drying chamber below the supporting means. and a flue leading from the bottom of the casing into the heater.
16. In a drying apparatus the combination of a casing forming a drying chamber, the lower part of said casing being closed and the upper part provided with air passageways to admit a volume of cold air directly to the upper part of sald chamber. means for supporting articles to be dried within the drying chamber, a heater outside of said casing, a flue leading from the heater and opening into the lrying chamber below said supporting means, and a flue leading from the bottom of the casing into the heater.
17. In a drying apparatus the combination of a casing forming a drying chamber the lower part of said casing being closed and the upper part provided with air passageways to admit a volume of cold air directly to the upper nart of said chamber. means for supporting the articles to be dried within the drying chamber, a heater outside of said casing and connected with the same so as to introduce heat into the drying chamber below the supporting means, a flue leading from the bottom of the casing into the heater and an outlet pipe extending upward from the lower part of the casing.
18. In a drying apparatus the combination of a casing forming a drying chamber, the lower part of said casing being closed and the upper part provided with air passageways to admit a volume of cold air directly to the upper part of said chamber, means for supporting the articles to be dried within the drying chamber, a heater outside of said casing and connected with the same so as to introduce heat into the drying chamber below the supporting means, a flue leading from the bottom of the casing into the heater and an outlet pipe extending from the lower part of the casing upward through the drying chamber.
19. In a drying apparatus the combination of a casing closed at the bottom and having apertures at the top, said casing forming a drying chamber, hood devices on the outside of the casing flaring at the bottom and extending closely over the apertures, means for supporting the articles to be dried in said drying chamber, means for introducing heat into the chamber below said supporting means and a discharge pipe leading upward from below the heat introducing means.

No. 101,583. Jewellers' Bench. Banc de bijouticrs.
MXI. 1.

James O. Kellum, Heron Lake, Minnesota, U.S.A., 16th October, 1906: 6 years. Filed 1st October, 1906. Receipt No. 139,938.
Claim.-The combination with a jewellers' bench having an opening in the front and adjacent to one end thereof, a lathe operating mechanism in said bench and in line with said opening, of a block adapted to take into sald opening, neans to removably secure sald block therein, a fiat base having a plurality of elongated slots therein mounted upon said block. bolts extending through said block and slots to adjustably secure the base on said block, an arm integral with the lower edge of the base and extending outwardly and downwardly therefrom, the lower end thereof being forked, a spindle rotatably carried by sald fork, a pulley on said sfindle, means disposed between said pulley and operating mechanism to rotate the spindle when the mechanism is operated.

No. 101,584. Printing Press. Presse \(d\) imprimer.

John Krehbiel, Detroit, Michigan, U.S.A., 16th October, 1906;
6 years. Filed 8th January, 1903. Receipt No. 102,036.
Claim.-1. In a printing press the combination with the frame thereof, of a curved platen carried by the frame and a reciprocating type bed, of means for reciprocating the type bed whereby a rolling contact between said type bed and platen is intermittently produced.
2. In a printing press the combination with the frame thereof and a reciprocating type bed having a plane surface, of a platen carried by the frame having a curved surface, and means for intermittently reciprocating the bed to produce a transverse line of rolling contact between said bed and platen.
3. In a printing press the combination with the frame thereof and a type bed having a :lane surface, of a platen secured to the frame and having a curved contact surface, and means for imparting a reciprocating and rocking motion to the type bed.
4. In a printing press the combination with the frame thereof, of a platen secured to said frame and having a curved contact surface, a type bed below said platen having a plane surface, crank shafts journalled in bearings on the frame, crank on said shafts, and pitmans connecting the cranks and bed. one of said cranks being set to move in advance of the other, whereiy a rocking motion is imparted to the bed.
5. In a printing press the combination with the frame thereof, of a reciprocating type bed, means for actuating said bed, a platen carried by the frame having a curved contact surface opposing said bed, and means for adjustably securing the platen to the frame and for yieldingly holding the same in its adjusted position.
6. In a printing press the combination with the supporting frame, of posts on the frame, a platen having eyes loosely ergaging the posts, a yielding member sleeved on each post above the platen, an adjusting wheel on each post engaging said ylelding member, a reciprocating type bed, and means for moving said bed.
7. In a printing press the combination with the supporting frame, of posts on said frame having screw-threaded upper ends, a platen having eyes engaging said posts, ylelding supports beneath the platen, an adjusting wheel on each post above the platen, a yielding member interposed between each wheel and the platen, a reciprocating type bed, and means for actuating the bed.
8. In a printing press the combination with the frame, of a platen having a curved contact surface, secured to the frame, a vertically reciprocating type bed beneath said platen, guides movable in ways on the frame and pivotally secured at their upper ends to the corners of the bed, crank shafts mounted in bearings on the frame, cranks on said shafts and pitmans secured at one end to said cranks and engaging sockets on the bed at their opposite ends, one of said cranks being set to operate in advance of the other to impart a rocking motion to the bed.
9. In a printing press the combination with the frame, a platen, and type bed, of a feed drum mounted upon the frame and adapted to intermittently draw a continuous web of paper across the platen, a series of ruling pens mounted uron the frame and means for moving said pens across the
10. In a printing press the combination with a frame, a platen, and a type bed, of a support on the frame at one side of the platen for a roll of continuous paper webbing, a feed drum at the opposite side of the platen to feed the web across the platen and a series of ruling pens supported adjacent to the roll of paper to rule longitudinal lines thereon.
11. In a printing press the combination of a shaft mounted in adjustable bearings on the frame and adapted to recelve and support a roll of paper, a disc loosely mounted on the shaft and adapted to be secured to the roll of paper to turn therewith, and a helical spring secured at one end to the shaft and at its opposite end to the disc to exert a force to turn the roll in a direction opposite to that in which said roll is turned when its web of paper is drawn therefrom and forming a connection between the shaft and roll to turn said shaft when the web is drawn from the roll.
12. In a printing press the combination with the frame thereof, of a platen secured to said frame, a type bed beneath the platen, crank shafts mounted on sald frame, cranks on said shafts, pitmans secured to said cranks and actuating and supporting the bed, a support at one side of the platen for a roll of paper web, an intermittently operated feed drum mounted on the frame at the opposite side of the platen and adapted to draw the web of paper across the face of the platen, a table support on the frame over which the web is adapted to pass from the drum, guides on said table, a bar on said guides, ruling pens carried by said bar, means a bar on said guving the bar, on its guides in timed relation to the movement of the type bed to rule transverse lines on the web and ruling pens supported adjacent to the roll of paper and adapted to rule longitudinal lines on the web.
13. In a printing press the combination with the frame thersof, of a platen secured to the frame, a type bed, means for intermittrintlv operating said bed, a shaft journalled in bearings on the frame at one side of the platen and adapted to support a roll of paper web, an intermittently operating feed drum supported on the frame at the opposite side of the platen, a transverse knife supported on the frame beneath which knife the web is adapted to pass from the feed rell, and means for intermittently operating said knife to sever the paper.
14. In a printing press the combination with an intermitsently operating leed drum and its supporting shaft, of a
ratchet wheel secured to said drum, a gear wheel loosely mounted on the shaft, a spring pressed pawl on the grar wheel in engagement with the teeth of the ratchet, a rack bar to engage the gear wheel, a way for the rack bar, a continuously rotating dise wheel having a radial undercut slot. a rod connected at one end by a bolt to the rack bar. and a bolt adjustably secured within said slot and adapted to secure the rod to the disc wheel.
15. In a printing press the combination with a feed drum and its actuating mechanism for imparting an intermittent movement thereto, of notches on the periphery of said drum. a dog to engage said notches, and means for throwing the dog into and out of engagement with the teeth in timed relation to the movement of the drum.
16. In a printing press the combination with a feed drum. a ratchet wheel on the drum, a gear wheel, a pawl on the gear wheel engaging the ratchet wheel, a rack bar engaging the gear, and means for moving the rack, of a head on the drum provided with peripheral teeth, a dog engaging the teeth and having an extended arm, a yoke on the rock bar, and pins on said yoke to engage the arms on said dog at each end of the movement with the rack bar and throw said dog into and out of engagement with the teeth.
17. In a printing press the combination with a feed dram for feeding a continuous web of paper and its operating mechanism, of radial clamping fingers at each end of the roll, and means for moving said fingers radially and laterally toward and from the paper.
18. In a printing press the combination with a shaft, a feed drum mounted on said shaft, and means for actuating said drum, of radial clamping fingers, and means mounted on said shaft within the drum for carrying said fingers and actuating the same to clamp and release the paper.
19. In a printing press the combination of a hollow feed drum provided with longitudinal slots, a spider within the drum and adapted to be moved longitudinally therein, means for actuating the drum independent of the spider, clamping fingers carried by said spider and extending outward through said slots, and means for actuating said fingers to clamp the paper.
20. In a printing press the combination of a shaft, hollow feed drum mounted on said shaft and provided with longitudinal slots in its frame, a series of radial clamping fingers extending outward through said slots, a spider mounted on the shaft, a spline to sccure the spider to the shaft with a free longitudinal movement thereon, and means engaging the fingers to operate the same, said clamping fingers and the means for operating the same being carried by said spider. whereby said fingers may be moved longiitudinally of the drum to bring the same adjacent to the edge of the paper.
21. In a printing press the combination of a shaft, a hollow feed drum mounted on said shaft and provided with longitudinal slots, means for actuating said drum independent of the shaft, a spider splined on said shaft and held from turning thereby, a series of clamping fingers supported nn said spider with their outer ends extending outward through the slots in the drum, a cam member secured to sald spider and adapted to be engaged by said fingers to cause the fingers to be moved radially and laterally by the movement of the drum.
22. In a printing press the combination of a fixed shaft, a hollow drum mounted to turn on sald shaft and provided with longitudinal slots, means for turning said drum on the shaft, spiders splined on the shaft within the drum and adapted to be moved longitudinally of the shaft, a series of radial clamping fingers supported by each of said spiders and extending outward through the slots in the drum. cams on the spiders for moving the fingers radially outward and springs for moving said finger radially inward.
23. In a printing press the combination of a fixed shaft, a drum mounted to turn on sald shaft and having longitudinal slots, means for turning sald drum on the shaft, spiders splined on the shaft, a series of radial clamping fingers outward through the slots in the said drum, heads on said fingers, springs to move said fingers radially inward to clamp the paper between the heads and drum cams onthe spiders for moving said fingers radially outward to release the paper and cams on the spiders to engage the inner ends of the fingers and rock the same to move the heads from over the paper.
24. In combination with a printing press, a fixed shaft, a drum mounted to turn on sald shaft and having longitudinal slots, spiders splined on the shaft, a ring loosely mounted on the hub of each of said spiders and having radial arms extending outward into the slots in the drum and adapte to be turned on said hub thereby, a series of radial clamping fingers supported and held between said arms and each of said spiders and adapted to move with said arms, and cams secured on the hubs of the spiders to engage the inner ends of the arms and move the same radially and laterally.
25. In combination with a printing press, a fixed shaft, a drum mounted to turn on said shaft and provided with longItudinal slots, spiders splined on the shaft, a ring loosely mounted on the hub of each of said spiders and provided with radial arms engaging said slots in the drum. lugs on said arms extending laterally toward the spiders, a radial clamping finger extending outward between the said lugs on each arm, a cam surface on the hub of each of the spiders engaged by the inner end of each finger to move the same radially outward, springs to hold said fingers with their inner ends in engagement with said cam surfaces, a cam surface on each spider to engage the side of each finger near its inner end and a rim having a high and low side on each of the spiders to engage said fingers near their outer ends.
26. In a printing press the combination with a vertically reciprocating type bed, of inking rolls, and means for moving said rolls across the type bed in one direction and beyond the same when said bed is approximately at the lower end of its movement and across and beyond said bed in the opposite direction when the bed next reaches approximately tts lowest position.
27. In a printing press the combination with a vertically reciprocating type bed, of inking rolls, Iracks to support said rolls at each end and extending beyond the type bed at each side thereof in the direction of the movement of the rolls, and means for moving said rolls along said tracks and over the face of the type bed when sald bed is approximately at the lower end of its stroke.
28. In a printing press the combination with a vertically reciprocating type bed, of tracks at each end of the type bed and extending beyond the same at each side thereof, irking rolls, carriages provided with open bearings for the ends of said rolls and adapted to be moved along said tracks. and means for moving said carriages and their rolls in timed relation to the movement of the bed.
29. In a printing press the combination with the frame thereof and a vertically reciprocating type bed guided on said frame, of tracks supported on said frame at each side of the type bed and extending beyond said frame, carriages novable on said tracks, inking rolls supported by the carriages, oscillating bars pivoted at one end on the frame at a point some distance from the tracks and midway between the ends of said tracks and extending upward to slidably engage the said carriages at their upper ends. and means for oscillating said bars in timed relation to the movement of said type bed.
30. In a printing press, the combination with the fram thereot and a vertically reciprocating type bed gulded on said frame, of tracks supported on the frame at carh side of the bed, inking rolls, carriages movable on said tracks and carrying said rolls, a shaft journalled on the frame beneath the type bed and in the vertical plane of the longithdinal center line of said bed, bars secured at one end 10 said shaft and forked at their opposite ends. studs on the carriages to engage the forked ends of said bars. and means for orcking said shaft in timed relation to the movement of the type bed to oscillate said bars and move the carriages along their tracks.
31. In a printing press the rombination with the frame. and a vertically reciprocating type bed guided on the frame ef tracks secured to said frame at each end of the type berd and extending beyond and inclined downward at each side of the frame carriage consisting of sections pivoted together and adapted to be moved along said tracks, bearings on said carriages, inking rolls journalled in said bearings, an oscillating bar pivoted to the frame below the trateks at each end of the type bed and having forked upper ends. a stud on each carriage to engage the forked upper ends of said bars, means for holding said carriages in contact with thelr tracks and means for oscillating said bars in timed relation to the movement of the type bed.
32. In a printing press the combination with the frame and a vertically reciprocating type bed, of tracks secured to said frame at each end of the type bed and extending beyond and inclined downward at each side of the frame, carriages consisting of sections pivoted together, rolls on said sections to engage sald tracks, bearings on said sections. iliking rolls journalled in said bearings, oscillating bars bivoted to the frame below the tracks, one at each side of carriage bed and having forked upper ends, a stud on each carriage to engage the forked end of each bar, springs attached at one end to the bars near their lower ends and th the end sections of the carriage at the other ends, and the tracks. 33. In a
ion In a printing press the combination with the base porfion of the frame, of upwardly extending side portions, a portions of the irame, type bed guided betwern said side the side portions frame, tracks secured to the upper ends of yond said sides and extending outward and downward beyond said sides. carriages morable on said tracks, inking rolls carried by sald carriages. a shaft journalled in berar-
ings in the base portion of the frame and extending beneath the type bed vertically below its longitudinal center line, bars secured to the ends of said shaft and having forked upper ends and adapted to be oscillated to extend beyond the side portions of the frame to said carriages across and beyond the type bed at each side thereof, studs on the carriages to engage the forked ends of the bars, a gear secured to each end of said shaft, rack bars engaging said gears, and means for moving said rack bars in timed relation to the movement of the type bed.
34. In a printing press the combination with the base porlion of the frame. of a transverse driving shaft mounted in bearings on the base portion, crank shafts mounted in bearings on said base at each side of the driving shaft. pinions on the drive shaft, gears on the crank shaft in mesh with said pinions, upwardly extending side portions on the base portion of the frame and provided with ways, a type bed, guides for said bed movable in the ways on the side portions of the frame. pitmans connected to the crank shafts and supporting and operating the bed, end portions extending upward from the base portion of the frame at a distance from the side portions, a platen supported on the upper ends of said end portions and also at a distance from the side portions, longitudinal supporting bars secured to the end portions above the platen and extending beyond the same. shafts journalled in bearings on the ends of said supporting bars. one of said shafts being adapted to support a roll of paper web and a peed drum loosely mounted on the other shaft, means for intermittently moving the feed drum to draw the web across the platen from the roll, a shaft journalled in bearings on the base of the frame and extending longitudinally thercof and beyond the same, a bevel gear o: one end of said shaft and a disc on the other end, a bevel giar on one end of one of the crank shafts in engagement with said bevel gear, a rod attached at one end to the said lisc and at its opposite end to the operating mechanism for the feed roll, tracks sccured to the upper end of the side portions of the frame and extending beyond the same at each side of the machine, carriages supported by said tracks, irking rolls on said carriages, a rock shaft journalled in harings on the base portion of the frame and extending beneath the type bed vortically below the longitudinal center line therrof, an oscillating bar secured to each end of said rock shaft and extending upward to engage one of the carriages on rach track and adapted to be oscillated within th: space between the side and end portions of the frame to nonve the carriages along their tracks. gears on the ends of said rock shaft, a shaft mounted in bearings on brackets on the basc and extending lougitudinally of the frame at one side thereof. dise wheels on the ends of said shafts, rack hars piroted at one end to said dise wheels and engaging the giars on the rock shaft, a bevel gear on one of the rrank shafis and a bewl gear on the longitudinal shaft in mush with sald gear.

No. 101.585. Water Wheel. Riout 小'ин.

Thomas Lambeth, Asheboro, North Carolina. U.S.A., 16th October. 1306; 6 years. Filed 30th May, 1906, Receipt No. 136,407.
'laill.-1. A water wheel comprising a casing having openings in its walls, plates mounted to slide in the rasing and having curved portions. the walls of sald openiugs With the rurved plates forming substantially oval tracks, a wheel mounted in the casing and having radial openings, blades movable in said openings. arms having swinging connection with the ends of the wheel and also having s:winging conncetion with the inner ends of the blades, rol-
lers on said arms for engaging the walls of said tracks, and at chute leading to the lower portion of the wheel. into the er wheel comprising a casing, a chute leading uasing, blades movable radially, a whecl mounted to the adjustable means for radially out of and into said wheel, movements, and portion of the casing directly under the gate in the lower 3. A water wheel
3. A water wheel comprising a casing, a chute communicating with the lower nortion thereof, a wheel arranged in the casing, radially movable blades carried by the wheel adustable means for causing inward and outward movements of the blades, a gate in the lower portion of the asing directly under the wheel and adjustable toward and rom the wheel, and a deflector plate mounted to swing in the chute and operating with said gate.
4. A water wheel comprising a casing, a chute communicating with the lower portion thereof, the said casing being provided with openings in its side walls, the upper ends of said openings being of oval form, plates mounted 10 slide on the outer sides of the casing, \(\mathbf{U}\)-shaped plates secured to the sliding plates within the openings, a wheel mounted in the casing and having radial openings, blades mounted to slide in and out of said openings, arms having swinging connection with the ends of the wheel and having pivotal connection with said blades, rollers carried by the arms for engaging in said openings in the end walls of the casing, and a gate in the lower portion of the casing adjustable toward and from said wheel.
5. A water wheel comprising a casing, a chute communicating with the lower portion thereof, said casing having an opening at the lower end, a gate adjustable in said opening directly under the wheel and having a concaved upper side, a wheel mounted in the casing, blades carried by the wheel and movable radially into and out of the same, and adjustable mechanism for causing said inward and outward movements.

No. 101,586. Manufacture of Tubes, Etc.
Fabrication ac tubes, etc.

Balfour Fraser McTear, Heyes Mounts, Rainhill, Lancaster, England, 16th October, 1906; 6 years. Filed 18th November, 1904. Receipt No. 120,076.
Olaim.-In machine, for reducing the diameter of tubes, a plurality of sets of grooved rollers, one behind the other, a stationary internal supporting mandril, adapted to stand and be held in the apertures formed by the grooves of the rollers, and short tubes 5 and 6 of practically the external liameter of the tube being rolled directly in front of and behind each set of rollers, and driven supporting rollers 20 in the lower part of said tubes, substantially as set forth.

No. 101,587. Lock for Bolts. Arrête-écrou.
Wallace Willard Parsons, Hamilton, Ontario, Canada, 16th October, \(1906 ; 6\) years. Filed 26th September, 1906. Receipt No. 139,801.
Claim.-1. In a device for locking bolts, a rail, plates on the sides of the rail. a threadless and parted bolt through the rail and plates and extending beyond a solid head on the the ran a threadless nut with tapered hole on the bolt and in contact with one said plate, a screw jack adapted to grip the head of the bolt, means on the jack for adjusting the same to the head, a screw through the opposite end of the jark. a block connected to the serew, a key in the hlock to enter the cads of the bolt and secure the same in the nut, and means to close the end of the bolt on the key to retain the same and the nut.
2. In a device for locking bolts, a threadless parted bolt with solld head, a threadless nut with tapered bole ou the

bolt, a screw jack adapted to adjustment to said head, a block on the screw of the jack, a key in the block to enter and spread the ends of the bolt in and beyond the nut, and means to close the ends of the bolt on the key to retain the same together with the nut.
3. In a device for locking bolts, a parted bolt, a screw jack adapted to hold on the head of the bolt, a threadless put with tapered hole on the bolt, means on the jack to adjust the same to position to the bolt, a slidable block in combination with the screw of the jack, a key in the block to enter the bolt and the nut and extend therefrom. and means in the screw to close the ends of the bolt on the key and retain the same
4. In a device for locking bolts, a pared and threadless bolt, a threadless nut with tapered hole on the bolt, a screw jack in contact with the head of the bolt, means on the jack to adjust and hold the same to the bolt, a block connected with the screw of the jack, a key in the block to spread the members of the bolt in the nut, shoulders on the key to contact with nut and independent means in the acrew to close the ends of the bolt on the key to retain the key.
5. In a device for locking bolts, a parted bolt, a threadless nut with tapered hole on the bolt, a screw jack to engage the head of the bolt. a hollow screw in the jack, a block with transverse slot in the face thereof and connected with the screw, a key in the slot, shoulders on the key, and adapted to spread the members of the bolt in the nut and contact with the side of the nut, and means in the hollow screw and in the block to closc the members of the bolt on the key.
6. In a device for locking bolts. a parted bolt, a threadless nut with tapered hole on the bolt, a screw jack adapted to engage the head of the bolt, a block connected with the screw of the jack. a key in the block adapted to spread the members of the bolt in the nut, shoulders on the key to contact with the side of the nut, and means in the screv and the block to close the members of the bolt on the key.

\section*{No. 101,588. Clamp and Support for Telegraph Cables.}

\section*{Crampon et support pour cables de télégraphe.}

Howard E. Sheeley. Michigan City. Indiana, U.S.A., 16th October, \(1906 ; 6\) years. Filed 15tb August, 1906. ReNo. 138,724.
Claint.-1. A cable clamp and support comprising sections having semi-circular grooves and at the centter of sald sections, means for securing said sections to a pole or other support, the upper surface of said sections being bevelled downwardly from said pole or other support, substantialls as shown and described.
2. A cable clamp and support comprising two sections each provided with a groove having its ends bevelled outwardly. and means for securing said sections together and to a pole or other support, the upper surface of said sections being bevelled downwardly from said pole or other support, substantially as shown and described.
3. A cable clamp and support comprising two sections each provided with a groove having its ends bevelled out wardly and with a conter hole therein and a bolt designed to pass through said hole and secure said sections to a pole or other support, the upper surface of said sections being bevelled downwardly from said pole or other support. substantially as shown and described.
4. A cable clamp and support comprising two sections each having a semi-circular groove in its inner face bevelled
outwardly at its opposite ends, screw bolts near each end of said sections for securing them, a hole in the center of

each casing and a screw bolt designed to pass through said hole and secure the section aforesaid to a pole or other support, the upper surface of said sections being bevelled downwardly from said pole or other support, substantially as shown and described.

No. 101,589. Machine for Cutting Tiles.
Machine pour couper les tuiles.

John A. Sloan, Trenton, New Jersey, U.S.A., 16th October, 1906; 6 years. Filed 17th September, 1906. Receipt No. 139,590.
Claim.-1. In a machine of the class described, a recipro cating knife, a stationary bed against which said knife acts, means for reciprocating said knife, means for shifting said knife transversely to the direction of its said reciprocating movement and feeding mechanism connected therewith comprising an intermittently acting feed roll for engaging and advancing the material to be operated upon by said knife, substantially as specified.
2. In a machine of the class described, a knife baving an irregular outline, means for reciprocating said knife and means for shifting it back and forth transversely to the direction of said reciprocating movement, and a statipnary bed for supporting material to be cut by said knife in combination with automatically operating feed rolls for advancing material to said knife, said bed supporting the material on both sides of aaid knife, substantially as specifled.
3. In a machine of the class described, a reciprocating ran, a shearing device having a transverse sliding connection with said ram, a revolving shaft, a cam on sald shafi for shifting said shearing device in alternation with the reciprocations of said ram, and a feed roll connected with and operated by said shaft, substantially as specified.
4. In a machine of the class described, a ram, a rotating shaft having means for reciprocating said ram, a knife of ir. rcgular outline having a sliding connection with said ram, a cam connected with said knife for shifting it in its said sliding connection, a rotating shaft connected with said cam and operated by said cam shaft, substantially as specifed.
5. In a machine of the class described, a reciprocating ram. a shearing device having a sliding connection with said ram, a crank shaft connected with said ram for reciprocating it, a cam shaft connected with said shearing device for shiftlation, means for connecting said shafts in co-operative relation, a feed roll, and mechanism operated by said cam shaft for intermittently operating said feed roll, substantiahy as specified.
6. In a machine of the class described, a vertically reciprocating guide, a slide reciprocating in said guide, a shearing device connected with said slide, a cam connected with said slide for shifting said shearing device, a rotating shaft connected with said cam, a second rotating shaft operated wheel connecting roting shaft, a feed roll, and a worm and wheel connecting said second shaft and roll, substantially as
specified. specified.
7. In a machine of the class described, a pair of feed rolls, a toothed wheel connected with one of said rolls, a plain and a helical thread revolved in alternating engagement with said wheel, a reciprocating knife, a bed for supporting material to be shorn by said knife on either side thereof, and mechanism for operating said knife and said threads in synchronous relation, substantially as specifled.
8. In a machine of the class described, a pair of feed rolls, a toothed wheel connected with one of said rolls, a straight and a helical thread alternately engaging the teeth of said wheel, a vertically reciprocating support, a knife having a horizontal sliding connection with said support, and mechanism connecting said threads with said support and sald kinfe whereby said feed rolls and said knife are operated in synchronous relation, substantially as specified.
9. In a machine of the class described, a pair of feed rolls, a toothed wheel connected with one of said rolls, a straight and a helical thread alternately engaging with the teeth of said wheel, a rotating shaft connected with and revolving said threads, a second rotating shaft connected with and operating said first shaft, a cam on said second shaft, a knife connected with and reciprocated by said cam, a guide in which said knife reciprocates, a ram for reciprocating said guide, a crank shaft connected to and reciprocating said ram, and mechanism connecting said crank shaft with said cam shaft, substantially as specifled.

No. 101,590. Milling Cutter and Head. Porte-lame.

Charles Borrome Tardif, Concord. New Hampshire, U.S.A. 16th October. 1906; 6 years. Filed 17th September, 1906 Receipt No. \(139,549\).
Claim.-1. In a device of the character described. a cylindrical cutter head provided with peripheral grooves, indrpendent gangs or rows of cutters, each gang being set in one of said grooves, cutter blocks set between the rutters in each row, means for locking said cutter blocks in position in the grooves, and mechanism adapted to be set against the outer ends of the different rows of cutters and blocks whereby the cutters and blocks in each row are held in position by friction. for the purpose set forth.
2. In a device of the character described, a cylindrical cutter head provided with a series of peripheral grooves, independent gangs or rows of cutters having substantially rectangular shanks, each gang being set in one of said grooves, and the individual cutters being disposed with their diagonally opposite corners next the opposite sides of the groove, cutter blocks set alternately with the cutters in each row, said blocks being of shape to fit the cutter heads between which they are placed, means for locking the blocks slidingly into engagement with the sides of the grooves, and set-up mechanism for bearing against the
outer ends of the different rows of cuttors and blocks, for the purpose set forth.
3. In a device of the character described, a cylindrical rutter head provided with a scries of substantially parallel peripheral grooves, independent gangs or rows of cutters, rach cutter consisting of a shank rectangular in cross section and an operating or cutting end extending from one side of said shank, earh gang being set in one of said krooves, and the individual cutters being disposed with their diagonal opposite corners next the opposite sides of the groove, pairs of cutter blocks bevelled to correspond in shape with the corners of the shanks of the cutters, one pair of blocks being set face to face in the groove between cach pair of cutters, cutter blocks provided with V-shaped gooves and extending across the grooves in the cutter head at the opposite ends of the rows of cutters and fitting against the outer cutter in each row, means for locking the blocks into engagement with the sides of the grooves, and set-up screws bearing against the outer ends of the rows of cutters and blocks, for the purpose set forth.

No. 101,591. Eiln for Drying Lumber. Four pour sécher le bois.

Charles F. Williams, Coldwater, Michigan, U.S.A., 16th October, 1906; 6 years. Filed 19th April, 1906. Receipt No. 135,067
Claim.-1. A kiln having a wet end and a dry end, and provided intermediate such ends with an air exit which acts as a division therefor, and a conduit leading from said exit to and communicating with the wet end of the kiln adjacent its entrance, and means for creating a draft therein.
2. A kiln provided with end air inlet chambers and intermediate air exit, a condult leading from the air exit means to the wet end of the kiln whereby to return the expelled air thereto, means for creating a draft in said air exit, and means for heating the air admitted to the kiln.
3. A kiln provided with end inlet ducts and intermediate air exit, connection between the air exit and the wet end of the kiln whereby to return the expelled air thereto, means for creating a draft in the air exit. means for controlling the return of the alr to the kiln, and means located in the ends of the kiln for heating the air.
4. A kiln provided with end air inlet ducts and an intermediate air exit duct the inlet openings to which latter are located in the opposite sides thereof and extend substantially the width of the building. in combination with means for creating an exhaust through the intermediate duct, and means for heating the air admitted.
5. A kiln having an air exit duct intermediate its ends and leading therefrom to one end of the kiln building, means for drawing the air from the kiln room through said exit and returning it to the room at the ond thereof. means for admitting air to the building, and means for heating the admitted air.
6. In a kiln, a heating system disposed at the entrance or wet end thereof and extending a distance therein, and an air inlet duct disposed under the heating system and transversely of the building and positioned a considerable dislance in advance of the eutrance to the kiln room whereby to form a dead air space at such end.
7. In a kiln, a plurality of steam pipes arranged longitudinally thereof at its entrance end to form a heater, an air inlet duct disposed under the plane of the heater transversely of the building and having a narrow discharge slit or opening extending substantially the width of the kiln room, said duct being disposed adjacent the forward end
of the heater whereby to form a dead air space at the entrance end of the room, and air exit means.
8. A kiln provided with end ducts for the inlet of air and intermediate air exit means, said end ducts extending Iransversely of the kiln room and having damper controlled inlets and elongated slits or openings for the discharge of air to the room, in combination with means located at the ends of the kiln for heating the air.
!. A kiln provided with end ducts for the admission of air and intermediate means for the expulsion of air, in combin. ation with steam heating means at the ends of the kiln, said means comprising spaced headers one of whlch has connection with a source of steam supply and the other with steam traps, and a plurality of superimposed parallel pipe sections each having direct connection to the headers and the steam traps.

No. 101,592. Kiln. Four.

Charles Arthur Matcham, Allentown, Pennsylvania, U.S.A.,
16th October, 1906 ; 6 years. Filed 1st September, 1906. Receipt No. 139,165 .
Claim.-1. The combination of a main kiln in which clinkfring is accomplished, and means for supplying fuel to sald kiln, a plurality of auxiliary kilns in communlcation with the main kiln, and means for directing material from the auxiliary kilns to the main kiln, substantially as described.
2. The combination of a maln kiln, a burner therefor, an auxiliary kiln. a casing connecting sald two kilns having openings for the admission of air, and means for delivering material from the auxiliary kiln to the main kiln. substantially as described.
3. The combination of a main kiln, a burner for supplying iuel thereto, a casing forming a chamber in communication with the end of the main kiln and a plurality of auxiliary kilns also connected to the casing and provided with means whereby material discharged from them is delivered to the main kiln, substantially as described.
4. The combination of a main kiln having means for supplying fuel to it, a plurality of auxillary kilns arranged to deliver into it, said auxiliary kilns belng of greater length than said main kiln, substantially as described
5. The combination of a main kiln having fuel supplying means and a plurality of auxiliary kilns with means for delivering material to said main kiln, said auxiliary kilns being of substantially double the length of the main kiln and of less diameter than the same, substantially as described.
6. The combination of a main kiln having fuel supply means, a plurality of auxiliary kilns of greater length and less diameter than said main kiln. a casing forming a chamber connecting the rear end of the main kiln with the front ends of the auxiliary kilns there belng openings for the admission of air into said chamber, substantially as described.

\section*{No. 101,598. Insuletion Buthing for Firectic WHea.} Dé ì isolation pour flls électriques.
John H. Goehst. Chicago, Illinois, U.S.A., 16th October, 1906:
18 years. Filed 10th August, 1906. Receipt No. 138,579.
Claim.-1. A bushing for protecting electric circuit wires made wholly of insulating material and comprising a hollow shank provided at one end with a hollow head and at iss other end with a screw thread and a thin sheet metal screw headed locking ring engaging said screw thread and provided with an integral resilient flange opposing said head of the bushing.
2. A bushing for protecting electric circuit wires made wholly of insulating material and comprising a hollow shank provided at one end with a hollow head and at its other and with a screw thread, a serew-threaded locking ring en-
aging said screw thread and provided with a flange oppos. ing said head and a concave spring washer made larger than

said locking ring and interposed between gaid flange and the part through which the bushing extends.
3. A bushing for the purpose set forth comprising a hollow shank provided at one end with a bollow head and at its other end with a screw thread and a thin sheet metal acrew-threaded ring engaging said screw thread of the shank and provided on its inner end with an integral, slitted concave flange opposing said head.

No. 101,594. Tube Cleaner. Neffoycur de tubes.

Thomas Andrews, Rockaway, New Jersey, U.S.A., 16th October, 1906; 6 years. Filed 2nd August, 1906. Receipt No. 138,375.
Claim.-1. A tube cleaner comprising a head having an annular chamber for receiving a motive agent, and also having a chamber at its inner end communicating with the firstnamed chamber through ports arranged at an angle transverse of the head axis, a tubular shaft extended through the head, a turbine mounted on said shaft, within the inucr chamber, a cylinder on the turbine, with which the tubular shaft communicates, a piston in the cylinder, tool carrying arms mounted to swing on the turbine, and link connections between said arms and said piston.
2. A tube cleaner comprising a head having an annular chamber for recelving motive agent, and also having a chamber at its inner end communicating with the first-named chamber through annularly disposed ports, a bushing extended centrally through the head. a tubular shaft arranged tc rotate in said bushing. a turbine attached to the tubular shaft within the inner tubular chamber, a cylinder on the turbine with which the tubular shaft communicates, a piston in the cylinder, arms mounted to swing on the turbine, tcols carrled by said arms and link connections between said alms and the pliston.
3. A tube cleaner comprising a head substantially in the icrm of a truncated cone, and having an annular chamber tor receiving motive agent, and also having a chamber at its inner end communicating through ports with said annular chamber, a turbine mounted to rotate in the inner chamber, blades on the periphery of said turbine having a spiral trend, a collar engaging around the blades, tool carrying arms mounted on the turbine, and a pressure actuated piston having connection with the arms.

No. 101,595. Steam Pipes for Boilery.
T'uyau à vapeur pour chaudičres.

0tto I. Hallbeck. West Salem, Illinois. U.S.A., 16th October, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,896.

Claim.-1. The combination of a stram boiler, a steam pipe arranged within said boiler and leading from the steam dome down into the body of the boller, along within said body, and then out. a passageway from the lowest part of said pipe to within the boiler whereby said plpe may be diained, and an automatically operating valve to said passageway, substantially as and for the purpose set forth.
2. The combination of a sloam boiler, a trapped steam pipe leading from the steam space, and having its lowest portion within the boiler, a passage from the lower portion of said pipe, and a check valve to said passage arranged to permit said pipe to be drained but preventing ingress of vater from the boiler therethrough into said pipe.
3. The combination of a steam boilers, a steam pipe arranged within said boiler and leading from within the steam dene down into the body of the boiler, along within said body and thence out, a passage from the lowest part of said pipe extending entirely below said lowest part and opening into the boiler, and an automatically operating valve wherety egress through said passageway is permitted but ingress therethrough is prevented.

No. 101,596. Water Tube Boiler.
Chaudière scctionnclir.

Alfred John Raynor, Toronto, Ontario, Canada, 16th October, 1906 ; 6 years. Filed 9th June, 1906. Receipt No. 136,746.
Clain.-1. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurallty of T-couplings superposed one upon the other, the couplings in the same plans being connected in pairs to one another by end pipes, which end pipes are connected together by cross pipes, as and for the purpose specified.
2. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of T-couplings superposed one upon the other, the couplings in the same plane connected in pairs to one another by end pipes, which end pipes are connected together by curved cross pipes, as and for the purpose specifled.
3. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes, which end pipes are connected together by \(S\) shaped cross pipes, as and for the purpose specified.
4. In a water tube boiler the combination with a battery composed of horizontal tubes connected together by way of riser tubes, of a firebox water chamber formed in the bridge, end and side walls of the firebox in free communication with each other and in communication with the riser plpes or tubes, as and for the purpose specified.
5. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes, which end pipes are connected together by cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings, ends and cross pipes have their cross pipes alternately arranged between the crass pipes of the first-named sections, and pipes connecting the adjacent risers of the two sections together at the top and bottom, as and for the purpose specified.
6. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes, which end pipes are connected together by curved cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings, ends and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named seclion and pipes connecting the adjacent risers of the two sections together at the top and bottom, as and for the purpose specifled.
7. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by tnd pipes which end pipes are connected together by \(S\) shaped cross plpes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipe have their cross pipes alternately arranged between the cross pipes of the firstnamed sections, and pipes connecting the adjacent risers of the two sections together at the top and bottom, as and for the purpose specifled.
8. A water tube boiler comprising a battery composed of a. plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of similar construction to the first section the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named sections, and pipes connecting the adjacent risers of the two sections together at the top and bottom, and a steam drum or dome in communication with the riser at the top, as and for the purpose specified.
9. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end plpes which end plpes are connected together by curved cross pipes, a second battery spetion of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged beween the cross pipes of the first-named section, and pipes connecting the adjacent risers of the two sections together at the top and bottom, and a steam drum or dome in communication with the risers at the top, as and for the purpose specified.
10. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in che same plane being connected in pairs to one another by end pipes which end pipes are connected together by \(S\) shaped cross pipes, a second battery section of similar construction to the first section the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pipes connecing the adjacent risers of the two sections together at the top and bottom, and a steam drum or dome in communication with the risers at the top, as and for the purpose specified.
11. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurallty of Tcouplings superposed one upon the other, the couplings in the same plane connected in pairs to one another by end pipes which end plpes are connected together by cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together a top and bottom, and a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, as and for the purpose specified.
12. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurallity of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by and pipes which end pipes are connected together by curved pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the toD and bottom, and a flrebox having the side and bridge walls in the form of a water chamber in communication with the battery, as and for the purpose spectfied.
13. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by \(S\) shaped cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged betwen the cross pipes of the firstnamed section, pipes connecting the adjacent risers of the two sectlons together at the top and bottom, and a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, as and for the purpose specified.
14. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\)-couplings superposed one upon the other, the couplings in the same plane being in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a steam drum or dome in communication with the risers at the top, and a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, as and for the purpose specifled.
15. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(r\)-couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the firstnamed section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a steam drum or dome in communication with the risers at the top, and a frebox having the side and bridge walls in the form of a water chamber in communication with the battery, as and for the purpose specified.
16. A water tube boiler, comprising a battery composed of a plurality of riser pipes each formed of a plurality of T -couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by S-shaped cross pipes, a second battery section of a similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross piprs alternately arranged between the cross pipes of the firstnamed section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a steam drum or dome in communication with the risers at the top, and a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, as and for the purpose specified.
17. A water tube boiler, comprising a battery composed of a plurality of riser pipes each formed of a plurality of T-couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of similar construction
the component sections of which formed of the raiser coupl-
ings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, and pipes connecting the adjacent risers of the two sections together at the top and bottom, the pipe piles at the ends of the battery formed by the risers. end pipes and connecting the top and bottom pipes being each in the form of a rhomboidal prism, as and for the purpose specified.
18. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of T-couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the firstnamed section, and pipes connecting the adjacent risers of the two sections together at the top and bottom. the plpe pile at the end of the battery formed by the risers end pipes and connecting top and bottom pipes being each in the form of a rhomboidal prism, as and for the purpose specifled.
19. A water tube boiler, comprising a battery comoosed of a plurality of riser pipes each formed of a plurality of T-couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected tozether by S-shaped cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the firstnamed section, and pipes connecting the adjacent risers of the two sections together at the top and bottom. the pipe piles at the end of the battery formed by the risers. end pipes and connecting top and bottom pipes bring each in the form of a rhomboidal prism, as and for the purpose specifled.
20. A water tube boiler comnrising a hattery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other. the couplings in the same plane being connected in pairs to one another by end plpes which end pipes are ennnectel together by cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pines have their cross pines alternately arranged between the cross pipes of the first-named section, pipes connecting the atiacent risers of the two sections thgether at the ton and bottom. and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boiler, as nad for the purpose specified. 21. A water tube boller. comprlsing a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other. the couplings in the same plane heing connected in pairs to one another by end pipes which end pipes are connected together by rurved cross pipes, a second battery section of similar construction the component sections of which formed of the riser counlings end and cross plpes have their cross pipes alternately arranged between the cross pipes of the firstnamed section. plpes connecting the adjacent risers of the two sections together at the top and bottom. and a return circulating pipe or pipes for forming a communication between the top and bottom portions of the boilers, as and for the purbose spicifled.
22. A watar tube boiler, comprising a hattery comnosed If a plurality of riser pipes each formed of a plurality of T-counlines sunerposed one upon the other, the counlina. in the same plane being connected in nairs to one another bv end pipes which end pipes are connected tongether by \(S\) shaned cross pipes. a second battery section of similar construction the component sections of which formed of the riser cuplings end and cross pipes have their cross nipes alternately arranged between the cross pines of the firstnamed section. nines connerting the alianont rianrs of the two sections together at the top and bottom. and a return circulating pine or pipes forming a communication between the top and bottom portions of the boiler, as and for the purpose specifled.
23. A water tube boiler comprising a battery composed of a plurality of riser plpes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane belag connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross plpes have thelr cross pines alternately arranged between the cross pipes of the first-named section. pipes connecting the adjacent risers of the two sections together at the top and bottom. a steam drum or dome in communfeation with the riser at the top, and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boller, as and for the purpose spectfied.
24. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane bcing connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a steam drum or dome in communication with the risers at the top, and a return circuiating pipe or pipes forming a communication between the top and bottom portions of the boller, as and for the purpose specified.
25. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of simllar construction the component scctions of which formed of the riser couplings end and cross pipes of the first-named section, plpes connecting the adjacent risers of the two sections together at the top and bottom, a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boiler, as and for the purpose specified.
26. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of similar construction the commonent sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a firebox having the side and bridge walls in the form of a water chamber in communication with the batterv, and a return circulating pipe or plpes forming a communication between the top and bottom portions of the boller, as and for the purpose psecified.
27. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the coulpings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by S-shaped cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pines connecting the adjacent risers of the two sections together at the top and bottom, a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boller, as and for the purpose specified.
28. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of a similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named sections, and pipes connecting the adjacent risers of the two sections tegether at the top and bottom, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
29. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pioes. a second battery section nf similar construction the component sections of whlch formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, and pipes connecting the adjacent risers of the two sectiona together at top and bottom, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
30. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by S-shaped cross plpes, a second battery section of similar construction the component sections of which formed of the riser coup-
lings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named sections and pipes connecting the adjacent risers of the two sections together at the top and bottom, the riser couplines of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specifted.
31. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in pairs to ono another by erd pipes which end pipes are connewted tognther by cross pipes, a sccond battery section of similar construction to the first section the component sections of which formed of th riser couplings end and cross pipes have their cross pipes aliernately arranged between the cross pipes of the firstnamed section, and pipes connecting the adjacent risers of the two sections together at the top and bottom, and a steam drum or dome in communication with the riser at the ton, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specifled.
32. A water tube boller comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) ccuplings superposed one upon the other, the counlings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section. ard pipes connecting the adjacent risers of the two sections tcgether at the top and bottom, and a steam drum or dome In communication with the risers at the top, the riser couplings of one set of sections being staggered to the riser couplirgs of the other set of sections, as and for the purpose srecified.
53. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by \(S\) shaped cross pipes. a second battery section of similar construction to the first section the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the top and bottom, and a steam drum or dome in communication with the risers at the top. the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections. as and for the purpose specified.
34. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battey section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named soction, pipes connecting the adjacent risers of the two sections together at the top and bottom, and a firebox having the side and bridge walls in the form of a water chamber in communication with the battery. the riser couplings of one set of sections being staggered to the riser couplings of the other section. as and for the purpose specified.
35. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of a similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross plpes of the first-named section, pipes connecting the adjacent risers of the two sections together at the top and bottom, and a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections. as and for the purpose specified.
36. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the counlings in the same plane being connected in pairs to one another by end pines which end pipes are connected together by sshaped cross pipes. a second battery suction of similar construction the component sections of which formed of the riser couplings enl and rross pipes have their cress pipes alternately arranciel between the cross pipes of the firstnamed section. hipes connerting the adjacent risers of the
two sections together at the tod and bottom. a firebox hav-
ing the side and bridge wall in the form of a water chamber in communication with the battery, the riser couplings of one sut of sections being staggered to the riser couplings of thr other set of sections, as and for the purpose specified.
37. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being conencted in pairs to one another by rad pipes which end pipes are connected together by cross pipes, a second battery of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged betwern the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a steam drum or dome in communication with the risers at the top, and a frebox having the side and bridge walls in the form of a water chamber in communication with the battery, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
38. A water tube boiler comprising a battery composid of a plurallty of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes. a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes aliernatelv arranged between the cross pipes of the first-named section pipes connecting the adjacent risers of the two sections together at the top and bottom, a steam drum or dome in communication with the risers at the top. and a fire box having the side and bridge walls in the form of a water chamber in communication with the battery, the riser couplings of one set of sections being staggered to the riser couplings of theoother set of sections, as and for the purpose specified.
39. A water tube boller comprising a battery composed of a plurality of riser plpes each formed of a plurality of \(T\) couplings superposed one upon the other. the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by \(S\) shaped cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the firsinamed section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a steam drum or dome in communication with the risers at the top, and a fire box having the side and bridge walls in the form of a water chamber in communication with the battery. the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
40. A water tube boller comprising a battery composed o? a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in palrs to one another bs end pipes which end pipes are connected together by crosa pipes, a second battery section of similar construction th. component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section. and pipes connecting the adjacent risers of the two sections together at the top and bottom, the pipe piles at the ends of the battery formed by the risers, end pipes and connecting the top and bottom pipes being each in the form of a rhomboldal prism, the riser couplings of one set of gections, being staggered to the riser couplings of the other sections, as and for the purpose specified.
41. A water tube boiler comprising a battery composel of a plurality of riser pipes each formed of a plurality of \(T\). couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross plpes have their cross pipes alternately arranged between the cross plpes of the first-named scetion, and pipes connecting the adjacent risers of the two scetions together at the top and bottom, the pioc piles at the end of the battery formed by the risers end plpes and connecting ton and bottom plpes being each in the form of rhomboidal prosm, the risers couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose spectfled.
42. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\). couplines superposed one upon the other, the couplings in the same blane being connected in pairs to one another by end pipes which end pipes are connected together to \(s\) shaped cross pipes, a second battery section of similar
construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the firstnamed section, and pipes connecting the adjacent risers of the two sections together at top and bottom, the pipe piles at the end of the battery formed by the risers. end pipes and connecting top and bottom pipes being in the form of a rhomboidal prism, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specifled.
43. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(\boldsymbol{T}\), couplings superposed one upon the other. the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately ar ranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the ton and bottom, and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boller, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
44. A water tube boiler. comorising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved crossed pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and crose nines have their ross pipes alternately arranged between the cross pipes of the first named section. pipes connecting the adiacent risers of the two sections together at the top and bottom, and a return circulating pipe or plpes forming a communication between the top and bottom portions of the boiler. the riser couplings of ene set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
'5. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of T-couplings superposed one unon the other, the couplings in the same glane being connected in pairs to one another by end pipes which end pipes are connected together by Sshaped cross pipes, a second battery section of similar construction the comnonent sections of which formed of thr riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first named section. pipes connecting the adjaceut risers of the two sections together at the top and bottom. and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boiler. the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
46. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of T-couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end nipes are connected together by cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross plpes have their cross pipes alternately arranged between the cross pipes of the first named section, pipes connecting the adjacent risers of the two sections together at the tod and bottom, a steam drum or dome in comunication with the risers at the top and a return cir;ulating pipe or pipes forming a communication between the lop and bottom portion of the boiler, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections. as and for the purpose specified.
47. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of Tcouplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes. a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first-named section, dipes connecting the adjacent risers of the two sections together at the ton and bottom, a steam dram or dome in communication with the risers at the top, and a return circulating pipe or pipes forming a communication becreen the ton and bottom portions of the boiler, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
48. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of
\(T\)-couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by cross pipes, a second battery section of similar construction the comnonent sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the first named section, pipes connecting the adjacent risers of the two sections together at the top and bottom, a firebox having the side and bridge walls in the form of a water chamber in communication with the battery, an a return circulating pipe or pipes forming a communication between the top and bottom por tions of the boiler, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
49. A water tube boiler, comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\)-couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by curved cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alterna tely arranged between the cross pipes of the first-named section, pipes connecting the adjacent risers of the two sections together at the tod and bottom, a frebox having the side and bridge walls in the form of a water chamber in communication with the battery, and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boiler, the riser couplings of one set of sections being staggered to the riser couplings of the other set o seections, as and for the purpose specifled.
50. A water tube boiler comprising a battery composed of a plurality of riser pipes each formed of a plurality of \(T\) couplings superposed one upon the other, the couplings in the same plane being connected in pairs to one another by end pipes which end pipes are connected together by Sshap d cross pipes, a second battery section of similar construction the component sections of which formed of the riser couplings end and cross pipes have their cross pipes alternately arranged between the cross pipes of the firstnamed section, pipes connecting the adjacent risers of the two sections together at the ton and bottom, a firebox having the side and bridge walls in the form of a water thamber in communication with the battery, and a return circulating pipe or pipes forming a communication between the top and bottom portions of the boiler, the riser couplings of one set of sections being staggered to the riser couplings of the other set of sections, as and for the purpose specified.
51. In a water tube boller the combination with a fire box water chamber and a steam drum having ingress and egress openings in the bottom thereof and passages from said ingress openings communicating with the extreme upper passages between tubes in the water tube battery, of a plurality of return tubes leading from said egress opening in the battom of the steam drum and extending beyond and without the heat zone of said firebox and emptying adjacent to the bottom of said firebox water chamber through a lower circulating pipe, as and for the purpose specified
52. In a device of the class described, in combination, a water tube battery of a plurality of sections, having one section formed of T-couplings, superposed one on the other and connected in pairs by end pipes, and cross pipes connecting said end pipes and a section similarly arranged having its cross pipes alternate with the cross pipes of the first section, and pipes connecting the adjacent risers respectively of the two sections at the top and bottom thereof, a steam drum surmounting said water tube battery having ingress and egress openings in the bottom thereof, a plurality of pipes secured to and communicating with the uppermost portion of said battery and leading to said ingress openings and leading support to said drum, a firebox having a hollow wall forming a water chamber, and return tubes leading from said egress opening in the steam drum and extending beyond and without the heat zone of the firebox and emptying to the bottom of the said firebox water chamber, as and for the purpose specified.
53. In a water tube boiler the combination with a hot air chamber entirely enclosing the battery of water and steam tubes, of a firebox the sides and bridge walls of which form a continuous connected water chamber which is in communlcation with the riser pipes of the battery and is connected by a perpendicular return pipe with the bottom of the steam drum, as and for the purpose specifled.
54. In a water tube boiler the combination with a hot air chamber entirely enclosing the battery of water and steam tubes, of a fire box the sides and bridge walls of which form a continuous connected water chamber which is in communication with the riser pipes of the battery and is connected by a perpendicular return pipe located oistside of the oattery casing forming the heating chamber with the bottom of the steam drum, as and for the purpose specified.
55. In a water tube boller the combination with a plurality of riser pipes, of a plurality of curved substantially Sshaped horizontal circulating pipes forming communication between the riser pipes, the curves ot the pipes being horizontal and all in the same plane and the ends of such \(S\) shaped pipes extending beyond the laops of the \(S\), and communicating with straight pipes, as and for the purpose specified.
56. In a water tube boiler the combination with a plurality of riser pipes, of a plurality of curved substantially \(S\) shaped horizontal circulating pipes forming communications between the riser pipes, and a casing enclosing the battery so formed in such a manner as to constitute a heating chamber, the curves of the pipes being horizontal and all in the same plane and the ends of such S -shaped pipes extending beyond the loops of the \(S\), and communicating with straight pipes, as and for the purpose specified.
57. In a water tube boiler the combination with a plurallty of riser pipes, of a plurality of curved horizontal circulating pipes superposed in series one upon the other and in free communication at one end with the riser or risers on one side of the battery so formed, and at the other end with the riser or risers on the opposite side, as and for the purpose specificd.
58. A circulating tube for water tube boilers of the shape of a cross elongated \(s\) the ends of which extend outward beyond the loops of the \(S\), and all the curves of which are in the same plane, as and for the purpose specified.

No. 101,597. Steam Boiler. Chaudive \(\dot{\boldsymbol{c}}\) zapeur.

Harry Del Mar, New York City, New York, U.S.A., 16th October, 1906; 6 years. Filed 9th April, 1906. Receipt No. 134,761 .
Claim.-1. A water tube boiler comprising inner and outer teaders arranged at one end of the boiler, water tubes arranged in couples with each couple connected to both series of headers, vertical mud drums at the sides of one series of headers, connections between the mud drums and the headers and the steam drum, and connections between a series of headers and the steam drums and connections between the steam drum and the mud drums.
2. In a water tube boiler the combination of the inner and outer headers forming one wall of the boiler, the inner beaders being in separate upper and lower series, and water tubes arranged in couples. each couple having one tube connected to an inner header and the other tube connected to the outer header.
3. In a water tube boiler the combination of the tube banks, and the stcam drum having indirect connection therewith, of the vertical mud drums at the sides of the tube banks, and water legs connecting the mud drums and steam drum.
4. In a water tube boiler, the headers forming one wall, one set of headers being placed inside the other, forming a double wall, and water tubes arranged in couples, one tube of each couple being connected to an inner header and the cther tube connected to the outer header, return bends on the other ends of the tubes and connecting the tubes of each couple, and a projectng nipple on each return bend and in li. with each tube, said nipple being constructed to receive an inner plug, and provided with an external screw-thread.
5. In a water tube boller the combination of the tube banks, an external header, a pair of headers arranged on the inner side of the external header and having no connection with one another, water tubes arranged in couples, each couple having one tube connected to an inner header and the other tube connected to the outer header, and return bends
on the ends of the tubes opposed to the headers the return bends having projections in line with the tubes, said projections being arranged to receive a plug or a cap.
6. In a water tube boiler the combination with the water tt:be arranged in couples, of the return bends connecting the couples, each bend having a projection in alignment with the ti:bes, the projection extending beyond the body of the return bend and having a plug in each projection ard an external screw thread on the projections for the affixing of a plugging tool.

\section*{No. 101,598. Steam Boiler. Chablijeg it voqur.}

Charles Andrew Sturm, Portland, Oregon, C.S.A., 16th October. 1906; 6 years. Filed 1st August, 1906. Recelpt No. 139,327.
Claim.-1. A stcam boiler comprising a bottom chamber having a cut-out portion for the firebox, a top chamber, an ir:termediate chamber extending from the front of the boiler t) within a distance of the rear of the boiler, pipes connecting the bottom chamber with the intermediate chamber, pipes connecting the intermediate chamber with the top chamber. pipes connecting the top chamber with the bottom chamber in the rear of the said intermediate chamber, and a horizontal partition between the top and intermediate chambers and extending from the rear forwardly to within a distance from the front of the boiler.
2. A steam boller comprising a bottom chamber having a cut-out portion for the firebox, a top chamber, an interreediate chamber extending from the front of the boiler to within a distance of the rear of the boiler, pipes connecting the bottom chamber with the intermediate chamber, pipes ccnnceting the intermediate chamber with the top chamber, pipes connecting the top chamber with the bottom chamber in the rear of the said intermediate chamber, and a horizontal partition between the top and intermediate chambers and extending from the rear forwardly to within a distance from the front of the boller, an outlet for the smoke and gases from the front of the boller at a point between the said top chamber and the said intermediate chamber.
3. A steam boller comprising a bottom chamber having a cut-out portion for the frebox, a top chamber, an intermediate chamber extending from the front of the boiler to within a distance of the rear of the boiler, pipes connecting the bottom chamber with the intermediate chamber, pipes connecting the top chamber with the bottom chamber in the rear of the said intermediate chamber, a horizontal partition between the top and intermediate chambers and extending from the rear forwardly to within a distance from the fron of the boiler, and a steam dome located above and connected w:th the said top chamber.
4. A steam bo!ler comprising a bottom chamber. a top chamber, an intermediate chamber, a steam dome carried by the top chamber, pipes connecting the bottom chamber with the Intermediate chamber, pipes connecting the intermediate chamber with the top chamber. pipes connecting the top chamber with the bottom chamber, and a horizontal partition between the top and intermediate chambers and extending from the rear forwardly and terminating short of the front of the boiler.
5. A steam boiler comprising a bottom chamber extending from the firebox to the rear of the boller, a top chamber extending from the front to the rear of the boiler, a steam come carried by the top chamber, an intermediate chamber extending rearward from the front of the boiler and spaced at its rear end from the rear of the boiler, pipes connecting the bottom chamber with the intermediate chamber, pipes connecting the intermediate chamber with the top chamber, pipes extending in the space at the rear of the intermediate chamber and connecting the top chamber with the boltom cbamber, a horizontal partition extending forward from the rear of the boiler, and located between the top and intermediate chambers, and an outlet for the smoke and gases leading from the front of the boiler immediately below the top chamber.

\section*{No. 101,599. Composition for Removing Scale from Steam Boilers.}

\section*{Composition pour enlever la rouille dans les chaudic̀res ì} vapestr.

Lancelet William Thompson, Hobart Mills. California, U.S.A., 16th October. 1906; 6 years. Filed 25th July, 1906 . Receipt No. 138,150.
Claim.-1. The herein described composition of matter consisting of potato, brown sugar and kerosene, substantially as described and for the purpose specified.
2. The herein described composition of matter for removing scales from steam boilers and for the prevention of the forration of scales in steam boilers, consisting in quantities to the gallon four and one-fourth pounds of potatoes, three fcunds of brown sugar and one quart of kerosene, substantially as described.

No. 101,600. Stay Bolt. Boulon deutreloise.

George Springer Thompson, Hockessin, Deleware, U.S.A., 16th October, 1906; 6 years. Filed 12th May, 1906 . Receipt No. 130,854.
Claim.-1. A two part stay bolt consisting of an eye head formed with a tapered body portion which is threaded, and an eyc bolt, the parts being coupled together by the interlocking of their eye loops, for the purpose described.
2. A two part stay bolt consisting of an eye head formed with a semi-circular seat in its eye and with an external surface concentric to said seat, and an eye bolt coupled to saill eye head and formed with bearing surfaces which engage with said concentric surface on the eye head, the bolt being recessed centrally between said bearing surfaces for the purpose set forth.
3. A two part stay bolt consisting of an eye head formed With a semi-circular seat in its eye with an extension of the eye of larger diameter than the said seat and with an external surface concentric to said seat, and an eye bolt coupled to said eye head and formed with bearing surfaces which engage with said concentric surface on the eye head, the bolt being recessed centrally between said bearing surfaces for the purpose set forth.
4. A two part stay bolt consisting of an eye head and an eye bolt coupled therewith, said eye bolt being formed of a central filler and of a strap welded thereto and extending the full length of the bolt on opposite sides of the filler, for the purpose set forth.
5. A two part stay bolt consisting of an eye head and a bolt coupled thereto, said eye bolt being formed of a cen(ral filler and of a strap looped into the eye in the said re head, and having its ends welded to the filler for the purpose described.
6. A two part stay bolt conslsting of an eye head and an cye bolt coupled therewith, said eye bolt being formed of a central filler an dof a strap welded thereto, the side members of the strap being flattened beyond the bend of the loop or eye, for the purpose set forth.
i. A two part stay bolt consisting of an eye head formed with a tapered body portion which is threaded, said threaded body having a central recess the side walls of which are adapted to engage with a driving implement, and a eye bolt, the parts being coupled together by the interlocking of their eye loops, for the purpose set forth.

No. 101,601. Stone Saw. Scie ì pierre.

Cortis K. George and John Burnett, co-inventors, both of
Milford, New Hampshire, U.S.A., 16th October, 1906;
6 years. Filed 6th September, 1906. Receipt No. 139,304.
Claim.-A stone saw having teeth of a common thickness throughout their height, arranged at a suitable distance apart, and intermediate portions of a less thickness than and corresponding in height to the teeth, arranged alternately at opposite sides of the saw and lying entirely in the vertically glane of the teeth, and having concave lower edges, the said comparatively thin intermediate portions affording interdental spaces extending throughout the heignt of the saw and adapted to permit the free passage of abrasive material to the bottom of a kerf in which the saw is disposed.

\section*{No. 101,602. Electric Mail Carriage.}

Porte-sacs postaux électriques.
Michael Danner, Panola, Illinois, U.S.A., 16th October, 1906;
6 years. Filed 17th September, 1906. Receipt No. 139,550.
Claim.-1. In a telpher system, line wires extending between stations and forming carrier suports, rigid bars connected to the wires and in alignment therewith, sald bars forming carrier supports at the stations, each bar having downwardly bent end portions forming guards or guides for directing the wheels of the carrier on to said bars.
2. In a telpher system, a carrier having a plurality of independent compartments each provided with a movable bottom portion. trip arms of different length carried by the car and connected to sald bottoms, and means for engaging said trip arms to effect the opening of the bottoms and the discharge of the contents of the receptacles.
3. In a telepher system, a carrier having a plurality of receptacles, tripping mechanism for controlling the dumpinp of said receptacles, said tripping mechanism extending respectively, different distances from the car, and means at the differcnt stations aranged to be engaged by said tripping mechanism to effect the discharge of the receptacles at the proper stations.
4. In a telpher system, a carrier having a plurality of independent receptacles, and a pivoted bottom for each re-

ceptacle, a latch for holding the bottom in closed position, a vertically disposed shaft connected to the latch, an adjustable arm extending from the shaft, and arm engaging members arranged along the line.
5. In a telpher system, a carrler having a plurality of independent receptacles, a pivoted bottom for cach receptacle, a latch holding the bottom in closed position, a vertically disposed shaft connected to the latch, an adjustable arm extending from the shaft, means arranged along the line for engaging the arms, and a spring acting on each shaft and tending to move the arm of said shaft into parallel relation with the carrier.
6. In a telpher system, a carrier having a plurality of independent receptacles, a pivotally mounted loop forming the bottom of each receptacle, a vertically disposed shaft having bearings in the frame of the carrier and provided with loop supporting arm, a holding spring engaging said arm and tending to maintain the same in loop engaging position, p trip arm carrled by the shaft and extending outward from the side of the carrier in position to be engaged by a tripping lever on the line, and a spring arranged on the shaft and tending normally to move the tripping arm into parallel relation with the carrier.
7. In a telpher system the combination with the line wires. of a carrier mounted thereon and provided with a collecting receptacle, article clamping jaws arranged at different points along the line and adjustable into the path of movement of the carrier, and a jaw spreading arm supported by the carrier and serving to open said jaws and effect the discharge of the articles into said receptacle.
8. In a telpher system the combination with the line wires. of a carrier having a collecting receptacle, article clamping jaws arranged at stations along the line, a swinging arm for the support of each pair of jaws, means for holding said arm with the jaws in the path of movement of the carrier. and a jaw spreading arm supported by said carricr and movable between the jaws to effect the discharge of the artickes carrled thereby.
9. In a telpher system the combination with the line wire, of a carrier having a collecting receptacle article clamping jaws arranged at different points along the line, a spring iending normally to hold the jaws together, an arm supporting the jaws. a support to which said arm is pivoted, a fair of guides for the arm, a spring tending normally to hold the arm in operative position, a locking device for holding the arm with the jaws in the path of the carrier, and a Jaw spreading arm supported by the collector and arranged to open the jaws and remove the erticles therefrom.
10. The rombination with a movable car or carrier having at article receptacle. of a pair of guard arms projecting from the carrier, a collecting arm arranged between the guard arms, and article supporting members arranged at different positions along the line and engageable by the collecting arm as the car passes the stations.
11. In a telpher system the combination with the liue wires, of a frame having a plurality of pairs of wheels runring on the wires, levers plvoted to the frame, and carrying one of the pairs of wheels, and springs engaging said levers and tending to fored said wher is into engagement with the wires.
13. In a telphor system, a line comprising three wires, two arranged in a herizontal plane, and the third in a plane above and between the other two, a carrier having a recresed cemtal portion to straddle the third wire. and supporting wheels arranged on the carrior and running on all of the wires.
13. In a tolpher systom, a maln linc, and a branch line, each comprising a plurality of parallel wires, a carrier hav-
ing wheels running on sald wires, a switching member in the form of a rail leading between the main and branch lines. and auxiliary wheels mounted on the carrier and arranged to engage and travel on said rall.
14. In a telpher system, a main line. and a branch line, each provided with a plurality of parallel wires, a switch rail extending over the wires, and forming a connecting ineans betwern the two lines, a carrier having wheels running on the line wires, auxiliary wheel supports on said carrier, wheels mounted thereon and adapted to travel on the switch rail, and means for automatically tripping said supcort and lowering the wheels to prevent the passage of the carrier to the branch line.

15 . In a telpher system, a main line, a branch line, each line including a series of parallel wires, a wheeled carrier arranged to travel on the wires, a switch rail extending over and connecting the two lines, pivotally mounted wheel carrying arms on the carrier, wheels arranged on said arms and adapted to travel on the switch rail, springs tending normally to lower said arms, and move the wheels to a position below the switch rail, locking devices for maintaining said arms in elevated position, adjustable trip arms connected to said locking device, and trip engaging devices arranged at different points along the line.
16. In a telpher system the combination with main and branch lines, each including a plurality or parallel wires, a switch rail extending over the two lines, said rail being of T-shape in cross section, a wheeled carrier arranged to travel on the wires, a pair of sets of pivoted arms mounted on the carrier, means for connecting the arms for mutual movement, wheels carried by said arms and adapted to travel on the horizontal web of the T-rall, springs tending to depress the arm, a locking bolt for holding said arms in upright position, a bell crank lever connected to the bolt, and an adjustable arm connected to the bell crank lever and arranged to be engaged by trips or stops at difierent points along the line.
17. In a telpher system, line wires, a support, and a track bar pivoted at a point intermediate of its length to sald support and free for swinging movement in a vertical planc and providel at its ends with means for engaging the wire.
18. In a telpher system, a pivotally mounted track bar forming a connection between the line wire and its support, said bar being free for swinging movement in vertical plane.

\section*{No. 101,603. Valve for Fire Extinguishors.}

Soupape pour extincteur.

Charles W. Kersteter, Chlcago, Illinois, U.S.A., 16th October,
1906 ; 6 years. Filed 6th August, 1906. Receipt No. 138,452
Claim.-1. In a device of the class described the combination with the alr valve and the water valve, of a pair of sibstantially vertical levers having arms disposed side by side and movable laterally with respect to the direction of the movement of the alr valve, means carried by the air valve and ungaging said arms for normally preventing their lateral mevoment, and means interposed between said levers and the water valve for holding the latter seated, substantially as described.
2. In a device of the class described, the combination with the air valve and the water valve, of mechanism for holding the water valve seated, said mechanism including a lever hi.ving an arm disposed in the general direction of the movement of the air valve and movable laterally with respect to said direction, a shoulder carried by the air valre and directly engaing said arm, laterally, for preventing its lateral movement. and a rigid stem interposed between the water valve and the lever, substantially as described.
3. In a device of the class described the combination with the air valve and the water valve, of mechanism for holding the water valve seated, said mechanism including a lever having an arm disposed in the general direction of move-
ment of the air valve and movable in a direction substantially perpendicular to the direction aforesaid, means carried by the air valve and engaging said arm for preventing its lateral movement, and a stem interposed between the water valve and the lever and engaging the latter at a point between its fulcrum and its contact with the air valve, substantially as described.
4. In a device of the class described the combination with the air valve and the water valve, of mechanism for holding the water valve seated, sald mechanism including a lever having an arm disposed in the general direction of the movement of the air valve and movable in a direction substantially perpendicular to the direction aforesaid, a shoulder on the air valve engaging said arm, the engaging faces of said shoulder and arm being cam-shaped, and means interposed between the lever and the water valve, substantially as described.
5. In a device of the class described the combination with the air valve and the water valve, of mechanism for holding the water valve seated, said mechanism including a plurality of levers having arms disposed in the general direction of the movement of the air valve and disposed at equal distances apart, sald arms being movable in directions substantially perpendicular to the direction of movement of the air valve, means carried by the air valve and engaging said arms for preventing their lateral movement, and means interposed between said levers and the water valve, substantially as described.
6. In a device of the class described the combination with the air valve and the water valve of mechanism for holding the water valve seated, sald mechanism including a pair or levers having arms movable laterally with respect to the direction of movement of the air valve, a circular shoulder carried by the air valve and engaging said arms for normally preventing their lateral movement and means interposed between said levers and the water valve for holding it seated, substantially as described.
7. In a device of the class described the combination with the air valve and the water valve of mechanism for holding the water valve seated, said mechanism including a pair of levers having arms arranged side by side and in the general direction of the movement of the air valve, said arms being movable laterally with respect to the direction of movement of the air valve, means carried by the air valve and engaging said arms for normally preventing their lateral movement and a stem or strut interposed between said levers and the water valve, substantially as described.
8. In a device of the class described the combination with the air valve and the water valve of mechanism for holding the water valve seated, said mechanism including a pair of levers having arms arranged side by side and in the general direction of the movement of the air valve, said arms being movable laterally with respect to the direction of movement of the air valve, means carried by the air valve and engaging sald arms for normally preventing their lateral movement and a stem or strut engaging said levers and the water valve, said stem or strut being adjustable in length, substantially as described.
9. In a device of the class described for combination with the air valve and the water valve of mechanism for holding the water valve seated, said mechanism including a pair of levers having arms arranged side by side and in the general direction of the movement of the air valve, said arms being movable laterally with respect to the direction of movement of the air valve, means carrled by the air valve and engaging said arms for normally preventing their lateral movement, means interposed between said levers and the water valve and stops for arresting the levers in positions to prevent the re-seating of the air valve, substantially as described.
10. In a device of the class described the combination with the air valve and the water valve of mechanism for holding the water valve seated, said mechanism including a composite stem or strut having two parts and means for moving them endwise relatively to each other, said means comprising two relatively movable parts having alternating cam surfaces and flat surfaces, substantially as described.
11. In a device of the class described the combination with the air valve and the water valve of mechanism for holding the water valve seated, said mechanism including a strut or stem, sald strut or stem comprising two parts, and straining mechanism for forcing them apart, sald straining mechanism having a collar on one of said parts and a second collar rotatively mounted on both of said parts, the engaging faces of said collars being complementary and having alternating cam surfaces and flat surfaces, substantially as described.
12. In a device of the class described the combination with the air valve and the water valve of mechanism for holding the water valve seated, said mechanism including a pair of levers having arms movable laterally with respect to the direction of movement of the air valve, means carried by the air valve and engaging said arms for normally preventing

10-25
their lateral movement and a stem engaging the water valve and engaging the levers at points between their fulcrums and their points of engagement with the air valve, substantially as described.
13. In a device of the class described the combination with a casing having a chamber and having vertically aligned ports leading into and out of said chamber, of valves adapted to sald ports, a lever having a substantially vertical arm, the upper end of which is movable in a substantially horizontal movement of its upper end, and means interposed between sald lever and the lower valve for holding the latter seated, substantially as described.
14. In a device of the class described the combination with a casing having a chamber and having vertically aligned ports leading into and out of said chamber, of valves adapted to said ports respectively, a plurality of levers having substantially vertical arms, the upper ends of which are movable in substantially horizontal directions, means carried by the upper valve and engaging said arms for preventing the horizontal movement of their upper ends, and means interpcsed between the levers and the lower valve for holding the latter seated, substantially as described.
15. In a device of the class described the combination with a casing having a chamber and having vertically aligned ports leading into and out of said chamber, valves adanted to said ports respectively, a lever having a substantially vertical arm, the upper end of which is movable in a substantially horizontal direction, said arm having a shoulder, means carried by the upper valve and engaging said arm for preventing the horizontal movement of its upper end, and a strut interposed between sald shoulder and the lower valve, for holding the latter seated, substantially as described.
16. In a device of the class described the combination with a casing having a chamber and having vertically aligned ports leading into and out of said chamber, of valves adapted to said ports, a plurality of levers having arms occupying substantially vertical positions, means carried by the upper valve and engaging said arms for preventing the horizontal movement of their upper ends, and a vertical stem interposed between said levers and the lower valve, substantially as described.
17. In a device of the class described the combination with a casing having vertically allgned ports, of valves adadapted to said ports, a plurality of levers disposed at substantially equal angles to the central line common to the axis of said ports, and substantially parallel with said line, means on the upper valve engaging eaid arms for preventing their lateral movement and means interposed between the levers and the lower valve for holding the latter seated, substantially as described.

No. 101,604. Spark Arrester. Arrête-étincellcs.

Charles Robert Mayo, 9 Mostyn Avenue, Wembley, Middlesex, England, 16th October, 1906; 6 years. Flled 1st August, 1906. Receipt No. 138,323.
Claim.-1. A spark arrester comprising a divided cage, hinged screens to which the parts of the cage are connected, and means adapted to support the cage and screens in position for use within a smoke box, said cage and screens being adapted to be displaced from said position, as set torth.
2. A spark arrester comprising a cage divided into two parts articulated together, hinged screens to which the parts of the cage are respectively articulated and means adapted to support the cage and screens in position for use within a smoke box, as set forth.
3. In a spark arrester the combination in a smoke box of blast pipe, and a cage surrounding and extending above the upper part of the blast pipe, a transverse dead plate next the tube plate and a transverse screen, sald dead plate and screen together extending entirely across the smoke box except where the cage occurs, as set forth.
4. In a spark arrester the combination in a smoke box a blast pipe, and a cage surrounding and extending above the upper part of the blast pipe, one side of said cage being solid and the other being adapted to allow the passage of products of combustion but to arrest sparks, as set forth.
5. In a spark arrester the combination in a smoke box of a blast pipe, and a cage surrounding and extending above the upper part of the blast pipe, one side of said cage being solld and formed with wings or lateral extensions and the other being adapted to allow the passage of products of other being adapted to allow the sparks, as set forth.
6. In a spark arerster the combination in a smoke box of a blast pipe, a cage surrounding and extending above the upper part of the blast pipe, and tran:sverse screens extending across the smoke box and formed of metal plate having ing across the smoke box and ormich are upwardly flanged, therethrough
7. In a locomotive or like smoke box the combination with a blast pipe of a surrounding edge, a plurality of screens, and means for simultaneously displacing said cage and screens as set forth.
8. In a locomotive or the like smoke box the combination with a blast plpe and smoke chimney of a cage interposed between the blast pipe and smoke chimney, a plurality of screens attached to the cage and means for altering the position of said cage and screens relatively to each other and to the smoke box, as set forth.
9. In a locomotive or like smoke box the combination with a blast pipe and smoke chimney of a divisible hollow cage interposed between the blast pipe and smoke chimney, and a plurality of screens articulated to the cage and to the smoke box, as set forth.
10. In a locomotive or like smoke box the combination with a blast pipe and smoke chimney of a divisible hollow with a the parts of which are articulatod to each other, and a plurality of screens articulated to the cage and to the smoke box, as eet forth.
11. In a locomotive or like smoke box the combination with a blast plpe and smoke chimney of a divisible hollow cage, a plurality of screens articulated to each other and to the cage and a dead plate, said cage and screens being adapted to be supported in the operative position partly by the blast pipe and party by the dead plate and to be simultaneously elevated, as set forth.
12. In a locamotive or like smoke box the combination With a blast pipe and smoke chimney of a hollow cage divided vertically into two parts hinged together at their lower extremities, a pair of screens hinged to the respective cage parts adjacent to their upper and outer edges and to the emoke box, as set forth.
13. In a locomotive or like smoke box the combination with a blast plpe and smoke chimney of a hollow cage divided vertically into two parts hinged together at their adjacent lower extremities, the pair of screens partially surrounding the said cage adjacent to its upper edge and hinged thereto and to the smoke box, as set forth.
14. In a locomotive or like smoke box the combination with a blast pipe and smoke chimney, of a hollow cage divided vertically in a plane perpendicular to that of the boiler tube plate and hinged along the lower divided edge, a dead plate secured in the smoke box next the boiler tube plate and partially surounding and supporting the parts of the cage, a pair of screens surrounding the parts of the cage not surrouded by said dead plate and overlapping the latter, and hinges connecting the screens with the divided parts of the cage and with the smoke box, as set forth.
15. In a locomotive or like smoke box the combination With a blast pipe and smoke chimney of a bollow cage divided in a plane perpendicular to that of the boiler tube plate, each half being perforated at the side remotr from said boller tube plate but having a solid portion adjacent thereto. hinges connecting the parts of the cage at the lower edge, as set forth.
16. In a locomotive or like smoke box the combination with a blast pipe and smoke chlmney of a hollow cage divided in a plane perpendicular to that of the boller plate, each half being perforated at the side remote from said boiler tube plate, but having adjacent thereto a solid portion provided with wings as set forth.
17. In a locomotive or like smoke box the combination with a blast pipe and smoke chimney, of a hollow cage divided vertically in a plane perpendicular to that of the boiler tube plate, each half being perforated at the side remote from said boiler tube plate, but having a solid portion adjacent thereto. wings extending from said solid portions, hinges connecting the parts of the cage at the lower edge, a dead plate secured in the smoke box next the boller tube plate and partially surrounding and supporting the parts of said cage, a nalr of sereens surrounding the parts of the cage not surrounded by said dead plate and overlapping the latter, binges connecting the screens with the divided parts of the cage, and hinges connecting the screens at one
side to the dead plate and at the other side to brackets fixed to the smoke box, as set forth.
18. In a locomotive or like smoke box the combination with a blast plpe and smoke chimney, of a hollow cage divided vertically in a plane perpendicular to that of the boiler tube plate, each half being perforated at the side remote from said boiler tube plate but having a solid portion adjacent thereto, wings extending from said solid portions. hinges connecting the parts of the cage at the lower edge. a dead plate secured in the smoke box next the boller tube plate and partially surtounding the parts of said cage, a pair of screens surrounding the parts of the cage not surrounded by said dead slate and overlapping the latter. wings depending from such screens co-acting with the wings upon the cage, hinges connecting the screens with the divided parts of the cage and hinges connecting the screens at one side to the dead plate and at the other side to brackets fixed to the smoke box, as set forth.
19. In a locomotive or like smoke box the combination with a blast plpe and smoke chimney of a cage comprising two half cones each perforated at the side remote from said boiler tube plate but having a solid portion adjacent thereto wings extending from said solid portions, hinges connecting the parts of the cage at the lower edge, a dead plate sccured in the smoke box next the boller tube plate and partially surrounding and supporting the parts of said cage, a pair of screens surrounding the parts of the cage not surrounded by said dead plate and overlapping the latter. wings depending from such screens co-acting with the wings upon the cage, hinges connecting the screens with the divided parts of the cage and hinges connecting the screens at one slde to the dead plate and at the other side to brackets fixed to the smoke box, as set forth.

\section*{No. 101,605. Machine for Making Gas.} Machine à faire lc gaz.

James Tallisford Paris, Chicago, Illinois, U.S.A., 16th October, 1906; 6 years. Filed 9th April, 1906. Receipt No. 134,768.
Cluim.-1. In apparatus for the manufacture of gas, a carbureter having an interior space divided into alternate layers of multicellular charibers and absorbent material. the cells of each chamber being connected in series with each other and with the colk of the other chambers to form a continuous pas:age for als through the carbureter.
2. In apparatus for the msnufacture of gas, a carbureter having an interior spac divilid into alternate superposed layers of multicellular chambers and absorbent material. the cells of cach \(\cdot h \cdot \ln _{1}, \ldots\) be ne connected in series with each other and with the cells of the other chambers to form a continuous passage fo-: : \(h\) ough the carbureter, the walls of said cells comprising absorbent material entirely surrounding the air pa:ag..
3. In apparatus for the manufacture of gas, a carbureter having an interior space divided into alternate layers of multicellular chambers and absorbent material, said chambers and absorbent material belng arranged horizontally in parallel relation, each of the cells having a covering of absorbent material entirely surrounding the walls thereof and adapted to be caturated with hydro-carbon held by sald absorbent layers, and the calls of each chamber being connected in series with each other and with the cells of the other chambers to form a continuous passage for air.
4. In apparatus for the manufacture of gas. a carbureter having an interior space divided into alternate superposed layers of multicellular chambers and absorbent material. each of the cells being composed of a reticulated wire body
covered with cloth adapted to be saturated with hydrocarbon held by said absorbent laycrs, the cells of each chamber being connected in series with each other and with the cells of the other chambers to form a continuous passage for air from the bottom to the top of the carbureter.
5. In an aerometer for regulating the flow of air into a carbureter, the combination with an aerometer bell, of a liquid containing tank in which said bell is sealed, an inlet plpe opening beneath said bell, a valve controlling the opening in said plpe, a lever carrying said valve. said lever being pivoted intermediate its ends and normally operated by gravity to hold said valve open, and a member conner.....g said lever and said bell, whereby the lever is operated by the aerometer bell to close said valve when the pressure reaches a predetermined amount.
6. In an aerometer for regulating the flow of air into a carbureter, the combination with an aerometer bell, of a liquid containing tank in which said bell is sealed, an inlet plpe and an outlet pipe each opening beneath said bell, a valve controlling the opening in the inlet pipe, a pair of oppositely mounted levers carrying said valve upon their inner ends, said levers being pivoted intermediate their ends and normally operated by gravity to hold said valve open, and members connecting the free nnds of said levers with said bell, whereby said levers are operated by the aerometer bell to close said valve when the pressure reaches a predetermined amount.
7. In apparatus for the manufacture of gas, the combination with a carbureting chamber having an air outlet, of an air supply chamber having an inlet and an outlet port. said latter chamber comprising an aerometer bell and a liquid containing tank. in which said bell is sealed, a pipe connecting the outlet of the air supply chamber with the falet of the carbureting chamber. a valve controlling the inlet port of the air supply chamber, and a lever normally operated by gravitt to hold sald valve open and adapted to ive operated by the aerometer bell to close sald valvo when the pressure reaches a predetermined amount.
8. In apparatus for the manufacture of gas the combination with a carbureting chamber, having an inlet and a vapour discharge port, of an aerometer for controlling the admission o: air through the inlet port. a pump for supplying air to the carbureting chamber and automatic means for noperating said Fump, said means heing operative when a supply of gas is withdrawn through said vapour discharge port and inoperative when the flow through said discharge port is stopped.
9. The combination with a carbureter, of a pump for supplying air thereto. said pump comprising a drum, a plurality of inverted cups mounted on sald drum and having valves opening inwardiv into the same, a llquid containing chamber ir which said drum is mounted to rotate, said drum being partially submergęd in said liquid, and automatic means for rctating said drum.
10. The combination with a carbureter, of an aerometer for controlling the admission of air thereto, a pump for supplying air to the carbureter, sald pump comprising a drum, a plurality of inverted cups mounted on said drum and having valves opening inwardly into the same, a liquid containing chamber in which said drum is mounted to rotate, said drum being partiallv submerged in sald liquid, and automatic means for rotating said drum, the operation of said means being dependent upon the pressure within the drum, whereby the pump automatically operates when the air is admitted to the carbureter and is inoperative when the supply of air is cut off therefrom.

No. 101,606. Animal Trap. Picge.
Walter W. Williams, Littlefork, Minnesota, U.S.A., 16th October, 1906; 6 years. Filed 11th August. 1906. Receipt No. 138,588.
Claim.-1. In a choker trap the combination with a frame \(0^{\prime}\) oppositely acting springs secured to said frame, looped chokers each having both ends secured to one of the springs and each constituting an endless loop and adapted to operate in opposite directions when released, and a pan or trigger for releasably locking the chokers in set or retracted position.
2. In a choker trap the combination with, a frame, of oppositely acting springs secured to sa!d frame, looped chokers secured to the respective springs and adapted to operate in opposite directions when released, said chokers having notches, and a pan or trigger for releasably engaging the notches aforesald to lock the chokers in set or retracted position.
3. In a choker trap the combination with a frame, of oppositely acting springs secured to said frame, looped chokers secured to the respective springs and adapted to operate in opposite directions when released, a ring loosely encircling crossed portions of sald chokers, and a pan or trigger for releasably locking the chokers in set or retracted position.
4. In a choker trap the combination with a frame, having slots in its side, of oppositely acting springs secured to said
frame, independent looped wire chokers secured to the respective springs and passing loosely through the respective

Kags 3

slots aforesaid and adapted to operate in opposite directions when released, and a pan or trigger for releasably locking the chokers in set retracted position.
5 . In a trap the combination with a frame having upright portions, of trapping mechanism carried by said frame, and swivelled eyes on the upright portions of said frame adapted io receive stakes for fastening the frame in upright position. 6. In a trap, the combination with a frame having a base or horizontal member, of trapping mechanism carried by said frame, and swivelled eyes extending horizontally from the base or horizontal member aforesaid whose openings extend vertically and are adapted to receive upright stakes for fastening the frame in upright position.

No. 101,607. Fishing Tackle. Attirail de pêche.

Martin Zimmerman, Rochester, New York, U.S.A., 16th October, 1906; 6 years. Filed 8th August, 1906. Receipt No. 138,494.
Claim.-1. In a fishing tackle, a suitable support and a hook secured thereto by a flexible and elastic connection whereby such hook, when inserted within a bait and extended outwardly through an opening therein, may be yieldably held against the body of such bait by such elastic connection.
2. In a fishing tackle, a suitable support and two hooks each independently secured thereto by a flexible and elastic connection whereby such hooks when inserted within the mouth and outwardly through and behind the gills of a fish innpaled thereon may be yieldably held in such position.
3. In a fishing tackle, a supporting wire adapted to be inserted through the bait and carrying a permanently closed loop and a hook removably secured in such loop, the whole device adapted to be drawn forwards within the bait to expose such hook adjacent thereto and such bait, when thus in
position thereon, operating to prevent the removal of such hook from such loop.
4. In a fishing tackle, a supporting wire adapted to be inserted through the bait and carrying a permanently closed loop and a twin hook removably secured in such loop, the while device adapted to be drawn forwards within the bait to expose each member of such twin hook on the sides thereof and such bait, when thus in position thereon operating to prevent the removal of the twin hook from such loop.
5. In a fishing tackle, a supporting wire, a hook connected thereto and adapted to be inserted within and extend outwardly through a bait impaled thereon, such wire carrying ar extension below such hook and adapted to be inserted tbrough the balt and carrying a loop and a hook removably secured in such loop, the whole device adapted to be drawn fcrwards within the bait when in position to prevent the removal of such last hook and to expose the same adjacent to such bait.
6. In a fishing tackle, a supporting wire, a hook connected thereto by a flexible and elastic connection and adapted to be inserted within and extend outwardly through a bait impaled thereon, such wire carrying an extension below such hook and adapted to be inserted through the bait and carrying a loop and a hook removably secured in such loop, the whole device adapted to be drawn forwards within the bait when in position to prevent the removal of such last hook therefrom and to expose the same adjacent to such bait.
7. In a fishing tackle, a supporting wire, two hooks each secured thereto by a fiexible and elastic connection whereby such hooks may be inserted within the mouth and extended outwardly through and behind the gills of a fish impaled thercon, such wire carrying an extension below such hooks and adanted to be inserted through the fish and carrying a loop and a twin hook removably secured in such loop, the whole device adapted to be drawn forwards within the flsh when in position to prevent the removal of the twin hook therefrom and adanted to prnose each member of such twin hook on the sides of the fish.
8. In a fishing tackle, a supporting wire, two hooks connected thereto and adapted to be inserted within the mouth and extended outwardly through and behind the gills of a fish impaled thereon. such wire carrying an extension below such hooks and adapted to be inserted through the fish and carrying a lonp and a twin hook removably secured in such loop, the whole device adanted to be drawn forwards within the fish when in position to prevent the removal of the twin hook therefrom and adapted to expose each member of such twin hook on the sides of the fish.
9. In a fishing tackle, a twirler or sooon comprising a blank struck nut from a sheet of metal having lings or ears bent in parallel nlanes and at practically right angles to the plane of the blank such lugs or cars having holes therethrough and comprising bearings spaced anart for revolubly supporting such twirler unon a suitable wire and such twirler having wings formed into blades extending outward from a line connecting such holes.
10. In a fishing tackle, a twirler or spoon comprising a blank struck out from a sheet of metal having lugs or ears heen in parallel planes and at practically right angles to the plane of the blant but on opposite sides thereof. such lugs or ears having holes therethrough and comprising brarings spaced apart for revolubly supporting such twirler upon a suitable wire, an opening through such twirler to receive such wire and such twirler having wings formed into curved blades extending obliquely outward from a line connecting such holes.
No. 101,608. Fishing Tackle. Attirail de peche.

Benjamin Franklin Flegel, Racine, Wisconsin U.S.A., 16th October, 1906; 6 years. Filed 4th August, 1906 . Receipt No. 138,409.
Claim.-A senarable fishing rod handle composed of two sections one of which is a grip section a tenon end, the
other section being provided with a socket in which the tenon has engagement, a band on the grip section encircling the rear portion of the tenon and provided with a wedging segmental offset for the engagement of one end of a line reel base, and a spring latch in connection with said tenon for engagement with an aperture with which the tenon socket is provided.
2. A separable fishing rod handle composed of two sections one of which is a grip section having a tenon end, the other section being provided with a socket in which the tenon has engagement. means locking said tenon against rotary movement in the socket, and a band on the grip section encircling the rear portion of the aforesaid tenon and provided with a wedging segmental offset for the engagement of one end of a line reel base.
3. A separable fishing rod handle composed of two nections one of which is a grip section having a longitudinally ribbed tenon end, the other section being provided with a longtudinally grooved socket in which the ribbed tenon has engagement, a band on the grip section encircling the rear portion of the tenon and provided with a segmental wedging offset for the engagement of one end of a line reel base, and a spring latch in connection with one handle section to have engagement with the other handle section.

No. 101,609. Fish Hook. Hamegon.

John Edward Buckingham, Jr., Washington, District of (nlumbia, U.S.A., 16th October, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,836.
Claim.-1. A fish hook, a line, a wrapping for securing said hook and line together, and a close fitting sleeve entirely surrounding said wrapping for protecting the same.
2. A fish hook, a line, a wrapping for securing said hook and line together, and a close fitting sleeve entirely surrounding said wrapping and cement thereto.
3. A fish hook, a line, and wrapping for securing sald hook and line together, and a close fitting sleeve eatureig surrounding said wrapping, said sleeve covering on. ihat portion of the hook and line embraced by the wrapping.

\section*{No. 101,610. Animal Trap. Piege danimal.}

Preston Armstrong, Shelton, Washington, U.S.A., 16th October, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138,564.
Claim.-1. In an animal trap the combination of a bed plate having an upturned edge, a pair of springs oppositely secured to said bed plate, and a flexible loop secured to and extending between the free ends of said springs and engaging said bed plate at points intermediate caid springs and adjacent to the upturned edge of the bed plate whereby when said loop is pulled taut it acts in conjunction with said edge to kill the animal therebetween.
2. In an animal trap the combination of a bed plate, a spring pivotally secured thereto, a head plate pivotally sccured to said spring, and a loop engaging sald head plate and adapted to be pulled thereby.
3. In an animal trap the combination of a bed plate, a pair of springs pivotally secured to the ends of said bed

plate, a pair of springs pivotally secured to the ends of eaid bed plate, head plates secured to the ends of said eprings. and a loop extending between said head plates and adapted to be pulled thereby.
4. In an animal trap the combination of a bet plate, opposite springs secured to the ends thereof, a flexible loop joining eaid springs and adapted to be pulled thereby, a pan plvoted to eald plate and holding down one of said springs, and independent means for holding down the other epring and adapted to be removed by said pan after said first spring has been released.

No. 101,611. Animal Trap. Piège danimal.

Robert John Scott, Adelaide, South Australia, Australia, 16th October, 1906; 6 years. Filed 11th August, 1906. Recelpt No. 138,614.
Olaim.-1. An anlmal trap comprising a receptacle, a door embodying hinged door pivoted eections, means for counterbalancing the weight of said sections and restoring the same to normal position, and an automatically projected detent, said detent being provided with a stop portion adapted to be engaged by one of the door sections, and a retracting portion adapted to be engaged by the other door section, whereby when the latter-named section is depressed the detent will be retracted.
2. An animal trap comprising a receptacle, a door embodying two hinged or pivoted sections, means for counterbalancing the weight of sadd sections and restoring the same to normal position, and an automatically projected detent, said detent being provided with a stop shoulder adapted to be engaged by one of said sections, and a bevelled retracting portion adapted to be engaged by the other section, whereby when the latter-named section is depressed the detent will be retracted.
3. A trap comprising a receptacle, a door embodying two hinged or pivoted sections, means for counterbalancing the welght of sald sections and restoring the same to normal position, and a spring projected detent provided with a stop
shoulder adapted to be engaged by one of said sections, and a retracting portion adapted to be engaged by the other section whereby when the latter-named section is depressed the detent will be retracted.
4. A trap comprising a receptacle, a door composed of a main section pivoted to the receptacle and an operating section pivoted to said main section, means for counterbalancing the weight of the door and restoring the same to normal position, and an automatically projected detent having a stop shoulder adapted to be engaged by the main section and a bevelled retracted portion adapted to be engaged by the operating section, whereby when the latter-named section is depressed the detent will be retracted to release the door.

No. 101,612. Euperheater for Traction Engines. Surchauffeur pour machines d traction.

Tomey D. Ulrich and Frank A. Huber and John A Schroeter executors of the Estate of Edward Huber, deceased, all of Marion, Ohio, U.S.A., 16th October, \(1906 ; 6\) years. Filed 26th December, 1905. Receipt No. 131,326.
Claim.-1. The combination with a horizontally disposed steam boller and a vertically disposed steam superheater, of an engine disposed horizontally upon said boller and connected to one end of said superheater, and an engine disposed ventically upon said boller and connected to the opposite end of said superheater, substantially as described.
2. In a traction engine the combination with a horicontally disposed steam boiler having a vertically disposed steam superheater mounted therein, of an engine mounted horizontally upon the upper portion of said boller, and an engine mounted vertically upon the lower portion of said boiler, a steam connection between hteu pper end of said superheater and said upper horizontal ev sinc. and a steam connection between the lower end of said superheater and said lower vertical engine, substantially as described.
3. In a traction engine the combination with a boller having a steam space and a fire space, of a steam superheater comprising outer and inner tubes extending through said steam space and into said fire space of said boiler, sald outer tube having its ends closed and said inner tube having one of its ends opening adjacent to one of the closed ends of said outer tutie, and its other end projecting through the other closed end of said outer tube, a steam connection between the projecting end of said inner tube and the steam space of said boller, an engine mounted upon the upper portion of sald boiler and connected to the upper end of said superheater, and an engine mounted upon the lower portion of said boiler and connected to the lower end of said superheater, substantially as described.
4. In a traction engine the combination with a boiler having a steam space and a fire space, of a steam superheater comprising outer and inner tubes extending through said steam space and into said fire space of said boiler, sald outer tube having its ends. closed and said inner tube having one of its ends opening adjacent to oae of the closed ends of staid outer tube, and its other end projecting through the other closed end of said outer tube, a steam connection between the projecting end of said inner tube and the steam space of said boller, a throttle valve in' said steam connection, a governor valve in said steam connection, a horizontally disposed engine mounted upon the upper portion of sald boller and connected to the upper portion of said superheater, a vertically disposed engine mounted upon the lower portion of said boller and connected to the lower end of sald superheater, a shaft mounted upon sald boiler having a crank or wrist pin, and connections between said engines and said crank or wrist pin, substantially as described.

No. 101,613. Superheater for Steam Boilers.
Surchauffeur pour chaudières à vapcur.

The American Locomotive Company, assignce of Francis J. Cole, all of New York City, New York, U.S.A., 16th October, 1906 ; 6 years. Filed 3rd July, 1906. Receipt No. 137,477.
Claim.-1. The combination with a tubular steam boiler, of a superheating tube, a pair of supcrheater pipes extending longitudinally therein and connected at their rear ends, a vertical casing or header comprising a receiving and a delivery compartment having substantially separated walls, the forward ends of the superheater phees communicating with said compartments, a steam supply connection opening into the recelving compartment, and a steam delivery connection leading out of the delivery compartment.
2. The combination with a tubular steam boiler, of a superlieating tube, a pair of superheater pipes extending longitudinally therein and connected at their rear ends, a vertical casing or header comprising a receiving and a delivery compartment having substantially separated walls, the forward ends of the superheater pipes communicating with said compartments, a main \(T\) head communicating with the receiving compartment of the header, and a delivery compartment \(T\) head communicating with the delivery compartment of the header.
3. The combination with a tubular steam boiler, of a superheating tube, a pair of superheater pipes extending longitudinally therein and connected to their rear ends, a vertical casing or header comprising a receiving and a delivery compartment having substantially separated walls, the forward ends of the superheater pipes communicating with said compartments, a main \(T\) hear communicating with the receiving compartment of the header, and a delivery compartment \(T\) head having its wall which is adjacent to the main \(T\) head separated therefrom by an open space, and communicating with the delivery compartment of the header.
4. The combination with a tubular steam boiler, of a vertical row of superheating tubes, pairs of superheater pipes extending longitudinally therein, fittings connecting the ends of the pipes of each pair nearer the firebox. a main steam stipply pipe, a steam delivery pipe, and a vertical casing or he ader comprising a compartment which communicates with the steam supply pipe and with the receiving ends of the steam channels formed by the vertical row of pairs of superheater pipes, and a compartment having its walls substantially separated from those of the compartment first stated and communlcating with the delivery ends of said channels ard with the steam delivery pipe.
5. The combination with a tubular steam boiler, of a vertica! row of superheating tubes, pairs of superheater pipes extending longitudinally therein, fittings connecting the ends of the pipes of each pair nearer the firebox, a main steam supply pipe, a steam delivery plpe, a vertical casing or header comprising a recelving and a delivery compartment having substantially separated walls, sald compartments communicating respectively with the receiving and the delivery ends of the steam channels formed by the vertical rows of patrs of superheater pipes, a maln \(T\) head communicating with the steam supply pipe and with one of the header ecmpartments, and a delivery compartment \(T\) head communicating with the other header compartment and with the steam delivery pipe.
6. A header for steam boller superheaters comprising a recelving and a delivery compartment, having their enclos-

Ing walls out of contact one with the other, and abutting through metal projecting from their adjoining ends.
7. A header for steam boller superheaters comprising a receiving and a delivery compartment, set one in advance of the other so as to prevent contact of their adjacent enclosing walls, and abutting through metal projecting from their adjoining ends.
8. A header for steam boller superheaters comprising a receiving and a delivery compartment, having their enclosing walls out of contact one with the other, and their rear walls progressivety downwardly and forwardly stepped, sald compartments abutting through metal projecting from their adjoining ends.
-9. A header for steam boller superheaters comprising a receiving and a delivery compartment, set one in advance of the other so as to prevent contact of their adjacent enclosing walls, and having their rear walls progressively downwardly and-forwardly stepped, said compartments abutting through metal projecting from their adjoining ends.
10. A header for steam boiler superheaters comprising a rcceiving and a delivery compartment, set one in advance of the other so as to prevent contact of their adjacent enclosing walls and having steam supply and delivery ports at their upper ends. said compartments abutting through metal projecting from their adjoining ends.
11. In a steam boiler superheater the combination of a superheating tube, a pair of superheater plpes extending longitudinally therein and constituting a steam channel, a T head structure comprising a main section compartment communicating with a steam supply pipe, and a dellvery compartment section communicating with a steam delivery nipe, and having its wall which is adjacent to the main \(T\) head section separated therefrom by an open space, and connections from the opposite ends of the superheater plpes steam channel to the main section and the delivery section compartments respectively.
12. In a steam boiler superheater the comblination of a \(T\) head structure comprising a main section compartment communicating with a steam supply pipe and a delivery comrartment section communicating with a steam delivery pipe and having its wall which is adjacent to the main T head scction separated therefrom by an open space, headers, each divided into two compartments which communicate respectively with the main and the delivery compartment sections of the \(T\) head structure, and superheater pipes forming steam channels. the opposite ends of which communicate with the compartments of the headers.

No. 101,614. Superheater Steam Bollera.
Surchauffeur pour chaudièrcs d vapcur.

The American Locomotive Company, assignee of Francis J. Cole, all of New York City, New York, U.S.A.. 16th OCtober, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,478.
Claim.-1. The combination with a tubular steam boiler, of a superheating tube, a pair of superheater pipes cxtending longitudinally therein and connected at their rear conds, a vertical saturated steam beader located in front of the superheating tube and connected to the forward end of one of the pair of superheater pipes, a similarly locatel vertical superheated steam header having its walls entirely vertical superheated steam header having its wals enam and
separated from those of the saturated steam beader and
connected to the forward end of the other superheated pipe, a steam supply connection opening into the saturated steam header, and a steam delivery connection leading out of the superheated steam header.
2. The combination with a tubular steam boiler, of a superheating tube, a pair of supêrheater pipes, extending longitudinally therein and connected at their rear ends, a vertical saturated steam header located in front of the superheating tube and connected to the forward end of one of the nair of sunerheater pipes, a similarly located vertical sunerheater steam head"r having its walls entirely separated from thosc of the saturated steam header and connected to the forward end of the other superheater pipe, and a \(T\) head comprising a supply compartment communicating with the saturated steam header and a delivery compartment communicating with the superheated steam header.
3. The combination with a tubular steam boiler, of a superheating tube, a pair of superheater pipes extending longitudinally therein and connected at their rear ends, a vertical saturated steam header located in front of the superheating tube and connected to the forward end of the pair of superheater pipes, a similarly located vertical superheated steam header having its walls entirely separated from those of the saturated stcam header and connected to the forwrad end of the other superheater pipe, and a \(T\) head comprising a supply compartment communicating with the saturated steam header and a delivery compartment having its wall which is adjacent to that of the supply compartment separted therefrom by an open space, and communicating with the gugerheated steam header.
4. The combination with a tubular steam boiler, of a vertical row of superheating tubes, pairs of superheater pipes extending longitudinally therein, fittings connecting the ends of the pipes of each pair nearer the fire box, a main steam supply pipe, a steam delivery pipe, a vertical saturated steam header located in front of the row of superheating tubes and communicating with the steam supply pipe and with the receiving ends of the steam channels formed by the vertical row of pairs of superheater pipes, and a similarly located vertical superheated steam header having its walls entirely separated from those of the saturated steam header and communicating with the delivery euds of said steam channels and with the steam delivery pipe.
5. The combination with a tubular steam boiler, of a vertical row of superheating tubes, pairs of superheater pipes extending longitudinally therein, fittings connecting the ends of the pipes of each pair nearer the firebox, a main steam supply pipe, a steam delivery pipe, a vertical saturated steam header and a vertical superheated steam header located in front of the row of superheated tubres, having entirely separated walls, and communicating respectively with the recelving and the delivery ends of the steam channels formed by the vertical row of pairs of superheated pipes, and a \(T\) head comprising a supply compartment communicating with the steam supply pipe and with the saturated steam beader and a delivery compartment communicating with the superheated steam header and with the steam delivery pipe.
6. In a steam boiler superheater, the combination of superheating tubes, pairs of superheater pipes extending longitudinally therein and constituting steam channels, a T head structure comprising a supply compartment communicating with a steam supply pipe and a delivery compartment communicating with a steam delivery pipe and having its wall which is adjacent to that of the supply compartment separated thereirom by an open space, a plurality of vertical saturated steam headers extending downwardly from the \(T\) head supply compartment and connected on their rear sides to the receiving ends of the steam channels, a plurality of vertical superheated steam headers extending downwardly from the T head delivery compartment and having their walls entirely separated from those of the saturated steam headers, said superheated steam headers being connected on their rear sides to the delivery ends of the steam channels, and removable plugs closing openings in the front sides of the headers opposite the ends of the superheater pipes.
7. In a steam boiler superheater. the combination of a T head structure comprising a supply compartment communicating with a steam supply pipe and a delivery compartment located in front of the supply compartment and communicating with a steam delivery pipe, a pluraity of saturated steam headers extending downwardly from the supply compartment, a plurality of superheated steam headers extending downwardly from the delivery compartment, and a plurality of superheater pipes forming steam channels, the opposite ends of which are connected to the rear sides of the saturated and the superheated stean headers respectively.

No. 101,615. Superheater for Steam Boilers. Surchauffeur pour chaudières à vapeur.

The American Locomotive Company, assignee of Francis J. Cole, all of New York City, and Carl J. Mellin, Schenecctady. New York, U.S.A., 16th October, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,479.
Claim.-1. In a steam boiler sperheater, a segmental reIurn bend connection for the rear ends of superheater pipes which is upwardly and rearwardly tapered or inclined on its lower side, so as to present thereon a substantially semiconical or half funnel face to products of combustion passing around it.
2. In a steam boiler superheater, a return bend connection for the rear ends of superheater pipes, which is of transversely curved or segmental form, provided with longitudinal nozzles on its front for the attachment of superheater pipes, and upwardly and rearwardly tapered or inclined on its lower side, so as to present thereon a substantially semi-conical or half funnel surface.
3. In a steam boiler superheater, a return bend connection for the rear ends of superheater pipes, which is of transvirsely curved or segmental form, provided with longltudinal nozzles on its front for the attachment of superheater pipos, upwardly and rearwardly tapered or inclined on its lower side, and grovided with lateral feet or projections curved to abut against a superheating tube.
4. In a steam boiler superheater, the combination of a superheating tube, two superheater pipes extending longitudinally therein, and a transversely curved or segmental return bend attached to the rear ends of the superheater pipes and having its lower side upwardly and rearwardly tapered or inclined so as to present thereon a substantially semi-conical or half funnel face to products of combustion passing through the superheating tube.
5. In a steam boiler superheater, the combination of a superheating tube, two superheater pipes extending longitudinally therein, and a transversely curved or segmental return bend attached to the rear ends of the superheater pipes and having its lower side upwardly and rearwardly tapered or inclined and provided with lateral feet or projections abutting against the inner surface of the supcrheating tube.

No. 101,616. Steam Boiler. Chaudière de vapeur.
Francis J. Hickey and James M. Dunnigan, assignee of a half interest, both of Sacramento, California, U.S.A., 16th October, 1906; 6 years. Filed 9th May, 1906. Receipt No. 135,708.
Claim.-A steam boiler having in combination a main boiler shell, a rearward extending shel of smaller diameter, an exterior shell having a diameter substantially equal to the diameter of the rear end of the main shell and secured thereto and extending over and beyond the smaller rearward extending shell, flues extending through the main and supplemental shells, and a shell within the firebox and enclosing the lower rear portion of the supplemental shell, said firebox shell having a lining of non-conducting material.
2. A steam boiler having two diameters forming main and supplemental shells, an exterior shell having a diameter substantially equal to that of the main shell and greater than that of the supplemental shell, said exterior shell extending rearward over and beyond the supplemental shell, flues extending through the main and supplemental shells, and a frebox of non-conducting material within the ex-
terior shell and enclosing the lower rear portion of the supplemental shell.

3. In a boiler, a main boiler shell, an extension riveted into the main boiler shell, and having a head at its rear end, flues connecting said rear head of the extension and the front head of the main boiler shell, an exterior shell having the upper segmental portion riveted to the rear of the main boiler shell and extending behind the extension of said shell to form an inclosure therefor, segmental plates riveted to the interior of said shell and to the top of the extension, and a heat resisting furnace located interior to the said shell.
4. In a boiler, a main shell, an extension rearwardly thereto of smaller diameter, an exterior shell having its front end secured to the rear end of the main shell and extending rearwardy over and beyond the rear end of the supplemental shell, flues extending through the rear and front heads of the main and supplemental shells respectively, a furnace enclosed by the exterior shell, said furnace consisting of a shell inclosing and surrounding a lower portion of the boiler extension, said shell having a heat resisting lining, and means for locking said lining to the shell.
5. In a boiler, a main shell, a supplemental shell of smaller diameter extending rearwardly therefrom, an exterior shell secured to the main shell and extending over and beyond the rear end of the supplemental shell, flues connecting the rear and front heads of the two main and supplemental shells, a furnace within the exterior shell consisting of a metal shell inclosing the lower part of the boiler extension, a non-conducting lining for said metal shell and holders fixed to the shell having flanges orojecting and interlocking with the lining substance.
6. In a boiler, a main shell, an extension rearwardly of smaller diameter, flues connecting the rear head of the extension with the front head of the boiler, a furnace consisting of a metal shell inclosing the lower portion of the boller extension and having a heat resisting lining as shown, an exterior shell extending from the rear of the main boiler shell, inclosing the upper part of the cylinder extension and the exterior of the furnace, and brackets connecting said shell with the upper part of the extension.
7. Devices for securing a refractory lining within a boller furnace, said devices comprising clamps or holders removably secured to the interior of the furnace wall and formed to grip and hold the lining bricks.

\section*{No. 101,617. Telephone System. Système de téléphonc.}

Robert Bines, assignee of David Henry Wilson, both of Chicago, Illinods, U.S.A., 16th October, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,143.
Claim.-1. A telephone system comprising a primary and a secandary circuit wound upon a core, a receiver circuit electrically independent of the primary and secondary circuits and wound about a core located in proximity to said first-mentioned core so as to be influenced thereby.
2. A telephone system comprising a transmitter circuit and a line circuit, a portion of each of said circuits being wound about a core, a receiver circuit, a core therefor about which a portion of said circuit is wound, said latter core in proximity to the core about which a portion of the transmitter and line circuits are wound but magnetically insulated therefrom.
3. A telephone system comprising a transmitter circuit containing a transmitter and a source of current supply, a line ofrcuit leading to the distant station, two iron cores about which a portion of each of said circuits is wound, an intermediate iron cone, a receiver circuit electrically independent of the other two circuits and having a pontion wound about said intermediate core.
4. A telephone system comprising a transmitter circuit containing a transmitter and a source of current supply, a line circuit leading to the distant station, two inon cares
about which a portion of each of said ctrcuits is wound, an intermediate iron core, a receiver circuit electrically in-

dependent of the other two circuits and having a portion wound about said intermediate core, sald several cores being magnetically insulated from each other.
5. A telephone system comprising a transmitter circuit containing a transmitter and a source of current supply, a line circuit leading to the distant station, two iron cores about which a portion of each of said circuits is wound, the windings of the transmitter circuit on the two cores being connected in multiple and the windings of the main line circuit being connected in series, an intermediate iron core, a receiver circuit electrically independent of the other two circuits and having a portion wound about said intermediate core.

No. 101,618. Telephone Apparatus.
Appareil de téléphone.

Robert Bines, assignee of David Henry Wilson, Chicago, illinois, U.S.A., 16 th October, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,144.
Claim.-1. A telephone apparatus comprising a transmitter circult, two separated iron cores about which a portion of said transmitter circuit is wound, a main line circult having a portion also wound about said cores, two separated iron cores interposed between said first-mentioned cores oach provided with a coil, and a receiver connected in circuit with both of said coils.
2. A telephone apparatus comprising a transmitter circuit, two separated iron cores about which a portion of said transmitter circuit is wound, a main line circuit having a portion also wound about said cores, the windings being such that the opposed poles of said cores are unlike, two separated iron cores interposed between said first-mentioned cores, each provided with a coll, and a receiver connected in circuit with both of said coils.
3. A telephone apparatus comprising a transmitter circuit, two separated Iron cores about which a portion of said transmitter circuit is wound, a main line circuit having a portion aiso wound about said cores, the windings being such that the opposed poles of said cores are unlike, two separated iron cores interposed between said first-mentioned cores, each provided with a coil, and a receiver connected in circuit with both of said colls, the several cores magnetically insulated from each other.

No. 101,619. Feed Water Heater.
Chauffeur d'eau d'alimentation.

The Eclipse Feed Water Heater and Purifier Company, Osh kosh, assignee of Conrad Kieren, Appleton, Wisconsin, U.S.A., 16th October, 1906; 6 years. Filed 15th May, 1906. Receipt No. 135,939 .
Claim.-1. In a water heater, a casing, a pair of telescoping tubes forming a sinuous passage for the water, and a heating chamber projecting partway within the inner tube and reducing the area of the passage therethrough at such part thereof, whereby a comparatively slight preliminary heating of the water will be produced during the comparatively slow travel of the water through the unreduced portion of the inner tube and subsequently a greater heating of the water will be produced during the faster travel thereof through the reduced portion of the inner tube around the heating chamber.
2. In a water heater, a casing, a tube therein closed at one end, a second tube closed at one end and telescoping with its other end the open end of the first-named tube, and a heating chamber projecting part way within the open end of the first-named tube and reducing the area of the passage therethrough, whereby a comparatively slight preliminary heating of the water will be produced during the comparatively slow travel of the water through the unreduced portion of the inner tube and subsequently a greater heating of the water will be produced during the faster travel thereof through the reduced portion of the inner tube around the heating ckamber.
3. In a device of the character described, a casing, a standing tube therein, and a second tube surrounding the upper end of the first-named tube and having its lower end closed to constitute a settling chamber.
4. In a device of the character described, a casing, a standing tube therein, a second tube surrounding the upper end of the first-named tube and having its lower end closed to constitute a settling chamber, and a valved draw-off pipe through which the sediment in the settling chamber may be removed.
- . In a device of the character described, a casing, a standing tube therein, a second tube surrounding the upper end of the first-named tube, and a shouldered flange on the firstnamed tube fitting and closing the lower end of the second tube to form a settling chamber thereof.
6. In a device of the character described, a casing, a tube therein closed at one end, a second tube closed at one end end telescoping with its other end the open end of the frst-named tube, a shouldered flange at the intermediate portion of the second tube, and a third tube fitting with and closed by said shouldered flange and extending above the upper end of the second tube to constitute a settling chamber.
7. In a device of the character described, a casing, a tube therein, a second tube closed at one end and telescoping with its other end the open end of the first-named tube, a heating chamber within the first-named tube, heating pipes leading to and from the casing, and a heating pipe connected with the heating chamber.
8. In a device of the character described, a casing, heads closing the ends of the casing, a pair of partitions within said casing, a tube passing through an opening in the upper partition and extending to near the lower partition, a cap closing the lower end of said tube, a heating chamber in the lower end of said tube, a second tube mounted on the cap of the first-named tube and surrounding said first-named
tube, said second tube terminating below the upper partition, a shouldered flange around the intermediate portion of the second tube, a third tube fitting upon and closed by the shouldered flange and also fitting within the opening of the upper partition and communicating with the space above the upper partition, a series of pipes connecting the space above the upper partition with the space below the lower partition, an outlet pipe leading from the space below the lower partition, and means for conveying heat to the interfor of the casing and the heating chamber, substantially as described.
9. In a device of the character described, a casing, heads closing the ends of the casing, a pair of partitions within sald casing, a tube passing through an opening in the upper partition and extending to near the lower partition, a cap closing the lower end of said tube, a heating chamber into the lower end of said tube, a second tube mounted on the cap of the first-named tube and surrounding said first-named tube, said second tube terminating below the upper partition, a shouldered flange around the intermediate portion of the second tube, a third tube fitting upon and closed by the shouldered flange and also fitting within the opening of the upper partition and communicating with the space above said upper partition, a series of pipes connecting the space above the upper partition with the space below the lower partition, a baffle plate secured beneath the lower partition and guiding the water issuing from the said pipes to the bottom of the space beneath the lower partition, an outlet pipe extending from said space below the lower partition through said partition and through the heating space between the two partitions, draw-off pipes for the third tube and the space beneath the lower partition, and means for admitting heat to the interior of the casing and the heating chamber.
10. In a device of the character described, a casing, heads closing the ends of the casing, a pair of partitions within said casing, a tube passing through an opening in the upper partition, a cap closing the lower end of said tube, a heating chamber located within said tube, a second tube mounted on the cap on the first-named tube and surrounding sald first-named tube, said second tube terminating below the upper partition, a shouldered flange around the intermediat portion of the second tube, a third tube fitting upon and closed by the shouldered flange and also fitting within the opening of the upper partition and provided with an out wardly extending flange engaging sald upper partition and detachably secured thereto, a series of plpes connecting the srace above the upper partition with the space below the lower partition, an outlet pipe extending from said space below the lower partition, a cylindrical head on the upper end of the first-named tube forming an elbow connection therefor, a detachable water supply pipe connecting with the cylindrical head, a steam supply pipe connecting with the heating chamber and passing through the water supply pipe and the cylindrical head, a removable screw cap for the cylindrical head, and means for conducting steam to and fiom the casing between the upper and lower partitions.

\section*{No. 101,620. Dynamo-Electric Machime.} Machine dynamo-électrique.

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Ferdinand Steber, Charlottenburg, Germany, 16th October, 1906 ; 6 years. FHled 2nd October, 1906. Receipt No. 139,987.
Claim.-1. In a dynamo-electric machine the combination with an armature, of a fleld magnet frame provided with main polar projections and with auxiliary polar projections of smaller cross section that are located between the main polar projections and are provided with colls that are concentrated in close proximity to the armature.
2. In a dynamo-electric machine the combination with an armature, of a fleld magnet frame provided with main polar
projections and with auxillary polar projections of smaller cross section that are lacated intermediate the main polar projections and are provided with coils that are concentrat. ed in close proximity to the armature and are connected in series with the armature winding.
3. In a dynamo-electric machine the combination with an armature, of a field magnet frame that is provided with sets of alternately disposed polar projections having windings that are connected respectively in series and in shunt relation to the armature winding, the coils of the series connected winding being concentrated near the armature.
4. In a dynamo-electric machine the combination with an armature, of a field magnet frame provided with sets of alternately disposed polar projections of respectively different cross sectional area and windings therefor that are connected respectively in series and in shunt relation to the armature winding, the coils of the series connected winding being concentrated near the armature.

5 . In a dynamo-electric machine the combination with an armature, and a field magnet frame having a set of main pole pieces, and a set of auxiliary pole pleces that alternate in position with the main pole pieces, of a set of colls for the auxiliary pole pleces that are concentrated adjacent to the armature and constitute a compensating and regulating winding.
6. In a dynamo-electric machine the combination with an armature, of a field magnet having a set of main coils and a set of auxiliary colls that alternate in position with the main coils and are concentrated adjacent to the armature to constitute a compensating and regulating winding.
40. 101,621. Carbureter. Carburateur.

The Peoples Individual Gas Company, assignee of Verne \(C\). Severance, Chicago, Illinols, U.S.A., 16th October, 1906 ; 6 years. Filed 26th June, 1905. Receipt No. 126,401.
Claim.-1. In a device of the class described the combination with a passage adapted to hold a suitable hydro-carbon, of a wick on each side of said passage carried toward the center of the same at intervals in diagonal lines, whereby the unobstructed portions of the passage takes a zigzag form.
2. In a device of the class described the combination with the walls of a carbureter, of vertical partitions dividing the same into longitudinal passages, cross pieces on the partitions and wicks stretched over the cross pieces and secured to the partitions between the cross pieces.
3. In a device of the class described the combination with the walls of a carbureter, of a partition within the walls, cross pieces on the partition, a wick stretched over the cross pleces and secured to the partition midway between the cross pieces, and pins on the partitions and cross pieces passed through the wicks to hold the same in place.

\section*{No. 101,622. Briquette Press. lresse d briquettes.}

Patrick Reynolds, Farnham, and Joseph A. R. Bédard, Quebec, both in Quebec, Canada, 16th October, 1906; 6 years. Filed 1st June, 1904. Receipt No. 115,831.
Claim.-1. In a press the combination of a partly rotatable plunger, and means for producing partial rotation and reciprocation of the same.
2. In a press the combination of a cyllnder with a reduced bore at its discharge portion, a partially rotatable plunger reciprocating therein, and means for producing partial rotation of the plunger a plurality of times during reciprocation thereof.
3. In a press the combination of a partially rotatable plunger, means for reciprocating the same, and means for im-

parting a plurality of partial rotary movements to the plunger during each compression stroke thereof.
4. In a press the combination of a cylinder constructed partially rotatable plunger, a rocking lever, and means for with a split and reduced discharge end, clamps thereon, a actuating the lever to cause partial rotation a plurality of times during each complete stroke of the plunger.
5. In a press the combination of a compression chamber a reciprocatory plunger operable therein, means for actuating the plunger, and means for causing a number of par. tial rotations of said plunger during each full stroke thereof.
6. In a press the combination comprising a compression chamber, a steam jacket surrounding its upper portion, said chamber being split for a portion of its lower end, clamps thereon, a reciprocatory plunger operable in said chamber, means for reciprocating said plunger, and means for causing partial rotation of said plunger while descending.
7. In a press the combination of a support, a compression chamber mounted on the support, a slidable block mounted in sald block, means for reciprocating the plunger and means for causing partial rotation of the plunger during its reciprocation.
8. In a press the combination comprising a compression chamber, a plunger, a rocking beam pivotally connected therewith, an actuating rod therefor, a crank shaft, a gear rotatable therewith, a pinion of less diameter in mesh with the gear, an eccentric actuated by said pinion and a rocking lever extending laterally from the plunger, which lever is actuated by said eccentric.
9. In a press the combination of a compression chamber, a plunger, a slide plate, a slidable member guided thereby. a plunger mounted in said slidable member, a compression chamber in allgnment with the plunger, and means for causing partial rotation of sald plunger while being actuated.
10. In a press the combination of a compression chamber. a plunger, means for reciprocating said plunger, and means for causing a plurality of partial rotary movements of the plunger during each full single thrust thereof.
11. In a press the combination of a compression chamber, a olunger, means for reciprocating the plunger, a collar attached intermediate of the ends of the plunger, a lever extending therefrom, a rocker arm connected with the lever, and an eccentric adapted to actuate the rocker arm.
12. In a press the combination of a compression chamber having a reduced bore at its discharge portion, a reciprocstory plunger operable in said chamber, means for reciprocating the plunger, and means for causing partial rotation of the plunger a plurality of times during each reciprocation thereof.
13. In a press the combination of a compression chamber having a reduced bore, a plunger operable therein, means for reciprocating the plunger, a rocking lever connected therewith and extending laterally therefrom, and means for actuating sald rocking lever to cause partial rotation of said plunger.
14. In a press the combination of a compression chamber. a steam jacket surrounding a portion thereof, the other portion of said chamber being of reduced bore, a hopper plate serving as a closure for said steam jacket, a plunger. means for reciprocating the plunger, and means for causing partial rotation of said plunger more frequently than it is reciprocated.

No. 101,623. Dinner Pail. Potager.

Lee C. Harding and Anna J. Harding, assignce of a half interest, both of Mannington, West Virginia, U.S.A., 23rd October, 1906; 6 years. Filed 21st September, 1906. Receipt No. 139,687.
Claim.-1. In a device of the character described, the combination of a pail, a cover for the pail, an annular flange profecting outwardly from the top of the cover, a lamp fitting removably within the annular flange and being held in position thereby, a second annular flange concentric with the first-mentioned annular flange and projecting from the top of the pail, a receptacle fitting removably over the second-mentioned annular flange and forming a cover for the lamp when the latter is not in use, and a supporting frame resting upon the lamp and also projected by the receptacle, the said supporting frame being adapted to hold the receptacle spaced from the lamp and the second-mentioned annular flange when the receptacle is being heated, thereby preventing the second-mentioned annular flange from being blackened by the flame of the lamp and imparting an undesirable taste to the contents of the receptacle.
2. In a device of the character described, the combination of a pail, a cover for the pail, a pair of concentric annular flanges having approximately the same height and projecting outwardly from the top of the cover, a lamp fitting removably within the inner annular flange and being held in position thereby, a receptacle fitting removably over the outer annular flange and having a depth somewhat greater than the height of the flanges. and a supporting frame resting upon the lamp and adapted to hold the receptacle in a spaced position with relation to the lamp and the outer annular flange when being heatcd. thereby preventing the outer annular flange from being blackencd by the flame of the lamp and imparting an undesirable taste to the contents of the recentacle, the said receptacle forming a cover for the lamp and supporting frame when the latter are not in use.

\section*{No. 101,624. Metallic Coupling for Conveying Fluid Between Vehicles.}

Joint métallique pour le transport des liquides entre les voitures.

Henry James Stuart Martin, F. T. Enright , and W. J. Henderson, each an assignee of a third of the interest, all of Montreal, Quebec, Canada, 23rd October, 1906; 6 years. Filed 21st September, 1906. Recelpt No. 139,665.
Claim.-1. A metallic coupling for the conveyance of fluids between vehicles comprising lengths of pipe extending from
ripes supported by the vehicles and angularly arranged and telescopically joined in the center thereof, and a plurality of ring and socket joints interposed in said lengths of pipes, as and for the purpose specifled.
2. In a metallic coupling for the conveyance of fluid between vehicles the combination with pipes suitably supported by said vehicles, of lengths of pipe extending from each ot the aforesaid pipes in substantially right angular bends to a telescopically arranged foint in the middle thereof, and joints interposed in said lengths of pipe having a rotary motion, as and for the purpose specified.
3. In a device of the class described in combination, a fluid pipe supported by a vehicle, a fluid pipe supported by a rehicle following the aforesaid vehicle, a pair of joint members secured to the open ends of each of the aforesald pipes respectively. a pair of pipes having joint members inscrted in the aforesaid joint member respectively and suitably secured therein, said pipes extending from the vehicle fipes and at right angles thereto and extending in a further length at right angles to the length directly connected to the vehicle pipes and forming U-shaped bends and terminating in pipes telescopically arranged, and at right angles to said U-shaped bend, and a pair of joints interposed in each of the second lengths of pipe, said joints having a rotary inotion, as and for the purpose specified.
4. In a device of the class described in combination, a fluid pipe supported by a vehicle, a fluid pipe supported by a vehicle following the aforesaid vehicle, a pair of joint members having a flanged upper end and annular recesses in said flange and a lateral projecting sleeve secured to the open ends of the aforesaid pipes respectively, a pipe extending from each of said joint members and a ring secured on the one end thereof and inserted in sald annular recess and suitably secured therein, pipes extending from the aforesaid pipes and meeting telescopically, a joint interposed intermediately in said second lengths of pipe having a rotary motion, as and for the purpose specified.
5. In a device of the class described in combination, pipes supported by adjoining vehicles, a pair of joint members secured to the ends of said pipes and containing a chamber having a drain opening at the bottom thereof, a pair of screw plugs closing said drain openings, a pair of pipes and a ring secured on the ends respectively co-acting with the aforesaid joint member, pipes extending in bends from the said pipes having the rings thereon and telescopically meeting the ring and socket joints interposed intermediately in the latter pipes, as and for the purpose specified.
6. In a device of the class described in combination, pipes supported by adjoining vehicles, a pair of joint members having lateral extending sleeves forming the entrance to the chamber contained within each of said members and secured to the ends of the aforesald pipes and flanged upper open ends forming annular recesses, a pair of pipes and a ring sccured on each of their inner ends, said rings being inserted in said annular recesses and forming bearings on Which said joint members are journalled, a sleeve encircling said ringed pipes and having lateral flanges secured to the aforesaid flanges and an enlarged outer end surrounding said pipe and forming a gland box, a packing ring in sald gland box, a gland member encircling each of said pipes and extending into said gland box and secured to said sleeve, pipes extending from said ringed pipes in suitable bends and meeting telescopically and a ring and socket joints interposed intermediately in the latter pipes, as and for the purpose specified.
7. In a device of the class described, plpes supported by adjoining vehicles, a pair of joint members having lateral sleeves extending therefrom and forming the opening thereto and secured to the ends of sald pipes, flanges at the top and open end thereof forming annular recesses and a drain opening at the bottom thereof suitably plugged, a pipe and a ring at the inner end thereof inserted in each of sald annular recesses, a pair of sleeves having lateral flanges at each end thereof and secured to the aforesaid flanges of the joint members and encircling each of said ringed pipes respectively and having an enlarged outer portion surrounding said plpes forming a gland box, a pair of gland members encircling sald pipe and having lateral flanges and secured to the outer flanges of said sleeves, a packing ring in each of said gland boxes, pipes extending from sald ringed pipes in suitable bends and meeting telescopically, a pair of rings and socket joints of similar formation to the aforesaid joint and interposed in each of the first lengths of plpe extending from the aforesaid ringed pipes and a suitable gland in said telescopic foint, as and for the purpose specified.
8. In a device of the class described in combination, a purality of ring and socket joints having the ring portion thereof secured on the end of a plpe and the socket portion thereof formed as an annular recess in a lateral extending flange from the joint member and a sleeve encircling said ringed pipe having lateral extending flanges at each end thereof, the inner flange thereof being secured to the afore-
said flange on the foint member and enclosing said ring, said sleeve having an enlarged outer portion surrounding the ringed pipe forming a gland box, a packing ring in said gland box and a gland member extending into the top of said gland boxes and securing said packing ring and having lateral extending flanges secured to the outer flanges of the sleeve, pipes secured to pipes on the vehicles and arranged in right angular bends and meeting in the center telescopically and a gland formed in said telescopic arrangment, as and for the purpose specifled.

No. 101,625. Railway Crossing.
Traverse de chemin de fer.

The Pennsylvannia Steel Company, Philadelphia, assignee of Charles Ames Alden, Steelton, both of Pennsylvania, U.S.A., 23rd October, 1906; 6 years. Filed 24th September, 1906. Receint No. 139,741.
Claim.-1. In a crossing the combination of the main rails, the guard rails. the bent out bearing ralls, the hard metal wear plates having a portion extending across the full width of the heads of the main rails and into the bent out portion of the bearing rails, the crossing rails abutting against said guard rails, and bearing ralls respectively, together with means for securing said several parts together, substantially as set forth.
2. In a crossing, the combination of the main rails, the guard rails bent out and recessed, the bearing rails bent out and recessed, the hard metal wearing plates having a portion extending into the recess of the guard rails, and having also a portion extending across the full width of the heads of the main rails and into the recessed portion of the bearing rails, the crossing rails abutting against said guard rails, and bearing rails respectively, together with means for securing said several parts together, substantially as set forth.

\section*{No. 101,626. Horseshoe Caulk.} Crampon de fer a cheval.
The Trojan Toe-Caulk Company, Troy, New York, assignee of Michael R. Murray, Cambridge, New York, U.S.A., 23rd October, 1906; 6 years. Filed 27th September 1906. Receipt No. 139,823.
olaim.-1. In combination a horseshoe having a caulk engaging hole, a wedge inserted in said hole, having wings on its lower end to prevent its being driven upward through the hole, and provided with ears on its upper end to prevent its removal from the holes, with a caulk having a shank provided with a slot, and adapted to enter the hole, engage the wedge, and be spread thereby so as to retain it in the hole, substantially as described.
2. In combination a horseshoe having a caulk engaging hole, a wedge adapted to be inserted in sald hole, and extending longitudinally and transversely thereof, and provided with wings on its lower end to prevent it passing upwardly through the hole, and with channels in its inclined faces, with a caulk having a shank adapted to enter the hole, said shank having an elongated \(V\)-slot adapted to engage the wedge, whereby when the wedge is driven home it is expanded and bound in the hole.
3. In combination a horseshoe having a caulk engaging hole, a wedge adapted to be inserted in said hole provided with wings on its lower end to prevent it passing upwardly through the hole, and with lungs on its upper side adapted to be turned down upon the upper edge of the shoe to prevent the wedge being withdrawn, with a caulk having
a shank adapted to enter the hole, said shank having an elongated \(V\)-slot adapted to engage the wedge, whereby

when the shank is driven home it is expanded and bound in the hole.
4. In combination a horseshoe having a caulk engaging hole, a wedge inserted in said hole, having wings on its lower end to prevent its being driven upward through the hole, and ears on its upper ends to prevent its dropping from the hole, and fins to prevent its turning in the hole, with a caulk having a shank provided with a slot, and adapted to enter the hole, engage the wedge, and be spread thereby so as to retain it in the kole, substantially as described.
5. The herein described horseshoe caulk comprising a wedge adapted to be inserted in a hole in a horseshoe and having wings on its lower end adapted to engage the under side of the shoe, and lugs on its upper end adapted to be turned down unon the upper side of the shoe to hold the wedge in place, and with channels in its inclined faces, with a caulk having a shank provided with an elongated V-slot adapted to engage the wedge when in the hole and also liaving an elongated head having bearing shoulders at opposite sides of the wedge wings, substantially as described.

No. 101,627. Railway Tie. Dormant de chemin de fer.

Michaeel C. Broderick and Bernhart Frederick Siber, coinventors, both of Massillon, Ohio, U.S.A., 23rd October. 1906; 6 years. Filed 21st September, 1906. Receipt No. 139,690.
Claim.-1. A metal railway tie comprising spaced vertical sides and connected by horizontal webs extending longitudinally thereof and spaced apart at the inner ends, and transverse vertical webs connecting said webs and spaced from the inner ends of the horizontal webs.
2. A metal rallway tie comprising spaced vertical sides and connected by horizontal webs spaced apart at the inner ends and with the lower surfaces coucaved, and transverse vertical webs connecting sald sides and spaced from the horizontal webs.
3. A metal rallway tie comprising vertical sides having recesses in their upper edges for receiving the ralls, said recesses having overhanging terminals bearing over the tie flanges of the rails, a horizontal web integral with the sides connecting said spaced sides opposite said recesses and with their upper surfaces flush with the bottoms of the recesses, and means for clamping said rails to said tie structure.
4. A metal railway tie comprising spaced vertical sides having recesses in their upper edges for receiving the rails, said recesses having overhanging terminals bearing over said vertical sides, transverse vertical webs connecting said spaced sides integral therewith and with the upper surfaces flush with the bottoms of the recesses for bearing beneath a rail, and means for clamping said rails to sald tie structure with the tie fianges beneath said overhanging portions.
5. A metal rallway tie comprising spaced vertical sides having recesses in their upper edges for receiving the ralls, said recesses having overhanging terminals bearing at one side over said vertical sides, webs connecting said spaced sides and integral therewith and with the upper surfaces flush with the bottoms of the recesses for bearing beneath rails, clamp members for bearing over the tie flanges of the rails at the opposite sides, and means for adjustably connecting said clamp members to the webs.
6. A metal railway tie comprising spaced vertical sides having recesses in their upper edges for receiving the rails, said recesses having overhanging terminals bearing at one side over the spaced sides, webs connecting said sides for bearing beneath the rails, clamp members for bearing against the ralls at the opposite sides, and camp bolts extending through said webs anid webs and clamp members.
7. A metal railway tie comprising spaced vertical sides having recesses in thelr upper faces for recciving the ralls, said recesses having overhanging terminals bearing at one side over sald vertical sides, webs connecting said spaced sides and integral therewith and with the upper surfaces flush with the bottoms of the recesses for bearing beneath rails, clamp members for bearing over the tle flanges of the rails at the opposite sides and provided with stop shculders, and clamping bolts passing through said clamp members and webs and with heads at one end bearing against said shoulders.
8. A metal railway tie comprising spaced vertical sides having recesses in their upper edges for receiving the rails, said recesses baving overhanging terminals for bearing over one side of the tie flanges of the rails, webs connecting said sides for bearing beneath the ralls, clamp members for bearing against the rails at the opposite sides and provided with inclined lips overhanging the tle flanges and provided with spaced teeth in the inclined faces of the clamp members and bearing upon the upper faces of the tie flanges, and clamp bolts connecting the clamp members to the webs.

No. 101,628. Kettle. Marmite.

Henry Appleby, London, England, 23rd October, 1906; 6 years. Filed 28th September, 1906. Receipt No. 139,874.
Claim.-1. A tubular kettle having an approximately horicontal partition dividing it into a lower or water compartment and an upper or air heating chanmer, the water chamber being provided with a fill opening and a spout and traversed by air heating tubes communicating with the air heating chamber, and the air heating chamber having one or more outlets for the hot air or gases of combustion, substantially as described.
2. The herein described tubular kettle composed of an approximately cylindrical or conlcal main body traversed by a
circular row of heating tubes, and surrounded with an axial tube serving as fill opening, and an annular hot air chamber surrounding said axial tube and communicating with the heating tubes.

No. 101,629. Crushing Roll. Machine à broyer.

Walter G. Bryant, Carterville, Missouri, U.S.A., 23rd October, 1906; 6 years. Filed 24th September, 1906. Receipt No. 139.730.

Claim.-1. In a crushing mill, a frame including a pair of longlitudinal sills, a rigid pillow box bases carried thereby, a roll journalled in said pillow box bases, recessed upper face, wear strips seated in the recesses, slidable plllow box bases mounted on said guide bars and having inturned flange portions enbracing the same, said slidable pillow box bases being also recessed, wear strips arranged in the recesses of the slldable plllow box bases and bearing against the corresponding strips of the guide bars, a roller fournalled in the slidable pillow hox bases, and springs engaging said slidable pillow box bases and tending to force the rolls into engagement.
2. In a crushing mill, a frame including a pair of parallel sill members, plllow box bases rigidly secured thereto, a roll journalled in said pillow box cases. flanged guide bars carriet by the sills and provided with recesses in their upper faces, reversible wear strips disposed in said recesses, slidable pillow box bases mounted in the guide bars and having recesses in their lower faces, reversible wear strips seated in the recesses of the slidable pillow box bases and bearing against the corresponding wear strips of the gulde bars, a second roller journalled in the slidable pillow box bases, and springs acting on said slidable pillow box bases and tending to force the rolls into engagement.
3. In a crushing mill, a frame including a pair of longitudinal sills, each of which is provided with a vertically projecting rib, guide bars recessed for the reception of sald ribs and provided with laterally extended flanges, means for securing the gulde bars to the sills, slidable pillow box bases having inturned flange portions embracing the flanges of the guide bars, a roll fournalled in said slidable pillow box bases, and a relatively stationary roll having bearings in a fixed portion of the frame.

\section*{No. 101,630. Milking Machine.}

Machine à traire les vaches.
Mark Carmickle, Hendrum, Minnesota, U.S.A., 23rd October, 1906; 6 years. Filed 27th September, 1906. Recelpt No. 139,815.
Claim.-1. A milking machine comprising a frame having uprights, one of sald uprights being slidably mounted thereon, upper and lower shafts journalled in said uprights, sprocket wheels carried by said shafts, chains connecting said sprocket wheels, milking rollers carried by the chains, gears carried by the said lower shafts at one end thereof bearings associated with the said frame, a shaft rotatably mounted in said bearings, gears on said last-named shaft, one of said gear being adjustable longitudinally of the sald shafi. and means for rotating said shaft.
2. A milking machine comprising a frame having uprights arranged in pairs, onn of said uprights being slidably mounted on said frame, means for adjusting the said upright, upper and lower shafts fournalled in said uprights, sprocket wheels carried by said shaft, chains connecting sald sprocket wheel. milking rollers carried by the chains, gears carried by the said shaft at one end thereof, bearings associated with the said frame, a shaft rotatably mounted in said bearing, gears on said last-named shaft, one of sald gears belng ad-
justable longitudinally of the said shaft, and means for rotating said shaft.

3. A milking machine comprising a frame, uprights arranged in pairs thereon, a guide carried by one of said upranged it pairs thereon, a guide carried by oned with the sides of said frame and including a crosspiece having openings thercin. pins engaged in said openings, a bar connected to said pins. springs engaged on said pins between said crosspiece and said bar. set screws associated with the frame for engagement with the said bar, bearings on said frame, a shaft rotatably mounted in said bearings. gears on satid shaft, one of said gears being adj:stable longitudinally of the said shaft, and means for rotating said shaft.

No. 101,631. Colter. Coutrc.

Jesse Fielder Cone, Ashby. Texas, U.S.A., 231d October, 1906;
6 years. Filed 4th September, 1906. Receipt No. 139,255.
Claim.-1. The combination with a plough, of a frame carried by the beam, a pair of rotary colters mounted in sald frame, a vertically adjustable frame extending rearwardly from the first-mentioned frame, and the rotary colter mounted in the adjustable frame.
2. The combination with a plough, of a frame carried by the beam. a pair of rotary colters mounted in said frame, vertically adjustable frame extending rearwardly from the flrstmentioned frame, a rotary colter mounted in the adjustable frame, and fenders extending along the sides of the lastmentioned colter.

\section*{No. 101,632. Grain Pickling and Cleaning Machine. Machine à trier et nettoyer les grains.}

John Alexander Cowan, Winnipeg, Manitoba, Canada, 23rd October, 1906; 6 years. Filed 24th September, 1906. Receipt No. 139.734.
Claim.-1. A device of the class described, comprising a feed hopper, an endless conveyer adapted to have the upper portion carry the graln upwardly, and a cross partition located in proximity to and beneath the upper portion, as and cated the purpose specified.
2. A device of the class described, comprising a feed hopper, an endless conveyer adapted to have the upper por-

tion carry the grain upwardly, a cross partition located in proximity to and beneath the upper portion, and a series of screcned openings extending across the cross partition, and towards its lower end, as and for the purpose specifed.
3. A device of the class described, comprising a feed hopper, an endless conveyer adapted to have the upper portion carry the grain upwardly, a cross partition located in proximity to and beneath the upper portion, and openings cxtending transversely across the partition, and towards its lowor end, and screens covering the openings, and secured to the lower face of the partition, as and fo." the purpose specified.
4. In a device of the class described, the combination comprising a tank, a hopper adapted to feed grain into the tank, an endless conveyer composed of chains hoving cross blades secured to opposing sets of links and to their upper faces, a cross partition mmediately below the upper asrending chains, a series of openings extending across the partition. and toward its lower end. and means located on the nartition below the lowest of the said openings, whereby the openings below the blades and between the chains arc closed in the movement of the carriers, as and for the burpose speciffed.
5. I device of the class described, comprising a tank, a feed hopper, an endless chain conveyer adapted to have the upper nortion carry the grain upwardly, a cross partition in proximity to and beneath the upper portion, and a series of bars extending transversely between the chains. and secured to the upper face of the lower end of the partition, as and for the purpose specifled.
6. In a device of the class described, the combination comprising a tank, a hopper adapted to feed grain into the tank, parallel oblique extensions extending forwardly from the tank and secured thereto. chain wheels secured in opposing sets toward the upper and lower ends of the extensions, endless link chains passing over the wheels, suitably disposed blades secured to opposing links in the chains, and to their upper faces, the said blades extending completely across between the oblique extensions, a cross partition immediately below the upper ascending chains, end a series of bars extending transversely between chains, and secured to the upper face toward the lower end of the partition, as and for the purpose specifled.
7. In a device of the class described, the combination comprising a tank, a hopper adapted to feed grain into the tank, narallel oblique extenslons extending forwardly from the tank, and secured thereto, chain wheels secured in opposing sets toward the upper and lower ends of the extensions. endless link chains passing over the wheels, suitably disposed blades secured to opposing links in the chsins. and to their upper faces, the said blades extending completely across between the oblique extensions, a cross partition immediately below the upper ascending chains, a series of bars extending transversely between chains, and secured to the unger face, toward the lower end of the partition, transverse screened openings in the partition ahead of the upper angle bar, and means for operating the chains, as and for the purpose specified.
8 . In a device of the class described. the combinatisp comprising a tank having a sloping bottom, a hopper adapted to feed the grain into the tank. parallel oblique extensions extending forwardly from the tank. sets of gear wheels revolvably mounted at cither end of the extensions, endless gear chains passing over and around the wheels. a cross partition extending longitudinally between the extensions, and immediately below the upper ascending chains. a series of screens passing over transverse openings within
the lower end of the cross partition, transverse plates secured to the partition below the lowest of the openings in the partition and extending between the chains, blades secured to the upper face of opposing links in the chain, the said blades being so designed that their lower face spans from tip to tip of two of the successive plates, and means for operating the chains, as and for the purpose specifled.
9. A device of the class described, in combination a tank containing a liquid for receiving the grain, means for elevatng the grain from the tank. a hood at the end of the conveyer to recelve the elevated grain, and a gate to regulate the flow of the grain from the hood, as and for the purpose specified.
10. In a device of the class described, the combination comprising a tank, means for conveying the grain from the tank, and a combined draining and drying board adapted to receive the grain from the tank, as and for the purpose specifled.
11. In a device of the class described, the combination comprising a tank, means for elevating the grain from the tank, a hood at the end of the conveyer to recelve the elevated grain, a gate to the hood, and a combined draining and drying board adapted to receive the grain from the hood, as and for the purpose specified.
12. In a device of the class described the combination comprising a tank, means for elevating the grain from the tank, a hood at the end of the conveyer to receive the elevated grain, a gate to the hood, and a flooring combined draining and drying board adapted to receive the grain from the hood, as and for the purpose specified.
13. In a device of the class described the combination comprising a tank containing a liquid for receiving the grain, means for elevating the grain from the tank, a hood at the end of the conveyer to/receive the elevated grain, a gate to the hood, and a combined draining and drying board adapted to receive the grain from the hood, consisting of an obtuse angled channel-way increasing in cross section from the top downward, a series of cross strips extending completely across the channel, flaps passing obliquely between the inner face of the channel and the outer edge of the cross strips, and a number of openings passing rearwardly through the body of the channel-way and behind the flaps, as and for the purpose specifled.
14. In a device of the class described the combination with the tank, the conveyer, and the hood of a combined draining and drying board consisting of a central body portion, side portions secured to the body portion, and at an obtuse angle thereto, said side portions being flared towards the bottom, vertical outboards secured to the side portions, cross strips secured to the body and side portions. flaps hinged to the body portion and extending obliquely towards the outer edge ot the cross strips, and exits from behind the flaps to the rear of the body, as and for the purpose specified.
15. In a device of the class described, a combined draining and drying board consisting of means for receiving the grain and spreading it as it falls, and means for draining the accumulated liquid from the grain, as and for the purpose specifled.
16. In a device of the class deseribed the combination with the tank for receiving the grain, and the conveyer for raising spreading it grefrom, of means for receiving the grain and lated liguid as it falls, and means for draining the accumu 17. In a from the grain, as and for the purpose specified. the tank device of the class described the combination with grain therefrom and the grain, the conveyer for ralsing the grain therefrom, a hood at the upper end of the conveyer, hood, of means for governing the flow of the grain from the falls, and means for receiving the grain and spreading it as it the grain, as and for draining the accumulated liquid from 18. In a device of the purpose specifled.
the tank for recelving the grain the combination with grain therefrom, and the grain, the conveyer for raising the veyer, having a and the hood at the upper end of the conthe hood, of means for governing the flow of the grain from as it palls, means for receiving the grain and spreading it the grain. and means for return the accumuated liquid from and for the purpose specifed 19. In a purpose specifled.
prising a tavice of the class described the combination comhopper adapted for feeding a llquid to receive the grain, a veyer for elevating the grain the grain into the tank, a conlow transversely within and out of the tank, a board extendedge of therion of the conveyer across the tank and above the
20. In a devoss board, as and for the purpoed to the upper prising a device of the class descrithe purpose specificd. hopper a tank containing a described the combination com for elevatingted to feed the grain for receiving the grain, a fransversely the grain out grain into the tank, a conveyer hinged to the upper the tank and above the converextending edge of the cross board, and a screen
extending rearwardly obliquely between the cross board and the tank, as and for the purpose specified.
21. In a device of the class described the combination adapted to be inserted within the tank comprising a cross board, a flap hinged to the upper edge of the cross board, a sieve extending obliquely and rearwardly from the cross board, a flap extending normally between the lower edge of the screen and the rear face of the tank, and a button adapted to retain the flap in a plane with the screen, as and for the purpose specified.
22. In a device of the class deseribed the combination comprising a tank containing a liquid for receiving the grain, said tank having a sloping bottom, a hopper for feeding the grain into the tank. a set of parallel oblique extensions extending forwardly from the tank and secured to the sides, a conveyer for elevating the grain from the tank, dependent from and between the extensions. a cross board within the lank bearing upon the upper edges of the extensions, and substantially vertical thereto. a flap hinged to the upper edge of the partition and of equal length, a sieve extending obliquely and rearwardly from the cross board and a flap extending normally between the lower edge of the screen and the rear inner face of the tank, and a button adapted to retain the flap in a plane with the screen, as and for the purpose specified.

\section*{No. 101,633. Tip for Gloves and Mittens.}

Renfort pour gants et mitaines.

John G. Davy, Dekalb, IlHnois, U.S.A., 23rd October, 1906; 6 years. Filed 12th September, 1906. Recelpt No. 139,450. claim.-The combination with the outside seam of the glove or mitten, of a protecting strip secured by passing the thread of the seam through one side only thereof so the other side may be doubled over upon the thread.

No. 101,634. Rail Joint. Joint dc rails.

Anton Ettlin, Noble. Oregon, U.S.A., 23rd October, 1906; 6
years. Filed 21st September, 1906. Receipt No. 139,695.
Claim.-1. In a rall joint the combination of meeting ends or rails, extensions projecting therefrom, the ralls being provided at one side thereof with sockets to receive the extensions aforesald, and means co-acting with the extensions aforesaid to prevent longitudinal separation of the rails.
2. In a rail joint the combination of meeting ends of rails, extensions projecting therefrom, the rails being provided at one side thereof with sockets to receive the extensions aforesaid, said sockets extending below the top portions of the basal flanges of the rails, and projections carried by the extensions of the sockets to prevent longitudinal separating movement of the rails.
3. In a rall joint the combination of meeting ends of rails, extensions projecting from said ends longitudinally thereof and connected with the rails at sides of the same, the opposite sides of the rails having sockets therein, the socket of one rail receiving the end portion of the extension of the other rail, the sockets of the rails exending at their lower portions beneath the surface or top of the basal portions of the rails, and projections integral with the outer ends of the extensions and adapted to enter the lowermost portions of the sockets to prevent longitudinal separating movement of the rails, the top partions of the extensions being cut away toward their outer ends to admit of engagement of the projections in the sockets as above mentioned.
4. In a rail joint the combination of meeting ends of ralls, a socket plate attached to an end of each rail at one side thereof, an extension plate attached to such end at the opposite side, the said extension plates being provided with projections which enter the sockets and form an interlocking connection therewith to prevent any relative movement of the rail ends.
5. In a rail joint the combination of meeting ends of cails, a socket plate attached to an end of each rail at one slde thereof, an extension plate attached to such end at the opposite side, the socket plate embodying a body attached to the web portion of the rall, and a longitudinal basal extension secured to the base portion of the raill, and the extension plate embodying a hook portion to engage in the socket of the socket plate, as specifled.
No. 101,635. Derrick. Grue.

3. In a travelling derrick the combination of track ralls, a derrick frame provided with traction wheels to travel on the track rails, said rails and frame being relatively arranged to form a wide and deep stacking space between the rails, derrick mechanism carried by said frame, a drive shaft for oper. ating said mechanism, derrick controlling mechanism actuated by said shaft, counter shafts arranged above and below the supporting frame, a driving connection between the driving shaft and upper counter shaft, drive gearing between sald upper and lower counter shafts, said gearing including connecting elements operating in an opening in the platform, a ated by the lowion gearing, and propelfor mechanism acto with certain of said traction wheels.

No. 101,636. Nut Lock. Arrête-écrou.

Charles Crawford Garrison, Boca, California, U.S.A., 23rd October, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,254.
Claim.-1. In a nut lock the combination with a threaded bolt provided with a pair of longitudinally disposed locking grooves extending the entire length of the threaded portion of the bolt, of a nut having communicating seating grooves formed in the central portions of its adjacent faces, one of which gradually decreases in depth from the point of intersection of sald grooves to the edge of the nut and the adjacent groove having its end wall curved and extending from one corner of the nut toward the center of the bolt, there being a pawl receiving opening formed in the rear wall of the lastnamed seating groove communicating with the bolt and forming a continuation of sald groove, a bell crank pawl pivoted at the intersection of the seating grooves and having one end thereof bowed laterally and its terminal portion curved inwardly through the pawl receiving opening and disposed substantially parallel with the curved end wall of said opening for engagement with the locking grooves of the bolt, the opposite end of the pawl being reduced to form a bowed spring an intermediate portion of which is normally projected beyond the general plane of the contiguous alde of the nut while its free end is slidable upon the inclined wall of the adjacent seating groove, a perforate enlargement formed at the juncture of the spring pawl, and a pintle passing through the perforation in said enlargement and engaging the nut at the iatersection of the seating grooves.

\section*{No. 101,637. Heating System.for Houses.} Système de chauffage pour maisons.
Emory J. Greene, Peoria, Illinois, U.S.A., 23rd October, 1906; 6 years. Filed 27 th September, 1906. Recelpt No. 139,817. Claim.-1. The combination with a wall having a projection along the line usually occupied by the upper side of a baseboard, of heating pipes located near said wall below said projection, and a plate secured in front of sald pipes below said projection and adapted to permit air to pass to and from the pipes near the lower and upper sides of the recess in which they lie.
2. The combination with a wall having a projection along the line usually occupied by the upper side of a baseboard. of heating pipes located near said wall below said projection, and a plate fixed below said projection at a short distance in front of sald pipes and adapted to allow air to pass to and front of sald pipes and adapted to allow air to pass
from the pipes near the lower and upper sides of the recess in which they lie.
3. The combination with a wall having a projection along the line usually occupied by the upper side of a baseboard. of heating pipes located near the wall below said projection.
and a removable plate located below said projection a little in front of the pipes, having its upper portion bent inward,

and adapted to permit air to pass to and from the pipes near the lower and upper sides of the recess in which they lie, and a series of plate supports located in said recess.
4. In heating devices the combination with a wall having a recess in the plate of the usual basebnard of a non-conducting lining for the top, bottom and rear walls of the recess, a metal lining protecting the non-conducting lining, a moulding extending along the wall just above the recess, heating pipes supported in the recess out of contact with its walls and with each other, metal plate forming the front wall of the recess, having its upper edge bent rearward below said moulding. and closing the recess except near its top and bottom, and screws detachably fixing the plate in position.
5. In apparatus for heating a room, the combination with side walls having along the floor a recess having the height of an ordinary baseboard and extending inward to the studding of the wall, of a thin lining for the recess, a thein vertical plate lying in the plane usually occupied by the face of the baseboard and arranged for the entrance of air below and its exit above, and a series of heating pipes in the same vertical plane, of a diameter less than the distauce between the plate and lining, and fixed midway between said plate and lining.

No. 101,638. Air Brake. Frein dair.

Edwin T. Hughes, Gladstone, Colorado, U.S.A., 23th October, 1906; 6 years. Filed 27th September, 1906. Recelpt No. 139,829.
Claim.-1. The combination with a triple valve of the Westinghouse air brake, a train pipe connected therewith through which air is supplied to the triple valve and in which the pressure is at times reduced and which is the sole means for establishing and cuting off communication between the auxiliary reservoir and the brake cylinder, an exhaust passage leading from the said triple valve, a valve casing applled thereto, a valve for opening and closing said exhaust passage without in any way affecting the passage between the auxiliary reservoir and brake cylinder, and electro-magnetlc devices for operating said exhaust valve.

10-27

No. 101,639. Mail Bag Delivering Device.
Appareil d livrer les sacs postauc.

William Irion, Morrison, Illinois, U.S.A., 23rd October, 1906; 6 years. Filed 24th September, 1906. Recelpt No. 139,732.
Claim.-1. A device for dellvering mail bags from a train, comprising a receptacle fixed to the station platform, and provided with a pair of swinging doors in the end thereof, a swinging buffer, transversely of said receptacle, a track supported above said receptacle, centrally and longitudinally thereof, a frame supported from the side of the car, and adapted to be swung at right angles thereto, and a hook pivoted at the outer end of said frame, and provided with a cam adapted to engage said track to suitably upset such hook substantially as shown and set forth.
2. In a device of the class named, the combination of the vertical shaft 12 , supported against the side of the car, the frame 13, secured to such shaft, a hook 15 , pivoted to the outer end of the frame 13, and provided with the cam 14, means for swinging the frame 13 at right angles to the side of the car simultancously with the outward movement of the catcher hook for gathering the mail, the receptacle 17 provided with a pair of doors 18 in that end which is towards the approaching car, means for holding such doors normally closed, the swinging buffer 20 supported transversely of the receptacle 17, and the track 22 supported above the receptacle 17 in position to engage the cam 14, and upset the hook 15 , substantially as shown and for the purpose mentioned.
3. In a device of the class named, the combination of the frame 13. swingingly supported to the side of the car, a pair of hooks, 15 pivoted to the outer end of said frame, means for swinging the frame 13 outwardly at right angles to the car, simultaneously with the operation of the catcher arm for gathering the mail, the receptacle 17, fixed to the station platform, and provided at each end with a pair of inwardly swinging doors 18 , normally held in closed position, the swinging buffer 20 supported transversely of the receptacle 17 , and the track 22 supported above the receptacle 17. in position to engage the cam 14, and upset the hooks 15 when the mail bag comes in contact with either pair of doors 18 , substantially as shown and described.
4. In a device of the class named, the combination of the receptacle 17 , having a bottom of spaced apart strips 27 , the pair of doors 18 at each end of the receptacle 17, means for holding said doors normaliy closed, and the swinging buffer 20. supported transversely of sald receptacle, substantially as shown and set forth.
5. In a device of the class named, the combination of the frame 13 swingingly supported to the side of the car, a pair of oppositely disposed hooks 15 pivoted to the outer end of the frame 13 the cam 14 integral with the hooks 15 , means for swinging the frame 13 outwardly at right angles to the side of the car. simultaneously with the operation of the catcher arm for gathering the mail, and means for engaging the cam 14 to suitably upset the hooks 15 , substantially as set forth and for the purpose named.
No. 101,640. Clothes Line and Case. Corde à linge.
Julie Lemon, Mono Mills, Ontario, Canada, 23rd October, 1906; 6 years. Filed 22ad September, 1906. Recelpt No. 139,712.
Claim.-1. A clothes line and casing therefor comprising a casing suitably secured to a wall or post and having an
open front and a door closing said front opening, a spring actuated roller journalled in suitable bearings supported

by said casing and a clothes line wound on said roller and adapted to be withdrawn against the spring pull of said roller, as and for the purpose specified.
2. A clothes line and casing therefor, comprising a castug sultably secured to a wall or post and having an open front and a door closing said front opening, a spring actuated roller journalled in suitable bearings supported by said casing, means for securing said roller in a fixed position. and a clothes line wound on said roller and adapted to be withdrawn against the spring pull of sald roller. as and lor the purpose specifled.
3. A clothes line and casing therefor, comprising a casing suitably secured to a wall or post and having an open front and a door closing said front opening, a spring actuated roller journalled in suitable bearings supported by said casing and a clothes line wound on said roller and adapted to be withdrawn against the spring pull of said roller, and means attached to said clothes line for securing it in its extended position, as and for the purpose specitied.
4. A clothes line aud casing therefor, comprising a casing suitably secured to a wall or post and having an open front and a door closing said front opening, a spring actuated roller journalled in suitable bearings supported by said casing, means for securing said roller in a fixed position, a line secured to said roller and a bar secured to the outer ends of said clothes line having screw eyes secured thereto for securing the line in an extended position, as and for the vurpose speciffed.
5. A clothes line and casing therefor comprising a casing suitably secured to a wall or post and having an open front and a door closing said front opening, a spring actuated roller journalled in suitable bearings supported by said casing, and having flanges at the ends thereof and a ring of holes in one of said flanges, a spring held pin attached to said casing and fitting into one of said holes, and a clothes line wound on said roller and adapted to be withdrawn against the spring pull of said roller, as and for the purpose specified.
6. A clothes line and casing therefor comprising a casing suitably secured to a wall or post and having an open front and a door closing said front opening. a spring actuated roller journalled in suitable bearings supported by said casing and having flanges at the ends thereof and a ring of holes in ove of sald flanges, a flat spring secured to said casing havIng a pin extending therefrom to fit within the holes in the flange of said roller, means for holding said pin out of engagement with the said flange and a clothes line wound on said roller and adapted to be withdrawn against the spring pull of sald roller, as and for the purpose specified.
7. A clothes line and casing therefor comprising a casing suitably secured to a wall or post and having an open front and a door closing said front opening, a spring actuated roller journalled in suitable bearings supported by said casing and a clothes line wound on sald roller and adapted to be withdrawn against the spring pull of sald roller, a spring actuated roller journalled in suitable bearings supported by sald casing above the aforesaid roller. a line having the ends thereof secured to said roller and adapted to be withdrawn against the spring pull thereof and a plurality of clothes pins having eye screws in the heads thereof surrounding said lirie, as and for the purpose specifled.
8. A clothes line and casing therefor comprising a casing stitably secured to a wall or post and havng an open front and a door closing said front opening, a ap-ing actuated roller jcurnalled in suitable bearings supported by said casing. langes at the ends of sald roller, a flat spring securid to said casing having a pin extending thercfrom to engage an oriflce in one of said flanges, means for holding said pin out of engagement with said flanges, a clothes ling wound on said
roller and adapted to be withdrawn against the spring pull o: sald roller, a second spring actuated roller journalled in suitable bearings supported by said casing above the aforesaid roller and having enlarged outer ends, flanges extending from the sides of the said enlarged ends, a flat spring sccured to sad casing having a pin extending therefrom to crgage an orifice in one of the said flanges, a line having its ends secured to the enlarged portions of said roller, guides secured to sald casing through which the line passes and a piurality of clothes pins having eye screws in the heads thereof surrounding said line, as and for the purpose spectfied.
9. A clothes line and casing therefor comprising a casing suitably secured to a wall or post and having an open front and doors closing said front opening, a spring actuated roller jcurnalled in suitable bearings supported by said casing. flanges at the ends of said roller, a flat spring secured to said casing having a pin extending therefrom to engage an orifice in one of said flanges, a slotted guide bar secured to said casing parallel with and in proximity to said roller, a clothes line wound on said roller and adapted to pass through the said slots in said guide bar and be withdrawn against the spring pull of said roller, a spanner secured to the outer -nd of said clothes line, means secured to said spanner for sceuring said line in an extended position, a second spring actuated roller journalled in suitable bearings supported by said casing above the aforesald roller and having enlarged outer ends, flanges extending from the sides of the said enlarged ends. a flat spring secured to said casing having a pin extending therefrom to engage an orifice in one of the said flanges, a line having its ends secured to the enlarged portions of said roller, guides secured to said casing through which said line passes and a plurallty of clothes pins having cye screws in the heads thereof surrounding said line and sidably arranged on second line, as and for the purpose specifled.

No. 101,641. Sad Iron. Fer d repasser.

Alexander Luethi, Lake Mills, Wisconsin, U.S.A., 23rd October, 1906; 6 years. Filed 1st October, 1906. Recelpt No. 139,929.
Claim.-1. In a sad iron the combination of a base portion provided on its top surface with upstanding converging lugs, an upper removable portion comprising a base, a handle above the basc, and connecting means between the handle and the base, the sald base having converging slde edges adapted to be brought Into engagement and registration with the inner faces of the converging lugs, and said base also provided longitudinally with a slot, said slot merging at its forward end into a recess formed in the under side of the base, a transverse pin having its ends supported in the side walls of the recess, and a locking device having a shank portion disposed in the recess and plvoted at its forward end on the transverse pin, and having its rear portion extending upwardly through the slot and provided with an engaging device adapted when the rear end of the locking device is pushed downwardly. to engage in advance of the forward chds of the upstanding lugs. and adapted to be disengaged from said front ends of the lugs, when the locking device is pulled upwardly.
2. In a said iron the combination of a base portion provided on its top surface with short converging upstanding lugs, an uper removable porton comprising a base, a handie above the base, and a connecting means between the handle and the base, the said base having its opposite side edges converged for short distances, sald converging surfaces adapted
to be brought into engagement and registration with the inner faces of the short converging lugs, and said base further provided longitudinally with a slot, the said slot merging at its forward end into a recess formed in the under side of the base, a transverse pin having its ends supported in the side walls of the recess, and a locking device having a shank portion disposed in the recess and pivoted at its forward end on the transverse pin, and having its rear portion extending upwardly through the slot and provided with an engaging device adapted. when the rear end of the locking device is pushed downwardly, to engage in advance of the forward ends of the upstanding lugs, and to be disengaged from said forward ends of the upstanding lugs. when the rear end of the locking device is pulled upwardly.
3. In a ead tron the combination of a base portion provided on its top surface with upstanding converging lugs, an upper removable portion comprising a base, a handle above the base, and connecting means between the handie and the base, the said base having converging side edges adapted to be brought into engagement and registration with the inner faces of the converging lugs, and said base further provided longitudinally with a slot, sald slot merging at jts forward end into a recess formed in the under side of the base, a transverse pin having its ends supported in the side walls of the recess, and a locking device having a shank portion disposed in the recess and pivoted at its forward end on the transverse pin, and having its rear portion extend ng upwardly through the slot and formed into a transverse head. said head having depending locking fingers at opposite ends thereof adapted when the rear end of the locking device is pushed downwardly to engage in advance of the forward ends of the upstanding lugs. and to be disengaged from said forward ends of the lugs when the rear end of the locking device is pulled upwardly.
4. In a said fron the combination of a base portion provided on its top surface with upstanding converging lugs. an upper removable portion comprising a base, a handle above the base, and connecting means between the handle ant the base. the said base having converging side edges adanted to be brought into engagement and registration with the inner faces of the converging lugs, and sald base further provided longitudinally with a slot, said slot merging at its forward end into a recess formed in the under s'de of the base, a transverse pin having its ends supported in the side walls of said racess, and a locking devief having a shank partion disposed in the recess and pivoted at its forward ond on the transverse pin, and having its rear portion extending upwandy through the slot and formed into a transverse head. sald head having a rearwardly extending prolection, and also having depending locking fing \({ }^{\circ}\) rs at opposite ends thereof, said fingers adapted when the rear end of the locking device is pushed downwardly to engage in advance of the forward ends of the upstanding lugs and to be disengaged from said lugs when the rear pnd of the locking device is pulled upwardly, and a knob or handle connected to and extendng upwardly from the rearwardly extending projection of the head.
5. In a sad iron the combination of a base portion provided on its top surface with upstanding converging lugs, said lugs having their front ends bevelled downwardly forwardly, an upper removable portion comprising a base, a handle above the base, and connecting means between the handle and the base, the said base having converging side edges adapted to be brought into engagement and registration with the inner faces of the converging lugs, and said base further provided longitudinally with a slot, said slot merging at its forward end into a recess. formed in the underside of the case, a transverse pin having its ends supported in the sidde walls of said recess, and a locking device having a shank portion disposed in the recess and pivoted at its forward end on the transverse pin. and having its rear portion extending upwardly through the slot and provided with an engaging device adapted, when the rear end of the locking device is pushed downwardiy. to engage in advance of the bevelled forward ends of the upstanding lugs, and to be disengaged from said lugs when the rear end of the locking device is pulled upwardly.
6. In a sad iron the combination of a base portion provided on its top surface with upstanding converging lugs. said lugs having dove-tail inner faces, an upper removable portion comprising a base, a handle above the base and connecting means between the handle and the base, the said base having converging and downwardly outwardly pevelled side edges adapted to be brought into engagement and registration with the inner faces of the converging lugs, and said base further provided longitudinally with a slot. said slot merging at its forward end into a recess formed in the under side of the base, a transverse pin having its ends supported in the side walls of the recess. and a locking device having a shank portion disposed in the recess and pivoted at its forward end on the transverse pin, and having its rear portion extending upwardly through the slot
and provided with an engaging device adapted when the rear end of the locking device is pushed downwardly to engage in advance of the forward ends of the upstanding lugs, and to be disengaged from sald lugs, when the rear end of the locking device is pulled upwardly.
7. In a sad iron the combination with a body portion, of an upper portion comprising a base, a handle above the base, and a connecting means between the handle and the base, the said base provided on its under side with a longitudinal open ended recess, and means for removably connecting the base to the top surface of the body.
S. In a sad iron the combination with a body portion of an upper portion comprising a longitudinally slotted base, a handle above the base, and a connecting means between the handle and the bese, the sad base provided on its under side with a longitudinal open-ended recess, and means for removably connecting the base to the top surface of the body.

No. 101,642. Cover for Churns. Couvercle de barattes.

Adah Delphene Matterson, Fremont, Michigan, U.S.A., 23rd October, 1906; 6 years. Filed 21st September, 1906. Receipt No. 139,697.
Claim.-The combination of a churn body, a dasher, a dasher rod, a cover for the churn provided with an opening through which the dasher rod passes, an inverted cupshaped member formed of sheet material fitting upon the cover and provided with an opening which is in alignment with the opening in the cover and through which the dasher rod passes, the said cup-shaped member forming a chamber around the dasher rod which is adapted to receive any splashings, and having its upper portion pressed outwardly to form an annular shoulder, and an annular flange projetcing outwardly from the upper portion of the cup-shaped member and secured to the before-mentioned annular shoulder, the said flange forming a trough around the dasher rod which is provided with means for delivering any liquid which may accumulate therein into the before-mentioned chamber.

No. 101,643. Awl. Aline.

George Allen Peacock, Hanford, California, U.S.A., 23rd October, 1906: 6 years. Filed 24th September, 1906. Receipt No. 139,764.
Claim.-1. A karness awl involving a tubular shank with head, a ferrule movably applied to the shank, a needle
secured to the shank and projectible through the ferrule and thread carrying means held in the head and provided with mechanism for controlling the feed of the same.
2. A harness awl involving a shank having a head and means for holding a needle, a ferrule movably supported by the shank, a needle projectable through the ferrule, a thread carrying bobbin removably disposed in the head. and means for engaging a portion of the bobbin to prevent the latter from turning.
3. In a harness awl, the combination of a tubular shank having a head and also provided with means for holding a needle, a movable member engaging the shank, a needle held by the shank and projectible through the said member, means for automatically restoring the movable member to normal position, and thread carrying and feeding means, the thread being drawn taut by the operation of the awl.
4. In a harness awl, the combination of a shank having a head, a ferrule having a telescopic organization with respect to the shank, a needle held by the terminal of the shank and projectible through the ferrule, and means enclosed within the head for carrying and feeding thread to the needle.
5. In a harness awl. the combination of a tubular shank having a head, a needle secured to the shank, a ferrule having a telescopic organization with respect to the shank and through which the needle is projectible, a thread carrying bobbin removably mounted in the head. a catch device for co-operating with a part of the bobbin to limit the movement thereof, and means for disengaging the catch device.
6. In a harness awl, the combination of a tubular shank having a head, needle secured to the shank, a spring actuated ferrule telescopically engaging the shank, the needle being projectible through the ferrule, and thread carrying and feeding spans disposed in the sald head, the thread beIng fed through the shank and ferrule to the needle.
7. A harness awl involving a shank and head, a needle secured to the shank, a spring actuated ferrule telescopically engaging the shank and normally enclosing the needle, the needle being projectible through one terminal of the ferrule and the latter acting as a stay and reinforce for said needle and means for feeding thread to the needle.

No. 101,644. Dumping Car. Char d bascule.

Francis Peteler, Minneapolis, Minnesota, U.S.A., 23rd October, 1906; 6 years. Filed 29th September, 1906. Receipt No. 139.902.
Claim.-1. A dumping car having central and eccentrically disposed pivot bearings located beneath the car body and on which the body successively turns in dumping the load, said bearings comprising a member having centrally and eccentrically disposed pivots and another member having centrally and end disposed sockets formed with side walls to receive the correspondingly disposed pivots and provided with plvots located between the central and end disposed sockets to bear against the first-mentioned member between its pivots, substantially as described.
2. A dumping car having central and eccentric pivot bearings, comprising a fixed and a movable plate formed with corresponding rocking pivots and sockets, the outer sockets on the movable plate having their outer end walls overhanging the pivots fitting in said sockets so as to bear in locking engagement with the outer face of sald pivots, substantially as described.
3. A dumping car provided with central and eccentrically arranged plvot bearings on which the car body successively turns in dumping the load. said bearings and body being so disposed in relation to each other that when the body is tilt-
ed the preponderance of weight thereof to one side of the bearing will cause the body to automatically return to its normal position after dumping.
4. A dumping car having a central pivot bearing located beneath the car body whereon the car body is normally supported, and an eccentric pivot bearing upon which the car body is supported and turned during the intermediate and latter part of its tilting movement, said central and eccentrically disposed bearings being so located in relation to each other that the centrally disposed bearing supports the body until the body bears upon the eccentrically disposed bearings, and said eccentric bearing having a double or reverse curve to lock the body thereon, substantially as described.
5. A dumping car provided with centrally and eccentr!cally arranged pivot bearings on which the car body successively turns in dumping the load. said bearing being so disposed with relation to the body that when the body is tilted the preponderance of weight thereof to one side of the bearing will cause the body to automatically return to its normal position after dumping, and said central pivot bearing belng bencath and close to the bottom of the load whereby tho initial tilting movement of the car body will be made easler. substantlally as described.
6. A dumping car having a central pivot bearing located beneath the car body and whereon the car body is normally supported in a horizontal position, an eccentrically arranged pivot bearing whereon the car body is automatically supported during the intermediate and latter part of its tiling movement, and said car body having doors normally carried by said car body, and means for temporarily supporting the door on the side toward which the car body is tilted to discharge its load, and the preponderance of weight of the car body on the other side aided by the door on that side being above said eccentric pivot when the car body is in its tilted position, whereby it will automatically return to its normal position when the dumping operation is completed, substantially as described.
7. The combination with a truck frame, of standards centrally mounted thereon and provided with centrally arranged pivots and with cccentrically arranged sockets and pivots upon each side of said central pliot and below the level of the same, a car body, plates secured transversely to the under side thereof and having centrally arranged sockets to recelve said central pivots and normally supporting the car body in a horizontal position, and said plates being also provided at each end with pivots and sockets to co-operate with the sockets and pivots on said standards and whereon the car body is supported and turned during the intermediate and latter part of its tilting movement, and said central sockets passing out of contact with thelr pivots during the latter part of the tilting movement of said car body, and sald eccentric sockets and pivots having double or reverse curves whereby their bearing area will be increased and the parts will be locked together during the tilting movement, substantially as described.
8. A dumping car comprising a frame, a car body having central and eccentric pivots thercon and capable of dumpins toward either side, doors for said car body, barz pivoted on said frame and engasing said doors to lift them vertically one at a time according to the direction in which the car body is tilted, and means connecting sald bars with said cal body whereby the tilting of the body toward one side will oscillate the bars on that side to lift the door, substantially as described.
9. A dumping car comprising a frame, a car body having central and eccentric pivot bearings thereon and adapted to dump upon either side, doors for said car body, bars pivotally supported intermediate to their ends on said frame at each end of the car having slotted outer ends, sald doors having gudgeons slidable within said slots, sald gudgeons normally resting on the sides of the car and the weight of th: door on the uppres side of the car belng utllized to ald in returning it to its horizontal position after dumping, and means connecting th. inner ends of said bars with the car body at one side of the center, whereby when the car is tilted toward one side, the door on that side will be lifted a sufficent distance above the bottom and sides of the car to allow the load to dump without obstruction, substantially as des. cribed.
10. In a dumping car the combination with a frame, of standards mounted on each end thereof, a car body pivotally sumportid between said standards and adapted to dump on rither sido. doors for sald car body. bars pivoted at pointa intermediate to their ends on said standards and having slotted outer ends wherein sald doors are mounted. said slots allowing the doors to bear on the sides of the car body except when raised in dumping, means connecting the inner ends of said bars with the car body at one side of its senter, whereby the weight of both doors will be utilized to return the car body to its horizontal position after dumplag. substantlally as deseribed.
11. A dumping car comprising a frame, a car body havins central and eccentric plvots thereon, doors for sald car hav-
ing gudgeons at each end adapted to rest upon the ends of the car body, bars pivotally supported upon said frame and having bearings at their outer ends at points intermediate to their ends for said gudgeons. and means at one side of its center whereby it is tilted. in either direction. the door on the dumping side will be lifted automatically above the bottom and sides of the car and the outer door will be raised, resting upon the upper side of the car and the weight of both doors will be utilized to return the car body to its horizontal position after dumping, substantially as described.
12. A dumping car comprising a frame, a car body pivoted thereon and capable of dumping toward either side, doors for said car body, bars pivoted at points intermediate to their ends on said frame above the level of said car body pivots and said bars engaging said doors to lift them vertically one at a time according to the direction in which the car body is tilted, and means connecting said bars with said bar body whereby the tilting of the body toward either side will oscillate the bars on the dumping side to lift the door on that side, substantially as described.
13. A dumping car comprising a frame, a car body pivoted thereon and capable of dumping toward either side, doors for said car body, bars plvoted at points intermediate to their ends and engaging said doors, and means connecting said bars with said car body. whereby the tilting of the body toward one side will oscillate the bars on that side to lift the door a sufficlent distance above the bottom and sides of the car to allow the load to dump without obstruction.
14. A dumping car comprising a frame, a car body having central and eccentric pivots thereon and capable of dumping toward either side, doors for said car body, bars pivotally supported on said frame at points intermediate to their ends above the level of said car body pivots, said bars having short and long arms, said long arms engaging said doors, and flexible means connecting said short arms with the car body at one side of the center thereof, whereby the tiling of said car body will lift the door on the dumping side, and stops for limiting the oscillating movement of said bars in one direction, substantially as described.

\section*{No. 101,645. Tank for Soaking Bottles. Refervoir pour tremper les boutorlles.}

Roland Schwarzenbach, Hornell, New York, U.S.A., 23rd October, 1906; 6 years. Filed 1st October, 1906. Receipt No. 139,939.
Claim.-1. A bottle soaking and cleansing apparatus comprising a tank or vat provided with a series of longitudinal stationary guides by which the bottles may be directed endwise through the said tank or vat, said guides being incllned downward at the entering or feeding end of the said tank or vat and being inclined upward at the discharging end of the said tank or vat, so that the bottles will readily fil with water as they are cotered into the sald tank or vat and will be drained or emptied as they are forced towards the discharging end thereof.
2. A bottle soaking and cleansing apparatus comprising a tank or vat having therein an openwork rack-above the bottom of the said tank or vat and constructed to provide a series of stationary longitudinal guides extending through the sald tank or vat, sald guides being inclined downward at the entering or feeding end of the sald tank or vat and being inclined upward at the discharging end of the said tank or vat, so that the bottles will readily fill with water as they are entered into the said tank or vat and will be drained or emptied as they are forced towards the discharging end thereof.
3. A bottle soaking and cleansing apparatus comprising a tank or vat provided with a series of longitudinal stationary guides by which the bottles may be directed endwise through the said tank or vat, said guides being in-
clined downward at the entering or feeding end of the said tank or vat and being inclined upward at the discharging end of the said tank or vat, so that the bottles will readily fill with water as they are entered into the said tank or vat and will be drained or emptied as they are forced towards the discharging end thereof, the downwardly inclined entering parts of said guides being partly composed of an overlying upwardly yielding frame or apron having guiding parts, as \(g\), to cause the empty bottles to be submerged.
4. A bottle soaking and cleansing apparatus comprising a tank or vat having therein an openwork rack above the bottom of the said tank or vat and constructed to provide a series of stationary longitudinal guides entering through said tank or vat, said guides being inclined downward at the entering or feeding end of the said tank or vat and being inclined upward at the discharging end of the said lank or vat, so that the bottles will readily fill with water as they are entered into the said tank or vat and will be drained or emptied as they are forced towards the discharging end thereof, the downwardly inclined entering parts of said guides being partly composed of an overlying upwardly yielding frame or apron having guiding parts. as 0 , to cause the emyty bottles to be submerged.
No. 101,646. Force Feed Seeder. Semotr.

Jacob H. Ullrick, Nashville, Tennessee, U.S.A., 23rd October, 1906; 6 years. Filed 27th September, 1906. Receipt No. 139,838.
Claim.-1. In a seeder of the class described the combination of a hopper provided with a seed opening, a grooved feed roll, a cut-off located at the seed opening and a rotary device mounted directly on the cut-off and provided with an opening recelving and conforming to the configuration of the feed roll, said rotary device being carried by the cut-off to vary the length of the exposed portion of the feed roll.
2. In a seeder of the class described, the combination of a hopper, a feed rolf, a cut-off provided with a depending supporting portion, a vertically disposed rotary device having an opening receiving the feed roll, said rotary device being mounted on the supporting portion of the cut-off and carried by the latter to vary the length of the exposed portion of the feed roll.
3. In a seeder of the class described the combination of a hopper having a sced opening, a casing, a grooved feed roll, a horizontal cut-off located at the seed opening and provided with a depending collar encircling the feed roll, and a rotary device having an opening to receive the feed roll, and mountcd on and carried by the collar of the cut-off to vary the length of the exposed portion of the feed roll.
4. In a seeder of the class described the combination of a hopper having a seed opening, a grooved feed roll, a cut-off located at the seed opening and having a depending collar encircling the feed roll, a rotary device mounted on the collar and having an opening receiving and conforming to the configuration of the feed roll, and an operating rod connected to the cut-off for operating the same and for adjusting the rotary device to vary the length of the exposed portion of the feed roll.
5. In a seeder of the class described the combination of a hopper, a grooved feed roll held against slidable movement, a rotary device consisting of a disc having an opening to receive the feed roll and provided with profecting portions extending into the groove of the same, and a cut-off having opposite lugs loosely embracing the disc.
6. In a seeder of the class described the combination of a hopper having a seed opening, a feed roll, a cut-off located at the seed opening, operating mechanism connected to the cut-off and means mounted directly on and carried by the cut-off for varying the length of the exposed portion of the feed roll.
7. In a seeder of the class described the combination of a hopper provided at the bottom with seed openings, casings depending from the bottom of the hopper and having discharge openings and provided with slots, grooved feed rolls operating within the casings, a shaft connecting the feed rolls, cut-offs for controlling the seed openings of the hopper. said cut-offs being extended through the slots of the casing and having means mounted directly upon the cut-offs for varying the length of the exposed portions of the rolls. operailing mechanism located exteriorly of the casings connected with the extended portions of the cut-offs, and means for rotating the said shaft.
8 . In a sceder of the class described the combination of a hrpper provided at the bottom with seed openings, casings deprnding from the hopper and having laterally extending portions forming horizontal guides, feed rolls operating within the rasings, a shaft connecting the feed rolls, cut-offs having horizontal portions to operate in the guides and providod with denending vertical portions located within the said casings, means mounted directly on the vertical portions of the cut-offs for exposing more or less of the feed rolls, means for operating the cut-offs, and gearing for rotating the said shaft.

No. 101,647. Grain Drill. Semoir en ligne.

Jacob H. Ullrick, Nashville. Tennessee, U.S.A., 23rd October, 1906: 6 years. Filed 27th September, 1906. Receipt No. 139.847.

Claim.-1. In a machine of the class described the combination of a main frame, hoppers arranged at an angle. feed mechanism, flexible spouts or tubes, drag bars or beams having drilling devices and connected with the s!outs or tubes, and means for moving the drag bars or beams backward and forward for arranging them either in a straight line or in angular relation.
2. In a machine of the class described the combination of opposite hoppers having feed mechanism provided with slides, operating rods connected with the slides, and means for connecting the operating rods for simultaneously actuating the same.
3. In a machine of the class described the combination of opposite hoppers having feed mechanism provided with slides. operating rods connected with the slides, and an adjusting screw having right and left hand threaded portions connected with the oprating rods for simultancously moving the same in opposite directions.
4. In a machine of the class described the combination with a hopper. and a movable furrow opener, of a flexible snout o: tube composed of a plurality of short telescopic sections having a limited longitudnal movement. and means rigid with the sections for limiting the longitudinal movement to pre\(v \in n t\) the sections from becoming disconnected.

5 . In a machine of the class described the combination with a hopper, and a movable furrow opener, of a flexible spout or tube composed of a plurality of telescople sertions having a limited longitudinal movement. and rigid connecting means for the sections to prevent their senaration, sald connecting means being arranged in spaced relation to permit a limited rotary movement of the sections.
6. In a machine of the class described the combination with a hopper, and a movable furrow opening. of a fiextble fipout or tube composed of a plurality of trlescopic sections having an annular series of exterior connecting devices spaced apart to permit the sections to have a limited rotary movement.
7. In a machine of the class described the combination of a hopper, a movable furrow opener, a flexible spout or tubs composed of a plurallty of sections capable of a limited
rotary and longitudinal movement on each other, and means for positively fimiting the rotary and langitudinal movemonts of the sections.
8. In a machine of the class described the combination of a hopper, a movable furrow opener, a flexible spout or tube composed of a plurality of sections capable of a limited and Icngitudinal movement on each other, eaid sections also having a rocking movement, and means rigid with the sections for llmiting the said movements.
9. In a machine of the class described the combination of a hopper, a movable furrow opener, and a flexible spout or tube composed of a pluraity of tapering telescopic sections circular in cross section, and separate means rigid with the upper ends of the sections and overlapping the contiguous sections. and engaging the same for positively limiting the movement of the sections on each other.
10. In a machine of the class described the combination of a hopper, a movable furrow opener, and a flexlble spout or tube composed of a plurality of telescopic sections, each provided with a projecting flange and having substantiall:y hook-shaped tongues engaging the flange of the adjacent section.
11. In a machine of the class described the combination of a hoppor, a movable furrow opener, and a flexible spout or tube composed of a plurality of telescoplc sections. each provided with a projecting ftange and having substantlally hook-shaped tongues engaging the flange of the adjacent section and having a limited lateral movement between the tongues thereof.
12. In a machine of the class described the combination with a hopper, and a furrow opener, of a flexible spout or tube composed of tapering telescopic sections circular in cross section, each section being provided at the top with an annular flange and having depending substantially hookshaped tongues arranged at intervals, the tongues of one section receiving the flange of the adjacent section and having a limited rotary movement between the tongues thereof. 13. In a machine of the class described the combination of opposite hoppers arranged at an angle, feed mechanism having shafts arranged at an angle and provided with spaced gears, an intermediate gear meshing with the said gears, and gearing for communicating motion from the intermediate gear.
14. In a machine of the class described the combination of a wheeded frame having a rotary axle. a plurality of hoppens arranged at an angle and provided with feed shafts arranged at an angle, spaced gears mounted on the feed shafts, intermediate gears meshing with the saif gears. lower transverse shafts and gearing for connecting the lower transverse shafts with the intermediate gears and with the axle.
15. In a machine of the class described the combination of a wheeled frame having a rotary element. a plurality of hoppers. feet meohanism heving feed shafts, spaced gears mounted on the feed shafts. Intermediate gears meshing with the said gears. lower transverse shafts. separate gearing connecting the transverse shafts with the intermediate gears, and other gearing for connecting the transverse shafts with the axle.
16. In a machine of the class described the combination of front. rear and intermediate hoppers having cups, the cups of the front hoppers being provifed at the front with discharge openings, and the cups of the other hoopers having discharge openings at the back. feed mechanism provided with feed shafts, lower front. intermediate and rear transverse shafts, gearing connecting the transverse shafts with the feed shafts. sprocket gears mounted on the axle and on the intermediate and rear transverse shafts. a sprocket chain arranged on the said sprocket gears, and spur gearing comnecting the front and intermediate transverse shafts.
17. In a machine of the class described the combination of front, rear and intermediate hoppers having cups, the cups of the front hoppers being provided at the front with discharge openings. and the cups of the other hoppers having discharge openings at the back. feed mechanism provided with feed shafts, lower front. Intermediate and rear transverse shafts, gearing connecting the transverse shafts with the feed shafts. sprocket wheels having gears of Hirect diameters and arranged on the axle and on the intermediate and rear transverse shafts. and a sprocket chain arraneed on the sprocket wher's and adapted to be changed from one set of gears to another, and spur gearing connecting the front and intenmediate transverse shafts.

\section*{No. 101,648. Boz. Boite.}

Thomas Wertz, Saint Louis, Missouri, U.S.A., 23rd October. 1!106; 6 years. Filed 1st October. 1906. Recelpt No. 134,922.
(laim.-1. A knockdown box comprising side. lop, bottom and end picers, bracing bars arranged on said pieces, guide plates secured to sald bars and adapted to engage the meet-
ing edges of each adjacent piece and means whereby said pieces of the box may be locked in a closed and set up position, substantially as described.

2. A knockdown box comprising side, top bottom and end pleces, each of which is provided around its outer side with a continuous rabbet, transversely disposed brace bars secured to the outer sides of said side pieces, guide and brace plates formed on the outer ends of said brace bars the side rabbets of said top and bottom pieces, brace bars secured to the opposite ends of said top and bottom pieces, guide and brace plates formed on said bars to engage the upper and lower rabbets of said end pleces, brace bars secured to the side edges of said end pleces, guide plates formed on said brace bars to engage the end rabbets of said side pieces, and means to lock said pieces of the box together in a set uj and closed position.
3. A knockdown box comprising side, top, bottom and end pleces, each of which is provided around its outer side with a continuous rabbet, transie.sely disposed brace bars secured to the outer sides of said side pieces, guide and brace plates formed on the outer ends of said brace bars to engage the side rabbets of said top and bottom pleces, brace bars secured to the opposite ends of said top and bottom piece, guide and brace plates formed on said bars to engage the upper and lower rabbets of sald end pieces, brake bars secured to the side edges of said end pieces, guide plates formed on said brace bars to engage the end rabbets of said side pieces, a locking bar adapted to be connected with the meeting ends of the top and one end piece of the boss, a keeper on said locking bar and lock arranged on said cover piece, the bolt of which is adapted to be engaged with said keeper to lock said cover in a closed position and thereby hold the parts of the box in a set up or operative position, substantially as described.
4. A knockdown box comprising side, top, bottom and end pieces. each of which is provided around its outer side with a continuous rabbet, transversely disposed brace bars secured to the outer sides of said side pieces, guide and brace plates formed on the outer ends of said brace bars to engage the side rabbets of said top and bottom pieces, brace bars secured to the opposite ends of said top and bottom pieces, guide and brace plates formed on said bars to engage the upper and lower rabbets of said end pieces, brace bars secured to the side edges of said end pieces, guide plates formed on said brace bars to engage the end rabbets of said side pleces, brace bars arranged on the inner side of said side pieces of the box, catches formed on the upper ends of said brace bars, similar bars arranged on the inner sides of the top and bottom pieces of said box, lugs on the ends of said latter bars to engage the ratches on the ends of said side brace bars, a locking bar secured to the forward end of the top piece and adapted to engage the upper edge of the forward end piece, removable fastening devices to secure said locking bar on the end of said top piece, a keeper formed on sald locking plate, and a lock arranged on said top piece, the bolt of which is adapted to be turned into engagement with said keeper, substantially as described.
5. A knockdown box comprising side, top, bottom and end pleces, each of which is provided around its outer side with
a continuous rabbet, transversely disposed brace bars secured to the outer sides of said side pleces, guide and brace plates formed on the outer ends of said brace bars to engage the side rabbets of said top and bottom pleces, brace bars secured to the opposite ends of said top and bottom piece, gulde and brace plates formed on said bars to engage the upper and lower rabbets of said end pieces, brace bars secured to the side edges of said end pieces, guide plates formed on said brace bars to engage the end rabbets of said side pieces, catch lugs arranged on the forward end of said top piece, a locking plate adapted to be engaged with said catch lugs, right angularly projecting top and end engaging plates formed on said locking bar, a metallic bar arranged between said locking bar and the end of said top piece and secured to the latter, removable fastening devices to detachably secure said locking plate on the ends of said top piece, a keeper formed on said locking bar, and a lock arranged on said top piece, the bolt of said lock being adapted to be turned into engagement with said keeper, thereby locking said top piece in closed position and holding the parts of the box in a set up or operative position, substantially as described.

\section*{No. 101,649. Straw Stacker.}

Appareil d ameulonner la paille.

Jack Wolf. Princeton, Minnesota, U.S.A., 23rd October, 1906; 6 years. Filed 21st August, 1906. Receipt No. 138,883.
Claim.-A device of the kind described comprising the casing open at its forward end, hinged doors arranged in the sides of the casing, a hopper adapted to form the lower portion and bottom of the casing, the rear wall of said hopper comprising an outwardly curved plate, a fan casing, an upwardly and rearwardly inclined chute leading from the fan casing and having an opening in its upper wall communicating with the hopper in advance of the said curved plate, feeding mechanism arranged in the recess formed by said curved plate, a fan in the fan casing, and means for driving the fan in the feeding mechanism.

\section*{No. 101,650. Electro-Magnet. Electro-aimant.}

John William Holman, assignee of Ernset Holman Miller, both of Lancaster, Pennsylvania, U.S.A., 23rd October, 1906; 6 years. Filed 26th February, 1906. Receipt No. 133,349.
Claim.-1. A solenoid for power purposes, comprising a tubular spool of non-magnetic material, a magnetic plug midway of said spool, a plurality of coil sections wound on said spool and connected in series, and movable cores entering said spool, said plug and cores having co-operating projections and recesses.
2. An electro-motive power device, comprising two solenoids side by side, each having a plurality of coil sections connected in series, and adjacent ends of the windings on said solenoids being connected, movable cores entering the ópposite ends of said solenoids, and yokes connecting adjacent cores.
3. An electro-motive power device, comprising two solenolds side by side, each having a plurality of coil sections connected in series, and adjacent ends of the windings on
sald solenolds, being connected, magnetic plugs midway of said solenoids, movable cores entering the opposite ends

of sald solenoids, and yokes rigidly connecting adjacent cores.
4. The combination with two solenoids arranged side by side, of a bridge of magnetic material arranged midway thereof and movable cores yoked together entering the opposite ends thereof.
5. The combination with two solenoids arranged side by side and each composed of a plurality of coll sections connected in series, of a magnetic bridge interposed between the middle sections, and movable cores yoked together entering the opposite ends of said solenoids.
6. The combination with two solenoids arranged side by side and each composed of a plurality of coll sections connected in series, the windings on the two solenoids being also connected in series, of a magnetic bridge interposed between the middle coil sections, and movable cores entering the ends of said solenoids and connected by rigid yokes, said bridge and cores having co-operating projections and recesses.
7. The combination with two solenoids arranged side by side and connected in series, of movable cores entering the opposite ends thereof, a yoke at each end of the solenoids to which said cores are connected, and a guide for each yoke.
8. The combination with two solenoids arranged side by side and connected in serles, of movable cores entering the ends thereof, a yoke at each end to which said cores are connected, a bifurcated slotted bar fastened to each yoke, and a stud engaging with said slot.
9. The combination with two solenoids arranged side by side, of a magnetic bridge arranged intermediate the ends of each solenoid, and connected movable cores entering opposite ends of said solenoids.
10. The combination with two solenoids arranged side by side, each composed of a plurallty of coil sections connected in series, of a magnetic bridge interposed between the middle coil sections, and connected movable cores entering opposite ends of said solenoids.
11. The combination of two solenolds arranged side by side, each comprising a tubular spool of non-magnetic material, a plurality of removable coil sections wound thereon side by side and connected in series, and movable cores entering the opposite ends of said spools.

No. 101,651. Briquetting Press. Presse d briquctte. Howard Ellsworth Marsh, Palms, and Frederick Dalton Parker, assignee of a half interest, Los Angeles, California, U.S.A., 23rd October, 1906; 6 years. Filed 4th April, 1906. Receipt No. 134,593.
Caim.-1. A briquet press provided with a series of disconnected moulding boxes, an endless guide for sald boxes, reciprocating compressing means for said boxes, and means constructed to operate said reciprocating compressing means and their boxes through their orbit.
2. A frame provided with an endless guide, a series of moulds to move along said guide, compressing means for moving said moulds along said guide and for compressing material in said moulds, and means for discharging material therefrom.
3. A frame provided with an endess guide extending in a vertal plane, a series of contracting moulds adapted to move along sald gulde. and compressing means engaging the ascending moulds to move the same forward.
4. A frame provided with an endless guide, a series of disconnected monlls adapted to move along said guide. a compressing drum closing the mouths of said moulds during a fortion of their travel, means for moving sald moulds and f.r compressing material against said drum in said moulds. and means for emptying said moulds.
5. A irame provided with an endless guide, a serfes of disconnected contacting moulds adapted to slide in said gukde.

compressing means for moving eald moulds and for compressing material thereinto, and means for emptying aald moulds.
6. A compressing drum, a moulding box, means for guiding the moulding box with its open mouth on the compressing drum, a plunger in said box, means for engaging the plunger and forcing it inward and at the same time onward, to move the box along its orbit.
7. A drum, a moulding box, means for guiding the moulding box with its opon mouth agalnst the drum, a plunger in the box, and rotary means for engaging the plunger to move it inward and onward.
S. A drum, a moulding box, means for guiding the moulding box with its open mouth against the drum, a plunger in said box, a gear having a face to engage eald plunger and move it inward and onward.
9. A moulding box, means for closing the mouth of the box, means for guiding the box in a path, a plunger in the box, rotary means for engaging the plunger to force it inward as the box moves onward in its path.
10. A frame, moulding means, means for guiding sald moulding means in a path in said frame, and rotary means sieldingly mounted on the frame and arranged to simultaueously advance and operate said moulding means.
11. In a press, a frame, a series of disconnected moulds arranged to move in a determined path in sald frame, a rock bar mounted on said frame, a rotary compressing means mounted on said rock bar and constructed to operate said moulds, and tension means for bolding toward the moulds said rotary compressing meuns.
12. In a press, a frame, moulding means arranged to move in a determined path in sald frame, a rock bar mounted on said frame, a notary compressing means mounted on said rock bar and constructed to operate said moulding means, and tension means for holding toward the moulding means said rotary compressing means, the center of gravity of the rock bar and its attachments being rearyard of the vertical drawn from the shaft of the rock bar to cauee gravity of the compressing means to hold the tension means normally at a constant tension.
13. A briquetting press provided with a series of disconnected moulds, notary means for operating said moulds. rocking means carrying sald rotary means, llnk moans for connccting the rocking means with the frame of the nress, and yleiding tension means for holding said rotary meane toward the moulds.
14. A frame, moulding means moving in an orbit therein, a moulding drum closing the mouths of the moulding means at a portion of said orbit, rocking means, a shaft fournalled therein, a compressing gear carried by sald sbalt, a driving shaft, balance wheels fixed on the driving shaft, a compressing gear fixed on the shaft and constructed to operate and advance the moulding means successively.
15. Disconnected mouiding boxes moving in an orbit. plungers in said boxes respectively having projeoting stems. and a rotary ejector gear arranged to engage said stems to depress the same.
16. In combination with means for moulding briquettes and carrying the briquettes through part of the orbit of the moulding means, a delivery device comprising a serfes of
hinged leaves, a shaft for supporting and rotating the hinged leaves, and means ior matntaining the leaves in a horizontal plane through a portion of their rotation and allowing the leaves to successively swing down at a definite point of their rotation.
17. In combination with means for moulding briquettes and carrying the briquettes through part of the orbit of the moulding means, a delivery device comprising a series of hinged leaves, a shaft for supporting and rotating the hinged leaves, and a segmental ring for maintaining the leaves in a hosizantal plane through a portion of their rotation and allowing the leaves to successively swing down at a definite point of their rotation.
18. A frame, moulding means, means for guiding said moulding means in a path in said frame, and rotary means ylaldingly mounted on the irame and arranged to simultaneously advance and operate said moulding means, and rotating lifting gears engaging with the moulding means for lifting the same thnough part of their orbit.
19. Disconinecting moulding boxes moving in an orblt, plungers in said boxes having stems, and a rotary ejector gear operating by friction to engage said steins and depress the eame.
20. Disconnected moulding boxes moving in an arbit. plungers in sadd boxes having stems, and a rotary ejector gear having a flat face operating by friction to engage said stems and depress the same.
21. In a briquetting press, a mould box having a compressing chamber of even diameter throughout. a plunger in the chamber a stem projecting through the wall of the box, the wall having an opening adjacent the stem for the escape of material which may wark past the plunger.
22. In a briquetting press, a frame, a moulding drum against which briquettes are pressed, and a scraping trough bearing against the drum for scraping the drum clean.
23. In a briquetting press, a frame, a moulding trum against which briquettes are pressed, and a scraping trough bearing against the drum for scraping the drum clean. the lower end of the trough being extended through the side of the frame.
24. In a briquetting press, a frame, a series of mould blocks movable abong said irame, and a cleaning ucraper across which the mould blocks travel for diverting inaterial on the mould blocks into the compressing chambers therein.
25. In a briquetting press, a frame, a series of mould blocks movable along sald irame, and a cleaning scraper, having a V-shaped notch across which the mould blocks travel for diverting material on the mould blocks into the compreestrg chambers therein.

No. 101,65\%. Can. Bidon.

The Canada Paint Company, Montreal, Quebec, Canada, assignee of John Forster Ross, Toronto, Ontario, Canada, 23rd October, 1906; 6 years. Filed 19th September, 1906. Receipt No. 139,616.
Claim.-1. As a new article of manufacture, an improved can, comprising a can body or wall, a can bottom or par-10-28
tition dividing same into two compartments, and means for closing said compartments.
2. As a new article of manufacture, an improved can for shipping aluminum paint, comprising a can body or wall, a can bottom or partition dividing same into two compartments, in one of which is the liquid vehicle, and in the other of which is the power designed to be mixed therewith, and means for closing said compartments.
3. As a new article of manufacture, an improved can for shipping aluminum paint, comprising a can body or wall, a can bottom or partition dividing same into two compartments, in one of which is the liquid vehicle, and in the other of which is the powder designed to be mixed therewith, and lids or covers for closing said compartments constructed so as to be readily pried open.
4. As a new article of manufacture, an improved can, comprising a can body or wall, a can bottom or partition dividing same into two compartments, a receptacle held in one of sald compartments, and means for closing said compartments.
5. As a new article of manufacture, an improved can, comprising a can body or wall, a can bottom or partition dividing same into two compartments, a receptacle held in one of said compartments, and lids or covers for closing said compartments constructed so as to be readily pried open.
6. As a new article of manufacture, an improved can for shipping aluminum paint, comprising a can body or wall, a can bottom or partition dividing same into two compartments \(n\) one of which is the liquid vehicle, a receptacle held within the other compartment and designed to contain the powder to be mixed with the liquid vehicle, and means for closing the ends of said compartments.
7. As a new article of manufacture, an improved can for shipping aluminum paint, comprising a can body or wall, a can bottom or partition dividing same into two compartments \(n\) one of which is the liquid vehicle, a receptacle held within the other compartment and designed to contain the powder to be mixed with the liquid vehicie, and lids or covers for closing said compartments constructed so as to be readily pried open.
8. As a new article of manufacture, a can comprising a can body or wall divided or separated into two compartments by a partition or can bottom common thereto, a suitable lid or cover for the top of said can, and a supportIng lid or cover closing the bottom of said can.
9. As a new article of manufacture, an improved can, comprising a can body or wall, a dish-shaped or cup-sthaped can bottom or partition placed within said can body and having its wall abutting portion of the inner side of said can body or wall, and having its end secured to the end of sald can body or wall, a lid for the top of sald can, and a lid for the bottom of said can.
10. As a new article of manufacture, an improved can, comprising a can body or wall, a dish-shaped or cup-shaped can bottom or partition placed within said can body and having its wall abutting portion of the inner side of said can body or wall, and having its end secured to the end of said can body or wall, a lid for the top of sald can, a lid for the bottom of said can, and a receptacle held within said can body between said can bottom or partition and said second-mentioned lid.
11. As a new article of manufacture, an improved can for shipping aluminum or similar paints, comprising a can body or wall, a can bottom or partition dividing same into two compartments, in one of which is the liquid vehicle, and in the other of which is the powder designed to be mixed therewith, and means for closing said compartments.
12. As a new article of manufacture, an improved can for shipping aluminum or similar paints, comprising a can body or wall, a can bottom or partition dividing same into two compartments in one of which is the liquid vehicle, a receptacle held within the other compartment and designed to contain the powder to be mixed with the liquid vehicle, and means for closing the ends of said compartments.

\section*{No. 101,653. Mould. Moule.}

Herman Besser, Alpena, Michigan, U.S.A., 23rd October, 1906; 6 years. Filed 30th August, 1906. Receipt No. 139,113.
Claim.-1. In a device of the class described, an expansible mould comprising a substantially rectangular frame, side and end walls hinged to the frame, means connected with the end walls for moving the same, and means connected with the side walls and engaging said moving means whereby to move the side walls in unison with the end walls.
2. In a device of the character described, an expansible mould comprising a substantially rectangular irame, side and end walle depeuding from the frame, handles movably connected with the end walls for 8 winging the same, and means connected with the side walls and engaging said
handles whereby to move the side walls in unison with the end walls.

3. A moulding device comprising movable mould walls, a plate on one wall, and a movable latch on another wall for locking said plate, said plate having a bend for engaging the edge of the other wall and limiting the motion of both walls.
4. A moulding device comprising movable mould walls. a plate on one wall, and a movable latch on another wall for locking said plate, said plate having a bend for engaging the edge of the other wall and limiting the motion of both walls, said latch having a projection on the outside of said plate for engaging the latter and forcing it inwardly.
5. A moulding device comprising movable mould walls, a plate on one wall having inwardly projecting ends beyond the ends of sald wall. a movable latch on another wall adapted to engage said plate and lock the two adjacent walls tognih.r. the second wall being adapted to engage the projection co. said plate for forcing the first wall outwardly, and means on the latch for engaging the outer edge of said plate.
6. A moulding device comprising movable mould walls, a plate on one wall having inwardly projecting ends beyond the ends of sald wall, a movable lateh on another wall adapted to engage said plate and lock the two alljacent walls together, the second wall being adapted to engage the projection on said plate for forcing the first wall outwardly, means on the latch for engaging the outer edge of said plate. and means for swingingly mounting said walls, said means comprising hinge pieces extending from each wall across the mould to the opposite side thereof. the outer ends of said hinge pleces being pivotally mounted.
7. In a moulding device the combination of a frame comprising a plurality of adjustably mounted rods, hinge pieces pivotally mounted on each rod and extending across the device, mould walls mounted on the hinge pieces. means on the mould walls for simultaneously and automatically swinging each wall outwardly when the device is lifted, and set collars secured to the rods against the hinge pieces.
8. In a moulding device the combination of a frame. bearings thereon, a pair of rods mounted in parallel position in said bearings, blocks mounted adjustably on said rods, a second pair of rods adjustably mounted on said blocks and located at an angle to the first-named rods, a series of hinge pieces pivoted to each of said rods, mould walls suspended from said hinge pieces. handles connected with sundry of said mould walls. and means whereby said handles may simultaneously swing all of said walls outwardly.
9. In a moulding device the combination of a frame having bearings, a pair of rods mounted thercon, a pair of blocks adjustably mounted on each rod, a second pair of rods ad. justably supported by said blocks, hinge pieces pivotally connected with each rod, inclined walls constituting a hopper mounted on said hinge pieces, and mould walls mounted on said hinge pleces.

\section*{No. 101,654. Plough, Seeder and Harvester. Charrus, somotr et moissonneuse.}

\section*{James Birrell, Winnipeg, Manitoba, Canada, 23rd October, 1906; 6 years. Filed 21st February, 1906. Receipt No.} 133,127.
Claim.-1. In a device of the class described in combination a wheeled frame, a dependent adjustable drag bar between the forward and rear sets of wheels, a series of adjustable ploughs dependent from the drag bar, and a motor supported above the frame, and designed to rotate the gear wheels, as and for the purpose specifled.
2 . In a device of the class described the combination comprising a whecled rectangular frame, a dependent vertically slidable drag bar. extending obliquely across and below the frame. a series of adjustable ploughs dependent from the drag bar, and a motor supported above the frame, and de-
signed to rotate the rear wheels, as and for the purpose specified.

3. In a device of the class described the combination with the forward carriage and the rearward traction wheels of a frame supported from the said wheels, a set of vertical guideways dependent from the frame below and on either side thereof, a drag bar extending obliquely across the frame, and designed to slide within the guideways, a set of adjustable swivel wheels secured to the ends of the drag bar, a series of ploughs adjustably supported from the drag bar, and means for rotating the traction wheels, as and for the purpose specified.
4. In a motor plough the combination with the carriage and traction wheels of a frame, and a series of adjustable ploughs slidably supported on the frame, forward of the traction wheels, as and for the purpose specified.
5. In a motor plough the combination with the forward carriage and rear traction wheels of a frame, a drag bar extending obliquely across the frame and forward of the traction wheels, means for ret rining the drag bar to withstand lateral pressure, and to allow motion in an upward and downward direction, adjustable means supporting the drag bar at its ends, a series of ploughs connected to the drag bar by nieans of equal length shanks, free to move in a vertical plane, and means for adjusting the plough, as and for the purpose specified.
6. In a device of the class described the combination with the main frame, having a set of carriage wheels forwardly disposed, and a set of traction wheels rearwardly disposed, of a motor secured above the frame, means connecting the motor to the traction, wheels to revolve the same, sets of arms forming guides secured below the frame and forward of the traction wheels, a drag bar extending obliquely across the frame, and beyond, and designed to slide within the guides, swivel wheels adjustably connected to and supporting the drag bar, a series of equal length arms extending successively from the drag bar, said arms being irce to move in a vertical plane, a series of ploughs connected to the arms, a set of levers actuating the arms, and a steering gear to centrol the carriage wheels from the rear, as and for the purpose specified.
7. In a motor plough the combination with the frame having forwardly disposed carriage wheels and rearwardly dispesed traction wheels, and a seres of adjustable ploughs slidably supported from the frame, of a set of brackets extending rearwardly behind the frame, as and for the purpose specified.
s . In a device of the class described, a seeder, and a set of arms extending rearwardly from the plough frame, and designed to receive and withhold the seeder thereon, and means for driving the seder from the traction wheels of the plough. a:: and for the purpose specified.
9. In a device of the class described, a seeder and a set of arms extending rearwardly from the plough frame, and designed to receive and withhold the seeder thereon, a chain gear operating the seeder from the traction wheels of the llough, as and for the purpose specified.
10. In a device of the class described the combination with the rectangular frame having a set of forwardly disposed carriage wheels, and a set of rearwardly disposed traction
wheels, of a gasoline motor supported above the frame, a crank shaft extending across the frame and bearing thereon, means connecting the crank shaft to the piston, a counter shaft bearing on the frame and parallel with the body of the crank shaft, gear wheels in proximity to the ends of the counter shaft, and pinions at the extremities of the crank shaft, meshing with the counter shaft gears, chain gears at the extremities of the counter shaft, chain gears on the inner face of the traction wheel, chains connecting the said chain gears, a drag bar extending obliquely across and under the frame, guldes extending downwardly below the frame, and in which the drag bar is vertically slidable, means for supporting the drag bar at its ends, a series of ploughs connected to the drag bar by means of equal length shanks, an angle bar extending across the irame, and parallel with the oblique bar, a series of hand operating levers connecting the levers over the angle bar to the rear of the plough shanks, and a steering gear, as and for the purpose specified.

No. 101,655. Corn Planter. Semoir à blé-d'inde.

James Oscar Brown, Sr., Kansas City, Missouri, U.S.A., 23rd October, 1906; 6 years. Filed 25th September, 1906. Receipt No. 139,771.
Claim.-1. In a corn planter a supporting frame, seed dropping devices on said frame and ground wheels, an independently mounted rotary shaft on said frame, power transmitting devices connected with the ground wheel and said independent shaft. a cam carrying wheel loosely mounted on said independent shaft, cams on said wheel actuating the seed dropping devices and means for engaging with and disengaging at will said cam carrying wheel from said independent shaft.
2. In a corn planter a supporting frame, seed dropping devices on sald frame and ground wheels, an independently mounted rotary shaft on said frame, power transmitting devices connected with the ground wheel and said independent shaft, a cam carrying wheel loosely mounted on said independent shaft carrying independently adjustable cams for actuating the seed dropping devices and means for engaging with and disengaging at will said cam carrying wheel from said independent shaft.
3. In a corn planter the combination with the supporting frame, the seed dropping devices and the ground wheels of a pivoted forked lever actuating the seed dropping devices, a rotary shaft independently mounted upon said frame, means for transmitting motion from the ground wheel to said independent shaft, a cam carrying wheel loosely mounted upon said shaft and cams thereon adapted to engage alternately with the forked ends of said lever and a clutch for connecting said cam wheel with said independent rotary shaft.
4. In a corn planter the combination with the supporting frame, the seed dropping devices and the ground wheels journalled on the sides of said frame, a disk on one of said ground wheels and cogs on said disk, a marker, a pivoted forked lever actuating the seed dropping devices, a rotary shaft independently mounted upon said frame, a cog wheel on said shaft meshing with the cogs on the disk on the ground wheel, a cam supporting wheel loosely mounted on said shaft, cams upon sald wheel adapted to engage alternately with sald forked ends of sald lever, a clutch connectfrg sald cam carrying wheel with the shaft, means for elevating one side of the frame of the planter and its ground wheel and a clutch operating lever.

No. 101,656. Insulator. Isolateur.
Gaetan Michel Corell, New York City, New York, U.S.A., 23rd October, 1906; 6 years. Filed 7th March, 1906. Receipt No. 133,621.
Claim.-1. In a device of the class described in combination, an insuiating body of substantially cylindrical form,
removable plugs seated in the extremities of said hody, plungers slidably mounted in sald plugs, said body having a

longitudinally disposed duct formed in the wall thereof and a conductor disposed in said duct and having laterally disposed legs passing into said plugs, contact plates carried by said plungers and engaging said legs, sperings pressing said plungers and line wires attached to said contact plates.
2. In a device of the class described in combination, an insulating body, a conductor having legs with breaks therein and mounted within said body, movable plungers mounted within sald body, contact plates carrled thereby which may bridge said breaks, springs constraining said plungers in the direction of said legs, and ather conitact "latica carried by plungers and engaging said conductor at other points.
3. In a device of the class described in combination, an insulating body, a conductor disposed longitudinally in sald body and having its extremities disposed in the extremities of said body, sald conductor having laterally disposed legs at substantially the middle portion of said body, said iegs having breaks, movable plungers mounted in sald body. springs constraining said plungers in the direction of said legs. contact plates carried by said plungers and which may bridge said breaks, and other contact plates carried at the opposite extremities of said plungers and engaging the extremities of said conductor.

No. 101,657. Rock Drill. Forêt d roche

Evan William Evans, Marysville, British Columbia, Canada, 23rd October, 1906; 6 years. Filed 1st September, 1906. Receipt No. 139,185.
Claim.-1. A rock drill, comprising a hammer having a pivot, a slotted support to which the said pivot is attached, a crossbar arranged to assume an angular position on the said support, and means for clamping the said crossbar to a supporting arm.
2. A rock drill comprising a hammer having a pivot on which the hammer is mounted to swing. a soltted support on which the pirot is removably secured, a soltted cross bar having wedge-shaped ends and adapted to siide lengthwise and transverse on the said support, and means for securing the said slotted support and the said crossbar in position.
3. A rock drill comprising a hammer having a pivot on which the hammer is mounted to swing, a slotted support on which the pivot is removably secured, a slotted crossbar having wedge-shaped ends and adapted to slide lengthwise and transverse on the said support. a washer, a supporting arm, and an eye bolt for connecting the supporting bar, the crossbar and washer in position relative to sald supporting arm.
4. A rock drill comprising a bammer having a pivot on which the hammer is mounted to swing, a slotted sunoort on which the pivot is removably eecured by a clamping bolt, a slotted crossbar having wedge-shaped ends and adapted to slide lengthwise and transverse on the sald support. and means for securing the said slotted support and the said crossbar in position.
5. A rock drill comprising a hammer having a pivot on which the hammer is mounted to swing. a slotted support on which the pivot is removably secured, a slotted crossbar having wedge-shaped ends and adapted to slide lengthwise and transverse on the said support, a supporting bar made croes shape in cross section, an eve bolt siidingly engaging the said supporting arm, a washer having recesses for engagement by the depending member of the sald cross-shaned supporting bar. a slotted crossbar fitting the underside of the said washer and through which and the said washer extends the said eye bolt, the sald crossbar having wedgeshaped ends. A slotted supporting har engaged by the safid crossbar and the nut of the eye bolt to fasten the parts together, a plvot set in a recess on the said supporting bar, a clamping bolt on the supporting bar for holding the pivot in place, and a hammer hung on the said pivot.

No. 101,658. Fire Extinguisher.
Extincteur d'incendic.

Wilhelm Graaff, Berlin, Germany, 23rd October. 1906; 6 years. Filed 11th August, 1906. Receipt No. 138,596.
Claim.-Chemical fire extinguisher with expansion device. mounted on the discharge pipe, and characterized by the fact, that the discharge pipe \(b\) is provided with a lateral expansion chamber \(c\) at the level of the liquid or above the same, holes in the wall of the pipe allowing the entrance of the liquid, while the ejecting force in the discharge passage is not interfered with.

\section*{No. 101,659. Reverse Relay Device.}

Ralph D. Mershon, New York City, New York, U.S.A., 23rd October, 1906; 6 years. FHled 23rd February, 1906. Receipt No. 133,245.
claim.-1. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device actuated by force proportional to the vectorial product of components dependent upon current and electro-motive force respectively, and adapted with reference to the phase relation of the said components to produce higher torque under conditions accompanied by low power factor than when accompanied by high power factor, as set forth.
2. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device actuated by force proportional to the vectorial product of components dependent upon current and electromotive force respectively, and means for adjusting the magnitude and phase relation of the said components, as set forth.
3. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device actuated by force proportional to the vec-
torial product of components dependent upon current and
electro-motive force respectively, and means (
the magnitude of one or more of the said components, as set forth.
4. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device actated by force proportional to the vectorial product of components dependent upon current and electro-motive force respectively and automatic means for adjusting the magnitude and phase velation of the said components, as set forth.
5. The combination with a source of currents connected with one or more other sources of curnent, of a circuit controlling device actuated by force proportional to the vectorial product of components dependent upon current and electro-motive force nespectively, and automatic means for adjusting the magnitude of one or more of the said components, as set forth.
6. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device actuated by force proportional to the vectorial product of components dependent on current and electro-motive force respectively, and automatic means for adjusting the magnitude and phase reletion of the said components, dependent tude and phase relation of the sald components,
for operation upon decrease of voltage, as set forth.
7. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device actuated by force proportional to the vectorial product of components dependent upon current and electro-motive force respectively, and automatic means for adjusting the magnitude of one or more of the said components, dependent for operation on decrease of voltage, as set forth.
8. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device connected with the first-mentioned source, a local circuit, a movable contact therein, a circuit closing device actuated by the circuit controlling device, and means for moving the contact toward the circuit closing device, the operation of said means being dependent upon, and proportional in extent to, abnormal conditions in the ex cuit of the circuit controlling device, as set forth.
9. The combination with a source of current connected with one or more other sources of current, of a circult costrolling device connected with the first-mentioned source, a local circuit, a movable contact therein, a circuit closing delocal circuit, a movable contact therein, a circuit and means for carrying the movable contact toward the circuit closing device, the operation of the said means being dependent upon.
and proportional in extent to, decrease of voltage in the external circuit of the circuit controlling device, as set forth
10. The combination with a source of curnent connected with one or more other sources of current, of a circuit controlling device connected with the first-mentioned source and actuated by force pnoportional to the vectorial product of components dependent upon current and electro-motive force, a local circuit, a movable contact therein, a circuit closing device actuated by the circuit controlling device, means for moving the contact toward the circuit closing device, means for adjusting the magnitude and phase relation of the said components, and mechanism for actuating both said means, dependent for operation upan abnormal conditions in the external circuit of the circuit controlling device, as set forth
11. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device connected with the first-mentioned source and actuated by force proportional to the vectorial product of components dependent upon current and electro-motive force, a local circuit, a movable contact therein, a circuit closing. device actuated by the circuit controlling device, means for moving the contact toward the circuit closing device, means for adjusting the magnitude of one or more of the said components, and mechanism for actuating both said means, dependent for operation upon abnormal conditions in the external circuit of the circuit controlling device, as set forth.
12. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device connected with the first-mentioned source and actuated by force proportional to the vectorial product of components dependent upon current and electro-motive force, a local circuit, a movable contact therein, a circuit closing device actuated by the circuit controlling device, means for moving the contact toward the circult closing device, means for adjusting the magnitude and phase relation of the sald components, and mechanism for actuating both said means, the operation of said mechanism being dependent upon, and proportional in extent to, decrease of voltage in the external circuit of the circuit controlling device, as set forth,
13. The combination with a source of current connected with one or more other sources of current, of a circuit controlling device connected with the first-mentioned source and actuated by force proportional to the vectorial product of components dependent upon current and electro-motive force a local circuit, a movable contact therein, a circuit closing device actuated by the circuit controlling device, means for moving the contact toward the circuit closing device means for adjusting the magnitude of one or more of the said components, and mechanism for actuating both said means, the operation of said mechanism being dependent upon, and proportional in extent to, decrease of voltage in the external circuit of the controlling device. as set forth.

No. 101,660. Hat Pin. Epingle d chapeau.

Herbert Frank Boyce, South Qu'Appelle, Saskatchewan, Canada, 23rd October, 1906; 6 years. Filed 2nd June, 1906. Receipt No. 136,498 .

Claim.-1. A hat pin comprising a body having a spiral spring at one end, which spiral spring is provided with an extension having an upwardly extending portion terminating in a hook having a point.
2. A hat pin comprising a body portion having an integral spring at one end, said spring having an extension terminating in a hook having a point adapted to lie against the body of the pin.

No. 101,661. Proceas of Mahimg Multiple Photo-
Procédé pour faire des photographies multiples.
Procédé pour faire des photographies multíples.

Hiram C. J. Deeks, Paterson, New Jersey, U.S.A., 23rd October, 1906; 6 years. Filed 4th June, 1906. Receipt No. 136,529.
Claim.-1. The process of printing photographs, which consists in exposing through a negative corrugated paper to the light so that the view will be printed in sections only on the sides of said corrugations facing in one direction and next exposing the same paper through a second negative so that the second view will be printed in sections only on the opposite sides of said corrugations.
2. The process of printing photographs, which consists first in forming parallel corrugations upon a printed surface; second, exposing through a negative the sides of the corrugations facing in one direction so that the view will be printed thereon in sections, and third, exposing through another negative the opposite sides of the corrugations so that the second view will be printed thereon in sections.

No. 101,662. Measure and Distributor for Liquid Disimfectants.
Mesure et distributeur de liquides désinfectants.

Charles Arthur Jarvis, London, England, 23rd October, 1906; 6 years. Flled 9th June, 1906. Receipt No. 136.731.
Claim.-In apparatus for automatically delivering liquid disinfectant to flushing cisterns and having a liquid disinfectant containing reservoir and a measuring vessel depending therefrom, the employment of a leaden weight whose lower end enters and normally closes the aperture leading from the reservoir to the measuring vessel, said weight being guided to move vertically by a spadle wheh is formed with a groove or is sufficiently cut away at that part where it normally passes through the cap of the measuring vessel, that disinfectant can flow from the measuring vessel when the inlet aperture \(b\) is closed, the lower end of said spindle fitting so as to completely close sald aperture in the cap when the weight is raised to a sufficient extent, all substantially as set forth.

No. 101,663. Match Box. Boite d allumettes.

Henry M. Kabele, Westford, Massachusetts, U.S.A., 23rd October, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,779.
Claim.-1. A match box comprising a body portion having a match discharge opening, a inger arranged for engagement of matches with the body portion and for movement to discharge matches through the opening, means for holding the finger in match engaging position, an agitator within the body portion. and means connected with the finger for moving the agitator when the finger is moved.
2. A match box comprising a body portion having a chamber therewithin provided with a trap at its bottom and havIng a match discharge opening communicating with the trap, a slide, a finger carried by the slide and lying in position for exgagement by a match within the trap to move sald trap outwardly through the opening when the slide is moved, an agitator located within the chamber for movement into and out of position to cover the trap, and means connected with the sllde and arranged to hold the agitator normally in position to cover the trap and arranged for movement to permit of movement of the agitator out of such position when the slide is moved, said means being arranged to hold the agitator in normal positon when the slide is in match projecting position.
3. A match box comprising a body portion having a chamber therewithin and having a match discharge opening, a slide having a finger movable into the body portion for engagement of matches therewithin successively to project them through the discharge opening, means for holding the slide with the finger yieldably in match engaging position, an agitator within the chamber and having a lip provided with a recess in its free edge, and a projection carried by the slide and engaging the free edge of the lip, to hold the agitator against movement, sald projection being movable with the slide into position to enter the recess to permit of movement of the agitator.
4. A match box comprising a body portion having a chamber therewithin provided wth a trap at its bottom and having a match discharge opening at one end of the trap, said trap having a recess in its end wall opposite to the discharge opening, and having a longitudinal slot at its lower portion, sald body portion having a horizontal slot above the trap, a rod mounted horizontally exteriorly of the body portion, a slide mounted upon the rod and having a finger extending through the slot of the trap and in position to enter the recess, a spring engaged with the rod and arranged to hold the slide with its finger normally in the recess, an agitator pivoted to the wall of the body portion above the horizontal slot, for movement into and out of position to cover the trap, said agitator having a lap extending outwardly through the slot and having a cut-away portion in its outer edge between its ends, a projection carried by the lip from the slot, and a projection carried by the slide and engaging the outcr edge of the lip, sald projection being arranged to hold the agitator in position to permit of movement of the agltator out of trap-covering position when between the onds of the lip and in the cut-away portion.

No. 101,664. Vnlcanization of Rubber.
Vulcanisution du caoutchouc.

Ernest Hopkinson, New York City, and Thomas Midgley. Hartford, Connecticut, U.S.A., 23rd October, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,826.
Claim.-1. The method of vulcanizing or curing the outer shoes or casings for pneumstic tires for vehicles which consists in supporting and securing the shoe or casing in form, applying a porous cover to the exposed surface of the shoc or casing, and subjecting the shoe or casing so supported and covered to the action of vulcanizing heat.
2. The method of vulcanizing or curing the outer sheaths or casings for pneumatic tires for vehicles which consists in supporting the shoe or casing upon a core, clamping the shoe or casing in position by the core with the tread portion exfosed, placing a porous covering over the exposed surface of the tire shoe or casing and an contact therewith. and subjecting the shoe or casing so supported, clamped and covered to the action of vulcanizing heat.
3. The method of vulcanizing or curing outer shoes or casings for pneumatic tires for vehicles which consists in sup. porting the shoe or casing upon a core, placing an abutment member between the margins of the shoe or casing, clamping the shoe or casing firmly upon the core and against the atutment member, but leaving the tread portion of the shoe ol casng exposed, placing a covering of textile fabric over the exposed tread portion of the shoe or casing and in contact therewith, and in subjecting the shoe or casing so supported and covered to the action of vulcanizing heat.
4. The method of curing or vulcanizing outer shoes or casitugs for pneumailc tires for vehcles which consists in supporting and securing the shoe or casing so as to hold it in the form which it is intended to retain, and leaving the tread portion of the shoe or casing exposed, placing a covering of porous material over the exposed portion of the shoe or casing and in contact therewith, subjecting the covering to tension to create pressure on the shoe or casing, and ex posing the shoe or casing so covered and supported to the action of live steam.
5. The combination in apparatus of the character specified, of a core adapsed for insertion within a tire shoe or casing, means for clamping the margins of the casing in proper relation to the core while ieaving the treed of the shoe or casing exposed, and a wrapping or covering for the tire shoe or casing of textile fabric.
6. The combination in apparatus of the character epecified, of a core adapted for insertion within a tire shor or casing, means for clamping the margins of the casing in proper relation to the core while leaving the tread of the shoe or casing exposed, and a wrapping or covering extending over the exposed portion of the tire shoe or cading and the clamping devices.
7. The combination in apparatus of the character specifled, of a core adapted for insertion within a tire shoe or casing, means for clamping the margins of the casing in proper relation to the core while leaving the tread of the shoe or casing exposed, a wrapping or cover for the tire shoe or casing of textile fabric, and means for subjecting the cover of textile fabric to tension.
8. The combination in apparatus of the character speclfied, of a core adapted for insertion within a tire shoe or casing, clamping members for engagement with the margins of the casing and having their exponed lateral surfaces tangent to the surface of the casing, a porous wrapping or cover for the tire shoe or casing, and means for securing the wrapping or cover in position.
9. The combination in apparatus of the character specified, of a structure adapted to support and hold a tire shoe or casing and leave the tread surface exposed, said holding structure presenting lateral channels, a porous wrapping or cover for the shoe or casing and the holding and supporting structure, and means for forcing said cover or wrapping into said channels to place the said wrapping or covering under tension.
10. The combination in apparatus of the character specifled, of devices for securely hoiding and supporting a tire shoe or casing in the form to be permanently held thereby, sald devices leaving the tread portion of said shoe or casing laxposed, a cover of porous material adapted to fit snugly on the exposed portion of the shoe or casing, and means for securing the cover in position.
11. The combination in apparatus of the character specifled, of a core adapted for introduction within a tire shoe or casing and clamping members adapted to secure the shoe or casing in position upon the core and leave the tread portion thereof exposed. said core and said clamping members co-operating to mould the margins of the shoe or casing to proper form.

No. 101,665. Magneto-Electric Dumb Bell.
Haltères magneto-électrique.

James Moores, St. Lesmo, Hastings Avenue, Chlorton-cumHardy, Manchester, England, 23rd Octoher, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136.910.
Claim.-1. The combination in a dumb beil of a magnetelectricity generator and clockwork for driving the armature of the magneto, substantially as hereinbefore described.
2. The combination in a dumb bell of a magneto-electricity generator, alockwork for driving the magneto armature, and a speed retarding device, substantially as hereinbefore described.
3. The combination in a dumb bell of a magneto-electricity generator, clockwork for driving the armature, and a starting and stopping device operable by the user, substantially as herein before described.
4. The combination with a pair of dumb bells of a mag-neto-electricity generator, clockwork for driving the armature of the same, a conductor from one pole of the armature to one bell, and a conductor leading from the other pole to the other bell, substantially as hereinbefore described.
5. The combination with a pair of dumb bells of a mag-neto-electricity generator, clockwork for driving the armature of the same, a starting and stopping device operable by the user, a conductor from one pole of the armature to one bell and a conductor leading from the other pole to the other bell, substantially as hereinbefore described.

No. 101,666. Apparatus for Extracting Turpentine, Ftc.

\section*{Appareil pour extraire de la térébentinc.}

Malcolm McKenzle, Plainfleld, New Jersey, U.S.A., 23rd October, 1906; 6 years. Filed th June, 1906. Recelpt No. 136,527.
Claim.-1. The method of treating wood which consists in subjecting the wood to the aotion of a bath in a suitable vessel, removing the bath to a separate vessel and agitating and cooling the same, then re-heating the bath to its former temperature and returning same to the vessel containing the wood.
2. The herein described method of treating wood which consists in subjecting the wood to the action of a suitable bath, removing portions of the bath. reducing the temperature of suoh memoved portion, and then returning same to the bath.
3. The method of treating wood which consists in subjecting the wood to the action of a bath, continuously removing a portion of the bath, agitating and cooling such removed portion and then returning said portion to the original bath.
4. The method of treating wood which consists in subjecting the wood to the action of the bath, continuously removing a portion of the bath, agitating and cooling such removed portion by steam, then re-heating such removed portion of the bath to its original temperature and returning same to the bath, substantially as described.
5. An apparatus for the extraction of turpentine, etc., from wood, comprising a vessel for the reception of the bath with which the wood has been treated, means for circulating the bath between the two vessels, means for cooling the portion of the bath contained in the second-named vessel, means for condensing the vapours from the secondnamed vessel, and means for re-heating the bath prior to its return to the first-named vessel.
6. An apparatus for the extraction of turpentine, etc., from wood, comprising a vessel for the reception of the wrod to be treated, a vessel for the reception of the bath with which the wood has been treated, means for circulating the bath between the two vessels, means for introducing steam into the bath in the second-named vessel, means for condensing the vapours from the second-named vessel, and means for re-beating the bath on its return fnom the secondnamed vessel to the first-named vessel.

\section*{No. 101,667. Inhaler for Anaesthetics. Inhalateur pour anesthésiques.}

William Webster, Winnipeg, Manitoba, Canada, 23rd October, 1906; 6 years. Filed 1st June, 1906. Receipt No. 136.462. Claim.-1. In a device of the character described the combination comprising a casing open at one end, a pad secured to the open end of the casing, inlet and outlet openings in the opposite end of the casing, spring actuated valves adapted to close sald openings, and means for admitting an anaesthetic to the casing.
2. In a device of the character described the combination comprising a casing open at one end, a pneumatic pad secured to the open end of the casing, inlet and outlet openings provided in the casing, valves normally closing the openings, means for admitting an anaesthetic to the casing, and means for maintaining a body of absorbent material in the casing.
3. In a device of the character described the combination comprising a casing open at one end, a body carried by the open end of the casing, means permitting the ingress and egress of gas from the casing, means for admitting a liquid anaesthetic to the casing, a vertical partition carried by the casing, a spring carried by the vertical partition, a corresponding spring carried by the casing, a perforated plate supported by the springs, and flanges carrled adjacent the perforated plate.
4. In a device of the character described the combination comprising a casing open at one end, a pad on the casing, means for maintaining a body of absorbent material in the casing, a fllling tube disposed through the wall of the casing and provided with perforations, means for admitting gas to the casing, and means permitting the escape of gas from the casing.
5. In a device of the character described the combination comprising a containing casing having an open end, a pad

secured to the casing at its open end, means for maintaining a body of absorbent material in the casing, means for admitting a liquid anaesthetic to the casing, a hood secured to the casing adjacent an opening provided therein, a cap disposed over the hood and provided with an opening, an annular casing disposed around the opening provided in the wall of the containing casing, a web disposed across the annular casing, a standard carried by the web, a spring disposed around the standard, a valve carried on the spring, \(a\) cap carried by the annular casing, and means adapted to permit the escape of gas from the casing.
6. In a device of the character described the combination comprising an open ended containing casing provided with inlet and outlet openings, a pad secured to the containing casing adjacent its open end, means for retaining a body of absorbent material in the casing, means for admitting a liquid anaesthetic to the casing. means for admitting a gas through the inlet opening in the casing, and an annular casing disposed around the outlet opening in the containing casing, a web dispos?d acros3 the annular casing, a standard carried by the web, a spring disposed around the standard, a valve disposed around the standard, and a perforated cap on the annular casing.

\section*{No. 101,668. Winding Machine. Machine d bobinage.}

The Northern Electric and Manufacturing Company, Montreal, Quebec, Canada, assignee of Edwin H. Smythe, Chicago, Illinois, U.S.A., 23rd October. 1906; 6 years. Filed 12th July, 1906. Receipt No. 137,735.
Claim.-1. In a winding machine the combination with a positively driven spool ring adapted to surround the core to be wound, of a guide adapted to convey the wire from tho spool to the core, said guide being mounted to slide around the circumference of the spool ring while being driven frictionally thereby.
2. In a winding machine the combination with a rotatable spool ring adapted to surround a core to be wound, and means ior positively driving said spool ring, of a gulde adapted to convey the wire from caid spool to said core, sald guide being firictionally driven by said spool ring but having a slip relative thereto according to the pull of the wire passing over said guide.
3. In a winding machin
driven spool ring adapted the combination with a positively driven spool ring adapted to be interlinked with a closed core, of a guide for directing the wire from the spool to the core, said guide being mounted upon the ring to be rotated thereby but having a relative movement of rotation thereon as the wire is unwound from the spool, and spring means for maintaining the guide advanced upon the spool to the bight of the loop of wire which passes over said guide between the spool and core, whereby said wire is held taunt.
4. In a machine for winding closed doors the combination with a spool ring adapted to be interlinked with the core, of means for positively driving said spool ring, a guide adapted to direct the wire from the spool over the side thereof and toward the core to be wound, said guide being mounted to move backward around the spool ring as the wire is unwound therefrom, a drag also mounted to move around the ring but having firictional engagement therewith and a spring connection between said drag and said guide whereby the guide is driven in the rotation of the spool ring and the wire being wound is held taunt.
5. In a winding machine the combination with a rotating ring. of a drag rotated frictionally by said ring and having a slip relative thereto, and a gulde connected to said drag by an extensible spring, substantially as set forth.
6. In a winding machine the combination with a spool ring. of means for positively driving the same, and a guide slidably mounted on said spool ring.
7. In a winding machine the combination with a positively Uriven spool ring having an endless way thereon, of a guide mounted to move on said way.
8. In a winding machine the combination with a positively driven spool ring having an endless way thereon, of a frictional drag and a wire guide mounted to move on sald way and a resilient connection between said drag and said guide.
9. In a winding machine the combination with a positively driven spool ring, of an endless way on said spool ring, a frictional drag and wire guide mounted to move on said way. a helical spring connecting said drag with said guide and a supporting block for said spring adapted to slide along said way.
10. In a winding machine the combination with the driving mechanism, of a spool ring adapted to be rotated at an approximately constant speed, and a frictionally driven wire guide adapted to be rotated at a variable speed concentrically with said spool ring.
11. In a winding machine the oambination with the driving mechanism, of a spool ring adapted to surround the core to be wound and to be notated at an approximately coastan speed, a frictionally driven guide rotating concentrically with said spool ring and adapted to convey wire from said spool ring to the core, and means adapted to vary the opeed of rotation of said guide, whereby the rate of transfer of wire from said spool ring is regulated and the accumulation of slack prevented.
12. In a winding machine for winding closed cores, the combination with the driving mechanism, of a spool ring intenlinked with the core to be wound and adapted to be rotated at an approximately constant speed, said spool ring having wire wound thereon, a frictionally driven guide rotating concentrically with sald spool ring, the wire passing from said spool ring to the core to be wound by way of sald guide, the pull on said wire being adapted to vary the speed of rotation of said guide, whereby the rate of transfer of wire from said spool ring is automatically regulated and the accumulation of slack prevented.

\section*{No. 101,669. Match Making Machine. Machine d faire des allumettes.}

The Sarnia Match Company, Sarnia, Ontario, Canada, assig. nee of William F. Hutchinson Nlack, New York, US.A. 23rd October, 1906; 6 years. Filed 21st August, 1906. Beceipt No. 138,899 .
Claim.-1. A match machine comprising a recelprocating buide bar heving transverse stock recelving recesses there in, means for cutting off the stock in the recess when the guide bar is moved in either drection, and means for ejecting the splinits thus formed from the said recesses.
2. A match machine comprising a reciprocating guide bar having transverse stock receiving recesses therein. oppo sitely arranged knives held opposite the gulde bar and adapted to cut-off the stock when the guide bar is moved in either direotion, and means for ejecting splints from the recesses in the guide bar.
3. A match machine comprising a movable guide havink transverse stock receiving recesses on opposite sides there-
of, means for cutting off the stock in the aforesaid recess, and means for ejecting splints from the said recesses.

4. A match machine comprising a reciprocating guide bar having transverse stock receiving recesses therein means for cutting off the stock while it is held in the said recesses by the movement of the guide bar in either direction, and means for ejecting the splints endwise from the said recesses.
5. A match machine comprising a reciprocating guide bar having transverse stock receiving recesses therein, cutting mechanism to sever the stock while it is heid in the recesses, means for operating the cutting mechanism bv the movement of the guide in either direction, and plungers moving endwise through the recesses to eject the splints therefrom.
6. A match machine comprising a reciprocating guide bar having transverse stock recelving recesses therein, means for feeding stock into the recesses, means for cutting off the stock in the recesses by the movement of the guide har in either direction, and means for ejecting the splints endwise from the recesses.
7. A match machine comprising a reciprocating guide bar having transvense stock receiving recesses extending across its entire width, means for feeding stock into the recesses, knives held opposite the guide bar to sever the stock. and means for ejecting splints endwise from the sail recesses.
8. A match machine comprising a reciprocating guide bar having transverse stock receiving recesses therein. knives held flatwise against the guide bar to sever the stock by the movement of the guide bar, and yielding guides behind the knives, the said guides being arranged opposite the recesses of the guide bar.
9. A match machine comprising a reciprocatino guide bar having transverse stock recelving recesses therein. means for cutting off the stock while it is held in the guide bar. and ejecting plungers movable in the recesses of the guide bar, the said plungers being arranged to side with the guide bar and to also move lengthwise through the recesses of the guide bar.
10. In a match machine, a reciprocating guide bar having transverse stock receiving recesses therein, oppositely arranged stationary knives held parallel with and close against the side bar, and a guide casing extending from knife to knife opposite the guide bar.
11. A match machine comprising a reciprocating guide bar having transverse stock receiving recesses therein, oppositely arranged knives held parallel with and close against the guide bar, a yielding guide or casing extending from knife to knife and arranged opposite the guide bar, and ejecting means for forcing splints lengthwise from the recesses in the guide bar.
12. A match machine comprising a reciprocating guide bar having transverse stock receiving recesses on opposite sides thereof, opposed pairs of knives arranged on opposite sides of the gulde bar, parallel therewith, each knife having its edges in opposite directions, guide extending between the knives of each bar, and plungers movable through the recesses of the guide bar.
13. In a match machine the combination with the reciprocating aud recessed guide bar having means for cutting splints in the recesses, of the piungers arranged to enter the recesses of the guide bar, the said plungers moving with the guide bar and also through the recesses thereof and being arranged in series one series moving through the aforesaid recesses while the other series is stationary.
14. In a match machine, the combination with the recessed stock receiving guide bar, of the independent heads arranged above the guide bar and moving in unison therewith the said heads being vertically movable in relation to each other, and plungers on the heads, which plungers enter and move through the recesses of the guide bar.
15. In a match machine, the combination with the splint discharging mechanism and the splint carrying frames, of means for feeding the frames opposite the splint discharging mechanism, and means for giving the frames an extra movement as their ends come opposite the splint discharging mechanism.
16. In a match machine, the combination with the splint discharging mechanism and the carrying frames movable opposite the splint discharging mechanism, of a series of ratchet wheels and pawls operatively connected with the splint carrying frames to feed them one of the ratchet wheels and pawls having an extra throw timed to give an added movement to the frames as their ends come opposite the splint discharging mechanism.
17. In a match machine, the combination with the stock feed, of a supplemental feed normally out of use but adapted to carry stock to the regular feed, and means for throwing the supplemental feed into operation by the exhaustion of stock from the regular feed.
18. In a match machine, the combination with the regular stock feed, of a supplemental feed normally out of action but adapted to carry stock to the regular feed, and means for throwing the supplemental feed into action by a break in or exhaustion of the regular stock.
19. In a match machine, the combination with the regular stock feed, of a supplemental feed normally out of action but adapted to carry stock to the regular feed, electrically operated means for throwing the supplemental feed into action, and means for starting the electrically operated mechanism by a break in the stock.
20. In a match machine, the combination with the regular stock feed, of a supplemental feed normally out of action out adapted to carry stock to the regular feed a circuit closer operatde by a break in the stock, and means actuated by the closing of the circuit to throw the supplemental feed into action.
21. In a match machine, the combination with the regular stock feed, of a supplemental feed normally out of action but adanted to carry stock to the regular feed, a magnet operated latch arranged to hold the supplemental teed out of action, and means operated by a break in the siok to energize the magnet and release the latch and throw the supplemental feed into action.
22. In a match machine, the combination with the regular stock feed, of a supplemental feed normally out of acfion but adapted when in use to advance stock to the regular feed, a circuit closer normally held open by the passage of the stock through it, electro-magnets in circuit with the circuit closer, and a latch operated by the energizing of Te magnets to release the supplemental feed and permit it to go into oneration.
23. In a match machine, the guide bar transversely recessed to receive stock, the said recesses being arranged on opposite sides of the guide bar and each recess having an abrupt wall on one side and an inclined wall on the opposite side.
24. In a match machine, the combination with the recesscd stock receiving guide bar, the said recesses being each provided with an abrupt and an inclined wall, and a suitable cut-off knife, of spring actuated means for pressing the stock against the abrupt wall of the said recesses.
25. A match machine, comprising a movable guide having transverse stock receiving recesses on opposite sides thereof, means for feeding stock into the said recesses, means for cutting the stock off in the said recesses, and means for ejecting the splints from the recesses.
26. A match machine, comprising a movable guide having transverse stock receiving recesses o nopposite sides thereof, means for feeding stock in opposite directions towards said guide, means for cutting off the stock in the recesses, and means for ejecting splints from the recesses.

\section*{No. 101,670. Loom. Métier.}

William F. Clayton and Cliffton P. Bentley, co-inventors, both of Atlanta, Georgia, U.S.A., 23rd October, 1906; 6 years. Filed 31st August, 1906. Receipt No. 139,123.
Claim.-1. The combination with a beam of a loom, of an arm pivotally connected to the beam, a resilient finger depending therefrom and normally held by gravity upon fabric woven in the loom, and means actuated by the arm for stopping the mechanism of the loom.
2. The combnation with a beam of a loom, of a rod rotat. ably mounted upon the beam, an arm extending therefrom, a spring controlled finger depending from the arm and normally contacting by gravity with fabric woven by the loom, and means actuated by the arm for stopping the mechanism of the loom.
3. A detector rod mounted with its point upon the cloth and having an extension, a knock-off lever and weft hammer, a latch bar connecting with the knock-off lever and supported by said extension to engage the weft hammer when the point enters the cloth.
4. A pivotally mounted detector rod having a cloth engagir:g point and an extension, a weft hammer and a latch bar

supported by said extension above said hammer and means t.) utilize the movement of the latch bar when the latter is siruck by the weft hammer incident to the point entering the cloth.
\(\therefore\). The combination with the knock-off lever, of a detector rod having an arm, a latch bar supported by the arm and a woft hammer designed to cause the latch bar to operate the knock-off lever.
6. The combination with the knock-off lever, of a pivoted detector rod, an arm upon the rod, a latch bar supported by the arm and connecting with the knock-off lever and a weft hommer designcd to engage the lateh bar and operate the knock-off lever.
7. The combination with the knock-off lever and weft hammer, of a detector rod, a latch bar connecting with the knock-off lever and means upon the detector rod for normally supporting the lateh bar out of engagement with the weft hammer.
h. The combination with the knock-off lever, weft hammer and hammer hook, of a detector rod, a latch bar connecting with the knock-off lever and having a projection designed to be engaged by the hammer hook, an arm upon the detector rod adapted to normally support the latch bar out of engagement with the hammer hook.
9. The combination with the knock-off lever and weft hammer, of a pivoted detector rod, a finger upon the rod to rast upon the cloth, an arm upon the rod, a lateh bar supported by the arm out of the path of the woft hammer when the li:ger is resting on the cloth whereby the lateh bar will move irto engagement with the weft hammer when the finger passes through the cloth.
10. In a mechanism of the class described the combination with the knock-off lever, hammer and weft hammer hook, of a pivoted detector rod, a latch bar pivoted to the knock-off lever provided with a projection in the line of travel of the hammer hook, and means upon the detector rod for normally supporting the latch bar out of engagement with said hook.
11. In a mechanism of the class described, the combination with the knock-off lever, hammer and weft hammer hook, of a pivoted detector rod. a latch bar pivoted to the knock-off lever provided with a projection in the line of travel of the hammer travel of the hammer hook, and means upon the detector rod for normally supporting the latch bar out of engagement with said hook.
12. In a mechanism of the class described the combination with the knock-off lever, weft hammer, and hammer hook, of a pivoted detector rod, a latch bar pivoted to the knockoff lever having a projection adapted to engage the hammer hook, and an arm upon the detector rod for normally keeping the latch bar out of engagement with the hammer hook.
13. In a mechanism of the class described the combination with the knock-off lever, weft hammer, and hammer hook. of a pivoted detector rod, a finger upon the rod adapted to rest upon the rod, an arm upon the rod, a latch bar provided with a projection supported by the arm above the hammer hook, when the finger is resting upon the cloth, and permitting the projection to engage the hammer hook when the finger descends, and pivoted connections between the knock-off lever and latch bar.

\section*{No. 101,671. Stop Motion for Looms.}

\section*{Mouvement l'arrêt pour métiers.}

Sydney Turner, Toronto. Ontario, Canada, 23rd October, 1906 ; 6 years. Fjled 7 th June, 1906. Receipt No. 136,645.

Claim.-1. A stop motion comprising a rocker arm, a detent bar to hold the rocker arm in an operative position, a
pair of friction rolls, and a trip bar actuated by the friction rolls to release the engagement of the detent bar with the rocker arm.

2. A stop motion comprising a spring actuated rocker arm, a detent bar to hold the rocker arm in an operative position, a pair of friction rolls and a trip bar actuated by the friction rolls to release the detent bar from engagement with the rocker arm.
3. A stop motion comprising a rocker arm, a detent bar to hold the rocker arm in an operative position, a pair of frictional rolls, a trip bar actuated by the friction rolls to relcase the engagement of the detent bar with the rocker arm, and means to restore the trip bar to its initial position when the rocker arm has been released by the detent bar.
4. A stop motion comprising a rocker arm, a detent bar to hold the rocker arm in an operative position, a pair of friction rolls, a trip bar actuated by the friction rolls to release the engagement of the detent bar with the rocker arm, means to restore the trin bar to its initial position when the rocker arm has been released by the detent bar and a stop connected to the rocker arm to fix the initial position of the trip bar.
5 . A stop motion comprising a rocker arm having a trip bar support, a detent bar to engage and hold the rocker arm in an operative position, a pair of friction rolls arrang. rd one above and the other below the trip bar support, \({ }^{2}\) trip bar slidable longitudinally on the trip bar support and actuated by the friction rolls to release the engagement of the detent bar with the rocker arm.
6. A stop motion comprising a rocker arm having a trip bar support, a detent bar to engage and hold the rocker arm in an operative position, a pair of friction rolls arranged one above and the other below the trip bar support, a trip bar slidable longitudinally on the trip bar support and actuated by the firiction rolls to release the engagement of the detent bar with the rocker arm, and means to restore the trip bar to its initial position when the detent bar has been released from engagement with the rocker arm.
7. A stop motion comprising a rocker arm having a trip bar support, a detent bar to engage and hold the rocker arm in an operative position, a pair of friction rolls arranged one above and the other below the trip bar support, a trip bar slidable longitudinally on the trip bar support and actuated by the priction rolls to release the engagement of the detent bar with the rocker arm, means to restore the trip bar to its initial position when the detent bar has been released from engagement with the rocker arm, and a stock connected to the rocker arm to fix the initial position of the trip bar.
8. A stop motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar piroted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rocker arm above the trip bar support, a second friction rol located below the trip bar support, adjustable bearings for the second-mentioned friction roll, means to cause the united revolution of the friction rolls, means for imparting motion to the pint=- wieels and friction rolls, and a trip bar slidab: = songitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to re-
lease the latch of the detent bar from engagement with the rocker arm.
9. A stoD motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar pivoted 10 the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rocker arm above the trip bar support, a second firiction roll located below the trip bar support, adjustable bearings for the second-mentioned friction roll. means to cause the united revolution of the friction rolls, means for imparting motion to the pinion wheels and friction rolls, a trip bar slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm and a cushion yieldingly supporting the bearings of the second-mentioned thiction roll.
10. A stop motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar pivoted to the machine irame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rocker arm above the trip bar support. a second friction roll located below the trip bar support. adjustable bearings for the second-mentioned friction roll. means to cause the united revolution of the friction rolls, means for imparting motion to the pinion wheels and eriction rolls. a trip bar slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm, a cushion yleldingly supporting the bearings of the second-mentioned frletion roll, and means for adfusting the cushion to regulate the frictional contact of the friction rolls unon the trip bar.
11. A stop motion comprising a marhine frame, a rocker arm rockably connected with the machine frame. a trip bar support carried by the rocker arm. s detent bar pivoted to the maching frame, a lateh connereted with the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connocted with the rocker arm above the trip bar support. a second friction roll lorated below the trip bar support, adjustable bearings for the second-mentioned priction roll, means to cause the united revolution of the friction rolls. means for imparting motion to the pinion wheels and friction rolls, and a trip bar slidable longitudinally upon the trip bar support and artuated in a forward dircction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm, and means for restoring the trip bar to its initial position when the rocker arm is relcased from engagement with the detent bar.
12. A stop motion romprising a machine frame. a rocker arm rockably connectod with the machinc frame. a trip bar support carried by the rocker arm. a detent bar pivoted to the machine frame, a lateh connected to the detent bar to engage the rocker arm and and hold it in an operative position. a friction roll revolubly connected to the rocker arm above the trip bar support, a second friction roll lorated below the trip bar support. adjustable bearings for the second-mentioned friction roll, means to cause the united revolution of the friction rolls, means for imparting motion to the pinion wherls and friction rolls, and a trip har slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to reluase the latch of the detent bar from engagement with th. rockor arm. means for restoring the trip bar to its inlial nosition when the rocker arm is released from ent gazement with the detent bar, and a cushion yieldingly sumporting the bearings of the second-mentioned friction roll.
13. A ston motion comprising a machine frame, a rocker arm rockably connected with the machinc frame, a trip bar support carried by the rocker arm. a detent bar pivoted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rocker arm above the trip bar support, a scoond friction roll located below the trip bar support, adjustable bearings for the second mentioned friction roll, means to cause the united revolution of the friction rolls. means for imparting motion to the pinion wherls and friction rolls, a trip bar slldable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the latch of the detent hartfrom engagement with the rocker arm, moans for restoring the trip bar to its inltial position When the rocker arm is released from engagement with the Artent bar, a cushion yleldingly supporting the bearings of the second-mentioned friction roll, and means for adjusting the cushion to regulate the frictional contact of the friction rolls upon the trid bar.
14. A stop motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar pivoted to the machine frame, a lateh connected to the detent bar to engage the rocker arm and hold it in an operative losition, a friction roll revolubly connected to the rocker arm above the trip bar support, a second friction roll located below the trip bar support, adjustable bearings for the second-mentioned friction roll, means to cause the tillited revolution of the friction rolls, means for imparting motion to the pinion wheels and friction rolls, a trip bar sidable longitudinally upon the trip bar support and artuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with iher rocker arm, and an adjustable stop connected to the rockir arm 10 fix the initial position of the trip bar.
15. A stoll motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar pivoted to the machine frame, a lateh connected to the detent bar to rngage the rocker arm and hold it in an operative position. a friction roll revolubly connected to the rocker arm above the triy bar support, a serond friction roll located brlow the trip bar support, adjustable bearings for the second-mentioned friction roll. means to cause the united revolution of the friction rolls, means for imparting motion to the ninion wheels and friction rolls, a trip bar slidabl. longitudinally unon the trip bar support andactuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm, a cushion yieldingly supporting the bearings of the second-mentioned friction roll, and an adjustable stop connected to the rocker arm to fix the initial position of the trip bar.
16. A ston motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar plvoted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position. a friction roll revolubly connected to the rocker arm above the trip bar support, a second friction roll located below the trip bar support, adjustable bearings for the second-mentioned friction roll. means to cause the united revolution of the friction rolls, means for imparting motion to the pinion whecls and friction rolls, a trip bar sildable lngitudinally upon the trin bar support and actwated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm. means for adjusting the cushion to regulate the frictional contact of the friction rolls upon the trip bar. and an adjustable ston connoctod to the rocker arm to fix the Initial position of the trip bar.
17. A ston motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm. a detent bar pivoted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative josition, a friction roll revolubly connected to the rocker arm above the trin bar support, a second friction roll located below the trip bar support, adjustable bearings for the second-mentioned friction roll. means to cause the united revolution of the friction rolls, means for imparting motion to the pinion wheels and friction rolls, a trip bar slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm, a friction clutch, a shifting lever to move the riction clutch into an active position, a link rigidly connecting the shifting lever with the rocker arm to cause their united movement, a spring to actuate the rocker arm and shifting lever co-incident with the release of the rocker arm by the detent bar, and means for moving the rocker arm and shifting lever into their active position.
18. A stop motion comprising a machinc frame, a rocker arm rockably connected with the machine farme, a trip bar support carried by the rocker arm, a detent bar pivoted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rncker arm above the trip bar support, a second friction roll located below the trip bar support, adjustable bearings for the second-mentioned friction roll, means to cause the united revolution of the friction rolls. means for imparting motion to the pinion wheels and Priction rolls, a trip bar slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the lateh of the detent bar from engagement with the rocker arm, a friction clutch, a shifting lever to move the friction clutch into active position, a link rigidly connecting the shifting lever with the rocker arm to cause their united movement, a spring to actuate the rocker arm and shifting lever coincident with the release of the rocker arm by the detent bar, means for moving the rocker
arm and shifting lever into their active position, comprising a treadle lever and a link connecting the treadle lever with the shifting lever.
19. A stop motion comprising a machine frame, a rocker arm rockably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar pivoted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rocker arm above the rtip bar support, a second friction roll located below the trip bar support, adjustable bearings for the second-mentioned friction roll. means to cause the united revolution of the friction rolls, means for \(1 m-\) parting motion to the pinion wheels and friction rolls, a trip bar slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm, a cushion yieldingly supporting the bearings of the second-mentioned friction roll, a friction clutch, a shifting lever to move the friction clutch into an active position, a link rigidly connecting the shifting lever with the rocker arm to cause their united movement, a spring to actuate the rocker arm and shifting lever coincident with the release of the rocker arm by the detent bar, and means for moving the rocker arm and shifting lever into their active gosition.
20. A stop motion comprising a machine frame, a rocker arm rotatably connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar pivoted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rocker arm above the trip bar support, a second friction roll located below the trip bar support, adjustable bearings for the second-mentioned friction roll, means to cause the united revolution of the friction rolls, means for imparting motion to the pinion wheels and friction rolls, a trip bar slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm, a cushion yieldingly supporting the bearings of the second-mentioned friction roll, and means for moving the rocker arm and shifting lever into their active position, comprising a treadle lever and a link connecting the treade lever with the shifting lever.
21. A stop motion comprising a machine frame, a rocker arm connected with the machine frame, a trip bar support carried by the rocker arm, a detent bar pivoted to the machine frame, a latch connected to the detent bar to engage the rocker arm and hold it in an operative position, a friction roll revolubly connected to the rocker arm above the trip bar support, a second friction roll located below the trip bar support. adjustable bearings for the secondmentioned friction roll, means to cause the united revolution of the friction rolls. means for imparting motion to the pinion wheels and friction rolls, a trip bar slidable longitudinally upon the trip bar support and actuated in a forward direction by the friction rolls to release the latch of the detent bar from engagement with the rocker arm, a friction clutch, a shifting lever to move the friction clutch into an active position, a link rigidly connecting the shifting lever with the rocker arm to cause their united movement, a spring to actuate the rocker arm and shifting lever coincident with the release of the rocker arm by the detent bar, means for moving the rocker arm and shifting lever into their active position, and a spring to hold the latch member of the detent bar in engagement with the rocker arm.

No. 101,672. Warp Stop Motion Looms. Mouvement d'arrêt de fl pour métiers.

Friedrich Plck, Vienna, Austria, 23rd October, 1906 ; 6 years. Filed 21st'July, 1905. Receipt No. 127,059.
Claim.-Healds for electrical and mechanical warp stop motions for looms for weaving, made of twisted thread and their lower ends furnished with eyes which loosely surround the lower heald rail, substantially as and for the purpose specifled

\section*{No. 101,673. Cutter-Fead. Porte-lame.}

Arthur Wilson Nelson, Chicago, Illinois, U.S.A., 23rd October, 1906 ; 6 years. Filed 1st August, 1906. Receipt No. No. 138,343.
Claim.-A cutter-head comprising a head stock, knives radia!ly disposed thereon, guldeways in the head stock perpendictelar to the knives, and clamps having sliding engagement with the guideways, bearing against the knives.

No. 101,674. Wood Working Machine.
Machine à travailler le bois.

Frank Diehl, Sheboygan Falls, Wisconsin, U.S.A., 23 rd Octo. ber, 1906 ; 6 years. Filed 2nd August, 1906. Repeipt No. 138,365
Claim.-1.A wood working machine comprising a suitable frame provided with parallel slde bars having upper outcr
being provided at its smaller and outer end with two points being provided at its of the tapered edges and a point dis-
forming a continuation of

posed between and extending beyond said two points and located coincident with the axil center of the shaft.

No. 101,677. Teeter Apparatus.
Appared d'amusement.

Frank H. Dickson, Oswego, New York, U.S.A., 23rd October, 1906 ; 6 years. Filed ist September, 1906. Receipt No. 139,155.
Claim.-1. The combination with the supporting frame and the upright spindle secured to said frame and formed with a convexpd top, of a rocker plate provided in its central portion with a longitudinal slot receiving through it the sald spindle and with an inverted V-shaped brace extending upward from the end portions of the plate and lengthwise ver the slot and mounted at its center on the top of the spindle, and the tecth beam composed of parallel menbers mounted on the plate at opposite sides of the slot thereof and recciving between them the aforesald brace, as set forth.
2. The combination of the teeter beam composed of two members disposed side by side with a space between them and provided with a plurality of transverse perforations in their end portions, spacing blocks Interposed between the beam members, tie bolts passing through said parts, seats mounted on the ends of the beam members, tenons depending from the seats and inserted between the beam members, pins inserted removably in the perforations of the beam members and tenons. and posts attached to the tenons, substantially as set forth.
3. An amusement apparatus comprising a suitable support, a teetcr beam pivotally mounted upon said support and composed of two parallel members disposed side by side with a space between them. seats disposed on the ends of the beam and provided with tenons interposed between the beam members, said tenons and beam members being provided with coinciding apertures, and pins inserted removably through said apertures and sustaining the seats adjustably toward and from the center of the beam, as set forth.
 lative to the cutting wheels, means for ylurning wheels re-

ing such depressable wheels in their uppermost position, and guards for receiving the log upon undue depression of said \(\log\) turning wheels. substantially as described.
4. In a rossing machine the combination of cutting wheels itrices extonding from the peripheries of said wheels. co operating sets of log turning wheels and feed wheels, means for vieldingly maintaining said log turning wheels in their uppermost position, and guards carried by said cutting wheels for receiving a log upon undue depression of said log turning wheels, substantially as described.
5. In a rossing machine the combination of cutting wheels. knives extrinding from the peripheries of said wheels, of ofrrating sits of log turning wheels and feed wheels, means for vieldingly maintaining said log turning wheels in their uppermost position, and an annular guard flange carried b. the peripheries of soid cutting wheels for receiving a log upon undue depression of said \(\log\) turning wheels, substantally as deseribod.
6. In an apparatus of the character deseribed the rombination of a series of swivel heads, a feed whee! journalled on each head and provided with a gear, a drive shatt, scries of drive gears carried by said shaft, intermediste gears carricd by each swivel head in mesh with the gear of the corrosponding feed wheel and with one of said drive and means for arially shifting the drive shaft and and simultaneously swinging sald
wherls. subsiantialiv as described.
i. In an apparatus of the character described the combination of a swivel head, a feed wheel journalled thereon, gear carried by said feed wheel, a stub shaft carried by aid swivel head, a sleeve journalled on sald stub shaft, an axially adiustable shaft, a drive sear seced thereto, in tormediate gears carried by said sleeve in mesh with said drive gear and with the gear carried by the feed whee. ibls mons ennneting said stub shaft to sald axially adjustable shaft. substantially as described.
8. In an apparatus of the character described the combiration of cutting wheels, co-operating sets of \(\log\) turnidg wheels and ford wheels means for depressing certain of said if turning wherls relative to the cutting wheels, and means o.g, turning wheels relative to the cutting wheels, a in their for yieldingly maintaining such depressable wheels cutting unpermost position. and a hood disposed over the cuth wheels, substantially as described.
9. In an apparatus of the character described the combination of cutting wheels, co-operatiog sets of log turnint wheels and ford wheels, means for depressing certain of sal lof turning wheels relative to the cutting whecls, means for violdingly maintaining such depressable whecls in :hot unpormost position and a hood removably disposed ofer th ci:tting wheels, substantlally as described.
10. In an apparatus of the character deseribed the combination of a series of swivel heads. a ferd wheel fournalied on each head and provided with a gear, a drive shaft, a series oi drive gears carried by said shaft. intermediate gears car-
ried by each swirel head in mesh with the gear of the corlesponding feed wheel and with one of said drive gears, a sleeve on the drive wheel, a rod connected to the sleeve. and a plvoted lever secured to the rod.
11. In an apparatus of the character desiribed the combl. nation of cutting wheels, a main shaft disposed through the cutting wheels, loose and fixed driving wheels on the shaft arranged outside of the apparatus, co-operating sets of log turning wheels and feed wheels. means for depressing cortain of said log turning wheels relative to the cutting wheels and means for yieldingly maintaining such depressable wheels in thelr uppermost position, substantially as des. cribed.

No. 101,680. Metallic Studding. Montant mitallique.

William James McMartin, Winnipeg, Manitoba, Canada, 23rd October, 1906 ; 6 years. Filed 12th September, 1906. Recelpt No. 139,447 .
Claim.-1. A metallic studding consisting of a single metallic sheet of a substantially \(Z\)-shaped cross sectional form, and having lips extending outwardly from the inner and outer faces of the opposing sides, as and for the purpose specified.
2. A metallic studding formed from a single piece of sheet metal, having a central body portion, side portions turned substantially right and luft at right arghes from the body portion, and end portions turned inwardly from the side portions, and substantially parallel with the body portion, and lips extending upwardly ami outwardly from the faces of the side portions, as and for the purpose specitied.

\section*{No. 101,681, Apparatus for Cutting and Sluicing. Appareil à couper et canueler.}

Samuel H. Richardson, Seattle, Washington, U.S.A., 23rd October, \(1906 ; 6\) years. Filed lith July, 1906 . Receipt No. 137,923.
Claim.-1. In an apparatus of the nature indicated, a cutter provided with peripheral teeth and pockets between said leeth, in combination with means for directing a fluid into said pockets, whereby the cutter is operated.
2. In an apparatus of the nature indicated, a cuiter provided with impact surfaces, and a means for discharging a fluid against said impact surfaces for operating the cutter.
3. In a combined cutting and sluicing apparatus, a cutter, means for directing a fluid to sald critter for operating the same, and mians whereby the fluid after operating the cutter will be dis: ha:ged the:efrom to sluice the material excarated.
4. In a combined cutting and sluicing apparatus, a rotary cutter, means for conveying a fluid to a point adjacent the cutter, and means acted upon by the fluid thus conveyed for operating said cutter.
5. In a combined cutting and sluicing apparatus, a cutter. means for directing a fluid to a point adjacent the cutter for sluicing, and means acted upon by the water for operating said cutter.
6. In a combined cutting and sluicing apparatus, a plurality of cutters, a fluid supply means, and means acted upon by the water from said means for operating said cutters.
7. In an apparatus of the nature indicated, a plurality of cutters, one of said cutters being provided with impact surfaces, and a nozzle arranged by juxtaposition to said impact surfaces.
8. In an apparatus of the nature indicated, a plurality of spaced apart cutters arranged side by side and provided with teeth, the teeth of certain of said cutters belng disposed out alignment with each other, and means for operating said cutters.
9. In an apparatus of the nature indicated, a cutter pron. In an apparatus of the nature cutter movable with the

first-named cutter, and means for directing an operating means ior the cutters against said impact surfaces.
10. In an apparatus of the nature indicatted, a hollow handle, a yair of arms secured thereto, a cutter mounted for rotation between said arms and being provided with pockets atod a nozzle secured to the inner end of said handle and being in alignment with said pockets.
11. In an apparatus of the nature indicated, a handle, a rotary cutter mimber supported from said handle, cutters disposed on opposite sides of said cutter member, and means for operating all of said cutters simultaneously, the axis of rotation of said cutters being at substantially right angles io said handle.

1․ In an apparatus of the nature indicated, a handle, a pair of arms secured thereto. a shaft journalled in said arms and projucting on opposite sides thereof, cutters mounted on said shatt, one of said cutters being disposed between said arms, and means whereby said cutters are operated simultancously.

1:. In an apparatus of the nature indicated, a hollow handle, a nozale secured thereto at one end and a rotary cutter dsposid in advance of the nozzle and being supported from said handle
14. In an apparatus of the nature indicated, a hollow handle. a valve therein, a rotary cutter in advance of the handle and being supported thereby, and means whereby the cutter is operated by a fluid passing through the handle.
15. In an apparatus of the nature indicated, a hollow handle, a flexible tube in communication with one end thereot, a nozzle on the other end of said handle, a valve in sald handle and a rutter disposed in juxtaposition to the nozzle and beins formed with impact surfaces movable past said nozzle.
16. In an apparatus of the nature indicated, a hollow handle. a flexibli tube in communication with one end thereof, a nozzle on the other end of said handle, a rotary cutter supported from said handle and lying in advance of said nozzle. said cutter being formed with impact surfaces disposed in alignment with said nozzle.
17. In an apparatus of the nature indicated, a hollow handle, a flexible tube connected to one end thereof, a pair of arms secured to the other end thereof, a shaft journalled in said arms, a plurality of cutters fixed to sald shaft, one of said cutters being formed with impact surfaces, and mean: for directing fluid from said handle against sald impact surfaces so as to rotate the cutters.
18. In an apparatus of the nature indicated, a hollow handle, a valve therein, a flexible tube connected to one end of the handle, a nozzle secured to the other end of the handle, a pair of arms formed integral with the handle, a shaft journalled in the arms and projecting on opposite sides thereof, a cutter fixed on each end of the shaft. a cutter fixed on the shaft at a point between the arms. said last-named cutter being formed with impact surfaces disposed in alignment with the nozzle.
19. In an apparatus of the nature indicated, a cutter having peripheral staggered teeth, alternately projecting on opposite sides thereof and teeth on one of its sides, said lastnamed teeth also being staggered relatively to each other.

\section*{Nio. 101,682. Bale Tie Machine.}

Machine pour liens de ballote.

Gordon A. Rumbel, Kokomo, Indiana, U.S.A., 23 rd October, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,639.
Claim.-1. A bale tie machine comprising mechanism adapted to convey wire stock within the machinc, means for severing the wire stock into wire blanks in combination with a revoluble detaining head, a series of radially disposed slots therein, a wire twister, a wire loop former adapted to receive, convey and confine an end of wire blank within said slots, said wire twister being adapted to twist said end of wire blank while thus confined within one of said slots.
2. A bale tie machine comprising mechanism adapted to convey wire stock within the machine a predetermined distance, means for severing the wire stock into wire blanks in combination with a revoluble detaining head, a series of radially disposed slots therein, a wire twister, a wire loop former adapted to receive, convey and confline an end of wire blank within said slots, said wire twisters being adapted to twist said end of wire blank while thus confined within one of said slots.
3. A hale tie machine comprising mechanism adapted to convey wire stock within the machine a predetermined distance, means for severing the wire stock into wire blanks of varying lengths by means of adjustment gears of varying diameters in combination with a revoluble detaining head, a serles of radially disposed slots therein, a wire twister, a wire loop formed adapted to receive, convey and confine an end of wire blank within said slots, said wire twisters being adapted to twist said end of wire blank while contined within one of said slots.
4. A bale tle machine comprising a feed wheel adapted to rotate upon a fixed axial plane, a second feed wheel adapted to make intermittent peripheral contact therewith, means for lateral conveyance of wire within the machine a predetermined distance, means for cutting the wire stock into blanks of predetermined varying lengths in combination with a series of slots upon a revoluble detaining bead, a loop former adapted to contact consecutively with said slots, and means for twisting one end of a wire bank while confined within the slot.
5. A bale tle machine comprising wire cutting means consisting of a stationary member and a cam actuated member, means for causing wire to be drawn within the machine a predetermined distance before being cut, a loop former allapted to form a loop upon the end of a wire, a revolving : wister adapted to twist a wire loop, a revolving detaining head, and a series of rotating receptacles adapted to contain the wire and after the wire is cut into lengths, said loop former bi ing atapted to make contact with the wire loop apon the detainlng head, at which time the twister rotates to form the 1 wisted loop.
6. A bale tie machine comprising wire cutting means concicting uf a stationary member and a cam actuated member. means for causing wire to be drawn within the machine a
predetermined distance before being cut, a loop former adapted to have an intermittent rotary movement to twist a wire loop, a rotating detaining head, and a serles of rotating receptacles adapted to contain wire before and after the wire has been cut, said loop former being adapted to make contact with the wire loop upon the detaining head at which time the twister rotates to form the twisted loop.
7. A bale tie machine comprising means for twisting a wire loop consisting of an angularly formed arm adapted to have periodical rotation, means for forming a wire loop consisting of an angularly formed arm adapted to have reciprocated rotation, means for cutting wire into lengths consisting of a stationary member and a cam actuated member. the angular arm for said twisting means being adapted to detain the wire length while the angular arm for said loop forming means performs its rotary movement.
s. A bale tie machine comprising means for twisting a wire loop consisting of an angularly formed arm adapted to have periodical rotation, means for forming a wire loop consisting of an angularly formed arm adapted to have reciprocated rotation, means for cutting wire into lengths consisting of a stationary member and a cam actuated member, the augular arm for said twisting means being adapted to detain the wire length whlle the angular arm for said loop ficrming means performed its rotary movement in combination with a shaft, and a series of receptacles longitudinally and radially disposed thereon.
9. A bale tle machine comprising means for twisting a wire loop consisting of an angularly formed arm adapted to have periodical rotation, means for forming a wire loop consisting of an angularly formed arm adapted to have reciprocated rotation, means for cutting wire into lengths consisting of a stationary member and a cam actuated member in combination with a shaft, a detaining head thereon, a series of receptacles longitudinally and radially disposed thereon, the angular arm for said twisting means being adapted to retain the wire length while the angular arm for said loop forming means performs its rotary movement, suid shaft being adapted to rotate in one direction causing rotation of said detaining head and series of receptacles, and said angular arm or loop forming means being adapted to make contact with the detaining head at the time the angular arm for the twisting means performs its rotation.
10. A bale tie machine comprising a twister having an angularly formed arm adapted to have a periodical rotation, a wire loop former having an angularly formed arm adapted to have reciprocated rotation, means for cutting wire into lengths consisting of a stationary member and a camactuated member in combination with wire wire feeding mechanism, wire straightening mechanism, a serles of recuptacles adapted to contain wire before and after it has been cut into lengths, a wire detaining head and a revoluble shait, said detaining head and series of receptacles to be disposed upon said shaft and to recelve rotation thereby, the angular arm of the twister being adapted to detain the wire length while the angular arm of the loop former performs its rotation, the angular arm of the loop former being adapted to make contact with the detaining head while the angular arm of the twister is performing its rotation.
11. The combination of a rotating twister having a shank portion, and transverscly positioned thereon a wire contacting portion, a rotating lood former having a shank portion and transversely seated thereon a wire receiving iortlon, a revoluble detaining head and radially disposed slots thereon, a wire feeding mechanism and wire cutting mechanism. said loup former being adapted to make contact upon the slots of the detaining head at which time the twister rotates to form the twisted loop.
12. The combination of a rotating twister having a shank portion and transversely positioned thereon a wire contacting portion and mechanism for delivering the wire upon the wire contacting portion, a rotating loop former having a shank portion, and transversely seated thereon a wire receiving portion, a revolving detaining head, and radially disposed slots thereon. wire fecding mechanism and wire cutting mechanism, said loop former being adapted to make contact upon the slots of the detaining head at which time the tuister rotates to form the twisted loon.
13. Thi combination of a rotating twister having a shank portion and transversely positioned thereon a wire contacting portion, and mechanism for delivering the wire upon the wire contacting portion, a rotating loop former having a shank portion and transversely seated thercon a wire roceiving portion. mechanism for rotating the twister. a revoluble detaining head and radially disposed slots thereon. wire freding mechanism and wire cutting mechanism. said loop former being adapted to make contact upon the slots of the detaining heal at which time the twister rotates to form the twisted loop.
14. The combination of a rotating twister having a shank portion, and transversely positioned thereon a wire con-
tacting partion, and mechanism for delivering the wire upon the wire contacting portion, a rotating loop former having a shank" portion, and transversely seated thereon a wire recelving portion, mechanism for rotating the twister and loop former, a revoluble detaining head and radially disposed slots thereon, wire feeding mechanlsm, wire cutling mechanism, and wire straightening mechanism, said loop former belng adapted to make contact upon the slots of the detaining head at which time the twister rotates to form the twisted loop.
15. The combination of a rotating twister having a shank portion, and transversely positioned thereon a wire contacting portion, a rotating loop former having a shank portion and transversely seated thereon a wire receiving portion, a revoluble detaining head and radially disposed slots thereon, wire feeding mechanism, wire cutting mechanism and wire straightening mechanism, said loop former being adapted to make contact upon the slots of the detaining head at which time the twister rotates to form the twisted loop, a shaft, and revoluble thereon a series of radially disposed wire receiving receptacles, said receptacles being adapted to receive wire before and after being cut.
16. The combination of a rotating twister having a shank portion, and transversely positioned thereon a wire contacting portion, a rotating loop former having a shank portion, and transversely seated thereon a wire receiving portion, a revoluble detaining head, and radially disposed slots thereon, wire feeding, wire cutting and wire straightening mechanism, sald loop former being adapted to make contact within the slots of the detaining head at the time the twister rotates to form a twisted wire loop, a shaft, and revoluble thereon a series of radially disposed wire receiving receptacles, a double and similarly toothed conveying wheel mounted upon said shaft, said receptacles being adapted to contaln wire before being cut and after the wire loop has been twisted, said receptacles, conveying wheel and detaining head being adapted to convey wire during their radial movement upon said shaft.
17. The combination of a rotating twister having a shank portion, and transversely positioned thereon a wire contacting portion, a rotating loop former having a shank portion, and transversely seated thereon a wire receiving portion, a revoluble detaining head, and radially disposed slots thereon, wire straightening, wire feeding and wire cutting mechanism, sald loop former being adapted to make contact with the slots of the detaining head at the time the twister rotates to form a twisted wire loop, a shaft, and revoluble thereon, a series of radially disposed wire receiving tube receptacles, a series of radially disposed longitudinally bisected tubes and a double similarly toothed conveying wheel mounted upon said shaft, the overlapping guards 54, said tube receptacles and series of bisected tubes being adapted to contain wire before the wire has been cut and after the wire loop has been twisted, said receptacles, bisected tubes, conveying wheel and detaining head being adapted to convey wire during their radial movement upon said shaft.
18. The combination of a rotating twister having a shank portion 123, and a wire contacting portion 124 , a rotating loop former having a shank portion and transversely seated wire receiving portions 106 and 105 thereon, the revoluble detaining head 47, the separating head 48 and the finger 150, the slots 91 within the detaining head, the feed wheels 18 and 19 with the actuating spring 30 upon the lever 29 , the straightening wheels 35 , the discs 75 and 75 , the dog levers 80 and 81 , the cutting shears 65 and 66 , the spring actuating rod 84 , the lugs 67 and 77 upon the said discs, said loop former being adapted to make contact with the slots of the detaining head at the time the twister rotacc to form a twisted wire loop, the shaft 52 and the series o: tubes 53, the bisected tubes 83 , the conveying wheel 49, detaining head 47 and separating head 48 mounted revolubly upon the shaft, the curved arms 55 radially disposed about and disposed to rotate by operation of sald shaft, the overlapping guards 54 upon said arms, computing devices consisting of the lever 129, the plunger 131, the wheel 135 having a blank periphery and a partially mutilated periphery, the shaft 61 with its radially extending arm 140 , the lever 137 adapted to make contact with periphery of wheel 135 and with arm 140, the arms 62 upon shaft 61 , the guide chamber 64 containing the slot 88 , the blocks 92 upon the detaining head, the depressing arm 111, the crank 90 and the arm 89 rigidly disposed thereon, said crank being adapted to rotate and make contact with the depressing arm 111, said depressing arm being adapted to move within the slot 88, said series of tubes and bisected tubes being adapted to contain wire before said wire has been cut and after the loop has been twisted, said receptacles, bisected tubes, conveying wheel and detaining head being adapted to convey wire during the radial movement of the shaft upon which they are mounted.
\(10-30\)

No. 101,683. Tie for Buildinge.
Lien pour batisses.

Henry Christian Seipp, Pittsburg. Pennsylvania, U.S.A., 23rd October, 1906 ; 6 years. Filed 13th September, 1906. Receipt No. 139,486.
Claim.-1. As a new article of manufacture, a tie or hanger having a body portion and an anchoring portion bent out at right angles from said body portion at one or both ends to form a U-shaped gutter supporting portion which is open at its side or top and ends.
2. A supporting device for walls, joists, etc., formed of a bent U-shaped body portion and an anchoring portion bent out at right angles from each end of said body portion to form a \(U\)-shaped gutter supporting portion which is open at its side or top and ends.

No. 101,684. Miter Clamp. Assemblage d onglet.

Charles Vallet, Amherst, Nova Scotia, Canada, 23rd October 1906; 6 years. Filed 11th August, 1906. Recelpt No. 138,591.
Claim.-1. A mitre clamp comprising a plurality of angularly recessed members, rollers on said members, an angularly recessed member having a roller thereon, a flexible member secured to said last-named angularly recessed member and disposed around said rollers, a lever pivoted to the last-named recessed member and provided with teeth and having the flexible member secured thereto and a pawl adapted to engage the lever.
2. A mitre clamp comprising a plurality of angularly recessed members, each provided with a guard lug, rollers on said members, an angularly recessed member having a roller
disposed thereon, a flexible member having one end secured to the latter recessed member and disposed around said rollers, a lever pivoted to the last-named recessed member and provided with teeth, said flexible member being adjustably secured thereto and a pawl adapted to engage sald teeth.
3. A mitre clamp comprising a plurality of angularly recessed members, rollers on said members, an angularly recessed member having a roller thereon, a fixible member disposed on said rollers, a lever plvotally secured to one of sald members, means for adjustably securing said flexible member to the lever, and means adapted to engage the lever to limit its movement.
4. A mitre clamp comprising a plurality of angularly. recessed members, rollers disposed on said members, a flexible member secured to one of said members and disposed around said rollers, a lever pivotally disposed on one of said members and provided with a lug having a hole therein througb which the flexible member is disposed, means for clamping the flexible member, and means for limiting the movement of the lever.
5. A mitre clamp comprising a plurality of angularly recessed members, rollers disposed on said members, a flexible member secured to one of said members and disposed around said rollers, a lever pivotally disposed on one of said members and provided with a lug having a hole therein through which the flexible member is disposed and having a screwthreaded lug thereon, a wing nut on the screw-threaded lug. and means for limiting the movement of the lever.

\section*{No. 101,685. Thin Leaves for Fabrics. Feuilles minces out tissu.}

Walter Arthur Ker, assignee of Henry Rochester Gregory, both of New York City, New York, U.S.A., L3rd October, 1906; 6 years. Filed 4th July, 1906 . Receipt No. 136,521.
Claim.-1. The method of forming a thin leaf or fabric comprising the following steps combining a volatile solvent, a fibre which acts as a binder and a colouring matter and pouring the same onto a liquid heavier than the volatile golvent.
2. The method of forming a thin leaf or fabric comprising the following steps : combining a volatile oil, a fibre which acts as a binder and a colouring matter and pouring the same onto a liquid heavier than the oil.
3. The method of forming a thin leaf or fabric comprising the following steps: combining a volatile solvent, soluble cotton and a colouring matter and pouring the same onto a liquid heavier than the volatile solvent.
4. The method of forming a thin leaf or fabric comprising the following steps : dissolving soluble cotton in a volatile oil, adding a colouring matter thereto and pouring the same onto a liquid heavier than the oll.
5. The method of forming a thin leaf or fabric comprising the following steps : dissolving soluble cotton in amyl oil, adding a colouring matter thercto and pouring the same onto a liquid heavier than the oil.
6. The method of forming a thin leaf or fabric comprising the following steps : dissolving soluble cotton in amyl oll, adding bronze thereto and pouring the same onto a liquid heavier than the oll.
7. The method of forming a thin leaf or fabric comprising the following steps : dissolving soluble cotton in amyl oll, in substantially the following proportions, one quarter pound of soluble cotton to one gallon of amyl oll combining therewith a colouring matter in the proportions of one part of colouring matter to four parts of the solution and pouring the same onto a liquid heavier than the oll.

\section*{No. 101,686. Machine for Gimlet Pointing Lag Screws.}

\section*{Machine pour pointer la eis a bois en forme de vrille.}

The St. Louis Screw Company, assignee of Edward Joseph Miller. St. Louls, Missouri, U.S.A., 23rd October, 1906; 6 years. Filed 26th March, 1906. Receipt No. 134,261.
Claim.-1. In a machine of the type described the combination of a spindle for rotating the blank, a slide moving at an angle thereto, a lead screw in connection with said spindle, a rod advanced by said lead serew, a roller borne by said rod, an incline upon sald slide upon which sald roller acts.
2. In a machine of the type set forth the combination of a spindle for rotating the blank, a slide movable at an angle thereto, a rod actuated lengthwise by the spindle for actuating sald slide, and means to permit the speed of travel of the slide with relation to the blank to be varied.
3. In a machine of the type set forth the combination with a spindle for rotating the blank. of a slide carrying cutters movable at an ancle thereto. means actuated by said spindle for operating said slide, means for automatically stopping the travel of said slidn at a predetermined point. and a spring connected to said slide for restoring said slide and the actuating means thereof to initial position.
4. In a machine of the type set forth the combination of \(n\) spindle for rotating the blank, a slide movable at an angle

thereto, means operated by said spindle for actuating sald slide, and adjustable means carried by the slide for engagement with said actuating means thereof.
5. In a machine of the type set forth the combination of a spindle for rotating the blank, a slide movable at an angle thereto, means operated by said spindle for actuating the slide, and an adjustable plate carried by the slide for engagement with said actuating means thereof to permit the speed of travel of the slide with relation to the blank to be varied.
6. In a machine of the type set forth the combination with means for rotating the blank, of a slide movable at an angle thereto, means for operating the slide, and a spring connected to the slide for returning said slide and the operating means thereof to initial position after actuation.
7. In a machine of the type described the combination of rotatable means for holding the blank, cutters movable with respect to said means, auxiliary means for holding said blanis in contact with said cutters, and means for actuating said cutters past the blank to permit the blank to drop by gravity from said holding means after the operation of said cutters thereon.
8. In a machine of the type described the combination of means for rotating the blank, a slide movable at an angle thereto, and having an inclined part, a rod carrying a projection on its end to engage said inclined part and operate the slide, and means for advancing the rod.
9. In combination with a spindle for rotating the blank, and a lead screw in connection with said spindle, a slide, a slidable frame carrying a lever formed with a toothed part to engage said lead screw, a trigger for retaining said lever in engagoment with the lead screw, means operated by the frame for actuating the slide, and means for operating said trigger to release the lever from engagement with sald lead screw at a predetermined point.
10. In a machine of the type set forth the combination of a spindle for rotating the blank, a lead screw in connection with said spindle, a slide movable at an angle to said blank. a slidable frame, a lever having a threaded part to engage the lead screw carried by said frame, a trigger for retaining said lever in engagement with said lead screw. a rod actuated by said trame for operating the slide, and means for operating said trigger to release the lever from engagement with the lead screw at a predetermined point
11. In a machine of the type set forth the combination of a spindle for rotating the blank, a lead screw in connection with said spindle, a slide movable at an angle to sald spindle. a rod advanced by said lead screw for operating said slide, a lever having connection with said rod, and having a threaded part to engage the lead screw, a trigger for retaining said lever in engagement with sald lead screw, and means for actuating the trigger to release the lever from engagement with the lead screw at a predetermined point.
12. In combination with means for holding the blank, a longitudinally movable element having a projection on one end, and a slide having an Inclined portion normally disposed across the path of movement of said element for engagement with said projection to be propelled in advance of and by said element.
13. The combination of a spindle for rotating the blank. a slide having movement across the end of the blank, the edge of a component part of said slide being disposed at an incline. and slidable means actuated by the spindle for riding on and traversing said inclined edge to actuate the slide.
14. In combination with means for actuating the blank, a slide having cutters mounted thereon with their cutting edges
presented at an angle to sald blank, and means for actuating the slide to cause said cutters to traverse the free end of the blank to cone point and gimlet point said blank in one continuous operation.
15. The combination with means for rotating the blank, of a slide carrying a cone pointing and gimlet polnting cutter, said cutters being angularly disposed with relation to said blank, the angle of disposition of the cutters being equal to the angle of the gimlet point to be imparted to the blank, and means for actuating the slide to traverse the free end of the blank
16. In combination with means for rotating the llank, a cutter carrier, cutters stationarily mounted on sald carrier for successively cone pointing and gimlet pointing the blank, and means for operating the carrier past the blank, to enable the blank to be cone pointed and gimlet pointed in one continuous operation.
17. In a machine of the type set forth the combination of means for rotating the blank, a slide movable at an angle thereto, a rod carrying a projection on its end to operate the slide, means for advancing the rod, and an element carried by the slide and having an edge thereof presented at an aingle to the path of movement of the rod, said edge being engaged by said projection.
18. In combination with means for rotating the blank, a longitudinally movable element having a projection on one end, a slide having the edge of a component part thereof presented at an angle to said element and being engaged by said projection, means for operating the element, and means connected to the slide for restoring the same to initial position, said slide restoring said element to initial position during ite return movement.
19. In combination with means for rotating the blank, a longitudinally movable element carrying a projection, a slide having an inclined portion engaged by said projection, means to operate the element, and a spring connected to the slide for returning the same to normal position, said slide during its return movement restoring said element to its normal position.
20. In combination with means for holding the blank, a rod having a projection, a slide having an inclined part to engage the projection, means for advancing the rod, and a spring connected to the slide for returning the same to initial position, said slide returning sald rod to its initial position.
21. In combination with means for holding the blank, a sliding element with means for actuating the same, a slide movable across the path of sald element and above the same. said sllde having an inclined part for engagement with said element, and means connected to said slide whereby when the same is restored to initial position. said element will be likewise restored and in advance of sald slide.
22. In combination with means for rotating the blank, a longitudinally movable rod having a projection on one end, a slide overlying said rod and disposed angularly across the same, said slide having an inclined part engaged by said projection, and means for advancing the rod.
23. In combination with means for holding the blank, a longitudinally movable element having an upright projection on one end. a slide having an inclined portion at its rear end for engagement with said projection, said element underlying said slide, and means for operating said element.
24. In combination with means for holding the blank, means slidable in a longitudinal plane, a slide overlying said means and movable in a plane at an angle thereto, and thereacross, and an inclined part on the slide engaging said means, said means being adapted to actuate said slide.

No. 101,687. Water Motor. Moteur deau.

Adolph Lang, Harper Forrest Smith and Charles Henry Zink, each an assignee of a third interest, all of Philadelphia, Pennsylvania, U.S.A., 23rd October, 1906; 6 years. Filed 11th Auguts, 1906. Receipt No. 138,611.
Claim.-1. In a water motor, a reciprocating piston, a hollow slide valve controlling admission and exhaust of motive
fluid to actuate said piston, and means actuated by said pison for controlling the movement of said slide valve.
2. In a water motor, a reciprocating piston, a slide valve around which motive fluid passes to actuate said piston and through which the exhaust from said piston passes, and means actuated by said piston for controlling the movement of said slide valve.
3. In a water motor, a reciprocating piston, a hollow slide valve around which motive fluid passes to actuate said piston and through which the exhaust from said piston passes, a throw valve for controlling the movement of said slide valve, and means operatively connected with said piston and said throw valve for actuating the latter at each end of the stroke of said piston.
4. In a water motor, a casing having an inlet and outlet chamber therein. a slide valve located above said chambers and controlling the inlet and exhaust of fluid, a piston located above said slide valve, the latter controlling the admission of fluid thereto and exhaust therefrom, and a throw valve actuated by the movement of said piston for controlling the movement of said slide valve.
5. In a water motor, a casing having an inlet and an outlet chamber, a slide valve casing located thereon, a piston casing located on said slide valve casing, a piston in said piston casing, there being ports and passages leading from said slide valve casing into said piston casing and ports leading from said slide valve casing into said inlet and outlet chambers, a slide valve within the slide valve casing, means for preventing the rotation of said slide valve, and means for changing the position of said slide valve relative to the movement of said piston.
6. In a water motor, a casing having an inlet and outlet chamber therein, a slide valve casing with which sald chambers communicate, a slide valve in sald slide valve casing, a piston casing communicating at one end with the slide valve casing, a connection communicating with the other end of said plston casing and with the slide valve casing, a slide valve in sald slide valve casing controlling the alternate admission and exhaust of water to opposite ends of sald piston casing, said sllde valve casing being always open to the inlet of fluid, and a throw valve actuated by sald piston and adapted to control the admission and exhaust of water to actuate said slide valve.
7. In a water motor, a casing having an inlet and an oullet chamber, a sllde valve casing having ports therein commusicating with sald chambers, a hollow slide valve liaving an annular groove therein, sald groove being always open to tire port communicating with said inlet chamber, a piston caslug mounted on sald slide valve casing, the latter having a port. opening into the piston casing, a connection opening into said piston casing at the opposite end thereof, said sllde voive casing having a port communicating with said connection. sald sllde valve having a port therein always communlcatinig with the port opening into the exhaust chambrr and having ports communicating alternately with the port opening into the Inlet chamber and the port opening ato said connection, \(r\) piston in sald piston chamber, a piston 10 carried thereby. and means actuated by said piston rod for actuating said slide valve.
8. In a water motor. a casing having an inlet and an outlet chamber, a slide valve casing having an inlet port communicating with the inlet chamber and an exhaust port communicating with the outlet chamber, a piston casing mounted on the slide valve casing. the latter having a port opening into said casing, a piston within said casing, a connection communicating with the opposite end of the piston casing, said slide valve having a port therein communicating with said connection, a throw valve casing carried by the slide valve casing, the latter having a feed port therein communicating with a feed port in the throw valve casing, a slide valve in the slide valve casing adapted to control the ports therein, there being passages leading from the throw valve casing for admitting fluid to actuate said slide valve, and a throw valve operatively connected with said piston for controlling the feed and exhaust of fluld to actuate said sllde valve.
9. In a water motor, a casing having an inlet and an outlet chamber, a slide valve casing mounted thereon having an inlet port communicating with the inlet chamber and an exhaust port communicating with the outlet chamber, a piston casing mounted on said slide valve casing, the latter having ports therein communicating with opposite ends of said piston casing. a piston in said casing, a hollow slide valve provided with an annular groove always open to said inlet port and having a port therein always communicating with said exhaust port, there being ports alternately communicating with ports opening into opposite ends of the piston casing, said slide valve being non-rotatably mounted in the slide valve casing, and means actuated by the movement of said piston for controlling said slide valve.
10. In a water motor, a casing having a diaphragm forming an inlet and an outlet chamber therein, said diaphragio
having a tongue, a slide valve casing having a recess with which said tongue engages, there being an inlet port commundcating with the inlet chamber. and an exhaust port communicating with the outlet chamber, a piston casing mounted on said sllde valve casing. there being ports in the latter communicating with opposite ends of sald piston casing, a piston mounted in said piston casing, a hollow slide valve having a plurality of annular grooves thereon, one of said grooves being always open to said inlet port. there being a port in said valve always open to the exhaust port and ports controlling admission and exinaust of fluid from opposite ends of the piston, a throw valve casing carried by the slide valve casing, there being ports and passages communicating with the slide valve casing and the throw valve casing to admit fluid through opposite ends of sald slide valve, a throw valve in the throw valve casing for controlling such admission, a valve stem therefor, set collars carried by said stem. and means actuated by said piston and co-acting with said set collars to actuate said throw valve.
11. In a water motor, a casing having a diaphragm therein forming an inlet and an outlet chamber, there being a longue extending from said diaphragm, a slide valve casing mounted above said chambers and having a recess with which said tongue engages, there being an inlet port communicating with the inlet chamber and an exhaust port communicating with the outlet chamber, a piston casing mounted on said slide valve casing. there being ports communicating with opposite ends of said piston chamber, a piston in said chamber, a piston rod carried thereby, an arm adjustably mounted on said piston rod, a rod adjustably mounted in said arm, a brackec carried by said rod, a throw valve stem on which said bracket is movable, set collars on said stem with which said bracket co-acts to actuate sald throw valve stem, a throw valve caried by said stem, and a slide valve in the slide valve casing controlling admission and exhaust of fluid to the piston casing. sald slide valve being controlled by said throw valve.
12. In a water motor, a casing having a diaphragm forming an inlet and an outlet chamber therein, a slide valve casing mounted above said chambers and having an inlet port communicating with the inlet chamber and an outlet port communicating with the outlet chamber, a hollow slide valve non-rotatably mounted in the slide valve casing and having a plurality of annular grooves, one of said grooves being always open to the inlet port and having a port always oden to the exhaust port, a piston casing mounted on the slide valve casing. there being ports communicating with opposite ends of the piston casing and with which the groove always open to the inlet port alternately registers, a piston in said piston chamber, there being exhaust ports in the slide valve alternately registering with ports communicating with opposite ends of the piston chamber. a plston rod carried by the piston. an arm adjustably mounted thereon, a tappet adjustably carrled by said arm, a throw valve adapted to actuate said sllde valve, a stem extending therefrom on which said tappet travels, and means adjustably mounted on said stem with which said tappet co-acts to actuate the throw valve.
13. In a water motor a casing having a diaphragm dividing the same into an inlet and an outlet chamber. a slide valve casing mounted thereon and having an inlet port communicating with the outlet chamber, a hollow sllde valve having a plurality of annular grooves mounted in said slide valve casing. one of sald grooves being always open to the inlet nort and one of sald grooves being always open to the exhaust part, there being a port in the slide valve communicating with sald latter groove, a piston casing mounted on said slife valve casing, the latter having ports communtcating with the opposite ends thereof. said slide valve having ports therein alternately communicating with salid latter norts, a throw valve casing adanted to close one end of the sllde valve casing, and having a lug scrving as a seat for sald slide valve, a closure for the other end of said slide valve casing having a lug serving as a scat for the other end of the slide valve. and means actuated by the piston for armitting motive fluid to and exhausting motive fuid from opposite ends of the slide valve piston at a predetermined noint in the travel of sald piston.
14. In a water motor. a casing having a diaphragm dividing the same into an inlet and an outlet chamber. a slide valve casing mounted thereon having an inlet port communicating with the inlet chamber and an exhaust nort communicating with the outlet chamber. a sllide valve having imperforate ends mounted in said slide valve casing. a throw valve casing forming a closure for one end of salत slide valve casing and having ports communicating with opposite ends of the slide valve casing. there being a feed port in the slide valve casing having a port always open to the inlet of fluid and communicating with the nort opening into the throw valve casing. a reciprocating piston controlled by sald slide valve. and a valve in the throw valve casing operatively connected with sald piston, and control-
ling the ports in the throw valve casing and thereby the movement of said slide valve.
15. In a water motor, a casing having an inlet and an outlet chamber therein. a slide valve casing mounted thereon. means for preventing improper movement with respect thereto. said slide valve casing having an inlet port communicating with the inlet chamber and an exhaust port communicating with the outlet chamber. a hollow slide valve having a plurality of annular g:ooves thereon mounted in said slide valve casing, one of said grooves being always open to the inlet port, there being a port in said valve always communicating with the exhaust port, a piston casing mounted on said slide valve casing, the latter having ports therein communicating with opposite ends of the piston casing, there bring ports in the slide valve adapted to co-act with sald latter ports, a piston within the piston casing, a piston rod carried thereby, an arm adjustably mounted on sald piston rod, a rod adjustably carried by said arm. a bracket carried by said rod. a throw valve controlling admission of motive fluid to opposite ends of the slide valve casing to actuate said slide valve, a valve rod extending from sald throw valve, and set collars adjustably carried by said rod with which said bracket co-acts to actuate said throw valve.
16. In a water motor, a casing having an inlet and an outlet chamber therein, a slide valve casing mounted thereon, means for preventing improper movement with respec: thereto, said slide valve casing having an inlet port communicating with the inlet chamber and an exhaust port communicating with the outlet chamber, a hollow slide valve having a plurality of annular grooves thereon mounted in said slide valve casing, one of said grooves being always open to the inlet port, there being a port in sald valve always communicating with the exhaust port, a piston casing mounted on said slide valve casing, the latter having ports therein communicating with opposite ends of the piston casing, there being ports in the slide valve adapted to co-act with said latter ports, a piston within the piston casing, a piston rod carried thereby, an arm adjustably mounted on said piston rod, a rod adjustably carried by said arm, a bracket carried by said rod, a throw valve controlling admlssion of motive fluid to opposite ends of the slide valve casing to actuate said slide valve, a valve rod extending from said throw valve, and means for preventing the rotation of said slide valve.
17. In a water motor. a casing having a diaphragm forming an inlet and an outlet chamber, a slide valve mounted thereon and having an inlet port communicating with the inlet chamber and an exhaust port communicating with the outlet chamber, a closure for one end of said casing having an inwardly extending lug, a chambered throw valve casing adapted to close the other end of said casing and having an in wardly extending lug, a hollow slide valve mounted in the slide valve chamber and adapted to alternately engage sain lugs, said valve having a plurality of annular grooves, ons of said grooves being always open to the inlet port, one of said grooves being always open to the exhaust port. a piston casing. a piston therein, there being ports in the slide ralre casing communicating with opposite ends of the piston casing and alternately serving as inlet and exhaust ports, means for conducting water from the inlet chamber into the chamber in the throw valve casing, means for conducting water from the throw valve casing, to opposite ends of the slide valve casing, and a throw valve operatively connected Fith the piston and mounted in said chamber for controlling sald means.
18. In a water motor, a casing having a diaphragm therein forming an inlet and an outlet chamber, a slide valve mounted thereon and having an inlet port communicating with the in let chamber and an exhaust port communicating with the outlet chamber, a closure for one end of sald casing haring an inwardly extending lug, a chambered throw valve casing adapted to close the other end of said casing and having an inwardly extending lug, a hollow slide valve mounted in the slide valve chamber and adapted to alternately engage said lugs, said valve having a plurality of annular grooves, on of sald grooves being always open to the inlet port, one of said grooves being always ope to the exhaust port, a piston casing, a piston therein, there being ports in the slide valve casing communicating with opposite ends of the piston cas ing and alternately serving as inlet and exhaust ports, meanfor conducting water from the inlet chamber into the cham ber in the throw valve casing, means for conducting wate from the throw valve casing to opposite ends of the slide valve casing, said slide valve having the side contiguous to the exhaust port faced off, and means carried by the slide valve casing engaging said faced off side for preventing the rotation of said slide valve.
19. In a water motor, a casing having a diaphragm forming inlet and outlet chambers, a slide valve casing mounfed thereon having an inlet port communicating with the inlet chamber and an exhaust port communicating with the outlo. chamber, meaps for preventing any relative lateral mosing ment of said casings, a hollow slide valve within sald casing and having a plurality of annular grooves thereon, one and said grooves always communicating with the inlet port, and
one of said grooves always communicating with the exhaust port, a piston casing mounted on the slide valve casing, the latter having ports therein communicating with opposite ends of the piston casing. a piston in said casing. a piston rod extending therefrom, an arm adjustably carried by said rod, a rod carried by said arm, a bracket carried by said rod, a removable closure for one end of the slide valve casIng, a chambered throw valve casing for closing the other end of the slide valve casing, there being a passage communicating with the throw valve chamber and with the slide valve casing in proximity to the inlet port, there being passages leading from the throw valve chamber to opposite ends of the slide valve casing, a throw valve within the throw valve chamber adapted to control the passages leading therefrom, a valve stem extending from said throw valve, and set collars mounted thereon with which said bracket co-acts to actuate said throw valve.
20. In a water motor, a casing having a daiphragm therein forming an inlet and an outlet chamber, a slide valve casing mounted thereon, means carried by said diaphragm and engaging said casing for preventing improper movement thereof, said slide valve casing having an inlet port communicating with the inlet chamber and an exhaust port communicating with the exhaust chamber, a hollow slide valve mounted in the slide valve casing and having a plurality of annular grooves, one of said grooves being always open th the inlet port, there being a port in said valve always open to the exhaust port, a piston casing mounted on the slide valve casing, the latter having ports communicating with opposite ends thereof and co-acting with one of the slide valve grooves to serve as inlet ports, sald slide valve having ports therein co-acting with said ports to serve as exhaust ports, a throw valve casing forming a closure for one end of the slide valve casing and provided with a chamber, there being ports and passages leading therefrom communicating with opposite ends of the slide valve casing, there being a feed port communicating with the throw valve casing, and an exhaust port communicating with said casing. a throw valve having a plurality of heads thereon in said throw valve casing and adapted to admit water alternately to opposite ends of the sllde valve, a piston within said piston casing, and means actuated by said piston for intermittently actuating the throw valve.
21. In a water motor, a casing having a diaphragm forming an inlet and an outlet chamber therein, a slide valve casing mounted thereon, means for nreventing relative lateral movement of sald casings, said slide valve having an inlet port communicating with the inlet chamber and an exhaust nort communicating with the outlet chamber, a hollow slide valve non-rotatably mounted in the slide valve chamber having a plurality of annular grooves, one of said grooves always communicating with the exhaust port, one of said grooves always communicating with the inlet port, there being a port in the slide valve communicating with the exhaust port groove, a piston casing mounted on the slide valve casing, there being ports in the latter communi cating with opposite ends of the piston casing and co-acting with one of said grooves to act as inlet ports, there being ports in the slide valve co-acting with sald ports to serve as exhaust ports, means for forming a chamber at each end of the slide valve casing. a piston in the piston chamber, an arm adjustably carried thereby, a rod carried by said arm, a bracket carried by said rod, and means coacting with said bracket to actuate said slide valve.
22. In a water motor, a casing having a diaphragm forming an inlet and an outlet chamber therein. a slide valve casing mounted thereon at right angles thereto, means for preventing relative lateral movement of said casings, said valve casing having an inlet port communicating with the inlet chamber, and an exhaust port communicating with the outlet chamber, a hollow slide valve non-rotatably mounted In the slide valve chamber and provided with a plurality of annular grooves, one of said grooves being always open to the inlet port and one of said grooves being always open to the exhaust port, said slide valve having a port communicating with the exhaust port groove, a piston casing mounted on the slide valve casing, there being ports through the latter communicating with upposite ends of the piston casing and alternately co-acting with one of said grooves to serve as inlet norts, said slide valve having ports therein alternately co-acting with said ports to serve as exhaust ports, a throw valve casing, and having ports and passages communicating with opposite sides of said slide valve casing and with a chamber in the throw valve casing, there being a communication between the inlet and the throw valve chamber and between the exhaust and the throw valve chamber. a throw valve mounted in said chamber controlling admission and exhaust to and from opposite ends of the sllde valve casing, and means actuated by the piston for intermittently actuating the throw valve.
23. In a water motor, a casing having a diaphragm forming an inlet and an outlet chamber, a slide valve casing mounted thereon at right angles thereto, means for preventing relative lateral movement of said casing, said slide
valve casing having an inlet port communicating wth the inlet chamber and an exhaust nort communicating with the outlet chamber, a hollow slide valve non-rotatably mounted in the slide valve chamber and provided with a plurality of annular grooves, one of sald grooves being always open to the inlet port and one of said grooves belng always open to the exhaust port, said slide valve having a nort communicating with the exhaust port groove, a piston casing mounted on the slide valve casing, there being ports through the latter communicating with opposite ends of the piston casing and alternately co-acting with one of said sroove to serve as inlet ports, said slide valve having ports therein alternately co-acting with said ports to serve as exhaust ports, a throw valve casing forming a closure for one end of the slide valve casing, having ports and passages communicating with opposite sides of said slide valve casing and with a chamber in the throw valve casing, there being a communication between the inlet and the throw valve chamber and between the exhaust and the throw valve chamber, a throw valve mounted in said chamber controlling admission and exhaust 'n and from opnosite ends of the slide valve casing, a removable cover for the piston casing, and means for fastening the casings together.

No. 101,688. Turbine Pump. Pompe turbine.

James Lang, Toronto, Ontario, Canada, 23rd October, 1906; 6 years. Filed 17th July, 1906. Receipt No. 137,898.
Claim.-1. In a rotary pump the combination of a casing, a shaft, impeller wheels secured to the shaft and provided with channels having inlets parallel with the shaft, and inwardly directed radial outlets, guide wheels secured to the casing ard provided with channels having radial inlets and outlets parallel with the shaft, substantially as described.
2. A rotary pump provided with sinuous chanbels for the fluid alternately bending in towards and bending away from the axis of the pump and formed partly in stationary and partly in rotary members, the outer bends being formed entirely in the rotary members, substantially as described.
3. A rotary pump provided with sinuous channels for the fluid alternately bending in towards and bending away from the axis of the pump, and formed partly in stationary and partly in rotary members, the outer bends being formed entirely in the rotary members, and the inner bends partly in the rotary and partly in the stationary members, substantially as described.
4. In a rotary pump an impeller comprising a hollow wheel heving an inlet parallel to the axis divided internally by gulde vanes to form channels for the fluid, the sald vanes being arranged helically in the inlet. substantially as des cribed.
5. In a rotary pump an impeller comprising a hollow wheel having an inlet parallel to the axis, and an inwardly directed radial outlet, and divided internally by guide vanes to form channels for the fluid, the said vanes being arranged helically in the inlet, in the outlet on a rearward curve relative to the direction of rotation of the impeller, substantially as described.
6. In a rotary pump an impeller comprising a hollow whe outlig an inlet near the axis and an inwardly a hollow wheel tenet, and substantially radial guide vanes in directed radial tending to the outlet, in combination vanes in the wheel cxlow guide wheel having a radial inlet with a stationary holthe outlet of the impeller indet adapted to co-act with Which adjacent to the inlet lie provided with spiral vanes coincident with the resultant in a direction substantially velocities of the fluid emerging frome radial and tangential ally as described.
7. In a rotary pump an impeller comprising a substantihaving an inlet near the axis and an inwardly directed whed outlet, and substantially radial guide vanes in the wheel rad tending to the outlet, and rearwardly curved relative the ex-
dircetion dirction of rotation of the impeller, substantative to the cribed.

\section*{No. 101,689. Photographic Developing Machine. Machine photographique à décelopper.}

Friedrich Heinrich Lange, Berlin, Germany, 23rd October, 1906; 6 years. Filed 11th May, 1905. Receipt No. 125,0s3.
Claim.-1. In a photographic developing machine the combination of a light tight conduit adapted to receive a web of sensitized paper, an illuminating chamber to receive the negative, such chamber having an exposing device consisting of two pivotally turning spring actuated and mutually engaging flaps forming portions of a cylinder, a source of light enclosed by these flaps, means for intermittently feeding the web between the said illuminating chamber and the platen. and means for simultaneously actuating the said exposing device and the platen relatively to each other so as to press the web and negative together. and for simultaneonsly opening the exposing device, substantially as described.
2. In a photographic developing machine the combination of a light tight conduit adapted to receive a web of sensitized paper, an illuminating chamber to recelve the negative, such chamber having an exposing device consisting of two pivotally turning spring actuated and mutually engaging flaps forming portions of a cylinder, a source of light cnclosed by these fiaps, and actuating means consisting of a shaft, means for driving the latter, a cam mounted on the same, a vertically reciprocating lever arranged to be lifted by the said cam, and a spring actuated slide operated by the said levef, the outer end of such slide being adapted to force the flaps apart, web carrying rollers located in the said light tight conduit, and means driven by the said shaft for interm!ttently rotating such rollers, substantlally as described.
3. In a photographic developing machine the combination of a light tight hinged cases, independent of the said light tight condult and mounted loose on the drum axis. and provided with a light tight closed slit for the web, substantially as described.
4. The process of developing, fixing, washing and drying webs of photographic paper consisting in winding the webs on drums of adjustable diameter, treating them with liquids and then drying them, substantially as described.
5. The process of developing, flxing, washing and drying webs of photographic paper, consisting in winding the webs or: drums of adjustable diameter, treating them with liquids and transferring them to second like drums for the purpose of drying them, substantially as described.

No. 101,690. Hot Mill Roll. Rouleau de laminoirs.
Jacob Loomis, Elwood, Indiana. U.S.A., \(\underset{1906 \text { 23rd October, }}{\text { Let }}\) 1906; 6 years. Filed 20th September, 1906. Receipt No. 139,644.
Claim.-1. A casting for hot mill rolls consisting of a hollow body having a middle chilled portion flanked at each end

With a journal portion each of which in turn terminates in

tion substantial uniformity of thickness of shell from end to end through the middle chilled portion and the fanking journal portions.
2. A casting for hot rolls consisting of a hollow body having a middle chilled portion flanked at each end with a journal portion each of which in turn terminates in a wabbler portion, the casting showing in longitudinal section substantial uniformity of thicknes of shell from end to end through the middle chilled portion and the flanking journal portions, the middle sectional dimenslons \(A\) of the chilled portion being slightly less than the end dimensions \(B\) of said chilled dortion.

No. 101,691. Sheet Metal Shears. Cisailles pour teuilles de métal.

Clinton DeWitt Wagner, Cedar Rapids, Iowa, U.S.A., 23rd October, 1906; 6 years. Filed 3rd October, 1906. Receipt No. 140,005.
Claim.-1. The combination with a guide track and holder for the sheet, of a sheet metal shear, comprising a palr of rotary cutters, a frame to carry them. having divergent throats for the barent sheet and cut-off portion to pass through. guides for said frame to follow said guide track, and a liandle by which the shear is pushed across the sheet. 2. The combination with a guide track and holder for the shect, of a sheet metal shear, comprising a frame, with divergent throats for the parent sheet and cut-off portion to pass through, a pair of rotary shear cutters mounted to turn in said frame, guide rollers on the frame to take the guide track, and suitable means for pushing the shear across the sheet.
3. The combination with a curved track therefor, of a sheet metal shear, comprising a frame with throats to allow the cut sheet to pass through It, rotary sheer cutters mounted in said frame, and two pairs of guide rollers to Cngage said track relatively forward of the cutters, the rearmost pair being separated but slightly more than the thickness of the track, and the forward pair enough more to allow for the maximum of curvature in said track.
4. Combined with a suitable guide track therefor, a sheet metal shear, comprising a frame with throats to permit the cut portion and parent sheet of any width to pass bodily through it, a pair of rotarg cutters mounted in sald frame, guide rollers to engage the guide track, and antifriction rollers to carry the shear.
5. The described shect metal shear, comprising a frame, with throats to allow the cut metal of any width to pass through it. a pair of rotary shear cutters mounted in said frame, means for adjusting one of them vertically. andle friction rollers for the shear frame, and a detachable handla by which it may be pushed across the sheet.

Ernest Ferdinand Wiederholdt, St. Louif, Missouri, U.S.A. 23rd October, \(19 n\). 6 years. Filed 7 th Missouri, U.S.A. Receipt No. 1359,314.
Claim.- 1 . The herein described wall construction, the same comprising hollow tiles consisting of containing walls walls, the cene and cross webs formed integral with said tracted, the central portion of said cross webs being conracted, the spaces in said hollow tiles connecting with as described.
2. The herein described wall construction, the same comprising a plurality of hollow tiles forming retaining walls that there is lateral communication between the hollow that there is lateral communication between the hollow spaces of the tiles, and reinforcing bars or rods extending horizontally and vertically through aligning spaces and embedded within the concrete material, substantially as described.
3. The herein described concrete wall construction, the same comprising hollow tiles which form containing walls for the concrete material, said tiles having spaces aligning in vertical and horizontal directions which are filled by concrete material, and tie bars embedded in the concrete material in said spaces, substantially as described.
4. The herein described concrete wall construction, the same comprising a foundation, courses of tiling arranged on said foundation, and having aligning vertical open spaces, concrete material in said spaces, said tiling being so constructed that there is a lateral communication between adjacent tiles, continuous horizontally disposed bars which are surrounded by the concrete that extends between the adjacent tiles of each course, and vertically arranged bars embedded in the foundation and surrounded by the concrete material in the vertical spaces of the tiles of each zourse, substantially as described.
5. The herein described concrete wall construction, the same comprising a foundation, tiling arranged on said foundation, said tiling providing containing walls for concrete material, integral cross pieces connecting said retaining walls, and horizontally arranged bars supported by the cross pieces below the upper edges of said retaining walls and completels surrounded by said concrete material, substantially as described.
6. The herein described concrete wall construction, the same comprising a foundation, vertically arranged bars anchored in said foundation, H -shaped tiles arranged on said foundation in such manner that the vertical bars extend through the spaces between the legs of said H -shaped tiles, the cross bars or conyerting \(n\) of said tiles being recessed to provide lateral communication between adjacent tiles, horizontally disposed tie bars arranged in the recesses of said cross pieces, below the upper edges of the legs of the tile, and concrete material in the spaces provided by the tiles and surrounding said bars, substantially as described.
7. The herein described tile for concrete wall construction comprising front and rear walls provided on their inner faces with profections to effect an intimate connection between said tile and the concrete contained therein, and an I-shaped web formed integral with said walls and located approximately midway the ends thereof, substantially as described.
8. The herein described wall construction, the same comprising a foundation, hollow tiles arranged on said foundation, said tiles having spaces aligning in vertical and horizontal drections which are filled by concrete matorial, the bars extending through said horizontal spaces and embedded in said concrete material, and vertically disposed bars anchored in the foundation and extending through the concrete which fills said vertical spaces, substantially as described.
9. The herein described wall construction, the same comprising hollow tiles each consisting of a front and rear wall whih are connected by an intergral web that is ar-
ranged approximately midway the ends of the tiles, the central portion of said web being of less of the tiles, the cenand rear walls, and a mass of of less depth than said front spaces between the walls of concrete material filling the the tiles together, substantially tiles and binding all of
No. 101,693. Concrete Crib

Michael John Haney, Toronto, Ontario, Canada, 23rd October
1906; 6 years. Filed 30th July, 1906. Receipt No. 138,252.
Claim.-1. A concrete crib comprising solid side and end walls forming a continuous wall, and separate tie members spanning the space between said side walls and adapte to slide thereinto, as and for the purpose specified.
2. A concrete crib comprising solid side and end walls forming a continuous wall therearound, said side walls having a plurality of vertically arranged sockets therein, and a plurality of tie members spanning the space between said side walls having means for engaging the vertical sockets in said side walls, as and for the purpose specified.
3. A concrete crib comprising solid side and end walls forming a continuous wall therearound, pairs of angularly shaped members secured within said side walls vertically arranged and forming a plurality of vertical sockets therein, a plurality of tie members spanning the space between said side walls and having flanged members projecting from the ends thereof to fit within the said vertical sockets, as and for the purpose specified.
4. In a concrete crib the combination with a mass of concrete forming the side and end walls, of a solid frame forming the base for said mass of concrete, and metal bars rising from said solid frame and extending upwardly through said concrete, as ind for the purpose specified.
5 . In a concrete crib the combination with a mass of concrete forming the side and end walls, of a base for the said mass of concrete, a plurality of horizontally arranged angularly shaped bass secured to said base and forming a frame, upright bars secured to said frame, a plurality of horizontally arranged angularly shaped bars secured to said uprights and superposed above the aforesaid frame, reinforcing members spanning the space between the upper and lower frame, and a plurality of angularly shaped bars arranged vertically in pairs to the inside of said framework and secured thereto embedded in said mass of concrete, and a plurality of tie members spanning the space between the sides of said crib and engaging the pairs of vertically arranged bars, as and for the purpose specified.
6. In a concrete crib the combination with a mass of concrete forming the side and end walls, of a base for the said mass of concrete, a plurality of horizontally arranged angularly shaped bars secured to said base and forming a frame, upright bars secured to said frame, a plurality of horizontally arranged angularly shaped bars secured to said uprights and superposed above the aforesaid frame, a plurality of reinforcing bars extending from the upper to the lower frame on the outer and inner sides thereof, a plurality of pairs of angularly shaped bars vertically arranged to the inside of the sides of said frame and forming vertical sockets on either sides directly opposite, the said frame being embedded in the mass of concrete, a plurality of tie members spanning the space between the sides of said crib having projections from the ends thereof to fit within the said vertical sockets, as and for the purpose specified.
7. In a concrete crib the combination with a mass of concrete forming the side and end walls, of a base for the sail mass of concrete, a plurality of horizontally arranged channel bars secured to said base and forming a rectangular frame, upright angle bars secured to said frame at the corners thereof, a plurality of horizontally arranged channel bars secured to said upright bars and superposed above the aforesaid frame, a plurality of reinforcing bars extending from the upper to the lower frame on the outer and inner sides thereof, a plurality of \(Z\) bars arranged in vertical pairs secured to said upper and lower frame and forming vertical sockets, said sockets being arranged on either side of said crib and directly opposite, the said frame being embedded in
a mass of concrete, a plurality of tie members spanning the space between the sides of said crib having projecting \(T\) shaped portions from the ends thereof to fit within the said vertical sockets, as and for the purpose specified.
8. In a concrete crib the combination with a mass of concrete, forming the side and end walls having a plurality of vertically arranged sockets thereln, said sockets being arranged to the inside of the side walls and in pairs directly opposite, a plurality of tie members formed of a mass of concrete having a section of I beam emt edded therein at each end thereof and partly projecting therefrom and reinforcin: rods secured to each of the said sections of I beam, sald tie members being adapted to span the distance between the sides of the crib and fit within the rertical sockets, as and for the purpose specified.
9. A concrete crib comprising solld side and end walls forming a continuous wall, one of said end walls extending only a portion of the height of said side walls and means for closing the upper portion of said end wall, as and for the purpose specifled.
10. A concrete crib comprising solid side and end walls forming a continuous wall, one of said end walls extending only a portion of the height of said side walls and having the upper edge thereof bevelled inwardly to the said sides, and means for continuing the side wall to complete the crib, as and for the purpose specified.
11. A concrete crib comprising rectangular sections having solid side and end walls forming a continuous wall, one end wall of one section extending only a portion of the height of said crib and bevelled inwardly from the outer face, and the succeeding section having one end thereof extending only a portion of the dept'l thereof and bevelled inwardly from the outer face, said sections being arranged to abut each other so that the bevelled edges of the portions of the end walls engage and form a solid wall between said sections, substantially as described.
12. A concrete crib comprising solid side and end walls forming a continuous wall, and a solid frame base supporting said wall, said wall and base having vertically arranged water passages, as and for the purpose specified.

No. 101,694. Marking Peg and Center Punch. Cheville à marquer et pointeau.

William Houghton, Bath, Maine, U.S.A., 23rd October, 1906;
6 years. Filed 1st October, 1906. Receipt No. 139,919.
Claim.-1. In a device of the character described the combination with a sleeve or tube, of a punch slidably mounted therein, a slotted guide collar arranged in the upper end of said tube, stop pins arranged in said punch to engage the slots in said guide collar, and a spring to retract said punch, stibstantlally as described.
2. In a device of the character described the combination with a sleeve or tube, of a punch slidably mounted therein, an upper guide collar arranged in the upper end of said tube, said collar having formed in its lower and vertically disposed slots and notches arranged at diametrically opposite points, means to secure said collar in said sleeve, upper and lower horizontally disposed pins arranged at right angles in said punch to engage the slots and notches in said collar, a retracting spring arranged on said punch, and means to hold said spring in place, substantially as described.
3. In a device of the character described the combination with a sleeve or tube, of a punch slidably mounted therein, an upper guide collar arranged in the upper end of said tube, said collar having formed in its lower end vertically disposed slots and notches arranged at diametrically opposite points, a set screw to hold said collar in place in said tube, upper and lower horizontally disposed pins arranged at right angles in and projecting from the sides of said punch to engage the slots and notches in said collar, a gulde collar fixed in the lower end of said tube, a collar loosely mounted on said punch below said lower pin and a colled retracting spring arranged on said punch between said fixed lower collar and arranged on said collar, substantially as described.

No. 101,695. Wind Wheel. Moulin d vent.

William T. Fine, Hopkins, Missouri, U.S.A., 23rd October, 1906; 6 years. Filed 24th April, 1906. Receipt No. 135,224. Claim.-1. In a wind wheel the combination with a support, of a turntable mounted thereon and carrying a vane, a fixed and a vertically movable platform on the turntable, a horizontally disposed wheel, rock shafts mounted on the wheel, and carrying blades at their outer ends, cranks formed on the inner ends of the shafts and fitted with rollers cooperating with the platforms to feather the blades, and stops ergaged by the rollers when off the fixed platform for limiting the swing of the cranks.
2. In a wind wheel the combination with a support. of a turntable mounted theren and having an outwardly extendine stem, a vane secured to sald stem, a fixed and vertically movable platform on the turntable, a lever pivoted on the aforesaid stem, and connected with the movable platform, means for operating the lever to raise and lower sald platform, a horizontally disposed wheel, rock shafts mounted on the wheel, and carrying blades, and means carried by the shafts, and co-operating with the platforms to feather the blades.

No. 101,696. Windmill. Moulin à went.

Albert Geoffroy, Eratt, Loulsiana, U.S.A., 23rd October. 1906;
6 ycars. Filed 23 rd March, 1906. Receipt No. 134,212.
Claim.-1. In a windmill the combination with a turntable having a hollow post upon which it rotates, and a vane pivoted upon the turntable in rear of the post, a verticalls movable locking bolt carried by the vane and having a series of engagements with the turntable, a lever fulcrumed upon the vane and connected to the bolt, a guide carried by the turntable and overhanging the top of the post, and a bolt operating cable connected to the lever and passing downwardly through the post in engagement with the guide.
2. In a windmill the combination with a turntable, a wiad wheel thereon, and a vane pivotally mounted on the turntable, of means tending to yieldably maintain the vane out of alignment with the wheel, a keeper upon the turntable, \({ }^{2}\) latch carried by the vane for engagement with the keeper to hold the vane in alignment with the wheel, tension means tending to disengage the latch from the keeper, and means controlled from the ground for holding the latch in engagement with the keeper.
3. In a windmill the combination with a turntable, of the vane pivotally mounted thereon, a locking bolt carried by the vane for engagement with the turntable, a keeper upon the turntable, a latch upon the vane for engagement with the keeper, and means operable from the ground and common to the bolt and lateh for controlling the same.
4. In a windmill the combination with a turntable, of \({ }^{2}\) vane pivoted thereon, a locking bolt carried by the vane for engagement with the turntable, a lever fulcrumed upon the vane and connected to the bolt, a keeper upon the turntable, a pivotal latch upon the vane for engagement with the keep er, tension means tending to normally hold the latch out ol engagement with the keepers, sald latch being provided with a cable guide, an operating cable running through the guide, and a link connected to the lever and the cable and bearinf upon the top of the latch.

No. 101,697. Windmill. Moulin d vent.

Catherine Jane McMasher, Corfield, North Queensland, Queensland, Australia, 23rd October, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,901.
Claim.-An improved irame for carrying the operating wheel and transmitting mechanism of a windmill consisting of side pieces jointed together at the top and bottom, said frame being supported between a swivel at the top and a swivel foot bearing on a platform at the bottom so as to be capable of revolving, the top swivel being maintained in position by guy ropes or stays, substantially as described and illustrated in the drawings.

No. 101,698. Dipper Teeth. Dent de pelle.

William Bodette, Riverside, California, U.S.A., 23rd October, 1906; 6 years. Filed 30th June, 1906. Receipt No. 137,430.
Claim.-1. A dipper tooth comprising upper and lower bifurcated portions having their extremities rabbeted, in combination with rabbeted saddle plates.
2. A dipper tooth comprising rearwardly extending bifurcated portions, and saddle plates with which sald bifurcated portions have an interlocked engagement.
3. A dipper tooth comprising bifurcated portions, and saddie plates having a scarf jointed connection with said bifurcated portions.
4. A dipper tooth comprising blfurcated portions terminating in tongues, and saddle plates recessed to recelve said tongue.
5. A dipper tooth comprising bifurcated portions having terminal tongues, saddle plates recessed to receive sald tongues, and lasteners passing through the tongues and saddle plates.
6. A dipper tooth comprising rearwardly extending blfurcated portions, saddle plates with which said bifurcated portions have an interlocked connection, and dipper engaging shoulders on sald saddle plates.
7. A dipper tooth comprising rearwardly extending bifurcated portions adagted to straddle the dipper, saddle plites secured to the dipper and having an interlocked engagement with the bifurcated portions of the tooth, and a bolt passing through the bifurcated portions of the tooth and also through the dipper.

10-31

No. 101,699. Grain Drier. Séchoir de grain.

John Nash and Hank Noll, assignee of a half interest, both of North Yakima, Washington, U.S.A., 23rd October, 1906; 6 years. Filed 5th July, 1906. Receipt No. 137,539.
Claim.-1. A drum cylinder having an axle supported for rotation, angular braces extending between the axle and the perimenter of the cylinder, and spaced strips constituting bucket members supported respectively upon the inner and the outer ends of said annular braces.
2. A drum cylinder having a foraminous body and an axle supported for rotation, spaced hoops supporting the foraminous body, angular braces connecting said hoops with the axle, and spaced foraminous strips constituting bucket members supported upon the angular braces adjacent to the axle and the hoops respectively.
3. A foraminous drum or cylinder supported for rotation and having interiorly disposed foraminous bucket members, a hopper bencath said drum, and heating means in the hopper.
4. A chamber or casing having a hopper shaped bottom, a foraminous drum supported for rotation in the casing and having interior agitating means, means for heating air within the hopper, and means, including valves bearing against the drum, for preventing heated air from rising adjacent to the other sides of the drum.
5. A chamber or casing having a hopper shaped bottom, a foraminous cylinder supported for rotation in the casing, heating pipes supported upon the sides of the hopper shaped bottom, and deflectors above said pipes.
6. A chamber or casing having an outlet in the lower part thereof, a foraminous cylinder supported for rotation within the casing, air heating means in the lower part of the casing, shelves upon the walls of the latter, and valves supported by said shelves and adapted for exterior engagement with the cylinder.
7. A chamber or casing, a foraminous cylinder supported for rotation within the casing, a supply hopper above the casing having an inclined foraminous floor and provided with an opening through which the contents of the hopper may be discharged into the cylinder, and air heating means in the chamber below the cylinder.
8. A chamber or casing, a foraminous cylinder supported for rotation within the casing, a supply bin above the casing having a foraminous hopper shaped floor, air heating means in the chamber below the cylinder, and means including valves exteriorly engaging the cylinder for preventing heated air from rising except through the cylinder.

\section*{No. 101,700. Machine for Making Lacing Tips.} Machine d faire les bouts métalliques de lacets.
Frank W. Whitcher, assignee of Charles Frank Pinkham, both of Boston, Massachusetts, 23rd October, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,666.
Claim.-1. In a machine of the character described in combination, turning-in mechanism, cement applying mechanism and compressing mechanism.
2. In a machine of the character described the combination with transferring mechanism, of turning-in mechanism, cement applying mechanism and compressing mechanism.
3. The combination of an exterior turning-in member, and an interior turning-in member co-operating therewith.
4. The combination of exterior turning-in mechanism, and Interlor turning-in mechanism comprising a central support, and grlppers co-operating with the sald central support.
5. Turning-in mechanism comprising a central support for the lacing, grippers therefor, and holding members contracting with the outside of the lacing while upon the central support.
6. Turning-in mechanism comprising a central support or spear for the lacing, grippers therefor, and a chuck engag-
ing the outside of the lacing during the turning-in movement.

7. Turning-in mechanism comprising a central support or spear for the lacing, grippers therefor, and a chuck provided with radially movable members engaging the outside of the lacing during the turning-in movement.
8. Turning-in mechanism comprising a central support or spear for dilating the end of a lacing said central support or spear being provided with an end portion for insertion in the lace, and having a contracted portion or neck back of said end portion, holding means co-operating with the neck of the said central support or spear to grip the end of the lacing. and exterior members contracting with the lacing upon the said central support or spear.
9. Turning-in mechanism comprising a central support or npear for dilating the end of a lacing, said central support or spear being provided with a tapering portion for insertion i:t the lacing, and having a contracted portion or neck back o! said tapering portion, holding means co-operating with the neck of the said central support or spear to grip the end of the lacing, and exterior members having a roughened interior surface contracting with the lacing upon the said central support or spear at its point of greatest diameter.
10. In a machine of the character described the cement applying apparatus comprising a fixed piston, a relatively movable cylinder whereby the cement is ejected from the cylinder during the backward movement of the cylinder.
11. In a machine of the character described the cement applying mechanism romprising a movable pump cylinder provided with a tip having a constricted bore, a fixed piston comprising two portions one of a size corresponding with the interior of the pump cylinder and the other with that of the bore of the tip.
12. In a machine of the character described the cement applying apparatus comprising a movable cylinder provided with a tip having a constricted bore, means supplying cement to the said cylinder, a fixed piston having one portion thereof of a size to fit the main part of the cylinder and another portion of a size to fit said constricted bore.
13. In a machine of the character described the cement applying apparatus comprising a movable cylinder provided with a tip having a constricted bore, means supplying cement to the said cylinder, a fixed piston having one portion of a size to fit the main part of the cylinder and another portion of a size to fit the said constricted bore, and moving means for the sald cylinder whereby the cement is ejected during the backward movement of the cylinder.
14. In a machine of the character described the cement applying apparatus comprising a movable cylinder provided with a tip having a constricted bore. means supplying cement to the said cylinder, a piston fixed with relation to the said cylinder having one portion of a size to fit the main part of the cylinder and another portion of a size to flt the said constricted bore, moving means for the said cylinder, and adjusting means for the said piston whereby the quantity of the cement ejected during the backward movement of the the cement ejected during
15. In a machine of the character described the combination with turning-in mechanism, cement applying mechanism and compressing mechanism, of a cutter gripper and a side gripper holding the lacing or other article during its transfer from the feeding position to the turning-in position.
16. In a machine of the character described the combination with turning-in mechanism, cement applying mechanism and compressing mechanism, of a lace carrier for transferring the turned in lacing from the turning-in position to the compressing position.
17. In a machine of the character described the combination with turning-in mechanism, cement applying mechanism and compressing mechanism of a lace carrier comprising an arm. gripplng members thereon, a rotatable slide rod upon
which the said arm is mounted, and a pair of cams one for imparting to the said lace carrier a rectllinear motion, and the other imparting to the lace carrier a rotary motion whereby the lacing is transferred from the turned-in position to the compressing position.

No. 101,701. Dredge. Dragueur.

Frank Yoeman and John J. Hamlyn, assignee of a half interest, Oroville, California, U.S.A., 23rd October, 1906; 6 years. Filed 20th August, 1006. Receipt No. 138,830.
Claim.-1. In a dredge the combination with a swinging frame carrying an endless excavator, of a counterbalancing weight, a drum, flexible connections between said weight, said frame and said drum, and a variable speed driving means for said drum.
2. In a drodge the combination with a swinging trams carrying a chain of excavating buckets, of vertical guides. counterbalanced weights slidable in said guides, a winding drum, cables attached to the free end of said frame and wound upon said drum, and cables attached to said weights and wound upon said drum in a direction opposite that of the tirst-mentioned cables, substantially as described.
3. In a dredge the combination with a swinging frame carrying an endless excavator, of a counterbalancing weight. a drum, flexible connections between said weight, said frame and said drum, a power shaft, driving connections between the latter and said drum, and variable speed friction drive gearing between said power shaft and said driving conneclions, substantially as described.
4. In a dredge the combination with a swinging frame carrying an endless excavator, of a counterbalancing weight, a drum, fiexible connections between said weight, sald frame and said drum, a power shaft, gearing between said power shaft and the shaft of said drum, sald gearing comprising a longitudinal shaft, a counter shaft geared to said power shaft, a friction disc upon said longitudinal shaft, a shaft extending radially with respect to said longitudinal shaft, a friction wheel slidable upon but free to rotate with the lastmentioned shaft and adapted to engage sald friction disc, and a driving connection between said counter shaft and sald radially disposed shaft, substantially as described.
5. In a dredge the combination with a swinging frame carrying an endless excavator. of a drum, a cable wound upon said drum and attached to said frame, a power shaft, drive gearing between said power shaft and the shaft of said drum and comprising a longitudinal shaft, a counter shaft geared to said power shaft, a friction disc upon said longitudinal. shaft, a shaft disposed radially with respect to said long. tudinal shaft, a friction wheel mounted to slide upon bui keyed to rotate with said radially disposed shaft, and a driring connection between the latter and said counter shaft, substantially as described.
6. In a dredge the combination with a floating body carrying a vertically swinging endless excavator, of guide devices adjacent to the corners of said body, a series of winding drums, and a serien of cables or the like engaged with sald guide and each having one of its ends wound upon one of said druns and its other end adapted for attachment to a stalionary object whereby said floating body may be moved laterally.
7. In a dredge the combination with a floating body carrying a vertically swinging endless excavator, of guide devices adjacent to the corners of said body, winding drums. cables wound upon said drums and engaged with said guide devices, the free ends of said cables being adapted to be secured to stationary objects, a driving mechanism for said drums, a driving mechanism for said excavator, and a variable speed driving mechanism hetween the driving mechanism of said excavator and the driving mechanism of naid drum, substantially as described.
8. In a dredge the combination of a float, a verticalls swinging frame mounted therein, and an endless excarator mounted upon said frame, a series of side line drums a drivng shaft for said irame, a serles shaft, longituding shats seared to sald drive and power shafts, oustershaft, fricgeared to said drive and power shafts, a countershaft and
tional gearing between the ends of said countershaft and
said longitudinal shaft, and means for driving said counter shaft. substantially as described.
9. In a dredge the combination of a float, a vertically swinging frame mounted therein, and an endless excavator mounted upon said frame, a series of side line drums, a driving shaft for said drums, a power shaft. longitudinal shafts geared to said driving and power shafts, a counter shaft, frictional gearing between the ends of sald counter shaft and said longitudinal shaft, means for driving sald countershaft, a main power nhaft, a countershaft geared to the latter and variable speed driving connections between the latter-mentloned countershaft and the first-mentioned countershaft, substantially as described..

\section*{No. 101,702. Bevel and Compass.}

\section*{Beauceau et compas.}

Henry Tatum, Wilbur Hodges and John A. Webb, each an assignee of a third interest, both of Miakka. Florida, U.S.A., 23rd October, 1906; 6 years. Filed 27th August, 1906. Receipt No. 139,026.

Clain.-A tool of the type described comprising a body having a reces formed in one face thercof, an arm pivoted to fold into said recess, a telescope pivoted to and movable with said arm and a cover movably connected with the body and adapted for normally closing the recess to house the telescope and arm therein.

No. 101,703. Meter. Metre.

The American District Steam Company, assignee of John Daniel Walsh, both of Lockport, New York, U.S.A., 23ril October, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,822.
Claim.-1. In a meter, a casing, a tunnel disposed and supported within the casing and a scraper device disposed within the funnel to remove therefrom sediment collecting therein.
2. In a meter, a casing, a funnel disposed and supported within the casing and a scraper device disposed within the funnel to remove therefrom sediment collecting therein and provided with manually operable means extending outside of the casing.
3. In a meter, a casing, a funnel disposed and supported within the casing, and a scraper device disposed within the funnel to remove therefrom sediment collecting therein and provided with an operating rod extending through the shell or side of the casing.
4. In a meter, a casing formed with an internal perforated shelf or flange, a funnel or nozzle secured to the shelf around the opening thereof and a hood or deflector supported above the nozzle and construoted to shunt liquid onto sald shelf before passing through the nozzle.
5. In a meter, a casing formed with an internal perforated shelf, a funnel secured to the shelf around the opening thereof and a hood supported above the nozzle and having a bowed or curved bottom and constructed to shunt liquid onto said shelf before passing through the nozzle or funnel.
6. In a meter, a casing formed with an internal perforated shelf, a funncl secured to the shelf around the opening thereof and a hood supported above the funnel and having open sides and constructed to shunt liquid onto said shelf before passing through the funnel.
7. In a meter, a casing formed with an internal perforated shelf. a funnel on nozzle secured to the shelf around the opening therrof and a hood supported above the nozzle and having open sides and a bowed bottom and constructed to shunt liquid onto said shelf before passing through the nozzle.
8 . In a meter, a casing, a funnel disposed and supported within the casing and a spear or wedge-shaped scraper device disposnd within the funnel to remove therefrom sediment collecting therein.
9. In a meter, a casing, a tilting bucket therein, and dash pots beneath the bucket, said bucket carrying on its under surface depending plungers disposed toward each end of the bucket, the plungers at each end of the bucket carrying at their lower extremities a connecting or uniting splasher bar adapted to impinge the water in the dash pots.
10. In a meter, a tilting bucket therein movable on ball bearings and dash pots beneath the bucket, said bucket carrying on its under surface depending plungers disposed toward each end of the bucket, the plungers at each end of the bucket carrying at their lower extremities a connecting or uniting splasher bar adapted to impinge the water in the dash pots.
11. In a meter, a casing, a tilting bucket therein, means for rendering the movement of the bucket noiseless, registering mechanism secured to the casing, and means carried by the bucket and engaging with the registering mechanism when the bucket tilts to actuate the registering mechanism.
12. In a meter, a casing, a tilting bucket therein, means for rendering the operation of the bucket noiseless and a pin projecting from the bucket and engaging with the registering mechanism, when the bucket tilts, to actuate the registering mechanism.
13. In a meter, a casing, a tilting bucket therein, means for rendering the operation of the bucket nolseless, a funnel disposed and supported within the casing and above the bucket, and a scraper devire disposed within the funnel to remove therefrom sediment collecting therein.
14. In a meter, a casing, a tilting bucket therein, means for rendering the operation of the bucket noiseless, a funnel disposed and supported within the casing and above the bucket, and a scraper device disposed within the funnel to remove therefrom sediment collecting therein, and provided with manually operable means extending outside of the casing.
15. In a meter, a tilting bucket therein movable on ball bearings, means in addition for rendering the movement of the bucket noiseless, and dash pots bencath the bucket, said bucket carrying plungers adapted to impinge the water in the dash pots, a funnel disposed and supported within the casing and above the bucket, and a scraper device disposed within the funnel.
16. In a meter, a casing, a tilting bucket therein, means for rendering the operation of the bucket nolscless, said casing being constructed with an internal ledge or shelf disposed above the bucket and perforated, a funnel secured to the under surface of the shelf around the opening thereof, and a hood supported above the nozzle and constructed to shunt liquid onto said shelf before passing through the nozzle and into the bucket.
17. In a meter, a casing, a tilting bucket therein, means for rendering the operation of the bucket noiseless, said casing being constructed with an internal shelf disposed above the bucket and perforated, a funnel secured to the under surface of the shelf around the opening thereof, a scraper device within the funnel, and a hood supported above the nozzle and constructed to shunt liquid onto said shelf before passing through the nozzie and into the bucket.
18. In a meter, a casing, a tilting bucket therein movable on ball bearings, additional means for rendering the operation of the bucket noiseless, said casing being constructed with an internal shelf disposed above the bucket and perforated, a funnel secured to the under surface of the shelf around the opening thereof. a scraper device within the funnel, and and a hood supported above the nozzle and constructed to shunt liquid onto said shelf before passing through the nozzle.
19. In a meter, a casing, a tilting bucket therein movable on ball bearings, dash pots beneath the bucket, said bucket carrying on its under surface plungers adapted to impinge the water in the dash pots, said casing being constructed with an internal shelf disposed above the bucket and perforated, a funnel secured to the under surface of the shelf around the opening thereof. a scraper device within the funnel, and a hood sumported above the funnel and constructed to shunt liquid onto said shelf before passing through the nozzle or funnel.
20. In a meter, a casing. a tilting bucket therein, dash pots beneath the bucket, said bucket carrying on its under
surface depending plungers disposed toward each end of the bucket, the series of plungers at each end of the bucket carrying, at their lower extremities a connecting or uniting splasher bar adapted to impinge the water in the dash pots, and means to limit downward movement of the bucket.
21. In a meter, a casing, a tilting bucket therein, dash pots beneath the bucket. said bucket carrying on its under surface and disnosed toward each end thereof depending plungers, the series of plungers at each end of the bucket carrying, at their lower extremities, a connecting splasher bar adapted to impinge the water in the dash pots, and adjustable means to limit downward movement of the bucket.
22. In a meter, a casing, a tilting bucket therein, dash pots beneath the bucket, said bucket carrying on its under surface and disposed toward each end thereof depending plungers, a series of plungers at each end of the bucket carrying, at their lower extremities, a connecting splasher bar, said dash pots being formed with upward projecting bumpers, and said bucket carrying, on its under surface, means adapted to impinge the bumpers.
23. In a meter, a casing, a tilting bucket therein. dash pots beneath the bucket, said bucket carrying on its under surface and disposed toward each end thereof depending plungers, the series of plungers at each end of the bucket carrying, at their lower extremities, a connecting splasher bar, said dash pots being formed with upward projecting bumpers, and said bucket carrying, on its under surface, adjustable means adapted to impinge the bumpers to limit downward movement of the bucket.
24. In a meter, a casing, a tilting bucket therein, dash pots beneath the bucket, said bucket carrying on its under surface disposed toward each end thereof depending plungers, the several plungers at each end of the bucket carrying, at their lower extremities, a connecting splasher bar adapted to impinge the water in the dash pots. said dash pots being formed with upward projecting bumpers, sald bucket carrying on its under surface adjustable means adapted to impinge the bumpers to limit downward movement of the bucket, said casing being formed with an internal shelf disposed above the bucket and perforated, a funnel secured to the under surface of the shelf around the opening thereof, and a hood supnorted above the shelf and constructed to shunt liquid onto said shelf before passing through the funnel.
25. In a meter, a casing. registering mechanism secured thereto, a tilting bucket within the casing, means carried by the bucket and engaging with the registering mechanism. when the bucket tilts, to actuate the same, and dash pots beneath the bucket, sald bucket carrying on its under surface and disposed toward each end thereof depending plungers, the plungers at each end of the bucket carrying, at their lower extremities, a connecting splasher bar adapted to impinge the water in the dash pots.
26. In a meter, a casing. registering mechanism secured thereto, a tilting bucket within the casing. means carried by the bucket and engaging with the registering mechanism when the bucke tilts, to actuate the same, dash pots beneath the bucket, said bucket carrying on its under surface depending plungers disposed toward each end of the bucket. the plungers at each end carrying, at their lower extremities a connecting splasher bar, said dash pots being formed with upward projecting bumpers, said bucket carrying on its under service, means adapted to impinge the bumpers to limit downward movement of the bucket.
27. In a meter, a casing, registering mechanism secured thereto, a tilting bucket within the casing. means carrjed by the bucket and engaging with the registering mechanism, when the bucket tilts, to actuate the same, dash pots beneath the bucket, sald bucket carrying on its under surface depending plungers disposed toward each end of the bucket, the series of plungers at each end of the bucket carrying at theid lower extremities a connecting splasher bar adapted to impinge the water in the dash pots, said dash pots being formed with upwardly projecting bumpers, said tucket carrying, on its under surface, means adapted to impinge the bumpers to limit downward movement of the bucket, said casing being formed with an internal shelf disposed above the bucket and perforated, a funnel secured to the under surface of the shelf around the opening thercof, and a hood supported above the shelf and constructed to shunt liquid onto said shelf before passing through the funnel.
28. In a meter, a casing. registering mechanism secured thereto, a tilting bucket within the casing, means carried by the bucket and engaging with the registering mechanism, when the bucket tilts, to actuate the same, dash pots beneath the bucket, said bucket carrying on its under surface and disposed toward each end thereof depending plungers, the series of plungers at each end of the bucket carrying a connecting splasher bar, sald dash pots being formed with
upward projecting bumpers, said bucket carrying, on Its under surface, means adapted to impinge sald bumpers to limit downward movement of the bucket, sald casing being formed with an internal shelf disposed above the bucket and perforated, a funnel secured to the under surface of the shelf around the opening thereof. a scraper device within the funnel, and a bood supported above the shelf and constructnd to shunt liquid onto said shelf passing through the funnel.
29. In a liquid measuring device, an oscillating bucket provided with plungers on its under side, and a dash pot arranged beneath the bucket and presenting water holding chambers having sides of a curvature corresponding approximateif to the angle formed by the plungers upon entering the chambers, whereby danger of jamming or wedging of the plungers in the chambers is obviated.
20. In a liquid measuring device, an oscillatory bucket provided with plungers on its under side, and a dash pot arranged beneath said bucket and presenting lindependent, non-communicating, water holding chambers having sides o: a curvature corresponding approximately to the angle formed by the plungers upon entering the chambers, whereby danger of jamming of the plungers in the chamber is otviated.
31. In a liquid measuring device, an oscillating bucket provided with plungers on its under side, having at their lower extremities splasher bars, and a dash pot arranged beneath the bucket and presenting water holding chambers baving sides of a curvature corresponding approximately to the angle formed by the plungers upon entering the chambers. whereby danger of jamming of the plungers in the chambers is obviated.
32. In a liquid measuring device, a bucket supported for oscillatory movement, and provided with plungers on its under surface, dash pots arranged beneath the bucket and an enclosing casing providing means to keep the dash pots constantly supplied with liquid, the said plungers terminating at their free ends in splasher bars.

No. 104,704. Weighing Scales. Balance.

E. and T. Fairbanks \& Co., assignee of Henry Fairbanks, all of St. Johnsbury, Vermont, U.S.A., 23rd October, 1906; 6 years. Filed 21st August, 1906. Receipt No. 138, 898.
Claim.-1. A lever formed with its material disposed near its upper and lower edges and having an opening through its neutral line of strains, the load receiver pivot carried by the lever with its knife edge in the opening, a saddle block bearing upon this pivot and two swinging links hanging from the saddle block and by which the free swinging support of the load receiver is carried.
2. A lever or scale beam having an opening and provided with projections in alignment with one wall thereof, and a knife edge pivot extending through said opening
forced by the metal of the lever and projections.
3. In a weighing scale a lever having an opening, a knife edge pivot extending through and beyond the sides of the lever and supported by the lever, a saddle block bearing also extending through the opening and engaging the pirot for its entire length and suspension links encirciing sald saddle block.
4. In a weighting scale a lever having a transverse openlng, a knife edge pivot extending therethrough and having a bearing edge of greater length than the thickness of the lever, said pivot being reinforced through its entire length, the opening being disposed to include the knife edge of the plvot and a bearing member co-extensive in length with the pivot and engaging the same throughout its entire length.
5. The combination with a lever having a fulcrum knife edge pivot with its edge down and a platform pivot with its edge up, of bearings for these pivots, a platform support. s rocking block beneath the platform support and suspension members connecting said block with the platform bearing.
6. The combination with a lever having a fulcrum pivot with its edge down and a platform pivot with its edge up. of bearings for the pivots, a rocking block and a pair of suspension members connecting the opposite end portions of one of the bearings to said block.
7. A lever having the bearing engaging the fulcrum knife edge pivot supported on a rigid stand and the bearing of the load receiver pivot arranged parallel with said pivot and carrying two swinging links by which the free swinging support of the load receiver hangs.
8. A lever having knife edge and fulcrum pivots, a stand, a bearing engaging the fulcrum knife edge pivot and supported on said stand, and the bearing of the platform pivot carrying swinging links encircling the pivot and bearing by which the free swinging support of the platform hangs.
9. In a weighing scale, a lever having a knife edge pivot, a rocking block \(e^{11}\), steel faced to serve as a bearing for said knife edge pivot and the support \(i^{1}\) upon which it rocks, the block and pivot being co-extensive in length in combination with the other pivot of the lever, and its bearing whereby the two bearings may swing into the same planc.
10. The combination in a weighing scalc. of a lever having a knife edge plvot, a bearing therefor, a rocker block connected with the two ends of the bearing and a support having interfitting portions to permit rocking movement. and guards for limiting such movement.
11. In a woighing scale, a rocking block fir, steel faced to serve as a bearing for one knife nign nivot of the lever. and the support \(i^{2}\) upon which it rocks, the block and pivot extending through an opening in the lever, in combination with the other pivot of the lever. and its bearing whereby the two bearings may swing into the same plane.
12. The combination in a woighing scale. of a lever having a knife edge pivot. a bearing therefor both the pivot and bearing extending through an onening in the Iever. a rocker block and a support having interfitting portions to permit rocking movement and guards for limiting such movement.
13. The combination in a weighing scale. of a lever having a knife edge pivot. a bearing therefor. the pivot being in contact with the bearing for its entire length, a rocker block connected with the two ends of the bearing. and a support having interfitting portions to permit rocking movement and guards for limiting surh movement.
14. In combination with a knife erlge pivot. of a lever. of a welghing scale, a saddle block bearing engaging the pivot links encircling this hearing, and a support connected by the link to the hearing, sald stand having an opening in alignmant with the bearing to permit removal of the lattor.
15. In combination with the two main knife eige pivots, of a lever and their bearings. a block. a proiection on which it is free to rock by which block one of these bearings is carried. whereby that bearing is allowed to swing into the same plane with the other and to equalize the stress at the t.wo ends of each pivot.
16. The underframing shown consisting of longitudinal sills \(p\) at the sides of the scale nit, the cross sills \(r\) in pairs coped upon the side sllls in place to carry the extension lever stands at the middle of the scale, (and the base plates r upon the masonary upon which plates all the sllls have their support) in combination with the fulcrum stands \(n\) bolted to the top of the side sills and with levers carried above the lever of the top of the sills.
17. In combination the lever having longitudinally projecting knife edge pivots, the stand, a rocking block and connecting means including a pair of link loons between the pivots and the opposite ends of said rocking block.
No. 101,705. Boiler. Chaudière.

Charles Trow, Wilbert R. De Harpport, Leon Marchessault, Louis Marchessault, Jr., Anna Marchessault, and Victor Marchessault, assginees of Louls Marchessault, all of Minneapolis, U.S.A., 23rd October, 1906; 6 years. Flled 22nd September, 1906. Receipt No. 139,718.
Claim.-1. In a boiler, a plurality of closely assembled
flues, said flues having reduced ends, which reduced ends
are extended through and in the vicinity of the flue sheet of the firebox, substantially as and for the purposes set forth. 2. In a boiler the combination with an outer shell and a fire box, said fire box having a flue shect \(2 a\) spaced apart from an adjacent plate of the sald outer shell, to form a mud leg. of a plurality of flues 3 , having reduced ends \(3 a\) passed through said flue sheet \(2 a\) and extending into the water space a distance approximately equal to the thickness of said underlying mud leg, substantially as described.

No. 101,706. Steam Boiler. Chaudiere d̀ capour.

David Wigert and Benjamin F. Butler, assignee of a half interest, both of Galesburg. Illinois, U.S.A., 23rd October, 1906; 6 years. Filed 27th September, 1906. Receipt No. 139, 846.
Claim.-1. A boiler having an approximately vertical portion provided with a series of sets of flues extending therethrough, each set comprising two rows of flues, one disposed above the other, and at a right angle thereto, all of the flues of one row of each set communicating with the combustion chamber and arranged for the direct passage of the procucts of combustion, and flue members or partitions for directing the products of combustion from one row of each set to the second row of each sct of flues.
2. The combination with a boller, of an auxiliary water heating chamber having a circulating connection with the boiler, said auxillary chamber forming the rear wall of the firebox and spaced from the front face of the main boller to form a vertical passage or combustion chamber through which the products of combustion must pass to the main boiler flue.
3. The combination with a steam boiler, of an auxiliary chamber arranged in front of the main boiler and forming the rear wall of the firebox, a water box arranged at the front of the boiler and having a circulating connection therewith, and a water grate formed of tubes connected at their iront edge to the water box, the rear ends of said tubes extending upwardly within the combustion space formed between the auxiliary chamber and the main boiler and their upper ends being connected to said auxiliary chamber.

\section*{No. 101,707. Comnosition for Removing Scale from Boilers.}

Composition pour enlever les inconstations dans les chaudieres.
Arthur D. Colquhoun. St. Marys, Ontario, Canada, 23rd October, 1906 ; 6 years. Filed 24th March, 1906. Receipt No. 134.230 .

Claim.-1. The herein described composition of matter consisting of water, substantially pure, caustic soda. tri-sodium phosphates. coal oll, potatoes.
2. The herein described matter for removing scale from steam boilers consisting of. water substantially pure-2 gallocs, caustic soda \(1 \frac{1}{2}\) to 7 lbs ., tri sodium phosphates \(1 \frac{1}{2}\) to 5 lbs ., coal oill 1 to \(1 \frac{1}{2}\) pints, potatoes 1 to 4 gallons, substantially as described and for the purposes specifled.

\section*{No. 101,708. Steam Boiler. Chaudière à vapeur.}

Acland Oronhyatckha, Desoronto, Ontario, Canada, 23rd October, 1906 : 6 years. Filed 30th April, 1906. Receipt No. 135,371.
Claim.-1. A steam boiler comprising a plurallty of scctions each composed of two metal plates spaced apart and suitably secured at their abutting portions so as to form a tight joint, each plate being provided with one or more holes in aligament with the holes in the opposite plate, couplings for providing intercommunication between said sections through their associated holes in said plates, and means for coupling said sections in relative position.
2. A steam boller comprising a plurality of sections each composed of two metal plates spaced apart and suitably se-

cured at their abutting portions so as to form a tight joint, each plate being provided with one or more holes in alignment with the holes in the opposite plate, couplings betwoen said sections for providing intercommunication betwen said sections through their associated holes in said plates. blocks held within said sections so as to keep said plates in position, a coupling rod passing through sald sections and said couplings, and means for securing said coupling rod in place.
3. A steam boiler comprising a plurality of soctinns each composed of two metal plates spaced apart and suitably secured at their abutting portions so as to form a tight foint, fach plate being provided with one or more holes in alignment with the holes in the opposite plate, couplings betwern eaid sections for providing intercommunication butwort said sections through their associated holes in said plates. blocks held within sald sections so as to keep said platos in position, a coupling rod massing throush said sections and said couplines, means for sccuring said coupling rod in place, and means for additionallv bracing said sections together preferably near their outer corners.
4. A stam hoiler comprising a plurality of sections each composod of two metal plates spaced apart and suitably secured at their abuttine portions so as to form a tight joint each plate being provided with one or more holes in alignment with the holes in the opposite plate. couplings between said sections and providing intercommunication between said sections throurh their associated holes in said plates, blocks held within said sections so as to keep sald plates in position, a coupling rod passing through said sections and said couplings. means for securing said coupling rod in place, brace rods nassing through the plates of said sections near each corner thercof, washrrs on said rods between said sections. and nuts on said rods for bracig sald sections and coupling them together.
5. A steam boiler comprising a plurality of metal frames. a metal plate secured to each side of said frame so as to form a tight joint, each plate being provided with one or more holes in alignment with the holes in the opposite plates, couplings for providing intercommunication between said sections through their associated holes in said plates, and means for coupling said sections in relative position.
6. A steam boiler comprising a plurality of metal frames provided with V-shaped bottoms. a metal plate secured to each side of said frame so as to form a tight joint, each plate being provided with one or more holes in alignment with the holes in the opposite plate. the lower sets of holes being near the apex of said \(V\)-shaped bottom. couplings for providing intercommunication between said sections through their associated holes in said plates, and means for coupling said sections in relative position.
7. A steam boiler comprising a plurality of metal frames provided with V-shaped bottoms, a first metal plate having its ends bent around said metal frame, a second metal plate having its ends bent around the bent end of said first metal plate, rivets for securing said ends to said metal frame so as to form a tirht joint. the said plates being provided with one or more holes in alignment with the holes in the opposite plate, couplings for providing intercommunication between said sections through their associated holes in said plates, and means for coupling said sections in relative position.
8. A steam boiler comprising a plurality of metal frames provided with V-shaped bottoms, a first metal plate having its ends bent around said metal frame, a second metal plate having its ends bent around the bent end of said first metal plate, rivets for securing said ends to said metal frame so as to form a tight joint. the said plates being provided with one or more holes in alignment with the holes in the opposite plate, couplings for providing intercommunication between said sections through their associated holes in said plates, removable coupling rods passing through said couplings and
said plates, means for keeping said coupling rods in place, and means for coupling said sections together so as to perinit of the removal of said coupling rods and yet prevent the displacement of said sections.
9. A bniler section comprising two metal plates spaced apart aid suitably secured at their abutting portions so as to form a ticht joint. each plate being provided with one or more holes in alignment with the holes in the opposite plate.
10. A boiler section comprising a metal frame, a first plate placed on one side thereof and having its ends lapped or folded over said metal frame. a second metal plate placed on the other side of said metal frame and having its ends lapped or folderl over the lapped ends of said first metal blatr. rach of said plates being provided with one or more holes in alignment with the holes in the opposite plate and rivets for securing the lapped or folded ends of sald metal plates to said metal frame so as to form a tight joint.
11. A boilor section comprising a metal frame provided with a V-shaped hottom. a first plate placed on one side thercof and having its ends lapped or folded over sald metal frame. a second metal plate placed on the other side of sald metal frame and having its ends lapped or folded over the lanper ends of said first metal plate, each of said plates hining norvided with one or more holes in alignment with the hols in the oprosite plate. the lower pair of holes in said plates being at the apex of said \(V\)-shaped bottom and rivets for securing the lapped or folder ends of said metal plates to said motal frame so as to form a tight joint.

\section*{No. 101,709. Conveyer for Excavators. Transport pour excavateurs.}

Thomas McMunn, Winnipeg, Manitoba, Canada, 23rd October, 1:06: 6 years. Filed 8th June, 1906. Receipt No. 186.6м\%.

Claim. \(\cdots 1\). In a device of the class described in combination, a sectional main frame, a sectional dependent adjustable frame, a set of gear wheels offset and dependent from the frame. endless chains meshing the opposing sets of gear wheels, carriers dependent from the chains, weans for keeping the chains continuously in mesh with the rear wheels at the opposing end of the adjoining frames, and means for supporting the frames, as and for the purpose specifed.

2 . In a device of the class described in combination :main frame, a dependent adjustable frame, side boards esHinding longitudinally with the frames and displaced laterally at either side, sets of gear wheels disposed between the side boards and the inain frame, sets of similar gear wheels disposed upon the lower face of the frames, endless sprocket chains passing over the gears one on elther side, carriefs driondent from the chains, a set of gear wheels disposed above the main frame and dependent therefrom designed to continuously mesh with the chains, means for pivoting the depenlent frame to the main frame, out boards carried by the frames and in proximity to the carriers, and means for supporting the frames, as and for the purpose specifled.
3. In a device of the class described, the combination with the sectional frames composed of longitudinal and cross beams, the gear wheels and the gear chains, of the riers dependent from arms extending inwardly from of sides of the chains, there being a carrier for he chain, as and for the purpose specifled.
4. In a device of the class described, the combination Fith the endless sprocket chains dependent from the frame, \(\mathrm{an}^{\text {d }}\) having arms extcnding inwardly from the sides of the inhaving arms extending inwardy from the sides of to the dividual links. of sets of flat plate carriers secured be
arms. arms, angle bar plate carriers disposed at interns there
ween the former carriers, and secured to the arms, tween the former carriers, and secured to the arms, within being a carrier to cach opposing set of the lingth equal the chains, and all of said carriers being of a eagectively, lo or less than the distance betwe
\({ }^{1}\). In a device of the class described. the combination with the frames, an endless belt and carriers dependent therefrom, of out boards carried by the frame, and extending longitudinally above the chain, and adjoining the ends of the upper carriers, as and for the purpose specified.
6. In a device of the class described, the combination with the main frame and the dependent frame pivotally supported therefrom, the chain gear whecls and the chain, of a set of gears above and carried by the main frame, said gears being designed to continuously guide the chains from the adjoining gears on the main frame to the adjoining gears on the dependent frame in the motion of the adjustable frame, as and for the purpose specified.

N0. 101,710. Excavator. Excavateur.

Ezra A. Mathers, Philadelphia, Pennsylvania, U.S.A., 23 rd October, 1906; 6 years. Filed 7th September, 1906. Receipt No. 139,331 .
Claim.-1. An excavating machine comprising a main frame mounted upon traction wheels and having a rotary digger supported thereon upon a pivoted frame, said pivoted frame carrying said rotary digger and the mechanism for conveying the material away from the machine, and means for operating said digger aud raising and lowering said frame, substantially as sot forth.
2. In an excavating machine, the combination for the frame, mounted upon wheels, a rotary digger carried by arms, said arms pivoted to said frame, means for adjusting and supporting said pivoted arms at the desired elevation, means for oprrating said digger, and a conveyer mounted within said dagher and carried by the same pivoted arms, substantially as sect forth.
3. In an excavating machiae, tho conbination of the main frame, a pair of pivoted arms pivoley thereto at their rear ends and having a hollow cylinder rigidly secured to their outer ends, said cylinder being formed with an opening in its top, a rotary digger mounted to rotate upon said cylinder and deposit the material through said opening, a conVeyrr mounted within said cylinder and arranged to receive said material and carry it away from the marhine, and mechanism for operating satd several parts, substantially as set forth.
4. In an excavating machine, the combination of the main frame, the pivoted frame mounted thercon, a hollow cylinder carried on the outer end of said pivoied frame, a rotary digger mounted upon said cylinder, which cylinder has an opening in its top and which digger is arranged to deposit the material through said opening, a conveyer within said cylinder and means for operating said parts, substantially as set fortl.
5. An excavating machine comprising a rotary digger formed of annular heads with radially extending digger blades between them mounted upon a hollow cylinder, said cylinder provided with an opening in its top, said digger being arranged to deposit the material through said opening a conveyer within said cylinder and means for operating said several parts, substantially as sct forth.
6. In an excavating machine the combination of the main frame, a pivoted frame, the hollow cylinder mounted in said pivoted frame and formed with an opening, a rotary digger comprising annular heads with digger blades secured between them and having anti-friction rollers mounted thereon, said rotary digger being mounted on said hollow cylinder with said rollers resting on its surface and means for operating said parts, substantially as set forth.
7. An excavating machine comprising a main frame supporting the driving mechanism, a pivoted frame mounted on said main frame having a hollow cylindrical bearing on its outer end formed with an opening in its top, a conveyer Within said bearing, a rotary digger mounted on said bearing and the driving mechanism, substantially as set forth.
8. In an excavating machine the combination of the main irame, the vertically adjustable frame carried thereby and
having a hollow cylindrical bearing at its outer end with an opening in its top, a conveyer in said bearing, a rotary digger comprising annular heads having digger blades secured bet ween them, said heads mounted to rotate upon said bearing and means for driving said several parts, substantially as set forth.

No. 101,711. Excavator. Excavateur.

George Henry Dunlop. South Melbourne, Victoria, Australia, 203 r October, 1906; 6 years. Filed 21st January, 1904. Receipt No. 111,947.
Claim.-1. In combination in apparatus for excavating, dredging and transporting earth and other materials, a main power station and an overhatal station in one structure, a scraper and power mechanism and three ropes for operating said scraper whereby earth may be filled into the seraper by hauling it iorward, transported in it by hauling it backward and deposited from it by overturning it forward, substantially as described.
2. In combination in apparatus for excavating, dredging and transporting earth and other materials, a main power siation and an outhaul station in one structure, a scraper and power mechanism and three ropes for operating said scraper wheroby earth may be filled into the scraper by hauling it forward, transported in it by hauling it forward and denosited from it by overturning it backward, substantially as described.
3. In combination in apparatus for excavating, dredging and transporting earth and other materials, a main power station and an outhaul station in one structure, a scraper and power mechanism and three ropes for operating said scraper whereby earth may be filled into the scraper by hauling it forward, transported in it by hauling it either backward or forward and deposited from it by overturning it forward or backward as the work may require, substantially as deseribed.
4. In combination in apparatus for excavating. dredging and transporting earth and other materials, a main power station and an outhaul station in separate structure, a seraper and power mechanisin and three ropes for operating said scraper whereby earth may be filled into the scraper by hauling it forward, transported in it by hauling it backward and deposited from it by overturning it forward, substantially as described.
5. In combination in apparatus for excavating, dredging and transporting earth and other materials. a main power station and an outhaul station in separate structures, a scraper and three ropes for operating said scraper whereby earth may be filled into the scraper by hauling it forward. transported in it by hauling it forward and deposited from it by overturning it forward, substantially as described.
6. In combination in apparatus for excavating, dredging and transporting earth and other materials, a main power station and an outhaul station in separate structures, a scraper and power mechanism and three ropes for operating said scraper whereby earth may be flled into the scraper by hauling it forward, transported in it by hauling it forward and deposited from it by overturning it backward, substantially as described.
7. In combination in apparatus for excavating, dredging and transporting earth and other materials. a main power station and an outhaul station in separate structures, a scraper and power mechanism and three ropes for operating said scraper whereby earth may be filled into the scraper hy hauling it forward, transported in it by hauling it either backward or forward and deposited from it by overturning forward or backward as the work may require, substantially as described.
8. In combination in apparatus for excavating. dredging and transporting earth and other materials, a main power
station and an outhaul station in one double cantilever structure, a scraper and power mechanism and three ropes for operating sald scraper whereby earth may be filled into sald scraper by hauling it forward, transported in it by hauling it forward toward the extreme outward limit of the main power station and deposited from it by overturning it forward, substantially as described.
9. In combination in apparatus for excavating, dredging and transporting earth and other materials, a main power station and an outhaul in one double cantlever structure, a scraper and power mechanism and three ropes for operating sald scraper whereby earth may be filled into said scraper by hauling it forward, transported in it by hauling it forward toward the extreme outer limit of the main power station and deposited from it by overturning it backward, substantially as described.
10. In combination in apparatus for excavating, dredging and transporting earth and other materials, a main power station and an outhaul in one double cantilever structure, a scraper and power mechanism and three ropes for operating said scraper whereby earth may be fllled into said scraper by hauling it forward, transported in it by hauling it backward toward the outhaul station and deposited from it by overturning it forward, substantially as described.
11. In combination in apparatus for excavating, dredging and transporting earth and other materials, a main power station and an outhaul station in one double cantilever structure, a scraper and power mechanism and three ropes for operating sald scraper whereby carth may be filled into the scraper by hauling it forward, transported in it by hauling it backward or forward and deposited from it by overturning it forward or backward as the work may require, substantially as described.
12. In combination with a main power station and an outhaul station having suitable power mechanism, a scraper and three ropes for operating said scraper substantially in the manner herein described whercby earth and other materials may be filled into the scraper, transported in it and deposited from it.
13. In combination with a main power station and an outhaul station having suitable power mechanism, a scraper having an arm or projection thereon and three ropes for operating said scraper substantially in the manner horein described wherehy earth and other material may be filled into the scraper, transported in it and deposited from it.
i4. For excavating, dredging and transporting earth and other materials in combination, a main power station and on outhaul station with power mechanism, a scraper and repes for operating said scraper whereby carth and other materlals may be flled into the scraper by haulling it forward, transported in it by hauling it forward and deposited from it by overturning it backward, substantially as described.
15. For excavating, dredging and transporting earth and other materials in combination, a main power station and an outhaul station with suitable power mechanism, a scraper and three ropes for operating said scraper whereby earth and other materials may be filled into the scraper by hauling it forward with one part of the scraper bearing upon the ground, transported in it by hauling it away with another part of the scraper bearing upon the ground and deposited from it by overturing it, substantially as described.
16. For excavating, dredging and transporting earth and other materials in combination, a main power station and an outhaul station with suitable power mechanism, a scraper and ropes for operating said scraper whereby earth and other mterials may be filled into by hauling it forward bearing upon one part of the scraper, transported in it by hauling it away bearing upon another part, deposited from it by overturning it onto the third part of its surface upon which it is borne when being hauled back to be refilled, substantially as described.
17. In combination machinery comprising a scraper, a main power station and an outhaul station power mechanism, three winding drums, brakes and clutches to sald winding drums, power controlling mechanism, manipulating levers therefor, an elevated platform for the operating attendant and three ropes passing from said winding drums to points of attachment at the scraper, of which ropes the main hauling rope is attached near the front of the scraper and the forward hauling rope and the backward hauling rope are attached at the upper part of the scraper whereby earth and other materials may be filled into the scraper, transported in it and deposited from it.
18. In combination a main power station and an outhanl station, a main hauling engine having a winding drum, a controlling engine with two winding drums, a scraper, a main hauling rope passing from the drum of the main hauling engine to the eront of the scraper, a forward hauling rope passing from a drum of the controlling engine to the upper part of the scraper, a backward hauling rope passing from a drum fitted with a friction brake on the controlling
end from the outhaul station to the upper part of the scraper whereby said scraper may be drawn along by the main hauling rope, tilted forward by the forward hauling rope, tilted backward by the backward hauling rope and held tilted as desired by the forward hauling rope hauled by the controlling engine acting against the backward hauling rope restrained by the friction brake so that earth and other materials may be filled into the scraper, transported in it and deposited from it, substantially as described.
19. For excavating, dredging and transporting earth and other materials by means of a scraper operated by ropes as herein described, an arm or projection on the said scraper with which the ropes engage whereby the control of the scraper by the forward hauling rope and the backward hauling rope is facilitated, substantially as described. 20. A scraper having an arm or projection of sufficient length to rise above the surface of the water, when being used for excavating and the like under water, bauling means eagaging with said arm, substantially as described.
21. For excavating, dredging and transporting earth and other materials, a power station and an outhaul station, with suitable power mechanism combined in one structure, consisting of a framing forming the main power station and boom projecting therefrom forming the outhaul station, and a scraper supported and operated by ropes controlled therefrom, substantially as and for the purpose described and shown.
22. For excavating, dredging and transporting earth and other materials in combination, a main power station and an outhaul station with suitable power mechanism, a scraper having a strengthening rib within the bowl and ropes for operating said scraper, substantially as described and shown.
23. For excavating, dredging and transporting earth and other materials in combination with a scraper and ropes attached to said scraper, a machine comprising a main power station and an outhaul station combined in one double cantilever structure with suitable power mechanism wherebs carth may be filled into the said scraper, conveyed in it and dumped from it beyond the llmits of area upon which said rachine stands, substantially as herein described.
24. In combination a main power station and an outhaul station with power mechanism, a scraper and ropes attached to the scraper of which ropes the main hauling rope is at. tached by three draft lines to connect with a single hauling rope, substantially as and for the purpose herein described.
25. In machinery for excavating, dredging and transporting earth and other materials in combination a main power station and an outhaul station with suitable power mechanism, a scraper and three ropes for operating said scraper, the operation of filling the said scraper when controlled as to its angle of tilt by the backward bauling rope restrained by a friction brake applied to its winding drum against the forward hauling rope drawn by its winding drum to which puwer is applied while the scraper is being drawn forwar by \({ }^{*}\) the main hauling rope, substantially as described. 26. In machinery for excavating, dredging and transportiog earth and other materials in combination, a main power station and an outhaul station with suitable power mechanism, a scraper and ropes for operating said scraper, the use ol a drek or decks upon which the mechanism is arranged so that an attendant may oversee the scraper throughout its course and control the scraper by means of such mechanism and ropes so that earth and other materials may be filled into the scraper, transported in it and deposited from it, substantially as herein described.
27. In machinery for excavating, dredging and transportligg earth and other materials in combination, a main power siation, an outhaul station, power mechanism, a scraper operating ropes with each rope directly attached to the scraper, operating ropes with each rope directly attached to the scraper for operating it and brackets or lugs at the front of the scraper, as and for the purpose herein described.
23. In combination for excavating, dredging and transport\(\rightarrow\) sairtr and other materials, a scraper, ropes attannd to said scraver and a machine with sultable power mechansin for operating said scraper by means of said ropes, sto. machine having a double cantilever arm bearing guide pulleys whereby said scraper may be operated each way beyond the limits of the area upon which said machine stands.

\section*{No. 101,712. Coin Assorter and Stacker.}

Appareil dassortir et empiler la monnaie.
Bertram Forrest Brewster, Burrton, Kansas, U.S.A., \({ }^{23 r d}\) (d October, 1906; 6 year.s. Filed 20th August, 1906. Receipt No. 138,822 .
Claim.-11. A' device of the character described comprising a supporting base, a series of superposed sorting
plates mounted to vibrate on said support, a stacking arm for each plate, and means for directing the coins toward said stacking arms.

2. A device of the character described comprising a support, a series of superposed sorting plates arranged to vibrate and also to turn on said support, the respective plates being provided with apertures of different sizes, that is, the apertures of one plate being of a different size from the apertures in the other plate, for the purpose specified, each of said plates being provided with a stacking arm, and there being provided a series of vertical passages leading downwardly from the respective sorting plates, said passages being of a diameter larger than the upertures in the plate from which such passage leads, as and for the purpose set forth.
3. In a device of the character described comprising a support, a series of superposed plates mounted to turn on said support, each plate being provided with apertures, and the apertures of each plate decreasing in size from the apertures in the plate above it, and each plate being further provided with apertures larger than its first-named apertures, the last-named apertures being in registry with one another, with respect to different plates, and stacking arms also provided with apertures coincident with the last-named apertures and constituting passages leading downwardly from the respective plates, as and for the purpose specifled.
4. In a device of the character described the combination of a series of superposed sorting plates, means for sorting coins of different denominations through said plates, whereby the coins of the respective denominations will rest upon the surface of the respective plates, the plates being provided with apertures to receive coins of the denominations it is designed to pass, as well as the coins of the denominations of the plates above it, a series of stacking arms mounted on the respective plates and provided with curved fingers, each of which extends partially around one of the last-named anertures of the plate on which it is mounted, and a stacking box secured to the lowermost plate.
5. In a device of the character described, a series of superposed sorting plates each provided with a series of apertures designed to pass coins of a certain size, the plate being adapted to retain coins of a larger size than their apertures on their upper surface respectively, there being provided passages of different diameters leading from the respective plates downwardly, each passage being of a diameter sufficiently large to pass the coins of that size which is too large to pass through the other apertures in said plate, and a series of stacking arms mounted on the respective plates, each arm being provided with a curved finger extending partially around the upper end of one of said passages.
6. In a device of the character described, the combination with a base, of a standard mounted to vibrate in a vertical plane on said base, a series of superposed sorting plates mounted to turn on said standard, a series of stacking arms, one of which is carried by each of said plates, means for sorting coins of different denominations so that they will be separated from each other and rest upon respective plates, there being provided passages, each of which extends downwardly through the other plate and adapted to pass coins from said plates, and a stacking box secured underneath the lowermost plate, for the purpose specified.
7. A device of the character described, comprising a base, a series of superposed plates mounted to vibrate and also to turn on said base, there being coin passages extending downwardly from the respective plates whereby to convey coins of a certain denomination therefrom, and a series of segmental stacking arms of varying widths, one edge of each arm being in the form of a compound curve, the outer portion of which constitutes the stacking finger and which partially surrounds the upper end of the passage leading from the plates upon which it rests.

No. 101,713. Ditching and Grading Plough. Charrue à fossoyer et de régalage.

Rosario Cardinal, St. Philippe de Laprairic. Quebec, Canada, 23rd October, 1906 ; 6 years. Filed 23rd June, 1906. Receipt No. 137,193.
Claim.-1. In a plough, a central beam having an upwardly curved front end having backwardly inclined sides, draught attaching means on the beam, a point on the beam, means for dividing the soil raised by the point, shields on the beam, wings connected with the beam, means for raising and lowering the wings and adjustable grading members carried by the wings.
2. In a plough, a central beam having an upwardly curved front end having backwardly inclined sides, draught attaching means on the beam, a removable point on the beam provided with vertical cutting blades, means for dividing the soil raised by the point, a shield on the beam, wings connecting with the beam, means for raising and lowering the wings and adjustable grading members carried by the wings.
3. In a plough, a central beam having an upwardly curved front end provided with rearwardly inclined sides, draught attaching means secured to the beam, a point on the beam, a vertical dividing plate secured to the front end of the beam, a shield on the beam, wings connected with the beam, means for raising and lowering the wings and adjustable grading members carried by the wings.
4. In a plough, a central beam having an upwardly curved front end and backwardly inclined sides, draught attaching means on the beam, a point on the beam, means for dividing the soil raised by the point, a vertical shield disposed adjacent the front end of the beam and provided with downwardly inclined flanges, wings connecting with the beam, means for raising and lowering the wings and adjustable grading members carried by the wings.
5. In a plough, a central beam having an upwardly curved front end having backwardly inclined sides, draught attaching means on the beam, a point on the beam, means for dividing the soil raised by the point, shields on the beam, wings connected with the beam, vertical shields secured to the beam and arranged to cover the forward ends of the wings, means for raising and lowering the wings, and adjustable grading members carried by the wings.
6. In a plough, a central beam having an upwardly curved front end having backwardly inclined sides, draught attaching means on the beam, a point on the beam, means for dividing the soil raised by the point, shields on the beam, wings connected with the beam, standards on the beam, bell crank levers supported by the standards, links connecting the wings and the bell crank levers, means for rocking the levers and grading members carried by the wings.
7. In a plough, a central beam having an upwardly curved front end having backwardly inclined sides, draught attaching means on the beam, a point on the beam, means for dividing the soil raised by the point, shields on the beam, wings connected with the beam, cross pieces connecting the wings, standards on the beams, bell crank levers pivotally supported on the standards, links connecting the cross pieces and the bell crank levers, a lever connected to one of the bell crank levers. a link connecting the other bell crank levers and said lever, a segmental rack, a pawl on said lever adjacent the rack and adjustable grading members carried by the wings.
8. In a plough, a central beam having an upwardly curved front end provided with backwardly inclined sides, draught attaching means on the beam, a removable point on the beam, means for dividing the soil ralsed by the point, a shield on the beam. wings connected with the beam, means for raising and lowering the wings, adjustable grading members pivoted to the outer ends of the wings and set screws adapted to lock the grading members.

No. 101,714. Apparatus for Testing Prommatie Tools.
Appareil pour éprouver les outils pneumatiques.

Robert Allison Chambers, New Glasgow, Nova Scotia, Canada, 23rd October, 1906; 6 years. Filed 7th August, 1906. Receipt No. 138,469 .

Claim.-1. In a device of the class described, a cylinder, a piston therefor, a reciprocating tool connected to said piston, and means for measuring the impact of said piston within the cylinder.
2. In a device of the cluss described, a cylinder, a plston therefor, means for introducing a volume of water into said cylinder, a reciprocating tool connected to said piston, and means for measuring the impact of said piston against the water within the cylinder.
3. In a device of the class described, a cylinder, a piston therefor, a water tank, means connecting said cylinder and water tank, a reciprocating tool connected to said piston, and means for measuring the impact of the piston against the column of water within the cylinder.
4. In a device of the class described, a cylinder, a piston therefor, adjustable means for introducing a column of water into sald cylinder, a compresser tank and cylinder, a reciprocating tool attached to said piston, and means for registering the impact of the piston against a column of water within the cylinder.
5. In a device of the class described, a cylinder, a piston therefor, an adjustable inlet port on one side of said cylinder, an adjustable outlet port on the opposite side of said cylinder, a compresser tank, means connecting said compresser tank and cylinder, a reciprocating tool connected to said piston, and means for registering the impact of the forward stroke of the piston.
6. In a device of the class described, a cylinder, a piston therefor, an adjustable inlet port at one side of said cylinder, an adjustable outlet port on the opposite side of said cylinder, a compresser tank, means connecting sald compresser tank and cylinder, a reciprocating tool connected to said piston, means for measuring the impact of the forward stroke of the piston, and means for measuring the return stroke of the piston.
7. In a device of the class described. a cylinder, a piston, therefor adjustable means for Introducing a column of water into said cylinder, an adjustable outlet port, a compresser tank, means connecting said compresser tank and cylinder, a vacuum tank, means connecting said vacuum and cylinder, a reciprocating tool connected to said piston, means for measuring the impact of the forward stroke of said piston, means for measuring the return stroke of the plston, and means for measuring the energy required by said reciprocating tool.
8. A device of the class described comprising a cylinder, a piston therefor, an adjustable inlet port on one side of said cylinder, an adjustable outlet port on the opposite side of the cylinder, a compresser tank, a vacuum tank, connections between said tanks and cylinder, a reciprocating tool connected to said piston, means for measuring the energy supplled to said tool, and means for measuring the forward and return strokes of sald piston.

No. 101,715. Method of Testing Pnenmatio Tools. Méthode d'eprouver les outils pneumatiques.

Robert Allison Chambers, New Glasgow, Nova Scotia, Canada, 23rd October, 1906 ; 6 years. Filed 7th August, 1906. Recelpt No. 138.470.
Claim.-1. A method of testing pneumatic tools and the like, which consists in measuring the fluid compressed by a
series of lmpinging or striking blaws against the eness consumed by such an operation.

2. A method of measuring the efinciency of paeumatic tools and the like which consists in connectirg a reciprocatiog tool to a pump piston, operating said piston to strike a series of impinging blows, and measuring the force of said blows against the power supplied to the tool.
3. A method of testing pneumatic tools and the like which consists in connecting said tools to a reciprocating piston, operating sald piston to impinge against a body of water to compress a column of air, and measuring the ares thes compressed against the energy consumed by the toal.
4. A method of testing pneumatic tools and the like which consists in connecting the tool to a reciprocating plston, operating said piston to strike a series of impinging blows against a volume of water, registering the forward strake of said piston by means of a compression tank, registering the return stroke of said piston by means of a vacuum tank, and measuring the sum of both forces against the energy sugplied to said tool.
No. 101,716. Closnre for Beals, Fto.
Fermeture de Uores, eto.

Michael Angelo Hirsch, Franklin, Pennsylvanla, U.S.A., gosrd October, 1906; 6 years. Filed 8th January, 1906. Beceipt No. 131,647.
Claim.-In a device of the class specified the comblaation of a book or other article, having an outwardly arched, freeonded, resilient tongue attached thereto, with an elastic band, removably retained by said tongue.
10. 101,717. Gas Retort. Cormue d gaz.

Gottfried Theodor Albert Jerratsch, Schweren, Germais, 23rd Ootober, 1906; 6 years. Flled 17th May, 1906. Receipt No. 136,096.
Claim.-In a retort furnace and in comblation with the supporting masonry, the retort formed in sections, the end
section being supported by the masonry while the midnle section is supported by the said end section, substanlially as described.

\section*{Ne. 101,718. Mould for Building Blocke.}

Moule pour blocs de construction.

John A. Johnson, Winamac, Indians, U.S.A., 23rd October, 1906; 6 years. FHled 4th September, 1906. Receipt No. 139,256.
Claim.-1. In a device for forming building blocks, a frame in plurality of separate parts, means for securely uniting sadd parts, a pallet, mould having sides and ends resting upon said pallet, said sides and ends being laterally movable, means for simultaneously separating the opposite members of said sides and ends and springs for returning them to a normal closed position.
2. In a mould for forming building blocks, a removable pallet, mould ends and mould sides mounted loosely on said pallet, two of the opposite of said side or end members having shoulders or projections and the remaining two of sald members having oblique surfaces in contact with the shoulders or projections on the two first members, means for oppositely moving and thereby separating the two first members, whereby the other two members will be simultaneously and oppositely separated and spiral springs connecting one of said members with its opposite co-onerating member.
3. In a mould for forming building blocks, a removable pallet, mould ends and mould sides mounted loosely on said pallet, two of the opposite of said side or end members having shoulders or projections and the remaining two of said members having oppositely sloped oblique surfaces to contact with the shoulders or projections on the two first members, and means for oppositely moving and thereby separating the two first members whereby the other two members will be simultaneously and oppositely separated. and elastic ties to normally move the members with the oblque faces toward each other.
4. In a device for forming concrete blocks. a base comprising side pieces and transverse connecting pieces extending under said side pleces, a pallet removably located on said cross pieces between the side pieces, a two-part frame having the parts hinged to the opposing members of said base, means for fastening the two parts of the frame together, moulds having movable ends and sides. said ends and sides being located within said frame, the sides having oblique surfaces next to the mould of which it is a part, and the ends having shoulders to contact with the oblique surfaces of the sides and separate said sides by an outward movement of the end pleces, and automatic means for restoring the sides and ends to their moulding positions when the separating strain is removed.
5. In a device for forming building blocks, a base, a pallet removably placed thereon, a frame in two parts each of which is hinged to said base, mould sides and ends in oppositely separable parts, means for simultaneously separating said parts and wedges carried by the frame sections for locking the closed members of the moulds.
6. In a device for making building blocks, a base comprising side members which are united by underlying cross pleces, the side members having inward projections adjacent to their ends with oblique inner faces, a pallet fitting between the side members and directed into position by the oblique surfaces of said projections from the base, adjustable mould ends and sides resting upon said pallet, and means for spreading the last-named parts for the removal of the product of the mould.
7. In a device for forming building blocks, a base, a pallet mounted thereon, a two-nart frame having sald parts hinged to the base, mould ends and sides having cutaway portions to permit said parts to cross each other,
means for simultancously spreading the sides and ends and for uniting said sides and ends so they may be removed as a whole, posts mounted on the base extending above the tops of the moulded product on the pallet, the end bars of said moulds having notched extensions to contact with said posts will serve as guides to prevent injury to the product by said sides and ends during the removal of the latter.
9. A base comprising side members connected by underlying cross pieces. said side members having inward extensions with oblique faces, a pallet located between said side members on the cross pieces and directed by said extensions, a frame in two parts, said parts being hinged to opposite side members of the base. mpans for fastening the two members together, a pair of bars parallel with each other extending from end to end within the frame and forming the ends of a plurality of moulds, sides for said moulds located within the frame and extending from side to side thereof. said sides having middle end notches to receive portions of the end bars which are reduced in width to enter said end notches, the projections of said sides having inner wedges to spread the sides by an outward movement of the end bars, springs to draw the sides of each mould together, wedges carried by the frame sections to enter between the sides of adjacent moulds and close the moulds, means to spread tho end bars and posts to limit the spread of said bars and serve as guides to control the withdrawal of the end bars and mould sides on the removal of the latter, said posts extending above the moulded product to prevent injury thereto.
9. In a mould for forming building blocks, a bane, a pallet located upon the base, a frame surrounding the pallet, mould sides extending from one side of the frame to the other within the frame, bars forming mould ends and extending from one end of the mould to the other within the frame remote from the ends of the mould sides and sheet metal plates covering the spaces between the end bars of the mould and the sides of the frame.
10. A device for making concrete blocks, a base, a pallet removably supported thereon, said pallet having a plurality of transverse openings, a plurality of moulds located on said pallet, said moulds being separated by spaces whick register with the transverse openings in the pallet, laterally adfustable sides and ends for said moulds, the outer surfaces of said sides being oblique to form spaces between said moulds which increase in width downwardly.
11. In a mould for forming concrete blocks, a base, a removable pallet located thereon, a two-part frame having said parts hinged to opposite sides of the said base, means for drawing parts of the frame together and fastoning them, a pair of transverse bars located within the frame and extending from end to end thereof and forming the ends of a plurality of moulds, mould sides located within the frame transversely and extending from side to side of the frame. said sides having middle notches to receive reduced portions of the end bars and providing extensions of said sides beyond the bars, wedge faces on said extensions to contact with the shoulders on the bars formed by seid reductions in width of the latter, friction rollers mounted in said shoulders to contact with the wedges, springs to draw the two sides of each mould together, a rock shaft having lateral ears, link bars connecting said ears with said bars forming the ends of the moulds whereby the rocking of the rock shaft will spread the end bars and open the mould.

No. 101,719. Variable Elootric Sige. Enseigne électrique variable.

Albert Levvy, Winntpeg, Manitoba, Canada, 23rd October, 1906 ; 6 years. Filed 2nd May, 1906. Receipt No. 135.475. Claim.-1. An electric advertising and signalling apparatus consisting of symmetrical groups of electric lights upon a irame, a lead wire connected from one side of a source of supply to pमe of the posts of each of the individual lamps,
electro-magnets supported on the frame. one for each lamp, the said magnets having a conducting pin connected thereto which extends through the frame and is connected to the other pole of the lamps, secondary exciting wires extending around the individual electro-magnets from the aforesaid conducting pins to a spring contact on the outer face of the spools. normally opened spring pressed armatures supported and slidable within a conducting plate, there being an armature opposing each of the electro-magnets and having a knife edge on the forward foce thereof designed to be received by the spring contact of the electro-magnets, a lead extending from the outer side of the source of supply to a conducting plate, a primary winding oxtending around each of the individual electro-magnets and connected to a second source of supply, means within the primary winding circuit for controlling the current so that predetermined electro-magnets at the back of any of the groups of lamps may be encrgized, as and for the purpose specifled.
?. An electric advertising and signalling apparatus comprising an insulated frame, symmetrically placed groups of incandescent lamps supported on the frame, an electromagnet connected to each lamp, said electro-magnets having normally open circuits, primary exciting windings designed to energize predetermined electro-magnets at the back of the group of lamps, means for controlling such predetermined energization and means upon the energization of such electro-magnets whereby a second electric circuit is closed and the lamps corresponding in position to the flectromagnets illuminated, as and for the purpose specified.
3. An electric advertising and signalling apparatus comprising an insulated frame, symmetrical placed groups of incandescent lamps supported thereon, an electro-magnet for each lamp upon the back of the frame. said electromagnets having a normally open circuit, primary exciting windings designed to energize predetermined electro-magnets at the back of the grougs of lamps, means for controlling such predetermined encrgization, a secondary winding encircling each of the electro-magnets and extending from one of the poles of the lamps to a spring contact upon the face of the clectro-magnet, a lead extending from the mains and connected to the other pole of the lamps and means where by upon the primary excitation of the electro-magnets a clrcuit is closed through the secondary winding to the other side of the main and the lamps illuminated, as and for the purpose specifled.
4. An electric advertising and signalling apparatus comprising an insulated frame, symmetrically placed groups of incandescent lamps supported on the frame, a lead wire connected from one side of a source of supply to one of the posts of each of the individual lamps. electro-magnets supported on the frame, one for each lamp, the said magnets having a conducting pin connected thereto which extends through the frame and is connected to the other pole of the lamps, secondary exciting wires extending around the individual electro-magnets from aforesaid conducting pins to a spring contact on the outer face of the spools, normally opened springs pressed armatures supported and slidable within the conducting plate there being an armature opposing each of the electro-magnets and having a knife edge on the forward face thercof designed to be recelved by the spring contact of the electro-magnets, a lead extending from the other side of the source of supply to the conducting plate, a primary wlading extending around each of the elec-tro-magnets and in a normally open electric circuit, means for closing such electric circuit so that predetermined elec-tro-magnets are primarily energized and the armature drawn over to close with the spring contact and illuminate the depending lamps and means for breaking the primary exciting circuit after the required lllumination in the first group and shifting it to the electro-magnets of the succeeding group of lamps, as and for the purpose specifind.
5. An electric advertising and signalling apparatus comprising an insulated frame, symmetrically placed groups of incandescent lamps supported thereon, said groups each containing an equal number of similarly situated lamps, a main source of electric energy, a lead extending from one side of the said main source and connected to one pole of the lamps respectively, a vertical conducting plate extending the length of the frame at the back and in proximity thereto, a lead extending from the other side of the main through a switch to said conducting plate, an electro-magnet for each lamp supported upon the back of the frame and having a spring contact on the forward face thereof, a secondary winding extending from each of the spring contacts around the electro-magnet to the second pole of the adjoining lamp, a normally open spring pressed armature opposing each electro-magnet and slidably supported within the plate making clectrical contact therewith, a tip extending from the forward face of the individual armatures and designed to close within the spring contacts of the electro-
magnets, individual leads extending from one side of a second source of supply to the similarly placed electromagnets of each of the groups, such being designed to form a primary exciting wiring for the electro-magnets, individual leads extending from the other side of said second source of supply, each of such leads forming a common return for the primary winding of the electro-magnets of the individual groups and means within the second circuit whereby predetermined electro-magnets within any of the successive groups may be primarily excited, as and for the purpose specified.
6. An electric advertising and signalling apparatus comprising an insulated frame. symmetrically placed groups of incandescent lamps supported thereon, said groups each containing a definite and equal number of situated lamps. a main source of electric energy, a lead extending from one side of the said main and connected to ona pole of the lamps respectively. a vertical conducting plate extending the length of the frame at the back and in proximity thereto, a lead extending from the other side of the source of electric energy through a switch to the said conducting plate. an clectro-magnet to the rear of each lamp and supported on the frame, a spring contact extending outwardly from the face of each electro-magnet, a winding extending from the spring contact around the electro-magnet to a conducting nin in electrical connection with the second pole of the individual lamns, a normally open spring pressed armature onposing each electro-magnet and slidably supported within the nlate making electrical contact therewith, a tip extending from the forward face of the armature and designed to close within the soring contacts of the electro-magnets, a set of binding posts corresponding in number of groups of lamps, a set of binding posts corresponding in number to the number of lamos within the groups. individual lead wires extending from each of the binding posts in the set corresponding to the lamps within the groups and passing behind the successive groups of lampa, wires extending from one side of the similarily nlaced electro-magnets in each group and tapped to one of the aforesald individual leads. wires extending from other of such similarily olaced elec-tro-magnets and tapned to other of the sair leads. and individual wire extending from each of the binding oosts of the set corresponding to the number of grouns of lamps. such wires forming a common return for a set of conductors extending from each of the successive groups, the number of wires in a set corresponding to the number of electromagnets in a group and each wire being connected to the other side of the electro-magnets within the groud. a second source of supply. means whereby said source of supply may be directly and individually connected electrically to any one of the binding nosts corresponding to the number of groups of lamps, and means whereby the other side of the second source of supply may be placed in electrical connection with any predetermined number of the binding posts corresponding to the number of lamns within the groups simultaneously. as and for the purpose specifled.
7. An electric advertising and signalling apparatus comprising an insulated frame. symmetrical placed groups of incandescent lamps supported thereon, sald groups each containing a definite and equal number of situated lamps. a main source of plectric energy. a lead extending from one side of the said main and connected to one pole of the lamps respectively, a verical conducting plate extending the length of the frame at the back and in proximity thereto, a lead extending from the other side of the source of electric energy through a switch to the said conducting plate. 20 electro-magnet to the rear of each lamp and supported on the frame. a spring contact extending outwardly from the face of each electro-magnet, a winding extending from the spring contact around the electro-magnet to a conducting pin in electrical connection with the second pole of the individual lamps, a normally open spring pressed armature opposing each electro-magnet and slldably supported within the plate making electrical contact therewith, a tip extending from the forward face of the armature and designed to close within the spring contacts of the electro-magnets, a set of binding posts corresponding in number to the number of groups of lamps, a set of binding posts corresponding in number to the number of lamps within the groups, individual lead wires extending from each of the binding posts in the set corresponding to the lamps within the groups and passing behind the successive groups of lamps, wires extending from one side of the similarly placed electro-magnets in each group and tapped to one of the aforesaid individual leads, wires extending from other of such similarly placed electro-magnets and tapped to other of the said leads, 8 n individual wire extending from each of the binding posts of the set corresponding to the number of groups of lamps. such wires forming a common return for a set of conductors extending from each of the successive groups, the number
of wires in a set corresponding to the number of electro-
magnets in a group and each wire being connected to the other side of the electro-magnets within that group, a set of series connected accumulators, means whereby said accumulators may be directly connected to any of the individual binding posts corresponding to the number of lamps, means whereby the other side of the accumulators may be placed in electrical connection with any predetermined number of the binding posts corresponding to the number of lamps within the groups simultancously, a series of constant head line lamps upon the display board and paralleled across the mains, such display lamps being designed to be Illuminated upon the cessation of the illumination of the lamps within the groups, a switch whereby the flluminating circuit mains may be thrown elther in electrical connection with the constant display lamps or the variable display lamps and a switch whereby coincident with the illumination of the constant display lamps the accumulators may be thrown in serles with the circuit and re-charged, as and for the purpose specified.
8. In a device of the class described the combination with the display board of an operating and controlling attachment. sald attachment consisting of a support, a finger keyboard. a central contact plate in electrical connection with the display board, keys radially disposed about the plate, electro-mechanical means whereby by the pressing of a finger key the dependent key is separated forwardly against the plate, and means whereby by such operation predetermined electro-magnets on the back of the display board are primarlly energized, as and for the purpose specified.
9. In a device of the class described the combination with the display board of an operating and controlling attachment. said attachment consisting of a sunport, a finger kevboard. a central contact plate in electrical connection with the display board. contact keys radially disnosed about the plate, electro-magnets arranged in a normally open circuit carried by the support, there being an electro-magnet for each key. individual exciting circuits for the electro-magnets directly controlled by individual finger keyg in the kevboard. means carried by the sunnort adanted hy the energization of the adioining electro-magnet to offset the overation of the keys forwardly against the nlate. and mpans whareby bv such operation oredetermined elertro-magnets on the back of the ilsplay board are energized, as and for the purpose specified.
10. In a device of the class describen the combination with the disdlay board of a kevboard controlling attarhment comprising a supdort, a rentrallv disposed contact plate in electrical connection with the disnlay board. contart keys radially disoosed on the sunnort nind ahout the nlate. eler-tro-magnets arranged in a normallv onen cirouit carried by the sunnort and one for each kev. meana carried by the sunnort adanted to be onerated bv the rlectro-magnets to nffect the operation of the keys forwardly against the plate, finger keys carried by the sunnort arraneed when onerated to closn the circuit of the denendont elactro-magnets moanc whernby upon the operation of the kev. fefinite electro-magnets at the back of a prefetermined groun of lamns mav be energized and means whereby the keys may be returnod to their normal nosition when the actuating electro-magnet cirruit is onened, as and for the murnose snecifled
11. In a device of the class described the combination with the display board of a keyboard controlling attachment consisting of a support, a centrally disnosed nlate having individual contact faces on the outer surface thereof. sain contact faces being in electrical connection with a definite set of binding nosts on the display board, an unper onposing conducting plate in electrical connection with a source of sunnly. contact kevs radially disposed on the sumport and about the plates. electro-magnets parangod in nomally onen circuits carried bn the support and one for each key, a series of levers adanted to be operated bv the electro-magnets to throw the kevs forwardly against the plates. finger keys carried by the support arranged when pressed to close the depondent electro-masnet circuit and actuate its lever, springs connected to the levers and the support designed to return the kevs to their normal positions upon the onening of the electro-magnet circuits, and means whereby by the oberation of the key against the plates definite electromagnets at the back of a nredetermined groun of lamps may be nenergized. as and for the purpose specified.
12. In a device of the class described the combination with the display board of a keyboard controlling attachment consisting of a support, a centrally disposed and devendent rtandard. an insulating plate encircling and vertically slidable upon the standard, said nlate having extending therethrough and protruding from its outer face, individual contact pins arranged in a definite number of symmetrical groups therearound and having the pins in electrical connection with the display board. an upper circular conducting plate in electrical connection with a source of supply dependent from the standard and insulated therefrom, keys
radially disposed on the support and about the plates, said keys having vertically disposed sets of outlining pins upon their forward face designed to close contact with the opposings pins on the plate, elcetro-magnets arranged in normally open sircuits carried by the support and one for each key, means carried by the support adapted to be operated by the electro-magnets to effect the operation of the keys forwardly against the plates, individually exciting circuits directly controlled by individual fingers keys in the keyboard, means for sliding the insulating plate upon the standard so that the contact pins thereon may be placed horizonally in alignment with either of the vertically disposed sets of contact pins upon the key an dmeans for withholding the plate in such position for any predetermined length of time, as and for the purpose specifled.
13. In a device of the class described the combination with the display board of a keyboard controlling attachment, consisting of a support, a centrally disposed vertically slidable contact plate in electrical connection with the display board. means for sliding said plate and sustaining in predetermined positions, an upper peripherally slotted conducting plate in electrical connection with a source of supply. an annular plate having slots extending radially outwardly from the inner edge dependent from the support, slidable keys vertically withheld upon the plate by means of a forked portion extending downwardly into and through the slots, vertically disposed sets of outlining contact pins arranged upon the forward face of the keys so that the pins may be either individually replaced or a completo set withdrawn, grooves extending across the top of the key and designed to close within the opposing slot of the upper conducting plate when the key is in operative position. electro-magnets arrangen in normally open circuits carried by the support and one for each key, a series of levers extending upwardly throush the support and terminating in roller ends restraining within the forked portions, such levers being adapted to be operated by the electro-magnets to throw the keys forwardly against the plates. finger keys carried by the supnort arranged when pressed to close the dependent electro-magnet circuit and actuate its lever, springs holding the finger keys normally open and springs connected to the levers and the support designed to return the keys to their normal positions uoon the opening of the electro-magnet circuits, as and for the pur pose specified.
14. In a device of the class described the combination with thte display sign of a controlling attachment, comprising a support. a dependent standard. a centrally disposed contact plate slidable upor the standard and in electrical connection with the display board, a support for the contact plate. keys radially disposed about the plate. electrical mechanical means whereby by the pressing of a finger key the dependent key is operated forwardly agalnst the plate, means whereby by such oneration predetermined electro-magnets un the back of the disnlay board are primarily energized. means for vertically sliding the contact plate, and sustaining in predetermined positions, sald means comprising suitably supported plunger electro-magnets. grouds of varying inngths of fulcrumed levers attached to the plungers and terminating at their other extremity in roller ends designed to roll upon the lower face of the contact plate support. individual finger keys arranged when nressed to close definite plunser electro-magnet exciting circuits and actuate the plunfers having equal lengths of lever arms, as and for the purnuse specifled.
15. In a device of the class described the combination with the lamp display board, the key controlling attachment and a source of supply of means whereby the adjoining groups of laraps may be successively thrown in and out of electrical connection with the source of supply, the circuit being completed when any individual key is in operative position, as and for the purpose specifled.
16. In a device of the class described the combination with the lamp display board, the key controlling attachment and a source of supply of a sliding contact in electric circuit therowith, sald sliding contact consisting of a circular nonconducting support, contact tips extending from the face thereof cach tip being in electrical connection with an indivilual group of lamps, a sliding conducting arm pivoted entirely to the plate, a slip ring in electrical connection with the arm and the source of supply, the circuit being completed when any one of the keys is in operative position and means for sliding the arm sucessively over the contacts at predetermined instants, as and for the purpose specified.
17. In a device of the class described the combination with the sliding contact of a ratchet wheel designed upon a tooth displacement to throw the stide arm successively over the contact tips and means for operating the ratchet against the teeth, as and for the purpose specified.
18. In a device of the class described the combination with the sliding contact of a ratchet wheel, a pawl engaging the teeth, an electro-magnet arranged in a narmally open cir-
cuit, means adapted upon the energization of the electromagnet to engage the pawl with the ratchet wheel and rotate it one tooth displacement and means for completely controlling the energization of the electro-magnet, as and for the purpose specifled.
19. In a device of the class described the combination with a circular non-conducting support of a set of equi-radially disposed contact tips, a contact arm centrally pivoted upon the support. a ratchet wheel having the number of teeth thereon equal in number to the number of contact tips upon the support, the said ratchet wheel being designed in its rotation to slide the arm successively in contact with the tips, an electro-magnet. a normally open exciting circuit which may be closed by the depression of a finger key, a lever arm, a dependent pawl bearing on the ratchet teeth and designed upon the energization of the electro-magnet to rotate the ratchet wheel forwardly one tooth displacement and means upon the cessation of the exciting circuit for placing the pawl in active position against the succeeding tooth, as and for the purpose specified.

No. 101,720. Trousers Eanger. Accroohe pantalons.

Robert James Linklater, Buffalo, New York, U.S.A., 23rd October, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,958 .
Claim.-1. A trousers hanger comprising two members which are intertwisted in an intermediate part for mutual support and extend parallel and in proximity from one end of the intermediate intertwisted part to one end of said members and curve in correspondence to the lower extremity of the trousers leg between which the lower extremities of the trousers are adapted to be slipped to suspend the trousers in the inverted position from the hanger and extend at an angle from each other from the opposite end of the intermediate part to provide vertically separated means of attachment to a suitable support.
2. A trousers hanger including two wires having outer portions extending parallel and in proximity between which the lower extremities of the trousers are adapted to be slipped to suspend the trousers in inverted position from the hanger, intermediate intertwisted portions for mutual support and inner portions extending at an angle to provide separated means of attachment to a suitable support and provided at their inner ends with eyes.
3. In combination a vertical support and a plurality of individual trousers holders mounted in a vertical row in said support, each of said individual holders being arranged at a different horizontal plane whereby the trousers are supported at different heights and comprising two wires having outer portions extending parallel and in proximity between the lower extremity of trousers and sloped to support them therefrom in inverted position, intermediate portlons which are twisted together for mutual allpport, and inner portions having eyes encircling the vertical support and which are separated to stiffen the supporting of the holders from the vertical support, substantially as set forth.
4. In combination, a vertical support adapted to be attached to any convenient point, and a plurality of trousers holders mounted on said vertical support in a vertical row whereby said trousers holders are in different horizontal row whereby saianes and support the trousers at different heights, each of said holders comprising two wires having outer portions extending parallel and in proximity between which trousers are adanted to be supported, intermediate intertwisted portions for mutual support, and inner portions one of which extends diagonally downward and inward from the intertwisted portions and has an eye at its end encircling the support, and the other of which extends substantially
horizontal inwardly and also has an eye excircling the support whereby each support is supported at two difierent points to stiffen its support and also separate the holders sufficiently from each other for convenient manipulation.

\section*{No. 101,781. Watorproofing Irothed for Oencede,}

\section*{Méthode de remare le beton al t'Sprewoe de l'aws.}

John Marion Rauhoff, Tinley Park, Illinois, U.S.A., 2ird October, 1906; 6 years. Filed th' September, 1806. Receipt No. 139,232.
Claim.-1. The process of rendering concrete waterprool which consists in supplying to the surtace of o previoumly formaed block or body of concrete motallic iron in the form of a fine dust held in suspension in a liquid as water, and afterwards allowing the moist particies of inon to oxdise and expand and fill the pores in the surface of the concrete, substantially as described.
2. The process of closing the surface pores of a subrtasce which consists in supplying to such surface metal th the form of a very fine dust, capable of entering capiliary pores, and afterwards allowing said metalkic duat to axidize and expand, substantially as described.

No. 101,72R. Ganket. Romiolla.

William Sclater, Montreal. Quebec, Canada, 23nd October,
\(1906 ; 6\) years. Filed 14th May, 1906. Lecetpt No. 135.851. Claim.-1. In a gasket the combiration with a length of material doubled and joined together at the eads and presenting an unbroken packing surface, of a metal backtng eaclosed within the fold and abutting the inaer sarface of the material behind said packing surfece and arranged th strands in the same plane es the aforesald metal backing, as and for the purpose specified.
2. In a gasket the combination with a length of resilieat material folded lengthwise and having its ends joined to gether to form a packing ring presenting an unbraten inser annular surface, of a metal backing annularly arranged is the fold of said material behind said unbroken surface and metal rings arranged in substantially the same plame as the aforesaid metal and encircling the same and one another respectively and enclosed in sajd fold, as and for the purpose specified.
3. In a gasket the combination with a length of resilient material folded lengthwise and having its ends joined together to form a packing ring, of a wire ring enclosed to the fold and abutting the inner surface thereof behind the outer and packing surface, and a plurality of wire rings enclosed in said fold afd arranged respectively one inside the other and encircling the aforesaid wire ring, as and for the purpose specified.

\section*{No. 101,728. Propaller Por Vesmels. \\ Propulsewr de antosean.}

Hugh Robertson Shaw, Rosseau, Ontario, Canada, 23rd October, 1906 ; 6 years. Filed 11th July, 1906. Recelpt No. 137.692.

Claim.-1. A propelling wheel for boats and the like comprising a comparatively long tapered front portion and a cylindrical portion located to the rear of the same and provided with a spiral circumferential flange rigidly afined thereto, such cylindrical portion being of a shorter length than the tapered front portion and a tapered rear portion of less length than the cylindrical portion, as and for the porpose specified.
2. A propelling wheel for boats and the like comprising \({ }^{9}\) comparatively long conlcal tapered front portion and a cylindrical portion located to the rear of the same and provided with a sprial circumferential flange rigidly anred thereto, such cylindrical portion being of a shorter length than the tapered front portion and a conical tapered reas portion of less length than the cylindrical portion, as and for the purpose syecifled.
3. The combination with a propelling shaft extending through the stern portion of the keel of the boat and jofro nalled in suitable bearings, of a propeling wheel amred to the shaft and provided with a conical front portion of a
comparativety longer taper, a shorter cylindrical Intermediate portion having spiral flanges rigidly affed thereto and

a conical rear portion of a less length than the intermediato portion, as and for the purpose specifled.

Na. 101,724. Ciam Shell Buchet.
Godets pour huîtres.

Gordon H. Williams, Cleveland, Ohio, U.S.A., 23rd October,
1906; 6 years. Filed 7th July, 1906. Receipt No. 137,607.
Claim.-1. In a clam shell bucket the combination of two scoop members having their inner ends hinged together, a bracket, means secured to said bracket supporting the outer ends of same members, a sheave mounted upon one of said. scoop members, sheaves mounted upon said bracket, and a closing cable secured at one of its ends to one of said scoop members and passing around sheaves.
2. In a clam shell bucket the combination of two scoop members hinged at their front or inner ends, one of such members provided with an extension, a sheave mounted on such extension, a bracket, means mounted upon said bracket and supporting the rear or outer ends of said members, a sheave mounted upon said bracket, and a closing cable secured at one of its ends to said extension and passing around said sheaves.
3. In a clam shell bucket the combination of two clam shell scoop members hinged at their front or inner ends, one of said members provided with an extension rigidly connected therewith, a sheave mounted upon such extension, a bracket, linhs having their upper ends pivoted upon said bracket and their lower ends pivoted to the rear or outer ends of sald members, two stheaves mounted upon such bracket, a closing cablo secured at one of its ends to said extension and passing around said sheaves and a supporting cable having one end attached to said bracket.
4. In a clam sheli bucket the combination of two scoop members each provided at their inner ends with brackets, a common shaft journalled in the brackets of one member, and keyed to the brackets of the other member, an extension keyed to such shaft and provided with a sheave mounted thereon, a separate bracket and means mounted thereon adapted to support the rear or outer ends of said members, shearves mounted upon said latter bracket and a closing cable secured to said extension and passing around said sheave.
5. In a clam shell bucket the combination of two scoop members each provided at their inner ends with brackets, a
common shaft journalled in the brackets of one member and keyed to the brackets of the other member, an extension keyed to such shaft intermediate of the brackets of sald members respectively, and provided with a sheave mounted thereon, a separate bracket, links having their upper ends pivoted upon said latter bracket and their lower ends plvoted to the rear or outer ends of said members, two sheaves mounted upon said latter bracket and a closing cable passing over one of the sheaves of said bracket around the sheave of said extension, over the other sheave of said bracket and thence secured to said extension.

No. 101,725. Liquid Meanuring Pump. Pompe d mesurer les liquides. -

George Yanacopoula, New York City, New York, U.S.A., 23rd October, 1906; 6 years. Filed 20th August, 1906. Receipt No. 138,826 .
Claim.-1. A measuring decanter comprising a casing having a top and forming a reservoir a part of which serves as a measuring chamber, a piston in operative position with respect to sald measuring chamber, a piston rod connected to said piston and slidingly guided through and adapted to extend above the cover, said rod having an abutment above said cover, and a series of independently movable abutments pivoted on the cover and of relatively different lengths, said abutments successively from the shortest one being of open character, whereby each of said abutments can occupy a position within that next external thereto, and the entire series lie compacitly flat on the reservoir top, and a discharge tube communicating with the measuring chamber and terminating in a spout.
2. A measuring decanter comprising a casing having a top and forming a reservoir a part of which serves as a measuring chamber, a piston in operative position with respect to said measuring chamber, and containing a port for establishing communication between said chamber and the reservoir above the piston, a piston rod centrally playing through said piston and having nut provision at its lower end, a flange secured on sald rod and designed to closely cover the piston port when the rod is depressed, and also to effect the depression of the piston, said rod being slidingly guided through and adapted to extend above the rescrvoir cover, an abutment on the upper portion of the rod, means comprising members independently movable with respect to each other, for arresting the rod at different degrees of depression, and a discharge tube communicating with the meascring chamber and terminating in a spout.

\section*{No. 101,726. Low Water Alarm.}

George Yeates, Montreal, Quebec, Canada, 23rd October, 1906; 6 years. Filed 14th April, 1906. Recelpt No. 134,917.
claim.-1. In a device of the character described, a casing provided with a stirrup, a fusible valve in the casing, a pipe leading from the casing, means on the pipe for giving an audible alarm when the valve is fused, and means for indicating when the pipe is closed.
2. In combination with a boiler having a crown sheet, a faced casing provided with screw threads adapted to engage an opening in the crown sheet and provided with an integral stirrup having openings therein, a screw-threaded plug disposed in the stirrup and provided with a passage therethrough, a fusible valve normally closing the passage, and a spring adapted to force the valve away from the passage when the valve is partly fused.

\section*{Avertisseur de niveau d'eau.} dre valvo is partly fused.
3. In combination with a boiler having a crown sheet, a screw-threaded casing adapted to engage an opening in the

crown sheet, and provided with a stirrup having openings therethrough, a screw-threaded plug disposed in the upper end of the stirrup and provided with a faced upper end and a passage therethrough, a fusible valve adapted to close said passage, a pipe connected with the passage, a normally open valve on the pipe, means for giving an alarm when the fusible valve is withdrawn from said passage, and means for indicating when the second valve is closed.
4. In combination with a boiler, a fusible member, a pipe acapted to be placed in connection with the boller by the fusing of said member, a valve on sald pipe provided with a handle, and a seal connecting the pipe and the handle.
5. In combination with a boiler having a crown sheet, a fusible member carried by the crown sheet, a pipe adapted to be unclosed by the fusing of said member, a valve on the outer end of said pipe normally open, a seal carried by the outer end of said pipe and adapted to be broken when the valve is closed, and means for giving an audible signal when said fusible member is fused.

No. 101,727. Relief Vaive. Soupape de soulagement.

Edgar B. May and James H. Davis, assignec of a half interest, both of Chicago, Illinios, U.S.A., 30th October, 1906 ; 6 years. Filed 1st October, 1906. Receipt No. 139,917.
Claim.-1. In a device of the kind described, an enclosing shell provided with an inlet and an outlec, and with a duct extending from the outlet to a point higher in the shell, and two valve seats connected with the duct, in combination with a float arranged between the valve seats and provided with a valve for each seat whereby the movement of the float will control the operation of the valves.
2. In a device of the kind described, an enclosing shell provided with an inlet and an outlet, in combination with a removable part having formed therein a duct extending from the outlet to a point within the shell and provided with two valve seats and a float arranged between the valve seats provided with a valve for each seat whereby the movement of the float will control the operation of the valves.
3. In a device of the kind described, an enclosing shell provided with an inlet and an outlet, in combination with a removable part formed to be seated within the shell to close the outlet and provided with a duct extending from the outlet to a point near the upper porion of the shell and two aligned valve seats connecting the duct, a float arranged between the valve seats provided with a valve for each seat and relatively adjustable to each other whereby the morement of the float will control the operation of the valves.
4. In a device of the kind described, an enclosing shell provided with an inlet and an outlet, in combination with a removable part formed to close the outlet and provided with a duct extending therefrom to a point in the upper portion of the shell, two aligned valve seats formed in said part permitting the entrance of fluid in the duct, a remorable cap 14 arranged to close an opening in the top of said part and a float arranged between the valve seats provided with relatively adjustable valves for said seats.
5. In a device of the kind described, an enclosing shell provided with an inlet and an outlet, a removable part 7 constructed to close the outlet and provided with a duct 8 extending from the outlet to a point in the upper portion of the shell, valve seats 9 and 10 formed in said part and an air duct 15 extending through the wall of said part, in combination with a valve stem 11 having mounted thereon valves 16 and 17 for said seats and a float 12 whereby the operation of the float will control the operation of the valves.
6. In a device of the kind described, a shell 1 provided with an inlet 2 and an outlet 3 with a depending wing 5 in said inlet, in combination with a removable part 7 , having formed therein a duct 8 and valve scats 9 and 10 , a valve stem 11 provided with valves 16 and 17 for said seats and harlag a float mounted on said stem.
7. In a device of the kind described, an enclosing shell provided with an inlet 2 , a foraminated depending wall in said inlet, an outlet 3 , a duct 8 extending from the outlet to a point higher in the shell provided with valve seats 9 and 10 , in combination with a float arranged between the valse seats provided with a valve for each seat.

No. 101,728. Skirt Supporter. Support de jupes.

Joseph M. Roberts and Lawrence O. Davis, assignee of a hall interest, both of St. Augustine, Florida, U.S.A., 30 th October, \(1906 ; 6\) years. Filed 6th October, 1906. Receipt No. 140,092.
rlaim.-A device of the character described comprising a supporting belt, a garment engaging clasp, suspension straps, tach independently adjustable as to length, hooks upon the upper ends of said straps detachably engaging the support. ing belt, a triangular loop to the sides of which said suspension straps are connected at their lower ends and a supporting strap carrying the garment engaging clasp and connected with the base portion of the triangular loop, said supporting strap also being adjustable as to length, substantially as described.

No. 101,729. Truck Bolster. Traversin de chứssis.
The Pressed Steel Car Company, Pittsburg, assignee of Charles August Lindstrom, Allegheny, Penasylvania. U.S.A., 30 th October, \(1906 ; 6\) years. Filed 28 th September. 1906. Recelpt No. 139,867.

Claim.-1. A truck bolster having a cast compression member, whose web is formed with integrally cast upwardy io clined thickered end portions, and a tension member whose end portions are bent around and secured to the said inclined portions, substantially as described.
2. A truck bolster having a cast compression member, formed with integrally cast upwardly inclined, thickened end

portions, having depending bolster guiding flanges, and a tension member extending in a substantially straight line to the said thickened portions, and bent around and secured to the same, substantially as described
3. A truck bolster having a cast iron compression member formed with flanges which are deeper at the center than al the ends, the ends having integrally cast upwardly inclined thickened portions, substantially as described.
4. A truck bolster having a cast compression member formed with depending flanges deepest at their central portion, said member having at its ends downwardly extending flanges forming bolster guides, and also upwardly inclined thickened portions, and a wrought tension member secured to said thickened portions, substantially as described.
5. A truck bolster having a cast compression member with integral end flanges extended downwardly and forming guides for the bolster and an open housing for the spring seat, and a wrought tension member connected to the compression member, substantially as described.
6. A truck bolster having a cast compression member with flanges deeper at the center than at the ends, and depending flange portions extending downwardly from the ends and arranged to form guides for the bolster, and an open housing for the spring seat, substantially as described.
No. 101,730. Steel Car. Char en acier.

The Pressed Steel Car Company. Pittsburg, assignee of Charles A. Lindstrom. Allegheny, Pennsylvania, and John Frederick Strelb, Avalon, Pennsylvania, U. S. A.. 30th October, 1906: 6 years. Filed 2nd October, 1906. Receipt No. 139,975.
Claim.-1. A car prame having diagonally extending metal platform sills suspended from the under frame of the car, the rear portions of said sills being bent upwardly and extending along the side sills of the under frame to a point back of the bolster, thereby relnforcing the side sills and strengthening the under frame of the car at the bolster, substantially as described.
2. A car frame having metal platform sills suspended from the under frame of the car and extending in a direction obliquely to the center line of the car, and a flanged platform end sill overlaying the forward ends of the platform sill and having a marginal flanged angle secured thereto, substantially as described

10-38
3. A car frame having an end sill, side sills and bolster, metal platform sills below the level of the side sills extending upwardly along the same to the bolster and fixed to the side sills, said platform sills being supported on open sided brackets attached to the end sill, substantially as described.
4. A car frame having flanged metal platform sills below the main under frame of the car and suspended therefrom, said platiorm sills extending upwardly and fixed to the car Srame back of the end sill, and C-shaped brackets suspending the platform sills from the end sill, substantially as described.
\(\overline{5}\). A car frame having a platform, and a platform end sill composed of a flanged plate and a marginal flanged beam, substantially as described.
6. A car frame having a platform, and a platform end sill composed of a flanged plate and a marginal flanged beam of angle shape, substantially as described.

No. 101,731. Railway Car. Char de chemin de fer.

James Mllton Waugh, Chicago, Illinois, U.S.A., 30th October, 1906; 6 years. Filed znd October, 1906. Receipt No. 139.991.

Claim.-1. The combination with shouldered draft irons and a drawbar provided with a yoke, of two like sets of spring cushioning plates, sliding spacing blocks interposed between and in contact with the ends of the sets of cushioning plates, follower plates interposed between the sets of cushioning plates and the drawbar and yoke, and spacing plates interposed between and in contact with the follower plates and the centers of the sets of cushioning plates.
2. The combination with shouldered draft irons and a drawbar provided with a yoke, of a plurality of sets of spring cushioning plates arranged in pairs, the sets constituting such pairs being of like stiffness and the sets in the different pairs differing in stiffness, sliding spacing blocks interposed between and in contact with the ends of the two sets of cushioning plates of each pair, follower plates interposed between the external sets of cushioning Flates and the drawbar and yoke, and interposed spacing plates having bearing contact with the centers of the sets constituting each pair and with the follower plates.
3. The combination with shouldered draft irons, and a drawbar provided with a yoke, of two like sets of spring cushloning plates, sliding spacing blocks interposed between and in contact with the ends of the two sets of cushioning plates, two sets of spring follower plates interposed between the sets of cushioning plates and the ends of the drawbar and yoke, and spacing plates interposed between and bearing on the centers of the sets of cushioning plates and the sets ot spring follower plates.
4. The combination with shouldered draft irons and a drawbar provided with a yoge, of two like sets of spring cushioning plates, sliding spacing blocks interposed between and in contact with the ends of the two sets of cushioning plates, spring follower plates interposed between sets of cushioning plates and the ends of the drawbar and yoke, and spac ing plates interposed between and bearing on the centers of the sets of cushioning plates and the sets of follower plates the shoulders on the draft irons engaged by the spring follower plates being inclined or bevelled.

\section*{No. 101,732. Railway Car. Char de chemin de fer.}

Anton Becker, Columbus, Ohio, U.S.A., 30th October, 1906 ; 6 years. Filed 27th September, 1906. Recelpt No. 139,' 861.

Claim.-1. In a device of the character described the combination of draft sills having pockets for follower plates,
follower plates therein，and colled springs located side by side between the follower plates．

2．In a device of the character described the combination of draft sills，internal lugs thereon，bars secured to the lugs，follower plates supported by the bars，and coiled springs located side by side between the follower plates．
3．In a device of the character described the combination of draft sills having pockets therein，follower plates in the pockets，lugs and supporting the follower plates，and nested of draft sills having pockets，lugs on the sills at the ends springs located side by side between the follower plates．
4．In a device of the character described the combination of draft sills having flanges at top and bottom，of center sills having flanges at top and bottom to receive the draft sills between them and both center and draft sills having aligned openings or pockets for the body bolster．
5．In a device of the character described the combination of draft sills made with buffing brackets at one end．
6．In a device of the character described the combination of draft sills having pockets for follower plates，and stops to limit the movement of the follower plates．

No．101，733．Metallic Car．Char métallique．

Anton Becker，Columbus，Ohio，U．S．A．，30th October，1906； 6
years．Filed 27th September，1906．Receipt No．139，862．
Olaim．－1．In a car，the combination of a plurality of con－ tinuous crossbearers，doors pivotally mounted between the crossbearers to form a part of the floor of the car and to swing downward to dump at the sides of the track，and channel irons mounted on the top of the crossbearers with their backs on the fioor level and with their edges turned downward，adapted to engage the edges of the adjacent doors to form a continuous level floor．
2．In a metallic car，the combination of a plurality of continuous crossbearers，doors plvotally mounted between the crossbearers to form a part of the floor of the car and to swing downward to dump at the sides of the track， continuous channel irons mounted on the top of the cross． bearers with their back on the floor level and with their edges turned downward and inward toward the centres of the crossbearers，said down turned edges also fitting the corresponding bevel on the sides of the doors whereby when the doors are closed and pushed upward a tight level floor is formed，as described．
3．In a metallic car，the crossbearer formed of a beam continuous with a wider continuous channel iron secured to its top，the edges of the channel being turned downward and inward．and a center sill below the bearer，as described．

4．In a car，the combination of a horizontal girder，cross－ b’arers and two bolsters extending crosswise of the girder， a shaft journalled on successive crossbearers or bolsters having crank arms adjacent to the fournalled portions， and a crank pin connecting successive crank arms be－ tween successive crossbearers or bolsters，means for re－ volving sald shaft，doors piroted to the longitudinal girder resting on the crank pin of the shaft between the crank arms adapted to be moved by rotating the shaft up to form a part of the level floor and own between the journals of said shaft to discharge the load at the sides of the car，and channel irons wide enough to fill the spaces between suc－ cessive doors，secured flanges downward on the tops of the crossbearers，the backs of the channels being level with the floor．
5．In a car the combination of a longitudinal girder， crossbearers and two bolsters，extending crosswise of the girders，a shaft journalled on successive crossbearers or bolsters having crank arms adjacent to the journalled portions，and a crank pin connecting successive crank arms between successive crossbearers or bolsters，means for revolving said shaft，doors pivoted on the longitudinal girder resting on the crank pins of the shaft between the crank arms adapted to be moved by rotating the shaft up to form a part of the level floor and down between the journals of said shaft to discharge the load at the sides of the car，and channel irons wide enough to fill the spaces between successive doors secured fianges downward on the tops of the crossbearers，the back of the channels forming a part of the level floor，and the channel flanges being turned downward and inward to engage corresponding ber－ ols on the edges of the dors whereby a tight floor is formed．

6．In a metallic car，in combination with a central longi－ tudinal girder，a floor frame consisting of a plurality of crossbearers above sald girder extending from side to side of the car，members connecting the outer ends of sald crossbearers and beams on the top of said central girder rigidly secured to successive crossbearers，as described．
7．In a metallic car，the combination of a central longi－ tudinal girder，a plurality of beam crossbearers on the top of said girder extending from side to side of the car， longitudinal beams above said central girder rigidly secured to successive crossbearers，hinge castings mounted on said longitudinal beams and floor doors hinged to said hinge castings adapted to swing up between the crossbearers to form a level floor and adapted to swing downward to dump the load at the sides of the car．
8．In a metallic car，the combination of a central longi－ tudinal girder having wide top and bottom flanges，a plu－ rality of beam crossbearers on the top of said girder er－ tending from side to side of the car，longitudinal beams above said girder connecting successive crossbearers，hinge castings for doors mounted on the tops of said longitudinal beams and floor doors mounted in said hinge castings adapt－ ed to swing up and from a part of a level car floor and adapted to swing down to dump the load at the sides of the cars．
9．In a metallic car，the combination of a central longi－ tudinal girder having wide top and bottom flanges，a plu－ rality of beam crossbearers on the top of said girder ex－ tending from side to side of the car，longitudinal besms above said girder connecting successive crossbearers，hinge castings for doors mounted on the tops of said longitudinal beams，floor doors mounted on said hinge castings adapted to swing up and form a part of a level car and adapted to swing down to dump the load at the sides of the cars，con－ necting the bottom of the central girder with the cross． bearer beams，as described．

10．In a metallic car，an end section construction prorid－ ing a housing for the draft rigging consisting of an end sill and bolster having in their lower center portions inverted， \(U\)－shaped notches，as described，and \(Z\)－bars 67 secured in vertical position in said notches connecting sald end sill and bolster，as described．
11．In a metallic car，an end section construction providing a housing for the draft rigging consisting of an end sill and bolster having in their lower center portions inverted c． shaped notches，as described，Z－bars 67 secured in vertical position in said notches connected to sald end sill and bol－ ster，as described，and a reinforcing casing 72 secured to the end sill，there being no opening 70 in the casting registering with the space between the Z－bars 67 ．
12．In a metallic car the combination of an end sill or bol． ster composed of two flanged half portions 60 meeting each other in the center line 61 of the car，having the upper por tions of their flanges secured together by bolts or rivets there belng in each half portion a flanged notch 63 in which 7－bars 67 extending parallel to each other and to the cenn
line of the car are secured by rivets or corresponding means 60 ，substantially as described for the purposes set forth．
13．In a dumping car，an under frame composed of longitu－ dinal and transverse members and having a floor substadt
ally wholly composed of drop doors, in combination with a center sill wholly underlying the said transverse members, substantially as described.
14. A dumping car comprising longitudinal and transverse members, including, an articulated center sill in combination with a plurallty of doors hinged adjacent to said articulated center sill, and a load sustaining center sill underlying said articulated center sill, substantially as described.
15. In a dumping car, a wide center sill in combination with slde members or sills, the transverse members extend ing from side member to side member and overlying the said center sill, a false or articulated center sill composed of sections connecting the transverse members and overlying the said center sill, and a plurality of drop doors occupying the openings framed by said side member, said articulated center sill and said transverse members, substantlally as described. No. 101,734. Freight Car. Ohar de marchandises.

Anton Becker, Columbus, Ohio, U.S.A., 30th October. 1906; 6 years. Filed 27th September, 1906. Recelpt No 139,863.
Claim. - 1 . The combination with a car bottom and sides thereon, of cross rods at the ends of the car, gates, castings secured to the gates and mounted to turn on the rods, and zeeans for holding the gates in upright position.
2. The combination with a car bottom and sides thereon of gates hinged at their lower edges between the sides, angle irons secured to the sides, timbers or furrings secured between the angle irons, said timbers or furrings and the gate edges constructed to fit each other, and reinforcing strips at opposite sides of the gate at its side edges.
3. The combination with a car bottom and sides thereon, of hinged gates at the ends of the bottom, angle irons secured ty) opposite sldes of the sides at their ends, timbers or furrings secured between the angle irons and shaped to fit the edges of the gates, hooks carrled by the gates, and pivoted locking pawls carried by the angle irons to enter the hooks and secure the gates in upright position.

\section*{No. 101,735. Metallic Car Underframe. \\ Char métallique.}

Anton Becker, Columbus, Ohio, U.S.A., 30th October, 1906; 6
years. Filed 27th September, 1906. Receipt No. 139,864.
Claim.-1. In a car in combination with a car underframe, a depending bracket secured thereto, a normally open upturned bearing on the bracket, a shaft resting in said bracket, and an angular cover for the bearing having one arm secured to the bracket and the other arm extending over the bearing.
2. In a car in combination with a car underframe, a hanger depending from a member thereof, a shaft adjacent to the hanger and at right angles to the member to which it is secured, an upturned open bearing on-the hanger supporting the shaft, and an angular cover having one arm secured to the hanger and the other arm holding the shaft in the bearing.
3. In a car in combination with a car underframe, a hanger depending from a member thereof, a shaft adjacent to the hanger and at right angles to the member to which it is secured, and upturned open bearing on the hanger supporting the shaft, and an angular cover having one arm detachably secured to the hanger and the other arm holding the shaft in the bearing.
4. In a car in combination with a member of a car underframe having a vertical web and a flanged bottom, a \(Y\)-shaped hanger secured at the tops of the \(Y\) to the flange of the un-
derframe member, and a brace member secured to the under frame member and to an angular portion of the \(Y\) of the hanger.

5. In a car in combination with a member of a car underframe having a vertical web and a flanged bottom, a \(Y\) shaped hanger secured at the tops of the \(Y\) to the fiange of the underframe meber, a reinforcing plate secured to the web of the underframe member, an angular portion on said plate bent at right angles into contact with an adjacent angular member of the \(\bar{Y}\), and means for securing said angular member to the \(Y\).
6. In a car in combination with a member of a car underframe having a vertical web and a flanged bottom, a \(\bar{Y}\)-shaped hanged secured at the tops of the \(Y\) to the flange of the underframe member, a reinforcing member secured to and depending from this underframe member, the depending portion being wedge-shaped to the angular portion of the Y of the hanger, flanges on the angular edges of said depending portion in contact with the angular portion of the \(Y\), and means for securing said flanges to the hanger.
7. In a car in combination with a member of a car underframe having a vertical web and a flanged bottom, a \(Y\) shaped hanger secured to the web of the underframe member and depending therefrom, the depending portion being wedge-shaped to fit the angular portion of the \(Y\) of the hanger, flanges on the angular edges of said depending plate in contact with the angular portions of the \(F\) and means for securing sald flanges to the hanger.
8. As an article of manufacture, a hanger for a shaft made in the form of a \(Y\) with a support for a shaft at the lower end thereof, there being flanges on the upper ends of the angular portions of the \(\bar{Y}\), the whole being formed by folding one continuous strip of metal, as described.
9. In mechantam of the class described, in combination with a car underframe having crossbearers. side stakes secured upon the ends of the crossbearers, plates over the crossbearers notched to recelve the stakes of the T's toward the centre of the car, plates over the crossbearers, notched to receive the T's having portions beyond the stakes and side sllls outside the stakes. supported on the ends of the plates and secured to the stakes.
10. In mechanism of the class described. the combination with a car underframe having crossbearers. T-shaped side stakes unon the ends of the crossbearers with the shanks of the T's toward the center of the car, plates over the crossbearers notched to receive the T's there being upturned flanges or lips near the ends of sald plates upon the crossbearers bearing against the flanges of the T's, and means for securing the sald upturned flanges to the flanges of the T's.
11. In mechanism of the class described. the combination with a car under-frame having crossbearers. side stakes secured upon the enis of the crossbearers with the shanks of the T's toward the center of the ear. plates over the crosshearers notched to receive the T's. there being upturned flanges or lips near the ends of sald plates unon the crossbearers bearing aguinst the flanges of the \(T\) 's, means for securing the said upturned flanges to the flanges of the T's, and horizontal side sills outside the stakes supported on the ends of sald plates over the crossbearers and secured to said stakes.
 transverse the crossbearers. the vertical to iongitudinal cured plates secured the combination of a crossbearers brace
girder.
girder. a metallic car, the and a plurality of the car, brace 15. In a metalox girder ang crosswise girder lying in the hollow central thereof exten of the central girder edges seupon the top opposite sides of having their uppen said brace plates upo nlane of thers. vertical ransverse crossbearevertical webs of the lower angular cured to the ecured to the vertas secured to the fates upon said plates secure upon said girder. diagonal farned extension of \({ }_{0}\) other flanges of the central girder. angular upturned a cross plate flanges of the secured to an atral girder. and a crose pand brace plates secur of the central sed the webs thereof and the bottom plate girder
inside diagonal braces. In a metallic car, the combinaturality of crossbearers 16. In a metral hox girder and a plurality of the car brace hollow ceniral therpof extonding crosswise of the central girder lying in upon the ton opposite sides of the car having their upper edges plates upon oppore of the car having the upon sald brace the transverhe crochearers. Vertical of the central girder, secured to the to the veritcal webs of to the lower angular plates secure upon said plates secured to the insife the ther flanges upon said girder. and a cross plate inside the other flanges of the central girder. amo thereof and to the diacentral girder gonal braces.
onal braces. metallic car the embination of a longitudinal 17. In a metalisc car mex and a plurality of crossbearers hollow central box irder and a crosswise of the car. hrace upon the top thereor extend the central girder lying in the plates upon opposite sides car having their upper edges setransverse plane of the car hertical flanges upon said brace cured to the crossbearers, vertical flanges upon said brace cured
plates secured to the vertical webs of the central girder.
and a cross plate inside of the central girder sccured to the webs thereof and to the diagonal braces.
18. As an article of manufacture, a top plate for a crossbearer for a metallic car, consisting of a plate 40 having beaches 48 in each end adapted to recelve a portion of a notes stake. and upturned flanges 49 adjacent to the notches 48 bent out of the cross plate, adapted to be secured to the fanges of the car stake.
19. As an article of manufacture, a top plate for a car rossbearer, consisting of a flat plate having recesses near the ends adapted to have car stakes fit therein, and extending portions 43 extending beyond the openings for the car stakes on which the side sills of the car may be supported.

\section*{No. 101,736. Checkrein Holder. Porte-rènes.}

Samuel Henry Altice, Jamestown, New York, U.S.A., 30th October. 1906; 6 years. Filed 3rd October, 1306. Receipt No. \(140,007\).
Claim.-In a device of this character described the combination with a casing having apertures, an integral base and means for securing the base upon a harness, of a rotatable drum within the casing, a tension device secured to the drum for controlling the movement thereof, annular notched flanges upon the ends of the drum and substantially equal in diameter to the internal diameter of the casing, an ear upon the casing. a lever pivoted upon the ear and disposed outside of the casing said lever having an angular extension overlapping the base, a spring seated within the base and bearing upon sald extension parallel locking arms extending from
the lever through the apertures within the casing and adapt. the lever through thandy engage the flanges and a checkrein
ed to simultaneously

secured to the drum between the flanges and adapted to be wound thereon.

No. 101,737. Table for Milliners. Table de modiste.

Kate Bynner Atherton and Herbert Warren Atherton, coinventors, both of Holyoke, Massachusetts, U.S.A., 30 Ib October. 1906; 6 years. Filed 4th October, 1906. Recelpt No. \(140,025\).
Claim.-1. A milliners' table consisting of a supporting frame, a top supported by said frame and adjustable as to height and inclination relatively thereto, and provided with a hat holder support adjustable vertically and revolubly relatively to the table top, means for confining sald support immovably in its adjusted position, and a hat holder carried by said support.
2. A milliners' table having a top provided with a hat holder support, and a hat holder carried thereby which is bodily vertically adjustable, and also longitudinally adjustable.
3. A milliners' table having a top provided with a hat holder support, and a hat holder carried by said support, and vertically adjustable, horizontally adjustable and adjustable revolubly about a horizontal axis.
4. A milliners' table having a top provided with a bat holder support comprising a vertical member which is rotstively and also vertically adjustable relatively to the top, and a horizontal member having a swivel clamp revolubly adjustable thereabout, and a hat holder comprising a supporting stem confined by said clamp and lonyitudinally and horizontally adjustable relatively thereto.
5. In a device of the character described, a hat holder head or body and supporting means therefor constructed with capability for the adjustment of the holder longitudinally of its axis, and means for the confinement of the holder in its adjusted position.
6. In a device of the character described, a hat holder head 6. In a device of the character described, a hat holder with
or body, and supporting means therefor constructed with
capabilities for the adjustment of the holder longitudinally of its axis and rotatively about its axis, and means for the conflnement of the holder in its adjusted position.
7. In a device of the character described, a hat holder head or body, and a supporting means therefor and with which the holder is adjustably connected whereby the latter is revoluble about an axis outside of and parallel with its own axis.
8. In a device of the character described, a hat holder head or body and a supporting ineans therefor with which the holder is adjustably connected and whereby it is movable revolubly about an axis at right angles to its own axis.
9. In a device of the character described, a hat holder head or body and supporting means therefor with which the holder is adjustably connected, and whereby the holder may be adjusted rotatively about its own axis, and along the line of its axis, also revolubly about an axis parallel to its own axis. and furthermore revolubly about an axis at right angles to its own axis.
10. A milliners' table having combined therewith a vertical rod provided with a horizontal member, a swivel clamp provided with a hole transversely therethrough, through which said horizontal member engages and having a hole therethrough at right angles to said first-named hole, and provided with opposite apertured ear lugs, a bar or stem slidably engaged through said ear lugs and carrying a contractible hat holder, a bolt having an eye engaging said stem and having its shank extended through the second-named hole in said clamp and receiving a binding nut at its protrudins threaded end and means for adjustably holding the clamp body on said horizontal member.
11. A milliners' table having combined therewith, vertically and also rotatively adjustable relative thereto, a vertical rod provided with a horizontal member, a swivel clamp provided with a hole transversely therethrough, through which said horizontal member engages, and having a hole therethrough at right angles to sald first-named hole, and provided with opposite apertured ear lugs, a bar or stem slid ably engaged through said ear lugs and carrying a contractible and expansible hat holder, a bolt, having an eye en. gaging said stem, and having its shank extending through the second-narned hole in said clamp and receiving a binding nut at its protruding threaded end, and means for adjustably holding the clamp body on said horizontal member
12. A milliners' table consisting of a supporting frame. oppositely arranged bent arms having pivot screws connecting them in a common axial line to the frame and having clamping nuts threading on said screws and against the arms for holding the latter in ans adjustably swung position, said arms having their inner ends approached and in parallelism. a table top having a depending member engaged between the adjacent extremities of said bent arms, a pivot screw passing horizontally through said arms and the depending member of the top therebetween, and having a clamping nut, and said table top having a vertical socket, a rod rotatively and vertically adjustable in said socket. with confining means therefor, and provided with a horizontal extension, a swivel clamp longitudinally and revolubly adjustable on said extension, and a contractible hat holder having a carrying stem which is horizontally and longitudinally adjustable relatively to and adapted to be engaged by the said swivel clamp.
13. A milliners' table consisting of a supporting frame, oppositely arranged bent arms having pivot screws connecting them in a common axial line to the frame, and having clamping nuts threading on said screws and against the arms for holding the latter in any adjustably swung position, said arms having their inner ends approached and in parallelism, a table top having a depending member engaged between the adjacent extremities of said bent arms, a pivot screw passing horizontally through sald arms and the depending member of the top therebetween, and having a clamping nut, and sald table top having a vertical socket, a rod rotatively and vertically adjustabe in said socket. with confining means therefor, and provided with a horizontal extension, a swivel clamp longitudinally and revolubly adjustable on said extension, a hat holder consisting of a partially circular band of spring metal, and a stem having an angularly bent end with Which an intermediate portion of said spring band is connected and which stem is horizontally and longitudinally, and also rotatively, adjustable relatively to and adapted to be confined by said swivel clamp.
14. In a device of the character described, a supporting bar of rod, a swivel clamp longitudinally and revolubly adjustable thereon, a hat holder conslating of a head, and a stem with which said head is connected, and which is horizontally and longitudinally and also rotatively adjustable relatively to and adapted to be confined by said swivel clamp.
15. In a device of the character described, a supporting bar or rod, a swivel clamp longltudinally and revolubly adjusiably engaged therewith, and said clamp comprising a clamp body \(m\) and a disc section \(m^{2}\) having opposite ear lugs \(s s\) made with transverse apertures, and said clamp body and disc section having an axial hole therethrough, an eye bolt
having its head located between said ear lugs, having its shank extending through and beyond sald axial hole, and having a thumb nut engaging thereon to be set against the back of the clamp body, and a hat holder head having a stem engaging through said ear lugs and the eye of sail bolt, for the purposes set forth.
16. In a device of the character described, a hat holder head and a support on which it is adjustably mounted with means for its confinement in any adjusted position, and said head being capable of contraction and expansion for a binding engagement within a hat.
17. In a device of the character described, a hat holder consisting of a partially circular band of spring metal provided with oppositely located finger studs, a stem having its extremity connected with an intermediate portion of saidspring band. and a support with which such stem is adjustably connected.
18. In a device of the character described, a hat holder consisting of a partially circular band of spring metal provided with oppositely located finger studs, a stem, having its forward extremity bent off-set from its main portion, and connected with an intermediate portion of said spring band, and a table having a hat holder support with which such stem is adjustably connected.

No. 101,738. Corn Planter. Plantoir de blé-d'inde.

Thomas Marshall Bailey, Madison, Alabama, U.S.A., 30th Orfober. 1406; 6 years. Filed 28th September, 1906. Receipt No. 139,882.
Claim.-1. In a planter the combination of a grain spout comprising vertical and horizontal portions, braces extended ernm respectively said vertical and horizontal portions and provided at their points of intersection with bearings, a transverse shaft mounted in said bearings, a gate located in said spout to retard the delivery of grain therethrough, and ar eccentric connection between said gate and transverse shaft for actuating the gate at stated intervals.
2. In a planter the combination of a grain spout comprising vertiral and horizontal portions, means for supplying grain to the spout at stated intervals, a gate located in said spout to retard the delivery of the grain therethrough, a shaft, an eccentric connection with said shaft and gate, a drive shaft. and independent connections between said drive shaft and the means for supplying grain to the spout and to the shaft for operating the gate located in said spout.

\section*{No. 101,739. Tnb Support, Ironing Board and Clothes Rack.}

Support pour cuves, planche à repasser et ratelier d linge.
Edwin Lot Bergstresser. Hublersburg, Pennsylvania. U.S.A., 30th October. 1906; 6 years. Flled 19th September, 1906. Receipt No. 139,628.
Claim.-1. The combination with a table or support having an attaching board at one end provided with a right angu-lar-shaped slot, of an ironing board, spaced plates at one end of said board adapted to engage said attaching board, a pin between said spaced plates adapted to engage said slot in said attaching board, and a brace secured to said ironing board and adapted to rest upon the top of said table or support, substantially as described.
2. The combination with a telescoping tub support or table having a vertically disposed attaching board at one end formed with a right angular-shaped slot, of an ironing board, vertically disposed spaced plates secured transversely at one end of said ironing board and adapted to engage said attaching board, a transverse pin between said spaced plates adapted to engage said slot in sald attaching
board, and a swinging brace pivotally connected to said troning board and adapted to rest upon the top of said tub support or table, substantially as descitibed.

3. In combination with a supporting device, an ironing board having brackets on its under side at suitable distances from its opposite ends. spaces being provided between said brackets and the under side of the board, means to secure one of said brackets to the supporting device, supporting legs pivotally secured to the other bracket and adapted to bear on the supporing device, and arms pivotally connected to the upper side of one of the said brackets, adapted to lie in the space between said bracket and the under side of the ironing board and to fold into the space between the other bracket and the under side of the ironing board, substantially as described.

No. 101,740. Stacker for Ore Tailinge. \(\Delta\) meulonneur pour métaus.

Hiram Wheeler Blaisdell, Los Angeles, California, U.S.A., 30th October, 1906; 6 years. Filed 15th August, 1906. Recelpt No. 138,706.
Olaim.-1. In an apparatus for discharging material from a conveyer belt, means independent of said belt for propelling the apparatus.
2. An apparatus for discharging material from a conveyer belt, means independent of said belt for propeling the apparatus and devices for reversing the direction of travel.
3. An apparatus for discharging material from a conveyer belt, means independent of said belt for propelling the apparatus and devices for automatically reversing the direction of travel.
4: An apparatus for discharging material from a conveser belt, and a motor on said apparatus for propelling the same.
5. An apparatus for discharging material from a conreyer belt, an electric motor on said apparatus for propelling the same and means for supplying current to said motor.
6. An apparatus for discharging material from conveyer belts, supporting wheels thereon, a motor mounted on said apparatus and power transmitting connections between se:id motor and wheels.
7. An apparatus for discharging material from conveyer belts, means for permitting the conveyer belt to leave sald apparatus in either a forward or reverse belt to leave sadd
be desired.
eyer belts, a discharging discharging material from conveyer belts, a discharging pulley 39, a first idler pulley 44
and a second 1 dler pulley 47 and a second ider pulley 47.
9. In an apparatus for discharging material from a conveyer belt, a rotary distributor mounted on said apparatus and a motor to drive said distributor.
10. In an apparatus for discharging material from a con veyer belt, a rotary distributor mounted on said apparatus and a motort o drive sald distributor.
11. In an apparatus for discharging material from a conveyer belt, a travelling carriage, discharging idler pulleys thereon and a rotary distributor to receive material from said conveyer belt and distribute the same and a motor to drive said distributer.
12. In an apparatus for discharging material from a conveyer belt, a distributor revolving on a horizontal axis carried by a support revoluable in a horizontal plane.
13. An apparatus for discharging material from conveyer belts, supporting wheels thereon, a motor mounted on sald apparatus, power transmitting connection between sald motor and wheels. a carriage and discharging and ider pulleys mounted thereon.
14. In an apparatus for discharging material from a conveyer belt a distributor and means for changing the direction of discharge of said distributor and a motor mounted on said apparatus to drive sald distributor.
15. In an apparatus for discharging material from a conveyer belt a motor mounted upon sald apparatus, connection between sald motor and the supporting wheels of said apparatus and devices in said connection for reversing the direction of rotation of said wheels.
16. In an apparatus for discharging material from conveyer belts. a motor mounted upon sald apparatus, a worm connected to the armature shaft of sald motor, a gear driven by said worm, a shaft driven by said gear. a bevel gear on said shaft, bevel gears driven in reverse directions by said bevel gear. clutches connected with said driven gears, a shaft actuated by sald clutches, worms on sald shaft, and gears driven by sald worms on the axle of said apparatus.
17. In an apparatus for discharging material from conveyer belts, a motor mounted upon said apparatus, connection between said motor and the supporting wheels of said apparatus, devices in said connection for reversing the direction of rotation of said wheels. a lever connected with sald devices and stationary contact pieces to operate said lever.
18. In an anparatus for discharging material from conveyer belts a motor mounted upon said apparatus, connection between said motor and the supporting wheels of said apparatus, a gear upon the outer end of the axles of said supporting wheels and a stationary rack for said gear to mesh with.
19. In an apparatus for discharging material from conveyer belts, a motor mounted upon said apparatus. connec tion between said motor and the supporting wheels of sald apparatus. devices in said connection for reversing the direction of rotation of said wheels, a gear upon the outer end of the axles of said supporting wheels and a stationary rack ir sald gear to mesh with.
20. In an apparatus for discharging material from convever belts, a rotary distributor and a pivoted support for said distributor.
21. In an apparatus for discharging material from conveyer belts, a rotary distributor, a motor to drive sald distributor and a pivoted support for said motor and distrlbutor.
22. In an apparatus for discharging material from convever belts, a rotary distributor, a plvoted support for sald distributor and a hooper to dellver material to said d!stributor.
23. In an apparatus for discharging material from conveyer belts, a rotary distributor, a pivoted support for sald distributor, a hopper to deliver material to said distributor and a revoluble portion unon sald hopper.
24. In an apparatus for discharging material from conveyer belts. a discharging pulley 39, a first ider pulley 44. a second idier pulley 47. a brush mounted adjacent to puller 39, and means for onerating said brush.

No. 101,741. Potato Harvester. Arrache-patates.
James P. Brennan, Columbus, Wisconsin, U.S.A.. 30th October, 1906; 6 years. Filed 1st October, 1906. Recelpt No. 139,930.
Claim.-1. In a potato harvester the combination with the beam of the excavating blade, of means for slidably connecting the front end of sald beam by a fixed pivot to the beam supporting frame, means for raising and lowering both the
front and rear ends of said beam simultaneously by the manuel act of the operator, means for retaining the front

cnd of the beam at substantially a fixed point upon said pivot as the rear end of the bean is raised and lowered by contact of the excavating blade with uneven surfaces.
2. In a potato harvester the combination with the main frame and reel screen and blade supporting beam, of means for slidably connecting the front end of said beam by a fixed pivotal draw bolt to said frame, means for communicating a vertical movement to both the front and rear ends of the beam simultaneously, by the manual act of the operator, such means consisting of a three-armed lever pivotally supported from said frame, a flexible connection communicating from one of the arms of said lever over bearings with the rear end of said beam, and a link communicating from another arm of said lever to the front end of said beam, said link being adapted to serve the twofold purpose of communicating motion from the hand actuated lever to the beam as said lever is moved and of holding the front end of said beam at a substantially fixed point relatively to said retaining pivot when said operating lever is at rest.
3. In a potato harvester the combination of a main supporting frame 3, operating lever 24 pivotally supported from said frame, blade supporting beam 5 provided at its front end with a vertical slot formed at right angles thereto for the reception of the pivotal bolt 55, pivotal bolt 55 rigidly fixed at one end to said frame and having pivotal bearings in said vertical slot. link 26 communicating between the arm 25 of said operating lever and said beam, said link being adapted to serve the twofold purpose of communicating a vertical movement from the operating lever 24 of the front end of said beam as said operating lever is moved and as a means of holding the front end of said lever at a fixed point as its rear end is raised by contact with an uneven surface, flexible connection \(3 n\) communicating from arm 29 of the operating lever 24 over the pulley 31 with the rear end of said beam, all substantially as and for the purnose specified.
4. In a potato harvester of the class described, a potato screen comprising a plurality of longitudinal screen bars provided with U-shaped depressions in combination with a nlurality of resilient fingers vieldingly supported alternately between said screen bars above the lower extremity of sald depressions, substantially as set forth.

No. 101,742. Band Re-maw. Scie d ruban.

John L. Graham, Haakwood, Michigan, U.S.A.. 30th October, 1906; 6 years. Filed 28th September, 1906. Receipt No. 139,884.
Claim.-1. In a sawmill the comblnation with a suitable frame provided with feed or gauge rolls, of a plurality of
sliding tables locsted opposite the feed rolls, a bracket pivotally secured at one end to each of the sliding tables, a journal bearing stationarily mounted in the upper free ond of the bracket, a pressure roller, the lower end of which is pirotally secured to the table, and the upper end of which is received in the journal bearing, an obliquely disposed rod, one end of which loosely engages the upper end of the bracket, cushion members on the rod bearing against the bracket to yieldingly retain the latter and its pressure roll in approximately vertical position, the opposite end of the rod being pivotally secured to the table, and means for effecting the independent reciprocation of the tables relative to each other.
2. In a sawing machine the combination with a suitable frame, and feed rolls or gauge rolls mounted thereon, of a plurality of independent relatively movable tables slidingly mounted on the frame opposite the feed rolls, a pivotally mounted yieldingly supported pressure roll carrled by each table, a separate fluid operated means connected to each table for moving individual table separately from the rest, a valve mechanism for each fluid operated means, said mechanism comprising a valve and valve rod, individual rock shafts to which the valve rods are connected, the rock shafts leading to a common point and a separate lever for each rock shaft, the levers grouped closely together.
No. 101,743. Shoulder Form. Forme pour épaules.

Alexandre M. Grean, New York City, New York, U.S.A., 30th October, 1906; 6 years. Filed 6th Occober, 1906. Receipt No. 140,077.
Claim.-1. As a new article of manufacture, a shoulder form for garments comprising a fabric sheet having a shoulder form for garments comprising a fabric sheet having a shoulder end curved lengthwise and crosswise, and a flattencd neck end, the contour of the form being in compound curves.
2. As a new article of manufacture, a shoulder form for garments comprising a fabric sheet having a flattened neck end, and a padded shoulder end curved lengthwise and crosswise and elevated above the neck end, the whole contour of the form being in compound curves, substantially as shown and described.

No. 101,744. Fiy Net for Horses. Moustiguaire pour chovauc.

Francis Jacques and Andrew I. Jacques, co-inventors, both of Chatham, Ontario, Canada, 30th October, 1906; 6 years. Flled 3rd October, 1906. Receipt No. 139,997.
Claim.-1. Fly net for horses, being formed out of one solid plece of leather, by slitting into regular lengths slits
fitted with suitable fastening, blackened, expanded forming meshes, dried and finished substantially as specified and set forth.
2. A fly net for horses being formed out of two pieces of leather by slitting into regular lens'ths slits secured in the center, on a strip of leather by means of metallic clips, blackened, expanded forming meshes, dried and flished substantially as set forth.
3. A fly net for horses being formed out of solid pieces of leather by slitting into regular leagths slits, except the lower ends which will be slit into laces, expanded forming meshes, dried and finished substantially as specified and set forth.

No. 101,745. Grain Cleaner. Nettoycur d grain.

Alfred Joel, Zurich, Switzerland. 30th October, 1906; 6 years. Filed 3rd August, 1906. Receipt No. 138,392.
Claim.-1. In a brushing machine, a cylinder, a brushing mechanism rotating within the same, means for rotating the same, and an inlet and discharge to said cylinder, substantially as described.
2. In combination with a mill, a cylinder or chamber, a sieve forming the bottom thereof and a rotating brushing device operating within the cylinder or chamber with means for rotating the same and an inlet and outlet to and from said cylinder. substantially as lescribed.
3. In combination with a mill, a brushing chamber having a sieve forming its bottom, a rotating brush contained within the chamber, means for driving the same and means for removing the dust during the jrocess of treatment, substantially as described.

No. 101,746. Nnt Lock. Arrête-écrou.

Willam Rundle, Johannesburg, Transvaal, South Africa, 30th October, 1906; 6 years. Filed 18th September, 1906. Receipt No. 139,605.
Claim.-1. In means for securing a nut on a bolt or its equivalent, the combination with the bolt or its equivalent and nut, of a washer, means which prevent the rotation of said washer round the bolt, the washer having a projection adapted to engage the nut.
2. Means for securing a nut on a bolt or its equivalent comprising in combination the bolt or its equivalent and nut. of the washer non-rotatably arranged on the bolt and having a plurality of projections which are adapted to be bent over or against the flat faces of the nut.
3. In means for securing a nut on a bolt or its equivalent, the combination with the nut and bolt or its equivalent, the latter having a longitudinal groove in the threaded portion of a washer slidably fitting the threaded portion of the bolt and constructed with an internal projection adapted to fit the
groove in the bolt to prevent the washer rotating on the bolt, the washer being constructed with a plurality of external projections which are adapted to be bent over or against the flat faces of the nut.
4. In means for securing a nut on a blot or its equivalent, the combination with the nut and bolt or its equivalent, the latter constructed with two longitudinal grooves in the threaded portion, of a washer slidably fitting the threaded portion of the bolt and constructed with two internal projections fitting the grooves in the bolt and constructed with a plurality of external projections, which are adapted to be bent over or against the flat faces of the nut.
5. In means for securing a nut on a bolt or its equivalent, the combination with the nut and bolt, the latter constructwith a longitudinal groove in the threaded portion, of a washer fitting the threaded portion of the bolt and constructed with an internal projection adapted to be beat into the groove in the bolt, and constructed with a plurality of external projections which are adapted to be bent over or against the flat faces of the nut.
6. In means for securing a nut on a bolt or its equivalent, the combination with the nut and bolt, the latter constructed with a longitudinal groove in the threaded portion, of a locking washer slidably fitting the threaded portion of the bolt and constructed with a projection engaging the groove in the threaded portion of the bolt, sald washer being provided with a plurality of projecting pieces formed by sawcuts or slits in the washer, which pieces are adapted to be bent over or against the flat faces of the nut.
7. In means for securing a nut on a bolt or its equivalent, the combination with the nut and bolt of a washer slidably fitting the threaded portion of the bolt and means which prevent the rotation of said washer round the bolt, the washer being constructed with a plurality of tapering projections formed by saw cuts or slits in the washer. Which tapering projections are adapted to be bent over or against the flat faces of the nut.
8. Means for securing a nut on a bolt or its equivalent, comprising in combination the nut and bolt or its equirs. lent, the latter formed with a flat running the full length of the threaded portion. of a locking washer slidably fitting the threaded portion of the bolt and constructed with a flat engaging the flat on the bolt to prevent its rotating thereon, the washer being constructed with a plurality of external projections adapted to be bent over or against the flat faces of the nut.
9. Means for securing a nut on a bolt or its equivalent, comprising in combination the nut and bolt or its equivalent, the latter formed with a flat running the full length of the threaded portion, of a locking washer slidably fitting the threaded portion of the bolt and constructed with a flat engaging the flat on the bolt to prevent its rotating thercon, the washer being constructed with a plurality of projections formed by saw cuts or slits in the washer. which projections are adapted to be bent over or against the flat faces of the nut.

No. 101,747. Plough Mechanism.
Mécanisme de charrue.

John M. Sausser, Osnaburg, Ohio, U.S.A., 30th October, 1906; 6 years. Filed 1st October, 1906. Receipt No. \(139,941\).
Claim.-1. A device for regulating the depth of furror cut by a plough consisting of a clevis pivotally attached to the plough and having means to which the draft animal attachments may be applied, an arch member passing ovef the plough beam and connecting with the clevis at the point

Where the same is pivotally attached to the beam, a lever attached to said arch. member and extending back within working distance of the plough handles, and a means attached to the plough beam for retaining said lever in temporary fixed positions.
2. A device for regulating the depth of furrow cut by a plough consisting of a clevis pivoted at its ends to the plough beam and extending around the end of the same. said clevis being provided with means to which the draft animal attachments may be applied an arch member connecting with the clevis at the pivotal points thereof and extending over the plough beam, a brace member connectine with said clevis at an intermediate point thereof and extending up over the end of the plough beam and connecting with said arch member, a lever attached to said arch and brace inembers an axtending bark on within operating distance of the plough handles, and means located upon the plough beam and adapted to retain the lever in temporary fixed gositions.
3. A device for regulating the depth of furrow cut by a plough consisting of a clevis pivoted at its ends to the plough beam and passing around the front end thereof and having at its intermediate point means adapted to receive the draft animal attachments, an arch member fixed to the ends of the clevis and extending over the plough beam, a brace member fixed at its ends to an intermediate point of the clevis and extending over the end of the plough beam and having a horizontal portion which connects with the arch member and projects in the rear thereof, a lever fixed to said horizontal portion of the brace member and extending back to within operating distance of the plough handles, a means attached to the plough beam and adapted to engage the lever to retain the same in temporary fixed positions.
4. A device for regulating the depth of furrow cut by a plough consisting of a clevis pivotally attached to the plough and having means to which the draft animal attarhments may be applied, an arch member passing over the plough beam and attached to the clevis, and a lever connected with said arch member.
5. A device for regulating the depth of furrow cut by a plough consisting of a clevis pivotally attached to the plough and having means to which the draft animal attachments may be applied, arch members attached to the clevis and passing over the plough beam, and a lever attached to said arch members.
6. A device for regulating the depth of furrow cut by a plough consisting of the clevis pivotally attached to the plough and having means to which the draft animal attachments may be applied, arch members attached to said clevis and spaced apart and passing over the plough beam. and a lever attached to said arch members.
7. A device for regulating the drpth of furrow cut by a plough consisting of a clevis pivotally attached to the plough and having means to which the draft animal attachments may be applied, an arch member attached to the clevis and being vertically disposed above the pivotal points thereof and extending over the plough beam, and a lever attached to said arch member.
8. A device for regulating the depth of furrow cut by a plough consisting of a clevis pivotally attached to the plough and having means to which the draft animal attachments may be applied, an arch member attached to the clevis and being vertically disposed over the pivotal points thereof and passing over the plough beam. a second arch member also attached to the clevis and being located in advance of the first said arch member and being spaced from the same, and a lever attached to said arch members.
9. A device for regulating the depth of furrow cut by a plough consisting in plates attached to the beam of tice plough and having a number of perforations, a clevis plvotally attached to said plates and having means to which the draft animal attachments may be applied and a lever attached to the clevis and extending back within operating distance of the plough handles.
10. A device for regulating the depth of furrow cut by a plough consisting in plates atached to the bea!n of the plough and having a number of perforations, a elevis pivotally attached to said plates and having means to which the draft animal attachments may be applied and a lever attached to the clevis and extending back within operating distance of the plough handles.

\section*{No. 101,748. Overshoe. Galoche.}

Solomon Schwarzscheld, Rochester, New York. U.S.A.. 30th October, 1906; 6 years. Filed \(12 t h\) September. 1916. Receipt No. 139,462.
Claim.-1. The herein described process of manufacturing overshoes, which consists in forming superposed deposits of rubber containing material on the exterior of a foot form, cementing a sole plece of rubber containing material to the 10-34
exterior of the sole portion of said material deposited on said form, and then vulcanizing the whole.

2. The herein described process of manufacturing overshoes, which consists in forming superposed deposits of rubber contining material on the exterior of a foot form, cementing a sole piece of rubber containing material to the exterior of the sole portion of the material deposited on the said form, reinforcing the material deposited on sald form by cementing a strip of rubber containing material thereto, and then vulcanizing the whoie.
3. The herein described process of manufacturing overshoes, which consists in dipping a foot form in a bath of rubber containing materlal, withdrawing said form from said bath with a coating of said material deposited on sald form. securing a reinforcoment of rubher containing material to said material deposited on said form. and then vulcanizing the whole.
4. The herein described process of manufacturing overshoes, which consists in dipping a foot form into a bath of rubber containing material, withdrawing said form from sald bath with a coating of said rubber containing material on said form. cementing a sole piece of rubber containing material to the exterior of the material deposited on sald form, and then vulcanizing the whole.
5. The herein described process of manufacturing overshoes, which consists in dipping a foot form into a bath of rubber containing material, withdrawing the said form from said bath with a coating of said material deposited on said form, cementing a sole piece of rubber containing material to the exterior of the material deposited on said form, and vulranizing the whole in contact with steam under pressure.
6. The hernin described process of manufacturing overshoos. which consists in dipping a foot form into a bath containing rubber and a volatile ingredient. withdrawing said form from said bath with a deposit of the ingredients thereof on said form, allowing the volatile ingredients of said deposit to evaporate, repeating the foregoing steps a number of times to form a plurality of superposed deposits on said form. cementing a sole piece of rubber contalning material to the exterior of the material deposited on said form, vulcanizing the whole in contact with steam under pressure. and then removing the same from sald form.
7. The herein described process of manufacturing overshoes. which consists in forming superposed deposits of rubber containing material on the exterior of a foot form, placing a reinforcing picce of sheet rubber containing material on the extcrior of said material deposited on said form, then depositing a film of material over the first denosit and said reinforcing plece.
s. The herein described process of manufacturinfg overshoes, which consists in dipping a foot form into a bath of rubber containing material. withdrawing said form from said bath with a coating of said material deposited on said form, attaching a reinforcing piece of sheet rubber to the outside of said material deposited on said foot form, then dipping the whole into said bath and withdrawing the same therefrom, and then putting the whole through a vulcanizing process.
9. The herein described process of manufacturing overshoes which consists in dipping a foot form into a bath of whber containing material, withdrawing said form from said bath with a coating of said rubber containing material on said form. repeating the foregoing steps a number of times to form a plurality of superposed deposits of said material on said form, cementing a sole plece and a reinforcing piece if sheet rubber containing material to the exterior of the naterial deposited on said form. dipping the foot form with said parts thereon again into sald bath and withdrawing the same therefrom and then vulcanizing the whole.
10. An overshoe for folding into a small space, comprising a flexible sole having portions which are more highly flexible than other portions of said sole arranged to facilitate bending the sole transversely at said more flexible portions in folding.
11. An overshoe for folding into a small space comprising a flexible sole of non-uniform thickness, the thin portions being arranged to facilitate bending the sole transversely at those portions in folding, and the thicker portions to form wearing surfaces.
12. An overshoe comprising an integral elastic rubber vamp and sole portion of substantially the same thickness, and an extra interrupted wear sole adapted to give extra thickness to the bottom of the overshoe at certain portions only while not adding to the same extent to the thickness of other portions thereof, substantially as and for the purpose herein set forth.
13. An overshoe comprisng an integral elastic rubber vamp and sole portion, and rubber sole pieces secured to said sole portion at points under the ball and toe of the overshoe, leaving therebetween portions of sald sole portion uncovered to facilitate folding of the said uncovered portions.
14. An overshoe comprising an integral rubber vamp and sole portion, a reinforcing strip around the edge of said sole partion to register with the sole edge of the shoe of the wearer, and a film of rubber extending over the said reinforcing strip and onto said vamp and sole portion and integral with said vamp and sole portion.
15. An overshoe comprising an integral elastic rubber vamp and sole portion, a reinforcing strip of rubber around said sole portion to register with the sole edge of the shoe of the wearer, an extra rubber sole piece secured to sald sole portion, and a film of rubber extending over said reinforcing strip and sole piece onto said vamp and sole portion and integral with said vamp and sole portion.
16. An overshoe comprising an integral elastic rubber vamp and sole portion, a reiuforcing strip around the foot entrance of said overshoe, a reinforcing strip around the edge of said sole portion to register with the sole edge of the shoe of the wearer, a rubber sole plece secured to said sole portion, and a film of rubber extending over said reinforcing piece and said sole piece onto said vamp and sole portion and integral with said vamp and sole portion.
17. An overshoe having a continuous integral rubber exterior, a continuous integral rubber interior, and a reinforcing plece therebetween.
18. An overshoe having a continuous integral exterior of elastic waterproof material, a continuous integral rubber interior, and an extra sole plece therebetween.
19. An overshoe comprising a seamless thin highly elastic rubber covering adapted to envelope the forward portion of the foot, and a reinforcement of elastic sheet rubber secured to said covering and disposed thereon to pass around the edge of the shoe sole of the wearer.
20. An overshoe having a vamp and inner sole portion made in one piece of concentrically stratified highly elastic thin rubber, and a sole piece of elastic sheet rubber secured to and covering the bottom of said inner sole portion and extending over the edges thereof to form a reinforcement, the whole adapted to stretch in being placed upon the shoe of the wearer.
21. An overshoa having a vamp and inner sole portion made in one piece of highly elastic thin rubber, a sole piece of elastic sheet rubber secured to and covering the bottom of sald inner sole portion and extending over the edges thereof to form a reinforsement and to retain the overshoe in place on the foot, and a strip of sheet rubber extending around the foot entrance of the overshoe and adapted to reinforce the said highly elastic thin rubber material at that point and by fts elasticity to act as an extra retaining means to keep the overshoe in place on the shoe of the wearer.

\section*{No. 101,749. Shoe. Chaussure.}

Thomas Skerrett, Spokane, Washington, U.S.A., 30th October, 1906; 6 years. Filed 3rd October, 1906. Receipt No. \(140,017\).
Claim.-1. In a shoe the combination with the quarters and full vamp of a shoe, of an auxiliary quarter attached to the main quarter, and a half vamp and toe cap forming an integral portion of the auxiliary quarter, the half vamp and toe cap being secured to the maln full vamp.
2. In the construction of shoes the combination with the unarters and a full vamp, of an auxiliary quarter having a half vamp and toe cip integral therewith, the auxiliary quarter being attached tu the outer face of the main quarter of a shoe, and the balf vamp and toe cap being attached to the
full vamp of the shoe, and a counter for the shoe having a side extension which is carried along the connected main and

auxiliary quarters and between the half and the full vamps, as described.

No. 101,750. Switch. Aiguille.

Ralph Rahiser, James Garfield Cunningham and Franklin Benjamin Hall, co-inventors, all of Evans City, Pennsylvania, U.S.A.. 30 th October, 1906; 6 years. Filed 10th August, 1906. Receipt No. 138,565.
Claim.-1. In a switch throwing device of the character described, the combination with a main track and siding track, of pivotally mounted spring depressed switch tongues connected together, casings located upon one side of said fracks, a bell crank lever pivotally mounted in one of the said casings and connected to said tongues, an operating lerer pivotally mounted in the other of said casings, and connectel to said lever a spring retained plate mounted in one of said siding tracks, a shaft mounted adjacent to said track and adapted to be actuated by said plate, said shaft being adapter to move said tongues, means mounted within one of sald rasings to lock said operating lever in its adjusted position. and means mounted within the other of said casings and connected to the first-named means to release sald means, substantially as described.
2. In a switch throwing device of the character described, the combination with two pivotally mounted switch tongues adapted to be connected together, of casings located in the vicinity of said tongues, a bell crank lever mounted in oing of said casings and connected to said tongues, an operatigb lever mounted in the other of said casings and connected to sald lever, means contained within the last-named casing to lock said tongues in an adjusted position, mearis mounted adjacent to the other of said casings to release said first-named means, and means to return said tongues to their dormal position, substantially as described.

\section*{No. 101,751. Tie Plate. Plaque de tirant.}

Bertie B. Moss, Salem, Indiana, U.S.A., 30th October, 1906; years. Filed 18th August, 1906. Receipt No. 138,791.
Claim.-1. A tie plate having a reversible lug plate pro. vided at opposite sides thereof with counterpart lugs, one lug near one end and the other lug near the opposite end thereof.
2. A tie plate comprising a main part having a groove extending from end to end thereof in one side of the part with

ribs on the opposite side thereof, the main part having a lug hole in the middle portion of the groove, and a reversible lug plate having two counterpart lugs at opposite sides thereof, one lug being near one end and the other lug near the opposite end of the body thereof, cither lug being insertible in the lug hole.
3. A tie plate comprising a main part having a groove in one side extending from end to end thereof with ribs on the opposite side thereof, the part having two pairs of spike holes therein spaced apart different distances between the two holes of the pairs. said main part having also a lug hole in the middle portion of the said groove, and a reversible lue plate having two counterpart lugs at opposite sides thereo:. one lug being near one end and the other lug near the opposite end of the body thereof, either lug being insertible in the lug hole, the body of said lug plate fitting into said groove.
4. In a tie plate the combination of a main part for supporting a rall provided with a groove in the top thereof extending across said top and having a lug hole extending across the groove at the middle portion thereof. with a lug plate fitting into said groove and lug hole.
5. In a tie plate the combination with a main part having a groove therein and a lug hole in the groove. of a lug plat. fitting into the groove from either end thereof and extending beyond the lug hole, the plate having a lug on one side near an end thereof and another lug on its other side near the opposite end thereof. either iug fitting into the said lug hole.

No. 101,752. Fastener for Bnildings in Construction.
Attache pour batisses en construction.

The Unit Concrete Steel Frame Company, assignee of Emile George Perrot, all of Philadelphia, Pennsylvania, U.S.A.. 30th October, 1906; 6 years. Filed 27th August, 1906. Receipt No. 138,997.
Claim.-1. Means Yor fixing a structural part or other device in position, comprising a block or casting, relatively movable means engaging said block or casting to hold the same in position on a fixed support, and other relatively movable means also engaging said block to hold said part permanently in position relative thereto.
2. Means for flxing a structural part or other device in position, comprising a block or casting having a socket, relatively movable means engaging said socket to hold said block in position on a fixed support, and other relatively movably means also engaging said block to hold said structural part or device permanently in position relative to said block.
3. Means for fixing a structural part or similar device in position. comprising a block or casting having a screwthreaded socket therein, means engaging said screw-threaded socket to hold said block in position upon its support and other means also engaging said screw-threaded socket to hold said part in position relative to said block.
4. Means for fixing a structural part or other device in position, comprising a block or castinz having screw-threaded sockets therein, means for engaging one of said sockets to hold said block in position on a suitable support, and means for engaging the other of said sockets to hold said part in position relative to said block.
5. Means for fixing a structural part or other device in position. comprising a block or casting having sockets therein. means for engaging one of said sockets to hold said block in position on its support, a screv-threaded stud engaging another of said sockets, and means carried by said stud to hold said part in position relative to said block.
6. Means for fixing a structural part or other device in position. comprising a block or casting having screwthreaded sockets therein, means for engaging one of sald sockets to hold said block in position on its support, a screwthreaded stud engaging other of said sockets, and nuts engaging said stud for holding said part or device in position relative to said block.
7. Means for flxing a structural part or device in position, comprising a block or casting having screw-threaded sockets therein, a bolt engaging one of said sockets to hold said block in position upon its support, a serew-threaded stud engaging other of said sockets, and a nut or plate ensaging said stud to hold said device in position relative to said block.
8. Means for fixing a structural part or other device in position, comprising a block or casting having a central screwi hreaded opening therein, means engaging said block to hold the same permanently in position upon its support, a screwthreaded stud adapted to enter said socket, means carried by said stud for holding said part in position relative to sald block, and separators also carried by said stud.

No. 101,753. Process of Making Cement and Concrete Products.
Procćdé pourl a fabrication du ciment et béton.

George H. Bartlett, Mattapan, Massachusetts, U.S.A., 30th October, 1906; 6 years. Filed 7th September, 1908. Receipt No. 139,315.
Claim.-1. The method of making a concrete article, consisting in confining concrete material containing an excess of water in contact with a polished and non-adhesive panel beneath said material, and allowing the same to remain in such contact untll dry and hardened and provided with a permanent polish.
2. The method of making a concrete article having a polished surface, consisting in confining a requisite quantity of concrete material containing an excess of water. during the setting and hardening and drying of the material. With a lower face portion thereof in contact with a polished, moisture repellent and non-adhesive surface or panel.
3. The method of making a concrete article having a polished surface consisting in preparing the concrete material under the wet process. and confining a requisite quantity of such material during the setting and hardening thereof, with a lower nortion in contact with a polished. moisture repellent. and non-adhesive surface or panel until it becomes dry and hard.
4. The method of making a concrete article having a polished surface, consisting in depositing concrete material including hydraulic cement with an excess of water in a mould having a glossy bottom pancl, and allowing the same to remain in contact with said panel during the settling and draining of the water in the material thereby cansing the last hardening to take place in the portion of the article that is in contact with said panel, the said article remaining in contact with the panel until hardened and dry and provided with a permanent polish.
5. The method of making a concrete article having a nolished surface. consisting in moulding a requisite quantity of concrete material containing an excess of water in a mould having a greater depth than whith. and having a polished, moisture repellant, and non-adhesive hotton surface or panel, and leaving sald matrrial in the mould during the setting and hardening and drying of the cement. whereby the sald article is formed with a glassy narrow edec.
6. The inethod of making an ornamentor conerete article which consists in fopositing unon a smooth and glossy forming surface a mass of conerote which includes hydranlic cement contain!ng an excess of water causing the cement to cover the forming surface, and confining the mass until the cement crystallizes and dries.
7. The method of making an ornamented concrete article which consists in denositing a coating of hydraulic cement upon a smooth and glossy forming surface. and then fenositing upon said coating mase of concrete containing a hydraulic cement and an excess of water. the cement of the concrete uniting with sald coating. and confining the said mass until the cement crystallizes and drios.

No. 101,754. Copy Folder. Porte-copie.

Jay Cook, Oelwein, Iowa, U.S.A., 30th October, 1906; 6 years. Filed 1Sth July, 1906. Recelpt No. 137,930.
Claim.-1. A copy holúer comprising in combination a frame constituting a back adapted to support a sheet of copy, a base plate projecting forwardly from said frame, a movable angle clamp supported on said base plate and located in the angle between said base plate and said frame, and means for resiliently pressing said clamp inwardly.
2. A copy holder comprising in combination a frame adapted to hold a sheet of copy, a movable clamp adapted to secure said sheet, means for attaching said clamp to sald frame in a substantially central portion, and means for attaching said clamp to gaid frame in a latterly removed position with said clamp projecting laterally from said frame.
3. A copy holder comprising in combination, a frame presenting an elongated opening therethrough, and a movable clamp mounted in said opening, having a frame transversely disposed upon the face of said holder and adapted to engage 1 sheet of copy placed thereupon.
4. A copy holder comprising in combination a frame having an elongated opening disposed substantially centrally therein. a second opening disposed laiorally upon sald frame, and a movable clamping frame adapted to be mounted in
rither of said openings, and extending transversely of sald frame.
5. A copy holder comprising in combination a frame haring an elongated opening therethrough, and adapted to support a sheet of copy, a movable clamp mounted in said onening and comprising a frame disposed upon the face of said first frame. an anchor disposed bchind sald first frame and a spring connecting said anchor with said second frame and resiliently maintaining said second frame in position.
6. A copy holder comprising in combination, a frame. a rack carried thereby, a movable sleeve mounted on sald frame and having a rotatable pinion meshing with said rack. said pinion being adapted to adjust said sleeve. a spring in connection with said sleeve and maintaining frictional pressure between said sleeve and said frame, and a marker carried by sald sleeve and projecting across said frame.
i. A cony holder comprising in combination, a frame. a rack carried thereby, a movable sleeve mounted on said frame and having a rotatable pinion meshing with said rack. said ginion being adapted to adjust sald sleeve, a epring in connection with said sleeve and maintaining friciional pressure between said sleeve and said frame. an arin rigidly carried by said sleeve, and a marker bar jointed to aid arm and projecting across the face of sald frame.
8. In a copy holder in combination, a frame adapted to support a sheet of copy, a base plate profecting forwardly from the lower portion thereof and having a substantial rentral groove in the upper face thereof, said base plate further having a second groove near one extremity thereof. an angle clamp attached to the point of connection of sald frame and sald base plate, means for constraining said angle clamp against said frame, and a draw bar attached to satd angle clamp and adapted to occupy either of said grooves.

No. 101,755. Concrete Wall Forming Apparatus Appareil pour la formation de murs en beton.

Harry Philip Englehardt, New York City, New York, U.S.A. 30th October, 1906; 6 years. Filed 5th September, 1906. Receipt No. 139,281.
Claim.-1. In an apparatus for the nurpose described. standards provided with channels, base bars on which the standards are mounted, mould plates or boards adapted 10 engage their ends in sald channels, and a spacing block removably engaging with said standards.
2. In an apparatus for the purpose described. standards or uprights having channels, mould plates forming the outer walls of said channels, base bars on which the stand ards are mounted, braces extended from the base bars to said standards, a spacing block adapted to engage betweca the inner and outer standards, a metal strap attached to said block, and wedges for engaging between the strap 30 d standards.
3. An apparatus for the purpose described, comprising standards having channels, angle plates forming the outer walls of sald channels, base bars on which the standardy are mounted, and mould plates or boards adapted to engage with their ends in said channels.
4. In an apparatus for the purpose described, inner and outer portable standards having channels. base bars to which the standards are connected, and mound the chanboard nels.
No. 101,756. Game. Jeu.

Bertram C. Kenyon, Mishawaka, Indiana, U.S.A.. 30th October, 1906; 6 years. Filed 29th August, 1906. Receipt No. 139,081.
Claim.-1. In a game device the combination of a drop table, a cue, a receptacle for a cue ball in front of said cue, a receptacle for object balls, means for shooting said cue, means for lowering said table to inclined position. means for lowering said ball receptacles, means for collecting the balls from the table when inclined and directing one of sald balls to said cue ball receptacle and the remeinder to said object ball receptacle. means for raising said table to substantially horizontal position and means for raising said ball receptacles to the level of said table.
2. A game device comprising a table, a ball, means for propelling said ball upon the table to thereby put it in play, means for repositioning said ball upon the table, and devices for correlating said propelling means and repositioning means, whereby the ball is automatically reposilloned after being propelled.
3. A game device comprising a table, a plurality of balls, means for propelling one of said balls towards the others, means for repositioning said balls upon different parts of the table, and means for co-relating said propelling and repositioning means, whereby the balls are automatically repositioned after propulsion.
4. A game device comprising a table adapted to lie horizontal when the device is in play, a ball free to roll upon said table, means for propelling said ball, means for subsequently repositioning the same, and means for co-relating said propelling and repositioning means, whereby the sequence of operation thereof is regulated mechanically.
5. In a game device, the combination of a table, an object ball, a cue ball, means for propelling said cue ball toward said object ball and means for collecting and repositioning said balls.
6. In a game device , the combination of a table, an object ball free to roll thereon, means for automatically positioning said ball upon said table, a cue bal, means for propelling sald cue ball toward said object ball, and means for co-relating said propelling and positioning means.
7. A game device comprising a table adapted to lie horizontal when the device is in play, a plurality of balls free to roll upon said table, means for pronelling one of said balls to act upon the others. means for repositioning the first propelled ball at one part of the table, other means for repositioning the other balls at another part of the table and means for co-relating said propelling means and both repositioning means for rendering the game device automatic.
S. In a game device, the combination of a table, a ball. a spring, ball propelling means urged by said spring, a handle, and a retractor operated by said handle for retracting said propelling means against the force of its spring. said retractor being adanted to release said propelling means when in retracted position, and subsequently re-engage it.
9. In a game device the combination of a table, a ball, a spring, a cue urged by said spring and adapted to propel said ball, a handle, a retractor operated by sald handle for retracting said cue against the force of its spring, said re-
tractor being adapted to suddenly release sald cue when retracted, and means operated by said handle for repositionin said ball upon thr table after being propelled by said cue.
10. In a game device the combinationally in substantially table, means for holding sald adapted to move said table into horizontal position, means adanted to receive said ball from inclined position, a runway adapticlined position, and means said table when the latter is in hichll upon said table. for subsequently positioning sambination of a ball, a drop
11. In a game device the combination of a substantially able, means for holdine san adanted to move said table into horizontal position, means adaptod to receive said ball from iaclined position, a runway and inclined position, reans for aid table when the lattor is in indmission of the ball when closing said runway against the admission of the receptacle the table is in normal prosceding from said runway.
iz. In a game device the combination of a ball, a drop rable. means for bolding said table normally in substantlally horizontal position, means adapted to move sald table into inclined position, a runway adapted to receive the ball from said table when the latter is in inclined position. a gate for retaining the ball when the table is down and positioning nceans adapted to receive the ball proceeding from. said runnay.
13. In a game device the combination of a ball. a drop table. means for holding said table normally in substantially horizontal position, means adapted to move said table into inclined position. a runway adapted to receive the ball proceeding from said table to direct it to a predetermined point, and lift means located at said point and adapted to raise the ball, substantially as described.
14. In a game device the combination of a ball, a drop table, meaus for holding said table normally in substantially horizontal position, means adapted to permit said table to drop into inclined position, a runway adapted to receive the ball from said runway and to direct it to a predetermined point. means adapted to automatically raise said lift means, and other means adapted to lower sald lift means when the latter is in raised position.
15. In a game device the combination of a ball, a table pivoted upon a horizontal axis, and adapted to assume horizontal and inclined positions, means for rotating said table about its pivot, a runway adapted to receive said ball from the table when the latter is in inclined position, and means for subsequently positioning said ball upon the table.
16. In combination, a table, a ball, means for positioning said ball upon the table, means for propelling said ball, a handle for operating said propelling means and said positioning means, and devices for controlling the times of operation of said propelling and positioning means.
17. In combination, a table, a plurality of balls, means for rolling said balls upon said, table, means for repositloning said balls, tally tokens, tally means for dellvering the same, a handle for putting into opeiation said ball rolling means and sald repositioning means and said tally means, and devices for controlling the times of operation of said ball rolling means, repositioning meuns and tally means.
18. In a game device the combination of a ball, a drop table, lift means adanted to raise sald table into normal and substantially horizontal position, means adapted to sustain said ball in raised position, a ball receptacle adapted to lift the ball to the level of the table when the latter is in raised position and means for sustaining said ball receptacle in raised position.
19. In a game device the combination of a ball, a table, means for positioning the ball upon said table, means for propelling it upon said table, and spring driven means for operating both of said means, substantially as described.
20. In a game device the combination of a ball, a table, means for propelling the ball upon the table, a spring for urging said propelling means. means for repositioning sald ball upon said table after said ball has been propelled, a second spring for urging said positioning means to operate the same, a handle for straining both of said springs, and means whereby the said handle is adapted to release the spring of the propelling means first and the spring of the positioning means afterwards.
21. In a game device the combination of a table, a ball, means for positioning said ball upon said table, means for propelling said hall unon said table. means for returning said ball from said table to said positioning means, a handle, means operated by the handle for driving said positioning and ball propelling and ball returning means, and correlating devices for controlling the times of operation of said position and ball returning and ball propelling means.
22. In a game device the combination of a table, an object ball, means for positioning said ball upon said table, means for propelling said ball upon said table, and means for returning said ball from said table to said positioning means, springs for operating said ball positioning means. ball propelling means, and ball returning means, a handle for strain-
ing said springs and corrclating devices for controlling the limes of operation of said ball positioning means, ball proprlling means and ball returning means.
23. In a game device, the combination of a ball, a drop table, means for supporting sald table and adapted to hold it normally in substantially horizontal position, said supporting means being also adapted to receive the ball from said table when inclined and to direct said ball to a predetermined point, and means adapted to raise and lower said table supporting means.
24. In a game device, the combination of a ball. a table adapted to swing about a horizontal axis, means for operating the table to bring it alternately to horizontal and inclined positions, a vertically movable receptacle for carryine said ball, means for raising sald receptacle to the height of the table when in level position and lowering said receptacle to a position below the table when the lattor is in inclined position so that the balls may roll from the table to the receptacle, and devices for co-relating said table operating means and sald receptacle operating means
25. In a game device the combination of a cue and object balls, a drop table having an aperture therein for the cue ball, and an aperture for an object ball, means for raising and lowering said table, vertically movable receptacles for carrying said balls, means for moving said receptacles to a top position flush with the raised position of the table. and to a bottom position lower than the lowered position of the table for the purpose described.
26. In a game device, the combination of a ball. a table, means for propelling the ball upon the table. mrans for positioning sald ball upon said table, two springs. the first for urging said propelling means and the second for urging said positioning means, a handle for straining said springs, an escapement for controlling the operation of said positioning means, and means whereby the said handle is adapted to relcase first the propelling mrans and afterwards the escapement and through the escapement the spring of the positing means.
27. In a game device the combination of a plurality of object balls, a cue ball. means for propelling said cue ball towards the object balls, a table having an aperture therein. a platform for elevating said object balls to the level of the table through the aperture therein, means for propelling said propelling means, means for elevating said platform, and devices for co-relating sald propelling means and platform elevating means whereby the parts are so timed as to clevate said platform to the level of the table automatically just prior to the operation of said propelling means.
28. In a game device the combination of a cue, a cue ball. a table having an aperture therein, a platform for elevating sald cue ball up to the level of said table through the aperture therein, said cue ball loosely fitting said aperture, means for both shooting said cue and elevating said platform co-relating devices for timing said shooting and elevating means to automatically elevate sald platform to the level of the table just prior to the shooting of the cue, and ball confining means located below the level of the table for governing the lateral position of the cue ball the normal position of the platform being below the level of the table whereby the cue ball is retained within its confining means prior to the shooting of the cue.
29. In a game device the combination of a cue. a cue ball, object balls, a table having an aperture therein, a platform for elevating said object balls up to the level of the table through the aperture therein, means for shooting said cue. means for olevating said platform, and co-relating devices for timing said elevating mechanisin and cue whereby the elevating mechanism automatically raises the platform to the level of the table just prior to the shooting motion of the cue, said platiorm normally resting below the lovel of the table for preventing premature scattering of the object balls.
30. In a game device the combination of a ball, a table having an aperture therein through which the ball may be elevated to the level of the table, a platform for elevating said ball, and a downwardly yielding wall adapted to retain said ball in said platform prior to the entrance of the ball into the aperture in the tabla.
31. In a game device the combination of a cue ball, means for propelling the same, a drop table hinged at one end for permitting said ball to roll off when table is in inclined position, means for raising and lowering said table and corelating devices connecting said propelling means and said table operating means whereby said table is held in raised position during the propelling action of said propelling means and sald table is subsequently lowered and again raised prior to the next succeeding propelling action of said propelling means.
32. In combination. a table, a ball, means for positioning said ball upon the table, means for propelling said ball, a handle for operating said propelling means and said positloning means, and devices including a fan escapement for
controlling the times of operation of said propelling and positioning means.
33. In a game device, the combination of a table, a ball. means for propelling said ball upon sald table, means for positioning said ball upon said table, and co-relating devices operative upon said propelling means and positioning means for automatically controlling the times of operation thereof, said co-relating devices including a fan escapement for modifying the rate of operation of said positioning means.
34. In an automatic game device the combination with the game playing parts, of a spring for driving the same, hand operated means for straining sa!d spring. a fan wheel escapr. ment for governing the speed of operation of the parts under the Influence of sald spring, said escapement comprising two independent fan wheels, one of which is a permanent part of the escapement and the other of which is auxiliary, a clutch for throwing the auxillary fan wheel into and out of engagement with the first. and a cam device for operating said clutch, sald cam device being adapted to throw said auxiliary fan wheel out of engagement with the first some time prior to the return of the driving spring to normal condition, the retarding influence of the escapement being therefore greater a: the time when the force of the spring is greatest.
35. In a game device having stationary parts and movable playing parts the combination including such parts. of a mester member for operating said movable parts, a spring operative upon said master member to return it to normal position, a hand lever adapted to move sald master member frward from normal position agalnst the force of said spring, said hand lever being adapted to return to its normal rosition independently of said master member, an escapement for governing the return movement of the master member under the influence of sald spring. a spring influenced escapement arrester urged to project said arrester to stop the motion of the escapement, a dog for holding sald arrester in retracted position, means operated by said hand lever for throwing said dog and arrester into engagement with each other and means operated by said master member for disengaging sald dog from said arrester.
36. In a game device the combination with the stationary parts of a table hinged at one end. means for raising and lowering the free end of said table to bring it to inclined position and to substantially horizontal position. balls adapted to be played on sain table. vertically movable lift means for elevating sald balls to the table when the latter is in horizontal position, collecting means for receiving said balls from the table when the latter is in horizontal position and delivering them to said lift means when the latter is in low. ered position, and correlating devices for timing sald table and platforms whereby the lift means is lowered before the tahin is brought to inclined position and said lift means is raised after said table is brought to horizontal position.
27. In a game device the combination with the stationary narts of a table hinged at one end. means for ralsing and lowering the free end of said table to bring it to inclined position and to substantially horizontal position, balls adapied to be played on said table. a vertically movable platform for elevating sald balls to the table when the latter is in horizontal position, collecting means for recelving said balls from the table when the latter is in inclined nosition and delivering them to said platform when the latter is in lowered rosition. and correlating devices for timing said table and platiorm whereby said platform is lowered before the table is brought to inclined position and said platform is raised after said table is brought to horizontal position.
38. In a game device the combination with the stationary parts of a table hinged at one end, means for ralsing and lowering the free end of said table to bring it to inclined position and to substantially horizontal position, balls adapted to be played on said table, a vertically movable platform for elevating said balls to the table when the latter is in horizontal position, inclined runways for receiving said balls from the table when the latter is in inclined position and de. livering them to sald platform when the latter is in lowered position, and correlating devices for timing said table and platform whereby said platform is lowered before the table is brought to inclined position and said platiorm is raised ifter sald table is brought to horizontal position.
39. In a game device the combination of a ball. a table adapted to swing about a horizontal axis, means for operat. ing said table for alternately swinging it to horizontal and inclined positions, a ball receptacle for raising said ball to the table. means for conveying the ball to said receptacl. from the table. means for operating said ball receptacle and correlating devices for timing the operation of said tabl. operating means and said receptacle operating means, said currelating devices including a fan escapement, a spring for driving it and a handle for both straining the spring and co: rolling the escapement.
40. In a game device the combination of a ball, a table adapted to swing about a horizontal axis, means for oper-
ating said table for alternately swinging it to horizontal and irclined positions, a ball receptacle for raising said ball to the table, means for conveying the ball to said receptacle from the table, a driving member having a limited movement, a compound lever connecting said driving member and said ball receptacle whereby said receptacle received a greater movement than has said driving member, said table operating means being also connected to and operated by said driving member.
41. In a game device the combination of a ball, an aper tured table, a platform for raising said ball to the level thereof, and a downwardly yielding retaining wall upon said nlatform.
42. In a game device, tally means consisting of a token receptacle, a member adapted to move in proximity thereto ard a set of fingers on said moving member each adapted to remove a token from said receptacle, said fingers being arranged in series whereby the number of tokens removed depends upon the amount of motion of the member wherein said fingers are mounted.
43. In a game device, tally means consisting of a token receptacle, having an opening therein through which a token may pass and a member having a set of projections arranged in series and adapted to move across the opening in said receptacle for removing tokens therefrom one after the other, substantially as described.
44. In a game device, tally means consisting of a token receptacle having an opening therein through which a token may pass, a member adapted to reciprocate in proximity thereto. and a set of fingers on eaid reciprocating member for removing tokens from said receptacle, said fingers beinf yielding in one direction for permitting return movement of the reciprocating member.
45. In a game device, tally means consisting of a token receptacle, open at the bottom, a sector pivotally mounted beneath said receptacle for supporting the tokens therein, and projections on said sector for removing tokens from said receptacle.
46. In a game device including balls, tally means consisting of a taken redeptacle, movable members for removing tokens therefrom, plungers for operating said movable members, a reciprocating tally box adapted to receive one and also more than one ball behind sald plungers for operating said plungers and moving them different amounts depending upon the number of balls in the tally box behind them, a power device and means operated by said power device for first moving said tally box forward and subsequently returning it to original position.
47. A game device including balls, tally means consisting of a token receptacle, movable members for removing tokens therefrom plungers for operating said movable members, a reciprocating tally box adapted to receive the balls behind said plungers for operating them, a door at the back end of the box for retaining and releasing the balls, and means for operating said door.
48. A game device including balls, tally means consisting of a token receptacle, movable members for removing tokens therefrom plungers for operating said movable members, a reciprocating tally box adapted to receive the balls behind said plungers for operating them and means for automatically reciprocating said tally box.
49. A game device including balls, tally means consisting of a token receptacle, movable members for removing tokens therefrom, plungers for operating said movable members, a reciprocating tally box adapted to receive said balls behind said plungers for operating them, a door at the back end of the box for retaining and releasing the balls, and means for automatically opening said door.
50. A game device including balls, tally means consisting of a token receptacle, movable members for removing tokens therefrom, plungers for operating said movable members, a reciprocating tally box adapted to receive the balls behind said plungers for operating them, a door at the back end of the box for retaining and releasing the balls, and means for automatically closing said door.
51. A game device including balls, tally means consisting of a token receptacle, a dellvering sector, a plunger for operating said sector, a reciprocating tally box adapted to receive a ball behind said plunger and in front of the back wall of the box, whereby the sald back wall may act upon the plunger through the ball, and means for reciprocating said box.
52. An automatic pool game apparatus consisting of a casing, a table, a plurality of balls, means for propelling one of them against the others, means for repositioung them upon the table, tally tokens, tally means for dellvering said tokens, and means for operating and means for timinm sald propelling means, repositioning means and tally means.

No. 101,757. Continuous Kiln. Four.

Johann Rappold, Allschwil, near Basle, Switzerland, 30th October, 1906; 6 years. Filed 7th September, 1906. Receipt No. 139,312.
Claim.-In a firing kiln with travelling hearth and in combination, a firing flue with a recessed lower portion along each side, a dependent ledge between each recessed portion and the upper portion of the flue, a hearth of fireproof matrial extending into said recessed portions and having side ledges projecting upwardly behind the aforesald dependent ledges and means to continuously supply granular material to the space between thg said ledges and to the side recesses.

No. 101,758. Dry Press. Presse d̀ sécher.

Johann Rappold, Allschwil, near Basle. Switzerland, 30th October, 1906; 6 years. Filed 8th September, 1906. Recelpt No. 139,357.
Claim.-1. A dry press comprising a mould table, upper and lower press heads, arms for supporting said press heads, means for raising the upper press head independently of the lower press head, pistons operated by fluid under pressure. and means connecting the pistons to the press head, arms to force the press heads toward each other when the pistons are driven outwards, substantially as set forth.
2. A dry press comprising a mould table, upper and lower press heads, arms for supporting said press heads, a cam for raising the upper press head independently of the lower press head, pistons operated by fluid under pressure, and means connecting the pistons to the press head arms to force the press heads together towards each other when the pistons are driven outwards, substantially as set forth.
3. In a dry press of the kind described a hydraulic cylinder, two pistons mounted therein, an operative connection between the upper piston and the lower press head arm, an operative connection between the lower piston and the upper press head arm, an inlet branch on the cylinder intermediate the two pistons and means for controlling the supply of fluid under pressure to said cylinder, substantially as set forth.
4. A dry press comprising a mould table, press heads on opposite sides of said mould table, means for operating one of said press heads arms independently of the other, a hydraulic cylinder for operating both said press head arms together, means for controlling the supply of fluid under pressure to the cylinder, and means for intermittently relieving the pressure in the cylinder simultaneously with the raising of the upper press head arm, substantially as desscribed.
5. In a dry press of the kind described. a rotary mould table, upper and lower press heads, arms carrying said press heads, a hydraulic cylinder, a valve therefor, pistons movable in said cylinder, operative connections between the upper piston and the lower press head arm, operative connections between the lower piston and the upper press head arm, a cam for raising the upper press head arm, a cam for operating the cylinder valve, a cam for operating the cylinder pump and gearing for intermittently rotating the table and operating the sald rams, substantially as set forth.

No. 101,759. Grain Door for Freight Cars.
Porte à grain pour chars ì marchandises.

Ludwig \(\Lambda\). Thorson, Melvin. Minnesota, U.S.A., 30th October, 1906; 6 years. Filed 11th August, 1906. Receipt No. 138,589.
Claim.-1. The combination with the side posts of a freight car door opening having their inner edges rabetted, of substantially U-shaped channel bars fitted in the rabbeted portlons of the posts and provided with longitudinal flanges lapping the inner sides of the posts and having transverse slots, fastenings piercing the posts and the slotted portions of the flanges, the channel bars being adjustable laterally upon the fastenings, and a slidable door having flanges working in the U -shaped channel bars.
2. The combination with a car having a doorway, of upper and lower brackets secured to the car at each side of the doorway, a hanger depending from each upper bracket and including a transverse seat which is open at one end, a cable connected to each hanger and the adjacent lower bracket, and a slidable door having guide loops slidably embracing the respective cables and capable of being received within the seats and turned therein to swing the door upwardly toward the top of the car.
3. The combination with a car having a doorway, of upright ropes at opposite sides of the doorway, a vertically slidable door having guides slidably embracing the ropes, and adjusting means to maintain the ropes taut.
4. The combination with a car having a doorway, of upright ropes at opposite sides of the doorway, a vertically slidable door having guides slidably embracing the ropes, pairs of brackets for the support of the ropes, and adjusting means carried by certain of the brackets for maintaining the ropes taut.
5. The combination nith a car having a doorway, or upper and lower brackets at opposite sides of the doorway, ropes carried by the brackets, there being a threaded adjustment between one end of eden rope and the adjacent bracket to maintain the rope taut, and a door having guides slidably embracing the ropes.
6. The combination with a car having a doorway, of upper and lower brackets to opposite sides of the doorway, ropes hanging from the upper brackets, ferrules provided upon the lower ends of the ropes and having hooks, screw eyes adjustable upon the lower brackets and engaged by the hooks of the lower brackets and engaged by the hooks of the respective ferrules for maintaining the ropes taut, and a door having guides slidably embracing the ropes.

No. 101,760. Stexilizer for the use of Barbers. Stérilisateur à l'usage des barbiers.

Ernest O. Bauer, Valatie, New York, U.S.A., 30th October, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,581. claim.-A sterilizer comprising an outer casing formed with openings near the tod and bottom, a flange extending inwardly from the casing, a heating vessel within the casing and supported by the flange, the vessel extending above the flange and forming a support for a razor or like, the upper edge of the casing forming a guide for the handle of sald razor, a heating medium in the casing below the vessel, a support within the casing below the vessel, and in alignment with an opening in the casing, the supoprt and opening forming a holder for an article between the heating medium and the bottom of the vessel, substantially as described.

No. 101,761. Syringe. Seringue.

Joseph Jacob Brin, Chicago, Illinois, U.S.A., 30th October. 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,995.
Claim.-1. In a syringe the combination with a spray tube, of a series of distending fingers surrounding said tube ald means for distending said fingers comprising a besd io which the outer ends of sald fingers are slidably connected. and means for imparting a relative sliding movement said cone and finger members, substantially as described.
2. In a syringe the combination with a spray tube, of a series of distending fingers surrounding said spray tube, 1 bevelled head to which the outer ends of sald fingers are
slidably connected and means for imparting a relative sllding movement to said head and finger members, substantially as described.
3. In a syringe the combination with a spray tube, of an expansible frame, a berelled head having tracks within it, the frame being slidably connected to said tracks whereby the end of the frame will lie concealed within said head when in a contracted position, and means for imparting a relative sliding movement to sald head and frame, substantially as described.
4. In a syringe the combination with a spray tube having fingers attached thereto, of a sleeve sliding upon said tube, a bevelled cone attached to said sleeve, grooves withing said cone to which the fingers are slidably connected, and means for imparting a relative sliding movement to sald cone and inger members, substantially as described.
5. In a syringe the combination with a spray tube of a series of distending fingers, a sloeve sliding upon said spray tube and provided with a cushion, a slotted cone attached to said sleeve, to which the outer ends of said fingers are slidably connected and means for imparting a relative sllding movement to said cone and finger members, substantially as described.
6. In a syringe the combination with a spray tube, of a series of distending fingers surrounding said tube, means for distending said fingers comprising a cone to which the outer ends of said fingers are slldably attached and project beyond the end of the cone, and means for imparting a relative movement to said cone and finger members, substantially as described.
7. In a syringe, the combination with a spray tube, of a series of distending fingers surounding sald tube, and means for distending said ingers comprising a head to which the outer ends of sald fingers are slidably connected, said head being of a form and size to serve as a guard for the ends of said fingers, and means for imparting a relative sliding movemant to said head and fingers, substantially as described.
8. In a syringe, the combination with a spray tube, of a series of distending fingers surrounding said tube, means for expanding and contracting said fingers comprising a longitudinally grooved cone-shaped head to which the outer ends of said fingers are slidably attached, the grooved guides of said head being inwardly convergent at a greater angle throughout their inner portions than throughout their outer portions, whereby sald fingers resist compression through external contraction throughout the first part of their contracting movement and yield to external compreselon throughout the latter part of their contracting movement, substantially as described.
No. 101,762. Artificial Teeth. Dent artifcielle.

Harry B. Gregory, Newberry, Michigan, U.S.A., 30th October, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,717.
Claim.-An artificial tooth having secured to its inner side a loop, a cap arranged over said loop, an individual backing pressed over said cap and the inner side of the tooth, said backings being connected together to form a bridge, and said artificial teeth being secured in said individual backings, substantially as described.

\section*{No. 101,763. Veterinary Dental Float. \\ Apparell dontaire pour vétérinaires.}

Garnet J. Read and Albert Meierhofer, Minonk, Illinois, U. S.A., 30th October, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,892.
Olaim.-1. A veterinary dental float having an abrading disc provided with tangential abrading furrows and an eccentric
channel intersecting the furrows, and means for operating sald disc.

2. In a veterinary dental implement, a supporting arm terminating in a circular socket, a disc mounted for rotation in said socket and provided with tangential abrading furrows and with a circular channel in said furrowe disposed eccentrically to said disc, and means operating through said arm for rotating said disc.
3. In a veterinary dental instrument, an arm having at one end a head provided with an internal circular shoulder, a disc having an abrading surface and mounted for rotation upon said shoulder, and means operative through said arm for rotating said disc.
4. A veterinary dental float having a held provided with a socket, a gear mounted in the socket and having its hub extending rearwardly through a bearing in the head, means for detachably securing the hub of the gear in place, a disc detachably secured to the face of the gear and mounted in said socket, and operating means including a pinion meshing with said gear.
5. In a veterinary dental instrument, an arm having at one end a head provided with an internal circular shoulder and with a central transverse bearing, a gear having a hub extending through said bearing and likewise extending beyond the opposite face of the gear and internally threaded, a stop plate bearing upon the rear face of said head and held in position by a cap screw operating through said plate, and into said hub within said bearing, a disc having an abrading surface, and mounted for rotation upon said shoulder, an3 provided with a socket for engaging the adjacent portion of said hub, and held in position by a cap screw operating through said disc and into said gear hub, and with a stud extending into a cavity in said gear, a rod mounted for rotation in said arm, and terminating in a pinion for engaging said gear, and means for rotating said rod.

No. 101,764. Indicator for Dispeneing Beveraces. Indicateur pour la distribution des browvages.

Henry A. Rueter, Boston, Massachusetts, U.S.A., 30th October, 1906; 6 years. Filed 16th June, 1906. Recelpt No. 136,974.
Claim.-1. The herein described means for mechanically employing trade marks or other insignia of origin in connection with high pressure beverage dispensing apparatus for securing and promoting the co-operation of the customers and the beverage manufacturers in preventing iraud in dis.. pensing the beverages, consisting of the combination with a bar having a stationary pipe connection with a remote source of beverage supply, and a high pressure dispensing faucet located in said pipe at the bar, of an indicator located always between the attendant and the customer, containing
the manufacturer's name, trade mark, or other distinctive and attractive insignia denoting origin, and indicator operating means for conspicuously visually altering the indicato: In such a manner as forcibly to attract the customer's at in stion, said faucet and operating means operating indepentention, said faucet and operating means operating indepen dently of and unaffected by the high pressure within said pipe connection, said operating means including permanent connection with the faucet for automatically actuating the indicator in the act of operating the faucet, and thereby prevent fraud, as described.
prevent fraud, as described. under high pressure, the combination with a bar, having a plurality of adjacent stationary plpe connections for drawing respectively different beverages under high pressure from remote sources of supply, each pipe having its own independent high pressure dispensing faucet located at the bar, of indicators arranged side by side at the bar within the direct visual range of the customer when belng operated under normal conditions by the attendant, and each containing the manufacturer's name, trade mark, or other distinctive and attractive insigna denoting origin of the particular high pressure beverage indicated thereby, and indicator operating means for each indicator, connecting it with its individual faucet, for conspicuously altering the indicator in such a manner as forclbly to attract the customer's attention in the act of operating the faucet, said faucets and operating means being capable of operating independently of and unaffected by the high pressure controlled by the faucets.
3. The combination with a bar, of a faucet below said bar and an indicator connected thereto to move into sight above said bar and to disappear from sight below said bar, said indicator being moved from one of said positions to the other in the act of operating the faucet.
4. As a means of preventing fraud in dispensing llquors the combination with the bar or counter, of a faucet provided with a visual indicator normally extended prominently above the counter and depressed from the sight of the customer by the act of operating the faucet.
5. As a means of preventing fraud in dispensing liquors the combination with the bar or counter, of a faucet havins an operating handle provided with an upward extension. whose upper end is provided with means for giving visual as surance that the correct faucet is operated, said means operating in the direct range of vision of the customer ordering liquor, said means containing the trade mark or other insignia of origin of the particular liquor, the movement of the handle giving a wide amplitude of conspicuous movement to said trade mark at the end of said extension, whereby the attention of the customer is drawn to said trade mark and his co-operation is thereby enlisted to prevent fraud.
6. As a means of preventing iraud in dispensing liquors, a plurality of signals having different distinguishing characteristics in the nature of conspicuous marks of origin of the respective llquors, and having a position in sight and a position out of sight, and connected respectively to the different dispensing devices, the movement of said signals from one of sald positions to the other being such as to attract attention and induce the customer to scrutinize said marks of origin, whereby he is led to watch for the movement of a given signal when ordering a corresponding liquor, and operating means for said signals, operated by the delivery of the liquor, for changing from one of sald positions to the other the signal relating to the particular liquor being dispensed.

\section*{No. 101,765. Dental Tool. Outil dentaire.}

Charles A. Spahn, Newark, New Jersey, U.S.A., 30th October.
1906; 6 years. Filed 13th June, 1906. Receipt No. 136,838.
Claim.-1. A dental tool for backing false teeth with gold comprising a pair of pivoted handle portions, a forwardly extending jaw member provided at its free end with a resillent cap or covering connected with one of said handle portions, and a forwardly extending arm connected to the other handle portion, said forwardly extending arm being provided with an oscillating forked jaw member, one of the arms of the sald forked jaw member being provided at its free end with a resilient cap or covering and the other arm of the forked jaw member being provided at its free end with a punch-like member, substantially as and for the purpose set forth.
2. A dental tool for backing false teeth with gold comprising a pair of pivoted handle portions, a forwardly extending jaw member connected with one of said handle portions, provided at its free end with a cup-like receiving socket, and a cap or covering of resilient material arranged upon said cup-like recelving socket, a forwardly extending arm connected to the other of said handle portions, sald forwardly extending arm being provided with an oscillating forked jaw member. one of the arms of sald forked jaw member being provided at its free end with a cup-like recelving socket, a cap or covering or resilient material arranged upon said cuplike receiving socket, and the other arm of sald forked jaw
member being provided at its free end with a punch-like member, substantially as and for the purpose set forth.

3. A dental tool for backing false teeth with gold comprising a pair of pivoted handle portions, a forwardly extending jaw member connected with one of said handle portions, provided at its free end with a cup-like recelving socket, and a cap or covering of resilient material aranged upon said cup-like recelving socket, substantially as and for the purposes set forth.
4. A dental tool for backing false teeth with gold comprising a pair of pivoted handle portions, one of said handle portions being provided with a forwardly extending jaw member, a cap or covering made of rubber or similar material, and nieans for sectring the said cam or cover to the said jaw member, a forwardly extending arm connected to the other handle portion, a forked jaw nember pivotally connected to said forwardly extending arm, a cap or covering made of rubber or similar material, arranged upon the free end of onc of the arms of said forked jaw member, means for securing the said cap or covering thereto. and a punch-like member connected with the otner arm of the said forked jaw member, substantially as and for the purposes set forth.
5. A dental tool for backing false teeth with gold comprising a pair of pivoted handle portions, one of said handle portions being provided with a forwardly extending jaw member, a cap or covering made of rubber or simllar material, and means for securing the said cap or covering to the said jaw member, a forwardly extending arin connected with the other handle portion, a forked jaw member pivotally connected to said forwardly extending arm, a cap or covering made of rubber or similar material, arranged upon the free end of one of the arms of said forked jaw member, and means for securing a cap or covering thereto, and a punch like member connected with the other arm of the said forked jaw member, said punch-like member being provided with a hole or opening in the end thereof adapted to fit over the pins or studs of the false tooth, the sald punch-like member providing a means for adapting the gold around the base of the pins or studs of the said false tooth, substantially as and for the purposes set forth.
6. A dental tool for backing false teeth with gold comprising a pair of pivoted handle portions, a forwardly extending jaw member connected with one of said handle portions, a cup-like receiving socket connected with the free end of said jaw member, a cap or covering of resilient material arranged upon said cup-like receiving socket, sald cap or covering consisting of a main body portion, substantially in the form of a truncated cone, said main body portion being adapted to be inserted within the said cup-like receiving socket, and an annular head extending around said cap or covering. adapted to engage with the outer edges of the sald cup-like recelving socket, a forwardly extending arm connected to the other handle portion, a forked faw member pivotally connected upon the free end of said forwardly extending arm. thr said forked faw member being provided with a pair of downwardly extending arms, a cup-like receiving socket upon the free end of one of said arms, a cap or covering of resilient material, arranged upon the said cup-like recelving sockrt, said cap or covering consisting of a main body portion, substantially in the form of a truncated conc. said main body portion being adapted to be inserted within the said cun-like receiving socket, and an anular head extending around the said cap or covering, adapted to engage with the
outer edges of said cup-like receiving socket, and a punchlike member connected with the other arm, said punch-like member being provided with a hole or opening in the end thereof adapted to fit over the pins or studs of the false tooth, the said punch-like member providing a means for adapting the gold around the base of the pins or stubs of the said false tooth, substantially as and for the purposes set forth.

\section*{No. 101,766. Process of Obtaining Fibre and other Products from the Plant Balsam Orriza. \\ Procédé pour obtenir des fibres, et autres produits des plantes de baumier.}

William Sunderland, Lehi, Utah, U.S.A., 30th October. 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,071.
Claim. -The process of obtaining flber, rubber gum, resins and other bodies from the plant balsam orriza consisting in first, removing the bark; second, boiling in an alkali solution and removing the floating gum ; third, fermenting in water rendered alkaline and lastly, carding ahe resulting fibre and evapourating the alkali solutions to dryness, substantially as described.

No. 101,767. Match Box. Boîte a allumettes.

Francis B. Watson, Caldwell, Kansas, U.S.A., 30th October, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,931.
Claim.-1. A match box comprising a casing, the lower portion of the walls of which taper toward each other, sald walls having cut-away portions, retalning springs carried by the inclined portion of one of said walls and extending across the bottom of the casing to a point adjacent the bottom of the other of said walls, and a guard bar secured to the casing and extending therebelow in such position as to limit the movement of the retaining springs, said bar having an upwardly bowed portion.
2. In a match box the combination with a receptacle, of match retaining springs normally closing the bottom of said receptacle, and a filling slide adapted to be inserted between said springs and the base of the receptacle.
3. A match box comprising a casing having an open bottom. springs spanning the bottom of said opening casing, a filling slidet adapted to be inserted betwern sald springs anh the bottom of said casing to form a temporary bottom for the box while the same is being flled, and a retaining spring plate formed upon the box and forming a keeper for the slide when sald slide is not in use.

\section*{No. 101,768. Fluid Actuated Turbino. Turbine d fluide.}

Frederick William Gordon, Philadelphia, Pennsylvania, and Alexander Gordon, Ashbury Park, New Jersey, U.S.A., assignee of a half interest, 30th October, 1906; 6 years. Filed 29th May, 1906. Receipt No. 136,361.
Claim.-1. The comblnation with a carrier having curved blades, and operable in one direction, of a second carrier inving blades varying in curvature from the blades of cne other carier, and operable in an opposite direction, whereby the rative fluid will be received by one set of blades at an angle varying from that at which it is received by the other set of blades.
2. The comblnation with a casing having supply and exhaust ports, of reversely operable carriers, each carrier
having curved blades, and the curve of one set of blades varying in depth from that of the other set of blades.

3. The combination with a rotatable carrier having a series of curved blades, of a second rotatable carrier having a series of curved blades formed on an arc shorter than that on which the blades of the first carrier are formed, one of said carriers being rotatable in a direction opposite to that of the other, and a casing having supply and exhaust ports.
4. The combination with a casing having supply and exhaust pors of a shaft journalled in sald casing, carriers secured to said shaft, and each having a series of curved blades, the arc on which one series of blades is formed being shorter than that of the other serles, a second shaft surrounding he first-named shaft, and also journa.... in the casing, a series of carriers secured to sald second shaft, a series of curevd blades on each carrier of the second shaft, each series of blades being formed on an are shorter than the arc on which the preceding blades are formed and means for transmitting power from the shafts.
5. The combination with a casing having supply and exhaust ports, of a pair of shafts, one mounted within the other, a scries of carriers, each having a chamber adjacent to its periphery, secured to the inner shaft, curved blades in each of said chambars, a carrier secured to the outer shaft. and having a chamber adjacent to its periphery, and curved blades in said chamber, a drum projecting from said carricr. carriers, each having a chamber adjacent to its periphery and curved blades in said chamber, secured to the drum, the blades of all the carriers being progressively shallower, and power transmitting elements carried by the shafts.
6. In a fluid actuated turbine, the combination with a carrier having curved blades. of a second reversely operable carrler also having curved blades drawn on an arc shorter than the arc of the blades of the frst carrier, and mean; for transmitting power from sald carriers.
7. The combination with a series of connected carriers operable in one direction, and having progressively varying curved blades, of a second series of reversely operable carriers also having progressively varying blades, and means for transmitting power from sald carriers.
8. The combination with a casing having supply and exhaust ports, of reversely operable sets of carriers, and blades or buckets of progressively varying curvature carried by said carriers.
9. The combination with a casing having supply and exhaust ports, of a primary carrier having curved blades to recelve the motive fluid, a reversely operable carrier having curved blades of less depth than the blades of the primary carrier, a carrier operable in the same direction as the primary carrier, and having curved blades less in depth than those of the interposed reversely operable carrier. a second reversely operable carrier having curved blades of less depth than the preceding carrier a third carrier operable in the same direction as the primary carrier, and hraving curved blades of less depth than the preceding reversely operable carrier, a shaft to which one set of carriers is secured, a tubular shaft surrounding the other 'shaft, and a drum projecting from said tubular shaft, and to which the other set of carriers is secured.
10. The combination with a casing having supply and exhaust ports. of reversely operable carriers, each carrier having curved blades. and the curve of one set of blades varylng in depth from that of the other set of blades.

No. 101,769. Convezer Belt. Courroie de transport.

Ernest B. Folsom and Warren Edwards Murray, assignee of a half interest, both of San Francisco, California, U.S.A., 30th October, 1906; 6 years. Filed 8th September, 1906 Recelpt No. 139,336 .
Claim.-1. A conveyer belt having staples driven through it from the underside with the projecting ends of the staples bent backward on top of the belt but not clinched, said bent ends providing a substantially continuous armoured surface.
2. A conveyer belt having staples driven through it from the under side with the projecting ends of the staples bent back flat upon the surface of the belt, said flattened ends unclinched and forming in the aggregate a substantially continuous protective armour.
3. A conveyer belt having staples driven through it from the under side and along the central portion of the belt most subject to wear, said staples having their projecting legs bent downward on to the belt to afford a substantially continuous protective armour.
4. A conveyer belt having staples driven through it, with the projecting legs of the staples bent back to provide a substantially continuous protective armour.
5. A conveyer belt having staples driven through it with the projecting legs of the staples bent back to provide a substantially continuous protective armour, said staples arranged with their heads diagonal to the belt to embrace both the warp and woof threads.
6. A conveyer belt having wires driven through it from the under side, means to prevent the wires being drawn through the belt, and the projecting ends of the wires bent back flat on to the belt in the direction opposite to the travel of the belt, sald bent ends constituting a substantlally protective armour.

INo. 101,770. Wire Strainer. Tendour de Ml de fer.

Thomas Francis Locke, Premaydena, and Edwin Walter Duncombe, assignee of a half Interest, Deloralne, both of Tasmania, Australia, 30th October, 1906; 6 years. Filed 11th July, 1906. Recelpt No. 137,685.
Claim.-1. In straining devices the combination of two wire gripping frames one of which is connected to the fulcrum of
a lever having two equal hooks pivoted to it . and the other of which has a chain, substantially as described.
2. In straining devices, a wire gripping frame having jointed members \(h, i, j\), adapted to swing freely and having two pivoted arms forming a large clear central space, substantlally as described.
3. In straining devices, a wire gripping frame having an arm \(c\), with a jaw recess \(e\), arm recess \(f^{1}\), and perforated lug 9 . in combination with an arm pivoted to the first-named arm and connections from both said arms to a chain or lever, substantially as described.
4. In straining devices, a wire gripping frame having two metal arms one having a recess at 20 formed by bending over a part of the metal, also a recess at \(x\) formed by bending over anotber part of the metal which forms a lug having a pivot pin through the sald lug and both arms, as described.
5. In straining devices the combination with a wire gripping frame arm having a pivot pin at one side of the longitudinal central line of the frame and a lug having an eye at that side of the plvot pin which is remote from the said line, substantially as described.
6. In stralning devices, a lever end \(n\) having its metal bent over forming a longitudinal gap, a fulcrum pin for a connection \(p\), and two hooks which are of equal length and have ends pivoted within the gap, substantially as described.

No. 101,771. Holder and Exhibitor for Carde. Appareil d exhiber et porte-cartes.

Wiliam E. Hateway, assignee of John Daniel Karle, both of Bridgeport, Connecticut, U.S.A., 30th October, 1906; 6 years. Filed 5th November, 1904. Receipt No. 119,747.
Claim.-1. A card holder and exhibitor comprising a back plate and a carrier pivotally supported thereto and in parallel relation therewith, a card separator connected with said plate and having a series of progressively arranged stops, each succeeding stop lying in a higher plane than the preceding one, a spring actuated spreading finger adapted to engage one edge of the pack of cards arranged in said holder so that, when the carrier is turned on its pivotal support, the pack is carried along with said carrier through the medium of said finger to distribute the cards against the several stops of the separator and thus open the pack sufficient to display he character and value of each card, said spreading finger adapted to spring back and ride over each halted card so as to engage with the remaining cards of the pack, substantially as set forth.
2. A card holder and exhibitor comprising a back plate and a carrier pivotally supported thereto and in parallel relation therewith, a card separator on said plate having a series of stops for the cards, each stop lying in a higher plane than the preceding one, a resilient spreading finger adapted to engage one edge of the pack, springs having projections adapted to engage the face of the uppermost card of the pack to prevent displacement of the cards and also to effect the engagement of the cards with the stops, substantially as set forth.
3. The combination in a card holder and exhibitor of the character described, of a back supporting plate and a carrier pivotally supported thereto, means on said plate for halting and separating the cards, means, Including an arcua.e slot in said plate and a co-operating pin on said carrier for restricting the movement of the carrler with respect to the plate, a support for the lower end of the cards, substantjally as described and for the purpose set forth.

No. 101,772. Boiler Tube Cleaner. Nettoyeur de tube de chaudieres.

Albert Florian Krause and Charles C. Ladd, assignee of a half interest, both of Buffalo, New York, U.S.A., 30th October, 1906; 6 years. Filed 28th June, 1905 . Receipt No. 126,434.
Claim.-1. In a boiler cleaner the combination of a casing provided with a transverse fluid chamber having an end opening which extends through the side of the casing and forms a lateral exhaust port for the motive fluid, a piston arranged in said chamber, means for controlling the supply of the motive fluid to opposite sides of the piston, and a scale loosener actuated by the piston and arranged to pass through the side of the casing, substantially as set forth.
2. In a boiler tube cleaner the combination of a casing having a transverse fluid chamber provided with an internal abutment and an end opening which extends through the side of the casing and forms a lateral exhaust port for the motive fluid, a hollow shouldered piston arranged in said chamber, opening at its shouldered end into the chamber and closed at its opposite end. said piston having means for alternately connecting the interior thereof with the space between said abutment and the shoulder of the piston and with said lateral exhaust port, a supply passage arranged in th.? casing and communicating constantly with said space, and a scale loosener extending through the side of the casing and actuating by the piston, substantially as set forth.
3. In a boiler tube cleaner the combination of a casing having a fluid chamber provided with an opening in its end, a hollow piston reciprocating in said chamber, means for controlling the supply of the motive fluid to opposite sides of the piston, and a hammer rod carried by the piston and extending through the hollow body thereof and the end opening of the fluid chamber, substantially as set forth.
4. In a boiler tube cleaner the combination of a casing having a transverse fluid chamber provided with end openings extending through the sides of the casing, a piston arranged In said chamber, means for controlling the supply of the motive fluid to opposite sides of the piston, and a duplex hammar consisting of a rod carried by and extending through the piston and having its ends arranged in the end openings of the casing, substantially as set forth.
5. In a boiler tube cleaner the combination of a casing having a transverse fluid chamber provided with an internal abutment, said chamber being closed at one end and provided at its other end with an opening which extends through the side of the casing and forms a lateral exhaust port, a hollow shouldered piston reciprocating in said chamber, opening at its shouldered end into the chamber and closed at its opposite end by a head, said piston having an exhaust port arranged to connect its interior with the open ended portion of the fluid chamber and an inlet port connecting its interior with the space between said abutment and the shoulder of the piston a supply passage arranged in the casing and leading to said space, and a hammer rod carried by said piston head and extending through the hollow body of the piston and the closed end of the fluid chamber and separated from the piston walls by an intervening fluid passage, substantially as set forth.
6. In a boiler tube cleaner the combination of a head or casing having a fluid chamber, a piston arranged in said chamber and having a port arranged to connect the space in front of its shoulder with the portion of said chamber behind the piston, sald chamber having an internal annular groove arranged on the front side of said shoulder in all positions of the piston, a supply passage arranged in the casing and communicating directly and constantly with said groove, and a scale lonsener actuated by said piston, substantially as set forth.
7. In a boiler tube cleaner the combination of a casing having a fluid supply passage and centering chambers extending through sides of the casing and having enlarged inner portions which communicate with said passage, and centering plungers sliding in sald chambers and each provided with an cnlargement fitting the enlarged portion of the corresponding chamber, substantially as set forth.
8 . In a boiler cleaner the combination of a casing having a fluid supply passage and centering chambers extending through the sides of the casing, bushings arranged in the outer portions of said chambers, the inner portions of the chambers being of greater diameter than the bore of said hushings, and plungers arranged in said bushings and chambers and provided at their inner ends with enlargements adrepted to strike the corresponding ends of the bushings, substantially as set forth.
9. In a boller cleaner the combination of a head or casing having a main fluid chamber, radial fluid chambers arranged on the front and rear sides of said main chamber and a supply passage leading to said main chamber, said front chambers connecting with said main chamber and said rear chambers connecting with said supply passage, a piston arranged in said main chamber, means for controlling the admission of the motive fluid to opposite sides of the piston, a scale loosener actuated by the piston, and centering pins or plungers fitted in said radial chambers, substantially as set forth.
10. In a boiler tube cleaner the combination of a head or casing having a fluid supply passage and radial fluid chambers communicating with said passage. centering pins or plungers sliding in said chambers and adapted to project beyond said head and bear against a surrounding boller tube, cupped packing discs applied to the inner ends of said plungers, and means for limiting the outward movement of said plungers in their chambers. substantially as set forth.
11. In a boiler tube cleaner the combination of a head or casing having a transverse fluid chamber and radial fluld chambers arranged on the front and rear sides of said transverse chamber, a main supply passage leading to said transverse chamber and connected with the rear radial chambers, an auxiliary passage extending forwardly from said transverse chamber and connected with the front radial chambers, a piston reciprocating in said transverse chamber, means for controlling the supply of the motive fluid to opposite sides of the piston, a scale loosener actuated by said piston, and centering pins of plungers fitted in said radial chambers, substantially as set forth.
12. In a boiler tube cleaner the combination of a head or casing having a transverse fluid chamber provided with an internal annular groove or channel and radial fluid chambers arranged on the front side of said transverse chamber, a main supply passage leading to said groove, an auxiliary pssage leading from said groove to said radial chambers, a piston reciprocating in said transverse chamber, means for controlling the supply of motive fluid to opposite sides of the piston, a scale loosener actuated by the piston and centering pins or plungers fitted in said radial chambers. substantially as set forth.

\section*{No. 101,773. Excavator. Excavateur.}

John C. Junkin, Drayton, and John E. Countryman, Grafton, assignee of a half interest, both in North Dakota, U.S.A. 30th October, 1906; 6 years. Filed 19th July, 1906. Receipt No. 137,960.
Claim.-1. In a excavating apparatus, excavating devices arranged to move outwardly and upwardly in reverse directions from the center of the ditch.
2. In an excavating apparatus the combination with supporting and guiding means, of a pair of endless bucket equipped carriers arranged to travel in the excavating action, in reverse directions outwardly and upwardly from the center of the ditch, substantially as described.
3. In an excavating apparatus the combination with a vertically adjustable supporting frame, of an endless bucket equipped carrier mounted to move over guides on said trame, and means for driving said carrier, substantially as described.
4. In an excavating apparatus the combination with a vertically adjustable supporting frame, of a pair of endless bucket equipped carriers mounted to move over guides on said frame, said guides being arranged to cause sald carriers to travel in reverse directions outwardly and upwardly from
the center of the ditch, and means for driving said carriers, substantially as described.

5. In an excavating apparatus the combination with a wheeled platform support, and a vertically adjustable supporting frame, and means for imparting vertical adjustments to the latter, of a pair of endless bucket equipped carriers mounted to travel over rotary guides on said supporting frame, said guides being arranged to cause said carriers to travel in the excavating action, in reverse directions outwardly and upwardly from the center of the ditch, substantially as described.
6. In an excavating apparatus the combination with a counterbalanced vertically adjustable supporting frame, of excavating device mounted on said frame, substantially as described.
7. In an excavating apparatus the combination with a vertically adjustable supporting irame, of a pneumatic counterbalancing device operative thereon and excavating devices mounted on sald frame, substantially as described.
8. In an excavating apparatus the combination with a supporting platform, of a supporting frame vertically movable thereon, a pneumatic counterbalancing device operative on the latter, means operative at will for causing said frame to raise and lower, and excavating devices mounted on said supporting frame, substantially as described.
9. The combination with a vertically movable support, of a pneumatic counterbalancing device arranged to balance said support in an intermediate position, and power actuated means operative at will to force said support either upward or downward from its center counterbalanced intermediate position, substantially as described.
10. In an excavating apparatus the combination with a supporting platform and a counterbalanced vertically adcarrier mounted on said supporting frame. means for driving said carrier in different positions of said supporting frame and a variable speed feed device for lowering said frame to force the buckets to their work, substantially as described.
11. In an excavating apparatus the combination with a supporting platform and a countorbalanced vertically adjustable supporting frame mounted thercon. a bucket equipped carrier mounted on said supporting frame. means for driving said carrier under different adjustments of sald frame, a variable specd drive for moving said supporting frame downward to force said buckets to their work. and a relatively high speed feed device for imparting upward or return movements to said supporting frame, substantially as described.
12. In an excavating apparatus the combination with a supporting platform and a vertically adjustable supporting frame mounted thercon, a power driven bucket equipped carrier mounted on said frame and a device for counterbalancing said supporting frame comprising a pair of cylinders anchored to said platform and having co-operating pistons, connections between said pistons and sald supporting frame and an alr storage tank having a pipe connection leading to said tro cylinders, substantially as described.
13. In an excavator the combination with a bucket equipped carrier and supporting and driving means therefor, of a bucket cleaning scraper properly positioned to scrape or clean the buckets. substantially as described.
14. In an excavating apparatus the combination with an endless bucket equipped carrier and guiding and driving means therefor, of a fixed scraper in position to scrape and clean the buckets which are moved past the same, substantially as described.
15. In an excavating apparatus the combination with an endiess bucket equipped carrier and guiding means therefor,
of an approximately U-shaped scraper located in position for action on the interior of the buckets as the latter are moved past the same in the vicinity of the dumping point, substantially as describe.
16. In an excavating apparatus the combination with a bucket and a carrier therefor arranged to move the same from the filling to the dumping position, of a scraper arranged to pass through the interior portion of said bucket to clean the same at or in the vicinity of the dumping point, substantially as described.
17. In an excavating apparatus the combination with an endless power driven bucket carrjer and guiding device therefor including guide wheels located at the dumping point. buckets attached to said endless carrier, said buckets having their bottom portions formed on such lines that said bottoms extend approximately concentric to the axis of the said guide wheel when said bucket is at the dumping point. and a fixed scraper located in position to engage closely with the bottom of said buckets as the latter are moved in the vicinity of the dumping point, substantially as described.
10. In an excavating apparatus the combination with a pair of parallel laterally spaced endless power driven carriers and one or more buckets to the outer side portlon of which buckets said parallel carrlers are attached, sald bucket or buckets having at the side adjacent to the bank laterally offset lips or projections arranged to cut clearance for the adjacent endless carrier, substantially as described.
19. In an excavating apparatus the combination with a vertically adjustable supporting frame, of a fluid actuated counterbalancing device operative on said frame, substantially as described.
20. In an excavating apparatus the combination with a vertically adjustable supporting frame and excavating devices mounted thereon. of a counterbalancing device for sald adiustable frame actuated by an elastic fluid under pressure. substantially as described.

No. 101,774. Roller Cutter. Coupe-rouleau.

Harry E. Wilmoth and Eugene Watson, assignee of a third interest, both of Atchison, Kansas, U.S.A., 30th October, 1906. 6 years Filed 1st October 1906. Receipt No. 139,942.
Claim.-1. The combination of two rotary cutters provided with shearing edges, and co-operating surface ad. jacent said edges which simultaneously with the cutting operation draw the metal along the freshly cut edge there of, with means for supporting and rotating the cutters.
2. The combination of two rotatory cutters each provided with a shearing edge and a roll portion, the roll portion of one cutter being tapercd and adapted to co-operate with the roll portion of the other, to draw the metal along the freshly cut edge thereot with means for supporting and rotating the cutters.
No. 101,775. Production of Nitric Acid from Air. Production d'acide nitrique de l'air.
Salpetersäure Industrie Gesellschaft, Gesellschaft mit Bes chrankter Haftung. assignee of Arthur Paulding and Harry Paulding, Bismark, Westphalia. Prussia, Ge many, 30th October, 1906; 6 years. Filed 26th March 1904. Receipt No. 115,665.

Claim.-Process for the production of nitric acid or nitric oxide, characterized by air or another mixture of oxygen and nitrogen being heated to a very high temperature br any non-reducing source of heat and being cooled dow from this highly heated condition or chilled as suddenly as possible, substantially as described and shown and for the purpose set forth.

No. 101,776. Dust Removing Device.
Appareil à enlever la poussidre.

Emery I. Nichols, San Francisco, California, U.S.A., 30th October, 1906; 6 years . Filed 12th December, 1905. Receipt No. \(130,925\).
Claim.-1. A dust removing device, consisting of a steam generator having a water inlet pipe connected to the top of the generator, and a steam outlet pipe connected to the bottom of the generator, a steam ejector connected to the generator and discharging into or through the generator chamber, and a heating device located below the generator, substantially as set forth.
2. A dust removing device, consisting of a steam generaator having a water inlet pipe connected to the top of the generator, and a steam outlet pipe connected to the bottom of the generator, a steam ejector connected to the generator and discharging into or through the generator chamber, a water regulating device consisting of the water inlet pipe and valve stem therein being constructed of two different kinds of metal, one having a greater expansion when exposed to the action of heat than the other, and a heating device located below the generator, substantially as set forth.
3. A dust removing device, consisting of a steam generator formed of a series of holliow sections connected together and arranged one above another so as to form one continuous water and steam passage through the whole series of sections, from the water inlet at the top section, to the steam outlet at the bottom section, and adapted to prevent the water from flowing by gravitation through the series of sections, means for forcing water into the generator through the water inlet pipe connected to the top section, a steam ejector connected to the generator for creating a vacuum, and a heating device located below the generator, substantially as set forth.
4. A dust removing device, consisting of a steam generator formed with a series of hollow sections, connected together and arranged one above another, forming one continuous water and steam passage through the whole series of sections, a self-regulating water supply device, cousisting of the water inlet pipe being formed of a metal having a greater expansion than the valve stem contained therein, when the same is exposed to the action of heat, a suitably designed steam ejector connected to the generator for creating a vacuum, a heating device located below the generator, and means for discharging the dust and refuse into or through the generator chamber, substantially as set forth.
5. The combination of a steam generator provided with a flue for carrying ofir the products of the combustion by which the steam is generated, an ejector, an exhaust tube leading thereto, a tube leading from said generator to the nozzle of said ejector, and a plpe for conveying to said flue the matter discharged from said ejector, substantialiy as get forth.
6. The combination of a steam generator provided with a flue for carrying off the products of the combustion by which the steam is generated, a water regulating device consisting of a water inlet pipe and a valve stem therein constructed of two different metals, one having a greater expansion when exposed to the action of heat than the other, an ejector, an exhaust tube leading thereto. a tube leading from said generator to the nozzle of sald ejector, and a pipe for conveying to said flue the matter discharged from the ejector, substantially as set forth.

No. 101,777. Fnrnace. Fournaise.

Embury McLean, Brooklyn, New York, U.S.A., 30th October, 1906; 6 years. Filed 13th June, 1905. Receipt No. 126,018.

Claim.-1. In combination with a furnace, a blower, means for varying the supply of air to the furnace from such blower, means for varying the escape of gases from the furrace in quantities substantially corresponding to the quantities of air supplied to the furnace by the blower, whereby substantially uniform pressure in the furnace is maintained.
2. In combination with a furnace, a blower, means for varying the supply of air to the furnace from such blower, means for varying the exhaust of gases from the furnace in quantities substantlally corresponding to the quantities of air supplied by the blower, the parts being so proportioned and arranged that a substantially uniform atmospheric pressure is maintained in the furnace.
3. In combination with a furnace, a blower, means for varying the supply of air to the furnace from such blower in quantities graduated between the extremes, means for varying the escape of gases from the furnace in quantitios graduated between the extremes and substantially corresponding to the graduated quantities of air supplled to the furnace by the blower, whereby a substantially uniform pressure in the furnace is maintalned and the function of the furnace, such, for example, as the production of steam pressure, is maintained substantially constant.
4. In combination with a furnace, a blower, means for varying the supply of air to the furnace from said blower in quantities graduated between the extremes, means for varying the exhaust of gases from the furnace in quantities graduated between the extremes and substantially corresponding to the graduated quantities of air supplied to the furnace by the blower, the parts being so proportioned and arranged that a substantially uniform atmospheric pressure is maintained in the furnace and the function of the furnace, such, for example, as the production of steam pressure, is maintained substantially constant.
5. In combination with a furnace, a blower, means for varying the supply of air to the furnace from such blower in quantities graduated between the extremes, means for varying the escape of gases from the furnace in quantitios graduated between the extremes, and substantially corresponding to the graduated quantitles of air supplled to the furnace by the blower whereby a substantially uniform pressure in the furnace is maintained.
6. In combination with a furnace, a blower, means for varying the supply of air to the furnace from said blower it quantities graduated between the extremes, means for varying the exhaust of gases from the furnace in quantities graduated between the extremes and substantially corresponding to the graduated quantities of air supplied to the furnace by the blower, the parts being so proportioned and arranged that a substantially uniform atmospheric pressure is maintained in the furnace.
7. A furnace, a forced draft blower therefor, a blower engine, an outlet for products of combustion from the furnace, a damper controlling the outlet, and a steam boller heated by the furnace, combined with a damper motor and a steam regulating valve controlled by the steam pressure and connected on one side of the steam space of the boiler and on the other to both the blower engine and damper motor, the valve being constructed to automatically reduce the amount of steam passing through it correspondingly with
rise of steam pressure and to permit an increase of volume of steam passing through it correspondingly with a fall of boiler pressure, and the blower engine and damper motor both being so constructed as to respectively cause corresponding variation of speed of the blower and corresponding variations in the position of the damper, whereby a substantially uniform pressure in the fire chamber of the furnace and a substantially uniform pressure of steam in the boller may be maintained.
8. A furnace, a forced draft blower therefor, a blower engine. an outlet for products of combustion from the furnace, a damper controlling the outlet and a steam boller icated by the furnace, combined with a damper motor, and a steam regulating valve controlled by the steam pressure and connected on one side to the steam space of the boller and on the other to both the blower engine and the damper motor, the valve comprising a diaphragm and means for adjusting the tension, a passage for admitting steam from the boiler to one side of the diaphragm and a passage from the inlet side of the valve to the connection leading to the blower engine and damper motor, the construction and arrangement of the valve being such as to automatically reduce the amount of steam passing through it correspondingly with rise oi steam pressure and to permit increase of volume of steam passing through it correspondingly with a fall of boiler pressure, and the blower, engine and damper motor both being so constructed as to respectively cause corresponding variations of speed of the blower and corresponding variations in the position of the damper. whereby a substantially uniform pressure in the fire chamber of the furnace and a substintially uniform pressure of steam in the boiler may bo lieintained.
9. A furnace, a forced draft blower therefor, a blower engine, an outlet for products of combustion from the furnace, a damper controlling the outlet and a steam boiler heated by the furnace, combined with a motor for the damper adapted to be operated or controlled by steam pressure in a direction to open the damper, and means opposing such actuation of the motor and tending to hold the damper in closed position and acting co-operatively with the motor to cause the damper to assume positions corresponding with the pressure of steam acting on the motor, and a steam regulating valve connected on one side to the boiler and on the other side to both the damper motor and blower engine, said valve being constructed and arranged to reduce the volume of steam passing therethrough when the pressure of steam in the boller rises above normal and to increase it when the boiler pressure falls below normal for the purposes set forth.

No. 101,778. Gate. Barrière.

Isaac Newton Merritt, Grassies Corners, Ontario, Canada, 30th October, 1906; 6 years. Filed 30th August, 1906. Receipt No. 139,111.
Claim.-1. In a lift and drop gate, a post, a gate having a lower end pivotally connected to the post and adapted to be lifted upward, a segmental bar on the gate at equal distance from the pivot, a guide on the post to receive the bar, means connecting the opposite end of the gate and the post and extendirg besond the post to lift the gate and and extending bijonc the post to bring the gate to closed means conuectini: rhe pivotal end of the gate and the post position.
2. A gate way comprising posts a distance apart and opposite to each other, gates having their lower and opposite ends pivotally connected to the posts and in line with each other, and adapted to be lifted upward and away from each
other, segmental bars on the gates at equal distance from their respective gates, pivots, guides on the post to receive the bars, means connecting the inner and adjoining ends of the gates and the posts, and extending beyoud the posts to open the gates, means connecting the pirotal ends of the gates and the posts and extending beyond the posts to close the gates, means on one said gate to lock the gates together, and means on the ground to support and lock the adjoining ends of the gates.

\section*{No. 101,779. Gate for Wire Fences.} Barrière pour clotures de al de fer.

Roy Hamilton Singer, Uniontown, Maryland, U.S.A., 30th October, 1906 ; 6 years. Filed 4th September, 1906. Receipt No. 139,258 .
Claim.-1. The combination with opposing fence posts and screw eyes set thereln, of wires attached to one set of the screw eyes and lever clamps secured to the other ends of the wires and consisting of curved bars having their free ends provided with lateral claws for engaging the wires and their opposite ends with openings for attachment of the wires, and with a contlguous hook or notch, the same being located out of lateral alignment with the opening and clav as shown and described.
2. The improved closure for passageways in fences comprising a series of wires, a series of screw eyes to which the series are permanently attached at one end, lever clamps secured to the other ends of the wires and having a hook and an end claw which are disaligned with the point of sttachment of the wire as described, and another series of screw eyes adapted for engagement with the clamps in the nanner described.

No. 101,780. Wire Fence Tie.
Attache de cloture de fil de for.

John McCawly Gilmer, Montpelier, Ohio, U.S.A., 30th October, 1906 ; 6 years. Filed 5th September, 1906. Recelpt No. 139,277.
Claim.-1. A wire fence tie consisting of a portion of wire bent in substantially circular form and engaging the fence wires near the crossing of the same and at the sides of the said wire opposite the sides thereof which contact each other, said tie also having its ends bent around itsell and terminating within the plane of the fence wires.
2. In combination with the crossed wires of a fence, \(a\) wire fence tie consisting of a portion of wire bent in a closed circuit and having its ends wound partially around itself in opposite directions and terminating in the plane of the said fence wires.

\section*{No. 101,781. Fence Post. Pôteau de clotures.}

Clement J. B. Moore, Calistoga, California, U.S.A:, 30th October, 1906 ; 6 years. Filed 23rd July, 1906. Receipt No. \(138,082\).
Claim.-A fence post comprising a right angular or Lshaped post, a squared base provided on its under face with a depending spiral-shaped anchor, the base being of a sufficlent height to provide a marginal recess on two of its sides which extends downwardly into the base and part of the way therethrough, said recess conforming to the configuration of the post, and said post having one end detachably mounted in the recess so that its end surface will contact or rest on the bottom of the recess and be wholly within sald base, substantially as specified.

\section*{No. 101,782. Fence Post. Pôteau de cloture.}

Daniel Rupert Parker, Chelsea, Massachusetts, U.S.A., 30th October, 1906 ; 6 years. Flled 26th September, 1906. Receipt No. 139,806.
Claim.-1. A fence post comprising a concrete base, and a metallic upright having its lower portion embedded in said base, and its upper portion provided with wire engaging members inserted in orifices in the upright, each member having at one end a screw thread and a nut engaged therewith and adapted to bear on one side of the upright, and at its opposite end a head or hook adapted to engage a fence wire, and to hold the same against the opposite side of
the upright.
2. A fence post comprising a concrete base, and a metallic upright composed of a metal strip bent to form two diverging legs or members, the lower ends of which are embedded in said base, the said upright being provided with adjustable wire engaging members.
3. A fence post comprising a concrete base, a metallic upright composed of a metal strip bent to form two diverging legs or members, the lower ends of which are embedded in said base, and adjustable wire engaging members secured to one of said legs.
4. A fence post comprising a concrete base, a metallic upright composed of a metal strip bent to form two diverging legs or members, the lower ends of which are embedded in said base, the said upright being provided with adjustable wire engaging members, and one or more cross bars or braces connecting the legs above the base.

No. 101,783. Fence Post. Pôteau de clôture.
Hugh C. Youngs, Attica, Michigan, U.S.A., 30th October, 1906; 6 years. Filed 10th September, 1906. Recelpt No. 139,371.
10-36

Claim.-A fence post having a retalning member embedded therein and comprising a pair of co-operating sections, one of said sections being corrugated to form transverse openings and the other having its inner edge folded to form a

channel and engaging members adapted for entrance through the openings and to engage at their inner ends within the channel.

No. 101,784. Structural Metal Bar.
Barre de métal pour construction.

Carl Weber, Chicago, Illinois, U.S.A.: 30th October, 1906; 6 years. Filed 27 th September, 1906 . Receipt No. 139,858. Claim.-1. As a new article of manufacture, a relnforcing bar for metal concrete construction consisting of a metal bar having longitudinal wings with spaces between adjacent wings concavely curved in cross section and longitudinal recesses at intervals in opposite wings having their bases expanded laterally and forming abrupt end shoulders projecting beyond the adjacent surfaces of the unrecessed portions of the wings in which said recesses are formed.
2. As a new article of ma ufacture, a reinforcing bar for metal concrete construction consisting of a metal var, fourwinged in cross section having recesses at intervals in opposite wings and the bases of said recesses expanded laterally and forming end shoulders, for the purpose set forth.

\section*{No. 101,785. Turbine Pump. Pompe d turbine.}

Frederick Wilson Gordon, Philadelphia, Pennsylvania, and Alexander Gordon, assignee of half of the interest, Ashbury Park, New Jersey, U.S.A., 30th October, 1906; 6 years. Filed 29th May, 1906. Receipt No. 136,362.
Claim.-1. The combination with a casing, of a pair of shafts, one mounted within the other journalled in said casing a series of independent carriers rigid with one of the shafts and each having blades, the blades of one carrier differing in spacing from those of anather carrier, and a series of carriers rigld with the other shaft, alternating with the first series and having blades, the spacing of one set of which is different from that of another set.

2. A turbine comprising a casing, means for supplying fluid thereto, sets of connected carriers, each carrier having a series of parabolic blades, the delivery ends of which lie in planes substantially parallel to the axis of the carrier and mechanisms for driving one set of carriers in one direction and the other set of carriers in an opposite direction.
3. A turbine comprising a casing, a carrier having blades of parabolic form, the delivery ends of which lie in planes substantially parallel to the axis of the carrier, means for rotating said carrier in one direction, a second carrier also having blades of parabolic form the delivery ends of which lie in planes substantially parallel to its axis, and means for rotating sald second carrier in a direction opposite to that of the first carrier.
4. In a turbine the combination with connected carriers each having blades of parabolic form and the delivery ends of which are substantially parallel to the axis of the carrier, of connected carriers each also having blades of parabolic form and the delivery ends of which are substantially parallel to the axis of the carrier, means for independently rotating one set of carriers in one direction, and means for independently rotating the other set of carriers in a direction opposite to that of the first set
5. The combination with a casing. of a carrier having blades of parabolic form the delivery ends of which are nearly parallel to its axis, a second carrier arranged in close proximity to the first carrier and also having blades of parabolis form the delivery ends of which are nearly parallel to its axis, sald blades being so disposed that they will enter the fluid delivered from the first set of blades without shock or blow at an angle different from that at which it was entered by said first set of blades, and means for rotating the carrlers in opposite directions.
6. The combination with a carricr having blades of parabolic form the dellvery ends of which are nearly parallel to its axis, said blades entering fluid at a certain angle, of a second carrier having blades of parabolic form, the delivery ends of which are nearly parallel to its axis and which enter fluid at an angle different from that of the blades of the other carrier;, and means for rotating the carriers in opposite directions.
7. The combination with a rotary carrier having parabolic blades, of a second oppositely rotatable carrier having parabolic blades differently spaced apart and of different height from those of the first carrier.
8. The combination with a primary carrier having parabolic blades, of means for rotating said carrier, a second carrier having parabolic blades differing in spacing, in number and In height from the blades of the primary carrier, and means for rotating said second carrier in a direction opposite to that of the primary carrier.
0. The combination with a primary carrier having parabolic blades, of means for rotating said carrier, a second carrier having parabolic blades differing in spacing. in number and in heighth from the blades of the primary carrier, and means for rotating said second carriage in a direction opposite to that of the primary carrier.

\section*{No. 101,786. Procens of Recovering Turpentine.} Procédé pour obtenir de la térébentine.
R. H. Durward Benn, Montreal, Quebec, Canada, 30th October, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,670.
Claim.-1. The herein described process of distilling wood which consists in subjecting the wood to the action of live steam until the heavier oils begin to distill, and then shut-
ting off the live steam and introducing superheated steam to complete the distillation of the heavy oils, substantially as

2.The herein described process of distilling wopd which consists in subjecting the wood to the action of live steam introduced in the form of a plurality of flne jets until the heavier oils begin to come off, then shutting off the supply of live steam and introducing superheated steam in the same manner until the distillation of the heavy olls is effected, substantially as described.
3. The herein described process of distllling wood which consists in heating the wood until the turpentine and heary oils have all distilled, then transferring the mass of partially distilled wood to a second retort and there completing the distillation, substantially as described.
4. The hercin described process of treating wood which consists in partially distilling the wood in one retort and completing the distillation in another retort, substantially as described.
5. The herein described process of distilling wood which consists in partially distilling the wood in an internally heated retort, then transferring it to an externally heater retort and completing the distillation, substantially as described.
6. The herein described process of distilling wood which consists in subjecting the wood to the action of live steam until the heavier oils begin to distill, then shutting of the live steam and introducing superheated steam untll the hearier oils are distilled, then transferring the mass of partially distilled wood to a second retort and there completing the distillation. substantially as described.
7. The herein described process of distilling wood which consists in subjecting the wood in a closed retort to the action of live steam introduced through the perforated pipes extending through the interior of the retort until the heavier oils begin to distill, then shutting off the live steam and introducing superheated steam until the distillation of the heavy oils is effected, then transferring the partially distilled mass of wood to an externally heated retort and then completing the distillation in the second retort, substantially as described.
8. The herein described precess of distilling wood which consists in distilling the wood for a predetermined period of time by internal heating and then completing the distillation by external heating, substantially as described.
9. The herein described process of distilling wood which consists in subjecting the wood to the action of live stean distributed through the midst thereof for a predetermined period of time and then subjecting the wood to the action of superheated steam in a similar manner for a second period of time, substantially as described.
10. The herein described process of distilling wood which consists in subjecting the wood for a predetermined period of time to the action of live steam then subjecting it for a second period of time to the action of superheated steam and then completing the distillation by external heating. substantially as described.

\section*{No. 101,787. Brick Making Machine. Machine à faire de la brique.}

Christian J. Boos, Jackson, Michigan, U.S.A., 30th October, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,176.
Claim.-1. A brick making machine, comprising a mould constructed and arranged for a vertical, step-by-step. swinging movement into inverted position.
2. A brick making machine, comprising a frame, a mould mounted for swinging movement within the frame, and a double facing member associated with the mould, and means constructed and arranged to present the double facing member with respect to the completed bricks to prevent accidental displacement of the latter when the mould is swung from over the bricks.
3. A brick making machine, comprising a mould composed of separable parts, means constructed and arranged where-
by the mould may be swung upon a horizontal axis, and means carried by the mould to prevent upsetting of the bricks when discharged from the mould.

4. A brick machine comprising a frame, a mould mounted for swinging movement within the frame, the mould including a double facing member, and means constructed and arranged whereby the double facing member may be separated from the mould when the latter is swung from over the completed bricks.
5. A brick making machine, comprising a frame, a pallet board support mounted upon the frame, a mould having each side provided with a slot, a pallet board for disposition upon the top of the mould, a lever mounted for projection through each of said slots to detachably secure the pallet board against displacement, and means constructed and arranged whereby the mould may be swung vertically to inverted position upon the pallet board support to permit of the removal of the completed bricks from the mould.
6. A brick making machine comprising a swinging mould, a pallet board detachably associated with the mould, and a double facing member mounted for swinging movement with the mould, and also independently thereof.
7. A brick making machine, comprising a swinging mould. a pallet board detachably mounted upon the mould, and a series of double facing members mounted for swinging movement with the mould. and also independently thereof.
8. A brick making machine comprising a swinging mould, and a double facing member mounted for swinging movement with the said mould and also indenendently thereof.
9. A brick making machine, including a swinging mould. and a series of double facing members mounted for swinging movement with the mould and also independently thereof.
10. A brick making machine comprising a mould having cach side provided with a slot and a pair of ears adjacent each slot, a pallet board, and a lever pivotally mounted in each pair of said ears for projection through the corresponding slot to detachably secure the pallet board in place.
11. A brick making machine comprising a mould having three of its facing members movable independently thereof. two of said members being formed of a single plece of material.
12. A swinging mould of the character described, including separable facing members, two of the facing members being formed of a single piece of material.
13. In a device of the class described, a mould including separable facing members, two of the facing members being formed of a single plece of material of substantially Z-formation.
14. In a device of the class described, a mould including a substantially Z-shaped facing member.
15. In a device of the class described, a mould including a series of substantially Z-shaped facing members.
16. A mould of the class described, ipcluding division plates, a hinged back facing plate, a series of combined front and bottom facing plates, and a removable pallet board.
17. In a device of the class described, a mould, including division plates, a hinged back plate, a combined front and bottom facing member, and a removable pallet board.
18. A brick making machine, comprising a swinging mould, means whereby the mould may be turned to an inverted position, and double facing members associated with the mould to prevent accidental displacement of the bricks when the mould is swung from over the bricks.
19. A brick making machine comprising a swinging mould of separable parts, and means constructed and arranged
whereby the mould may be swung to an inverted position, parts of the mould preventing displacement of the bricks when the mould is swung backwardly from over the bricks.
20. A brick making machine comprising a swinging mould including separable facing plates, two of the facing plates being formed of a single piece of material, means for swinging the mould into an inverted position, and means constructed and arranged whereby the double facing plates may prevent displacement of the bricks when the mould is swung backwardly.
21. A brick making machine comprising a swinging mould composed of separable facing member, means whereby the mould may be swung to an inverted position, and means whereby some of the facing members will prevent accidental displacement of the bricks when the mould is swung from over the bricks, the latter facing members being of substantially Z-formation.
22. A brick making machine comprising a swinging mould composed of separable parts. means constructed and arranged whereby a part of the mould may be separated from other parts thereof when the mould is swung from over the bricks to prevent upsetting of the discharged bricks.
23. A brick making machine comprising a swinging mould composed of separable facing members, a part of the mould preventing accidental displacement of the bricks when discharged from the mould.
24. A brick making machine comprising a mould constructed and arranged for vertical swinging movement, and means to prevent accidental displacement of the bricks when discharged from the mould.
25. A brick making machine comprising a mould constructed and arranged for vertical swinging movement into inverted position, a part of the mould preventing accidental displacement of the bricks when the mould is swung to its normal nosition.
26. A brick making machine including a combined tilting and swinging mould.
27. A brick making machine including a combined vertically tilting and swinging mould.
28. A brick making machine including a combined tilting and swinging mould composed of separable parts.
29. A brick making machine comnrising a combined tilting and swinging mould including means to prevent accidental disnlacement of the bricks when discharged from the mould.
30. A brick making machine comprising a mould movable about two separate and distinct axes. and means carried by the mould to prevent accidental displacement of the bricks when dierharged from the mould.
31. A brick machine comprising \(\Omega\) mould movabic about two senarate axes, and means carried bv the mould to prevent accidental displacement of the bricks when discharged from the mould.
32. A brick making machine comprising a mould movable abont two senarate axes and including means to prevent accldental displacement of the bricks when discharged from the mould.
33. A brick making machine including a combined tilting and swinging mould, both movements thereof being in the same dircetion.
34. A hrick making machine including a mould provided with a shiftable fulcrum olement.
35. A brick making machine including a mould provided upon opposite parts with diagonally opposite fulcrum members.
36. A brick making machine including a mould provided upon opnosite parts with diagonally opposite fulcrum memhers. and a support provided with bearing notches for cooperation with said fulcrums.
37. A brick making machine including a mould provided With fulcrum members, a support nrovided with bearing notches for co-operation with sald fulcrum members, and means carried bv the mould to prevent accidental displacement of the bricks when discharged from the mould.
38. A brick making machine including a swinging mould provided with separable facing members, one of sald facing members being arranged to swing with the mould and also indeyendently thereof.
39. A brick making machine lncluding a swinging mould having one element thereof movable independently of the mould during movement of the latter.

\section*{No. 101,788. Stock Car. Char d bétail.}

Rose Ellis, Creston, Iowa, administratrix of the estate of William F. Ellis, deceased, 30th October, 1906; 6 years. Flled 13th December, 1905. Recelpt No. 130,952.
Claim.-1. An attachment for stock cars consisting of supporting plates lavinis means for protruding the same into the interior of the car to support the intermediate deck or flour ariu for withcrawing them when said floor is rem. \(\%\) d
2. An attachment for stock cars consisting of supporting plates having means for protruding the same into the in-

terior of the car to support an intermediate deck or floor and for withdrawing them into the spaces within the framework when said floor is removed.
3. An attachment for stock cars consisting of supporting plates having means for protruding the same into the interlor of the car to support an intermediate deck or floor and for withdrawing them when said floor is removed, and means operative from the exterior of the car for actuating the plates.
4. An attachment for stock cars consisting of supporting plates having means for protruding the same into the interior of the car to support an intermediate deck or floor and for withdrawing them when said floor is removed, rods having means for rotative connection to the car, and connecting means between the plates and rods whereby the rotation of the rods will actuate the plates.
5. An attachment for stock cars consisting of supporting plates having means for protruding the same into the interior of the car to support an intermediate deck or floor and for withdrawing them when said floor is removed, rods having means for rotative connection to the car, connecting means between the plates and rods whereby the rotation of the rods will actuate the plates, and means for detachably supporting said rods with the plates in their withdrawn position.
6. The combination with a stock car, of supporting plates having means for protruding the same into the interior of the car to support an intermediate detachable deck or floor and withdrawing them when the intermediate deck or floor is removed.
7. The combination with a stock car, of supporting plates for protruding into the interior of the car to support an intermediate deck or floor and for withdrawal into the spaces within the framework when the intermediate floor is removed.
8. The combination with a stock car, of supporting plates for protruding into the interior of the car to support an intermtdiate deck or floor and for withdrawal into the spaces within the framework when the intermediate fioor is moved and means operative from the exterior of the car for actuating the plates.
9. The combination with a stock car, of supporting plates for protruding into the interior of the car to support an intermediate deck or floor and for withdrawal into the spaces within the framework when the intermediate floor is removed, rods mounted for rotation upon the car, and connecting means between the plates and rods whereby the rotation of the rods will actuate the plates.
10. The combination with a stock car, of supporting plates for protruding into the interior of the car to support an intermediate deck or floor and for withdrawal into the spaces within the eramework when the intermediate floor Is removed. rods mounted for rotation upon the car, connecting means between the plates, and rods whereby the rotation of the rods will actuate the plates, and locking means for sustaining sald rods in their withdrawn position.
11. The combination with a stock car having as an element of its construction side walls formed of spaced longitudinal slats, of supporting plates for protruding into the interior of the car and sustained when thus protruded by said slats, for supporting an intermediate deck or floor, and for withdrawal when the intermediate deck or floor is withdrawn.
12. The combination with a stock car having as an element of its construction side walls formed of spaced vertical stanchions and spaced longitudinal slats, of supporting plates for protrusion into the interior of the car for supporting an intermediate deck or floor, said supporting plates having spaced recesses corresponding to the spaced side members for engagement thereby to permit said plates to be withdrawn into the spaces within the framework when the intermediate deck sections are removed.
13. The combination with a stock car, of supporting plates having means for protruding the same into the interior of the car and for withdrawing the same when not required, and an intermediate deck section for extension across the doorway opening and of greater width than the same for supporting upon sald plates, said deck section having lateral projections for extension into the doorway openings.
14. The combination with a stock car, of supporting plates having means for protruding the same into the interior of the car and for withdrawing the same when not required. and an Intermediate deck section for extension across the doorway opening and of greater width than the same for supporting upon said plates. said deck section having lateral projections for extension into the doorway openings. and reinforcing stay plates extending beneath its ends and resting with the deck section upon sald supporting plates. 15. The combination with a stock car, of supporting plates having means for protruding the same into the interior of the car and withdrawing them when not required, and an intermediate deck for support upon said plates when protruded formed of a plurality of detachable sections placed side by side throughout the Interior of the car.
16. The combination with a stock car of supporting plates mounted to swing into the interior of the car to support an intermediate deck or floor, and having means for withdrawing the plates when the deck or floor is removed.
17. The combination with a stock car of supporting plates mounted to swing into the interior of the car to support an intermediate deck or floor, and means for withdrawing the the plates when the deck or floor is removed and latera! srut-off plates carrled by sald supporting plates to fill the gaps in the car through which the supporting plates work when the supporting plates are projected into the car.
18. The combination with a stock car of supporting plates nounted to swing into the interior of the car to support an irtermndiate deck or floor, means for withdrawing the plates when the deck or floor is removed, and lateral shut-off plates integral with the supporting plates for filling the gans in the sides of the car through which said supporting plates work when the supporting plates are projected into the rar.
19. The combination with a stock car of supporting plates for protruding into the interior of the car to support an iritermeriate deck or floor, means within the frame work when the intermediate floor is removed, rods mounted for rctation upon the car frame, and means for connecting the supporting plates to the rods.
20. The combination with a stock car having as an element of its construction side walls formed of spaced vertical stanchions and diagonal brace stanchions, swinging supporting plates for protrusjon into the interior of the car for supporting an intermediate deck or floor, means for willing drawing the plates when not required, sald supporting flates having spaced recesses corresponding to sald spaced side members for engagement whereby when the plates are withdrawn. and lateral shut-off plates carried by said supporting plates to fill the gaps between the frame members.
21. The combination with a stock car having as an element of its construction spaced vertical stanchions and longitudinal slats forming its side walls, of movable support. ing plates for protrusion into the interior of the car and supported when thus protruded by said longitudinal slats, said plates for supporting intermediate deck or floor sections, and reinforcing checks beneath said plate supporting slats.
22. The combination with a stock car of supporting plates for protruding into the interior of the car to support intermediate deck or floor and for withdrawal into the spaces \(\begin{gathered}\text { rith- }\end{gathered}\) ir. the framework when the intermediate floor is remored. rods mounted for rotation upon the car, connecting means between the plates and rods whereby the rotation of the rods will actuate the plates, said rods having cranks upon their free ends, and slidable bolts extending into the paths of said cranks to detachably engage the same to maintain said plates in withdrawn position.

\section*{No. 101,789. Preparation of Oxygen.} Préparation d'oxigène.
George Francois Jaubert, Paris, France, 30th October, 1906 ; 6 years. Filed 24th November, 1905. Receipt No. 130,380. Claim.-The process for preparing oxygen or gases rich in oxygen, which consists in kindling and burning in a closed vessel a mixture of combustible material and of a large excess of perchlorate or nitrate of potash, and if desired of inert matcrials serving to moderate the decomposition, said mixture being brought in the form of cartridges, blocks, agglomerates, or the like.

No. 101,790. Shock Loader. Monte-gerbes.

Soren M. Nelson and Nicls Neilsen, co-inventors, both of Marietta, Minnesota, U.S.A., 30th October, 1906; 6 years. Filed 19th September, 1906. Receipt No. 139,625.
daim.-1. The combination with a wheeled frame provided with a hopper, of a fork pivotally supported on sald frame and having teeth or tines adapted to rest and slide upon the ground and pick up the shocks of grain or corn thereon, and mechanism within control of the operator for lifting said pivoted fork to discharge the shock gathered up thereby into said hopper.
2. The combination with a wheeled frame provided with a hopper or receptacle, of a fork pivoted on said frame near said hopper and having teeth or tines adapted to rest and sllde upon the ground and pick up the bundles or shocks of grain or corn thereon, mechanism within control of the operator for lifting said fork to discharge the shock into said hopper, and a carrier arranged to gather up the bundles it sald hopper and dellver them at the side of the machine, substantially as described.
3. The combination with a wheeled frame provided with a hopper, of a plvoted fork adapted to rest and slide upon the ground, an inclined plate arranged in said hopper and whereon the bundles of grain are discharged from said fork, mechanism for tilting said fork, and a carrier arranged to recelve the bundles from said plate.
4. The combination with a wheeled frame having a shock receptacle, of a fork pivoted on said frame and having teeth to rest and slide upon the ground, a hinged plate arranged in sald hopper, means for imparting a jarring or lolting movement to sald plate, and a transversely operating carrier arranged to receive the bundles from said plate, substantially as described.
5. The combination with a wheeled irame having a hopper rear its forward end, of a fork pivotally supported on the lorward wall of said hopper and having teeth that rest and slide upon the ground, mechanism for raising said fork to allow the shocks gathered up thereby to be discharged into said hopper, an inclined plate provided in sald hopper and whereon the bundles fall from said fork, means for imparting a jarring or jolting action to sald plate, and a carrier pivotally supporied at its lower end in said hopper and arranged to receive the bundles from said plate and deliver them at the side of the machine.
6. The combination with a wheeled irame provided near its forward end with a transversely arranged hopper, of a fork pivoted on the forward wall of said hopper and having teeth that rest and slide upon the ground, a drum loosely mounted on the rear axle. a standard mounted on sald frame and having a pulley, a cable attached to said drum and passing over said pulley to said fork, and a clutch mechanism within control of the operator for temporarily locking said drum on said axle and a carrier operating in the bottom of said hopper and arranged to receive the bundles of grain or eorn and deliver them at the side of the machine.
7. The combination with a wheeled frame and a hopper, of a tilting fork arranged in front of said hopper and having teeth adapted to pick up shocks of grain or corn and mechanism for raising said fork to discharge the gathered shock into said hopper.
8. The combination with a frame and hopper, of a tilting fork arranged to pick up shocks of grain or corn from the eround, mechanism for tilting said fork to ralse a shock and discharge it into sald hopper and a carrier or elevator operating in comnecton with said hopper.
9. The combination with a wheeled frame provided with a shock receptacle, of a fork having teeth adapted to pick up shocks of grain or corn, a vibrating plate provided in said receptacle and a carrier or elevator operating in connection with said receptacle.
10. The combination with a wheeled frame provided with a hopper having a removable floor or plate, of a pivoted fork arranged to pick up shocks of grain or corn. means for tilting sald fork to discharge its load into said hopper and a carrier or elevator operating in sald hopper.
11. The combination with a wheeled frame having a drop portion near its forward end and a hopper carried thereby. the bottom of said hopper being below the rear of said frame, a forked hinged near the forward wall of sald hopper and having teeth adapted to pick up shocks of grain or corn, a side delivery elevator operating in sald hopper, and means for tilting sald fork.
12. The combination with a frame, of a side delivery carrier or elevator mounted thereon, a fork pivoted in front of said elevator and having teeth adapted to slide upon the ground and pick up shocks of grain or corn, a vibrating bundle support provided near said elevator and mechanlsm for raising said fork to discharge its load upon sald support, subtantially as described.
13. The combination with a frame. of a side delivery elevain or carrier thereon, a fork hinged in front of said elevator and having teeth adapted to pick un shocks of grain or corn. an unright standard monnted on said frame in the rear of said elevator and provided at its upper end with an anti-friction wheel, a cable attached to said fork and passing over said wheel and mechanism for winding up said cable to ralse said fork.
14. The combination with a wheeled frame and hopper, of a. side delivery carrier or elevator operating therein, a fork hinged near the forward wall of said hopper, mechanism for driving said carrier continuously from the wheel axle and merhanism for intermittently raising said fork to discharge ils contents.
15. The combination with a wheeled frame and a shock receptacle, of a vibrating bundle support provided in said receptacle, a carrier or elevator operating near said support, and means for delivering shocks of grain or corn to said support, substantially as described.

No. 101,791. Tead Pencil. Crayon de mine de plomb.

Edward Penkala, 15 Franz-Josef Platz, Acram, Kroatien Hungary, 30th October, 1906 ; 6 years. Filed 29th May, 1906. Receipt No. 136,382 .

Claim.-1. In a lead pencil the combination of a holder having a boring therein, a tube having a boring therethrough and adapted to slide with friction in the holder, a lead within the tube, and means for retaining the lead stationary therein, substantially as set forth.
2. In a lead pencil the combination of a holder having a boring therein, a tube having a boring therethrough and adapted to slide with iriction in the holder, a lead within the tube and a rigid member inserted in said holder boring and extending from the top wall thereof into the said tube
gaging the upper end of said lead, substantially as set orth 3. In a lead pencil the raving a boring therethrough and boring thercin, a tube havion in the holder, a lead within the dapted to slide with iriction within said holder boring and abe. and a wire contained with and extending downwardly abutting the upper wall in the said tube and enga
substantially a Wire Stretcher. Tendeur de fl.
No. 101,792. Wire Stretcher. Tendeur de fl.

Henry Waller, Binscarth, Manitoba, Canada, 30th October, 1906; 6 years. Filed 25th June, 1906. Receipt No 137,246.
Claim.-1. The herein described wire stretcher comprising a lever, a fulcrum bar on one side and at one end thereof and comprising a laterally inclined portion and an incurved portion bent therefrom to provide a concave recess to receive a post, the ends of said fulcrum bar being secured to said lever, a link connected to the lever, a chain attached to said link and a wire engaging hook attached to said chain and having a \(V\)-shaped gripping notch, substantially as described.
2. A wire stretcher comprising a lever, a segmental fulcrum plate or bar connected to one end of said lever and projecting laterally from one side of the same, a brace bar connected to said fulcrum bar, a wire engaging hook having a V-shaped gripping notch, a link to engage said lever, means to hold said link in place and a flexible connection to attach said hook to said link, substantially as described.

\section*{No. 101,793. Cooler for Beer, Etc.}

Refrigérant pour la bière, etc.

Edward Neely. Chicago, Illinois, U.S.A., 30th October, 1906; 6 years. Filed 9th July, 1906. Recelpt No. 137,651.
Claim.-1. In a device of the class described the combination with the cabinet having the top portion and the bot-
tom portion of the coil chamber forming the front of of the cabinet, a member removable from the of the top cobinet to give access to the coil chamber for top of the the coil chamber and connected supported in the frot, a supply pipe extending adjacted to one end of the front of supply pipe extending adjacent to the chamof the coil, a other end of the coll emerges therefrom and where the \({ }^{2}\) connections between the pipe and the end and detachable elements being so constructed and arrend of the coil, the connections are detached the coll chamber that when the faucet in place can be removed bodily fror with its coll and
2. In a device of the class dodily from the cabinet.
the cabinet having the top portion the combination with of the coil chamber forming the fon and the bottom portion inet, a member removable the front of the top of the cabgive access to the coil from the ton of the cabinet to coil rhamber, a faucet supported in the it. a coil in the chamber and connected to one end of the front of the coll extending adjacent to the one end of the coil. a supply pipe the coll emerges the the chamber where the other end of the pine and therefrom. detachable connectlons between sncuring the chamber in place the elements being so constructed and arranged that when the connections are de. tached the coil chamber with its coll and faucet in place can be removed hodily from the cabinet.
3. In a device of the class described the combination with a cabinct having the ton portion and the wider bottom portion, the top portion being over the rear of the bottom portinn of the coll chamber forming the front of the top of the cabinet and fllling the top nortion above the rear of the bottom nortion. a member removable from the ton of the cabinet to give access to the coll rhamber for icing it, a coll in the coil chamber. a fancet supnorted in the front of the chamber and connected to one end of the coil. a supply pipe extending adjacent to the chamber where the other end of the coll omerges therefrom. detachable connections between the pipe and the end of the coil and a drip non adapted to fit between the coil chamber and the front of the ton of the hottom portion of the cabinet to secure the cooling chamber in nlace, the elements beine so constructed and spranged that when the connections are detached and the drip dan romoved the coll chamhar with itc coll and faucet in place can he removed hodily from the eabinet.
4. In a device of the class described the combination with the cabinct having the tob portion and the widor bottom nortion, the ton nortion beine over the rear of the bottom nortinn of the roil chamber forming the front of the tnn in the chest and filling the ton nortion above the rear of the bottom portion and supported by the horizontal edges of the cabinet. a member removable from the ton of the cablaet to rive acenss to the coil chamber for icing it. a coil in the coll chamber, a faucet supported in the front of the chamber. nnd connected to one end of the coil. a sumply nipe exten. ing adiacent to the chamher where the other end of the peil emerges therefrom and detachable connections between the nine and the end of the coll. the elements heing so conatran ted and arranged that when the connestione are detachin the coil chamber with ita roil and fauret in nlace ran be forwned on the cabinet and remarai hodilv therefrom.
5. In a device of the class described the combination with the cabinct having the top portion and the bottom portion, the top portion being over the rear of the bottom nortion and adapted to extend partly beneath a bar. of the coil chamber forming the front of the top of the cabinet and flling the ton portion above the rear of the bottom portion. the grain plate resting on the top of the nortinn of lo cabinet not extending beneath the bar and removable to ice the coil chamber, a coll in the coll chamber. a faucet suoported in the front of the chamber and connected to one end of the coll. a supply pipe extending adiacent to the chamber where the other end of the coil emerges therefrom and detachable connections between the pipe and the end of the coil, the elements being so constructed and arranRed that when the connections are detached the coll cham from with its coil and faucet in olace can be
beneath the bar and out of the cabinet.
6. In a device of the class described the combination \(\begin{aligned} & \text { rith }\end{aligned}\)
6. In a device of the class described the combination rita the the top portion and the bottom portion and adapted to extend partly beneath a bar, of the coll chamber forming the front of the top of the cabinet and flling the top portion above the rear of the bottom portion. the drain plate resting on the top of the portion of the ce the inet not extending beneath the bar and removable to the coll coil chamber, a drip pan adapted to fit between the col chamber and the front of the top of the boiler portion the the cabinet to secure the coil chamber in nlace. a cofl in the coil chamber, a faucet supported in the front of the chamber over the drip pan and connected to one ond of the coll. supply pipe extending adjacent to the chamber whabe conother end of the coll emerges therefrom and detachable con-
nections between the pipe and the end of the coll, the elements being so constructed and arranged that when the connections are detached and the drip pan removed the coil chamber with its coll and faucet in place can be removed bodily from beneath the bar and out of the cabinet.
7. In a device of the class described the combination with the cabinet, of a removable cail chamber carried by the cabinet and provided with a coil, a faucet on the coil chamber and connected to the coll, and a removable drip pan mounted on the cabinet under the faucet and which when in position prevents the removal of the coil chamber.
8. In a device of the class described the combination with the cabinet, of a drain pipe therein, a removable coil chamber carried by the chest and having an overflow pipe discharging into the waste plpe, a coil in the coil chamber provided with a faucet, and the removable drip pan located under the faucet and securing the coil chamber in position and having an outlet also discharging into the drain pipe.
9. In a device of the class described the combination with a storage cabinet, of a removable coil chamber carried by the the cabinet and provided with a plurality of coils, supply pipes passing into the cabinet and detachably connected to the coils, a discharge faucet for each coil mounted on the front wall of the coil chamber, and a removable drip pan mounted on the cabinct under the faucets and engaging the coil chamber to secure it in place and providing a closure for the chest whereby when the drip pan is removed and the colls disconnected from the supply pipes, the coil chamber may be removed from the cabinet.
10. In a device of the class described the combination with the coil chamber adapted to extend partially beneath the bar, of the drain plate covering a partion of the chamber not beneath the bar, the ice holding cylinder, the coil about the cylinder, and the hopper-shaped extension of the top of the cylinder extending toward the side away from the bar, for the purpose described.
11. In a device of the class described the combination with the coil chamber adapted to extend partially beneath the bar, of the drain plate covering a portion of the chamber not beneath the bar, the ice holding cylinder about the cylinder, the faucet in the front of the coil chamber to which the pipe extends, and the hopper-shaped extension on the top of the cylinder extending toward the side away from the bar and covering the connections between the pipe and the faucet.
12. In a device of the class described the combination with the cabinet having the top and bottom portions, the bottom portion being wider than and extending beyond the top portion, of the coil chamber in the top portion of the cabinet and supported thereby and having the strip 33 across the front thereof, and the removable drip pan adapted to be supported on the strip 33 and the tops of the walls of the extended portion of the cabinet.
13. In a device of the class described the combination with the cabinet having the drain pipe in the bottom thereof, of the coil chamber in the top of the cabinet having the overflow plpe therein discharging into the drain pipe, and the drain plate on the top of the cabinet over the coil chamber having an aperture in the bottom thereof discharging into the overfiow pipe.
14. In a device of the class described the combination with the cabinet having the drain pipe in the bottom thereof, of the coil chamber in the top of the cabinet baving the overflow pipe therein discharging into the drain pipe, the drain plate on the top of the cabinet over the coil chamber having an aperture in the bottom thereof discharging into the overflow pipe, and the drip pan carried by the cabinet adjacent the coil chamber and having an aperture discharging into the drain pipe.
15. In a device of the class described a hollow drain plate having one side perforated, with the swab therein and a handle for moving the swab.
16. In a device of the class described a hollow drain plate having one side perforated, with the swab therein, and the rod extending the length of the plate and through one end thereof and provided with a handle for moving the swab.
17. In a device of the class described the trough-like hollow drain plate having its top perforated and extending beyond the edges of the trough portion, with the swab therein, and the handle for moving the swab.
18. In a device of the class described the hollow troughlike drain plate having one side perforated, the swab exlending across the trough portion, the rod extending the length of the plate and through one end thereot and provided with a handle for moving the swab, and the brace rod 68 , for the purpose described.

No. 101,794. Lock. Serrure.

John F. Pixley, Columbus, Ohio, U.S.A., 30th October, \(1906 ; 6\) years. Filed 1st August, 1906. Receipt No. 138,348.
Claim.-1. The combination with a casing and a keeper, of a locking bolt, rotatively journalled, and operating in said casing, and adapted to be projected into or withdrawn from, said keeper and arm or finger arranged to project into the path of said bolt, to be rocked when said bolt is moved endwise, said arm or finger being independent of said bolt, to permit rotative movement of the latter, and a registering mechanism operated by said arm or finger.
2. The combination with a casing having a cylindrical chamber, and a chambered extension, of a registering mechanism arranged in the chamber of the extension, a bolt jcurnalled to rotate axially and having endwise movement it: the cylindrical casing, and an arm or finger connected with the register mechanism and arranged to extend freely it.to the cylindrical chamber, and in the path of the endwise movement of the bolt.
3. The combination with the casing having a chamber, and a chambered extension, the wall of said chamber being slotted longitudinally of the chamber, of a bolt mounted for rotative and longitudinal movement in said chamber, the handle or knob connected to the bolt, and extending through the slot in the casing, and a register mechanism arranged within the chambered extension, and independent of the bolt, to permit of the rotative movement of the latter, and adapted to be engaged by the bolt when moved longitudinally to register such longitudinal movements.
4. The combination with a chambered longitudinally and transversely slotted casing having a chambered extension, of a bolt mounted in the chamber of said casing for both rotat!ve and longiturinal movement therein, a knob handle connfected to the bolt and extending through and operating in the slot in said casing, and registering mechanism arranged within the chambered extension of the casing, and indepenlent of the bolt, to permit of the rotative movement of the latter, and means arranged to be engaged and actuated by the bolt, when moved longitudinally, for operating the registering mechanism to register such longitudinal movement.
5. The combination with a casing having a chamber, and a chambered extension, of a bolt fitting said chamber, and arranged for longitudinal and axial rotative movement therein, means for moving said bolt longitudinally and axially, means for locking said bolt when it is moved axially, and means arranged within the chambered extension of the casing for registering the longitudinal movements of the bolt.
6. The combination of a casing having a chambered extension, and a keeper, an axially rotated bolt mounted in the casing for movement longitudinally into and out of locking relation with respect to the keeper, an arm or finger independent of but arranged to extend into the path of longitudinal movement of the bolt, to be engaged and rocked thereby, a register mechanism arranged within said chambered extension, and actuated by said arm or finger, and means connected with the bolt for moving the same.
7. The combination with a chamber casing having a chambered extension, a register mechanism arranged in the chambered extension, and including a spring pressed arm or finger, said arm or finger having its iree end extending Into the casing chamber, a bolt mounted in the casing chamber, means connected to said bolt for rocking it axially and for moving it longitudinally, a keeper into and out of engagement with which said boit is moved longitudinally, and means operative when the bolt is moved axially for holding the bolt against longltudinal movement.

No. 101,795. Reifigerator.
Appareil refrigérant.

George A. Masters, Chicago, Illinois, U.S.A., 30th October, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,483. Claim.-1. In a refrigerator, in combination, an alr compressor, a storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for said tank, adapted to open and close communication between said tank and said cylinder, a piston in said cylinder, means actuated by the movement of said piston for stopping the operation of said air compressor, an expansion engine adapted to be driven by the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by variations of temperature within said cold room, for varying the supply of compressed air to said engine.
2. In a refrigerator, in combination, an air compressor, a clutch for connecting said compressor with a source of power, a storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for said tank, adapted to onen and close communication between said tank and said cylinder, a lever for operating said clutch, a piston in sald cylinder for moving sald lever to disconnect said compressor from its source of nower, an expansion engine adanted to be driven by the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by variations of temperature within said cold room, for varying the supply of compressed air to said engine.
3. In a refrigerator, in combination, an air compressor, a storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for said tank, adapted to open and close communication between said tank and said cyllnder, a piston in said cylinder, means actuated by the movement of said piston for stopping the operation of said air compressor, means for starting the operation of said compressor when the pressure in said tank has been lowered to a predetermined point, an expansion engine adapted to be driven by the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by variations of temperature within said cold room, for varying the supply of compressed air to said engine.
4. In a refrigerator, in combination, an air compressor, a clutch for connecting said compressor with a source of power, a storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for sald tank, adapted to open and close communication between said tank and said cylinder, a lever for operating said clutch, a piston in said cylinder for moving said lever to disconnect sald compressor from its source of power, means for starting the operation of gaid compressor when the pressure in said tank has been lowered to a predetermined point, an expansion engine adapted to be driven by the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by variations of temperature within said cold room, for varying the supply of compressed air to said engine.
5. In a refrigerator, in combination, an air compressor, a clutch for connecting said compressor with a source of power, a storage tank for compressed air, a cyllinder adapted to have communication with said tank when the pressure in said tank passes a predetermined point, a lever for operating said clutch, a piston in said cylinder for moving said lever to disconnect said compressor from its
source of power, a spring for moving said lever to condect said compressor with its source of power when the pressure in said tank luas been lowered to a predetermined point, an expansion engine adapted to be ariven by the compressed ail, a cold room, means for cooling said cold room with the exhaust rom said engine, and means actuated by variations of temperature within said cold room for varylag the supply or compressed air to said engine.
b. In a reirigerator, in combination, an air compressor, a clutch for connecting said compressor with a source of power, a storage tank tor the compressed air, a cyinder adapted to have communication with said tank, an adjustable pressure valve for said tank adapted to open and close communication between said tank and said cylinder, a lever tor operating said clutch, a piston in said cylinder tor moving said lever to disconnect said compressor from its source of power, a spring for moving said lever to connect said compressor with its source of power when the pressure in said tank has been lowered to a predetermined point, an expansion engine adapted to be driven by the compressed air, a cold room, means tor cooling said cold room with the exnaust from said engine, and means actuated by variations of temperature within said cold room, for varying the supply of compressed air to said engine.
7. In a refrigerator, in combination an air compressor, a storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for said tank adapted to open and close communtcation between said tank and said cylinder, a piston in said cylinder, means actuated by the movement of said piston for stopping the operation of said air compressor, an expansion engine adapted to be driven by the compressed air, a pump driven by said engine for causing a circulation of water for cooling the compressed air, a cold room, means for cooling said cold room with the exhaust from said enginc, and means actuated by variations of temperature within said cold room for varying the supply of compressed air to said engine.
8. In a refrigerator, in combination an air compressor, a clutch for connecting said compressor with a source of power a storage tank for the compressed air, a cylinder adapted to have communication with said tank, and adjustable pressure valve for said tank adapted to open and close communicstion between said tank and said cylinder, a lever for operating said clutch, a piston in said cylinder for moving sald lever to disconnect said compressor trom its source of power, an expansion engine adapted to be driven by the compress. ed air, a pump driven by said engine for causing a circulation of water for cooling the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by variations of temperature within said cold room for varying the supply of compressed air to said engine.
9. In a refrigerator, in combination an air compressor, s storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for said tank adapted to open and close communics. tion between said tank and said cylinder, a piston in said cylinder, means actuated by the movement of said piston for stopping the operation of said air compressor, megns for starting the operation of said compressor when the pressure in said tank has been lowered to a predetermined point, an expansion engine adapted to be driven by the compressed air, a pump driven by said engine for causing a circulation of water for cooling the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by variations of temperature within said cold room for varying the supply of compressed air to said engine.
10. In a refrigerator. in combinstion an air compressor, \(a^{2}\) clutch for connecting said compressor with a source of power, a storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for said tank adapted to open and close communication between said tank and said cylinder, a levef for operating said clutch, a piston in said cylinder for moring said lever to disconnect said compressor from its source of power, means for starting the operation of said compressor when the pressure in said tank has been lowered to predetermined point, an expansion engine adapted to be driven by the compressed air, a pump driven by said engine for causing a circulation of water for cooling the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by variations of temperature within said cold room for varying the supply of compressed air to said engine.
11. In a refrigerator, in comblnation an air compressor, \& clutch for connecting said compressor with a source of power, a storage tank for the compressed air. a cylidef adapted to have communication with said tank, an adjustable pressure valve for sald tank adapted to open and close
communication between said tank and said cylinder, a lever for operating said clutch, a piston in said cylinder for moving said lever to disconnect said compressor from its source of power, a spring for moving said lever to connect said compressor with its source of power when the pressure in said tank has been lowered to a predetermined point, an expansion engine adapted to be driven by the compressed air, a pump driven by said engine for causing a circulation of water for cooling the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, and means actuated by varintions of temperature within said cold room for varying the supply of compressed air to said engine.
12. In a refrigerator, in combination an air compressor, a storage tank for the compressed air, an expansion engine adapted to be driven by the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, an adjustable valve for delivering a predetermined quantity of compressed air to said engine, a by-pass valve for delivering an additional quantity of compressed air to said engine, and means actuated by variations of temperature within said cold room for operating said by-pass valve.
13. In a refrigerator, in combination an alr compressor, a storage tank for the compressed air, a cylinder adapted to have communication with said tank when the pressure in said tank passes a predetermined point, a piston in said cylinder, means actuated. by the movement of said piston for stopping the operation of said air compressor. an expansion engine adapted to be driven by the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, an adjustable valve for delivering a predetermined quantity of compressed air to said engine, a by-pass valve for dellvering an additional quantity of compressed air to said engine, and means actuated by variatlons of temperature within said cold room for operating said by-pass valve.
14. In a refrigerator, in combination an air compressor, a storage tank for the compressed air, means actuated by the pressure within said tank for stopping the operation of said air compressor when the pressure in sald tank passes a predetermined point, means for starting the operation of said compressor when the pressure in said tank has been lowered to a predetermined point. an expansion engine adapted to be driven by the compressed air, a cold room, means for cooling said cold room with the exhaust from said engine, an adjustable valve for delivering a predetermined quantity of compressed air to said engine, a by-pass valve for dellvering an additional quantity of compressed air to said engine, and means actuated by variations of temperature within said cold room for operating said by-pass valve.
15. In a refrigerator, in combination air compressor, a clutch for connecting sald compressor with a source of power, a storage tank for the compressed air. a cylinder adapted to have communication with said tank when the pressure in said tank passes a predetermined point, a lever for operating sald clutch, a piston in sald cylinder for moving said lever to disconnect said compressor from its source of power, a spring for moving said lever to connect sald compressor with its source of power when the pressure in sald tank has beed lowered to a predetermined point, an expansion engine adapted to be driven by compressed air, a cold room. means for cooling said cold room with the exhaust from sald engine. an adjustable valve for delivering a predetermined quantity of compressed air to said engine, a by-pass valve for delivering an additional quantity of compressed air to said engine, and means actuated by variations of temperature within said cold room. for operating said by-pass valve.
16. In a refrigerator. in combination an air compressor, a storage tank for the compressed air, an expansion engine adapted to be driven by the compressed air, a pump driven by said engine for causing a circulation of water for coollng the compressed alr, a cold room, means for cooling said cold room with the exhaust from said engine, an adjustable valve for delivering a predetermined quantity of compressed air to said engine, a by-pass valve for delivering an additional quantity of compressed air to said engine, and means actuated by variations of temperature within said cold room for operating said by-pass valve.
17. In a refrigerator, in combination an air compressor, a storage tank for the compressed air, means actuated by the pressure within sald tank for stoppling the operation of sald compressor when the pressure in said tank has been lowered determined point, means for starting the operation of said compressor when the pressure in the tank has been lowered to a predetermined point, an expansion engine adapted to be driven by the compressed air, a pump driven by said engine for causing a circulation of water for cooling the compressed air. a cold room, means for cooling said cold room with the exhaust from said engine, an adjustable valve for dellvering a predetermined quantity of compressed air to said englne, a by-pass valve for delivering an additional quantity of compressed air to said engine, and means actuated by variations
of temperature within said cold room for operating said bypass valve.
18. In a refrigerator, in combination a cold room, an air compressor, a storage tank for the compressed air located in said cold room, a pipe extending through said tank and communicating with the air of said cold room for permitting a circulation of air for cooling said tank, an expansion engine adapted to be driven by said compressed air, a pump driven by said expansion engine for causing a circulation of water for cooling said compressed air, and means for cooling said cold room with the exhaust from said engine.
19. In a refrigerator, in combination a cold room, a storage tank for compressed air, a smaller air storage tank within said first-mentioned tank, a valve adapted to prevent the passage of compressed air from the smaller tank to the larger tank, an air compressor arranged to deliver compressed air to each of said tanks. a second air compressor arranged to deliver compressed air to said smaller tank, an expansion engine adapted to be driven by the compressed air, means of cominunication between said smaller storage tank and said engine, and means for cooling said cold room with the exhaust from said engine.
20. In a refrigerator car, in combination an air compressor, means for driving said air compressor with power from the car axle, a storage tank for the compressed air, an expansion cugine, an adjustable valve for dellvering a predetermined quantity of compressed air to said engine, a by-pass valve, and means actuated by variations of temperature within said cold room for operating said by-pass valve.
21 . In a refrigerator car, in combination an air compressor, means for driving said air compressor with power from the car axle, a storage tank for the compressed air, an expansion engine, an adjustable valve for delivering a predetermined quantity of compressed alr to said engine, a by-pass valve, means actuated by variations of temperature in sald cold room for operating said by-pass valve, and means actuated by the pressure within said storage tank for stopping the operation of said air compressor when the pressure in said tank passes a predetermined point.
22. In a refrigerator car, in combination a car body, trucks for supporting said car body, one of sald trucks comprising a rotatable axle, a sprocket wheel on said axle, a rotatable shaft journalled within said car body, an alr compression pump operatively connected to said shaft, a sprocket wheed loosely mounted on said shaft, said wheel carrying one wember of a two-part clutch, a corresponding clutch member slidably mounted on said shaft, a chain belt extending over the sprocket wheel on said axle and the sprocket wheel on said shaft, a storage tank for the compressed air, a cylinder adapted to have communication with said tank, an adjustable pressure valve for said tank adapted to open and close communication between said tank and said cylinder, a lever for sliding said slidable clutch member, a piston in said cylinder for moving said lever, an expansion engine adapted to bet driven by the compressed air, a cold room, pipes in said cold room for receiving the exhaust from said engine, and means actuated by variations of temperature within said cold room for varying the supply of compressed air to said engine.
23. On air storage and cooling tank comprising a large air tank and a smaller air tank within the larger each supplied with air inlets, a valve for permitting the passage of air from said larger tank to said smaller tank, an air outlet for said smaller tank and a pipe extending through and opening upon the exterior of said tanks for permitting a circulation of the outer air for cooling said tank.

No. 101,796. Lock. s'crrure.
Martin Mohr, Newport, Kentucky, U.S.A., 30th October, 1906 , 6 years. Filed 27 th June, 1906. Receipt No. 137,347.
Claim.-1. In a lock the combination with the casing formed in two parts, of a heap plvoted to the lower part, a duuble set of tumblers arranged in said part, a lever pivoted in said part, adapted to engage the hasp, and a locking bolt carried by the other part for the purpose described.
2. In a lock the combination with the casing formed in two parts, of a hasp pivoted to the lower part, a pair of double tumblers pivoted in said part, a plate secured over sald tumblers, a duplicate pair of tumblers arranged over said tumblers on the plate, a spring locking bolt carried by the other part, and a line connected to the hasp adapted to en. gage said bolt for the purgose described.
3. In a lock the combination with the casing formed in two parts, one of the parts being provided with a guldeway on the outside, a locking belt arranged under the guideway cn the inside, and means connected to the hasp for forcing the bolt into the guideway, for the purpose described.
4. In a lock the combination with the casing, of a double set of tumblers pivoted in said casing, a hasp pivoted in said casing and provided with an inwardly projecting memver a guideway formed on the face of the casing, a spring bolt secured in the casing under the guldeway, and a line connected to the hasp adapted to engage the bolt, for the purpose described.

plate secured between sald tumblers, a spring actuated asp secured in sald shell, a lever provided with jaws at one end and adapted to engage the hasp and bevelled at one other end, a guideway formed in the face of the other shell, a spring bolt secured under the guldeway on othe projecting in said guideway operated by the bevelled end of the lever adapted to be described.

\section*{No. 101,797. Wire Straining Apparatus. appareil détirer le fil de fer.}

Whlliam Nepean Hutchison, 57 Peckham Road, Camberwell, London, England, 30th October, 1906 ; 6 years. Filed 7th January, 1906. Receipt No. 132,705.
Claim.-1. In a wire tightening device the combination with a strainer bar having hooks at its end, and a winding spool at its middle provided with means for engaging the wire, of an operating lever having cranked handles at its ends, and two movable cllips secured to the middle part of the said lever and holding the sald bar between them crosswise of the sald lever.

\section*{No. 101,798. Refrigerator. Appareil réfrigérant.}

Frederick A. Hickson, Atlanta, Georgia, U.S.A., 30th Octo. ber, 1906 ; 6 years. Filed 11th April, 1906. Receipt No. 134,836.
Claim.-1. A refrigerator having supporting devices detachably secured on the inner sides of its walls, each of said supporting devices comprising a yoke portion, upstanding lugs thereon and angularly bent arms extending outwardly and upwardly from the ends of the yoke portion, laterally spaced apart and detachably secured to the sald walls of the refrigerator, and an ice pan in the refrigerator resting on the yoke portion of the supporting devices and bearing against the upstanding lugs thereon, said icepan being thereby detachably and removably supported in the refrigerator and out of contact with the walls thereof.
2. A refrigerator having removable shelf supporijuc do vices interiorly thereof, said shelf supporting devices comprising corner posts having projections to support the

NT OFFICE RECORD Shelves,
posts in

RECORD.

which a refrigerator, a removab
Which is less than th, a removable
refrigerator, and suppe space between the one the length of their supporting supporting brackets the end walls of of from the end wing members which devices to engalls of the refrigeratorge the icepan spaced the refrigerator the icepan and maintain brackets baving he refrigerator walls.
4. A supporting and maintain it spaced from 4. A supporting brac refrigerator, comprising a for the removable ice pan of a thereon, and angularly bent arms extion, upstanding lugs upwardly from the ends of the yoke extending outwardly and spaced apart.
5. A supporting bracket for refrigerator, struck up from a removable icepan of the comprising a yoke portion irom a single piece of metal and gularly bent arms extending from the lugs thereon and antion and laterally spaced from the ends of the yoke por 6. An ice pan for refrige apart.
side wall provided at its lower edge with a shell having a posed depending extension having end notches, end walls and bottom sections formed integrally with said side wall, said bottom sections being inserted in said notches and supported thereby, and a door forming the opposite side of the pan and secured between the end walls, substantially as described.
7. An icepan for refrigerators comprising a shell having a side wall, provided at its lower edge with a centrally disposed depending extension having end notches, end walls and bottom sections formed integrally with said side wall, sald bottom sections being inserted in said notches and supported thereby, and having upturned flanges at their sides, sald fanges at one side of the bottom sections partly forming a wall opposite the said side wall, and a door co-acting with said side sections to form the opposite side of the pan, when said door is closed, substantially as described.

\section*{No. 101,799. Wire Stretcher. Tendeur de \(\mu \mathrm{defor}\).}

William P. Sullivan, Steele, Montana, U.S.A., 30th October, 1906; 6 years. Filed 13th August, 1906. Receidt No. 138,622.
Claim.-1. In a fence wire stretcher, in combination with a fence post and wire, a frame, a flexible element secured at its ends to said frame and adapted to encircle the post, a vertically disposed stirrup secured to said frame and provided with spikes at opposite ends adapted to engage the post at one side thereof, and a cam lever secured to said flexible element intermediate its ends and adapted to bear against the opposite side of the post to maintain the stirrup spikes in engagement with the post.
2. In a fence wire stretcher, in combination with a fence post and wire, a frame, a vertically disposed stirrup attached to said frame and provided at opposite ends with spikes adapted to engage the post at one side thereof, sald stirrup being formed of sheet metal coiled upon itself, s fiexible element secured at opposite ends to said frame, and adapted to encircle the post, and a cam lever secured to said element intermediate the endsh thereof and adapted to bear against the opposite sides of the post to maintain the stirrup spikes in engagement with the post.
3. In a fence wire stretcher, in combination with a fence post and wire, a frame comprising sides and a connecting end piece, a pair of transverse shafts journalled in sald
sides, a roller and a gear wheel mounted on the front shaft, a gear wheel mounted on the rear shaft in mesh

With said first-mentioned gear, means for rotating said gear shaft, a stirrup secured to the end piece of the frame and provided with spikes for engagement with the post. a pawl secured to one of the sides of the frame for engagement with the gear on the rear shaft, and a flexible element secured at one end to sald roller and provided with a wire clamp at its opposite end, said clamp comprising a plate formed with a longitudinal hook-shaped lug, forming a seat for the wire, a pin mounted in said plate to one side of said lug and extending on opposite sides of said plate, a cam mounted on one end of said pin and extending within the seat formed by said lug, and a crank attached to the opposite end of the pin to actuate said cam, and retain the wire within said seat.

No. 101,800. Saw Swage. Scic de étamper.

Charles John Anderson, Eureka, Callfornia, U.S.A., 30th October. 1906; 6 years. Filed 17 th September, 1906. Recelpt No. 139,568.
Olaim.-1. A saw swaging device comprising a body, two rocking swaging tools mounted therein, a handle in connection with one tool, a rock shaft, a swinging arm connected to the rock shaft and having a sliding connection with the handle and gearing for establishing connection with the rock shaft and the other tool
2. A saw swaging device comprising a body, two positively operating swaging tools mounted thereon, a handle in connection with one tool, a rock shaft mounted on the body, an arm in connection with the rock shaft, means establishing connection between the handle and said arm, and means connecting the rock shaft with the other tool.
3. A saw swaging device comprising a body, two positively operating swaging tools mounted thereon, a handle in connection with one of sald tools, a rock shaft mounted on the body, an arm attached to the rock shaft, means effecting a sliding connection between said arm and sald handle and toothed sectors meshed with each other and respectively
connected with the rock shaft and with the remaining tool, for the purpose specified.
4. A saw swaging device comprising a body, two positively operating swaging tools mounted thereon, a handle attached to one of the tools, a guide attached to the handle, a rock shaft, an arm attached to the rock shaft and sliding in the guide, and a means establishing connection between the rock shaft and the other tool whereby both of the tools are operated together.

No. 101,801. Device for use in Transferming Ioe Cream Cans.
Appareil d̀ transfer les bidons de crême d̀ la glace.

Jacob Renner, Rockwell City, Lowa, U.S.A., 30th October. 1906 ; 6 years. Filed 11th September, 1906. Receipt No. 139,636.
Claim.-1. A device for separating ice in a cream ireezer tube from a can therein, consisting of two semi-cylindrical pivotally connected sections adapted to pass downward over a can to separate and hold the ice therefrom, whereby the can may be lifted from the tub or a can placed therein while the device remains in the tub.
2. A device for the purpose specifled comprising two substantially seml-cylindrical sections, metal strips secured along the edges and around the top of the sections, and pivoted connections between the sections at about the center between the upper and lower ends.
3. A device for the purpose specifled comprising two substantially semi-cylindrical sections consisting of metal pivotally connected together centrally of the upper and lower ends, metal strips secured to the side edges of the sections, and also extending around the top thereof and handles attached to the top of the sections.

No. 101,802. Ioe Tonge. Tenailles dalace.

Murdoch Hugh McDonnell, Cyrstal Falls, Michigan, U.S.A.. 30th October, 1906; 6 years. Filed 21st September. 1906. Recelpt No. 139,693.
Claim.-1. As an improved article of manufacture the herein described ice tongs comprising two side frames each of which embodies two arms pivotally connected together intermediate of their ends with two links connected to the upper ends of the arms and to each other and three handlea,
two of sald handles connecting one frame with the other at the pivotal juncture of the links with the upper ends of the arms and the third handle connecting said irames together at the juncture of the two links with respect to each other and flexible supporting members connecting the lower ends of said arms.
2. As an improved article of manufacture the herein described ice tongs comprising two frames each of which embodies two arms pivotally connected together intermediate of their ends, two links connected at one end with the upper end of said arms and connected together at their opposite conds, chains connecting the frec ends of the arms of one frame with the corresponding ends of the other frame arms, and handles connecting said frames together at the juncture of the links with the arms and also at the juncture of the two links with respect to each other.

No. 101,803. Holdback for Harness. Entrave pour harnais.

Hallock R. McDonald and Laurin R. Cope, assignee of a half interest, both of Lisbon, Ohio, U.S.A., 30th October, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,365.
Claim.-1. The combination with an ordinary harness including a breeching, traces, back strap, girth and breast strap or collar, of an attachment therefor comprising sockets or thimbles fitted on the front ends of the shafts and holdback straps independent of the traces connected at their rear ends to the breeching and at their front ends to the sockets or thimbles, the connection of the holdback straps to the breeching forming the sole connection betwen the attachment and the harness.
2. A harness including a girth, breast member and breeching in combination with traces extending directly from the breast member and holdback straps extended directly from the breeching and having terminal means of attachemnt to the front ends of the thills, said traces and holdback straps being otherwise disconnected from and independent of each other and of the harness.
3. A harness including a breast member, girth and breeching in combination with traces extended directly from the breast member and holdback attachments each including a holdback strap and an attaching thimble, each of said attachments being terminally secured to the breeching and otherwise disconnected from the harness.
4. A harness including a breast member, girth and breeching in combination with thills and a whiffletree, traces extending directly between the breast member and whiffletrse and otherwise disconnected from the harness and holdbacis attachments each secured at its opposite ends to the breeching and to the front end of a thill respectively and otherwise disconnected from the harness or vehicle, each of said attachments including a holdback strap and an attachment thimble.
5. A holdback for harness comprising a holdback strap and a socket or thimble provided on its interior with a compressible shaft engaging device arranged to frictionally engage a shaft to prevent the socket or thimble from rotating on the same.
6. A holdback for harness comprising a holdback strap and a socket or thimble adapted to fit on the front end of the shaft and provided with an interiorly arranged spring secured at one end to the socket or thimble and having its other end free, said spring being bowed between its ends and
arranged to be compressed when the socket or thimble is placed on a shaft.
7. A holdback for harness comprising a holdback strap and a socket or thimble consisting of a tapering leather body portion, a core tapered within the smaller end of the body portion, a tapered metal tip fitted to the core and recelving and engaging the adjacent ond of the leather body portion and clamping the same on the core and fastening devices piercing the tip and the leather body portion and securing the same to the core.
S. A holdback for harness comprising a holdback strap and a socket provided with interiorly arranged yleldable means allapted to conform to shafts of different sizes and arranged to frictionally engage the same to prevent the socket or thimble rotating thereon.
9. In a device of the class described, a thimble or socket provided with an interiorly arranged spring for frictionally engaging a shaft to prevent the socket from rotating on the front end of the same, said spring being yieldable to at shafts of different sizes.

No. 101,804. Wheel for Vehicles. Roue de vethicules.

The Pradeau Wheel Syndicate, assignee of Charles William Pradeau, 1 Stowe Road, Shephard's Bush, London, England, 30th October, 1906; 6 years. Filed 13th September, 1906. Receipt No. 139,482.

Claim.-1. A spring wheel for motor cars and other vehicles, each spoke of which is provided with a hollow cylinder containing a spring plunger, the onter end of each plunger being formed into a fork to which is pivoted a crank piece carried by a bearing bridge attached to the outer rim, for the purposes set forth.
2. A spring wheel for motor cars and other vehicles comprising a serics of spokes. each provided with a hollow cylinder, a spring plunger mounted in each cylinder, a fork fcrmed at the outer end of each plunger, a pivoted member, a hearing bridge attached to the outer rim for supporting said pivoted member, and means for securing satd bearing bridge to the rim, substantially as described.

No. 101,805. Vehicle Wheel. Roue de véhicules.
William H. Parham and Finis E. Lack, assignee of a hall interest, both of Paducah. Kentucky, U.S.A., 30th October, \(1906 ; 6\) years. Filed 23 rd June, 1906. Receipt No. 137,187.
Claim.-1. A wheel of the class described comprising a resilieut rim having flat inner and outer faces, a hub, and a plurality of spokes constructed of flat resilient metal and consisting of arched outer portlons, and straight inwardly converging sides, the straight portions of the contiguous spokes being fitted together, whereby the spokes mutually st:pport each other.
2. A wheel of the class described comprising a resilient rim, a hub, a plurality of resilient spokes. and mesns for adjusting the tension of the spokes to vary the stifiness of the wheel.
3. A wheel of the class described comprising a resilient series of elastic tubes between the rims, and bolts near the rim, a hub, and a plurality of resilient spokes constructed

of resllent material, which is bent to form loops, and adjustable means for varying the tension of the spokes.
4. A wheel of the class described comprising a resillent rim, a hub, a plurality of spokes constructed of resillent material and forming loops, and adjustable means for connecting the sides of the loops to vary the tension of the spokes.
5. A wheel of the class described comprising a resillent rim, a hub, and a plurality of resilient spokes forming loops, the sides of the loops being provided with bends forming seats, and adjusting devices receiving the sides of the spokes ar the said seats, whereby they are held against inward or outward movement on the spokes, the said adjusting devices being adapted to vary the tension of the spokes.
6. A wheel of the class described comprising a rim, a hub composed of sections having radial grooves, and provided at the inner ends thereof with annular grooves and spokes consisting of loops having sides fitted in the radial grooves of the hub, said spokes being also provided at their inner ends with lugs fitting in the annular grooves of the sections of the hub to interlock the spokes with the latter.
7. A wheel of the class described comprising a flat resilient rim, a solid tire arranged on the rim, a hub, spokes secured to the hub and having loops fitted against the inner face of the rim, and clips engaging the spokes and the tire and securing the same to the rim.
8. A wheel of the class described comprising a resilfent rim having a flat outer sace, an endless solid rubber tire provided with a flat inner face and arranged on the rim, and means for holding the tire against lateral movement.
9. A wheel of the class described comprising a resilient rim having a flat outer face, an endless rubber tire arranged on the flat outer face of the rim, and an endless metallic band embedded in the tire, and surrounding the rim and spaced therefrom.
10. A wheel of the class described comprising a resllient rim having a flat outer face, an endless rubber tire arranged on the flat outer face of the rim and provided with a base having projecting edges, an endless metallic band embedded in the tire at the projecting edges of the base and presenting exterior metallic faces and having interiorly arranged openings for the rubber of the tire, and means for engaging the exterior metallic faces for retalning the tire on the rim.

\section*{No. 101,806. Elastic Wheel for Vehicles.}

\section*{Roue élastique pour véhicules}

Robert Henry Isaac Cook, 9 South Street, Greenwich, Kent, England, 30th October, 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,843.

Olaim.-1. The combination of inner and outer rims of cylindrical form, and a series of elastic tubes between the rims.
2. The combination of inner and outer rims of cylindrical form, a series of elastic tubes between the rims, tubes between the rims, and bolts near the ends of the tubes securing them to the rims.
3. The combination of inner and outer rims of cylindrical form, and a series of elastic tubes between the rims in contact throughout their length with them.
4. The combination of inner and outer rims of cylindrical form, a series of elastic tubes between the rims in contact throughout their length with them, and bolts near the ends of the tubes securing them to the rims.
5. The combination of a felloe, inner and outer rims of cylindrical form and of greater width than the felloe, and a series of elastic tubes between the rims.
6. The combination of a felloe, inner and outer rims of cylindrical form and of greater width than the felloe, a
ands of the tubes securing them to the rims.

7. The combination of a felloe, inner and outer rims of cylindrical form and of greater width than the felloe, and a series of elastic tubes between the rims in contact throughout their length with them.
8. The combination of a felloe, inner and outer rims of crifuriral form and of greater width than the felloe, a series of elastic fubes between the rims in contact throughout their length with them, and bolts near the ends of the tubes securing them to the rims.
9. The combination of Inner and outer rims of cylindrical form, a series of elastic tubes between the rims, plates irside the tubes, and bolts passing through the walls of the tubes and connecting the plates to the rims.
10. The combination of inner and outer rims of cylindrical form, a series of elastic tubes between the rims in contact throughout their length with them, plates inside the tubes, and bolts passing through the walls of the tubes and ecnnecting the plates to the rims.
11. The combination of a felloe, inner and outer rims of cylindrical form and of greater width than the felloe, a scries of clastic tubes between the rims, plates inside the tubes, and bolts passing through the. walls of the tubes and connecting the plates to the rims.
12. The combination of a felloe, inner and outer rims of cylindrical form and of greater width than the felloe, a scries of clastic tubes between the rims in contact throughcut their length with their plates inside the tube, and bolts passing through the walls of the tubes and connecting the plates to the rims.

\section*{No. 101,807. Wagon Wheel. Roue de wagon.}

Israel T. Hurd, Lansing, Michigan, U.S.A., 30th October, 1906; 6 years. Filed 12th June, 1906. Receipt No. \(136,825\).
Claim.-1. A wheel having a rim composed of a central and side layers made in sections with the sections of the layers breaking joints and having washers extending across the joints between the sections of the outer layers, and means for securing said washers in olace.
2. A wagon wheel comprising a hub, spokes radiating therefrom, and a rim applied to said spokes and consisting of a central and side layers, the sections of the layers breaking joints, and plates overlapping the joints of the sections of the side layers.
3. The combination in a wheel with the central and side layers of the rim, of bolts extending through the rim at a point between the sections of the side layers thereof, and washers on said bolts and overlapping the joints between the sections of the outer layers.
4. A wheel comprising a hub, spokes radiating therefrom, and a felloe formed on central and side layers made in sections, the sections of the central layer fitting between the outer ends of the spokes and the sections of the side layers overlapping the joints of the central section with the joints of the side sections arranged between the spokes.
5. A wagon wheel comprising a hub, spokes attached at their inner ends to the said hub, a felloe formed of layers made in sections fastened together, the outer ends of the spokes fitting between the adjacent ends of successive sections of the central layer, the sections of the layers breaking joints, transverse bolts for fastening the layers together, sundry of the bolts extending through the joints of the sections of the outer layers and washers for the bolts passing through the joints, each washer extending across the joint and its end being provided with Inwardly extending prongs driven into the adjacent sectlons.
6. A wagon wheel comprising a hub having a polygonal face portion, an integral flange and a ring, the opening of

which corresponds with the sald polygonal face portion, spokes having their inner ends abutting against the polygonal face portion, transverse bolts for fastening the flange, spokes and ring together, a felloe made of a central layer and outer layers superimposed on opposite faces of the sald central layer, bolts for fastening the layers together and bolts for fastening the outer layers and the outer spoke ends together.
7. A wagon wheel comprising a hub having a polygonal face portion, an integral flange and a ring, the opening of which corresponds with the said polygonal face portion, spokes having their inner ends abutting against the polygonal face portion, transverse bolts for fastening the flange, spoke and ring together and a felloe made of a central layer and outer layers superimposed on opposite faces of the said central layer, the central layer being made in sections abutting with their ends on the outer ends of the spokes.
8. A wagon wheel comprising a hub having a polygonal face portion, an integral fiango and a ring, the onnning of which corresponds with the sold polygonal face portion, spokes having their inner ends abutting against the polygonal face portion. transverse bilts for fastening the flange, spokes and ring together and a felloe made of a central layer and outer layers superimposed on opposite faces of the said central layer, the certral layer being made in sections with their ends on the outer ends of the spokes. the latter having shoulders for the ends of the said sections to rest on.
9. A wagon wheel comprising a hub having a polygonal face portion, an integral flange and a ring, the opening of which corresponds with the said polygonal face portion. spokes having their inner ends abutting against the polygonal face portion, transverse bolts for fastening the fiange. spokes and ring together and a felloe made of a central layer and outer layers superimposed on opposite faces of the said central layer, the central layer being made in sections abutting with their ends on the outer ends of the spokes. the outer lavers being also made in sections breaking joints with each other and with the sections of the central layer.
10. A wagon wheel comprising a hub having a polygonal face portion, an integral flange and a ring. the opening of which corresponds with the said polygonal face portion. spokes having their inner ends abutting against the polygonal face portion, transverse bolts for fastening the flange. spokes and ring together, a felloe made of a central layer and outer layers superimposed on opposite faces of the sald central layer, the central laver being made in sections abutting with their ends on the outer ends of the spokes. the outer layers being also made in sections. breaking foints with each other and with the sections of the central layer, with each berse bolts for fastening the layers together and trans: verse bolts for fastening the outer layer and the spokes together.

No. 101,808. Vehicle Wheel. Roue de oéhicule.

Fīテ1

John C. Schleicher, Mount Vernon, New York, U.S.A., 30th October, 1906; 6 years. Filed 20th August, 1906. Rocelpt No. 138,833.
Claim.-1. A vehicle wheel comprising two side wheels, a wheel located between said side wheels and having a band secured to its under face with projections, spring plates carried on the spokes of the side wheels, seats on cald plates engaged by the projections of the band, an eccentrically mounted ratchet wheel, a pawl engaging it, a spring band adapted to be expanded and contracted by said ratchat wheel and springs supported between said spring band and spring plates, substantially as described.
2. A vehicle wheel comprising two side wheels, a wheel located between said side wheels and having a band secured to its under face provided with projections, spring plates carried on the spokes of the side wheel and engaged by the projections of the band, an eccentrically mounted ratchet wheel, a pawl engaging it, a spring hand adanted to be expanded and contracted by said ratchet wheel and springs supported between said spring band and spring plates, substantially as described.
3. A vehicle wheel comprising two side wheels, a wheel located between said side wheels and having a band secured to its under face provided with projections, spring plates carried on the snokes of the side wheels and engaged by the nroiections of the band. an eccentrically mounted ratchet wheel. a pawl engaging it, a spring band adapted to be exnanded and contracted by said ratchet wheel and vieldable means supported between said spring hand and spriak plates. substantially as described.
No. 101,809. Sectional Wheel Tire.
Bandage sectionnel de roue.

Albert John Fortescue, Arncliffe, near Sydney, New South South Wales, Australia, 30th October, 1906;6 years. Filed 31st August, 1906. Receipt No. 139,136.
Claim.-1. In sectional wheel tires combination with a projection under each end of one or more sections, of a bridge piece holding behind sald projections and against the ends of the rim sections.
2. In sectional wheel tires the combination with a projection under each end of one or more sections, of a bridge plece having stops which hold against said projections and against the ends of the rim section, substantially as described.
3. In sectional wheel tires the comblnation with a projec-
tion under each end of one or more sections. of a bridge
piece having stops which hold against said projections and against the ends of the rim sections and loose liners on the inner or outer faces of said stops, substantially as described and illustrated.
4. In sectional wheel tires the comblnation with a projection under each end of one or more sections, of a bridge piece provided with stops which take against said projections, a plug or spacing plece between the ends of the tire and with or without bolts for retaining said bridge piece in position substantially as described and illustrated.

No. 101,810. Adjustable Wheel Tire. Bandage de roue ajustable.

Samuel Frederick Mudge, Arncllffe near Sydney, New South Wales, Australia, 30th October, 1906 ; 6 years. Filed 17th July, 1906. Receipt No. 137,901.
Claim.-1. An improved adjustable wheel tire formed in one or more sections, enlarged ends on said section or sections, recesses formed in said ends and tie or connecting pleces formed corresponding in shape to sald recesses, in combination with a wheel having its rim formed corresponding to the tire sections.
2. An improved adjustable wheel tire formed in one or more sections, enlarged ends on said section or sections, circular recesses formed in said ends and tie or connecting pieces formed with ends corresponding in shape to said recesses in combination with a wheel having its rim formed in sections, substantially as herein described.
3. In a wheel tire of the kind described, formed of one or more sections, enlarged ends on said sections, recesses extending through said enlarged ends, a feather edge flange on said section or sections of tire in combination with a tie or connecting piece and fastening bolts or pins extending through the ends of the tie pieces and through the enlarged ends of the tire section or sections, substantially as set forth.
4. In a wheel tire of the kind described, formed of one or more sections, enlarged ends on each section of the tire, circular recesses extending partly through said enlarged ends, a shoulder formed at the end of each círcular recess, a hole extending through sald shoulder, in sombination with a tie or connecting piece having circular ends thereon and lateral pins on sald ends, substantially as described.
5. In a wheel tire of the kind described, formed of one or more sections, enlarged ends on sald section or sections, recesses in said ends and tie pieces corresponding in shape to said recesses and with or without fastening bolts, slots in the ends of said tie pleces and in the enlarged ends of the tire sections, pins adapted to fit into said slots, in combination with a wheel having its rim formed corresponding to the tire sections, substantially as set forth.

\section*{No. 101,811. Tire Setter.}

\section*{Appareil d poser les bandages.}

George W. Tinkey, Plymouth, Ohio, U.S.A., 30th October, \(1906 ; 6\) years. Filed 25th June, 1906. Recelpt No. 137,240. Claim.-1. A tire setter comprising a lever with opposite
minal portions arranged to fit against the outer face of a felly of a wheel, said terminals being provided at the bot-

tom with projecting lips arranged to engage beneath the felly and a tire engaging hook pivotally mounted between the arms.
2. A tire setter comprising a lever provided with opposite felly engaging arms having a shank, a lug extending from the shank and provided with an opening, a set screw mounted on the lug, a tire engaging hook pivotally mounted between the arms, adjusting means connected to the outer ends of the lever and embodying guide pulleys and a flexible connection the free end of the flexible connection being passed through the opening of the lug and adapted to be engaged by the set sorew, and means for anchoring said adjusting means.

No. 101,812. Tire Setter. Apparell d poser les bandages.

Seward E. Tumalty, Perry, New York, U.S.A., 30th October, 1906; 6 years. Filed 6th August, 1906. Receipt No. 138,444.
Claim.-1. An attachment for a tire setting machine, comprising a center rod, co-axial with the hub of the wheel receiving the tire, a support for sald rod, a part on the center rod to meet the hub of the wheel, a universal foint connection between said part and rod, a spring around said rod and means co-optrating with said spring to resist the upward motion of the hub and means adapted to extend over the wheel and in which said center rod is mounted.
2. An attachment for a tire setter consisting of an arm over the floor of the machine, a slidable center rod held co-axially with the hub, a spring around said rod and hav-
ing a bearing on said arm, a plate on the center rod having a universal joint connection with said rod, and means cooperating with said spring to resist the movement of the hub.
3. An attachment for machines for setting tires consisting of a base ring, an arm over the base ring and crossing the extended axis thereof, a slidabie center rod on the arm held co-axial with the hub and with the base ring to conform to the hub of the wheel, means for permitting the movement of the arm out of action, a plate on the center rod having a unlversal joint connection with said rod, a spring around said rod and means co-operating with the spring to resist the upward movement of the hub.
4. An attachment for a tire setting machine, having an arm over the base ring, a bracket on the arm, a center rod guided by the bracket, a nut threaded on the center rod and supported by the arm, and means on the bracket and spring means on the center rod to resist the upward motions of the hub of the wheel.
5. An attachment for machines for setting wagon tires, consisting of a movable arm over the base ring, a bracket on the arm, a center rod in the bracket, a threaded nut on the center rod and held against turning thereon, a sleeve threaded in the bracket, and receiving said center rod, said rod being movable in the sleeve and said nut being movable with the rod, and a spring internosed between said nut and the sleeve, and means on the center rod to meet the hub of the wheel.
6. In an attachment for a tire setting machine, a horizontal arm over the machine, a vertical center rod held by the arm co-axial with the wheel and independent of the hub thereof, a foot plate on the center rod to press against the end of the hub of the wheel, and means for longitudinally adjusting the center rod and means around said rod for holding said foot plate with yielding pressure against the hub of the wheel.

No. 101,813. Prepayment Device for Electric Meterm.
Compteur électrique actionné par une pièce de monnaie.

Berrle Cunningham, Peterborough, Ontario, Canada, Amos Berrle 30 th October 1906; 6 years 30th October, 184
ent electric meter, ceipt No. 138,184. Claim. -The combination and \(B\) in connection wing dogs \(A\) and.
of the two rocking dogs \(A\) andine feed, as
of the two rocking dogs
I and \(E\) to produce a magazin

No. 101,814. Wrench. Clé d̀ écrou.

John Franklin Doss, Depoy, Kentucky, U.S.A., 30th October, 1906: 6 years. Filed 11th June, 1906. Receipt No. 136,783.
Claim.-A tool of the ciass described, formed of a blade 1 having the opening 3 therein, the side edges 4 of the opening being converged and one of the side edges 4 being provided at spaced intervals throughout its entire length with the teeth 6 , the said side edges at one end of the opening being terminated in an acute angle with respect to each quer at the point of intersection of the planes occupied by the edges as at 5 , and the continuance 7 of the convergent edges 4 in parallel relation with respect to each other, substantially as described.

No. 101,815. Pipe Wrench. Clé à tuyau.

George M. Gealey, Enon Valley, Pennsylvania, U.S.A., \({ }_{\text {Re- }}^{\text {30th }}\) October, \(1906 ; 6\) years. Filed 16th ceipt No. 140,335 . Claim.-1. An implement prising a pair of alligatortical slot, a body portiod by sald portion provided with a vertare secured, pins varried undersaid jaws and to which they are stion having an incline ued bebody portion, the said body portion upper end received the neath face, lever having a bevelled jaws and engaging haid neath face, a tween the dependig portion, a sleeve pa for securing liver incline face of the body through said sleeve forted to the lever slots, a bolt passing throig pivotally connecterried by said lever to the jaws and a chaged with the pins
and adapted to be engaged as described. body portion, substantialiy po paws of alligator and haring 2. In a pipe wrench, 2. In by a body portion in said body portions, a lever received spart by a boding below said ical slots, a lever red upper portions depencovided with vertical having a bevelled portion, ing portions provideing portions and ha on the body ports to between said dependincline lower face onged in said slon conend to engage an incline lever and engaged its one end cortion end to passed through jaws, a chain having the body porting means passever to the jaws, ans carried bynected after being secure the leve lever, and means to be connected.
nected to the chain is adaptedially as described
to which said a pipe, substantiall structur
passed around a concrete Struen.
No. 101,816. Reinforced Conction en béton. \({ }_{\text {Renfort pour constructh octo- }}\) Renfort pour constructiongton, U.S.A..306. Recelpt
Charles E. Fowler, Seat Filed 4th Septem ature specifed. ber, 1906, 6 structure of the nature formed core congisting ber, 139,251 . forced structure body or core congistian co. 10, a reinforceprising a boang means
claim.-1. In a rener comprising inforcing
structural member metallic
of bars embedded in said body with their end portions projecting therefrom, a facing formed from plastic composition

and metallic reinforcing means consisting of members spaced apart and interposed between said body and facing.
2. A structure of the nature indicated comprising shafts or columns spaced apart, a web extending therebetween havIng a body or core formed of plastic composition, metallic reinforcing members embedded in said body and extending into said shafts or columns, a facing formed from plastic composition, and metallic reinforcing means interposed between sald body and the facing.
3. A reinforced structure of the nature specified comprising shafts or columns spaced apart, and a web extending therebetween, each of said parts having a body or core formed from plastic composition, and a facing formed from plastic composition, metallic reinforcing members embedded in the body or core of said web and extending into the bodies or cores of sald shafts, and metallic reirforcing means interposed between said bodies or cores and their respective facings.

\section*{No. 101,817. Windmill Mechanism.}

Mécanisme de moulin de vent.

John W. Innes, West Zorra, Oxford, Ontarlo, Canada, 30th October, 1906 ; 6 years. Filed 5th September, 1905. Receipt No. 128,200 .
Claim.-1. In a device of the class described the combination with pulleys, and a belt passing over said pulleys, of a lever one end of which rests on sald belt, and means for regulating the pressure of said lever on said belt to give a uniform rate of speed.
2. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, of a lever, one end of which is provided with an anti-friction roller or pulley and rests on said 10-38
belt, a support for said lever, and means for regulating the pressure of said lever on said belt to give a uniform rate of speed.
3. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, a lever one end of which rests on said belt, and a support for said lever, of a rod resting on said lever, and means for regulating the pressure of said rod on said lever to give a unlform rate of speed.
4. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and oferating said pulleys, a lever, one end of which rests on sald belt, and a support for said lever, of a tubular spindle, means for supporting and operating said tubular spindle, a spindle rod vertically adjustable in and rotating with said tibular spindle, and resting on said lever, and means for
 give a uniform rate of speed.
5. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, a lever one end of which is provided with an anti-friction roller or pulley and rests on said belt, and a support for said lever, of a tubular spindle, a cross bar and bracket in which said tubular spindle is supported, a plate secured to the underside of said crossbar on which said tubular spindle rests, a support for said crossbar, a spindle rod vertically adjustable in and rotating with said tubular spindle and extending through said plate secured to the underside of said crossbar and resting on said lever, and means for regulating the pressure of said spindle rod on said lever to give a uniform rate of speed.
6. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and oferating sald pulleys, a lever one end of which rests on said belt, and a support for said lever, of a tubular spindle in which elongated slots are formed, means for supporting and operating said tubular spindle, a spindle rod partly located in said tubular spindle and provided with lugs adapted to engage with the elongated slots in said tubular spindle. and the lower end of sald spindle rod resting on said lever, weighted arms pivotally connected at one end to the upper end of said tubular spindle, and links connecting said weighted arms with the lugs on said spindle rod.
7. In a device of the class described the combination with pulleys, and a belt passing over said pulleys, of a lever, one end of which rests on said belt, means for regulating the pressure of said lever on said belt to glve a uniform rate of speed, and means for giving a greater or less pressure of said lever on said belt to give a greater or less speed.
8. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, of a lever, one end of which is provided with an anti-friction roller or pulley and rests on sald belt, a support for said lever, means for regulating the pressure of said lever on said belt, to give a uniform rate of speed, and means for giving a greater or less pressure of said lever on said belt to give a greater or less speed.
9. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, of a lever one end of which is provided with an anti-friction roller or pulley and rests on said belt, and a weight on the other end of and a support for said lever, and means for regulating the pressure of sald lever on said belt.
10. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and oferating said pulleys, a lever one end of which rests on said belt, and a support for said lever, of a rod resting on sald lever, means for regulating the pressure of said rod on sald lever to give a uniform rate of speed, and means for giving a greater or less pressure of said lever on said belt to give a greater or less speed.
11. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, a lever one end of which is provided with an anti-friction roller or pulley and rests on said belt. and a weight on the other end of and a support for said lever, of a rod resting on said lever, and means for regulating the pressure of said rod on said lever.
12. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, a lever, one end of which rests on sald belt, and a support for said lever, of a tubular spindle, means for supporting and operating said tubular spindle, a rod vertically adjustable in and rotating with said tubular spindle and resting on said lever, means for regulating the pressure of sald rod on sald lever to give a uniform rate of speed, and means for giving greater or less pressure of said lever on said belt to give a greater or less speed.
13. In a device of the class described the combination with pulleys, a belt passing over and means for supporting and operating said pulleys, a lever one end of which is provided
\[
{ }^{\triangle} \mathrm{TE}_{\mathrm{NT}}
\]

William Edward Murray, Los Angeles, California, U.S.A. 30th October, 1906 ; 6 years. Filed 20th September, 1906. Receipt No. 139,643.
Claim.-1. The steady floating foundation consisting of a hollow braced and stiffened water tight structure upon which different kinds of superstructure are carried, the said foundation having a flange projecting beyond the width and length of the superstructure carried thereon, said flange having receptacles for being loaded with water and with another substance such as gravel of greater density than water, in order to sink the foundation to the requisite depth for insuring steady floation, substantially as hereinbefore described.
2. The steady floating foundation consisting of the combination of a hollow water tight structure or foundation, a superstructure upon the same, a flange projecting outward from and constituting part of the said foundation and surrounding the same and projecting beyond said superstructure, said flange provided with receptacles or pockets adapted to be flled with water and with heavier substances in order to sink the foundation to the required depth, substantially as hereinbefore described.

No. 101,819. Cutter Head. Porte-lamps.
John James Stevens, Galt, Ontario, Canada, 30th October, 1906: 6 years. Filed 22nd November, 1905. Receipt No. 130,309.
Clam.-In a turret lathe or the like the combination with the head having a central orifice and radial grooves, of cutters held in the grooves and extending slightly beyond the face of tha head, a flat clamping plate having a central ori-

of the tools in proximity to the inner and outer periphery
of the plate.
No. 101,820. Means of Storing Hydranic Power.
Moyen demmagasiner le powvoir hydraulique.

Leo Von Gerstenbergk-Zeck, Bergsulza, near Sladtsulza, Germany, 30th October, 1906 ; 6 years. Filed 5th September, 1906. Receipt No. 139,276.
Claim.-1. Means for storing hydraulic power comprising in combination means adapted to form an upper reservoir, adjustable means adapted to regulate the flow of water from said upper reservoir, means adapted to form a lower reservoir to receive water from said upper reservoir after said water has done work, adjustable means adapted to regulate the flow of water from said lower reservoir whereby the flow of water in the lower water course may be kept normal notwithstanding variations in the flow of the same from upper reservoir.
2. Means for storing hydraulic Dower comprising in combination a plurality of means adapted to form a plurality of upper reservoirs, a plurality of adjustable means adapted to regulate the flow of water from said upper reservoirs, meang adapted to form a lower reservoir to receive water from said upper reservoirs after said water has done work, adjustable means adapted to regulate the flow of water from said lower reservoir, whereby the flow of water in the lower water course may be kent normal notwithstanding varistions in the flow of the same from sald upper reservolr.
3. Means for storing hydraulic power comprising in combination means adapted to form an upper reservoir, adjustable means adapted to regulate the flow of water from said upper reservoir, a plurality of means adapted to form a plurality of lower reservoirs to receive water from sald reservoir after said water has done work, a plurality of adjustable means adapted to regulate the flow of water from said lower reservoirs, whereby the flow of water in the lower water course may be kept normal nothwithstanding variations in the flow of the same from said upper reservoir.
4. Means for storing hydraulic power comprising in combination a plurality of means adapted to form a plurality of upper reservoirs, a plurality of adjustable means adapted to regulate the flow of water from said upper reservoirs, a plurality of means adapted to form a plurality of lower reservoirs to recelve water from sald upper reservoirs after said water has done work, a plurality of adjustable means adapted to regulate the flow of water from said lower reservoirs, whereby the flow of water in the lowermost water course may be kept normal nothwithstanding variations in the flow of the water from said upper reservoirs.
5. Means for storing hydraulic power comprising in combination a weir a adapted to form an upper reservoir d, adjustable sluice valves \(g\) adapted to regulate the flow of water from said upper reservoirs, a weir \(c\) addapted to form a lower reservoir \(e\) to receive water from said upper reservolr after sald water has done work, adjustable sluice valves \(f\) adapted to regulate the flow of water from said lower reservoir. whereby the flow of water in the lower water course may be kept normal notwithstanding variations in the flow of the water from sald upper reservoir, substantially as described.

No. 101,821. Means of Regulating a Water Supply.
Moyen de régulariser la consonmation de l'eals.

101821
F=.
The Harrison Safety Boiler Works, assignee of Joseph Willard Gambler, all of Philadelphia, Pennsylvania, U.S.A., 30th October, 1906 ; 6 years. Filed 19th May. 1906. Receipt No. 136,076.
Claim.-1. A filter, by-pass about the filter, a float actuated valve in the by-pass, and means for operating it according to the variation in pressure of the water actuating the float.
2. A filter, a by-pass about the filter, a valve in the bynass, a water chamber and means therein for automatically operating the valve according as the filter is clogged or free.
3. A heater, a filter, a by-pass about the filter, a valve in the by-pass, a vented fioat chamber below the normal water level of the heater and opening at the bnttom into a space beyond the filter, a float in the chamber adapted to operate the by-pass valve according as the water therein rises or falls.
4. In a heater, a filter, a by-pass nbout the fllter, a valve in the by-pass, a float chamber opening into the heater beyond the filter, a float in said chamber adapted to operate the by-pass valve.
5. A tank, a filter therein, means for automatically regulating the supply to the tank, a by-pass about the filter containing a valve, a water chamber adapted to fill or empty according as the filter is clear or clogged, and means for automatically operating the by-pass valve according to the height of the water in the chamber.
6. A tank, a filter therein, means for automatically regulating the supply to the tank, a by-pass about the fliter containing a valve, a water chamber opening into the space beyond the filter, and means for operating the by-pass valve according to the height of water in the supplemental chamber.
7. A filter, a valved by-pass about the same, a float and intermediate means for operating the valve arcording as the filter is cleared or clogged.

No. 101,822. Trap Gun. I'nsil-piage.

David A. Cowsert, San Angelo, assignee of Charles D. Lovelace, Fort Worth, both in Texas. U.S.A., 30 th October. 1906; 6 years. Filed 1st August, 1906. Recoipt No. 138,349.
Claim.-1. The combination with a barrel having one end thereof enlarged and provided with a pair of shoulders one of which is adapted to receive the head of a cartridge, a breech block fitting within the enlarged end of the barrel and engaging the second shoulder for retaining the cartridge in position, means for detachably connecting the barrel and breech block, a flring mechanism, and means for roleasing the firing mechanism.
2. In a trap gun, a breech frame having spaced resilient side members, provided with apertures, a breech block provided with trunnions extending through the agertures in said side members, a barrel having one end thercof enlarged for the recention of the breech block and provided with cam slots for locking engagement with said studs. firing mechanism carried by said breech frame, and means for releasing said firing mechanism.
3. In a tray gun, a breech frame having spaced resilient side members provided with apertures, a breech block provided with oppositely deposed trunnions extending through the apertures in said side members and held thereby from rotation, a barrel having one end thereof enjarged for the reception of the breech block and provided with cam slots for locking engagement with said studs, a firing pin carried by the breech block, a spring actuated bolt mounted on the breech frame, a trigger for holding said bolt in withdrawn position, and means for releasing said trigger.
4. In a trap gun, a breech frame provided with spaced depending ears, a standard pivotally connected to said cars, a post having a swivel connection with the standard, a breech block carried by the frame. a barrel having one end thereof enlarged for the reception of the breech block and detachably secured to the latter, firing mechanism carried by said breech frame, means for releasing the firing mechanism, and means for clamping the standard to the lepending ears of the breech frame.

No. 101,823. Mirpor Support. Support de miroir.
Charles H. Ayer, Franklin J. Hole and Ralph E. Olney, coinventors, all of Mt. Clemens, Michigan, U.S.A., 30th October, 1906; 6 years. Filed 4th September, 1906. Receipt No. \(139,229\).
Claim.-1. A mirror support for bureaus and the like comprising a pair of like fixtures, each comprising a bracket, an arm hinged to the bracket, a universal hinge connection be-
tween the arm and the mirror frame, and supports hingedly connecting the bracket at its upper and lower ends with ons

of the supporting standards of the mirror, the lower support being laterally adjustable.
2. A mirror support for bureaus and the like comprising a pair of like fixtures, each comprising a bracket, an ara hinged to the bracket and adapted to fold on top of the braket, a universal hinge connection between the arm and the mirror frame and supports hingedly connecting the bracket at its upper and lower ends with one of the supporting standards of the mirror, the lower support being laterally adjustable and provided with stops to limit the swing of the bracket thereon.

No. 101,824. Boiler Flue Cleaner.
Nettoyeur de tubes de chaudieres.

Samuel McAdoo, Toronto, Ontario, Canada, 30th October,
1906 ; 6 years. Filed 12th September, 1906. Receipt No. 139,461.
Olatm.-1. In boiler flue cleaners the combination of the tubular boller and a boiler setting whose wall has a slot, with a slide movable in said slot, a steam supply pipe movable through said slide, a discharge pipe secured to its inner end and provided with jet openings in that face which is adjacent to the end of the boller, substantially as and for the purpose specifled.
2. In boiler flue cleaners the combination of the tubular boiler and a boiler setting whose wall has a slot, a slide movable in said slot, a steam supply pipe movable through said slide, a discharge plpe secured to its inner end and provided with jet openings in the face which is adjacent to the end of the boiler, and means for closing the slot whatever may be the position of the pipes with respect to the top and bottom of said slot.
3. In boiler flue cleaners the combination of the tubular boiler and a boiler setting whose wall has a slot, a slide movable in said slot, a steam supply pipe movable through said slide, a discharge pipe secured to its inner end and provided with jet openings in that face which is adjacent to the end of the boller, said slide belng so much longer than the slot that it will close the same whether the boiler cleaning device is in use or out of use.

No. 101,825. Steam Boiler Regulator. Régulateur de chaudières.

Fred Behrens, Angelica, New York, U.S.A., 30th October, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,215. Claim.-1. The combination with a boiler Including a valved steam supply plpe to a pump, of a feed regulator for the boller comprising a casing connected with said boiler, a flexible diaphragm mounted in sald casing, and means \(10-\) cated on opposite sides of said diaphragm and operated by its movement for opening and closing the valve in sald steam supply pipe, to regulate the feed water to the boiler.
2. The combination with a boiler including a valved steam suply pipe, to a pump, of a boller, a feed regulator comprising a casing connected with said boiler and a flexible diaphragm mounted in said casing, and means mounted in sald casing and bearing against opposite sides of said diaphragm. said means being operated by the movement of the diaphragm and adapted to open or close the valve in said steam supply pipe to regulate the feed of water to the boller.
3. The combination with a boiler including a valved steam supply pipe to a pump, of a feed regulator for the boiler comprising a casing connected thereto and a flexible diaphragm mounted therein, means mounted in said casing and bearing against opposite sides of said diaphragm, said means being adapted to be operated upon movement of the diaphragm to open or close the valve in said steam supply pipe, and means for adjusting the vertical position of sald regulator with respect to the boller.
4. The combination with a boiler including a valved steam supply pipe to a pump, of a feed regulator for the boller connected thereto and comprising a casing and a flexible diaphragm mounted therein the movement of said diaphragm being automatically controlled by the pressure of the water within the boller, and means for opening and closing the valve in said steam supply pipe, said means being operated by the movement of said diaphragm.
5. The combination with a boiler including a valved steam supply pipe to a pump, of a feed regulator for the boiler connected thereto and comprising a casing, and a flexible diaphragm mounted therein, the movement of said diaphragm being automatically controlled by the pressure of the water within the boller, means for opening and closing the valve in said steam supply pipe, said means being operated by the movement of said diaphragm, and means for raising or lowering sald regulator with respect to the boller.
6. The combination with a boller of a feed regulator connected therewith and adapted to be automatically operated by the pressure of the water within the boller, and means connected with the boiler above and below the feed regulator for automatically sounding an alarm when the water level in the boiler has reached certain fixed limits.
7. The combination of a steam boiler, of a feed regulator connected therewith and adapted to be automatically operated by the pressure of the water within the boiler, and means connected with the boiler and located above and below the feed regulator for automatically sounding an alarm when the water level in the boiler reaches certain fixd limits, sald means each comprising a casing, a diaphragm mounted in each casing and operated by the water pressure in the boiler and connections between said dlaphragms and sald alarm means.
8. The combination with a steam boller, of a feed regulator comprising a casing and upper and lower vertically disposed pipes connested therewith. and pipe connections between sald boiler and the outer end of said vertical pipes. the joints between the several pipes being swivelled to permit the regulator to be raised or lowered with respect to the boiler, and means for raising or lowering the regulator.
9. The combination with a boller including a valved steam supply pipe to a pump, of a feed regulator for the boller connected therewith ani comprising a casing and a flexible diaphragm mounted therein. the movement of said diaphragm being automatically controlled by the pressure of the water in the boiler, a lever pivotally mounted in the casing on each side of said diaphrgam and bearing against the diaphragm at one end, a lever for operating the valve in the steam supply pipe and connections between the opposite ends of said diaphragm and said valve lever for operating the latter to onen or close the valve to regulate the feed of water to the boller.
10. The combination with a boiler including a valved steam supply pipe to a pump, of a feed regulator for the boiler connected therewith and comprising a casing formed of upper and lower shells, a skeleton guard mounted on the Inner face of each shell and a flexible diaphragm secured between said shells and guards, the movement of said diaphragm being automatically controlled by the pressure of the water within the boiler, and meuns for opening and closing the valve in the caid steam supply pipe, said means being operated by the movement of said diaphragm.
11. The combination with a boiler including a valved steam supply pipe to a pump, of a feed regulator for the boller connected therewith and comprising a casing formed of the upper and lower shells. a slgeleton guard mounted on the inner face of each shell and a flexible diaphragm secured betwern said shells and guards. the movement of said diaphragm being automatically controlled by the pressure of the water within the boiler, means for opening and closing the valve in said steam supply pipe, said means being operated by the movement of said diaphragm, and means for adjusting the vertical position of the regulator with respect to the boiler.
12. The combination with a voiler including a valved steam supply pipe, of a feed regulator comprising a casing and upper and lower vertically disposed pipes connected therewith. and horizontal pipes connecting sald vertical pipes with the boller, the joints between the several pipes being swlvelled to permit the regulator to be raised or lowered by means for raising or lowering the regulator, a flexible diaphragm mounted in the casing and adapted to be automatically operated for opening and closing the valve in said steam boiler supply pipe, and means being operated by the movement of the diaphragm.

\section*{No. 101.826. Cover for Sap Bucketa. Couvercle pour seaux d sève.}

George Adams, Franklin Center, Quebec, Canada, 30th October, 1906; 6 years. Filed 23rd May, 1906. Recelpt No. 136,169.
Claim.-1. A soap bucket cover provided with a sleeve on one side, and provided with a transversely extending ralsed portion, and provided with a rolled curved flange on its under sidc, and sccuring means carried by the curved olled flange.
2. In combination with a sar bucket cover having a rolled flange on its under side, a curved body disposed beneath the rolled flange and provided with resilient arms.

No. 101,827. Sap Spout. Couttiere d sève.

Joseph Clark, Richford, Vermont, U.S.A., 30th October, 1906;
6 years. Filed 30th July, 1906. Receipt No. 138,241.
Claim.-1. A sap spout having a cup on its under side in communication with its bore and a partition over the sald up with its lower end in the cug.
2. A sap spout having a cup on its under side in comaunication with its bore and a partition across the bore over the cup having its lower end within the cup and notched.
3. A sap spout comprising a rear portion having a cylinirical bore, a trough-shaped front portion lower than the rear portion, a cun connecting the trough and the rear portion, and a partition in rear of the trough with its lower end within the cup.
4. A sap spout having a rear portion provided with a longitudinal bore, a cup on its under side in communication with said bore, and a partition extending across the front cnd of the bore and having its lower end within the cup and provided with a V-shaped notch.

No. 101,828. Injector. Injecteur.

George H. Boetcher, Cambridge, Ohio, U.S.A., 30th October, 1906; 6 years. Filed 9th October, 1906. Recelpt No. 140,162.
Claim.-1. An injector comprising a nozzle, a conduit into which the nozzle extends and which is provided with an opening beside said nozzle into the outer air, a casing adapted to contain a body of liquid and having a liquid discharge opening and an air discharge opening and into which the conduit extends. and a sleeve surrounding the end of the conduit within the casing and being provided with an onening at the side of the conduit end.
2. An injector comprising a nozzle, a conduit into which the nozzle extends and which is provided with an opening besides said nozzle into the outer air, a casing adapted to contain a body of liquid and having a liquid discharge opening and an air discharge opening and into which the conduit extends, and a sleeve surrounding the end of the conduit within the casing and flaring outwardly into close proximity with the casing and being provided with an opening at the side of the conduit end.

No. 101,829. Bouquet Holder. Porte-bouquet.

John Burdick, Browning, Montana, U.S.A., 30th October, 1906 ; 6 years. Filed 4 th September, 1906. Receipt No. 139,257.
Claim.-1. A device of the class described comprising a hollow body portion including two sections hinged rugether at their lower ends for movement of their upper ends toward and away from each other, means for holding the sections yieldably with their upper ends separated, means for holding the sectlons with their adjacent edge portion in mutual engagement, absorbent linings for the sections, and flanges carried by the upper ends of the sections and extending outwardly, therefrom, said sections and their respective flanges being each formed from a single piece of metal, the body portion being open at its upper end.
2. A device of the class described comprising two transversely semi-circular sections rounded at their lower ends and open at their upper ends, a hinge secured to the rounded portions of the sections for movement of the sectlons into and out of engagement with each other, said sections being cut away to recelve the hinge, means for holding the sections with their edge portions in mutual engagement, absorbent linings for the sections, an outwardly extending flange carried by the upper end of each section, each of said sections and its flange being formed of a single piece of metal, and means for holding the sections yieldably with their edge portions in spaced relation.
3. A boquet holder comprising a body portion including two sections hinged together at their lower ends for movement into and out of operative position, said body portion belng adapted for engagement in the neck of a vase, outwardIv extending flanges carried by the outer ends of the sections and arranged to rest upon the neck of a vase in which the body portion is engaged, means for holding the sections yieldably in operative position, a latch arranged to hold the sections in operative position, absorbent linings for the sections, and pins carried by the sections and extending thereinto for the engagement of plants disposed within the holder to retain sald plants in position.

No. 101,830. Feed Water Regulator. Régulateur d'eau d'alimentation.

Charles H. Chandler, Seattle, Washington, U.S.A., 30th October, 1906; 6 years. Filed 24th July, 1906. Recelpt No. 138,118.
Claim.-1. A feed water regulator comprising a receptacle, flexible pipes connecting the receptacle with a boller, a lever carrying a weight on one of its arms, supporting connection between the receptacle and the other
arm of said lever, an oscillating valve, a lever handle for the valve, means for adjustably regulating the amount of opening and closing of said valve, and operative connection between said lever and the handle, substantially as described.
2. In an apparatus of the class described the combination with a vessel, and a water receptacle connected to the vessel by two flexible pipes being respectively connected to the vessel at points above and below the normal level of the water therein, of a valve, operative connection between said receptacle and the valve whereby the latter is caused to reduce the opening of the valve through a descending movenent of the receptacle, means to further open the valve when the receptacle ascends and means to regulate the amount of both the closing and opening movements of the valve, substantially as described.
3. In apparatus of the class described the combination with a vessel, and a water receptacle connected to the vessel by two flexible pipes, said pipes being respectively connected to the vessel at points above and below the normal level of the water therein, of a valve, operative connection between said receptacle and the valve whereby the latter is causcd to reduce the opening of the valve through a descending movement of the receptacle, means to further open the valve when the receptacle ascends, means to regulate the amount of both the closing and opening movements of the valve, and means to cause the yalve actuating means to operate to a limited extent independentiy of the valve, substantially as described.
4. In apparatus of the class described the combination with a vessel, and a water receptacle connected to the vessel by two flexible pipes, of a valve, a handle fixedly secured to the valve and provided with a slot inclined from a radial line projected through the valve axis, sald slot terminating adjacent of the valve in an enlarged portion, a bar loosely mounted upon the spindle of said valve and provided with a slot, means for securing said handle to the bar, such means being also adapted when extended through said enlarged portion of the first-named slot to move to a limited extent with the bar independently of the handle, and operative connection between the said bar and the receptacle, substantially as described.
5. In combination with a vessel, a receptacle in communication therowith, a pivoted lever having a weight adjustably mounted with respenct to one end thereof and an adjustable connection with said receptacle at its opposite end, a valve and mechanism for operating said valve, and means in the plane of the fulcrum of said lever and operative with the l \(\in\) ver for actuating said mechanism.
6. In combination with a vessel a receptacle in communication therewith, a pivoted element connected to sald recoptacle at one end thereof and carrying a weight at the opposite end thereof, a valve, mechanism for operating said valve, and means located, in the plane of the fulcrum of sald element and operated by the element for actuating said mechanism.
7. In combination with a vessel, a receptacle in communication therewith, a pivoted lever adjustably connected to said receptacle at one end thereof and having a weight adjustably mounted with respect thereto at its opposite end, a valve with mechanism connected thereto for operating the same, and arms carried by the lever and located in the plane of the fulcrum thereof for operating mechanism.
S. In combination with a vessel, a receptacle in communication therewith, a valve, mechanism for operating said valve adjustably connected thereto, mechanism for supporting said receptacle adjustably connected thereto and means operative with said supporting mechanism for actuating said valve operating mechanism.
9. In combination with a vessel, a receptacle in communl cation therewith, a valve having mechanism adjustably connected thereto for operating sald valve, a pivoted lever for supporting said receptacle, and means carried by said lever In the plane of the fulcrum thereof for actuating said ralve operating mechanism.
10. In combination with a vessel, a receptacle in communication therewith, a valve having an element rigidly connected thereto, a pivoted element adjustably connected to said rigid element, and means for supporting sald receptacle and for operating said pivoted element.
11. In combination with a vessel a receptacle in communication therewith, a valve having an element rigidly connected to the spindle thereof and an element pivoted to said spindle and adjustably connected to said rigid element, and means supporting the receptacle and connected to sapivoted element for communicating movement of the receptacle to said pivoted element.
12. In combination with a vessel a receptacle in communication therewith, a valve having a handle mechanism ad justably connected to the handle for operating the ralvans a pivoted element for supporting sald receptacle, and meang mechanism.

No. 101,831. Axle Repairer.
Appareil à réparer les essieux.

Lottie G. Fader, Bayside, Nova Scotia, Canada, administratrix of the estate of Samuel L. Fader, deceased, 30th October, 1906; 6 years. Filed 24th March, 1905. Receipt No. 123,664.
Claim.-1. A broken axle repairer comprising a supplemental axle with lugs at one end and a spindle at the other, and clips and set screws for securing the same in place upon an axle.
2. A broken axle repairer comprising a supplemental axle with a spindle at one end and adapted to be secured to the underside of an axle, a plate with elongated slot, a clip and a set screw, as and for the purposes specifled.
3. A broken axle repairer comprising a supplemental axle with spindle at one end and lugs at the other end, set screws engaged in said lugs, a clip to embrace the axle and the supplemental axle and adjustable means for co-operation with said clip and axle, as set forth.
4. A broken axle repairer comprising a supplemental axle with spindle at one end and lugs at the other, set screws ongaged in said lugs to engage opposite faces of an axle, a clip, a plate with openings to receive the legs of the clip, one of said openings being elongated and a set screw engaged in a vertical extension of said plate, as and for the purpose set forth.
5. A supplemental axle having a spindle at one end and lugs at the other end, set screws engaged in said lugs to engage opposite faces of an axle, a plate with horizontal portion with openings, one of which is elongated and a vertical extension with an opening and a set screw engaged in the opening of the extension and engaged with one of the legs of said clip.

\section*{No. 101,832. Car Door Lock.}

Serrure de porte de chars.
Carl O. Johnson, Lynn, Massachusetts, U.S.A., 30th October, 1906 ; 6 years. Filed 4th July, 1906. Receipt No. 137,511. Claim.-1. In a lock device of the class described the combeination of a movable catch, a movable hook arranged to hold the catch in a predetermined position, and a gravity operating member for actuating the hook.
2. In a lock device of the class described the combination of a pivoted catch, a hook arranged to hold the catch in a predetermined position, and a pivoted gravity operating member for actuating the hook.
3. In a lock device of the class described the combination of a pivoted catch, an extension projected therefrom, a hook arranged to engage the extension aforesaid, and a movable gravity operating member engaging the hook for actuating the same.
4. In a lock device of the class described the combination of a nivoted catch, an extension projected therefrom, a hook arranged to engage the extension aforesaid, and a movable gravity operading member having a loop for engagement with the hook.
5. In a lock device of the class described the combination of a pivoted catch, an extension projected therefrom, a pivoted hook adanted to engage the extension aforesaid, a tall for said hook and a gravity operating member cooperating with the tail of the hook.
6. In a lock device of the class described the combination of a pivoted catch, an extension projected therefrom, a pivoted hook adapted to engage the extension aforesaid, a tail for said hook and a pivoted gravity operating member provided with a loop receiving the tail of the hook.
7. In a lock device of the class described the combination of a support, a catch pivoted thereto, a hook arranged to
hold the catch in a predetermined position, a tail extending from the hook, means for actuating the hook and a guide means co-operating with the hook.

8. In a device of the class described the combination of a movable car body, a door for said body, lock means for the door comprising a catch pivoted thereto, a hook arranged to engage the catch, a gravity operating member for actuating the hook and a connection between the catch and the car body.
9. In a device of the class described the combination of a movable car body. a door therefor, lock means for the door comprising a catch npivoted thereto, an extension projected from the catch, a pivoted hook engaging said extension, a tail extending from the hook, a pivoted gravity bar provided with a loop recelving the tall aforesald, a weight at one end ofe said bar and a connection secured at one end to the car body and passed through the door and connected with the catch aforesald.

No. 101,833. Railway Scales.
Balance de chemin defer.

Peter B. Kimpler, Ellinwood, Kansas, U.S.A., 30th October, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,376.
Claim.-1. In a platform scale the combination of two substantially parallel sets of cams, each cam having a pair of trunnions, bearings for the trunnions, the inner trunnion being projected and provided with a terminal socket, crossbars received within the sockets of the opposite trunnions, detachable fastenings connecting the trunnions and the crossbars, a platform supported upon the cams, arms carried by the crossbars and means connected to the arms for rotating the crossbars.
2. In a platform scale the combination of two series of rotatable cams, crossbars connecting the corresponding cams of the two series, arms carried by the crossbars, a connecting rod connecting one-half of the arms, another connecting rod connecting the other half of the arms, a windlass at each end of the device, a cable extending from one windlass to the inner end of the opposite connecting rod,
another cable leading from the same windlass to the inner end of the adjacent connecting rod, a guide for said other cable located beyond the inner end of the adjacent connecting rod, a cablo leading froin the other windlass to the outer end of the adjacent connecting rod, another cable leadIng from the latter windlass to the outer end of the opposite connecting rod, and a guide for said cable beyond the outer end of the other connecting rod.
8. In a platform scale the combination of abutments, cams rotatably mounted upon the abutments, crosshars connecting opposite cams, upright push bars, a platform supported upon the cams normally out of engagement with the push bars and capable of being lowered with the cams into engagement with the push bars, arms rising from the crossbars and terminating short of the platform, a connection rod connecting one-half of the arms, another connecting bar connecting the other half of the arms, a windlass at each end of the scale, a cable leading from one windlass to the inner end of the opposite connecting har, another cable leading from the same windlass to the inner end of the adjacent connecting bar, a guide for said cable located beyond the inner end of the adjacent connecting bar, a cable leading from the other windlass to the outer end of the other connecting bar, another cable leading from the said other windlass to the outer end of the opposite connecting bar, and a guide for said cable located teyond the outer end of said opposite connecting bar.

No. 101,834. Mud Guard for Vehicles.
Garde-grotte pour véhicules.

William Terrence McCaulay, Osgoode, Ontario, Canada, 30th October, 1906: 6 years. Filed 25th August, 1906. Recelpt No. 138,983 .
Claim.-1. In a vehicle mud guard the combination with the guard extending partially around the vehicle wheel, of a plurality of braces supporting the guard and means intermediate of the length of each brace for adjusting the length of the same.
2. In a vehicle mud guard the combination with the guard extending partially around the vehicle wheel, of a plurality of two part braces suppoiting the guard in position and means for adjustably holding the two parts of each brace together, as and for the purpose specifled.
3. In a vehicle mud guard the combination with the guard extending around the outside of the wheel and a side shield extending around the inner side of the wheel, of adjustable means for supporting both guards in position, as and for the purpose snecified.
4. In a rehicle mud guard the combination with the wheel, the axle and two clips thereof, a mud guard extending partially around the wheel, two braces connected to the innermost cllp. a third brace connected to the outer cllp, and means for adjustably connecting two braces of the guard, as and for the purpose specifled.
5. In a vehicle mud guard the combination with the wheel, axle, and two cllps thereof, a mud guard extending partially around the wheel, a brace connected to the outer clip and to the center of the mud guard, two braces connected to the inner clip and to the extremities of the mud guard, a third star-shaped brace having the arm thereof connected to the three braces thereof the innermost clip, as and for the purpose specifed.
6. In a vehicle mud guard the combination with the guard extending partially around the vehicle wheel, of adjustable braces for supporting the same in position, and a mud scraper secured to the mud guard at the rear thereof, as and for the purpose specified.
7. In a vehicle mud guard, the combination with the wheel, axle and two clips thereof, a mud guard semi-circular in cross sections extending partially around the wheel. straps secured thereto at the center and extremitles, a b:ace adjustably connected to the center strap and to the outer clip. two braces adjustably connected to the straps at the extremities of the guard and to the inner clip, a side guard secured to the straps and a star-shaped brace connecting the three braces and the inner clip, substantially as described.

No. 101,835. House. Maison.

Donald J. McKay, Winnipeg, Manitoba, Canada, 30th October, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,223.
Claim.-1. A house comprising a frame covered with wire netting and layers of straw or grass secured thereon, by clamping strips, for the purpose described.
2. A house comprising a frame, wire netting secured over said frame and a series of layers of straw or grass arranged on said netting, for the purpose set forth.
3. A house comprising a frame, a netting secured over said frame, a series of horizontal layers of straw or grass arranged on said netting and means for clamping said layers to said netting, for the purpose described.
4. A house comprising a Prame covered with wire netting. a series of horizontal layers of straw or grass arranged on said netting and strins secured over the ends of the straw or grass to the netting by wire loops, for the purpose described.
5. A house comprising a frame covered with netting. a series of horizontal layers of straw and grass arranged on said netting and means for clamping the butts of one layer under the heads of the next lager, for the purpose described.
6. A house comprising a frame covered with neting, a series of horizontal layers of straw or grass arranged over said netting and clamping strips adapted to clamp the butts of one layer under the heads of the next layer on said netting, for the purpose set forth.

Mo. 101,836. Folder for Umbrellan, Cames, Etc.
Porte-parapluie, etc.

Gusten Nordenstierna, Bristol, Pennsylvania, U.S.A., 30th October, 1906 ; 6 years. Filed 6th September, 1906. Recelpt No. 139,303.
Claim.-1. A holder for umbrellas, canes and the like, comprising a main frame having upright bars and a horizontal crossbar interposed between and connected to said upright bars, a bar connected at its ends to the upright bars and at intermediate points of its length to the crossbar and having intermediate \(U\)-shaped receivers and rounded projections between the mouths of said receivers and also having vertically disposed posts at opposite sides of the mouth of the recelvers, hollow retainers mounted on the vertical posts so as to swing horizontally and having their free ends disposed adjacent to each other and in the mouth of the receiver and springs contained in the hollow retainers and connected to the posts and engaging the retainers so as to return the said retainers to and normally hold the same in a position crosswise of the mouths of the receivers.
2. A holder for umbrellas, canes and the like comprising a receiver having a mouth, vertically disposed posts on the sides of the receiver, hollow retainers mounted on the vertical posts so as to swing horizontally and having their iree ends diapased adjacent to each other and in the mouth of the receiver, and springs contained in the hollow retainers and connected to the posts and engaging the retainers ao as \(t 0\) return the said retainers to and normally hold the same in a position crosswise of the mouth of the receiver.
8. A holder for umbrellas, canes and the like comprising a receiver, a mouth, posts on the sides of the receiver, hollow swinging retainers mounted on the said posts and having their free ends normally disposed adjacent to each other and in the mouth of the receiver and apring traps fixed to the posts and arranged in the longitudinal centers of the retainers with their forward ends in engagement with portions of the retainers.

\section*{To. 101,837. Table. Table.}

James Rozee, Yarmouth, Nova Scotia, Canada, 30th October, 1906; 6 years. Filed 10th September, 1906. Receipt No. 139,881.
Clatm. -The herein described new article of manufacture adapted to be converted for use as a work holder, lap board, a skirt fitting appliance and an invalid bed table, consisting of a table top having a continuous unbroken surface and provided at each corner with an opening, the openings at. each end of the table top being in transverse alignment. sleeves secured to the lower face of said top at each corner thereof and arranged in alignment with said openings and sleeves, means for bracing and connecting together each pair of legs arranged at each end of the table thereby causing when a leg is adjusted, the vertical adjustment of a pair
of legs, said means further constituting astop for limiting the vertical movement of the legs, and set screws extending

through each of the sleeves, and engaging the legs for securing them in adjusted position.

No. 101,838. Ventilator for Windows.
Ventilatcur pour fenêtre.

Augustus A. Stephens, Bellaire, Ohlo, U.S.A., 30th October, 1896; 6 years. Filed 21st August, 1906. Recelpt No. 138,892.
Claim.-The combination with a window casing having screened openings beneath its bottom which openings lead from the outside, of a perforated tubing arranged within the casing at the bottom thereof, sald tubing having a dependent pipe extension at each end adapted to extend through the bottom of the casing and having flaring mouths fitting over the corresponding openings beneath the bottom of the casing, a second perforated tubing arranged at the top of and within the casing and independest of the other tubing, the perforalions of the latter tubing being arranged in the bottom thereof, a pipe leading from one end of the upper tubing through the flooring of the casing, a fan in communication with the lower end of the last-named pipe, and means for operating the fan to draw warm air out of the casing through the tubing, the pipe and the lan.

\section*{No. 101,839. Wromght Metal Ferrule.}

Ferrure de métal.
The Cleveland Hardware Company, assignee of Sereno S. Holcomb. all of Cleveland, Ohio, U.S.A., 30th October, 1906 ;
6 years. Filed 17th October, 1906. Receipt No. 140,402.
Claim.-1. A wrought metal ferrule for single trees and the like comprising an approximately cylindrical body and two integral outwardly extended ears and a tubular rivet passing through said cars and having its ends upset against them, substantially as and for the purpose specifled.
2. A wrought metal ferrule for single trees and the like comprising an approximately cylindrical body and two in-

egral outwardly extending ears, one of said ears being bent over the edge of and against the face of the other ear, and a tubular rivet which passes through the three thicknesses of metal thereby produced and is upset at its ends to secure them together, substantially as and for the purpose specified.

No. 101,840. Smoke Congumer. Foyer fumivore.

B

The Perfect Simplex Combustion Company, Montreal, assignee of William McArdle, Montreal, Quebec, Canada, 30th October, 1906; 6 years. Filed 19th May, 1906. Receipt No. 136,066.
Claim.-1. The combination with a fire chamber having a bridge wall therein of a continuous transverse tuyere between the front of the fire chamber and the bridge wall and directing a blast within such chamber, and means whereby an oxygenic fuid is supplied to such tuyere, substantially as described and for the purpose set forth.
2. The combination with a fire chamber having a bridge wall therein, of a continuous transverse tuyere between the front of the fire chamber and the-bridge wall and directing a blast within such chamber, and means whereby pure air is supplied to such tuyere, substantially as described and for the purpose set forth.
3. The combination with a fire chamber having a bridge wall therein, of a continuous transverse tuyere between the front of the fre chamber and the bridge wall and directing a blast within such chamber, substantially as described and for the purpose set forth.
4. The combination with a fire chamber having a bridge wall therein, of a pair of converging plates between the front of the chamber and the bridge wall, means whercby air is supplied to the space between such plates, substan tially as described and for the purpose set forth.
5. The combination with a fire chamber, of a pair of converging plates within such chamber adjacent to the exit port thercof and disposed to direct a blast against the wall of such exit port, means whereby air is supplied to the spare between such plates and such plates being ar-
ranged to present ports whereby the gases of combustion flow into the said space, substantially as described and for the purpose set forth.
6. In a tubular boiler the bridge wall whereof has its front side concaved transversely to the fire chamber, the combination of a tuyere extending continuously from side to side of the combustion chamber and disposed to direct a blast against the said concaved wall, means whereby air is supplied to the tuyere, the said tuyere being provided with intake ports to allow the entry of the gases of combustion thereinto, substantially as described and for the purpose set forth.
7. In a tubular boiler the bridge wall whereol has its front side concaved transversely to the fire chamber, the combination of a pair of downwardly converging plates extending transversely to the chamber and disposed in direct a blast against such concaved wall, means whereby air is supplied to the space between the plates, and such plates being arranged to present ports whereby the gases of combustion flow into the sald space, substantially as described and for the purpose set forth.
8. The combination of a tubular boiler b, fire chamber \(c\), bridge wall d, concavity g. ash plt e, plates h, i, fues \(k k\), entry ports \(m, m\), baffle walls \(o, 0\), and curved passage \(r\). substantially as described and for the purpose set forth.

No. 101,841. Gate Valve. Soupape.

The Darling Pump and Manufacturing Company. Williamsport, assignee of Henry Nillholland, Reading, both in Pennsylvania, U.S.A., 30th October, 1906; 6 years. Filed 9th July, 190b. Keceipt No. 137,626.
Claim.-1. The improvement in gate valves herein described comprising the main ir body wedge block having a longitudinal borf or passage and provided in two opposite sides with openings forming bearings for the trunnions of the valve discs and having surrounding one of sald openings a projection whereon to support the bottom wedge block and provided on its two other opposite faces with inclined surfaces, the bottom wedge block having side plates provided with inclined faces co-operating with those of the body wedge block, and a front plate having an opening recoiving the projection on the main wedge block and fitting over said projection whereby the bottom wedge block may be supported thereon and directly by the main or body wedge block, the opposite valve discs or plates provided with inwardly pdojecting studs turning in the cearings in the body wedge block and the casing for aaid valve, all substantially as described, whereby the botom nedge block and the valve plates or discs may be supported directly by the body wedge block, substantlally as and for the purpose set forth.
2. The combination in the gate valve with the body wedge block of the valve discs or plates supported at the opposite sides thereof, and the bottom block supported directly by the body wedge block and operating between the same and one of the valve plates or discs, substantially as set forth. 3. The combination of the body wedge block having a longitudinal opening or bore and provided in its opposite sides with openings leading to sald bore and forming bearings for the studs of the valve plates or discs, the valve plates or discs arranged on opposite sides of the body wodge block and having studs projecting into the bearing openings thercof, and the bottom wedge block operating between the body wedge block and one of the valve plater and supported directly by the body wedge block, substantially as set forth.
4. The combination in a gate valve of parallel rotative discs having journal studs, the main wedge block having
a pertures for the reception of said studs and provided cround one of said apertures with a support for the bottom wedge block and bottom wedge block suspended from said support, substantially as and for the purpose set forth.
5. The combination in a gate valve of the valve plates and the body or main wedge block having on one side a projection forming a support for the bottom wedge block, the bottom wedge block supported on said projection and having an opening receiving the same and the opposite rotative discs, substantially as set forth.
6. The combination of the main wedge block, the opposite rotative discs, connections between the discs and the main wedge block, and the bottom wedge block operating between the main block and one of the discs an dsupported independently of the connections between the said discs and the body wedge block whereby the bottom wedge block is carried by the body independently of the rotative discs.

No. 101,842. Air Cooler for Engines.
Refrigérant d air pour machines.

George Wolke, Edward P. Kirby and William K. McLaughlin,
each an assignee of a third interest, all of Jacksonville, Illinols, U.S.A., 30th October, 1906 ; 6 years. Filed 22nd April, 1905. Receipt No. 124,488.
Claim.-1. An internal combustion motor having a crank chamber, a cylinder having heat radiating flanges or webs and communicating with sald crank chamber, air distributing tubes supported by the flanges and having discharge openings for projecting cooling streams or jets of air between the flanges to the heated parts of the motor, a piston in said cylinder, and valve mechanism co-acting with said piston to pump a cooling medium through said air distributing tubes, substantially as described.
2. An internal combustion motor having a crank chamber, a cylinder communicating with sald crank chamber, flanges surrounding the cylinder, air distributing tubes extending through the flanges and having discharge openings for projecting cooling jets or currents of air longitudinally along and against the heated portions of said cylinder, a piston in said cylinder, and valve mechanism co-acting with said piston to pump air into said distributing tubes, substantlally as described.
3. An internal combustion motor having a crank chamber a cylinder communicating with said crank chamber, flanges surrounding said cylinder, distributing tubes passing through said flanges and provided with jet orifices for directing cool ing jets of currents of air longitudinally along and against the heated parts of the motor, a piston in said cylinder, and valve mechanlsm co-acting with said piston and crank chamber to pump air into said distributing tubes, substantially as described.
4. An Internal combustion motor having a crank chamber, a cylinder provided with exterior flanges and communicating with said crank chamber, an air distributing chamber surrounding the cylinder at its inner end, discharge tubes supported by said flanges and leading from said distributing chamber longitudinally of the cylinder, and provided with jet orifices to direct cooling currents of air against the heated parts of the motor, a piston in said cylinder, and valve mechanism co-acting with said piston and crank chamber to
pump air into said distributing chamber, substantially as described.
5. In an internal combustion motor the combination of a cylinder, an annular air distributing chamber surrounding sald cylinder at one end, air discharge tubes projecting from said chamber and arranged around said cylinder, sald tubes belng provided with jet apertures to project streams of air against the cylinder, and means for forcing air into said air distributing chamber, substantially as described.
6. In an internal combustion motor the combination of a cylinder having heat radlating flanges upon its sides and head, and air discharge tubes extending through said flanges upon its sides and adapted to discharge air bo: ween the same and said flanges upon its head, substantially as described.
7. An internal combustion motor having a closed crank chamber, a cylinder in communication with said crank chamber, an annular air distributing chamber surrounding one end of said cylinder, a plurality of longitudinally extending air discharge tubes projecting from said distributing chamber and arranged around said cylinder to direct cooling currents of air against the heated parts of the latter, a piston in said cylinder, and valve mechanism co-acting with said piston and crank chamber to pump air into said distributing chamber, substantially as described.
S. An internal combustion motor having a closed crank chamber, a cylinder in communication with said crank chamber, heat radiating flanges or webs upon said cylinder, air discharge tubes projecting through sald fianges or webs and adapted to discharge sooling currents of air between the same and against the cylinder, an air distributing chamber in communication with said discharge tubes and said crank chamber, a piston in said cylinder, and valve mechanism coacting with sald piston and crank chamber to pump air into said distributing chamber, substantially as desoriber.
9. In an internal combustion motor the combination of a cylinder, a piston in said cylinder, flanges surrounding the cylinder, perforated alr distributing tubes passing through the flanges, a closed crank chamber in communication with said cylinder and provided with inlet and discharge openings, a crank shaft in said crank chamber operated by said piston, and a semi-circular disc secured to said crank shaft and adapted to alternately open and close said openings in sald crank chamber, substantially as described.
10. In an internal combustion motor the combination of a cylinder having heat radiating flanges, pir discharge tubes projecting through said flanges, and means for forcing air through said tubes, substantlally as described.
11. In an internal combustion motor the combination of a cylinder having annular radially projecting heat radiating flanges, longitudinally disposed air discharge tubes projecting through said flanges, and means for forcing air through said tubes, substantially as described.
12. In an internal combustion motor the combination of a cylinder having heat radiating flanges upon its sides and head, and air discharge tubes extonding through said flanges upon its sides and adapted to discharge air between the same and said flanges upon its head, substantially as described.
13. In an internal combustion motor the combination of a cyinder head having an exhaust valve, heat radiating flanges upon sald head and projecting radially from said exhausi valve, and air discharge tubes adapted to direct cooling currents of air between said flanges and against said discharge valve, substantially as described.

No. 101,843. Glags Retaining Device for Sashes. Appareil d retenir les vitres de chassis.

Christopher Columbus Chancey, Hartford, Alabama, U.S.A.; 30th October, 1906 ; 6 years. Filed 19th September, 1906. Receipt No. 139,627.
Claim.-A window sash having an undercut groove for the reception of putty \(B\) behind the glass \(C\), under the lip por-
ton \(A^{1}\) of the sash \(A\), substantially in the manner and for the purposes hereinbefore described and set forth.

No. 101,844. Oorn Harvester.
Moissonneuse à blé d'inde.

Frederick J. Cook, Ballard, Washington, U.S.A., 30th October, 1906 ; 6 years. Filed 21st August, 1906. Receipt No. 138,891.
Claim.-1. In a corn harvester the combination with longitudinally disposed snapping rolls and husking rolls, of a transversely extending guide between said rolls, and an endless conveyer for positively feeding ears or corn along said snapping rolls and through said guide, substantially as described.
2. In a corn harvester the combination of a wheeled frame, a pair of snapping rolls mounted thereon, a pair of husking rolls mounted longitudinally upon said frame to one side of sald snapping rolls. a guideway upon said frame between said paire of rolls, a fingered endless conveyer mounted upon said frame to travel along said snapping rolls and said guideway, and means for simultaneously operating said rolls and said conveyer, substantially as described.
3. In a corn harvester the combination of a wheeled frame, a pair of snapping folls mounted thereon, a pair of husking rolls mounted upon said frame to one side of the said snapping rolls, a guideway upon said frame between the adjacent inner ends of said pairs of rolls, an endless conveyer mounted upon said frame to travel along sald snapping rolls and sald guideway, a hopper at the lower end of sald husking rolls, a deflector plate for directing the ears of corn from said husking rolls into said hopper, and an endless conveyer for conducting the ears of corn from said honper to a suitable receptacle, substantially as described.

No. 101,845. Well Btrainer. Lien pour murs.

Edward E. Johnson, White Bear, Minnesota, U.S.A., 30th October, 1906; 6 years. Filed 6th October, 1905. Receipt No. 129,009.
Claim.-1. A strand or wire adapted to interlock on itself to form a strainer wall, substantially as described.
2. A strainer wall composed of parallel interlocking strands between which the water is admitted, substantially as described.
3. As a new article of manufacture, a strip or wire having longitudinally grooves and flanges constructed to interlock with the flanges and grooves of a corresponding parallel strip or portion to form a strainer wall, substantially as deseribed.
4. As a new article of manufacture, a strip or wire having a series of perforations and longitudinal grooves and flanges constructed to interlock with the flanges and grooves of a corresponding parallel strip or portion to form a stralner wall, substantially as described.
5. A strainer wall composed of adjacent interlocking portions or strips of wire between which the water is admittod, substantially as described.
6. A strainer wall comprising overlapping portions or strips of wire forming in effect outer and inner walls, a water admitting crevice belng provided between the strips in the outer wall and the inner wall being provided with nerforations communicating witll said crevice, substantially as described.
7. A well strainer comprising a spiral winding haviag interlocking convolutions between which the water is admitted, substantially as desoribed.
8. A well strainer comprising a spiral winding having overlapping convolutions forming in effect a cylinder having outer and inner walls, a water admitting cravice being provided between the convolutions in the outer wall and the inner wall being provided with perforations communicating with said crevice, substantially as described.
9. A well strainer comprising a cylinder formed of a spiral winding having overlapping convolutions provided with grooves and flanges interfitting with each other in adjacent convolutions and inlet apertures extending through the wall of the cylinder, substantially as described.
10. A well strainer formed of a spiral winding provided with water passages and having overlapping convolutions provided with grooves and flanges interfitting with each other in adjacent convolutions and spun or rolled together to prevent unwinding, substantially as described.
11. A well strainer comprising a cylindric strainer portion formed of a spiral winding. and end nipples having a screwthread engagement with the ends of the spiral winding, substantially as described.

No. 101,846. Life Saving Apparatun.
Apparedl de sauvetage.

Peter Mahoney, Brooklyn, New York, U.B.A., 30th October,
1906; 6 years. Filed 20th September, 1906. Receipt No. 139,661.
Olatm.-1. In a life saving apparatus for ships the comblastion of a kite, a kite line attached theroto, a tall block secured to the rigging through which tail block the kite lits is rove, a reel box and a frame adjustably mounted therela and carrying the kite line reel.
2. In a life saving apparatus for ships the combination of a kite, a kite line held on the ship and attached to the kite in the usual manner, a second line supported by eaid kite line and held on board the ship and forming the means for estab lishing connection between the ship and the shore.
shing connection between the ship and the shore.
3. In a life saving apparatus for ships the combination of a kite, a kite line held on the ship and attached to the kite in the usual manner and a second line supported by the kite line at a suitable distance from the kite, its free ond being weighted 60 that it can be lowered to the ground by paying it out from the ship faster than the fite line.
4. In a life saving apparatus for ships the combination of a kite and a kite line connected thereto and held on the shilp. a block suspended from the kite liae at a sultable diatance from the kite, the second or communicatiag line held of the ship and rove through sald block, a weighted lantern or other weight attached to the second line which when paid out faster
than the kite line drops to the shore and establishes communication between the shore and the ship.
5. In a life saving apparatus for ships the combination of a kite, a kite line, a tail block secured to the rigging through which tall block the kite line is rove and then connected to the kite in a usual manner, a block suspended from the said kite line at a suitable distance from the kite, a reel box adapted to be secured to the ship and containing an adjustable frame carrying the kite line reel and alsu a second line reel, the second line being rove through the block suspended from the kite line, a wind drag attached close to the end of the second line and a weighted lantern or other weight attached to the free end of the second line so that when the second line is paid out faster than the kite line, the former is brought to the ground and communication is established between the ship and the shore.
6. The combination with a life saving apparatus embodying a kite, a kite line attached thereto and a second line, af a float or drag pointed at both ends and connected at one end to the shlp end of said kite line and at the other end to a supplementary line carried aboard a ship and controlling said fioat or drag.

No. 101,847. Life saving Apparatus.
Appareil de sauvetage.

Peter Mahoney, Brooklyn, New York, U.S.A., 30th October, 1906: 6 years. Filed 20th September, 1906. Recelpt No. 139,662.
Claim.-1. In a life saving apparatus the combination of a kite or other aerial device, a kite line attached to the kite and a second or trip line adapted in conjunction with the kite line to lower the kite.
2. In a life saving apparatus the combination of a kite or other aerial device, a kite line connected to the kite, a second or trip line attached to the kite for the purpose of tripping or throwing the kite, both lines being controlled from the ship and adapted in conjunction with each other to lower the kite when desired.
3. In a life saving apparatus the combination of a kite, a \(k i t e\) une connected hereto, a reel box contalning a folding reel trame carrying reels upon one of which is wound the said kite line, a second or trip line attached to the kite and carried by said kite line and wound upon a reel in aald reel box, and a cord connecting said kite line and said trip line to each other, the cord being of a lower breaking atrength than the kite line or trip line.
4. In a life saving apparatus the combination of a kite, a kite line attached thereto, a block secured to the rigging through which block the kite line is rove, a second or trip line carried by said kite line and connected to the kite, a cord of lower breaking strength than the two sald lines and connecting said kite line and gaid trip line, and suspension hanks upon said kite line for carrying said trip line.
5. In a life eaving apparatus the combination of a kite, a kite line attached thereto, a block secured to the rigging through which blook the kite line is rove, a second or trip line carried by suld kite line and attached to the bottom of
the kite, a cord of lower breaking strength than the two said lines and connecting them to each other near the kite whereby the cord is snapped and the kite tripped and thrown to the ground when the trip line is held back.

No. 101,848. Water Feed Mechanism for Boilers.
Apparcil d'alimentation d'eau pour chaudidres.

Walter Andrew Moffat, Denver, Colorado, U S.A., 30th October, 1906 ; 6 years. Filed 9th October, 1905. Receipt No. 129,079.
Claim.-1. In a steam boller water feed the comblnation with the boiler, of a feed water receptacle, a feed water pipe connecting said receptacle and boiler and having a valve, a steam pipe leading from the boiler into the feed water receptacle and opening above the water line thereln, a valve for sald steam pine, and means whereby eald valves are simultaneously onerated.
2. In a steam boiler water feed the combination with the boller and its safety valve of a fced water receptacle. a feed water pipe connecting the water space of said receptacle with the water space of the boller, a steam pipe leading from the safety valve into said feed water receptacle and opening atave the high water line therein, a valve in sald feed water pipe, and means operated by the safety valve to actuate the valve in the feed water pipe.
3. In a steam boiler water feed the combination with the briler, of a feed water receptacle, a feed plpe connecting the water space of the said receptacle with the water space of the boiler. a steam plpe leading from the boiler into the feed water receptacle, a heating coll within the water space of said receptacle forming a continuation of sald steam pipe and opening above the high water line therein, and valve for controlling the said steam plipe and feed pipe.
4. In a steam boiler water feed the combination with the boller and its smoke stack. of a feed water receptacle surrounding the smoke stack, a feed pipe connecting the water space of sald receptacle with the water space of the boller, a steam plpe leading from the boller into the feed water receptacle, a heating coil within the water space of said receptacle forming a continuation of said steam plpe and openIng above the high water line therein, and valves for controlling said steam pipe and feed pipe.
5. In a steam boller water feed the combination with the boller and its stack, of a feed water receptacle having a flue passage therethrough and adapted to form an intermediate section of the stack. a feed water pipe connecting said receptacle and boiler, a steam pipe leading from the boiler into the feed water receptacle, a heating coll within the water space of sald receptacle surrounding the fiue passage thereof and opening above the high water line therein, the sald coil fcrming a continuation of said steam pipe, valves for controlling the steam pipe and feed pipe, and means whereby said valves are operated by the steam pressure within the boller,
6. In a steam boller water feed the combination with the boller, its safety valve and lever controlling the same, of a feed water receptacle, a feed water pipe connecting said receptacle with the boiler, a steam pipe leading from the safety valve into the feed water receptacle and opening above the high water line therein, a valve in the feed water plpe connected to the lever of the safety valve, a float within the boller connected to said lever and adapted when not sustained by the water within the boiler to actuate said lever by gravity and open the feed valve.
7. In a steam boiler water feed the comblnation with the boiler. its safety valve and lever for controlling the same, of a peed water receptacle, a feed water pipe connecting said receptacle with the boller, a steam pipe leading from the
safety valve into the feed water receptacle and opening above the high water line therein, a valve in the feed water pipe connected to the lever of the safety valve, and means for operating said lever manually.
8. In a steam boier water feed the combination with the boiler and its safety valve, of a feed water receptacle having a feed water pipe connecting the same and the boiler, a steam plpe leading from the safety valve into the feed water re\(c \in p t a c l e\) above the high water line thereln, and a safety valve for controlling the steam pressure within said receptacle.
9. In a steam boller water feed the combination with the boiler, of a feed water receptacle, a feed water pipe connecting said receptacle and said boller, a steam pipe leading from the boiler into the feed water receptacle and opening above the high water line therein, a valve for said steam pipe, an engine steam pipe communicating with the boiler and with said steam pipe, means for alternately cutting off said communications whereby steam for the engine may be taken from the water feed receptacle when the pressure therein is equal to or greater than that in the boller.
10. In a steam boller water feed the combination with the boiler and its safety valve, of a feed water receptacle, a feed water pipe connecting said receptacle and boller, a steam pipe leading from the safety valve into the feed water receptacle and opening therein above the high water line thereof, an engine steam pipe having communication with said steam pipe and with the boiler, a check valve for closing said communication with the steam plpe under the pressure direct from the boller, a valve for closing communication between the engine steam pipe and the boiler, a float within the feed water receptacle, and means actuated by said float and connected to the latter valve to close the same.
11. In a steam boiler water feed the combination with the boller and its safety valve, of a feed water receptacle wholly located above the boiler, a feed water pipe connecting said receptacle and boiler and having a valve, a steam pipe leading from the safety valve into the feed water receptacle and opening above the water line therein, and a heating coil within the water space of said receptacle and forming a continuation of the said. steam pipe.
12. In a steam boiler water feed the combination with the boiler and the smoke stack, of a feed water receptacle through which the smoke stack passes, a feed water pipe connecting said receptacle with the boiler, a valve in the feed water pipe, a steam pipe connecting the boller with said receptacle and opening above the high water line therein, a heating coil forming a part of said steam pipe, a valve in the steam pipe and means to operate both valves simultaneously and automatically.
13. In a steam boiler water feed the combination with the boller, of a feed water receptacle. a feed water pipe connecting said receptacle and boiler, a steam pipe leading from the boiler and opening into said receptacle above the high water line therein. a heating coll within said receptacle forming a continuation of said steam pipe, a water supply pipe opening into said receptacle, a valve in said supply pipe, a float within said receptacle. and means operated by said float to open and close the valve of the water supply pipe.
14. The combination with the feed water receptacle. of a water supnly pipe, a valve therein. a pinion mounted on the stem of the valve, a vertically movable yoke having one limb outside the receptacle and having a rack to engage the pinion and the other limb slidably projected into said recentarle and a float on the latter limb within the recentacle.
15. In a steam boller water feed the combination with the holler. of a feed water receptacle, a feed water pipe connecting sadd recentacle and boiler. a steam pipe leading from the boiler into the feed water recentacle and opening above the high water line therein. a supply dipe having a valve adapted to close the same by steam pressure within said receptacle, a second valve in said supply pipe. means for onening and rlosing said valve and a float within the receptacle for actuating said valve operating means.

\section*{No. 101,849. Rescue Broy. Bouéc de sauvetage.}

Jerusha C. Quarterman. Titusville, Florida, U.S.A., 30th October, 1906; 6 years. Filed 5th September, 1906. Receipt No. 139,283.
Claim. - 1 . A rescue buoy consisting of an inflated ring body, a netting surrounding said body, loops extending from the netting and forming a plurality of series of hand holds in addition to those provided by the netting, and a tow rope attacked to the ring, said tow rope being provided with an enclosed wire strand whereby to prevent said tow rope from becoming tangled.
2. A rescue buoy consisting of an inflated ring body, a netting encircling said body, a stay rope secured to the netting and peripherally encircling the said body, a marginal rope formed in a series of loops, said rope being attached to the stay rope between the loops, a second marginal rope formed
in a series of shorter loops. said loops crossing the spaces between the longer loops, the second rope forming the

shorter loops being also secured to said stay rope between the loops.
3. \(\Lambda\) rescue buoy consisting of an inflated ring body, a netting surrounding said body, a stay rope secured to the netting and peripherally surrounding said body, a marginal rope formed in a series of loops, which marginal rope between the loops is attached to the stay rope. a second marginal rope formed in a series of shorter loops which cross the spaces between the longer loops, the second rope having the shorter loops therein being also secured to sald stay rope, a ring secured to said stay rope, and a tow rope attached to said ring, the tow rope being provided with an enclosed wirt sirand whereby to prevent the tow rope from becoming tangled with itself.

No. 101,850. Wrapper Cord Knotter and Cutter. Fil ì cnvelopper, noucur et couteau.

John E. Quinn, Lime Springs, Iowa, U.S.A., 30th October, 1906;
6 years. Filed 7th September, 1906. Receipt No. 139,320.
claim.-1. In an implement of the class described, a casing, a shaft mounted therein and carrying at one end a cord knotter and at its other end a miter gear, a second shaft carrying a pinion and a miter gear meshing with that of the first shaft, a third shaft carrying a pinion and a comblned tension device and knife, and means for simultaneously driving both pinions.
2. In a device of the class described, a casing, a shaft nounted therein and carrying at one end a knotter and at its other end a miter gear, a second shaft carrying a pinion and a miter gear meshing with that of the first shaft, a third shaft carrying a pinion of greater size than that of the second shaft and a combined tension device and knife, and a rack bar engaging the two pinions.
3. In an implement of the class described the combination with a handle, of a casing provided in its side and both ends with a cord guide, a shaft journalled in the casing and carry ing at one end a cord knotter arranged in the line of the cord guide and at its other end a miter gear, a second shaft carrying a pinion and a miter gear meshing with that of the first shaft, a third shaft carrying a pinion and a combined tension device and knife, a rack bar projecting transversely through the casing and engaging the pinions, and a spring pressed arm for actuating the rack bar.
4. In an implement of the class described the combination with a handle, of a casing provided in its side and both ends with a cord guide, a shaft mounted within the casing and carrying at one end a cord knotter arranged in the line of the gulde and at its other end a miter gear, a second shaft carrying a pinion and a miter gear meshing with that of the first shaft, a third shaft carrying a pinion and a combined tension device and knife provided with a cord engaging beak,
stationary members disposed on each side of the tension device and co-acting therewith, and a rack bar engaging the pinions.
5. In an implement of the class described the combination with a handle, of a casing secured thereto and provided with a lateral cord guide, frame members secured within the casing, a pair of shafts journalled in the frame, and carrying intermeshing miter gears, a knotter carried by one of the shafts, a pinion carried by the other shaft, a third shaft carrying a pinion and a combined tension device and knife a rack bar meshing with the two pinions, and a spring pressed arm for actuating the rack.

No. 101,851. Lawn Mower. Faucheuse de pelouse.

John H. Seip, Peckville, Pennsylvania, U.S.A., 30th October, 1906; 6 years. Filed 13th August, 1906. Receipt No. 138,628.
Claim.-1. The combination with a frame having a finger bar and a pair of branches extending rearwardly therefrom, said branches having a cross connection therebetween, of a reciprocating cutter bar on the finger bar, having a socket in the top, a lever pivoted on the cross connection between the branches and having a head fitting in the socket, a hand crank and crank disc mounted on the frame and having gearirg therebetween, and a tumbling rod located between said branches and connecting the crank disc and the lever.
2. The combination with a frame comprising a finger bar, branches extending rearwardly therefrom and united at a reck, a bandle connected to and offset on one side of the neck, a bearing frame offset on the other side from the neck, a crank shaft and gear mounted on said frame, a shaft mounted on a bearing on the neck and having at one end a pinion meshing with the gear aud at the other end a crank disc, a cutter bar on the finger bar, a lever pivoted between sajd branches and engaging the cutter bar, and a tumbling rod connecting the lever and crank disc and osclllating between said branches.

No. 101,852. Hay Rake and Loader.
Rateau d foin et monte-charge.

Lewis Shultz, La Harpe, Illinots, U.S.A., 30th October, 1906; 6 years. Filed 29th May, 1906. Recelpt No. 136,373.
Claim.-1. In a device of the class described, an inclined frame, an approximately horizontal frame connected therewith and having meaus for the attachment of draft, an axle supported for rotation, wheels upon sald axle, a rock shaft constituting a rake head supported for oscillation between said axle and the lower end of the inclined frame, curved rake teeth connected with said rake head and extending in
oferative position around the lower end of the inclined frame, transverse shafts journalled in the upper and lower ends of said inclined frame, sprocket wheels upon said shafts, an endless slatted carrier mounted upon said sprocket wheels, iransverse braces connecting the side members of the inclined frame between the upper and lower leads of the carrier, longitudinal floor slats mounted upon said transverse braces, transverse braces supported by the frame and above the upper lead of the endless carrier, longitudinal resilient compression bars supported by and connected with the under sides of said braces and disposed intercurrently with relation to the floor slats and the lower ends of said resilient bars being extended between and in rear of the curved rake teeth, sald compression bars co-operating with the rake teeth to convey material gathered by the latter between the upper lead of the carrier and said compression bars.

No. 101,853. Method of Converting Energy.
Méthode de convertir l'énergic.

Adolf Vogt, 149 Tulse Hill, Surrey, England, 30th October,
1906; 6 years. Filed 18th May, 1906. Receipt No. 136,050.
Claim.-1. A method of converting the chemical energy of fuel into the kinetic energy of a moving fluid and consisting ir burning the fuel by air under pressure and allowing the hot compressed fluid thus produced to expand and to pass through a regenerator whereby substantially the whole or a part of the sensible heat which the fluid still contains is recovered, substantially as described.
2. In a method of converting the chemical energy of fuel into the kinetic energy of a moving fluid and consisting in burning the fuel by air under pressure and allowing the hot compressed fluid thus produced to expand and to pass through a regenerator, causing the fluid that issues through the regenerator to pass through an injector, substantlally as and for the purpose set forth.
3. In a method of converting the chemical energy of fuel into the kinetic energy of a moving fluid and consisting in burning the fuel by air under pressure and allawing the hot campressed fluid thus produced to expand and to pass through a regenerator, causing a fluid to pass around the regenerator and subsequently to enter the combustion chamber, substantially as and for the purpose set forth.
4. In an apparatus for converting the chemical energy of fuel into the kinetic energy of a moving fluid and consisting in burning the fuel by air under pressure and allowing the hot compressed fluid thus produced to expand and to pass through a regenerator, the combination of a gas generator or other fuel supply, a combustion chamber having one or more nozzles for the expansive escape of gas and a regenerator whereinto the said nozzle or nozzles open, substantially as described.
6. In combination a compressor, a gas generator or other fuel supply, a combustion chamber, arrangements for distriand consisting in burning the fuel by air under pressure and allowing the hot compressed fluid thus produced to expand and to pass through a regenerator, an air compressor arranged to supply air under pressure to the generator or other fuel supply and to the combustion chamber directly or through the regenerator, substantially as described.
6. In combination, a compressor, a gas generator or other fuel supply, a combustion chamber, arangements for distributing air from the compressor to the generator or other fuel supply and the combustion chamber, a regenerator, an expansion nozzle or nozzles opening from the combustion chamber into the regenerator, an arrangement for passing fluid through the regenerator to other parts of the apparatus, a motor operated by the fluld that expands through the nozzle or nozzles, and suitably governed devices for controlling the said arrangement for distributing air and passing fluid, substantially as described.

No. 101,854. Bow Facing Oar. Ramcs.

Jacob William Wagner, Garrett, and Henry Bhenk, Ceder, both in Indiana, U.S.A., 30th October, 1906; 6 years. Filed 28th September, 1906. Receipt No. 139,870.
Claim.-1. In a bow facing oar the combination of an upright bracket provided at its ends with open socket bearings and at its central portion with laterally apertured lugs, a horizontal plate pivotally mounted in the bearings and lugs of said bracket, and provided upon its outer free end with a pivoted stirrup or gulde, and a two-part car whose handla section is fulcrumed near the inner edge of the said plate, and whose blade section is slidably mounted in the said guide and is pivotally connected at its inner end to the said handle section, all substantially as described.
2. The combination in a bow facing oar of an upright bracket having open socket bearings at its ends, and provided with laterally apertured lugs at its central portion, a horizontal plate resting in the socket bearings, and having an apertured lug wh!ch extends between the before-mentioned lugs, and a removable bolt extending through all of said lugs, and a two-part oar connected with the horizontal plate and supported thereby. whose handle section is fulcrumed near the inner edge of the said plate, and whose blade section is slidably mounted in the said guide, and is pivotally connected at its inner end to the said handle section, all substantially as described.
10. 101,855. Golf Oap. Chapeau de golfe.

Warren C. Ogllvie and James C. Coulson, Truro, Nova Scotla, Canada, 30th October. 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,667.
Cuim.-1. As an article of manufacture a golf cap with a llexible shield extending part way round and permanently attached to the front part of the interior of said cap, substantially as described and set forth.

\section*{170. 101,856. Windrow.}

Lonis Franzmeier. Newton. Wisconsin, U.S.A., 30th October, 1:006; 6 years. Filed 20th August, 1406. Recelpt No. 138,867.
finim.-1. A windrower comprlsing a bar for attachment to the rear of the thater bar of a mowing machine, slats havling their forward ends fastened to the bar first aforesaid and ruarardly extended on a horizontal plane below the same,
ho whermost slat being the shortest, the others of gradually

Increasing length, the longest crossed on the next two, the lallor being rearwardly divergent from one another and all

of them having forwardly bowed rear ends, and a plate surmounting the horizontal portions of the crossed slats.
2. A windrower comprising a bar for attachment to the rear of the finger bar of a mowing machine, slats having thelr forward ends fastened to the bar first aforesald and rearwardly extended on a horizontal plane below the same. the outermost slat being the shortest and rearwardly divergent from the one next outermost. the others of gradually increasIng length, the longrst crossed on the next two, the latter being rearwardly divergent from one another and all of them having forwardly bowed rear ends, and a plate surmounting the horizontal portions of the crossed slats.
No. 101,857. Wind Instrument. Instrument d pent.

Albert O. Paulson, Sharon, North Dakota, U.S.A., 30th October, 1906; 6 years. Fiked 3rd July, 1906 . Receipt No. 137,487.
Claim.-1. In a wind instrument, a plurality of piston valves, provided with both curved and transverse ports, adjustable to alter the lengths of the wind passage, there being the same number of reverse turns in all positions of the valves.
2. In a wind instrument, piston valves, each having a curred port corresponding to one of the alides, and provided with transverse ports, which are connected in the wind passage when the curved ports are moved out of communication therewith.
3. In a wind instrument, a cylinder, a ported plunger arranged therein, and a finger actuated stem disconnected from the plunger and serving as an operating means thereof.
4. In a wind instrument, a cylinder having a pivoted end member. a plunger arranged within the cylinder, a plunger elevating spring, and a finger actuated stem independent of said plunger.
5. In a wind insirument, a pair of tuning slides, of different lengths, means fir controlling the slides to permit simulianeous adjustment, and a valve having ports through which ctither slide may be connected in the wind paseage.
6. A wind instrument having valves provided with curved ports, said curved ports being adapted to conduct the wind from an upper to a lower tube, substantially as described.
-. In a wind instrument. a plurality of valves provided with both curved and transverse ports, said ports being alapte 1 to conduct the wind from an upper to a lower cube, ald valvers being adjustable to alter the lengths of the wind passage, there being the same number of reverse turne in all positions of the valves.

No. 101,858. Fruit Picking Bag.
Sac à ramasser les fruits.

James Utterback, Honeoye Falls, New York, U.S.A.. 30th October, 1906; 6 years. Filed 5th October, 1906. Receipt No 140,063 .
Claim.-1. A fruit picking bag having a closed top and a peir of mouths one of which is disposed at the front and the other at one side of the bag.
2. A fruit picking bag having a closed top, an open bottom and means for closing the same, and a pair of mouths one of which is disposed in front and the other at one side of the bag.
3. A frult picking bag having a pair of mouths arranged one in front and one at the side of the upper portion thereof, and means for holding the mouths open and permitting them to yield to pressure.
4. A frult picking bag having its upper end closed and its lower end open, a gathering cord combined with the lower end and carrying a catch, and means carried by the upper portion of the bag to be engaged by the catch thus to hold the lower portion closed.
5. A fruit picking bag having a closed top, a pair of mouths one of which is disposed at the side and the other at the tront of the upper portion thereof, keepers combined with the upper portion of the bag, and suspenders secured to the keepers.

No. 101,859. Fruit Gatherer. Jaffet.

James M. Chritton, Rockyford, Colorado, U.S.A., 30th October, 1906 ; 6 years. Filed 26th March, 1906. Receipt No. \(134,295\).
Claim.-1. In a device of the class described, a split receiver having its adjacent edges bent to form laterally extending flanges, and cutting blades carried by said flanges.
2. In a device of the class described, a split receiver provided with inwardly extending flanges, cutting blades secured to said flanges and a spring secured to the receiver and encircling the same.
3. In a device of the class described, a split receiver provided with inwardly extending flanges, cutting blades secured thereto, and a pin or rivet passing through said fingers at the bottom of the receiver and engaging the cutting blades

10-40
4. In a device of the class described, a split receiver formed of a single plece of spring metal the opposite ends of which are bent to form laterally extending fianges, vertically disposed cutting blades secured to sald flanges, and a pin passing through said flanges and cutting blades and forming a pivotal connection for both.
5. In a device of the class described, a split receiver havin: is adjacent longitudinal edges bent inwardly and provided with cutting blades.
6. In a device of the class described, a split receiver provided with a laterally projecting flange and having its adjacent longitudinal edges bent inwardly and provided with cutting blades, and a fruit containing receptacle engaging the annular flange of the receiver.

No. 101,860. Vehicle Wheel. Roue de voiture.

Marcellus. Bunker, Woburn, Massachusetts, U.S.A., 30th October, 1906; 6 years. Filed 15th August, 1906. Receipt No. 138,704.
Claim.-1. A vehicle wheel comprising in its construction a rim, a series of blocks adapted to slide radially to said wheel, the outer end of each of said blocks respectively projecting outwardly beyond the periphery of said rim, each of sald blocks having a radial post in the interior thereof surrounded by an annular recess, a series of radial pins each projecting into a recess in its respective post, a spiral spring located in each of said annular recesses encircling said post and acting to move its respective block outwardly, and means to limit the extent of said outward movement.
2. A vehicle wheel comprising in its construction a rim, a series of blocks adapted to slide radially to said wheel, the outer end of each of said blocks respectively projecting outwardly beyond the periphery of said rim, each of said blocks having a radial post in the interior thereof surrounded by an annular recess, a series of radial pins each adapted to guide its respective block in its radially sliding movement, a spiral spring located in each of said annular recesses and acting to move its respective block outwardly, and means to limit the extent of sald outward movement.
3. A vehicle wheel comprising in its construction a rim, a series of blocks adapted to slide radially to said wheel, the outer end of each of said blocks respectively projecting outFardly beyond the periphery of said rim, each of said blocks having a radial post in the interior thereof surrounded by an annular recess, a series of radial pins, cach fast to said rim and projecting into a recess in its respective post, a spiral spring located in each of said annular recesses and acting to move its respective block outwardly, and means to limit the extent of sald outward movement.
4. A vehicle wheel comprising in its construction a rim, a series of blocks adapted to slide radially to sald wheel, the outer end of each of said blocks respectively projecting wardly beyond the periphery of said rim, each of said blocks having a radial post in the interior thereof surrounded by an annular recess, a series of radial pins, each fast to said rim, and projecting into a recess in its respective post, a spiral spring located in each of said annular recesses and acting to move its respective block outwardly, and a cross pin fast to said pin and projecting into a slot provided in sald post.

No. 101,861. Wheel. Roue.

Charles F. Morohn, Milwaukee, Wisconsin, U.S.A., 30th October, 1906; 6 years. Filed 6th September. 1906. Recelpt No. 139,302.
Claim.-1. In a wheel the combination of a wheel body, a box adapted to recelve an axle, a pneumatic tube surrounding the box and resting against the wheel body, an annulus of resilient or springy material interposed between the box and the pneumatic tube, and rings of cushloning material disposed at opposite sides of the annulus and surrounding and extend-
ing radially from the box, the wheel body and the sald riags of cushioning material being so relatively arranged that the latter do not bear on the former sxcept when undue weight \(1: 3\) imposed on the box.
2. A wheel comprising a body containing a case baving side walls provided with central circular openings, a bor arranged in the case and having rings of resillent material es tending beyond the outer side and arranged in the same planes as the side walls of the case and loosely occupying the openings in said side walls, an inflatable tube surrounding the box and arranged in and against the case, and an annulus of resilient or springy material surrounding the box and interposed between the same and the inflatable tube.
3. A wheel comprising a body containing a case having gide walls in which are central circular openings and also having a circular wall and apertures therein, a box arranged in the case and having rings of resilient material extending beyond its outer side and arranged in the same planes as the side walls of the case and loosely occupying the openings in said side walls, an Inflatable tube surrounding the box and arranged in and against the case and having teats disposed in the apertures in the circular wall thereof. in combination with an axle occupying the box and having threaded portions. threaded discs mounted on the threaded portions of the axle and disposed at opposite sides of the case of the wheel, and anti-friction balls interposed between said discs and the ends of the box.
4. A wheel comprising a body containing a 'case, a box arranged in the case, an inflatable tube surrounding the box and arranged in and against the case, and an annulus of resilient or springy material surrounding the box and interposed between the same and the inflatable tube, in combination with an axle occupying the box, and discs fixed on the axle at opposite sides of the case of the wheel.
5. A wheel comprising a body containing a case having side walls provided with central circular openings, a box arranged in the case and having rings of resilient material extending beyond its outer side and arranged in the same planes as the side walls of the case and loosely occupying the openings in said side walls, an inflatable tube surroundigg the box and arranged in and against the case, and an annulus of resilient or springy material surrounding and held to the box and interposed between the same and the inflatable tube, in combination with an axle occupying the box, and discs fixed on the axle at opposite sides of the case of the
wheel.

\section*{TRADE-MARKS}

Registered during the months of August, September and October, 1906, at the Department of Agriculcure - Copyright and Trade-Mark Branch.

17732. CONTRACTORS' REPORTS. (Leaflet.) Muir \& Shaw, Montreas, Que., 31st Octoher, 1906.

Vol. XXXIV.-No. 11. NOVEMBER 30th, 1906.

\section*{NOTICE.}

All solicitors, agents or attorneys who, in circulars or advertisements, or otherwise, refer to the Commissioner or Dcputy Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

\section*{INVENTIONS PATENTED.}

SOTP.-Patents are granted for 18 years. The term of years for which the fee has been pald, in given after the date of the patent.

No. 101,862. Charn. Baratte.

William Wood Mellor and Frederic Nevile Baildon, assignee of half of the interest, Liverpool. England, 6th November, 1906; 6 years. Filed 8th October, 1906. Recelpt No. 140,143.
Claim. - 1. In apparatus for the separation of butter from cream or milk, in which a rotary wheel, drum or the like is employed, and revolves with a container or vessel, the construction of such container or vessel with openings such as referred to, through which air is freely admitted to and allowed to circulate through the vessel or container, as set forth.
2. In apparatus for the separation of butter from cream or milk, wherein such cream or milk is carried through air on the periphery of a wheel or drum, the construction of the centainer or vessel with air inlets at each side about the axis of the wheel or drum, and internal shelves or flanges projecting inwards from sald inlets, substantially as herein set forth for the purposes specified.
3. In apparatus for the separation of butter from cream or milk, of the kind herein referred to, comprising a lower part \(l\) constituting substantially half of same, and an upper cover, as \(r\), of similar form, fitting on the top of \(b\), and having air inlets 8 in its sides, substantially as set forth.
4. In apparatus for the separation of butter from cream or milk, of the kind herein referred to, the rotary wheel or device being mounted on an axle carried on a frame, hinged in supports parallel with same, whereby said wheel can be moved out of the milk or cream container of the apparatus by swinging said frame up, substantially as and for the pur poses described.
5. In apparatus for the separation of butter from cream or milk of the kind herein referred to, a lower container of hinged towards one end of same, and a swinging frame if carrying a wheel \(o\) drum \(e\) having hinged supports at the opposite side of the apparatus to the container hinge, whereby the said wheel or drum in belng moved out of the apparatus is swung in one direction, and the container \(b\) is swung in tipping it in the opposite direction, as set forth.
6. In apparatus for the separation of butter from cream or milk of the kind herein referred to, the arrangement of the rotary wheel or like device, in relation to the contalner, so that its periphery at the point nearest the bottom of the milk or cream container, is disposed in close proximity to same, and further from the ends of same, as set forth.
7. In apparatus for the separation of butter from cream or milk, a rotary wheel or barrel constructed particularly as herein set forth with reference to the drawings.

No. 101,863. Pulley Block. Poulie.

Frank W. Carter and Henry E. Mills, assignee of a half interest, both of San Diego. California, U.S.A., 6 th November, 1906; 6 years. Filed 17th October, 1906. Receipt No. 140,403.
Claim.-1. In an automatic safety pulley block the combination with a pulley block having a pivot and provided with curved slots arranged eccentrically in relation to sald pivot, of a cable sheave mounted on said pivot, a bodily shiftable or displaceable choke sheave adapted to bear on the cable, a lifter, a pivot for the choke sheave which passes through the slots and is connected to the lifter whereby the choke sheave may shift bodily, and means for holding the lifter with the choke sheave out of choking position.
2. In an automatic safety pulley block the combination with a pulley block having a cable sheave pivot and a cam surface disposed eccentrically to said pivot, of a cable sheave on said pivot, a bodily shiftable or displaceable choke sheave having means co-operating with the cam surface, and a combined lifter and choke breaker co-operating with sald choke sheave for shifting said choke sheave bodily and adapted for fulcruming on the pulley block.
3. In an automatic safety pulley block the combination with a pulley block having a cable sheave pivot and a cam surface arranged eccentrically to said pivot and also provided with slots of corresponding contour to the cam surface, of a cable sheave on sald pivot, a choke sheave adapted to bear on the cam surface and the cable, a combined lifter and choke breaker adapted for fulcruming on the pulley block, and a pivotal connection between the lifter and the choke sheave, said pivotal connection passing through the slots aforesaid.
4. In an automatic safety pulley block the combination with a pulley block having a cable sheave pivot or fulcrum and provided with a cam surface eccentrically arranged in relation to said pivot, of a lifter, a choke sheave connectel to said lifter and adapted to be wedged or crowded against the cable by the cam surface, and a catch for holding the lifter raised with the choke sheave out of operative contact with the cable.
5. In an automatic safety pulley block the combination with a pulley block having a cable sheave pivot or fulcrum and provided with a cam surface arranged eccentrically to said plvot or fulcrum, of a lifter having legs which straddle the pulley block and which is provided with a handle, a choke sheave connected to and lying between the legs of the lifter and adapted to be wedged or urged against the cable by the cam surface aforesaid, and a catch on the pulley block to engage the lifter and hold it and the choke sheave raised with the latter out of operative contact with the cable.

No. 101,864. Ohurn. Baratte.

John R. McConnell, Marysville, and John Kllburn, Fredericton, each an assignee of a fourth interest, and George W. Robertson, Marysville, assignee of a half interest all in New Brunswick, Canada, 6th November, 1906: 6 years. Filed 11th October, 1906. Receipt No. 140.214.
Claim.-1. A churn comprising base members, uprights and braces on the base members, transverse braces secured to the uprights, hinged stop members on the transverse braces, and a rockable receptacle carried on the uprights and provided with filing and decanting openings.
2. A churn comprising base members, uprights and braces on the base members, transverse braces secured to the uprights, a plurality of separately operable hinged stop members on the transverse braces. and a rockable receptacle carried on the uprights and provided with filling and decanting openings.
3. A churn comprising base members, uprights and braces on the base members. transverse braces secured to the uprighte hinged stop members on the transverse braces, a rockable receptacle carried on the uprights and provided with flling and decanting openings, and a single piece slotted partition removably disposed in the receptacle.

No. 101,865. Fulerwm. Porte.
The Simplex Rallway Appliance Company of Canada, Montreal, Quebec, assignee of Carl Edward Bauer, Hammond, Indiana, U.S.A., 6th November, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137,690.
Claim.-1. In combination with a brake beam, a fulcrum comprising an open sided clip adapted to fit over the beam and provided with projecting inner edges, a headed king post adapted to int such clip and securing means interposed between the said inner edges and the head of the king post.
2. In combination with a brake beam. a fulcrum comprising an open sided clip adapted to fit over the beam and provided with profecting inner edges, a headed king post adapted to revolubly int such clip and securing means interposed betownen the said inner edges and the head of the king post.
3. In combination with a brake beam, a fulcrum comprising an open-sided clip adapted to fit over the beam and provided

with projecting inner edges, a headed king post adapted to fit such clip, securing means interposed between the said inner edges and the head of the king post, and through holding means to secure the clip to the beam and hold the said securing means in place.
4. In combination, a supporting means \(U\)-shaped in section, a king post provided with a head fitting the supporting means, which head is shaped to be partially revoluble in the supporting means but to be positively stopped at a certaln point, by the engagement of the head with the sides of the supporting means, and means for securing the bead against longitudinal movement in the supporting means.
5. In combination a supporting means U-shaped in cross section, a king post provided with a head engaging the supporting means, which head has a short diameter fitting the inside width of the supporting means and a long diameter whereby the post will be positively stopped after a certain amount of revolution, and means for securing the bead against longitudinal movement in the supporting means.
6. In combination, a supporting means \(\mathbf{U}\)-shaped in cross section, a king post provided with a head fitting the supporting means, which head is a pointed oval with the short diameter approximately fitting the inside width of the supporting means, and means for securing the head in the supporting means against longitudinal movement.
7. In combination with a trussed brake beam, and opensided clip for the beam provided with inner projecting edses, a king post supporting member having an open-sided recess to engage the truss, a king post provided with a head engaging the clip and a bottom portion engaging the supportmas. member, and holding means interposed between the projecting edges of the clip and the head of the king post.
8. In combination with a trussed brake beam, an opensided clip for the beam provided with inner projecting edges. a king post supporting member having an open-sided recess to engage the truss, a king post provided with a head rotat. ably engaging the cllp and a bottom portion engaging the supporting member, and holding means interposed between the projecting edges of the clip and the head of the king post 9. In combination, a brake beam \(\mathbf{U}\)-shaped in cross section, an open-sided clip therefor, and a king post revolubly supported therein and provided with a head having stops adapted to engage the sides of the beam and limit the movement of revolution.
10. In combination, a brake beam \(U\)-shaped in cross section, and open-sided clip therefor, and a king post revolubly sup. ported therein and provided with a pointed oval head adapred in certain positions to be positively engaged by the sides of the beam whereby the post is positloned rotatively.

\section*{No. 101,866. Crane for Wagome. Cheore de wapon.}

Theobald M. Hackett, Albany, New York, U.S.A., 6th November, 1906; 6 years. Flled 29th August, 1906. Recelpt No. 139,065.
Claim.-1. A crane device for wagons and vehicles consist ing of a tubular member in operative connection with the vehicle aranged when swung to describe a portion of the arc oi a circle at least. a second tubular member arranged to act telescopically with the first-named tubular member, means for holding the second member securely in connection wilu and at a predetermined point with the first-mamed tubular member, a lever pivotally attached to sald second member and practically inclosed thereby when the lever is in its
inoperative position, all arranged and operating to lift objects, substantially as described.

2. A crane device for vehicles consisting of a member in cperative connection with the vehicle and arranged to swing into a practically vertical and into a practically horizontal position at will, and having means to secure the member in elther position, an extension piece for the member arranged to be made fast thereto automatically at will, a lever in operative connection with the extension piece and lying within the same when the lever is in its inoperative position, sub stantially as described.
3. A crane device consisting of a member arranged to swing into a practically vertical and into a practically horizontal position at will, and having means to secure the member in either position, an extension piece for the member arranged to be made fast thereto automatically at will, a lever in operative connection with the extension piece and lying within the same when the lever is in its inoperative position, substantially as described.

\section*{No. 101,867. Temperature Regulator. Régulateur de température.}

Thomas C. X. A. Berget, Paris, France, 6th November, 1906 6 years. Filed 12th October, 1906. Receipt No. 140,243
Claim.-1. Improved means for regulating the temperature inslde vehicles consisting in utilizing for this regulation the cold created by the expansion of a liquified or compressed gas contained in a reservoir, the gas outlet valve from which is controlled by a self regulating thermostat which opens the expansion valve so soon as the temperature exceeds a given limit and closes it so soon as the temperature has been brought back to the required value, substantially as described.
2. In an arrangement such as covered by claim 1, a self regulating thermostat connected to the doors of the vehicle in such a manner that it is confined, and consequently closes the expangion valve, so soon as the doors of the vehicle are opened.
3. An arrangement for regulating the temperature of vehicles, substantially as described.

\section*{No. 101,868. Temperature Regulator. Régulateur de température.}

Thomas C. X. A. Berget, Paris, France, 6th November, 1906; 6 years. Filed 12th October, 1906. Receipt No. 140,244 .
Claim.-1. In an arrangement such as that which forms the cbject of my application for a patent of even date herewith the employment of an electric current as intermediary between the self regulating thermostat and the expansion valve, substantially as described.
2. In an arrangement such as covered by claim 1, introducing an interval in the displacement of the electric contacts in such a manner as to give steadiness to the regulation.
3. An arrangement such as covered by claims 1 and 2 in which a valve actuated by means of an electro-magnet of which the current is contiolled by contacts and a ring actuted by stops with an interval between them and carried by the rod of a liquid thermometer or a Bourdon tube ther-
mostat, substantially as described and illustrated in the drawings.

4. Means for regulating the temperature in vehicles, substantially as described and illustrated in the drawings.

No. 101,869. Tenperature Regriater. Régulatewr de tempórature.

Fritz Kaeferle, Hanover, Germany, 6th November, 1906; 6 years. Filed 10th September, 1906. Receipt No. 189,389. Claim.-1. In an electro-magnetícally operated temperature regulating apparatus the combination of a two-seated valve, and an electro-magnet, substantially as set forth.
2. In an electro-magnetically operated temperature regulating apparatus, the comblnation of a two-seated valve firmly connected with the armature of an electro-magnet, and an electro-magnet placed outside the chamber containing the valve and the armature connected with the latter, the arrangement being such that the lines of force due to said electro-magnet act directly on said armature carrying the double seated valve through the partition by which the elec-tro-magnet is separated from the valve chamber, substantially as set forth.

No. 101,870. Tram Car Eafety Defice.

\section*{Appareil de sûreté pour tramioays.}

Hermann Deleré and Heinrich Leygraf, co-inventors, both of Marxloh, Ruhrort, Germany, 6th November, 1906; 6 years. Filed 8th October, 1906. Receipt No. 140,132.
Claim.-Safety device for tram cars, comprising in combination a catching irame A normallye held in inoperative position, a protecting netting \(B\) between said frame \(A\), two ejecting devices \(C\) fixed to the tram car and connected to aafd catching trame \(A\) and adapted to bring, when ejected the
latter instantaneously into its operative position, and an actuating device 1 ) adapted to be operated by the tram con-

ductor and thus to effect the ejection of the ejecting devices C, substantially as described and shown.

\section*{No. 101,871. Heating Furnace.}

Fournaise de chauffage.

Jullus F. Adams and F. O. Adams, co-inventors, both of A1legheny, Pennsylvania, U.S.A., 6th November. 1906; 6 years. Filed 16th October, 1906. Receipt No. 140,357.
Claim.-1. The combination of a combustion chamber, a fume drum above the combustion chamber, fume tubes connecting said chamber and drum, and air pipes extending through the tubes and drum.
2. The combination of a vertically open combustion chamber, a vertically open fume drum above the combustion chamber, fume tubes connecting the chamber and drum, the vertical openings in the chamber and drum affording frec circulation of air, and alr pipes extending through both the chamber and drum.
3. The combination of a combustion chamber. flue tubes rising therefrom, a gas burner within the combustion chamber having vertical passages in line with the flue tubes, and air circulating pipes extending through the combustion chamber, the burner passages and said tubes.
4. The combination of a combustion chamber, fume tubes rising therefrom, a fume drum into the bottom of which sald tubes open, and air circulating pipes extending through the combustion chamber and through said tubes and drum.
5. The combination of a combustion chamber, upwardly tapering tubes rising therefrom, a fume drum into the lower end of which the tubes open. and air circulating pipes exfending through the fume tubes and drum, said plpes being of such slze as not to wholly close the fume tubes.
6. The combination of a combustion chamber, fume tubes rising therefrom. a fume drum into the lower end of which the tubes open. a gas burner within the combustion chamber
and formed with vertical passages in line with the fume tubes, and air circulating pipes extending through the combustion chamber and the burner and through the fume tubes and drum.
7. The combination of a combustion chamber, a lume drum above the chamber and open from top to bottom for the circulation of air, fume tubes rising from and connecting the combustion chamber with the drum, and air circulating plpes extending through the tubes and through the inclosed portions of the drum.
8. The combination of a combustion chamber in form of a hollow square, a gas burner section in each side thereof, fume tubes rising from each side of the chamber, a fume drum into the lower end of which the tubes open, and air circulating pipes extending through the tubes and through the drum.
9. Improved heating apparatus comprising a combustion chamber, a fume drum above the chamber, a plurality of relatively small upwardly tapering fume tubes rising from the said chamber and communicating with the drum, and gas burning means within the chamber.
10. Improved heating apparatus comprising a combustion chamber of tube-like form extending around or inclosing a vertically open air space, a fume drum above the combustion chamber, the drum having an alr passage formed therethrough from top to bottom which is in line with the air space around which the combustion chamber extends, a plurality of upwardly tapering fume tubes connecting the chamber and drum, and gas burning means within said chamber.

No. 101,872. Nut Lock. Aırêtc-écrou.

3
3

Peter Emil Bagge, Moline, Illinois, U.S.A., 6th November, 1906; 6 years. Filed 10th October. 1906. Receipt No. 140,181.
Claim.-1. A lock nut having end sections b \(b^{1}\) internally screw-threaded and connecting pillars or posts \(c c\) the inner faces of which are screw threaded, the height of the pillars being approximately equal to the thickness of the sections b \(b^{1}\).
2. A lock nut comprising end sections \(\delta, b^{2}\), and a plurality of connecting posts or pillars \(c\), both said sections and the pillars being internally screw threaded to engage with a bolt, and the cross sectional area of the pillars or connecting parts being materially less than the cross sectional area of the end section \(b\) and \(b^{1}\) and the height of such pillars being approximately equal to the thickness of the end sections, substantlally as set forth.
3. A lock nut comprising the internally screw-threaded end sections \(b, b^{1}\), and the connecting pillars or posts \(c\). the latter being screw threaded and distorted, substantially as set forth.
4. A lock nut having end sections \(b\). \(b^{2}\), and the connecting ports or pillars \(c\), said parts being internally screw threaded and the said end parts being turned, about the axis of the nut relative to each other, whereby the connecting pillars or posts are twisted and distorted, substantially as set forth.
5. A lock nut comprising end sections separated from each other by spaces \(c\), and he pillars or posts connecting the ead sectlons of the nut and of less sectional area than the area of the nuts, the said connecting pillars or posts being distorted by a turning of one of the end sections of the nut relative to the other, whereby they are caused to engage with and blad upon the screw threads of the belt to which the nut may be applied, substantially as set forth.

No. 101,873. Pad for Horee Oollara.
Bourrelet de collier de cheval.

Delmont S. Brown, Watertown, New York, U.S.A., 6th November, 1906; 6 years. Filed 12th October, 1906. Receipt No. 140,258.
Clatm.-1. A horse collor provided with a pad comprising a sheet of fabric material having upon one face thereof a layer of curled hair, portions of the hair throughout the extent of the layer being passed through the fabric material whereby to secure the hair to the fabric, said layer being relatively thick along the longitudinal center and gradually diminishing in thickness toward the edges thereof, the edges of the fabric material beling secured between the edges of the face and back of the collar and the layer of hair being between the face and the filling of the collar.
2. A horse collar provided with a pad comprising a sheet of fabric material having on one of the faces thereof a layer of hair, said layer being secured to the fabric throughout the extent of the layer, said layer being relatively thick along its longitudinal center and gradually diminishing in thickness toward the edges thereof, the edges of the fabric material being secured between the edges of the face and back of the collar, and the layer of hair being between the face and the flling of the collar.
3. A horse collor provided with a pad comprising a sheet of fabric material having upon one face thereof a layer of hair, portions of the hair throughout the extent of the layer being passed through the fabric material whereby to secure the hair to the fabric, said pad being arranged between the face and the fllling of the collar.
4. A pad for horse collars comprising a sheet of fabric material having upon one face thereof a layer of cushioning material, portions of said material throughout the extent of the layer being passed through the fabric material whereby to secure said material to the fabric.
5. A pad for horse collors comprising a sheet of fabric material having upon one of the faces thereof a layer of hair, portions of the hair throughout the extent of the layer being passed through the fabric material whereby to secure the hair to the fabric, the edges of the sheet of fabric material being extended beyond the layer of hair to form a means whereby to attach the pad to the collar.

\section*{No. 101,874. Flour Sifter. Tamis d fleur.}

Carl A. Carlson, Underwood, North Dakota, U.S.A., 6tn November, 1906 ; 6 years. Filed 16th October, 1906. Receipt No. 140,351.
Claim.-1 A flour sifter comprising a flour receptacle with a hemisphere sieve in its lower portion and an agitator having wings moving near the inner surface of the sieve, said sleve having in its bottom a fixed integral reservoir for the sifting.
2. A flour sifter comprising a receptacle with a hemispheric sieve in its lower portion and an agitator having wings moving near the inner surface of the sieve, said sieve having in its bottom a fixed integral reservoir for the sifting, some of said wings being \(U\)-shaped or \(V\)-shaped so as as to gather the siftings speedily into the pit.
3. A flour sifter comprising a vessel or receptacle, a sieve therein and agitator above the sieve, a shaft fixed in the agitator and journalled in the sides of the vessel, a handle or hand hold on the receptacle, a spring pressed lever fulcrumed within operative reach of the fingers of the hand holding handle and operative connection between said spring and finger actuated lever and the shaft of the agitator, said operative connection consisting of a ratchet wheel fixed on
the end of the shaft and two spring pressed pawls pivotally carried by the finger operated lever and engaging opposite

edges of the wheel and operating alternately to keep the wheel in practically constant rotation.
4. A flour sifter comprising a vessel or receptacle, a sieve therein and agitator above the sieve, a shaft fixed in the agitator and journalled in the sides of the vessel, a handle or hand hold on the receptacle, a spring pressed lever fulcrumed within operative reach of the flingers of the hand holding the handle, and operative connection between said spring and finger actuated lever and the shaft of the agitator, said operative connection consisting of a ratchet wheel fixed on the end of the shaft and two spring pressed pawls pivotally carried by the finger operated lever and engaging opposite edges of the wheel and operating alternately to keep the wheel in practically constant rotation, said pawls having the guiding arms 15 straddling the edge of the wheel for the purpose set forth.

No. 101,875. Grain Drill. Semoir en ligne.

Frank E. Davis, La Crosse, Wisconsin, U.S.A., 6th November, \(1906 ; 6\) years. Filed 15th October, 1906. Receipt No. 140,299 .
Claim.-1. In a grain drill the combination of an independent drag bar pivoted at its front end so it will be free to swing vertically, a furrow opening disc set at an angle with respect to the line of draft and supported by the rear portion of the drag bar, and means independent of the other drag bars for angularly adjusting the drag bar about its front end to vary the angularity of the drag bar to vary the line of travel.
2. In a grain drill the combination of an independent drag bar, pivotal connection at its front end which leaves the bar free to swing vertically, a furrow opener sustained by the rear portion of the drag bar, and means independent of the other drag bars for varying the angularity of the drag bar about the pivot around which the drag bar swings vertically and whereby the line of travel of the opener can be varied.
3. In a grain drill the combination of an independent drag bar, a pivotal connection at its front end which leaves the bar free to swing vertically, a furrow opening disc sustained by the rear portion of the drag bar, and means independent of the other drag bars for varying the angularity of the drag bar about the pivot around which the drag bar swings vertically, and whereby the line of travel of the disc may be varied.
4. In a grain drill the combination of an independent drag bar, a fixed support to which the drag bar is pivotally connected at its front end so it can swing vertically, a furrow opener sustained by the rear portion of said drag bar and an adjustable connection between the drag bar and the support and independent of the other drag bars by which the angularity of the drag bar can be varied to vary the line of travel of the opener.
5. In a grain drill the combination of an independent drag bar, a fixed support to which the drag bar is pivotally connected at its front end so it can swing vertically, a furrow opening disc sustained by the rear portion of the drag bar at an angle with respect to the line of draft, and an adjustable connection between the drag bar and the support whereby the angularity of the drag bar can be varied to vary the line of travel of the disc.
6. In a grain drill the combination of an independent drag bar comprising two members laterally disposed with respect to each other, means whereby the drag bar can be pivotally connected to a support to swing vertically, a furrow opener sustained by the drag bar, and means adjustably connecting the members of the drag bar and whereby the line of travel of the opener can be varied.
7. In a grain drill the combination of an independent drag bar comprising two members laterally disposed with respect to each other, means for pivotally connecting the drag bar to a support so it will be free to swing vertically, a furrow onening disc sustained by the drag bar, and an adjustable connection between the members whereby the drag bar can be adjusted to vary the line of travel of the opener.
8. In a grain drill the combination of a drag bar provided with means at its front end whereby it can be pivotally connected to a support to swing vertically, a furrow opener sustained by the rear portion of the drag bar, a brace momber and an adjustable connection between the brace member and a drag bar whereby the line of travel of the opener can be varind.
9. In a grain drill the combination of a drag bar nrovided with means at its front end whereby it can be pivotally connected to a supnort to swing verticallv, a furrow opening disc sustained by the rear nortion of the drag bar. a brace member and an adjustable connection between the brace member and the drag bar whorebv the angularity of the drag bar can be varied to vary the line of travel of the dise.
10. In a grain drill the combination of \(n\) drag bar comprising two members adanted to be pivotally connected to \(a\) sunport and adiustably secured so the draz har can be adfusted aneularlv. and a furrow noener suctained he the dras bar and whereby the line of travel of the onener can be varied.
11. In a graln drill the combination of a drag bar comprising two members adanted to be pivotally connected to a supnort and adjustably secured together so the angularity of the drag bar can be varied. and a furrow opening dise supnorted by sald drag bar and whereby the line of travel of the dise can be varied.
12. In a grain drill the combination of a drag bar comorisline two members adanted to be nivotally connected to a sunnort and adjustably secured tocether so the angularity of the drag bar can be varied. a furrow opening dise and a sced boot, sald disc and boot being supported by said drag bar.
13. In a grain drill the combination of a bar provided with means whereby it can be pivotally connected to a support. a brace also provided with means whereby it can be pivot. ally connected to a support, an adjustable connection between sald brace and said bar whereby the angularity of the bar can be varied, and a furrow opener sustained by said bar.
14. In a grain drill the combination of a bar provided with means whereby it can be pivotally connected to a support. a brace also provided with means whereby it can be pivotally connected to a support, a bolt and sint connection between said brace and said bar whereby the angularlty of the bar can be varied. a furrow opener and a geed boot sustained by sald bar.
15. In a grain drill the combination of a drag bar, a disc. a boot having a channel therein extended to deliver the seed into tha furrow, and a scouring blade secured to the boot and extending upwardly from the toe of the boot on the outer sille thercof.
1is. In a gram drill the combination of a drag bar. a disc. a boot having a cbannel therein extended to conduct seed
into the furrow, and a blade secured to the boot and comprising a strip extending upwardly from the toe of the boot on the outer side thereof and a scraper extending upwardly and forwardly from the toe.
17. In a grain drill the combination of a drag bar, a disc, a boot having a channel therein extended to deliver seed into the furrow and having a wall at the side adjacent the disc and the lower portion of its outer side open, and a scouring blade extending upwardly from the tee of the boot and on the outer side of said opening.
18. In a grain drill the combination of a drag bar, a disc, a boot having a channel therein extended to deliver seed into the furrow, and having an enclosing wall at the side of the disc and the lower portion of its outer side open, and a blade comprising a strip extending upwardly from the toe of the boot and on the outer side thereof and a scraper strip extending upwardly and forwardly from the boot.
19. In a grain drill the combination of a disc, a bracket 1:: which the disc is journalled, a single drag bar to which said bracket is secured, and arranged at one side of the disc. and a seed boot at the other side of the disc, said bar haring an integral portion extending rearwardly of the bracket, and to which the boot is secured.
20. In a grain drill the combination of a concaro-convex disr, a bracket in which the disc is journalled. a single drag bar to which sald bracket is secured. and arranged at the concave side of the disc, and a seed boot at the convex side of the disc, sald bar having an Integral portion extending rearpardly of the brarket, and to which the boot is secured.
21. In a grain drill the combination of a concavo-coavex disc. a bracket in which the disc is journalled, a single drag bar to whtch said bracket is secured, and arranged at the concave side of the disc. a seed boot at the conver side of the disc, said bar having a portion extending rearwardly of the bracket and to which the boot is seoured. and a scouring blade secured to the outer side of the boot and having a forwardly and upwardly extending scraper strip.
22. In a grain drill the combination of a concavo-convex disc, a drag bar whereby the disc is sustained. said draf bar being arranged at the concave side of the disc. and having an integral portion bent into the concarity of the d!sc. and a seed boot gustained by said drag bar.
23. In a grain drill the combination of a concavo-convex disc. a bracket in which the disc is journalled, a drag bar to which sald bracket is secured arranged at the concave sid? of the disc and having an integral portion thereof bent irto the concavity of the disc and extended rearwardly of the bracket, and a seed boot secured to the rear end of gald bar.
24. In a grain drill the combination with a dras bar. of a disc, a hanger in which the disc is journalled secured to the drag bar. said drag bar being arranged at the concave side of the dise and having its rear integral portion bent uowardly, and a seed boot arranged at the other side of the lise and securer to the upwardly extending portion of the drag bar.
25. In a grain drill the combination of a concavo-convex disc, a bracket in which the dise is journalled, a drag bar to which sald bracket is secured arranged at the concave side of the disc and having an integral portion thereaf beat into the concavity of the disc and having also its rear end extended upwardly. and a seed boot on the convex slde of the disc and spcured to the rear pad of the drag bar.
2f. In a grain drill the combination of a drag bar. a disc and a bearing for said disc comprising a bracket having a wall with a central opening therein and a recess at each side of said wall. a stud having a lange fiting in one of said recesses and extending through said opening and haring a reduced portion, and a collar around said reduced partion and lying in the other recess. said stud being secured to revolve with the disc and having a shoulder, said collar fitting between said shoulder and the disc.
27. In a grain drill the combination of a drag bar a disc. and a bearing comprising a bracket secured to the dras bar. a stud journalled in sald bracket and having a non-circular portion extending into a central opening in the disc, and a collar adjacent the disc and fitting around sald portion. s.i." 'aving an annular rib fitting into a correspondiag groove in the bracket.
28. In a grain drill the combination of a draz bar. a diac and a bearing comprising a bracket secured to the drag bar. a stud journalled in said bracket and having a non-circular portion extending into a central opening in the disc, a collar alijacent the dise and fitting around said portlon, said collar having an annular rib fitting into a corresponding groow in the brarket, and a tie bolt securing the stud, collar and dise together.
29. In a grain drill the combiation of a drag bar. a disc. ard a bearing comprising a bracket and having a pecess at rach ind and a wall having an opeaias therein. atud having a flange fitting into one of said recesses and its central partion fitilag in said opening and having a mancircular
end, and a shoulder, and a collar held between said shoulder and the disc and having an annular rib lying in a groove in said wall.
30. In a grain drill the combination of a drag bar, a disc. a bearing bracket secured to the drag bar and having a recess at each end, and a wall having a central opening therein, a stud having a flange fitting into one of said recesses and its central portion extending through said opening and having a shoulder thereon, a collar held between said shoulder and the disc and having an annular rib fitting in a groove in sald wall, said collar having an annular groove into which a portion of said wall is extended.
31. In a drill the combination of a drag bar, a disc, and a bearing comprising a bracket, a stud journalled in said bracket and secured to revolve with the disc, a plate secured to the bracket and closing the bearing recess at one side of the pracket, and a packing between the plate and the bracket.
32. In a grain drill the combination of a drag bar, a disc, a bearing bracket adjacent the concave side of said disc and having a central opening therein, an enlarged recess at each end thereof, a stud extending through said opening having a flange fitting in one of said recesses and secured to revolve with the disc, a collar secured to revolve with the stud and fitting in the recess adjacent the disc, and a plate secured to the bracket and closing the opening at one end of the bracket.
33. In a grain drill the combination of a drag bar, disc, a bearing bracket adjacent the concave side of the disc having a central opening therein, and an enlarged recess at each end thereof, a stud having a flange fitting in one of said recesses and secured to the disc, a shoulder on said stud, a collar secured to revolve with the stud and adjacent the concave side of the disc and fitting into the other recess and having an annular rib fitting into a corresponding groove in the bracket, and a plate secured to the bracket and closing the bearing recess at one side of the bracket.
34. In a grain drill the combination of a drag bar, a disc, and a bearing comprising a bracket secured to the drag bar, a stud journalled in said bracket, an oil duct formed in the bracket and having an enlarged portion formed in the bracket and leading to the bearing surface therein, a closure for the oil duct and a cotter pin extending into said duct and impinging against the wall of said duct to frictionally secure the closure.
35. In a grain drill the combination of a drag bar, a disc, a bearing bracket secured to the drag bar, a stud secured to revolve with said disc and journalled in said bracket, an oil duct in the side of that portion of the bracket which lies adjacent the drag bar and a packing between the drag bar and the bracket.
36. In a grain drill the combination of a drag bar, a disc, a bearing bracket secured to the drag bar, a stud secured to revolve with the disc and journalled in said bracket which lies adjacent the drag bar, said drag bar being secured to the bracket at the side, thereof, and to extend across the open side of the oil duct.

\section*{1.e. 101,876. Nnt Lock. Arrête-écrou.}

Noah Howell, Baxter, Arkansas, U.S.A., 6th November, 1906; 6 years. Filed 8th October, 1906. Receipt No. 140,152.
Claim.-1. In a nut lock the combination of a bolt, a nut co-operating therewith, an inner washer member provided with an opeaing, meańs for preventing the inner washer member from turning, an outer washer provided with a tongue which passes through the opening in the inner washer, and fits against the inner face of said washer, and means for securing an interlocking connection between the nut and the outer washer member.
2. In a nut lock the combination of a bolt, a nut co-operating therewith, an inner washer member provided with an opening, means for preventing said inner washer from turning. an outer washer having a tongue which passes through the opening in the inner washer, said outer washer being 3lso provided with an elongated bolt recelving opening, and means for securing an interlocking connection between the outer washer and the nut.
3. In a nut lock the combination of a bolt, a nut co-operating therewith, an inner washer provided with an opening. means for preventing the inner washer from turning, an outer washer having a tongue which passes through the opening in the inner washer and fits against the inner face of said washer, said outer washer being also provided with an elongated bolt recejving opening, and means for securing an interlocking connection between the outer washer and the nut.
4. In a aut lock the combination of a bolt, a nut co-operating therewith, an inner washer provided with an opening. means for preventing the inner washer from turning, an outer washer havfag a tongue which passes through the opening in the inner washer and fits against the inner face
of sald washer, said outer washer being also provided with an elongated bolt receiving opening and a tongue projecting

from the outer washer member and bent outwardly against a side of the nut.

No. 101,877. Gate Por Elievatore.
Barrière d'ascenseur.

William D. Kehl, Reading , Pennsylvania. U.S.A., 6th November, \(1906 ; 6\) years. Filed 8 th October, 1906. Receipt No. 140.131 .
Claim.-1. In a safety gate mechanism for elevators, a gate operating arm pivotally mounted on the shaft frame adjacent to a landing, a curved spring lever also mounted upon said shaft frame in the plane of said pivoted arm and having an inclined inner surface upon which the free end of sald pivoted arm operatively rides and a contact device carried by he car and adapted to press upon the outer surface of sald spring lever in passing and to thereby operate said gate arm, substantially as set forth.
2. In a safety gate mechanism for elevators, a gate operating arm pivotally mounted on the shaft frame adjacent to a landing. a curved spring lever also mounted upon said shaft frame in the plane of sald pivoted arm and having its inner surface adapted to form an operating incline having a start-

Ing extension for the free end of the same, and a contact device carried by the car and adapted to press upon the outer surface of said spring lever in passing and thereby operate said gate arm, substantially as set forth.
3. In a safety gate mechanism for elevators, a gate operating arm pivotally mounted on the shaft frame adjacent to a landing, a curved spring lever also mounted upon said shaft in the plane of said pivoted arm having an inclined inner surface forming a track upon which the free end of said plvoted arm rides and oppositely inclined above and below the pivotal mounting of said arm and a contact plece carried by the car and adapted to successively press upon the oppositely inclined outer surfaces of said spring lever in passing either up or down and thereby reversely operate said gate arm, substantially as set forth.

No. 101,878. Radiator. Calorifère.

Thomas J. Kehoe, Dayton, Ohlo, U.S.A., 6th November, 1906; 6 years. Filed 16th October, 1906. Recelpt No. 140,349. Claim.-1. In a radiator, two tanks, a series of flat hollow sections arranged between the tanks, each section having connection at its respective ends with the adjacent tank and affording communication therethrough from one tank to the other, and a number of radiating plates, one in connection with each side of each section, and each plate having numerous protruding tongues which extend into the spaces between sald sections.
2. In a radiator, two tanks having a common support. and a multiplicity of fiat hollow sections arranged between the tanks, each section having connection at its respective ends with the adjacent tank and affording communication therethrough from one tank to the other, the sides of each ection having in connection therewith numerous tongues which protrude from the corresponding sides thereof.
3. In a radiator, a multiplicity of flat hollow sections two tanks, one having connection with the upper ends of said sections, and the other with the opposite ends thereof, each section affording communication therethrough from one tank to the other, and radiating plates in connection with the respective sides of said sections, each plate having numerous portions thereof pressed outwardly so as to protrude from the general plane of its surface.
4. In a radiator, two tanks having a common support and a multiplicity of flat hollow sections arranged between the tanks and each affording communication therethrough between said tanks, and with their respective front and rear edges ranging in common planes, the said edges of sald sections each being reinforced by forming the same with a lad seam.
5. In a radiator, a multiplicity of fiat hollow sections two tanks, one having connection with the upper ends of sald sections and the other with the opposite ends thereof, each section affording communication therethrough from one tank to the other, radiating plates in connection with the respective sides of said sections, and suitable pipe connections, one with each of sald tanks.
6. In a radiator, two tanks having a common support, a multiplicity of flat hollow sections arranged between the tanks and each affording communication therethrough between said tanks, and numerous tongues protruding externally from the flat sides of sald sections which extend into the spaces upon elther side of the corresponding section.

No. 101,879. Rubber Footwear. Chaussure de caoutchouc.

Peter MacAllister MacKaskie, Tonopah, Nevada, U.S.A.. 6th November, 1906; 6 years. Filed 8th October, 1906. Recelpt No. 140,122.
Claim.-1. In a rubber boot or shoe, exteriorly formed ventilating pockets located at the foot section and extending up to the body section, an auxiliary lining located in the body section and having series of ventilating chambers formed therein, extending to the upper portion of the body and being closed at their bottom and open at the top and provided with series of apertures communlcating with the interior of the body, the said pockets being likewise provided with communications with the foot section and with sundry of the chambers in the body section.
2. In a rubber boot or shoe, exteriorly formed ventilating pockets located at the foot section and extending up to the body section, the body section having serles of ventilating chambers formed therein, extending to the upper portion of the body and being closed at their bottom and open af the top, and provided with series of apertures communleating with the interior of the body, the said pockets being likewise provided with communications with the foot section. and with sundry of the chambers in the body section.
No. 101,880. Car Compler. Attelage de chars.

James E. Nisbet, Jacksonville, Alabama, U.S.A., 6th November, 1906; 6 years. Filed 16th October, 1906. Receipt No. 140,336 .
Claim.-1. In car couplings, a drawbar body, a coupling hook pivoted at each side of said body, one hook facing upward and the other downward, a stud projecting downward from each hook near its pivot, springs between these studs and fixtures to the aforesaid body actuating the hooks topard engagement, a reversing lever pivoted to a ixture of the car, connecting rods between the said studs and the respective ends of the reversing lever and means for connecting the lever with motive power, substantially as described.
2. In car couplings, a drawbar body, a coupling hook piroted at each side of the body, one hook facing upward and the other downward, an alr pipe attached vertically to the side of each coupling hook, the end of one of the said pipes being tapered to enter and the other to receive a corresponding pipe, the pipes on two corresponding hooks being located to engage each other when the hooks engage.
3. In car couplings, drawbars, coupling hooks pivoted thereon, pipes adapted to be coupled together and attached to the hooks, valves in the pipes, a crank arm for each valve and a brace pivoted to the hook to engage the crank pin of the corresponding valve.
4. In car couplings, coupling hooks hung to engage each other, pipes attached to the hooks and adapted to be coupled by the act of coupling the hooks, valves for the pipes, each valve having a crank arm with the crank pin in line of the car's travel and a brace on the hook opposite to each crank, the brace being adapted to receive and guide the crank pin.
No. '101,881. Combustion Apparatua. Appareil de combustion.

William H. Ricker, Cambridge, Massachusetts, U.S.A., 6th November, 1906; 6 years. Filed 10th October, 1906. Receipt No. 140,196 .
Claim.-1. In a furnace or heater the combination of a fire pot, means for admitting air to the upper part of said firepot, a conduit extending into said firepot and communicating therewith through a plurality of openings, a chamber communicating with said pot and said conduit, and means within said chamber to cause some of the heated gases to be drawn directly from said firepot through perforations in said casing into said chamber and then forced again therefrom into said firepot through said conduit.
2. In a furnace or heater the combination of a firepot, means for admitting air to the upper part of said firepot, a conduit extending into said firepot and communicating thereWith through a plurality of openings, air passages surrounding said firepot and communicating therewith through a plurality of perforations, a fan chamber communicating with said air passages, said conduit and through perforations in the casing thereof directly with the firepot, and a fan therein adapted to indraw the heated gases from the firepot and the heated air from the air passages and force them thoroughly mixed through said condult into said firepot.
3. In a furnace or heater the combination of a firepot, means for admitting air to the upper part of said firepot, a conduit extending lengthwise of said firepot and communicating therewith through a plurality of openings, a casing provided with a plurality of perforations communicating with the interior of said firepot, and means located within said casing for indrawing air and gases through said perforations and forcing same through sald conduit into said frepot.
4. In a furnace or heater the combination of a firepot, means for admitting air to the upper part of said firepot, a conduit extending lengthwise of said firepot and communicating therewith through a plurality of openings, a casing provided with a plurality of perforations communicating with the interior of said firepot, a side inlet to said casing for the admission of air thereto, and means located within said casing for indrawing air and gases through said perforations and forcing the same through said conduit into said frepot.
5. In a furnace or heater the combination of a firepot, means for admitting air to the upper part of said firepot, a conduit extending lengthwise of said firepot and communicating therewith through a plurality of openings. a casing provided with a plurality of perforations communicating with the interior of said firepot, a side inlet to said casing for the admission of air thereto, a water jacket for said casing, and means located within said casing for indrawing

11-2
air and gases through said perforations and forcing the same through said conduit into said firepot.
6. In a furnace or heater the combination of a firepot, means for admitting air to the upper part of said firepot, a conduit extending lengthwise of said firepot and communicating therewith through a plurality of openings, side air chambers provided with inlets communicating with said firepot, and means for drawing air and gases from said firepot into said chambers and forcing them therefrom through the openings in sajd condult in the bottom of said firepot into the same.
7. In a furnace or heater the combination of a firepot, an air chamber above said firepot, means for admitting air thereto, a perforated conduit beneath said firepot, and a fan for drawing the air from said chamber above the fuel in the firepot and in contact with the gases therefrom into said conduit to be forced therefrom into said firepot again.
8. In a furnace or heater the combination of a firepot, an air chamber above said firepot, means for admitting air thereto, means for regulating the admission of said air, a perforated conduit beneath said firepot, and a fan for drawing the air from said chamber above the fuel in the firepot and in contact with the gases therefrom into said conduit to be forced therefrom into said firepot again.
9. In a furnace or heater the combination of a firepot, a conduit extending into said firepot and communicating therewith through a plurality of perforations, air passages surrounding said flrepot and communicating therewith through a plurality of openings, an air chamber above said firepot, means for admitting air thereto, and means for indrawing the air from said chamber and products of combustion from said firepot through said passages and forcing them into the firepot again through said conduit.

\section*{No. 101,882. Fish Dressing Machine.}

Machine à préparer le poisson.

Edmund Augustine Smith, Seattle, Washington, U.S.A., 6th November, 1906 ; 6 years. Filed 17 th October, 1906. Receipt No. 140,375.
Claim.-1. In a fish dressing machine the combination with a carrier supported for movement, of means operated automatically during movement of the carrier for feeding the fish bodies, and meansl on the carrier for removing the bodies from said first means and holding the same to movement with the carrier.
2. In a fish dressing machine the combination with a carrier supported for movement, of means supported for movement toward and from the carrier for feeding the bodies, mechanism automatically set for operating said means, and means on the carrier for removing the bodies from said first means and holding the same to movement with the carrier.
3. In a flsh dressing machine, a carrier supported for rotating means for feeding a fish body to said carrier, means for operating said first means, and means on the carrier for removing the fish body from said first means and holding the same to movement with the carrier.
4. In a fish dressing machine, a carrier supported for movement, a feeding means mounted for movement toward and from said carrier means on the carrier for removing a body from said feeding means, and mechanism for operating sald feeding means controlled by a body arranged thereon to be fed.
5. In a fish dressing machine, a carrier supported for movement, a body feeding means mounted for movement toward and from said carrier, means on the carrier for removing a body from said feeding means, and mechanism for operating said feeding means set to operate by a body to be fed.
6. In a flsh dressing machine, a carrier supported for movement, a feeding means mounted for movement toward and from said carrier, means on the carrier for removing a body from said feeding means, normally inactive mechanism for operating said feeding means, and means controlled by a fish body arranged on the feeding means for setting said mechanism so that it will operate.
7. In a fish dressing machine, a carrier supported for movement, a feeding device supported for movement toward and from sald carrier, means on the carrier for removing a body from said feeding means, normally inactive mechanism for operating said device, and means for setting said mechanism so that it will operate, including a member arranged to be engaged by a body being inserted into said device.
8. In a fish dressing machine, a carrier supported for movement, a feeding device comprising a head supported to slide and provided with opposing grippers, means on the carrier for removing the body from between the grippers on said head and holding it to movement with the carrier, and means for operating said feeding device.
9. In a fish dressing machine, a carrier supported for movement, a feeding device comprising a head supported for movement toward and from said carrier and provided with forwardly converging yielding grippers, means on the carrier for removing a body from between the grippers on said head and holding it to movement with the carrier, and means for operating said feeding device.
10. In a fish dressing machine, a carrier supported for movement, a feeding device supported for movement toward and from sald carrier, means on the carrier removing the body from said feeding device, means for operating sald feeding device, and movable means for limiting the movement of a body being inserted in said device, said last means being normally secured against movement and related to said feeding device to be released during movement thereof.
11. In a flsh dressing machine, a carrier supported for movement, means supported to slide toward and from said carrier, grippers on said means for holding a body, gates arranged to limit the movement of a body being inserted between said grippers, said gates being normally secured against movement, and means on the carrier for removing the first body from said first means and holding the same to movement with the carrier.
12. In a fish dressing machine, a carrier supported for movement, a feeding device supported for movement toward and from said carrier, a feed regulating device in advance of said feeding device to limit the movement of a body being positioned on said feeding device, said last-named device being normally secured and arraneed to be moved from the path of said ferding device during the movement thereof, means for operating said feeding device, and means on the carrier for removing a body from said feeding device.
13. In a fish dressing machine, a carrier supported for retation, means rotatable with said carrier provided with a plurality of spaced projections, a body feeding device supported for movement toward and from sald carrier, means on the carrier for removing a body from the feeding device, and mechanism for operating said feeding device including a wiper arranged for engagement with the projections on sald rotatable means.
14. In a fish dressing machine, a carrier supported for rotation, a feeding device supported for movement toward and from said carrier, means on the carrier for removing a body from said feeding device, a rotatable element provided with spaced projections, mechanism for operating said device including a wiper, and means for moving sald wiper into and out of the path of the projections on said rotatable element.
15. In a fish dressing machine, a carrier supported for rotallon, a body feeding device supported for movement toward and from said carrier, means on the carrier for removing a body from said feeding device, mechanism connceted to the feeding device to operate the same, and means movable with the carrler for operating said mechanism.
16. In a fish dressing machine, a carrier supported for rotation, a body feeding device supported for movement toward and from said carrier. means on the carrier for gripping the body fed by said device, a means movable with the carrier and provided with spaced projections, mechanism for operating said device including a momber movable into and out of the path of the projections on said last means, and means controlled from the feeding device for setting sald member so that sald mechanism will be operated.
17. In a fish dressing machine, a carrier supported for rotation, a feed device supported for movement toward and from said carrier and being yieldingly held in retracted position, means for moving sald device toward the carrier, and means on the carrier for removing a body from said device.
18. In a fish dressing machine, a carrier supported for movement, a means slidably supported for movement toward and from said carrier for ferding a body into said last mrans consisting of gates, arms on said gates engaged by said fref means to prevent movement of the gates, means
for operating said fecd means, and means on the carrier tor gripping a body fed by sald feed means.
19. In a fish dressing machine, a carrier supported for rolation, means on the carrior for holding a body, a feed way extending at an angle to sald carrier, and spring presscl guide members supported above said feed way and consisting of segmental plates arranged to have a body on said rarrier moved therebetween, the lower end portion of said plates being curved outwardly.
20. In a fish dressing machine, a carrier comprising a hub and outwardly projecting arm on said hub, a seat for a nish body projecting from the outer end portion of said arm and gripping devices on said arm projecting on opposite sides of raid seat.
21. In a fish dressing machine, a carrier comprising a hub, an outwardly projecting arm on said hub, a seat for a fish body pivoted on the outer end of said arm, and means for securing said seat from movement.
22. In a fish dressing machine, a carrier provided with a seat for a fish body, gripping devices on opposite sides of said soat and yielding guards adapted to engage the fish body to hold the same from movement with said gripping device.
\(\because 3\). In a fish dressing machine, a carrier provided with a seat for a fish body, opposite pairs of gripping devices arranged to grip the body on said seat and yielding guards arranged at opposite sides of said seat between soid gripping devices.
24. In a tish dressing machine, a cutting device and guides for supporting a fish body to be fed to sald device, sald guides being spaced for the reception of a fln of the fish body therebetween and provided with means to cause the fish body to move upwardly on said guides as it is fed.
25. In a fish dressing machine, a cutting device and guldes for supporting a tish body to be fed to said cutting device, said guides being spaced for the reception of a fin of the fish body therebetween and provided with inclined portions asranged for co-action to efiect straightening of the fin disposed between said guides during movement of the fish body.
26. In a fish dressing machine, a cutting device and spaced guides for supporting a fish body to be fed to said cutting device, said guides having the contiguous edges of their forward ends converged and provided with upwardly inclined surfaces on opposite sides of said converging edge portions.
27 . In a fish dressing machine, a cutting device and concaved guides for supporting a body to be fed to said cuttlog device, said guides being spaced for reception of a fin of the fish body therebetween and provided at their forward end portions with upwardly inclined surfaces disposed in the path of the fish body, the contiguous edge portions of said guides adjacent said inclined surfaces being converged.
28. In a fish dressing machine, a cutting device, spaced guides for supporting a fish body to be fed to said cuttinz device having forwardly converged contiguous edges and upwardly inclined surfaces on opposite sides thereof and a guard having an upwardly inclined upper surface disposed beneath the converging edge portions of said guides.
29. In a fish dressing machine, a carrier supported for movement and provided with a seat and a device supported so as to be immovable with the carrier for centering a fish body on said seat, said device comprising opposite members connected to have equal lateral movement when a fish body is moved therebetween.
30. In a fish dressing machine, a carrier supported for movement and provided with a seat and a device for centering a fish body on said seat comprising members swingingly supportod on means immovable with the carrier, toothed bodies tixed on said members, said bodies being in mesh, and means on the lower portions of said members arranged to have the fish body pass therebetween.
31. In a fish dressing machine, a feedway, a carrier morable at an angle thercto and provided with a seat, gripping means on opposite sides of said seat, and means engaging the fish body as it moves upwardly with the carrier for forcing it into said rest.
:32. In a fish dressing machine, a revoluble carrier provided with a seat, means for supporting said carrier, a feed way extonding at an ancle to said carrier and yieldingly pressed membres ior centering a fish body as it moves to its seat on the carricr. said members being supported on a fixed part above said recd way and having thelr lower portions flared oul wardly.
33. In a fish dressing machine, a carrier supported for movement. means on the carrier for holding a body. a cutter secured to a fixed part and having a heel arranged in the path of travel of a body mounted in said means. the cutting cdge of the cutter being arranged above and in advance of said heel, and a guard for the cutting cdge of said cuttedisposed in front thereof for engagement with the fish body. 34. In a fish dressing machine. a carrier supported for movement. means on the carrier for holding a body. a cutting device secured to a fixed part and arranged in the path
of travel of a body mounted in said means and a rotary guard for the cutting device arranged to engage the first body in advance of said cutting device.
35. In a fish dressing machine, a carrier supported for movement, means on the carrier for holding a body, a cutter secured to a fixed part and having a heel arranged in the path of travel of a body mounted in said means, the cutting edge of the cutter being arranged above and in advance of said heel, and a guard for said cutter, said guard being supported for rotation to engage the fish body in advance of the cutting edge of said cutter
36. In a fish dressing machine, a carrier supported for movement, means on the carrier for holding a body, a cutting device secured to a fixed part and arranged in the path of a body mounted on said means, fin guides projecting forwardly of said cutting device and a guard for said cutting device arranged above said fin guides for engagement with the fish body
37. In a fish dressing machine, a carrier supported for movement, means on the carrier for holding a body, a fin cutter secured to a fixed part, means for guiding the fins to said cutter, and means for removing severed fins from about said cutter.
38. In a fish dressing machine, a carrier supported for movement, means on the carrier for holding a body, a fin cutter supported in the path of the carrier, means for supporting the fins severed by said cutter, and means for removing fins from said last means
39. In a fish dressing machine, a carrier supported for movement, means on the carrier for holding a body, a fin cutter supported in the path of the carrier, fin guides projecting forwardly of said cutter, a plate on one of said guides for supporting the fins severed by said cutter, and means for removing fins from said plate.
40. In a fish dressing machine, a carrier supported for movement, means on the carrier for holding a body, a fin cutter supported in the path of the carrier and rotatable means for removing severed fins from about said cutter.
41. In a fish dressing machine, a carrier on said frame for movement, a head supported on said frame and disposed in the path of said carrier, a cutting means mounted for ortation on said head and fin guides supported on said head for bodily movement toward and from one another.
42. In a fish dressing machine, a frame, a carrier supported on said frame for movement, a head supported on said frame and disposed in the path of said carrier, a cutting means mounted on said head for rotation and fin guides having curved stems slidably engaged with said head.
43. In a fish dressing machine, a frame, a carrier supported thereon for movement, means on the carrier for holding a body, a splitter arranged in the path of said carrier, means swingingly connected with the frame for supporting said splitter, and shoes on opposite sides of said splitter swingingly connected to said last means
44. In a fish dressing machine, a main frame, a carrier supported thereon for movement, means on the carrier for holding a body, a frame swingingly supported on said main frame, a splitter supported by said last frame, a yieldingly pressed means connected with said last frame for independent movement toward and from the carrier, and shoes on said last means disposed to engage the fish body to regulate the depth of cut of said splitter.
45. In a fish dressing machine, a frame, a carrier supported thereon for movement, a splitter supported on said frame for movement toward and from the carrier, a body entering device supported to the rear of said splitter, a spreader arranged between said splitter and body entering device, the rear portion of said spreader having outwardly flared portions arranged on opposite sides of said body entering device, and means on the forward portion of said spreader related to said splitter, for the purpose specified.
46. In a fish dressing machine, a frame, a carrier supported thereon for rotation, a splitter supported for movement toward and from the carrier, a body entering device supported to the rear of said splitter, and means supported from the frame and extending from the splitter to said body entering device and arranged to enter the fish through the cut made by the splitter.
47. In a fish dressing machine, a frame, a carrier supported thereon for movement on said carrier for holding a body, a splitter supported on said frame, and a presser arranged forwardly of the splitter and being supported for movement toward and from the same.
48. In a fish dressing machine, a frame, a carrier supported thereon for movement, means on said carrier for holding a body, a splitter supported on said frame for movement toward and from said carrier, and a presser arranged forwardly of said splitter and being supported for movement independently thereof.
49. In a fish dressing machine, a frame, a carrier supported thereon for movement, means on said carrier for holding a body, a splitter supported on said frame and a presser sup-
ported for movement toward and from said splitter and being arranged to engage a body in advance thereof
50. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body and an entrail dislodging device comprising co-acting rotatable members supported in the path of said carrier to enter the fish body.
51. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body and entrail disloging device supported in the path of said carrier comprising co-acting angularly disposed rotatable members having opposing gripping portions.
52. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body, a body entering device supported in the path of said carrier for movement toward and from the same comprising co-acting rotatable gripping members and means for rotating said gripping members.
53. In a fish dressing machine, a frame, a carrier supported thereon for movement, means on the carrier for holding a body, a hanger swingingly supported on said frame, a coacting body entering grippers rotatably supported on said hanger in the path of said carrier and means to rotate said grippers.
54. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body, a bracket supported for swinging, co-acting grippers rotatably mounted in said bracket, the axes of said grippers being at an angle to the axis of swing of said brackets, means to rotate said grippers and means to swing said bracket.
55. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body, co-acting rotatable angularly disposed grippers, means swingingly supported in the path of said carrier on which said grippers are mounted for rotation, and means to automatically swing said last means during movement of the carrier.
56. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body, co-acting rotatable angularly disposed grippers having meshing teeth arranged in the path of said carrier, a support for said grippers, means on which said support is swingingly mounted, means to rotate said grippers, and means to swing said last means during movement of the carrier.
57. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body, a rotatable body entering scraper supported in the path of said carrier, and rotatable means at opposite sides of said scraper for drawing the fish body thereover.
58. In a fish dressing machine, a carrier supported for movement, means thereon for holding a body, a body entering scraper supported in the path of said carrier, and rotatable means on opposite sides of said scraper between which the fish passes, the opposing sides of said last means moving toward the scraper, as specified.

No. 101,883. Planter. Plantoir.

Judah N. Taylor, Los Angeles, California, U.S.A., 6th November, \(1906 ; 6\) years. Filed 16th October, 1906. Receipt No. 140,341 .
Claim.-1. A roller having a seed chamber therein, a dropsing slide adapted to deliver seed through the periphery of said roller, an arm operatively connected with said slide, said arm extending across an end of said roller and moving therewith, and stationary operating means for said arm carried by said frame.
2. A roller having a seed chamber therein, a dropping slide acapted to deliver seed through the periphery of said roller
and an arm operatively connected with said slide, sald arm extending across an end of said roller and moving therewith, and antomatic operating means for said arm.
3. In combination a frame, a roller having a seeding chamber therein, and a dropping device adapted to deliver seed through the periphery of said roller, said dropping device including an operating arm extending across the end ot said roller and piroted thereto and a bevelled lug mounted on the frame in the path of sald arm to operate the same.
4. A roller having a seed chamber thercin, a soed valve in the periphery of said roller. a plunger having a pocket adapted to receive seed from said valve, said plunger being provided with a movable jaw to discharge teeth therefrom, a pivoted arm extrinding across the end of said roller and moving therewith, a frame, and a bevelled lug mounted on said frame in the path of said lever to swing the same.
5. In a planter. a roller having a sced chamber therein and a dropping device at one end, said roller baving peripheral walls increasing in thickness from the end at which the dropping device is located toward the other end.
6. A planter provided with a roller having a seed chamber therein. and a seed dropping device for discharging seed from one end of said chamber, said chamber bring of greater interior diameter at the end where the seed drophing device is located than at the other end.
7. In a planter, a roller having a seed chamber therein, a sted valve in the periphery of said roller, a plunger havink a pocket therein adapted to receive seed from said valve, an arm carried by said roller and pivoted thereto, said arm being adapted to move sald valve and open said plunger, a frame, and means carried by said irame for actuating said arm.
8. In a planter, a roller having a seed chamber therein, a seed valve in the periphery of said roller, a plunger having a nocket therein adapted to receive seed from said valve, an arm carried by said roller and pivoted thereto, said arm being adapted to move said valve and open said plunger, a frame, and a bevelled lug carried by said frame for actuating said arm.
9. In a planter, a roller having a seed chamber therein, a sced valve in the periphery of said roller, a plunger having a pocket therein adapted to receive the seed from said valve, an arm carried by said roller and pivoted thereto, said ar'm being adaptord to move said valve and open said plunfrer, a bevelled bracket hinged to said frame and means for swinging said bracket into and out of the path of said arm.
10. In a planter. a roller having a seed chamber therein, a seed valve in the periphery of said roller, a plunger having a pocket therein adapted to receive seed frgm said valve, an arm carried by sald roller and pivoted thereto, said aim being adapted to move said valve and open said plunger, a frame, means carried by sald frame for actuating said arm in one direction. and resilient means for restoring said valve and plunger to the normal position.
11. In a planter, a frame, a supporting shaft thercior and a roller mounted on said shaft provided with a seed chaml. \(口\) therein and inclosed by said frame, a dropipng devico adapted to dellver seed from sald roller, an arm extending across. moving with and pivoted to sald roller to operate said device. bevelled bracket mounted on the end of sald irame above the shaft and means extending inwardly from the top of the roller for moving said brackets into and out of the path of said arm.
12. In a planter, a frame, a supporting shaft therefor, a pair of rollers on sald shaft provided with seed chamber: therein and inclosed by said frame, a dropping device adapted to dellver seed from each roller, an arm extending across and moving with and plvoted to each roller to operate said device, bevelled brackets mounted on each end of said frame above the shaft, and means extending inwardly over the top of each roller for moving said brackets into and out of the paths of said arms.
13. In a planter, a frame, a supporting shaft therefor, a roller mounted on said shaft having a serd chamber therein. a seed dropping device adapted to deliver seed through the periphery of said roller. satid device comprising a dropping slide and arm for operating the same, and a plunger adapted to recoive seed from sald slide and provided with a movable jaw and arm for operating the same, an arm extending across the end of the roller pivoted thereto and moving therewith, said last-namod arm being connected with satil flrit-named arms to simultatheously operate the same, and a lug mounted on the irame in the path of the arm which extends across the end of the roller to operate the same.
14. In a planter, a frame, a supporting shaft therofor, a reller mounter on sadi shaft having a seed chatmber therein a zeed dropplng ellde in the periphory of satil roller. sald cllde having a slot, therethroumh. a portion of which is adaptcd to form a send pockot, a block atjustable along said slot t) Increase and diminish the slze of sild pocket, a hollow
rod extending to the end of the roller for operating the slide, an adjusting rod extending from the block through sald hollow rod to the end of the roller for adjusting said block, an adjusting nut inside said hollow rod and having a screw-threaded engagement with said adjusting rod and accessable at the end of the roller, and means for automatically reciprocating said hollow rod.

No. 101,884. Carrier and Dumping Devico.
Transport et appareil a bascule.

Martin J. Sylstad and Carl G. Rude, both of Sacred Heart. Minnesota, U.S.A., 6th November, 1906: 6 years. Filed 16th October, 1906. Recelpt No. 140,339.
Claim.-1. In a device of the class described, a track. a stop on the track, a carrier capable of longitudinal movement of the track, a pivotally mounted carrier box forming a portion of the carrier, a mechanism for locking the carrier box in an upright position, and means designed io be engaged by the stop for releasing the mechanism which folds the carrier box in an upright position for returning the box to its point of starting away from the stop.
2. In a device of the class described, an inclined track, a carrier capable of longitudinal movement of the track, a carrier box forming a part of the carrier, a stop on the track, a mechanism for securing the carrier box in an upright position relative to the carrier, means designed to engage the stop on the track for releasing the mechanism for holding the carrier in an upright position and allowing it to dump and to force the carrier back to its polnt of starting.
3. In a device of the class described, an inclined track. a carrier capable of longitudinal movement of the track. a carrier box forming a part of the carrier, an adjustable stop on the track, a mechanism for securing the carrier box in an upright position relative to the carrier. and means designed to engage the stop on the track for releasing the mechanism for bolding the carrier in an upright position and allowing it to dump and to force the carrier back to its point of starting.
4. In a device of the class described, an Incllned track, a carrier capable of longitudinal movement of the track. a carrier box forming part of the carrier, a stop on the track. a mechanism for securing the carrier box in an upright position relatlve to the carrier, and spring actuated means designed to engage the stop on the track for releasing the mechanism for holding the carrier in an upright position and allowing it to dump and to force the carrier back to its point of starting.
5. In a device of the class described, an Inclined track, ، carrier capable of longltudinal movement of the track. a carrier box forming a part of the carrier, an adjustable stop on the track, a mechanism for securing the carrier box In an upright position relative to the carrier, and spring actuated means designed to engage the stop on the track for releasing the mechanism for holding the carrier in an upright position and allowing it to dump and to force the carrier back to its point of starting.
6. In a device of the class described, a track, a stop on the track, a carrier capable of longltudinal movement of the track, a pivotally mounted carrier box forming a portion of the carrier, a mechanism for locking the carrier box In an upright position, means designed to be engaged by the stop for holding the carrier box in an upright position and for returning the box to its point of starting away from the stop. and means for retaining the carrier at lis inner limit of movement.
7. In a device of the class described, an inclined track, a stop near one end of the track, pulleys mounted on the track, a carrier support connecting the pulleys, hanger bars connected with the carrier support, a carrier box pivoted between the hangers and nearer its bottom portion than its top portion, a substantially semi-circular plate having a series of openings therein, a pin designed to pass through an opening in one of the hangers and into one of the openings in the semi-circular plate, aa spring actuated lever for maintaining the pin at its inner limit of movement, said lever designed to be engaged by the stop for taking advantage of the momentum of the carrier sliding from its inner limit to its outer limit of movement and return the same to its inner limit of movement.
8. In a device of the class described, a track, a stop on the track, a carrier capable of longitudinal movement of the track, a pivotally mounted carrier box forming a portion of the carrier, a mechanism for locking the carrier box in an upright position, means for holding the box in an upright position, a plvotally mounted forked lever connected with the said means, the forked portion thereof extending on each side of the track, and a spring for normally holding the lever away from the support to which it is pivoted, for the purposes stated.

\section*{No. 101,885. Apparatus for Burning Cement. Appareil d bruller le ciment.}

The Combustion Utilities Company, New York City, assignee of Byron E. Eldred, Bronxville, New York, U.S.A., 6th November, \(1906 ; 6\) years. Filed 7th August, 1906. Receipt No. 138,466.
Claim.-1. The herein described process of burning cement which consists in producing in operative relation to the cement forming material a region of relatively low temperature combustion suited to the calcination of the material and a distinct region of relatively high temperature combustion suited to the sintering thereof.
2. The herein described process of burning cement which consists in producing in operative relation to the cement forming material in successive portions of a stream of the material, a region of relatively low temperature combustion suited to the calcination of the material, and a distinct region of relatively high temperature combustion suited to the sintering thereof.
3. Process of burning Portland cement which consists in calcining the lime in the material with a slow burning voluminous flame so regulated as not to sinter the material.
4. Process of burning cement by successive steps which consists in first calcining the material with a slow burning flame artificially inflated with products of combustion added to the suply current of the fire and later sintering the material with a higher temperature.
5. The described method of preparing cement material for clinkering which consists in driving off the gasifiable portions from material containing lime and fusible ingredients in proportion to make Portland cement, without substantially fusing said fusible ingredients.
6. The herein described process of burning cement which consists in performing substantially the whole of the calcining of the material at one time and substantially the whole of the sintering of the calcined material at a different time.
7. The herein described process of burning cement which consists in performing substantially the whole of the calcining and substantially the whole of the sintering of a stream of cement material as distinct steps in successive sec!ions of said stream.
8. The herein described process of burning cement which consists in producing a slow burning voluminous flame in operative relation to the cement forming material and locally intensifying the activity of said flame in a desired region.
9. The herein described process of burning cement which consists in producing a slow burning voluminous flame in operative relation to the cement forming material to calcine the lime in said material and locally intensifying the activity of said flame by a transverse jet of air directed toward the material to effect the final sintering.
10. The herein described process of burning cement which consists in calcining the lime in the material with a slow burning voluminous flame applied in a substantlally unobstructed space, and sintering the material by the action of a flame intensifying pressure jet.
11. The herein described process of burning cement which consists in causing the cement forming material to travel through the furnace, causing a slow burning voluminous flame to travel in operative relation to and in the opposite direction to the material and producing a local intensified combustion in the vicinity of the root of the flame.
12. Process of treating cement material which consists in decarbonizing the lime therein with a long, slow burning flame produced by means of a blast of previously unignited fuel in suspension together with air and a gaseous diluent. 13. Process of making cement in a kiln or furnace which consists in calcining the material with an artificially inflated flame of retarded combustion produced by means of a blast of prevlously unignited fuel together with air and a volume of gaseous diluent equivalent to a modicum of the total waste kiln gases.
14. Process of making cement which consists in calcining the material with a blast flame containing powdered coal in suspension together with air and products of combustion.
15. Process of burning cement material which consists in calcining the lime with an artificially inflated or retarded impinging blast flame.
16. Process of burning cement material which consists in calcining the same in a reverberative chamber with an impinging slow burning flame produced with a blast containing powdered coal in suspension together with air and gaseous products of combustion.
17. The process of applying a powdered fuel blast flame to the calcination of cement material in a rotating refractory llned chamber, which consists in inflating the flame with products of combustion introduced with the blast and causing said flame to substantially fill the cross section of the working chamber.
18. Process of burning cement which consists in applying thereto a blast flame of previously unignited fuel sufficiently hot to calcine the lime in the cement material but not hot enough to complete the sintering.
19. Process of making cement which consists in feeding the material in a stream and passing over the same a diffuse slow burning blast flame of concentrated fuel in suspension so regulated so as to calcine the lime but not fuse the clinker.
20. Process of burning cement which consists in applying a blast flame of previously unignited fuel so regulated as to calcine but not fuse the material and subsequently fusing to the clinker condition with a high temperature heating agent.
21. Process of making cement which consists if feeding the material in a stream, passing over the same a diffuse slow burning blast flame of concentrated fuel in suspension so regulated as to calcine the lime but not fuse the clinker, and producing an adjacent higher temperature which fuses the clinker.
22. Process of burning cement which consists in calcining the lime in the cement forming material with a flame produced by means of a blast of previously unignited fuel in suspension together with air and products of combustion and sintering the hot calcined material with the adjacent flame of higher temperature.
23. Process of burning cement which consists in calcining the lime in the cement forming material with a flame produced by means of a blast of previously unignited fuel in suspension together with air and a diluent, and localizing the combustion of a distinct portion of said blast with a gaseous jet to produce a sintering temperature.
24. Process of making cement which consists in calcining the lime in the cement material with a relatively cool flame produced with a blast of previously unignoted fuel, air and products of combustion and producing a local sintering temperature with an auxiliary gaseous jet acting on a portion of the blast and directed toward the material.
25. Process of making cement which consists in calcining the lime in the cement material with a relatively cool flame produced with a blast of powdered fuel, air and products of combustion, and sintering the material with a local high temperature produced by acting on a partial section of sald blast with a transverse jet of air at a higher pressure than that of the blast.
26. Process of sintering cement which consists in acting thereon with an impinging flame of fusing temperature containing powdered fuel in suspension together with an added volume of gaseous products of combustion and driven against the material by means of a high pressure jet.
27. Procesis of making cement clinkers which consists In acting on calcined cement forming material with a blast thame of powdered fuel and gaseous diluent oncentrated with a high pressure jet of alr.
28. Process of burning cement which consists in passing a stream of material through a furnace, calcining the body of sait stram with a blast flame of previously unignited fuel travelling oppositely to the material and so regulated as not to fuse the same and producing a local fusing temperature near the exit of said material from the furnace.

2:. Process of burning ccment which consists in acting on a progressing stream of cement material with a powdered fuel blast flame travelling oppositely to the material and renderd slow burning by dilution so as to calcine the material and acting on the calcined portion of the stream near its terminus with a local high temperature caused by intunsifying a portion of the blast.

3U. A cement burning furnace comprising a reverberative chamber having provision for advancing the material along its floor or hearth, a seat of combustion or propagation of the flame, connections enterior to said seat for deriving a supply of diluent fixed gas for retarding combustion, an air supply inlet for supporting combustion so disposid as to oporate under forced draft, and means for artificially propelling the draft current for the flame.
31. A cement burning furnace comprising a reverberative chamber having provision for advancing the material along its floor or hearth, a scat of combustion of propagation of the flame, a flue for discharging the products of combustion, a return conduit for products of combustion branching from flue and leading to said seat, a draft accelerator in said conduit, and an inlet located to supply air for supporting combustion under forced draft.
32. A cement burning furnace comprising a reverbarative chamber having grovision for advancing the material along its floor or hearth, a seat of combustion or propagation of the fiame, a flue for discharging the products of combustion, a return conduit for products of combustion branching from said flue and leading to said seat, a fan blower in said conduit, an air inlet. to the condult on the suction side of the fan, and means for varying the relative proportions of air products of combustion in the fan current.
33. A cement burning furnace comprising a rotary inclined combustion chamber having at one end a stack and device for supplying the chamber with cement material, and at the other end a seat of combustion propagation of the flame. and connections for supplying underforced draft through said seat, air for supporting the combustion of the flame and a diluent gas for retarding said combustion.
34. A cement burning furnace comprising a rotary inclined combustion chamber through which the material is caused to travel, a seat of combustion at one end thereof, a conduit leading to said seat and having connection at its receiving end with a source of gascous diluent. draft accelerating means for said diluent and the air supply. whereby a forcible flame current is projected from said seat into the combustion chamber, and an air supply inlet on the suction side of sald means.
35. Appratus for burning cement comprising a hearth for supporting the coment material, means to supply the material to said hearth, a seat of combustion arranged for the profection of a flame over said hearth. means to supply powdered fuel anterior to said seat. means to sumbly and propel a blast current to drive the fucl and connections for driving a volume of neutral nroducts of combustion as a compgnent of said blast current.
36. A rement burning furnace comprising a reverberative roofed combustion chamber having a hearth for supporting the rement material. a blast nozzle directed thereinto. fuel ferding and air supply connertions to said nozzle. connections from a furnace for supplying products of combuction to the nozzle as an ingerdient of the blast current and pressure blact producing means.
37. A cement burning furnaer comprising a long reverberative combustion chamber whose floor constitutes a hearth for the sunnort of the materials. fuel let deviers at one end of sald chamber directed longitudinally therothrough. connections for supnlying to sald jet divied unignited fuel. air to supnort combustion and a fixed diluent gas to retard combustion, and propelling means in sald connections whereby the air and diluent gas act to drive the fuel.
38. A cement hurning furnare comprising a hearth having provision for advancing the cement material therealone. means to supply a flame current of entrained fuel over the hearth and a jet nozale directed toward the hearth and commanding a portion only of said current.
:3. A cement burning furnace comprising a combustion chamber to contain the cement materal under treatment. a blast nozzle dirocted therrinto, means for feeding powered furl to said nozale. means for supplying a propelling blast -urrent therethrough, a jot nozzle commanding said blast currint and directed at an angle to the axis of the blast
nozzle, and means for supplying pressure fluld to said jet nozzle.
40. Apparatus for burning coment comprising a hearth having provision for feeding the material therealong. a seat of combustion from which a flame is projected over the hearth, means for supplying air and a flame retarding diluent to sald seat, an auxiliary jet nozzle commanding the dilute fuel current, and means to supply pressure fluld to said nozzle.
41. A cement burning furnace comprising a reverberativ. chamber having a provision for advancing the material therethrough, means for projerting a substantially axial flame through sald chamber, and a jet nozzle directed at an angle to the chamber axis toward the foor of the chamber near the material discharging end.
42. A cement burning furnace comprising an inclined rotary combustion and material feeding chamber having a stack at the higher end, blast devices at the lower end for forribly projecting a fuel carrying flame current longitudinally of the chamber, and a jet nozzle at the lower end commanding the flame current and directed downwardly toward the foor of the chamber.
43. Process of treating incandescing substances which consists in passing thereover a long inflated impinging flame produced with a blast of preexisting concentrated fuel together with a supporter of combustion and diluent products of rombustion.
44. Process of treating materials disposed in a layer on the hearth of a reverberative chamber which consists in subjecting the same to a superincumbent flame produced by a blast containing previously unignited fuel and a supporter of combustion and modifled by diluent gaseous producta of combustion.
45. Process of treating incandescent material in a reverberative chamber which consists in subjecting the same to a long slow burning flame produced with a blast of powdered coal in suspension together with air and a modicum of the gaseous products of combustion.
46. Process of heating incandescing materiala disnoarl nh the hearth of a reverberative chamber which consiste in subiecting the materials to an impinging slow burning diffusc flame produced with a blast of powdered coal containing a volume of burned out gases equivalent to a modicum of the total gascous nenducta of combustion.
47. Process of apnlying heat to mineral sollis or other material on a hearth which consists in subjecting the same to a superincumbent long voluminous. slow burning and re. latively cool flame produced with a blast of powdered coal and ncutral products of combustion together with air. and intenalfying the combustion of a portion of said blast in a restricted region with an auxiliary jet of alr directed toward the materials.
48. A process of treating materlala which conciats in fact. ing the same in a stream. subjecting one sertion of asit. stream to a relatively low temperature flame nroduced with a blast of previously unignited fuel. and subierting another arction to a re'atively higher temperature produced by a concentrating jet.

No. 101,886. Process of Electrically Wolding Tarbine Blades.

\section*{Procédé électrique à souder les ailes des turbines.}

Subastian Ziani de Ferrantl, London, Fngland, fith November. 1!06; 6 years. Filed 23rd May, 1905. Recelpt No. \(1: 5\). 4:6.
Plaim.-1. Process for the attachment of turbine blades • thrir rarriers, consisting in so adjusting the volume of nut in the carrior in the neighborhood of the point of attor mrut that, on heating locally, said blade and sald carrier
rise to approximately the same temperature and welding the blades to said carriers so prepared, as set forth.
2. Process for the attachment of turbine blades to their carriers, consisting in so adjusting the volume of metal in the carrier in the neighborhood of the point of attachment, that on heating locally, said blade and said carrier rise to approximately the same temperature and electrically welding the blades to said carriers so prepared, as set forth.
3. Process for the attachment of turbine blades to their carriers, consisting in so removing metal from the carrier in the neighbourhood of the point of attachment that on heating locally said blade and said carrler rise to approximately the same temperature and electrically welding the blades to said carriers so prepared, as set forth.
4. Process for attachment of turbine blade to their carriers, consisting of so grooving the carrier in the neighbourhood of the point of attachment that on heating locally, said blade and said carrier rise to approximately the same temperature and electrically welding the blades to said carriers s, prepared, as set forth.
5. A bladed turbine element comprising in combination a blade carrying element, the volume of which in the neighbourhood of the point of attachment of the blades has been so adjusted as to retard the flow of heat away from said point of attachment together with blades welded to said carrying elements, as set forth.
6. A bladed turbine element, comprising in combination a blade carrying element, the volume of which in the neighbcurhood of the point of attachment of the blades has been so adjusted as to retard the flow of heat away from sald point of attachment together with blades electrically welded to said carrying elements, as set forth.
7. A bladed turbine element, from which metal has been \(r \in m o v e d\) in the neighbourhood of the point of attachment of the blades so as to retard the flow of heat away from said point of attachment together with blades welded to said carrying elemelits, as set forth.
8. A bladed turbine comprising in combination a blade carrying element grooved in the neighborhood of the point of attachment of the blades so as to retard the flow of heat away from said point of attachment together with blades welded to said carrying elements, as set forth.

No. 101,887. Joist Ranger. Support de solive.

Frederick L. Heughes, Rochester, New York, U.S.A., 6th November. 1906; 6 years. Filed 4th October, 1906. Receipt No. 140,023 .
Claim.-1. A double joist hanger comprising two bent straps adapted to go over the beam, with depending legs, and stirrups each having a supporting shelf with angle-iron sides made integral with said shelf with rivets, bolts, screws or pins connecting said angle-iron sides to said supporting straps, substantially as described.
2. A double joist hanger comprising two supporting straps each composed of a flat piece of metal bent to fit the beam, and each provided with depending legs, a pair of stirrups, one on each side, each provided with a supporting shelf, an upwardly projecting rib integral with said shelf, and flanges projecting laterally from said ribs, with rivets, bolts, screws or pins securing said flanges to said depending legs substantially as described.
3. A joist hanger comprising two bent straps adapted to go over a beam, with depending legs, and a stirrup having a supporting shelf with angle-iron sides integral therewith,
and rivets, bolts, screws or pins connecting said angle-iron sides to said supporting straps.
4. In a hanger the combination of straps bent to fit a beam a stirrup connecting the lower ends of said straps together. said stirrup being formed of angle-iron with a notch cut out of one leg and then bent at right angles at each end of the notch, and means for securing said stirrups to said straps, substantially as described.

No. 101,888. Etch Powdering Machine.
Machine à saupoudrer les gravures d l'eau forte.

Lewis Edward Levy, Philadelphia, Pennsylvania, U.S.A., 6th November, 1906; 6 years. Filed 17th September, 1906. Receipt No. 139,589.

Claim.-1. In a machine for the purpose set forth, the combination of powder applying, powder packing and powder fusing instrumentalities arranged in operative succession.
2. In a machine for the purpose set forth, the combination of power applying, powder packing, powder fusing and plate cooling inst mentallties arranged in operative succession.
3. In a machine for the purpose set forth, the combination of powder placing, powder packing, plate clearing, piate heating and plate cooling instrumentalities.
4. An apparatus for applying etch powder to plates having a design thereon to prepare the same for etching, consisting of mechanically operated means for applying etch powder upon the surface of the plate and in the lines or depressions which form the design, and a plurality of brushes mounted and operated to engage the powder surface of the plate and place the etch powder against the sldes of the lines or depressions therein.
5. In a machine for preparing a plate having a design thereon for etching, means for moving the plate from the front to the rear end of the machine, a hopper or receptacle for etch powder, means for taking etch powder from the hopper or receptacle and applying the same to the surface of the plate, a plurality of powder placing and packing brushes which engage the powder cover surface of the plate to place the etch powder against the sides of the lines or depressions of the design on or in the plate, and means for heating the plate to fix the etch powder where placed by the powder applying means and the powder placing and packing brushes.
6. In a machine for powdering plates prior to etching, a plate carrier comprising side chains and a plate engaging cross bar, means for applying powder upon the surface of the plate, and a plurality of powder placing and packing brushes, the brushes being driven in an opposite direction from the direction of travel of the plate.
7. In a machine constructed to place etch powder against the sides of a design in or on a plate, the combination of means for placing etch powder upon the plate, a plurality of brushes constructed and actuated to pack the powder against those parts of the design that it is desired to protect, and a fan that produces a draft of air which will remove from the plate such particles of etch powder that have not been packed against those parts of the design which it is requisite to protect.
8. In a machine for the purpose set forth, a travelling plate carrier, a hopper for etch powder, means for taking etch powder from the hopper and placing the same upon a plate as the plate is moved beneath the hopper by the plate carrier. the povder applying means being adjustable to and from the plate and means for varying the quantity of etch powder fed upon the plate.
9. An etch powdering machine baving powder applying meaus, a plurality of powder placing and packing brushes, a casing for the powder placing and packing brushes, curved plates within the casing with which the brushes engage and a fan located in a casing which communicates with the casing for the brushes.
10. In a machine for preparing a plate for etching, the combination of plate carriers, a hopper for etch powder, means for taking powder from the hopper and placing the same upon the surface of a plate, powder placing and packing brushes which engage the plate as it is moved beneath such brushes, a series of chains upon which the plate is placed by the plate carriers and a furnace through which the plate is carried by the series of chains to fuse the powder upon the plate.
11. In a machine for the purpose set forth, a table, endless plate carriers, plate powdering means, an opening through the table that is spanned by bars, a source of heat below the bars and a casing above the source of heat that is adapted to be swung upward.
12. In a machine for the purpose set forth, the combination with means for placing and means for fusing etch powder upon a plate, of a plate receiving table beyond the plate powdering and the powder fusing means, a blower and air directing spouts connected with the blower and positioned adjacent to one end of the plate receiving table.
13. In a machine for preparing a plate having thereon a design for etching, a series of plate carriers, means for placing etch powder against the sides of the lines or depressions that form the design on the plate, a furnace through which the powdered plate is carried, a fuel supply pipe connected with burner pipes of the furnace, a mechanically operated valve for said fuel supply pipe, means for turning the valve so that fuel will be supplied to the burners when a plate enters the furnace and will be cut off therefrom when a plate leaves the furnace.
14. In an etch powdering machine, the combination with plate carlers, powder applying means, a furnace and plate cooling means beyond the furnace, of a driven shaft having thereon a mutilated gear wheel, a trip for a belt shifter, d cam, a gear for driving such shaft and means for driving the plate carriers, means for manually placing such shaft In operative connection with a driven shaft, a gas supply plpe for the furnace having a valve that is turned by the mutilated gear wheel to admit fuel to the burner pipes of the furnace when a plate enters the same and to cut off the fuel therefrom when a plate leaves the furnace, a belt shifter that is moved in one direction by a spring and is engaged by the trip to render idle the powder applying means when a plate has been carried beyond the same, a second belt shifter operated by a rock arm that engages the cam on the shaft to place in operation a blower when a plate has been carried beyond the furnace and is on the plate coollng table, substantially as shown.

No. 101,889. Building Block. Bloc de construction.

Frank McMurray Sawyer, Charlotte, North Carolina, U.S.A. 61h November. 1906; 6 years. Filed 1st October, 1906. Recript No. 139.423.
craim.-The hereln described building wall made up of bricks or blocks having three unbroken surfaces 2, 3, 3, the surfacis 3. 3, forming the inner and outer facing of the wall, and a recessed side forming feet 6, the lnner walls 4
of which are oblique and providing the inner wall or web 5, said blocks being placed in reverse order in each alternate layer to break joint and to provide vertical ventilating spaces 7 between the bricks and to form cross bracing webs in the corners of the wall, essentially as described.

101890

Albert James Bowers, Worcester, Massachusetts. U.S.A.. 6th November, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 1:37.209.
Claim.--1. That improvement in the art of making a bifocal lens, which consists in providing a segment plece with a backing interposed between sald segment piece and the reciprocating block of a grinding machine, and in grinding the surface of said segment piece in a plane cutting the supporting surface of the backing, whereby the diameter of the segment is determined.
2. That improvement in the art of making a bifocal lens. which consists in grinding a sugment plece in a lens grinding machine when attached to a backing capable of being ground to correspond with the ground surface of sald segment piece.
3. That improvement in the art of making a bifocal lens. which consists in interposing a backing between the segment piece and the reciprocating block of a lens grinding machine, grinding the face of the lens in a plane cutting thy supporting surface of sald backing, whereby the segment piece is brought to a thin edge and of the desired diameter of the segment.
4. That improvement in the art of making a blfocal lens. which consists in attaching a segment plece to a backing interposed between the segment piece and the reciprocating block of a lens grinding machine, grinding the face of the segment plece to the desired diameter of the segment. and transferring the ground segment to the lens of an eyeglass.
5. That improvement in the art of making a bifocal lens. which consists if attaching a segment plece to a backins interposed between the segment piece and the reciprocating block of a lens grinding machine, grinding the segment piece to the desired diameter, reducing the diameter of the backing to the diameter of the segment and edge grinding th: segment while attached to sald backing.
6. The method of making a bifocal lens, consistine in brinding a segment piece while attached to a becking interposed between the segment piece and the reciprocation block of a lens grinding machine, reducing the diameter of the backing to the diameter of the segment, edge grinding the segment while attached to the backing. attaching a transfer piece to the ground fuce of said segment, remorio: the backing. attaching the segment to the lens of an eyeglass and removing the transfer plece.

\section*{No. 101,891. Manufacture of Gum Tragasol from Locust Bean Kernels. \\ Fabrication de gomme.}

Peter Cameron Douglas Castle, Bebington, Chester, England, 6th November, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,189.
Claim.-1. The process of obtaining gum tragasol from the split locust kernels, which consists in steeping the sam? in water and a substance capable of rendering the colouring matter insoluble until the cotyledons have swelled out, gradually adding further water with heat and stirring, pressing out the gum solutlon.
2. The process of obtaining gum tragasol from the split locust kernels which consists in steeping the same in water and a substance capable of rendering the colouring matter insoluble until the cotyledons have swelled out, adding formalin and hot water and stirring until the materials are sufficiently cooked, and then pressing.
3. The process of obtaining gum tragasol from the split locust kernels which consists in steeping the same in water and a substance capable of rendering the colouring matter insoluble until the cotyledons have swelled out, gradually adding further water with heat and stirring, pressing out the gum solution and quickly cooling the gum with refriger. ation and agitation, separating any solid matters that may remain suspended and casking in the usual manner.
4. The process of obtaining gum tragasol from the split kernels, which consists in steeping the same in water and formalin untll the kernels have swelled up, separating the solution, adding further water with heat and stirring, then pressing and straining, substantially as described.
5. The process of obtaining gum tragasol from the split locust kernels which consists in steeping the same in water ard a substance capable of rendering the colouring matter insoluble until the cotyledons have swelled out, removing the husks, adding further water with heat, and stirring, and separating the solld matter, substantially as described.
6. The improvement in the process of obtaining gum tragasol, which consists in converting the colouring matter of the husks into an insoluble compound by means of formalin before proceeding to extract the gum.
7. The improvement in obtaining gum tragasol, which consists in treating the split beans with long continued soaking in water and formaldehyde (formalin) and afterwards extracting the gum from the cotyledons.
8. An improved article of manufacture. consisting of gum tragasol, characterized by it contalning a solution of formaldehyde and being clear of the colouring matters of the husk.
9. An improved article of manufacture, consisting of gum tragasol, characterized by it containing a solution of formaldehyde and being clear of the colouring matters of the busk and germ.
10. In the process of manufacturing gum tragasol, forming the hoppers and spouts of copper lined with tin.
11. The improvement in the process of manufacturing gum tragasol, which consists in refrigerating the gum with powerful agitation while cooling.
12. In the process of manufacturing gum tragasol, running the swelled kernals into bags made of milling silk preferably number 9 , supported inside and out by cotton or other very strong open net-work like bags, the combined bags being put into the presses with fluted spacing blocks between them, and gradually pressing.

No. 101,892. Oil Burner. Brûleur d'huile.

Milton A. Fesler, Berkeley, California, U.S.A., 6th November, 1906; 6 years. Flled 6th June, 1906. Recelpt No. 136,595.
Claim.-1. In a jet for oil burners the combination with a
nozzle having steam and oll passages therethrough, of a suit-11-3
able oil and steam supply, an adjustable cap valve fitting over said nozzle, a needle movable in said nozzle for the purpose set forth, and connections between said cap valve and needle whereby they are moved together in opposite directions to regulate the oil and steam supply, substantially as described.
2. In a jet for oll burners the combination with a nozzle laving steam and oil passages therethrough of a longitudinally adjustable cap valve fitting over said nozzle, a needle movable in said nozzle for the purpose set forth, and connections between said needle and cap valve whereby they are moved together in opposite directions, substantially as set forth.
3. In a jet for oll burners the combination with a nozzle having steam and oil pasages, of a longitudinally movable cap valve fitting over said nozzle, a needle movable in said nczzle for the purpose set forth, a regulating device, and connections between said device and the cap valve and needle whereby the latter are moved together in opposite directions when the regulating device is manipulated, substantlally as and for the purpose set forth.
4. In a jet for oil burners the combination with a nozzle, oi a longitudinally movable cap valve fitting over said nozzle, a needle movable in said nozzle, for the purpose set forth, a rockable arm pivotally secured to said jet and having connections with the valve or cap and needle whereby the cap and needle are moved together when the arm is rocked, and a regulating device so connected with said arm as to move the same upon the manipulation of said device, substantially as described.
5. In a jet for oll burners the combination with a nozzle, having a movable end portion, a slidable cap valve fitting over said nozzle, a needle movable in said nozzle, connections between the needle and cap valve whereby they are moved together and means carried by the cap for engaging the movable end portions of the nozzle to diminish the opening therein when desired, substantially as described.
6. In a jet for oil burners the combination with a nozzle having a movable end portion, a needle working in said nozzle for the purpose described, a slidable cap valve fitting over said nozzle and having an opening therein registering with the opening in the nozzle, a movable lip working in said cap valve and adapted to increase or diminish the size of the opening therein, means for operating said lip by the movement of the cap, means carried by the cap valve adapted to engage the movable portion of the nozzle for the purpose described, and connections between said needle and cap valve whereby they are moved together, substantially as and for the purpose set forth.
7. In a jet for oil burners the combination with oil and steam supplies, of a nozzle having steam and oil passages, ineans for controlling the admission of steam to the nozzle, a slidable cap valve fitting over said nozzle and operating to control the passages of oil through the nozzle and having an opening therein, a movable lip working in said cap valve and adapted to increase or diminish the size of the opening in said cap valve, and means for automatically operating said lip, substantially as described.
8. In a jet for oil burners the combination with suitable steam and oil supplies, of a nozzle having steam and oil passages therethrough, means for controlling the admission of steam to said nozzle, a cap valve fitting over said nozzle and operating to control the passage of oil through the nozzle, and having an opening therein, a movable lip working in said cap valve and adapted to increase or diminish the size of said opening, and means for operating said lip by the movement of the cap valve, substantially as described.
9. In a jet for oil burners the combination with a nozzle, having a movable end portion, means for controlling the admission of steam to said nozzle, a movable cap valve fitting over said nozzle and having an opening therein, a movable lip working in said cap valve and adapted to increase or diminish the size of the opening therein, means for operating said lip by the movement of the cap valve, means carried by said cap valve adapted to engage the movable portion of the nozzle. for the purpose described.
10. In a jet for oll burners the combination with a nozzle, of a movable cap valve fitting over said nozzle and having an opening therein for the passage of oil and steam, said cap valve operating to control the passage of oil through the nozzle, and means for automatically increasing or diminishing the size of the opening in the cap valve, substantially as described.
11. In a jet for oll burners the combination with a nozzle having steam and oil passages therethrough, of a movable cap valve having an opening therein for the passage of oil and steam, said cap valve operating to control the passage of oil through the nozzle, and means for increasing or diminising the size of the opening in the cap valve by the movement thereof on the nozzle, substantially as described.
12. In a jet for oil burners the combination with a nozzle having a movable end portion adapted to operate as des-
cribed of a cap valve fitting over sald nozzle and adapted to slide thereon and having therein an opening, means for increasing or diminishing the opening in the cap valve, and means carried by the cap adapted to operate upon the movable portion of the nozzle end to contract the opening therein, substantially as described.
13. In a jet for oil burners the combination with a nozzle having stean and oil passages therethrough, of a movablo cap valve fitting over said nozzle and having an opening therein for the passage of oll and steam, said cap valve operating primarily to control the passage of ofl through the nozzle, means carried by the nozzle and adapted to be engaged by the cap valve to diminish the size of the opening in said nozzle, and means for increasing or diminishing the opening in the cap valve, substantially as described.
14. In a jet for oil burners the combination with a nozzle having steam and oil passages therethrough, of suitable oil and steam supplies, an adjustable cap valve fitting over said nozzle, a needle movable in said nozzle for the purpose set forth, connections between said cap valve and needle whereby they are moved together to regulate the oil and stram supply, and means for adjusting both of said connections to determine the relative movement of the cap valve and needle, substantially as described.

No. 101,893. Electric Furnace for Tranaforming Pig Iron into Steel.
Fournaise électrique pour la transformation du fer en acier.

Gustave Gin, Paris, France, 6th November, 1906; 6 years. Filed 24th January, 1906. Receipt No. 132.290.
Claim.-1. In combination with a furnace a plurality of drains, a single or multiple electro-magnetic inductor provided with an exterior common core, and a primary coll wound thereon.
2 . In a furnace the combination comprising three parallel drains with double inductors and joinced at their ends, electro-magnetic inductors provided with cores, a circuit wound on one core and a primary circuit wound in opposite directions on the other two cores and adapted to generate in the central drain a current of double intensity to that generated in the two other drains.
magnetic inductors provided with cores. a circuit wound on one core and a primary circuit wound in opposite directions on the other two cores and adapted to gencrate in the contral drain a current of double intensity to that generated in the two other drains.

\section*{No. 101,894. Process of Developing the Fermontable Products of Grain.}

Procídé pour dévclopper les produits fermentablrs du grain
August Ferdinand Kniesche, Syracuse, New York, U.S.A., 6th
November, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,218 .
Claim.-1. A process of developing the fermentable products in a grain mash, consisting of macerating malt meal in cool water until it has taken up the soluble parts of the malt, and then adding this mixture to a mash of cooked corn and uncooked rye meal and cooling the mash, substantially as specifled.
2. The process of the class described, consisting in preparing a mash of corn meal, cooking the same for a suffleient length of time at a boiling temperature of about \(212^{\circ}\) Fahronheit cooling this corn mash down to a tumperature of \(150^{\circ}\) Fahrenheit, and then stirring in uncooked dry rye meal and adding to this mesh a mixture formed by macerating malt meal in water at a temperature from \(50^{\circ}\) to \(80^{\circ}\) Fahrenheit. until the wator has extracted and taken up the diatiase and other soluble parts of the malt, then allowing the whole mixture to rest from one to two hours at a temperature of about \(142^{\circ}\) Fahrenheit to ennvert the contained starch into fermentable sugar, and then cooling the entire
mixture down to \(75^{\circ}\) to \(80^{\circ}\) Fahrenheit, substantially as specifled.
3. The process of developing the fermentable products in a grain mash consisting in macerating malt meal in water at a temperature of from \(50^{\circ}\) to \(80^{\circ}\) Fahreneit until the water has taken up the diastase and other soluble parts of the malt, then adding this preparation of malt and water to a mash formed by cooking the corn meal in water for a sumclent length of time to make a perfect starch paste, then stirring in dry rye meal into the cooked corn meal and water, allowing the whole mixture to rest for from one to two hours at a temperature of about \(142^{\circ}\) Fahrenheft. to convert the starch into fermentable sugar, and then cooling the mixture down to \(75^{\circ}\) Fahrenhelt, substantially as specified.

No. 101,895. Loose Leaf Binder.
Reliure à feuilles mobiles.

James Luther Hickok, and James Mackenzie, co-inventors. both of Winnipeg. Manitoba, Canada, 6th Novomber. 1506; 6 years. Filed 29th June, 1906. Receipt No. 13i.404. Claim.-1. In a binder the combination of upper and lower strips movable to and from each other, slotted end plates to the strips and means co-acting with the strips and end plates for expanding and contracting the strips, as and for the purpose specified.
2. In a binder the combination of upper and lower angle har sectioned strips movable to and from each other. lugs extending from the strips, slotted end plates to the strips. a rounded back with flanged ends, an operating rod extending through the slots and bearing in the flanged ends of the back, and means whereby upon the rotation of the rod the strips may be expanded or contracted, as and for the purpose specified.
3. In a binder the combination of upper and lower angle bar sectioned strips movable to and from each other. lug. extending from the strips, telescoping posts sccured to the strips and extending therebetween, slotted end plates to the strips, racks upon the upper face of the upper strip. racks dependent from the end plates of the lower strip. pinions in engagement with the racks. and means for rotating the pinions, as and for the purpose specifled.
4. In an expansible and contractible binder the combinalion of upper and lower strips, having opposing curved sides with vertically flanged edges, lugs extending outwardly from the vertical flanges, a cover hinged to the lugs, telescoping posts sceured within and extending between the flanges. slotted end plates to the strips, a curved back, a rod carrind by the back and within the slots, and means actuated by the rod to move the strips to and from each other, as and for the purpose sjecifled.
5. In an expansible and contractible binder the combination with the movable strips, having opposing curved sides with rertically flanged edges of a reinforcing strip extending longitudially with the flanged edge and on the inner face luzs winnding outwardly from the flange and bearing within the flange and the reinforcing strip, telescoping posts extending betwion the flanges and bearing within the lugs. and a pin passing transverscly across the reinforclag serip and anchoring the post to the lug. as and for the purposc speceitid.
6. In an expansible and contractible binder the combination of upper and lower strips, a curved back, overlapping end plates to the strips having similar oppositely disposed slots in the adjoining plates, a rotatable rod bearing within the back and extending through the slots, pinions disposed upon the rod and in proximity to he ends, racks in mesh with the pinions and secured to the upper strip, racks in mesh with the pinions and dependent from the end plates of the lower strip, and grooves extending within the upper racks, adapted to receive the end plates of the upper strip, as and for the purpose specified.
7. In a binder the combination with the slotted end plates of the expansible and contractible strips and the curved back, of a longitudinal centrally disposed rod extending withif the slots and bearing in the back, a squared free end to the rod extending through a perforation acting as a key hole formed in the back, pinions toward the extremities of the rod, and upper and lower racks in engagement with the pinions and so designed that upon the rotation of the rod the upper and lower strips may be expanded or contracted as and for the purpose specified.

No. 101,896. Device for Relief of Club-Foot, Etc. Appareil pour le soulagement des pieds bots.

William M. Scholl, Chicago, Illinols, U.S.A., 6th November, 1906; 6 years. Filed 28th June, 1906. Receipt No. 137,377.
Claim.-1. A foot support adapted to fit within a shoe comprising a sole plece shaped to conform to the arch of a foot, a metal plate secured thereunder, and a yielding bridge plece or plate extending thereunder across the arch and arranged to rest upon the shank of the shoe.
2. A foot support adapted to fit within a shoe, comprising an arched sole plece, an arched reinforcing metal plate thereunder, and a spring plate under said plate, bridged across the arch and having a projection extending sidewise from one edge and arranged to rest upon the shank of a shoe, and an arm extending from the other edge and bent up at the outer edge of the sole piece.

\section*{No. 101,897. Fyeglasg. Lunettes.}

William Henry Weaser, Pittsfield, Massachusetts, U.S.A., 6th November, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,244
Claim.-The herein described eyeglasses comprising the horizontally disposed spring having its end bent or coiled inwardly and extending forwardly, lens studs, each having an arm 11 bearing against the under side of the spring and having an upturned end disposed in one of the loops formed between the end and adjacent portion of the spring bridge
and secured to said end thercof, and nose guards each having an upwardly extending arm 17 secured between said up-

turned end of one of the lens studs and the adjacent end of the spring bridge, substantially as described.

No. 101,898. Safety Stop Valve. Soupape de sûreté.

Charles W. Nicholson and Frank Fiegle, assignee of a half interest, both of Roslyn, Washington, U.S.A., 6th November, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,391.
Claim.-1. The combination with a casing having a valve seat, of a reciprocable valve, means for moving the valve over and away from over the valve seat, and means for permitting the valve to drop upon the seat when directly thereabove.
2. The combination with the casing having a valve seat, of a reciprocable valve, a shaft journalled in the case, means whereby the rotation of the shaft will reciprocate the valve, and means for automatically rotating the shaft.
3. The combination with the casing having a valve seat. of a reciprocable valve, a shaft journalled in the case, means whereby the rotation of the shaft will reciprocate the valve means for automatically rotating the shaft means for restraining said rotation, and electro-magnetic means for releasing the restraining means.
4. The combination of a reciprocable valve, a pair of racks connected with the valve, a pair of pinions adapted to mesh with said racks, for reciprocating the valve, a shaft upon which sald pintons are mounted, a collar on the shaft between the pinions for keeping them apart, a valve casing in which said valve is mounted, a pair of studs mounted in opposite sides of the said valve casing and having bearings for said shaft, and means on said shaft for automatically closing said valve
5. The combination of a reciprocable valve having out wardly extending flanges, a slide having projections located between said flanges, whereby a reciprocating motion of the slide will be transmitted to the valve while the valve is free to move in a direction transverse to the reciprocating motion, a rack connected with said slide, and means for operating the rack and slide.
6. The combination of a reciprocable valve having outwardly extending flanges, and a slide located at the rear of said valve and having projections loosely fitting between said flanges.
7. The combination of a reciprocable valve having flanges spaced apart, a casing in which said valve is mounted. said casing having ways upon its sides, and a slide mounted on said ways and having projections extending between said flanges.
8. The combination of a reciprocating valve having outwardly extending flanges, a slide located at the raar of said valve and having projections loosely fitting between said flanges, wheels on which said valve is adapted to move, and a track for said wheels.
9. The combination of a valve casing having a seat. a pair of tracks located on opposite sides of said seat, and a valve for said seat, said valve having wheels adapted to travel on said track.
10. The combination of a valve casing having a seat, a pair of tracks located on opposite sides of said seat. and a valve for said seat, said valve having wherls adapted to travel on said track, the wheels located on one side of said seat having a wider face than those located on the othor. and the track having depressions for said wheels. said depressions corresponding in width to the width of the wheels.
11. The combination of a valve casing having a seat, tracks located adiacent to the seat and having depressions. and a valve having wheels adapted to enter said depressions.
No. 101,899. Centrifugal Liquid Separator.
Séparateur centrifuge de liquides.

Aktiebolaget Baltic-Scparator, Stockholm, assignee of J. V. M. Risberg. Kanalstrand, 3, Södertelje, Sweden, 6th Novvember. 1906; 6 years. Filed 27th June, 1906. Receipt No. 137,333.
Claim.-A liner for centrifugal liquid separators, consisting of conical plates adapted to slide into each other and provided with interposed pieces, ribs \(a\) or projections in the plate serving as distance means, which ribs extend from or substantially from the central opening of the plate to or substantially to the periphery of the same, characterized by the fact that openings \(e\) for the introduction of the liquid (the full milk) between the plates are provided immediately in front of the interposed pieces, \&c., with regard to the rotary direction of the centrifugal drum. substantially as described and for the purpose specifled.

No. 101,900. Hose Coupler. Joint de boyaus.

The Nelson and Morrison Manufacturing Company, assignee of Lewen R. Nelson, all of Boulder. Colorado, U.S:A.. 6 th November, 1906; 6 years. Filed 13th August, 1906. Recelpt No. 138,618.
Claim.-1. In a hose coupling, the combination of a coupling sleeve having an interiorly threaded portion, and an
interior shoulder adjacent the inner extremity of the thread"d portion, a packing washer engaging said shoulder and being wider on the shoulder engaging surface than upon its opposite surface, the wider portion of the washer having a relatively thin part projecting inwardly beyond the inner jeriphery of the thicker and narrower part, whereby the said thinner part is adapted to be acted on by the water flowing through the coupling.
2. The combination of a coupling sleeve having an interiorly threaded part, an unthreaded recessed part and an intermediate shoulder part, and a washer engaging the shoulder of the shoulder part and having its surface in direct contact with the shoulder, wider than its opposite surrace. its wider portion projecting Inwardly beyond the narrower portion, the interiorly projecting part belng relatively thin and extending into the waterway for the purpose set forth.
3. The combination of a coupling sleeve having an interiorly threaded part at one end, and a conical chamber at the other end, a cone-shaped head adapted to fit said chamber and having an exterior shoulder, the sleeve having a locking lug rigid therewith and adapted to engage the exterior shoulder of the head. and a spring actuated dog mounted on the sleeve and also adanted to engage the same shoulder. the lug and the dog co-operating to lock the parts together.
4. In a hose coupling. the combination of a sleeve having a threaded portion, an unthreaded recessed portion and an intermediate shouldered portion, two male members engaging respectively the threaded and unthreaded parts of the sleeve, a washer engaging the shoulder of the shouldered portion and having its shoulder engaging surface wider than the opposite surface, the wider portion of the washer having a relatively thin part on its inner periphery adapted to be acted on by the water passing through the hose. the lastnamed surface of the washer being engaged by the threaded male member, leaving a space between sald male member nnd the wider portion of the washer, the unthreaded male memher having an exterior shoumer, the sleeve having locking parts engaging the shoulder of the unthreaded male member.
5. The combination of a coupling sleeve having its opposite extremities respectively fashioned to receive twn metal members, one of which is provided with an exterior shoulder. the said sleeve having rigid lugs adapted to engage said shoulder, and a spring actuated dog mounted on the coupling sleeve. the latter being provided with guide lugs for the dng. said lugs being located at the extremity of the sleeve remote from the pivoted end of the dog, the locking ertremity of the dog being adapted to encage the said shoulder momber, the said rigid lugs of the sleeve and the locking dog co-operating to hold the parts in the assembled relatinn. substantially as described.
6. The combination of a coupling sleeve having a pair of apertured lugs at one extremity. a dog provided with an onening registering with the openings in the lugs of the sleeve. a pin passed through the registering openings of the lugs an dog, and an integral spring having a double portion engaging the dog at a suitable distance from the pin, the extremitles of the spring being colled around the pin, to give the spring sufficient tension to normally hold the dog in the locking position. the sleeve being provided with guide lurs for the dog, located at the extremity of the sleeve remote from the apertured lugs.
7. The combination of a coupling sleeve and a male member adapted to enter one extremitv of the sleeve and provided with an exterior shoulder. the sleeve having a rigid lug adapted to engage sald shoulder, and a spring actuated dog mounted on the sleeve and having a hook-shaned -ortremity also adapted to engage the shoulder of the shouldered member. the dor and rigld lug of the sleeve co-operating to hold the parts in the assembled relation, substantially as described.

\section*{No. 101,901. Hosiery Making Machino.}

\section*{Machine à faire de la bonneteric.}

The British Hosiery and Electrolytic Bleaching Company, London, assignee of Frank Taylor, Nottingham, both in England, 6th November, 1906; 6 years. Flled 25th September, 1906. Recelpt No. 139,783.
Claim.-1. A hosiery machine having latch needles, cams and means for throwing said needles in the knitting action, and means for throwing said cams out of action on the breakage of a yarn, substantially as described.
2. In a hosiery or knitting machine, the combination of ing the needles yarn feeders, a cam at each feeder for operatinoperative when and means for rendering any needle cam breaks, in order the yarn of the corresponding feeder breaks, in order to enable the needles to remain ldle when venting the needles where the break has accurred so prefor the purposes indicated.
3. In a hosiery or knitting machine, the combination of a plurality of yarn feciers, a cam at each feeder for operat-

ing the needles, and means whereby on the breakage of a yarn the corresponding needle cam is put out of operation and the needles are allowed to pass without lossing their loons and remain idle until the next yarn feeder is reached. for the purpose of preventing the formation of press-offs, substantially as described.
4. In a hosiery or knitting machine, the combination of a needle cam, means for moving such cam into or out of position to engage the needles, and means for causing the cam to assume its inoperative or idle position on the breakage of a yarn in order to enable the needles to pass without losing their loops and without stopping the machine, substantially as described.
5. In a hosiery or knitting machine having a plurality of feeders, the combination of a movable needle cam, a feeler arrangement for controlling the position of sald cam, a wedge-shaped piece for retaining the needle cam in its normal working position, and means for disengaging said wedge on the breakage of a yarn, substantially as described.

No. 101,902. Coiling Apparatus.
Appareil d rouler en serpentin.

The Iroquois Machine Company, New York City, assignee of James Alexander Horton, Providence, Rhode Island, both in the U.S.A., 6th November, 1906; 6 years. Filed 17th September, 1906. Receipt No. 129,543.
Claim.-1. A coiling apparatus comprising a rotary driver, ard a storing drum or reel normally in substantially axial alignment with the driver and rotative therewith, the drum having a swinging engagement with the driver.
2. A coiling apparatus comprising a rotary driver having a drum seat, and a storing drum hinged to the driver and normally bearing on said seat.
3. A coiling apparatus comprising a rotary driver, a storing drum or reel normally in substantially axial allgnment with the driver and rotative therewith. the drum having a
swinging engagement with the driver, and means for locking the drum or reel in its normal position.
4. A coiling apparatus comprising a rotary driver, a storing drum or reel rotative with the driver and having a swinging engagement therewith, a spring presed locking member pivoted to one of said parts, and a fixed locking member on the other part.
5. A coilling apparatus comprising a rotary driver, a storing drum or reel rotative with the driver and having a swingirg engagement therewith, a spring pressed latch pivoted to the driver and having an operating handle projecting below the base of the drum, and a fixed keeper for said latch on the drum.
6. A coiling apparatus comprising a rotary driver having a laterally projecting ear, a spring pressed latch pivoted to said ear, the driver having guides for said latch, and a drum or reel hinged to the driver and having a notched stud or kfeper adapted to engage said latch.
7. A coiling apparatus comprising a rotary driver having a seat, and a hinge member projecting outwardly from the seat, and a drum or reel having a base member formed to bear on said seat, and a hinge member engaged with the hinge member of the driver.

No. 101,903. Fancet. Fuusset.

William Angehr, Des Moines, Iowa, U.S.A., 6th November, 1906 ; 6 years. Filed 27th January, 1906. Receipt No. 132,349.
Claim.-1. In a faucet, a base having a tubular extension at its bottom, a valve seat fitted in its top, a chambered body piece fixed to the valve seat, a flanged ring fitted and fixed to the valve seat and the base, valve stem and a valve fixed to the lower end of the stem, a nut having a pointed extension on the valve stem below the valve, a tubular body piece fixed to the top of the valve seat and provided with bearings for the valve stem, packing in the top part of the body piece and means for normally retaining the valve stem elevated and the valve closed, arranged and combined, as shown and described for the purposes stated.
2. In a faucet, a base having a tubular extension at its bottom, a valve seat fitted in its top and a flange ring fitted and fixed to the valve seat and the base, a valve stem and a valve fixed to the lower end of the stem, a nut having a pointed extension on the valve stem below the valve, a tubular body piece connected with the valve seat, bearings for the valve stem in said body piece, packing above the upper bearing, a coil spring on the top end portion of the valve stem and a nut and washer on the stem and on top of said spring, and means for actuating the valve stem and valve, arranged and combined, as shown and described for the purposes stated.
3. In a faucet, a base having a tubular extension at its bottom, a valve seat fitted in its top and a flanged ring fitted and fixed to the valve seat and the base, a valve stem and a valve fixed to the lower end of the stem, a nut having a pointed extension on the valve stem below the valve, a tubular body piece connected with the valve seat, bearings for the valve stem in said body piece, packing above the upper bearing, a coil spring on the top end portion of the valve stem and a nut and washer on the stem and on top of said spring. a tubular extension on top of the body piece, a crank shaft mounted in said extension and bridle on the crank of the shaft and fixed to the top of the valve stem, arranged and combined, as shown and described for the purposes stated.
4. In a faucet, a base having a tubular extension at its bottom, a valve seat fitted in its top and a flanged ring fitted
ard fixed to the valve seat and the base, a valve stem and a valve fixed to the lower end of the stem, a nut having a pointed extension on the valve stem below the valve, a tubular body plece connected with the valve seat, bearings for the valve stem in said body piece, packing above the upper bearing, a coll spring on the top end portion of the valve stem and a nut and washer on the stem and on top of said spring, a tubular extension on top of the body piece, a crank shaft mounted in said extension and a bridle on the crank of the shaft and fixed to the top of the valve stem, a handle on the end of the shaft and a cap fitted over the top and the crank shaft, arranged and combined, as shown and described for the purposes stated.
5. A self closing faucet comprising a tubular extension at its bottom, a valve seat fitted in its top and a flanged ring fitted and fixed to the valve seat and the base, a valve stem and a valve fixed to the lower end of the stem, a nut hving a pointed extension on the valve stem below the valve, a tubular body piece connected with the valve seat bearings for the valve stem in said body piece, packing above the upper bearing. a coil spring on the top end portion of the valve stem and a nut and washer on the stem and on top of said spring, a tubular extension on top of the body piece, a crank shaft mounted in sald extension and a bridle on the crank of the shaft and fixed to the top of the valve stem, a handle on the end of the shaft and a cap fitted over the top and the crank shaft and means for restricting the downward motion of the crank of the shaft, arranged and combined, as shown and dtscribed for the purposes stated.

No. 101,904. Tobacco Pipe. Pipe à tabac.

Ardrew Paysen, Anadarko, Oklahoma Territory, U.S.A., 6th November, 1906: 6 years. Filed 27th September, 1906. Receipt No. 139,840.
Claim.-A tobacco pipe the bowl of which is cylindrical in form and composed of carthy material, said bowl being provided except at the bottom thereof with a thick covering of fbrous material, and said fibrous material being provided with a covering of thin paper.

No. 101,805. Sewer Pipe. Tuyau d'égout.
George Feltz and William Sherman East, both of Lima, Ohio, U.S.A., 6th November, 1906; 6 years. Filed 6th July, 1906. Recelpt No. 137,582 .
Claim.-1. A pipe section having lugs on the outer face thereof, said lugs having slots formed therethrough, and a bulk head abutting the extremity of said pipe and having a:ms passing through sald slots, and means for retaining said arm in said slots.
2. A plpe section comprising an upper section and a lower section jointed thereto. said pipe sections having lugs form-- 1 on the outer sille thereof with transverst slots, and a head abutting the extremity of said pipe section and having arme passing through said slots and pins passing through sald arms and engaging said lugs.
3. A pipe section comprising an upper section and a lowner spertion forinted thereto, a bulk head tormed in sections corrosponding to said upper and lower sec-- in in soctions corrcsponding to sald upper and lower secdions and ahutting the extremity of and pipe section, said pipe s.ection having lugs on the outer side thereof with Tslots therethrough, sald bulk head having arms on the inner
face thereof projecting through said slots and lying agains: the outer face of sald pipe section, and pins passing through

said arms and engaging the remote sides of said lugs to retain said bulk head.

No. 101,806. Hose Clamp. Agrafe de boyauc.

Juseph W. Adams, Pasadena, California, U.S.A., 6th November, 1906; 6 years. Filed 21st July, 1906. Receipt No. 138,012.
Claim.-1. A hose clamp comprising a hose embracing band provided with terminal studs, and a handle member provided with oppositely directed cam slots engaging the studs and so curved that both ends contact with the hose.
2. A hose clamp comprising a hose embracing band, provided with terminal studs, a guard member slidably mounted thereon and bridging the interval between the terminals and a handle member provided with oppositely directed cam slots and so curved that both ends contact with the hose.
3. A hose clamp embodying a flexible band carrying rigid studs, a handle engaging the studs to clamp the band upon the hose and means whereby the handle is held from a return movement of the hose.
4. A hose clamp embodying a flexible band, studs radially outstanding from the band adjacent the free ends, a handle engaging the studs to clamp the band upon the hose and means whereby the handle is held from a return movement by the hose.
5. A hase clamp embodying a flexible band, studs radially outstanding from the band adjacent the free ends, a handl. having ram slots engaging the studs to clamp the band upan the hose and means whereby the handle is held from a \(\quad \mathrm{m}\). turn movement by the hose.
6. A hose clamp embodying a flexible band. headed stil: \(=\) radially outstanding from the band adjacent the efree rnila handle having cam slots engaging the studs to clamp th. band upon the hose, and means whereby the handle is bell from a return movement by the hose.
7. A hose clamp embodying a flexible band provided with a circumferentially adjustable guard section, a handle for clamping the band upon the hose and relative to the guard section and means whereby the handle is held from a return movement by the hose.
8. A hose clamp embodying a flexible band provided with a circumferentially adjustable guard section, and headed studs radially outstanding from the band adjacent the ends connected with the guard section, a handle having eccentric cam slots engaging the studs to clamp band upon the hose and means whereby the handle is held from a return movement by the hose.
9. A hose clamp comprising a flat band and a lever having oppositely directed cam slots detachably engaging the ends of the band, said ends being incapable of independent lateral movement.
10. A hose clamp comprising a flat band having studs upon its end portions and a lever having oppositely directed cam slots constituting guides for the studs, the ends of said band being incapable of independent lateral movement.

No. 101,807. Wire Fence Maling Machine.
Machine d faire les clôtures de fl de fer.

Alfred William Burbury, Woodbury, Tasmania, Australia, 6th November, 1906; 6 years. Filed 7th September, 1906. Receipt No. 139,332 .
Claim.-1. The combination with a fencing standard or dropper of a clip formed of sheet metal which is bent into a ridge and having means in the ridge for holding a strand of a wire fence, and grips for securing the clip to the standard or dropper.
2. The combination with a fencing standard or dropper of a clip adapted to be locked thereon, the same consisting of a piece of sheet metal bent medially to form a ridge in which a hole is bored horizontally and an incision made about opposite to and obliquely with such hole, as specified.
3. The combination in a wire fence with the standards and croppers, of clips formed with a ridge in which is an oblique ircision, the interior portions of which are hollowed out as described, and additional clips having parallel or right angled incisions usable upon the top and bottom strands of the fence, and a tapered pin for locking the strands in said additional clips, as described.
4. The combination in a wire fence with the standards and droppers and clips as herein specified, of the tool for putting on or taking off said clips, same consisting of two parts pivotally attached, a claw upon one part that is slotted and two arms or horns on the other part, as described.
Ko. 101,908. Mitre Jack. Levier de boîte d onglet.
Daniel D. Cameron, San Francisco, California, U.S.A., 6th November, 1906; 6 years. Filed 4th September, 1906. Receipt No. 139,198.
Claim.-1. In a mitre jack, a bottom horizontal plate, a front vertical plate hinged to the bottom plate so that the two can be folded together or arranged at right angles to one another. folded legs for supporting the bottom plate, the front plate provided with an opening formed therethrough through which the work is adapted to extend, a fence adapted to be pivoted from either end of the opening, two vertical bolts passing through each end of the fence, one extending from the upper edge and one from the lower edge, means for retracting or protruding the ends of said bolts, a knife frame slidably mounter at the front of the front plate so as to slide longitudinally thereof. a vertically reciprocating knife rarried by said knife frame, the cutting edges of said knife being upon the lower side and inclined inward and downward toward the center, means for reciprocating said knife, and means for holding said knife in any position placed, as specified.
2. In a mitre jack, a bottom plate, a front plate hinged to the bottom plate, legs secured to the bothom plate, the front

plate provided with an opening formed through the same through which the material to be operated upon may pass, a tence against which the material is adapted to rast, means for pivoting said fence in either end of the opening, means for securing said fence in any position placed, a knife frame provided with a dovetail tongue upon the rearward side thereof, the front plate provided with a longitudinal dovetail groove in the front side thereo! in which the tongue is adapted to slide, a vertically reciprocating knife carried by the knife frame, the cutting edges of said knife being at the lower end thereof upon both sides and being inclined downward and Inward toward the center, a lever pivoted at one end to the knife, the upper edge of the front plate being provided with notches, a pawl pivoted to the back of the knife framo adepted to be swung over in either direction to engage the notches so as to hold the knife frame against pressure from either side, as specified.
No. 101,909. Device for Controlling a Smpely of Water.
Appareil d̀ contrôler l'approvisionnement de l'eau.

Robert Greig Kennedy, Largo Fife, Scotland, 6th November, 1906; 6 years. Filed 25th July, 1906. Receipt No. 138,144. Claim.-1. In devices for controlling water supply and in combination, an inlet, a movable cylinder forming a sluice for said inlet, means for balancing said cylinder, an outlet, and means for controlling the movement of the cylinder to keep constant and indicate the amount of the water supply.
2. In devices for controlling water supply, and in combination, an inlet pipe, a movable cylinder forming a sluice for said inlet, means for balancing said cylinder, an outlet, and means carried by the cylinder for controlling the movement of same to keep constant the water supply.
3. In devices for controlling water supply, and in combination, a pipe having an inlet on the supply side and an outlet on the outfall side, a movable cylinder forming a sluice for regulating the amount of inlet water from a given maximum to zero, means for balancing the cylinder, and means for controlling the movement of the cylinder to keep constant the water supply.
4. In devices for controlling water supply and in combinatín, an inlet pipe, an outer movable open-ended cylinder forming a sluice for said inlet, an inner movable open-ended cylinder rigidly connected thereto, means for balancing said cylinder, an outlet, and means carried by said inner cylinder for controlling the movement of the latter and the outer cylinder to keep constant the water supply.
5. In devices for controlling water supply and in combination, an inlet pipe, a movable cylinder forming a sluice for said inlet, means for balancing said cylinder comprising a weighted body, a fulcrumed lever attached thereto and to said cylinder, means for adjusting the weight of said weighted body, an outlet, and means in connection with said cylinder whereby the movement of the latter is controlled to keep constant the water supply.
6. In devices for controlling water supply and in combination, an inlet pipe, a movable cylinder forming a sluice for said inlet, means for balancing said cylinder, a dash pot in connection with said means, an outlet, and means in connection with the cylinder whereby the movement of the latter is controlled to keep constant the water supply.
7. In devices for controlling water supply and in combination an inlet pipe, an outer open-ended cylinder forming a sluice for said inlet, an inner open-ended cylinder rigidly connected thereto, means for balancing said cylinders, an outlet, and means comprising a cone frustum carried by an extension of said inner cylinder to project into said inlet pipe for controlling the movement of said cylinders to keep constant the water supply.
8. In devices for controlling water supply and in combination, an inlet plpe, a movable cylinder forming a sluice for said inlet, means for balancing said cylinder, an outlet, means for controlling the movement of said cylinder to keep constant the passage of water to said inlet, and means for locking said cylinder against movement in any desired position, and for releasing same when desired.
