VOLUME XXXIV., 1906. - ANNUAL INDEX.

## INDEX OF INVENTIONS.

Abdominal and hose support. Nellie Lennon Digney Abrasive apparatus. Olmedo C. Wysong...
Accident preventing device. Camil Mathews.
Accounting appliances. The Bennett Register Co. Acetylene gas generator. Jacob Kuljis... Acetylene gas generator. John J. Hendler. Acctylene gas machine. Frederick P. Cave......... Acetylene gas machine. Frederick W. Moore, et al. Acetylene gas. Proces ol bur lag. John B. Carroll Acetylene generator. Aquile Lauzon, et al. Acetylene machine. Arthur E. Blanchard Actd. Sce Aluminates, hydrochloric acid and sode. Acid. Sce Aluminates, hydrochloric acid and soda.
Acid. Concentrating nitric. Harry Pauling..... Acid. Concentrating nitric. Harry Pauling
Acid. Hydrochloric. Isaiah L. Roberts..... Acids. Process of making oxalate and oxalic. Frederick A. Feldkamp......................................... et al.
vertising apparatus. The Berliner Ausstel-lungsGallerien.
Advertising apparatus. William Whitehead.

Brunler....................................
Advertising device. Elias A. Lyon.
Advertising means. Adam
Advertising means. Adam B. Mackie...............
Gomlla.. .. .. .. .. .. .. .. ....... .. $\quad . . .$.
Adding and recording machine. Charles B. Gartreli Adding device. Edward C. Dilworth.................... Adding machine. See Typewriter and adding machine.
Adding machine. Andrew Rawson Jennings......... Adding machine. Augustin M. Benedic.
Adding machine. Joseph H. Ginet.
Adding machine. Joseph Pallweber..
Addressing machine. Edward P. Sheldon, et al... Addressing machine. Michael $P$. Kenna.
Addressing machine. The Cox Multimailer Co......
Aerator. B. H. Thomas, et al.
Air and gas. Apparatus for mixing. Selas geseli-schaft-mit-beschrankter Haftung
Air-feeding device. Emro Harcharick
Air heating chamber for ovens and furnaces ...........
Max ........... .................. .........................
Air presser. The Ingersoll-Rand Company.
Air purlfying apparatus. John H. KInealy.........
ir purifying process. The Roessler and Hasslacker Chemioal Company.
Nir ship. Ignazio Perugint.
Air ship. John F. Harris.
Air to electric discharges. Machine for subjecting. John E. Mitchell, et al..
Alarm and signal. The Zorge Safety Rallway Equipment Compans
Alarm. Electric Burton s. Bell............................... Limited........... ......... ............................ 1

| Alarm. Electric fire. Wlllam G. Meddings | 98,901 |
| :---: | :---: |
| Alarm. Fire. Alfred E. Watts. | 99,559 |
| Alarm. Fire. Osman K. Ne | 97,397 |
| Alarm for gauges, clocks, etc. Adelard Ch | 97,652 |
| Alarm for grain binders. Charles | 98,514 |
| Alarm for sprinklers. Edwin | 99,773 |
| Alarm fuse for telephone exchanges. The Bell Telephone Company of Canada. | 101,216 |
| Alarm. Low water. George Ye | 101,726 |
| Alldade. Isabel B. Kilham | 101,518 |
| Alkalichlorid solution. Electrolytic decomposition of. Johan J. Rink. | 100,270 |
| Alloy. Ferro. Edgar F | 102,789 |
| Alloy. Iron. Process of producing. Harleston Corbett Gesner. |  |
| Alphabet. Telegraphic. Is |  |
| Aluminates, hydrochloric acid and soda. Manufacture of. Paul Klein.. |  |
| Aluminum, hyrdoxide, etc. Manufacture of. The Chemische Fabrik Grieshelm Electrom.......... | 102,718 |
| Amalgamator. Charles W. Patte | 99,733 |
| Amalgamator. Henry J. Horstma | 99.784 |
| Amalgamator. William H. Morgan, | 102,068 |
| Amalgamator. Willis C. Bourdette | 99.760 |
| Amalgamator for ore, etc. John R. Harrison, et al.. | 101.161 |
| Ammonia production. August Fillu | 102.615 |
| Ammonia production. Ottokar Serpek.............. | 102,653 |
| Ammonium chloride. Process for obtaining. Andrew Gordon French. | 102,270 |
| Anchor for guy wires. Jaspar Black | 98,015 |
| Anchor. Ground. Charles McLean St | 101.462 |
| Anchor. Ground. William J. Galla | 101,193 |
| Anchor ice or frazil. Means of controlling. John Murphy. | 96,898 |
| Anchor. Post. Thomas E. Temp | 99,020 |
| Animal chase. Willis M. Elder, et | 100,649 |
| Animal trap. Alexis Lavoie | 98.828 |
| Animal trap and stock loader. Charles L. Burrus. | 100,776 |
| Ankle support for skates. Royal N. Riblet | 97,334 |
| Annealing apparatus for metal. Darwin Bates, et al | 98,011 |
| Annunciator. Electrical. Goldsmith English, et al. | 102.780 |
| Anti-creeper for railways. Christian Lien........ | 97,067 |
| Anti-creeper for rallways. John G. Sullivan...... | 97,070 |
| Antimony and arsenic. Method of recovering. John <br> R. Masbon. | 100.344 |
| Antiseptic compound. Frederick Stearns \& Company | 99,848 |
| Arc. Voltalc. Harry Pauling | 102,535 |

## NOTICE.

All solicitors, agents or attorneys who, in circulars or advertisements, or otherwise, refer to the Commissioner or Deputy Connnis sioner of Patents, or to any other official of the Patenl Office, for cvidence of their professional standing, do so without authority.

## INVENTIONS PATENTED.

 which the fee has been pald, is firen aftor the date of the patent.

No. 99,816. Soeder for Root Crops.
Semoir pour légumes.

Frank Kitchen Bell, St. George, Ontario, Canada, 3rd July, 1906; 6 years. Filed 4th June, 1906. Recelpt No. 136,533. Claim.-1. In a seeder and fertilizer, the combination of a rame, a preparing roller journalled at its forward end, and fertilizlng apparatus intermediate of the rollers provided with discharge spouts, and driving means for the seeding and fertilizing apparatus geared to one of the rollers, substantially as described.

7-1
2. In a seeder and fertilizer, the combination of a substan 2. In H -shaped frame, adapted at each end for the journalling of rollers, and brackets secured to the cross bar and extending forwardly and rearwardly respectively for the at tachment of seeding and fertilizing apparatus, substantially as described.

No. 99,817. Door for Car Floorg. Porte de chars.

Argyle Campbell, Chicago, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 9th June, 1906. Recelpt No. 136,733.
claim.-1. In a car in comblnation with a frame and load retaining car body a load carrying fioor door normally closIng a load discharging opening in said body, a crank shaft mechanism adjacent to two opposite sides of the door each taving a pin and slot connection with a side of the door so that by operating one of said crank shaft mechanisms the door may be tllted about the pin of the opposite mechanism as a hinge.
2. In a car in combination with a frame and load retainlcad discharging opening in the body, a crank shaft mechaniبm adjacent to two opposite sides of the door each having anm adjacent to two opposite sides of the door each having
a pin and slot connection with the side of the door to which it is adjacent, the whole so arranged that by operating elther of said crank shaft mechanisms the ioor may be tilted about the pin of the opposite mechanisms as a hinge.
3. In a car in combination with a frame and load retaining car body, a load carrying floor door normally closing a lcad discharging opening in the body, a crank shaft mechanism adjacent to each of two opposite sides of the door, each crank shaft mechanism carrying a pin adapted to slide backward and forward in a slot in the underside of the door, the whole so arranged that by operating either crank shaft mecharism the door is tilted about the pin of the opposite crank In a ar a hinge to discharge in
g in body, a load carrying floor drame and load retainload discharging opening in said body, a crank shaft mechcoad discharging opening in said body, a crank shaft mecheach crank shaft mechanism carrying a pin adapted to slide backward and forward in a slot on the under slde of the
door, adjacent to its operating mechanism, the whole so arianged that oporating either crank shaft mechanism tilts the door about the pin of the opposite crank mechanlsm as a linge to discharge load.
5. In a car in :ombination with a frame and load retaining car body, a load carrying floor door normally closing a load discharging opening in said body, a crank shaft mechanism adjacent to each of two opposite sides of the door having a pin anil slot connection with the side of the door to which it is a ljacent so that operating one of said crank shaft mechanisnis tilts the door on the pin of the opposite mechanism as a hinge and a locking mechanism normally holding each crank shaft mechanism in load carrying position while the opposite mechanism is being operated.
6. In a car in combination with a frame and load retaining car body, a load carrying floor door normally closing a loail discharging opening in the body, a crank shaft mechanism mounted on each of two opposite edges of the door, each crank shaft merhanism carrying a pin adapted to slide backward and forward in a slot on the underside of the door, the whol.s so arranged that by operating one crank shaft mechanisnt the door is tilted about the pin of the opposite crank neechanlsm as a hinge to discharge load, and a locking mechanism normally holding each crank shaft mechanism in load carrying position while the opposite mechanism is being operaled.
7. In a car in combination with an under frame consisting of a central glider and cross members, a load carrying floor door between a pair of cross members at one side of the central girder nccupying less space than the distance between the central ginler and the side of the car, a longitudinal shaft munnted upon the under frame at each side of the door, one shaft near the central girder and one shaft near the side of the car, a crank mechanism upon each of said shafts having a pin aud slot connection with each of two opposite edges of the dour, means for normally locking each shaft in normal pusition and means for rotating each shaft, the whole so arranged that operating either mechanism tilts the door about the opposite pin as a hinge.
8. In a car in combination with an under frame consisting of a central girder and cross members, a load carrying floor door betreen a pair of cross members at one side of the central girder oicupying less space than the distance between the central girder and the side of the car, a longitudinal shaft mounted upon the under frame at each side of the door, une shaft near the central girder and one shaft near the side of the car, a crank mechanism upon each of said shafts having a pin and slot connection with the edge of the door to which it is adjacent, means for normally locking each shaft in normal position and means for rotating each sh.fft, the whole so arranged that operating either mechanism tilts the door about the opposite pin as a hinge to dischargu load at the side of the door adjacent to the operating shaft which is being manipulated.

## No. 99,818. Garment Band. Bande de vêtement.

John Hamilton Cowan, Ottawa, Ontario, Canada, 3rd July, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,636.
Claim.-1. The combination with a band of an extension strip adjustably secured to the end of the same, as and for the purpose specified.
2. The colubination with a band of double thickness of a connecting strip extending between the folds at the end thereof, and means for adjustably securing the same in position, as and for the purpose specified.
3. The conibination with a band of double thickness of a connecting strlp extending between the folds of the end thereof having a plurality of holes therein, a two part fastener having one part secured to each fold of the band and adapted to be locked with the central portion thereof extending through oae of the holes in the band, as and for the purpose specifled.
4. The combination with a two-part band of a connecting strip extending between the folds of each part and means for securing the same adjustably in position, as and for the purpose specifled.
5. The comtination with a two-part band of a connecting strip extending between the folds of each part and having a plurality of holes therein, two-part fasteners secured to each part of the band and having the separate parts thereof connected respertively to the two folds of each band and adapted to lock with the central portion thereof extending through the holes in the connecting strip, as and for the purpose specified.
6. The coubination with a tro-part band of a connecting strip extending between the folds of each part and means for separately ind adjustably securing the strip to each part of the band, as and for the purpose specified.
7. The combination with a band of a connecting strip adjustably secured to the end of the same having a buttonhole
in the part thereof external to the band, as and for the purpose specified.

8. The combination with a band divided into two parts of connecting means extending into each part and means for securing the connecting means adjustably in position, as and for the purpose specified.
9. The combination with the band divided into two parts of pockets in the end of each part and connecting means extending into each pocket and means for adjustably securing the connecting means in each pocket, as and for the purpose specified.
10. The combination with a band divided into two parts of pockets formed in the end of each part having one of the sides of each in the form of flaps, a connecting strip extending in each of the pockets and means controlled by the raising and lowering of the flap for locking the connecting strip in position, as and for the purpose specifled.
11. The combination with a band of a pocket formed in the end thereof, a connecting strip extending into the pocket, and means for locking the strip in any adjustable position in the pocket, as and for the purpose specified.
12. The combination with a band of a pocket in the end of the same, a connecting strip extending into the pocket, and a fastener secured to the sides of the pocket adapted to lock the strip in position therein, as and for the purpose specified.
13. The combination with a band divided into t.wo parts of pockets in the end of each part having one side of each in the form of a flap, a connecting strip extending into each pocket and having a plurality of holes therein, two-part dome fasteners in each pocket having one of the parts of each secured to the band and one to the flaps central portions of each being adapted to extend when locked through the holes in the connecting band, as and for the purpose specifled.
14. The combination with a band divided into two parts of connecting means extending between the two parts and adjustably secured to each, as and for the purpose specified.
15. The combination with a band of an extension means located at one end of the same, as and for the purpose specified.
16. The combination with a band of adjustable extension means located at one end of the same, as and for the purpose specifled.
17. The combination with a shirt of an extensible annular neck band therefor, as and for the purpose specified.

No. 99,819. Egg Beater. Vergette.

John S. Dunlap, Chicago, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,624.
Claim.-1. An egg beater comprising a shaft having a perforated dasher secured thereto and normally disposed at right angles to the shaft, said dasher being relatively thin and flexible to permit the opposite ands thereof to be deflected upwardly in contact with the interior walls of a contalning vessel when placed within the latter, and means for rotating the shaft.
2. An egg beater comprising a bar laving a handle at one end and with the opposite end bent to form a U-shaped bracket, a dasher shait journalled in the opposite arms of the bracket, a pinion mounted upon the shaft within the bracket, a resilient blale mounted upnn the shaft and adapted to conform substantially to the interior of a containing vessel, a disc mounted upon the bar and provided with an annular ball race, a gear wheel provided with an opposing ball race and mounted to rotate adjacent the disc and in engagement with the pinion and means for rotating the gear.
3. An egg beater comprising a shaft, a dasher secured to the shaft and normally disiosed at substantially right angles thereto, said dasher belng relatively thin and flexible to permit the arms of the dasher to conform to the interior walls of a containing vessel, ari means for rotating the shaft.
4. An egg beater comprising a shifft, a dasher secured to the shaft and normally disposed at substantially right angles thereto, said dasher being relatively thin to permit the arms of the dasher to conform to the interior walls of a containing vessel, and means for rotating the shaft.
5. An egg beater comprising a shaft, a dasher secured to the shaft and consisting of a flat relatively thin cutting blade the front and rear edges of which are disposed in the same horizontal plane, said dasher baving its major axis disposed substantlally parallel with th: plane of its movement, and means for rotating the shaft.

No. 99,820. Rotary Harrow. Hersc rotatoire.
Frceman Hanson, Hollis Center, Maine, U.S.A., 3rd July 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,576.
Claim.-A rotary harrow comprising a frame with a shaft connected thereto, an axle journalled in suitable bearings in said frame, a countershaft also journalled in said frame, swinging beams $E$ mounted upun said countershaft, a harrow shaft journalled in the ends of said beams, a sprocket wheel fixed to the harrow shaft, sprocket wheels upon the countershaft, a sprocket chain passing wver the sprocket wheel upon the harrow shaft and one of said sprocket wheels upon the countershaft, and integral clutch collar and sprocket wheel loosely mounted upon the axle, a sprocket chain passing about the sprocket wheel upon the axle and one of sald sprocket wheels of the countershaft, a clutch collar splined to the axle, lever mechanism for throwing the same into engagement with the clutch collar which is in-
tegral with said sprocket wheel, a drum carrying shaft journalled in bearings in the frame, chain connections between

said drum carrying shaft and said beams, and lever mechanism for rotating the drum carrying shaft, as set forth.

## No. 99,821. Stump Burner.

Appareil d lmaler des souches.

Charles Nicholas Itubbard, Bee, Washington, U.S.A., 3r1 July,
1906; 6 years. Filed 10th May, 1906. Receipt No. 135,786.
Claim.-1. In a stump burner the combination of a re*eptacle for inclosing a stump composed of detachable panels, a cover on said recrptacle and means for supplying a draft of air to said receptacle, substantially as described.
2. In a stump hurner the combination of a receptacle for inclosing a stumy composed of detachable panels lined with asbestos or like material, a cover on said receptacle, and means for supplying a draft of air to said receptacle, substantially as described.
3. In a stump burner the combination of a receptacle for inclosing a stump composed of detachable panels, a cover. also formed of detachable panels, on said recnptacle and means for supplying a draft of air to said receptacle, substantially as discribed.
4. In a stump burner the combination of a receptacle for inclosing a stump composed of detachable panels, a cover, also formed of detachable panels, on said receptacle, said cover having an opening in its center, a pipe communicating with sad opening, and means for supplying a draft of air to said receptacle, substantially as described.
5. In a stump burner the combination of a receptacle for inclosing a stump composed of detachable panels, a cover also formed of detachable panels, on said receptacle, said cover having an opening in its center, a pipe communicating with said opening, and means for supplying a draft of air to said receptacle near its bottom, substantially as described.
6. A stump burner constructed of circularly disposed vertically divided panels, and a cover therefor, constructed of corresponding radially divided panels, the panels of each set beIng detachably secured together, whereby the number thereof receptacle near its bottom, substantially as described.
7. A stump burner comprising means for Incosing a stump, a cover therefor constructed of radially divided panels having flanges at their edges. and means for detachably securing together the flanges of adjoining panels, whereby the number of panels may be increased or diminshed.
7. A stump burner comprising means for inclosing a stump, constructed of vertically divided panels having flanges at their edges, means for detachably securing together the flanges of adjolning panels, whereby the number of panels may be increased or diminished, and a cover for said means.
9 A stump burner comprising means for inclosing a stump constructed of vertically divided panels having flanges at their edges, a U-shaped device detachably embracing each pair of flanges and detachable fastening means extending through said device and sald flanges, whereby the number of panels may be increased or diminished.
10. In a stump burner the combination of a receptacle for enclosing a stump, said receptacle comprising a number of detachable panels, a cover for said receptacle, and a plurality of stralght tubes for supplying air to said receptacle.

No. 99,822. Draft Gear for Cars. Appareil de tirage pour chars.

John Lange, Jr., Moberly, Missouri, U.S.A., 3rd July, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,627.
Claim.-1. In a draft gear the frame members having spring receiving pockets and interchangeable devices adapted to be removably mounted within said pockets and comprising means for varying the space occupled by the spring according to the size of the latter.
2. In a draft gear a frame having spring recelving pockets and means for varyng the width of the pockets.
3. In a draft gear the frame members baving spring receiving pockets, and interchangeable devices adapted to be removably arranged within said pockets for varying the length of the space therein according to the length of the spring to be employed.
4. In a draft gear a frame having a spring recelving pocket and means for varying both the length and width of the pocket.
5. In a draft gear, a frame having a spring receiving pocket and detachable blocks for varying the width of the pocket.
6. In draft gearing, a frame having a spring receiving pocket, there being an opening formed in the wall of the pocket, and a detachable block adjustable to a position within the pocket and having a lug extending through said opening.
7. In a draft gear the combination with the draw bar, of a carry iron supporting the draw bar and having a vertical adjustment, and a draw spring connecting with the inner end of the draw bar, said draw spring connection having a corresponding vertical adjustment to that of the carry iron.
8. In draft gear, a frame, a reverslble carry Iron for supporting the draw bar at different heights, and means for rigidly locking said carry iron in either of its positions.
9. In draft gear, a frame having spring recelving pocket, and a reversible plate forming the bottom of said pocket.
10. In draft gear, a frame having a spring receiving pocket and reversible lug strap forming the bottom of the pocket and adjustable to alter the effective height of said pocket.
11. In draft gear, a frame having lugs for embracing the transom, and interchangeable and adjustable filling blocks disposed between the sides of the transom and the lugs.
12. In draft gear, a frame having spaced lugs for embracing the transom and interchangeable blocks adjustable to varying positions with respect to the transom and the lugs.
13. In a draft gear the combination with the vertically disposed web platés arranged between the longitudinal sills ans provided with edge flanges, of a transversely disposed brac-in- plate extending between the web plates and resting on said flanges in a position to the rear of the end sill of the frame, and securing bolts extending through said bracing plate and end sill and serving to prevent rearward movement of all of the plates.
14. In a draft rigging, convertible side castings having upper integral guides and lower removable guides and front and rear stops for the followers, and provided with removable insert or conversion pleces and abutting against said rear stops, substantially as specifled.
15. In a draft rigging the combination with convertible side castings having integral front and rear stops and integral upper guides for the followers, of removable insert or conversion pleces, substantially as specified.
16. In a draft rigging the comblnation with side castings having each front and rear stops and integral upper guides for the followers of insert or conversion pleces abutting against said front and rear stops and furnished each with a stop, substantially as specified.

No. 99,823. Plough Share. Soc de charrue.

Jacob Lledle, Irvine, Alberta, Canada, 3rd July, 1906; 6 years. Filed 7th June, 1906. Recelpt No. 136,647.
Claim.-1. In a device of the class described, the combination with a shank, mould board and share, of means for interlocking the share to the shank and the mould board, as and for the purpose specifled.
2. In a device of the class described, the combination with the shank, mould board and share of a slidably interlocking joint between the share, and the mould board and shank, and adjustable means for securing the parts in said interlocked position, as and for the purpose specified.
3. In a device of the class described, the comblnation with the shank, share and mould board, the said shank having a slotted lower end, of a lip extending inwardly from the share and designed to slide and be constrained within the slot and adjustable means for securing the share to the mould board when the lip is at its inner position in the slot, as and for the purpose specified.
4. In a device of the class described, the combination with the shank share and the mould board, the said shank having a slotted end portion, of a lip extending inwardly from the upright face of the share and designed to slide and be constrained within the slot, a strip secured to the inner face of the mould board and extending transversely there beyond, a clip secured on the inner face of the share having an over-
hanging portion designed to receive between its inner face and the share, the strip aforesaid, a pln extending downwardly from the strip, at or near its outstanding end, the zaid pin being designed to rest flush against the overhanging face of the clip, when the lip is in Its inner position in the slot and adjustable means for securing the mould board when the lip is in its inner position, as and for the purpose specified.
5. In a device of the class described, the combination with the shank, share and the mould board, the said shank having a slotted end portion, of a lip extending inwardly from the upright face of the share and designed to slide and be constrained within the slot, a strip secured to the inner face of the mould board and extending transversely therebeyond, a clip secured on the inner face of the share having an overhanging portion designed to receive between its inner face and the share, a strip aforesaid, a pin extending downwardly from the strip, at or near its outstanding end, the sald pin being designed to rest flush against the overhanging face ef the cllp when the lip is in its inner position in the slot. and a pin secured within a bearing on the lower face of the mould board, the extending end being designed to be adjustably retained by a similar bearing on the inner face of the share when the lip is at its inner position in the slot, as and for the purpose specified.

## No. 99,824. 8hirt. Chemise.

Milton Paul Magly, Cincinnati, Ohio, U.S.A., 3rd July, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,230.
Olaim.-As a new article of manufacture, a shirt having a soft, thin and pliable body portion and provided with a closed front and open back, and having a miniature inverted triangle shape reinforce forming a bosom that extends downward from the neckband with the apex at a point just below that of the converging diagonal sides of a high cut vest opening, and with its dlagonal sides terminating at said neckband adjacent to the collar bone of the wearer.

No. 99,825. Convejer. Transport.

Wiliam L. McCabe, Seattle, Washington, U.S.A., 3rd July, 1906; 6 years. Filed 6th June, 1906. Receipt No. 136.594.
Claim.-1. In a conveyer, the combination with a framework and conveying mechanism carried thereby, of a platform plvotally supporting said framework, a telescoping section of platform telescopically engaging said first-mentioned
platform, a standard plvoted to said telescoping section of platform and adapted to support said framework, and means ioi bracing said standard against pivotal movement.
2. In a conveyer, the combination with a conveyer framework and conveylng mechanism carried thereby, of a pivot ally mounted standard disposed beneath said framework, and n:eans for temporarily bracing said standards against plvotal movement.
3. In a conveyer, the combination with a framework, and conveying mechanism carried thereby, of means for raising and lowering sald framework, pivotally mounted standards carrying said ralsing and lowering means, and means for preventing pivotal movement of said standards.
4. In a conveyer, the combination with a framework and cunveying mechanism carried thereby, of a pair of standards arranged beneath said framework, a shaft supporting said framework, and differential pulleys and chains supporting said shaft
5. In a conveyer, the combination with a framework and a conveying mechanism arranged therein, of plvotally mount ed standards arranged to support said framework, and removably mounted brace rods supporting said standards in position against pivotal movement.
6. In a conveyer, the combination with a conveyer framework and a conveying mechanism arranged therein, of pivot ally mounted standards arranged at the sides of said conveyer, a shaft extending across said standards, means for adjustably supporting said shaft on said standards, and removable means for normally retaining said standaris against pivotal movement.
7. In a conveyer, the combination with a conveyer pramework and a conveying mechanism carried thereby, of standards pivotally mounted and adapted to support said framework in an inclined position and pivoted to swing toward the lower end of the framework.
8. In a conveyer, the combination with a framework and a conveying mechanism carried thereby, of a platform plvotally supporting said framework, and means pivoted to sald platform for supporting said framework in an inclined position, the said supporting means being adapted to sving toward the plvot of the said framework.
9. In a conveyer, the comblation with a platiorm and carrying wheels supporting the same, of a conveyer framework pivotally connected therewith, means carried by said platform for supporting the free end of said framework, an auxillary framework spaced from sald main framework, carrying means for supporting sald auxiliary framework, a conveying mechanism carried by sald main iramework, and a conveying mechanism carried by said auxiliary framework.
10. In a conveyer the comblation of a main conveyer framework. a conveyer belt arranged therein. end drums carrying sald belt, means for driving one of gaid drums, an auxiliary conveyer framework spaced from the main framework, a conveyer belt arranged in said auxiliary framework. drums arranged in sald auxiliary framework supporting the belt thereof. sliding journal boxes for the shaft of one of the drums of the auxiliary framework, and sliding journal boxes for the shaft of one of the drums of the main framework, spacing bars connecting said journal boxes, and driving gears connecting said shafts for transmitting power from the maln conveyer belt to the auxiliary conveyer belt.
11. In a conveyer the combination of a main conveyer framework, an auxiliary convever framework spaced therefrom, sliding journal boxes arranged at one end of one of sald conveyer framework, and simllar journal boxes arranged at the contlguous end of the other framework, longitudinally extensible shafts connecting said journal boxes, shafts journalled in said journal boxes. drums carried by sald shafts. conveyor belting supported by said drums. means for conveying power from one of said shafts to the other, and means for driving the belting of one of said drums.
12. In a conveyer the combination with a framework and a conveyer belt arranged therein, of a driving shaft journalled in said framework, a plurallty of gears splined on said shaft. a second shaft journalled in said framework. a plurality of gears fixed to sald second shaft, means for communicating power from one of the gears of the Arst shaft to one of the gears of the second shaft, sald power communicating means being adapted to be adjusted for transmitting power from any one of the gears of the first shaft to any one of the gears of the second shaft, and means driven by the second shaft for actuating said conveyer belt.
13. In a conveyer mechanism the combination with a framework, of a drum journalled thereln, conveying means actuated by said drum, a belt for driving said drum, and means for limiting sald belt against vertical and edgewise movement.
14. In a conveyer mechanism the combination with a framework and a drum journalled therein, of conveying means actuated by sald drum, a belt for driving sald drum, an Ider limiting said belt against vertical movement, and grooved
pulleys engaging the edges of said belt for limiting the same against edgewise movement.
15. In a conveyer the combination with a framework, a drum journalled therein and formed with an annular groove, and a conveyer belt passed about sald drum and designed to be driven thereby, of a driving belt passed about the drum within the groove thereof, and means for preventing edgewise movement of said driving belt.
16. In a conveyer the combination with a conveyer iramework, a drum journalled therein and formed with an annular groove, and a conveger belt passed about said drum and designed to be driven thereby, of a driving belt passed about the groove in said drum and pulleys rotatably mounted in position for sliding transversely of the path of movement of said driving belt and engaging the edge thereof for preventing edgewise play of said driving belt.
17. In a conveyer the combination with a framework a drum journalled in the same and formed with an annular groove, and a conveyer belt surrounding said drum and designed to be driven thereby. of a driving belt passed about the groove of sald drum, shafts fixed in sald framework transversely of the path of movement of sald drum and grooved pulleys rotatably and slidingly carried by said shafts and positioned with the edges of said driving belt within their grooves.
18. In a conveyer the combination with a framework, and a conveyer belt arranged therein, of a driving drum for said belt comprising a plurality of poly-sided plates, and segments of cushioning material fixed to sald plates.
19. In a conveyer the combination with a framework, and a conveyer belt arranged therein, of a driving drum for sald belt comprising poly-sided end plates and segments removably connected to said plates.
20. In a conveyer the comblnation with a framework and a conveyer belt arranged therein, of rollers for supporting said belt, a shaft supporting each of said rollers, and a journal casing for each of said shafts comprising a base formed with a substantially semi-circular aperture and a lug projecting into the same, a substantially semi-circular plate disposed above said base and formed with a lug depending therefrom, and a thimble arranged between said base and plate and apertured for recelving sald lugs.
21. In a conveyer the combination with a framework, a drum journalled therein, and a conveyer belt passed about said drum, of a driving belt arranged beneath said conveyer belt and passed about said drum, and means for guiding said driving belt for preventing edgewise play thereof on said drum.
22. In a conveyer the combination with a framework, a grooved drum journalled therein, and a conveyer belt passed about said drum, of a driving belt passed about the drum and arranged within the groove beneath the conveyer belt, and means for preventing said driving belt from leaving said groove.
23. In a conveyer the combination with a pivotally mounted framework and a platform slidingly mounted with respect thereto, of a motor carried by said slidingly mounted platform, conveyer mechanism arranged within said framework, means for driving said conveyer mechanism, means for transmitting power from said motor to said driving means, and a spacing bar interposed between the motor and driving means for maintaining said power transmitting means in operative condition.
24. In a conveyer the combination with a framework and a platform pivotaliy engaging the same, of a conveyer mechanism carried by said framework, a shaft for driving said mechanism, a motor slidingly carried by said platform, spacing bars connecting the shaft of said motor with said driving shaft, and means for transmitting power from the motor to the driving shaft.
25. In a conveyer the combination with a framework and conveyer mechanism arranged therein, of a driving shaft for actuating sald mechanism, a sprocket carried by said shaft, a motor spaced from said framework and movably mounted with respect thereto, a spacing bar arranged on each side of said motor and engaging the motor shaft, and extending to and engaging said driving shaft for spacing the shaft of the motor from the driving shaft, a spocket on the shaft of the motor, and a sprocket chain connecting the sprocket of the driving shaft with the sprocket of the motor shaft.
26. In a mechanism of the class described, the combination with a conveyer of a platform supporting the same and comprising telescoping sections, a pulley carried dy one of said bections, a cable fixed to the other said sections and passed about said pulley, a block carried by the stetion carrying the said pulley, the said cable being passed beyond the pulley and through said block and being extended beyond the block to and connected with the free end of that section to which the opposite end of said cable is connected, and means for rotating said cable for paying out one side of said cable and for taking in the other side.
27. In a mechanism of the class described, the combination with a conveyer, of a platform frame sustaining the same, a second frame telescopically engaging the first-mentioned frame, a pulley rotatably carried by said second-mentionau frame, a cable fixed to the first-mentioned frame and extencing to said pulley and wrapped about the same, a block co.1nected with the second-mentioned frame at a point in frnnt of said pulley, the cable being passed beyond the pulley 114 about sald block and extending to and connected with th first-mentioned frame at a point in the rear of the blo:k and means for rotating said pulley for taking in one side of the cable and paying out the other, whereby said frames may be caused to telescopically approach each other, the said pulley being adapted to be rotated in an opposit direction for taking in the other side of said cable and paying out the side formerly taken in for causing said frames to telescopically separate.
28. In a conveyer the combination with a carrying belt and means for supporting the same, of a cleat therefor comprising a flexible member, means connecting the same to the carrying belt, and means lim ting the amount of lateral movement of said flexible member.
29. In a conveyer the combination with a carrying belt and means for supnorting the same, of a cleat for said belt com prising a flexible member laced at one edge onto the belt, a transverse limiting bar extending across said thexible member at a point between the point of said lacing and the free end of the flexible member, and means for connecting said limiting bar to the belt.
30. In a conveyer the combination with a conveying belt and means for supporting the same, of a cleat for sald belt comprising a flexible strip, means securing the same to the belt, a second flexible strip, means connecting the second strip to the first strip, and means for limiting the lateral play of the free ends of said strips.
31. In a conveyer the combination with a conveying belt and means for supporting the same, of a cleat for sald belt comprising a plurality of flexible members connected with the belt at one edge and free at the opposite edge to move laterally, and means arranged transversely of said flexible members and connected to the belt for limiting the lateral play of the free ends of the said members.
32. In a conveyer the combination with a conveyer belt and means for supporting the same, of a cleat therefor compris ing a flexible member connected at one edge to the belt and free at its oppos te edge to move laterally, a transverse limiting bar arranged above said flexible member and having its end extended beyond the same, and means connecting the ends of the limiting strip to the belt.
33. In a conveyer the combination with a conveyer belt and means for supporting the same, of a cleat for said belt comprising a flexible strip connected with the belt at one edge and free for the remainder of its length to swing laterally, and a second flexible strip connected to the first flexible strip and otherwse frec to move laterally.
34. In a conveyer the combination with a conveying belt and a support therefor, of a cleat for said belt comprising a plurality of superposed flexible strips, means connecting the lowermost strip to the belt, and means connecting each successive strip to the preceding strip only.

No. 99,826. Railway THo.
Dormant de chemin de for.

Archibald J. McCallum, Eagle Harbour, Michigan, U.S.A., 3ri July. 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,650.
Claim.-1. The combination with a hollow railway tie having boxes formed therein, of rail chairs fitting in said boxes and having lateral extensions engaging under the top of the? tie.
2. The combination with a hollow rallway tie having boxe;s formed therein, of rall chairs fitting in said boxes and having hook-shaped extensions engaging under the top of the tie.
3. The combination with a hollow railway tie having bosses formed on the inside thereof, of rail chairs having hook shaped extensions engaging said bosses.

No. 89,827. Grain Tank. Coffre d̀ grain.

Hector Colin McMartin, Winnipeg, Manitoba, Canada, 3ri July, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,570.
Claim.-1. A grain tank comprising a bottom and a sectlonal corrugated cylindrical body, said body sections respectively overlapping and bolted and means for securing the body to the base, as and for the purpose specifled.
2. A grain tank comprising a bottom, a cylindrical sectional corrugated body, the sections being composed of arcuate segteents overlapping at their ends and bolted forming vertical joints and the individual sections overlapping and bolted joining horizontal points and means for securing the body portion to the base, as and for the purpose specified.
3. A cylindrical grain tank comprising a bottom corrugated arcuate segment overlapping and bolted vertically and horizontally and means for securing the body to the base, as and for the purpose specified.
4. In a device of the class described the combination with the circular base, of a cylindrical body, said body being composed of corrugated arcuate sections overlapping and secured the one to the other and segmental portions of an angle bar cross section having the vertical portion secured to the lowest section and the horizontal portion bolted to the base, as spectfled.
5. In a device of the class described the combination with a circular base, of a cylindrical body, sald body being composed of corrugated arcuate sections overlapping and secured the one to the other, a flange extending outwardly from the bottom of the lowest section and continuous therewith, angle bars encircling the body and having their vertical portion bolted to the lowest section of the body portion and their horizontal portion resting on the flange and bolted therethrough to the base, upright reinforcing strips secured to the inner face of the body portion, an outlet from the body portion, a removable flexible top and means for lacing the top to the tank, as speciffed.
6. In a device of the class described the combination with the base and the cylindrical corrugated body portion secured thereto of a removable flexible covering, eyelets extendin; circumferentially from the top of the body portion, supplescentary eyelets within the cover and a lacing means for connecting the cover to the tank as specified.
7. In a device of the class described the combination with a circular base and a cylindrical corrugated body section secured thereto, of an adjustable outlet from the body portion, a chute extending outwardly from the tank and continuous with the outlet and a hopper in juxtaposition to the outlet and extending inwardly from the inger face of the body portion, as specified.

No. 99,828. Coaling Device for Moving Traing. Appareil à charger de charbon les trains en mouvement.

Charles M. Miller, Tyrone, Pennsylvania, U.S.A., 3rd July 1906; 6 years. Filed 7th June, 1906. Recerpt No. 136,640.
Claim.-1. In apparatus for supplying coal to the tenders of moving rallway trains, an elevated support arranged above the rallway track, and provided with inclined rails, a dumping car mounted on the rails, means for locking the dumping car from movement, and a train carried member for releasinf the car in advance of the arrival of the tender thereunder, permitting the car to descend the inclined rails by gravity, said member serving subsequently to engage and move the car, and serving further to trip the dumping mechanism and permit the dumping of the load carried by the car.
2. In apparatus of the class described an elevated structure having an inclined track, a dumping car arranged on said inclined track, a check for holding the same from movement, a lever connected to said check and a train carried member adapted to engage said lever in advance of the arrival of the tender under the car, permitting the car to descend the inclined track and acquire momentum in advance of the dumping operation.
3. In apparatus of the class described, an elevated support, a dumping car arranged to travel thereon, a sectional bucket having locking fingers arranged in close relation, a release bar having lugs engaging said fingers, and an arm carried by the train and arranged to move said bar to release position.
4. In apparatus of the class described, the combination with an elevated support, of a car arranged to travel on the support, a sectional dumping bucket carried by the car, locking fingers carried by the bucket members, a release bar having lugs for engaging said fingers, and a train carried arm for moving the bar to release position and for moving the car at a speed equal to that of the train.
5. In apparatus of the class described, the combination with an elevated support, of a car arranged to travel on the support, a sectional dumping bucket on the car, a trip mecharism for releasing the bucket, a slidable frame for operating said trip mechanism, a pair of fingers carried by the frame and having cam-shaped inner ends, and a train carried arm arranged to engage and be guided by said fingers.
i. In apparatus of the class described, the combination with an elevated support, of a car arranged to travel thercon, a sectlonal bucket on the car, locking fingers carried by the bucket members, a release bar engaging sald fingers, a slldable frame connected to the relcase bar, a traln-carried arm for engaging such irame and forcing the release bar to disengaged position, and a pair of gulding fingers plvoted to the frame and having cam-shaped free ends for guiding said arm to proper position.
7. In apparatus of the class described, the combination with an elevated frame, of a car arranged to travel on the frame, a sectional dumping bucket on the car, a plvotally mounted counterweighted chute on the car at a point below the bucket, and movable to open position under the weight of the contents of such bucket, and a train-carried means for releasing the bucket.
8. In apparatus of the class described, the combination with an elevated support, of a car, a sectional bucket carried by the car, a chute pivoted to the lower portion of the ca; at a point under the bucket, a counterweight for holding the chute in elevated position when empty, and a train-carried means for releasing the bucket and insuring movement of the car at a speed equal to that of the train.
9. In apparatus of the class described, the combination with an elevated support, of a dumping car arranged to travel thereon, a plvotally mounted arm carried by the train, a locking pin for holding the arm in elevated position, and an operating lever for releasing said pin and allowing the arm to drop to inoperative position.
10. In apparatus of the class described, the combination with an elevated structure, of a dumping car mounted thereon, means for locking said car from movement, and a signal connected to said locking means.
11. In apparatus of the class described, the combination with an elevated support, of a dumping car mounted thereon, a signal, and means for automatically moving said signal in accordance with the position of the car.

No. 99,829. Shirt Collar. Collet de chemise.

Frederick William Parsons, Cleveland, Ohio, U.S.A., 3rd July, 1906; 6 years. Filed 4th June, 1906. Recerpt No. 136,532.
Claim.-A lay-down collar having a neck band provided with two cut out portions at its rear forming open recesses extending from the lower edge thereof upward and having their greatest width at the bottom and converging upward, and a tongue integral with the band between said recesses and provided with a button hole.

No. 99,830. Stump Extractor. Arrache-80uches.

Henry Rustad, Lindsay, Ontario, Canada, 3rd Juy, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,575.
Claim.-1. In a stump extractor, the combination with the bed beams, and the base of the device secured thereto having an upwardly and rearwardly projecting frame therefrom, a frame secured to the aforesaid frame and superposed above the base. standards supporting said frame, a rotatable frame supported on said frame, means for rotating said frame, a drum turning in suitable bearings in said base and said superposed frame, means for holding said drum, means supported from sald rotatable frame for engaging said drum, means for releasing from engagement the aforesaid means, a rotatable vertical shaft journalled in said base and extending upwardly through said rotatable frame, means from said
shaft for engaging said drum, means for rotating said shaft, a cable winding on said drum, and means for anchoring said frame, as and for the purpose specified.
2. In a stump extractor, the combination with the bel beams, and the base of the device secured thereto having a central depression therein forming a bearing and an upwardly and rearwardly projecting frame therefrom, a cylindrical frame secured to the aforesaid frame superposed centrally above said base, standards supporting said frame, a rotatable frame supported on said frame, means for rotating said frame, a drum having a trunnion projecting from the bottom thereof and journalled in the bearing in sald base and turning in said superposed frame, means supported from said rotatable frame for engaging sald drum, means for releasing from engagement the aforesaid means, a rotatable vertical shaft journalled in said base and extending upwardly through said rotatable frame, means from said shaft for engaging said drum, means for rotating said shaft, a cable winding on said drum, and means for anchoring said frame, as and for the purpose specifled.
3. In a stump extractor the combination with the bed beams, and the base of the device secured thereto having a central depression therein forming a bearing and an upwardly and rearwardly projecting frame therefrom, a cylindrical frame secured to the aforesaid frame superposed centrally above said base, standards supporting sald frame, a rotatable frame supported on said frame, means for rotating said frame, a drum having a hollow trunnion projecting from the bottom thereof and journalled in the bearing in said base and turning in said superposed frame and a ring of ratchet teeth around the bottom of said drum, a spring held ratchet dog engaging said ratchet teeth, means for holding sald ratchet out of engagement with said drum, means supported from said rotatable frame for engaging said drum, means for releasing from engagement the aforesaid means, a rotatable vertical shaft journalled in said base and extending upwardly through said rotatable frame, means from said shaft for engaging said drum, means for rotating said shaft, a cable winding on said drum, and means for anchoring said frame, us and for the purpose specified.
4. In a stump extractor the combination with the bed beams and the base of the device secured thereto having a central depression therein forming a bearing and an upwardly and rearwardly projecting frame therefrom, a cylindrical frame secured to the aforesaid frame superposed centrally above said base, standards supporting said frame, a rotatable frame supported on said frame, means for rotating said frame, a drum journalled in the bearing in said base and turning in said superposed frame having a ring of ratchet teeth on the upper end thereof, means for holding said arum, a clutch block having ratchet teeth on the underside thereof engaging the ratchet teeth of said drum and supported from said rotatable frame and spring held therefrom, means from said rotatable frame for engaging said clutch block, means for releasing said clutch block from engagement with said drum, a rotatable vertical shaft journalled in said base and extending upwardly through said drum and rotatable frame, means from said shaft for engaging said drum, means for rotating said shaft, a cable winding on said drum, means for preserving the even winding of said cable on said drum, and means for anchoring said frame, as and for the purpose specified.
5. In a stump extractor the combination with the bed beams and the base of the device secured thereto having a central depression therein forming a bearing and an upwardly and rearwardly projecting frame therefrom, a cylindrical frame secured to the aforesaid frame superposed centrally above said base, standards supporting said frame, a rotatable frame supported on said frame, means for rotating said frame, a drum journalled in the bearing in said base and turning in said superposed frame having a ring of ratchet teeth on the upper end thereof, means for holding said drum, a clutch block having ratchet teeth on the underside thereof engaging the ratchet teeth of said drum and supported irom sald rotatable frame and spring held therefrom, means from said rotatable frame for engaging said clutch block, means for releas-in- said clutch block from engagement with said drum, a rotatable vertical shaft journalled in said base and extending upwardly through said drum and rotatable frawe, means from said shaft for engaging said drum, means for rotating said shaft, a cable winding on said drum, rods vertically disposed and spring held to said drum from said standards, rollers on said rods, means for adjusting said rods to und from said drum, and means for anchoring said frame, as and for the purpose specifled.
6. In a stump extractor the combination with the bed beams and the base of the device secured thereto having a contral depression therein forming a bearing and an upwardly and rearwardly projecting frame therefrom, a cylndrical frame secured to the aforesaid frame superposed centrally above said base and having an annular flange projecting therefrom, a standard arranged preferably diametrically opposite the upright portion of said frame secured to the flange of said cylindrical frame and to the base of the machine and having
a recess formed in the base thereof, a pair of standards supported from said bed beams and secured to the flange of said cylindrical frame, a rotatable frame supported on said cylindrical frame having a central angularly shaped orifice therethrough and sockets in the upper side thereor, an angularly shaped block fitting the orifice in said frame and projecting downwardly therefrom having a central oriflce therethrough, sweeps secured in said sockets, braces from said frame sup porting said sweeps, a drum having a projecting trunnion from the bottom thereof turning in the bearing in said base and turning in said cylindrical frame, a ring of ratchet teeth around the base of said drum, a ratchet dog pivoted in the recess in the base of one of the said standards and bearing against said standard, a ring of ratchet teeth around the upper edge of said drum, a clutch block supported from said rotatable frame having a central angular orifice therethrough corresponding to the central orifice in the rotatable frame and surrounding said downwardly projecting block and sliding free thereon and a ring of ratchet teeth on the underside engaging the teeth on said drum, means for holding said clutch block in engagement with said drum, means for disengaging said clutch block from said drum, a rotatable vertical shaft jour nalled in the base of said machine and held therein and projecting upwardly through said angularly shaped block, means for holding said rotating frame to lts seat, means for rotating sald drum from said shaft, means for rotating said shaft, a cable winding on said drum, and means for anchoring said machine, as and for the purpose specified
7. In a stump extractor the combination with the bed beams and the base of the device secured thereto having a central depression therein forming a bearing and an upwardly and rearwardiy projecting irame therefrom, a cylindrical iramt secured to the aforesaid frame superposed centrally above said base and having an annular flange projecting therefrom, standards supported from the base and bed beams flxedly se cured to said flange and supporting said frame, a drum journalled in the depression in said base and in said cylindrical irame having a ring of ratchet teeth around the outer peri phery of the bottom thereof and a ring of ratchet teeth arogind the upper edge thereof, a ratchet dog pivoted in the base of one of said standards and spring held in engagement with the lower ring of ratchet teeth on said drum, a cam lever pivoted on the base of the machine and engaging sair ratchet dog, a rotatable frame supported on said cylindrical frame having a flange embracing the edge of said frame and a central squared oriflce therethrough and a pair of circular oriflces through said frame diametrically opposite and equi distant from the center thereof, a squared block havin fanges at the top thereof and a central circular orifice ther through secured to said frame and projecting downwardly through said squared orifice, a clutch block having a ring of teeth corresponding to the teeth on said drum and a central squared orifice loosely surrounding said squared block and a pair of orifices diametrically opposite registering with th pair of orifices in said rotatable frame having the top portion thereof formed cylindrical and the lower portion reduced and squared, a pair of $T$-headed bolts projecting downwaldy from said rotatable frame through said orlfices and passin: through the orifices in said clutch block, and having squar portions at the lower ends and nuts on the ends thereof, coil springs surrounding said bolts resting in said orifices and abutting the underside of said rotatable frame, a pair of can blocks surrounding said bolts and resting on the upperside of said rotatable frame and engaging the heads of said bolts means for rotating said cam blocks, means for rotating, said rotatable frame, a vertical shaft journalled in the base of sald machine and held securely therein and projecting upwardly through and beyond the aforesaid square block and threaded at the upper end, a washer surrounding said shaft and resting on said square block, an adjusting nut on said shaft above said washer, a hand wheel threaded on sald shaft, a lock nut on said shaft above said hand wheel, means from sald shaft for engaging said drum, a cable winding on said drum, and means for anchoring said machine, as and for the purpose specified.
8. In a stump extractor the combination with the bed beams and the base of the device secured thereto having a central depression thereln forming a bearing and a central orifice therethrough and a triangular frame extending rearwardly from sald base, a cylindrical frame superposed centrally above said base having a projection therefrom secured to said triangular frame, standards supporting said cylindrical irame a rotatable frame supported on said cylindrical irame, mean for rotating said frame, a drum having a trunnion from the bottom thereof and a central squared orifice in the end of said trunnion, a shaft journalled in said base and securely held thereto projecting upwardly through said squared orifice and said rotatable frame having a squared shoulder fitting within the said squared orifice, means for rotating said shaft a cable winding on sald drum, and means for anchoring said frame, as and for the purpose specifled.
9. In a stump extractor, the combination with the bed leams, and the base of the device secured thereto having a

7-2
journal bearing therein and a triangular frame extending rearwardly therefrom, an anchor block having a plurality of grooves therein secured in said frame, a cylindrical frame secured to said triangular frame and superposed above said base, standards supporting said frame, a rotatable frame supported on said base, means for rotating said frame, a drum turning in the journal in said base and said cylindrical frame, means for holding said drum, means supported from said rotatable frame for engaging said drum, means for releasing from engagement the aforesaid means, a rotatable vertical shaft journalled in said base and extending upwardly through said rotatable frame, means from said shaft for engaging said drum. means for rotating said shaft, a cable winding on said drum. and means for preserving the even winding of said cable on said drum, as and for the purpose specified.
10. In a stump extractor, the combination with the bed reams, and the base of the device secured thereto having a journal bearing therein and a triangular frame extendinc rearwardly therefrom, said triangular frame having a thattened end portion, an anchor block preferably semi-cylincrical in shape and titting against sad fattened portion of said frame and having a plurality of horizontal grooves in the face thereof, means for holding said block securely in said frame, a spring held bar secured to said frame in prox imity to the face of said block, an athehor catble embracing satid block and fitting in said grooves, a cylindrical frame stcured to said triangular frame and superposed above said base, standards supporting said frame, a rotatable frame supported on said base, means for rotating satd frame, a arum turning in the journal in said base and said cylindrical trame, means for holding said drum, means supported from said rotatable frame for engaging said drum, means for relasing from engagement the aforesaid means, a rotatale vertical shaft journalled in said base and extending upwardly through said rotatable frame, means from sad shaft for engaging said drum, meaus for rotatius satd shat, a cable winding on said drum, and means for preserving the even winding of said cable on said drum, as and for the purpose speciffed.
11. In a stump extractor, the combination with the bed beams, and the base of the device secured thereto haviner an upwardly and rearwardly projecting frame theretrom. a frame secured to the aforesaid frame and superposed abow the base, standards supporting said frame, a rotatable frami supported on said frame, sweeps fixedly secured to sadd frame, braces from said frame to the outer ends of said. sweeps, a bar secured to one of said sweeps intrrmediate of its length and embracing the said brace having a hole the rothrough, a tongue pivotally secured to the end of said sweeps, a bracket on said tongue having lugs diagonally aranged and a hole through the top of said lugs, a drum turning in suitable bearings in said base and said superposid frame, means for holding said drum, means supported from said rotatable frame tor engaging said drum, moans for re lasing from engagement the aforesaid means, a rotatable vertical shaft journalled in said base and extending upwardly through said rotatable frame, means from said shaft for engaging said drum, means for rotating said shaft. a cable winding on said drum, and means for anchoring said frame, as and for the purpose specitied.
12. In a stump extractor, the combination with the ber beams, and the base of the deviee secured thereto having a central depression therein forming a bearing and a profect ing flange on the bottom of said depression and an upwardly and rearwardly projecting frame theretrom, a guard plat. bearing against said flange and bent upwardly at the ends and forming a shoe or skid, a cylindrical frame sccured to the aforesaid frame superposed centrally above said base standards supporting said frame, a rotatable frame supportind or. said frame, means for rotating said frame, a drum having a trunnion projecting from the bottom theroof and journalled In the bearing in said base and turning in said sulurpos. frame, means supported from said rotatable irame for 1 n gaging said drum, means for relcasing from cheagement th, aforesaid means, a rotatable vertical shaft fournalled in said tase and extending upwardly through said rotatable fram. reans from said shaft for engaging said drum, means for rotating said shaft, a cable winding on said drum, and mans for anchoring said frame, as and for the purpose speciticid.

## No. 99,831. Chnri. Baratte.

John I. Shaw. Movinger, Missouri, U.S.A., 3rd July, 1906; 6 years. Filed ith June, $1: 06$. Receipt No. $136,6: 8$
Claim.-1. In a churn. a base frame. a milk receptacle disposed upon said bise framer, a dasher operating in said re ceptacle, spaced standards rising from sad base frame, a bar hinged to one of sitid stambards and extonding beyond the same at on, end and with the othor a mof the bar bear ing upon the other stamdard, a supporimg frame rising from
said bar, a twlsted rod journalled in said bar and its supporting frame and detachably coupled to said dasher, and an

operating lever pivoted at one end to the extended end of said bar and provided with transverse apertures bearing over said twisted rod and operatively engaging the same.
2. In a churn, a base frame, a milk receptacle disposed upon said base frame, a dasher operating in said receptacle, spaced standards rising from said base frame and supporting said receptacle, a guard rod extending between said standards and bearing against said receptacle, a twisted rod supported for rotation above said receptacle and detachably coupled to said dasher, and an operating lever movably disposed above said receptacle and provided with transverse apertures bearing over said twisted rod.
3. In a churn, a base irame, a milk receptacle disposed upon sald base frame, a dasher operating in said receptacle, spaced standards rising from said base frame, a bar hinged to one of said standards and extending beyond the same at one end and with the other end of the bar bearing upon the other standard, said bearing standard having a pin projecting into a socket in said bar, spaced stops depending from sad bar and bearing against the inner and outer faces of said bearing standard, a resilient catch member carried by said bearing standard and detachably engaging one of said stops, a iwisted rod supported for rotation through said bar and detachably coupled to said dasher, and an operating lever movably disposed above said bar and provided with transverse apertures bearing over said twisted rod.

No. 99,832. Wooden Box or Crate.
Boîte ou manne en bois.

John Shellenberger, Rome, Georgia, U.S.A., 3rd July, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,643.
Claim.-1. A fruit shipping crate comprising end heads, longitudinal spaced bottom and side slats secured to said end heads, opposite end and intermediate parallel battens fitting the outer faces of and crossing and secured to said side and bottom slats and bent transversely to extend from the bottom slats upwardly across the side slats, and wires arranged longitudinally along the outer faces of said battens and secured thereto approximately throughout the length thereof, substantially as described.
2. In combination in a ventilated fruit shipping crate, end heads, a bottom and sides composed of spaced longitudinal slats secured to said end heads, battens secured to and extending across the slats and arranged at the outer faces thereof, each batten formed with transverse cuts across its inner side and extending the greateportion of the distance through the batten, each batten bent at said cuts to extend from the crate bottom upwardly along the sides of the crate,
the walls of each cut abutting against each other to form a miter joint, and wires secured to the battens and extending longitudinally thereof and bridging said joints, substantially as described.
3. A shipping crate comprising end heads, and a bottom and sides lapping and secured to the edges of said end heads, said bottom and sides consisting of longitudinal slats and several battens secured to the slats and arranged at the outer faces thereof, each batten extending transversely across the bottom and upwardly across the sldes and having tapered cuts extending across the same forming miter joints at the junctions between the sides and bottom and a wire secured longitudinally to the batten and bridging said joints, substantially as described.
4. As an article of manufacture, a flat sheet or series of slats adapted to be bent and secured to crate ends to form the bottom and sides thereof and consisting of a series of separated or spaced longitudinal slats, and several battens extending across and secured to the outer faces of said slats, each batten at its inner face between certain slats having transverse flaring cuts extending the greater portion of the distance through the batten, and longitudinal wires secured along the outer faces of the battens approximately throughout the length thereof, substantially as described.
5. A crate comprising end heads, bottom and side slats secured to said heads and forming the bottom and sides of the crate, battens transversely fitting and secured to the outer faces of said slats of the bottom and sides, and wires extending transversely across said bottom and sides and secured thereto, each wire extending longitudinally of at least two battens.

No. 99,833. Nut Lock Arrête-écrou.

Charles H. Smith, Rockford, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 6th June, 1906. Receipt No. 136,598.
Claim.-A lock nut formed from a series of connected coils, each of the coils having its contacting faces in parallel relation to the outer end faces of the nut and having the connecting portions between adjacent coils bent or formed in oblique relation to the contact faces of the coils, the body of the nut being provided with a hole of uniform diameter having an uninterrupted, continuous and uniform screwthread terminating in an enlarged bore having smooth walls, the outer coll of the nut at one end being formed of spring material and normally outwardly projected from the screwthreaded body of the nut and adapted to be forced back against said body, in combination with a screw-threaded bolt having a uniform diameter and of a size to allow the nut to be easily screw-threaded thereonto and to have its expanded end coil compressed by continued revolution of the nut to be forced back onto and abut against the body portion thereof and exert a spring tension to lock the nut onto the bolt, substantially as described.

## No. 99,834. Lifting Jack. Cric.

Willard Austin Story and William Andrew Hall, co-inventors, both of Chillicothe, Ohio, U.S.A., 3rd July, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,231.
Claim.-1. A lifting jack comprising a body portion provided with a bore having screw-threads and adapted to turn, means, at one end of the body portion to engage a support and a lifting screw engaged in the threaded bore of the body portion and provided with a head to engage a load to be shifted.
2. A lifting jack comprising a body portion of polygonal cross section and adapted to turn and provided with a screwthreaded bore, means at one end of the body portion to engage a support and a lifting screw engaged in the threaded bore of the body portion and provided with a head to engage a load to be shifted.
3. A lifting jack comprising a body portion provided with a bore the end portion of which has screw-threads and the

adjacent part of which is counterbored to an increased diameter, said body portion being adapted to turn and having at one end means for engagement with a support and a lifting screw having a threaded part engaged in the screw-threaded part of the bore of the body portion and adapted to penetrate the enlarged part of said bore and provided with a head for engagement with a load to be shifted.
4. A lifting jack comprising a rotary body portion provided with an axial bore, the latter being open at its upper end only and provided with screw-threads part way down the body portion and closed at the lower opposite end of said body portion, said lower closed end of the body portion being tapered to a central bearing tip or solid conlcal point aligned with the axis of the body portion and a non-rotary lifting screw threaded for engagement with the threaded portion of the bore of the body portion and having a head to engage a load to be shifted.
5. A lifting jack comprising a body portion adapted to turn and provided with an axial bore open at its upper end only and provided with screw-threads part way down the body portion from said open upper end and closed at the lower opposite end of said body portion, said lower closed end of the body portion being tapered to a solid central tip or conical point aligned with the axis of the body portion, a base plate engageable with a support and having a central recess or niche to receive the closed tapered tip or conical point of the body portion and a non-rotary lifting screw threaded for engagement with the threaded bore of the body portion and provided with a head to engage a load to be shifted.

## No. 99,835. Platting Machine. Machine d plaquer.

William Wolkaw, Portland, Oregon, U.S.A., 3rd July, 1906; 6 years. Filed 23rd April, 1906. Receipt No. 135,163.
Claim.-1. In a plating machine the combination of a base, a series of plaiting blades mounted thereon, and means for simultaneously changing the direction of the plaiting blades across the base.
2. In a plaiting machine the combination of a base, a series of plaiting blades mounted thereon, and a longitudinally movable plate for simultaneousy changing the direction of the plaiting blades across the base.
3. In a plaiting machine the combination of a base, a plate fixed to one side thereof, a longitudinally movable plate mounted on the opposite side of said base, means for locking sald movable plate in its several adjustments, and a series of plaiting blades loosely mounted in said plates.
4. In a plaiting machine the combination of a base, a series of parallel plaiting blades carried edgewise by said base, and means for slmultaneously tilting the blades.

5. In a plaiting machine the combination of a base, a series of plaiting blades mounted thereon, and means for simultaneously tilting the blades.
6. In a plaiting machine the combination of a base, a series of plaiting blades pivotally mounted thereon, and a longitudinally movable bar engaging the several blades for simultaneously tilting them.
7. In a plaiting machine the combination of a base, a series of plaiting blades pivotally mounted at their opposite ends on the base, a longitudinally movable bar engaging the several blades for simultaneously tilting them, and means for locking the bar against movement.
8. In a plaiting machine the combination of a base, plates secured to said base, a series of plaiting blades having pintles at opposite ends thereof journalled in said plates, and a longitudinally movable bar mounted on the base and connected with the blades for simultaneously rocking them upon their pivots.
9. In a plaiting machine the combination of a base, a series of plaiting blades pivotally mounted thereon. a bar engaging the several plaiting blades for simultaneously tilting them, a fixed support within which one end of the bar is loosely mounted, a lever carrying the opposite end of said bar, and means for locking the lever against movement.
10 In a plaiting machine the combination of a base, a serles of parallel plaiting blades mounted thercon, a longitudinally movable bar connected to each of the blades, and a lever pivotally connected to the movable bar, whereby the position of the plaiting blades may be simultaneously changed without altering their parallelism.
11. In a plaiting machine the combination of a base, plates secured to the sides thereof, a series of plaiting blades plvotally mounted in said plates. and a longitudinally movable bar for simutaneously tilting the blades.
12. In a paiting machine the combination of a base, plates secured to the sides thereof, one of said plates being movable longitudinally, and a longitudinally movable bar connected to the several plaiting blades for tilting them.
13. In a plaiting machine the combination of a base, plates on opposite sides thereof, one of said plates being movable longitudinally. means for locking sald movable plates, plafting blades pivotally mounted on said plates, and a longitudinally movable bar connected to the several plaiting blades.

## No. 99,836. Cultivator. Cultivateur.

The Anchor Implement Company, assignce of Amos C. Wickham, all of Carthage, Missourl, U.S.A., 3rd July, 1906 ; years. Filed 4th June, 1906. Receipt No. 136,515.
Claim.-1. In a cultivator the combination with the frames and drag bars thereof, of loops passing around the cultivator frames, clamping members engaging upon the drag bars at the points where they engage against the cultivator frames. a bolt passing through each corresponding pair of loops and clamping members, and nut located upon the screw-threaded end of the bolt. substantially as specified.
2. In a cultivator, a clamp comprising a loop encircling the frame of the cultivator, a clamping member engaging one of the drag bars of the cultivator, and means whereby the clamping member is detachably connected to the loop, substantially as specifled.
3. In a cultivator, a clamp comprising a loop encircling a part of the cultivator frame in one portion of which loop is formed an aperture, a clamping member engaging upon one
of the dray bars, a perforated car intryral with said clamping member, and a draw bolt passing through the aperture in

the loop and through the perforated ear, substantially as speciffed.

No. 99,837. Rubber Boot.
Challssure de caoutchouc.

The Rubber Hide Company, Boston, Massachusetts, assignee of Frederick Ferdinand Schaffer, Naugatuck. Connecticut, U.S.A., 3rd July, 1906; 6 years. Filed 6th June, 1906. Receipt No. 136,591.
claim.-A rubber boot comprising a welt sole, an upper -unred theroto, and a rubber reinforce strip located in the
angle formed on the exterior of the boot by the adjacent surfaces of the welt and upper beyond thelr point of juncture and secured to said faces, and extending around the sole.

No. 99,838. Water Feater. Chauffeur d'eau.

Brooks Hynie. Nelson O. Brenizer and Harry E. Baxter, each an assignee of a one-third interest, all of Austin, Texas, U.S.A., 3rd July, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,623.
Claim.-In an apparatus of the class described, a body including a base having upstanding walls provided with outwardly extending flanges at their upper ends and with webs connecting said flanges, wall and base at the ends and at intermediate points of the walls, header plates secured to form closures for the chambers thus formed, a plurality of sets of pipes connecting the several chambers in series, a valve inlet pipe connected with one chamber, an exit pipe connected with another chamber, burners supported beneath the water heating pipes, and a cover supported upon the inner walls of the chambers.

No. 99,839. Shoe. Chanssure.

Arthur Bellamy and Peter F. Bellamy, assignee of a onehalf interest, both of Fort William, Ontario, Canada, 3rd July, 1906; 6 years. Filed 9th Juve, 1906. Receipt No. 136,729.
Claim.-1. In a shoe the combination comprising an upper having spaced tongues integral therewith, stitching adapted to maintain the tongues in loops, and a lace having one of its ends secured to the shoe and its body passed through the loops.
2. In a shoe the combination comprising an upper having spaced tongues integral therewith maintained in looped form, a lace disposed through the loops, a tab secured to the lace and secured to the shoc, and an eyelet in the upper.
3. In a shoe the combination comprising an upper provided with integral loops, a lace disposed through the loops, a tab secured to the lace and disposed partly under the upper and partly on the vamp of the shoe.
4. In a shoe the combination comprising an upper provided with integral loops, a lace disposed through the loops, a diamond shaped tab secured to the lace and to the shoe and means for retaining the free end of the lace.

No. 99,840. Linotype Machine. Machine linotype.

The Mergenthaler Linotype Company, New York City, assignee of Philip Tell Dodge, Brooklyn, New York, U.S.A. 3rd July, 1906; 6 years. Filed 30th April, 1906. Receipt No. 135,388 .
Claim.-1. In a linotype machine, the combination of a main frame, an inclined magazine removable endwise at the front of the machine, and means for mechanically lifting the forward end of the magazine and sustaining it during its removal and replacement clear of the adjacent parts at the front of the machine.
2. In a linotype machine, the combination of a main frame, an escapement mechanism fixed thereon, a magazine sustained on the frame in operative relation to the escapement machanism and removable endwise at the front of the machine, and mechanism for raising the magazine and sustaining the same clear of the escapement mechanism during its removal.
3. In a linotype machine, the combination of a main frame, un inclined magazine mounted thereon and removable endwise at the front of the machine, and a support movable forward beyond the magazine and adapted to raise the same and sustain it during its removal.
4. In a linotype machine, a main frame, an inclined magazine removably mounted thereon. magazine supports adapted to be advanced to the front of the machine, and means for suspending the magazine thereon.
5. The combination of the main frame and the base frame $a$ thereon, the removable magazine, and a sliding frame $H$.
6. The combination of the main frame and secondary frame $a$ thereon, the forwardly sliding frame H , and the removable magazine provided with suspending means to engage the frame $H$.
7. In a linotype machine, the main frame, the Inclined frame a thereon, the magazine removable in a forward direction, the movable support for the forward end of the magazine, and means, such as projections $b$, to prevent accidental movement of the magazine endwise.
8. In a linotype machine and in combination with a supporting frame $a$, a magazine $B$ seated thereon and removable endwise therefrom at the front, and longitudinally guiding means substantially as described, to prevent lateral movement of the magazine during its removal and replacement.

## No. 99,841. Procens of Purifying Rubber.

## Procédé pour purifier le caoutchouc.

Frederlc Clarke Hood, Brookline, Massachusetts, U.S.A., 3rd July, 1906; 6 years. Filed 26th March, 1906. Receipt No. 134,262.
Claim.-1. The herein described process of purifying rubler and the like which consists in compressing or shredding it between co-acting rolls and passing it through a body of purifying liquid whereby the liquid has access to all sides of the material permitting the heavier impurities to fall through the liquid and the lighter impurities to rise, substantially as described.
2. The herein described process of purifying rubber and the like which consists in compressing or shredding it while suspended in a body of purifying liquid whereby the liquid has access to all sides of the material permitting the heavier impurities to fall through the llquid and the lighter impurities to rise, substantially as described.
3. The herein described process of purifying rubber and the like, which consists in passing it between co-acting rolls while submerged in the purifying liquid, and automatically
returning the sheet issuing from between the rolls to the vip of the rolls for a fresh pass, substantially as described.

4. The herein described process of purifying rubber and the like which consists in passing it between co-acting rolls while submerged in a current of purifying liquid, and utilizing said current to return the rubber issuing trom the rolls to the nip of the rolls for a fresh pass, substantially as described.
5. In a device for washing rubber, a tank, a pair of coacting rolls therein at a fixed elevation and means for maintaining the washing liquid therein at a height above the nip of the rolls, substantlally as described.
6. In a device for washing rubber, a tank, a pair of coacting rolls journalled therein with means for operating them, means for supplying washing liquid thereto to maintain a level above the nip of the rolls, and a liquid outlet al the surface for removing floating impurities, substantially 3: described
7. In a device for washing rubber, a tank, a pair of coacting rolls journalled therein, an outlet at the bottom of the tank, a second outlet from the surface, and means whereby liquid may be supplied to the tank in excess of that passing out by the bottom outlet, substantially as described.
8. In a device for washing rubber, a tank, a pair of coacting rolls journalled therein, means for maintaining liquid in sald tank at a level above the nip of the rolls, and means for automatically returning the rubber to the nip of the rolls as it rises to the surface, substantially as described.
9. In a device for washing rubber, a tank, a pair of coacting rolls journalled therein, means for supplying liquid to the tank, a liquid outlet near the upper part of the tank, und a device located between the rolls and said outlet and operated so as to automatically return the rubber to the upper side of the rolls, substantially as described.
10. In a device for washing rubber, a tank, a pair of rolls journalled therein in the same horizontal plane, means located above the nip of the rolls for supplying hot and cold iiquid thereto, upper and lower liquid outlets from said tank with means for regulating the flow of liquid therethrough, substantially as described.
11. In a device for washing rubber, a tank, a pair of rolls journalled side by side therein, a liquid supply, a surface outlet at the front of the machine where the washed rubber is removed, a tilting hopper at the back of the machine for kolding a charge of unwashed rubber, and means extending to the front of the machine for tilting said hopper to deliver its contents upon the rolls, substantially as described.
12. In a device for washing rubber, a tank, a liquid supply thereto, washing rolls journalled therein in the same horizontal plane, a liquid outlet from the tank above the level of the nip of the rolls, and means located in the tank for for varying the temperature of the liquid therein, substantially as described.

## No. 99,842. Match Box. Boite d allumettes.

Walter Tracey Ives, Montreal, Quebec, Canada, 3rd July, 1906; 6 years. Filed 21st March, 1906. Receipt No. 134,099. Claim.-1. In a match box the combination with the base and a standard rising therefrom and rigid therewith, of a casing forming a receptacle supported on said standard and having inclined ways therein converging to an elongated egress opening, a movable member supported by said standard immediately beneath said receptacle and slotted to receive the match therefrom, and striking means interposed in the way of the match head in proximity to said movable member, as and for the purpose specifled.
2. In a match box the combination with the base and a standard rising therefrom and rigid therewith, of a casing

forming a receptacle supported on said standard and having inclined ways therein converging to an elongated egress opening, a rotary member journalled in said standard immediately beneath such receptacle and slotted to recelve a match therefrom, and means interposed in the way of the match head in proximity to said movable member for igniting said match, as and for the purpose specified.
3. In a match box the combination with the base and a standard rising therefrom and rigid therewith, of a casing forming a receptacle supported on said standard and having inclined ways therein converging to an elongated egress opening, a rotary member journalled in said standard beneath said receptacle and extending thereinto through said egress opening, agitating means within said receptacle, and means interposed in the way of the match head in proximity to said rotating member, for igniting said match, as and for the purpose specifled.
4. In a match box the combination with the base and a standard rising therefrom and rigid therewith, of a casing forming a receptacle supported on said standard and having inclined ways therein converging to an elongated egress opening, a rotary member journalled in said standard beneath said receptacle and extending thereinto through said egress opening, a roller loosely anchored within said receptacle and normally resting on said rotating member, and means interposed in the way of the match head in proximity to said rotating member for igniting said match, as and for the purpose specifled.
6. In a match box the combination with the base and a standard rising therefrom and rigid therewith, of a casing forming a match box supported on said standard having an egress opening a the bottom thereof, means for engaging a match from said egress opening and carrying it therefrom, and friction means interposed in the way of the match head on its travel from said receptacle, as and for the purpose specified.
6. In a match box the combination with the base and a standard rising therefrom, and rigid therewith, of a casing forming a receptacle for the matches supported on said standard and converging towards its lower end to an egress opening, a rotating member journalled in said standard beneath said receptacle and extending thereinto through said opening, a hollow roller forming an a.gitator resting on said rotating member and anchored within said receptacle by a pin extending therethrough and fixedly secured to the casing. and friction means interposed in the way of the match head in its travels with said rotating member from said receptacle, as and for the purpose specifled.
7. In a match box the combination with the base and a standard rising therefrom, and rigld therewith, of a casing forming a receptacle converging towards its lower end to an egress opening, a rotating member journalled in the sides of said standard and having discs extending from the hubs therearound towards each end thereof. said discs having slots in alignment, agitating means within said casing, and friction means interposed in the way of the match head from said receptacle, as and for the purpose specified.
8. In a match box the combination with the base and a standard rising therefrom, and rigid therewith, of a casing forming a receptacle converging in the interior to a suitable egress opening, agitating means within said receptacle, a rotating member having a plurality of discs extending from its hub therearound and slots in alignment in said discs, springs secured to said hub and extending across said slots and forming a spring cushion above the bed of said slots,
and friction means interposed in the way of the head of the match transported by said rotating member, as and for the purpose specified.
9. In a device of the class described in combination, a base, a standard rising therefrom and rigid therewith having a cutaway front portion, a runway having upturned fianges at its lower end thereof secured to the top of said front portion and upwardly extending guiding rods, a casing forming a receptacle having interior walls converging to an egress opening, a spring-held rotating member journalled in the sides of the standards beneath said receptacle and having slotted discs extending from the hub thereof through said opening into said receptacle, an agitator within said receptacle supported on said discs, a curved face plate closing in said standard beneath said casing and extending downwardly over the top portion of said runway and having friction means for striking said match head in its travel with said rotating member from said receptacle, and a suitable handle for turning said rotating member, as and for the purpose specified.
10. In a device of the class described in combination, a base having an up-turned flange at the edge thereof and forming a tray, a standard rising therefrom and rigid therewith and having cut-away front and rear portions, a casing forming a match receptacle supported on said standards and having in the interior thereof converging walls to an egress opening, a rotating member journalled in the sides of said standard beneath said receptacle and having slotted discs extending from the hub thereof into said receptacle through said opening and springs secured to the hub thereof and extending alongside the discs past the slots therein forming a spring cushion above the beds of said slots, a spring encircling the hub of said rotating member and caught thereto and having its other end secured to the standard and normally holding said rotating member with its slot immediately beneath the aforesaid egress opening, an agitator resting on the discs of said rotating member within said receptacle, a runaway from the front portion of said standard having upturned fingers at its lower end and suitable guides extendingo upwardly, a face plate extending downwardly on the front of said standard over said rotating member to the top of sald runway and having a plurality of longitudinal ribs on its inner surface, two of said ribs at the edges thereof having roughened surfaces engaging the match heads on their travel from said receptacle in said rotating member, a removable back plate secured to said standard, and a handle abutting a suitable stop from said standard and secured to the axle of said rotating member, as and for the purpose specified.

No. 99,843. Finger Exercising Device.
Appareil à exercer les doigts.

Edmund Barrow Kursheedt, East Orange, New Jersey, U.S.A., 3rd July, 1906; 6 years. Filed 19th March, 1906. Receipt No. 134, 052.
Claim.-1. A finger exercising device or hand expander comprising a base plate, a large number of openings therein arranged in a plurality of segmental and parallel series, and a number of independent finger plates or keys each adapted to be set in one of the openings in the base plate.
2. A finger exercising device or hand expander comprising a base plate, supports secured thereto having rubber buttons at the bottom, a large number of openings in the front portion of said base plate arranged in a plurality of segmental and parallel series, and a number of independent finger plates or keys each adapted to be set in one of the openings in the base plate.
3. A finger exercising device or hand expander comprising a base plate, a large number of openings in its front portion arranged in a plurality of segmental and parallel series, a plurality of threaded openings in the rear center portion of the base plate, an adjustable hand support or knob with central screw adapted to be applied in each of the threaded openings, and a number of finger plates each adapted to be set in one of the openings in the front portion of the base plate.
4. A finger exercising device comprising a base plate, supports secured thereto having each a rubber button at the bottom, a large number of openings in the front portion of said base plate arranged in a plurality of segmental and parallel series, and a number of threaded openings in the rear center portion of the base plate, an adjustable hand support or knob with central screw adapted to be secured in each of the threaded openings, and a number of finger plates each adapted to be set in one of the openings in the front portion of the base plate.
5. A finger exercising device comprising a base plate having supports below, a large number of openings in the front portion, and a plurality of threaded openings in ther rear center portion, an adjustable hand support or knob with central screw adapted to be applied in each of the threaded openings, and a plurality of finger plates each adapted to be set in one of the openings in the front portion of the base plate.
6. A finger exercising device comprising a base plate with openings in the front portion, threaded openings in its rear center portion, an adjustable hand support adapted to be applied in the threaded openings, and a number of finger plates consisting each of the finger plate proper haring a slightly curved front portion, an integral piece on its lower rear surface in the center, and a pin in said piece extending downwardly and adapted to be inserted in the front openings of the base plate
7. A finger exercising device comprising a base plate with supports below, openings in the front portion, threaded openings in its rear center portion, an adjustable hand support adapted to be applied in the threaded openings and a number of finger plates consisting earh of the finger plate proper having a slightly curved front surface, an integial piece on its lower rear surface in the center, and a pin in said piece extending downwardly and adapted to be inserted in the front openings of the base plate.

## No. 99,844. Baking Powder. Poudre a pate.

Richard Paul, Berlin, Germany, 3rd July, 1906; 6 years. Filed 19th March, 1906. Receipt No. 134,051.
Claim.-1. The process of manufacturing baking powder which consists in mixing tartaric acid with froth forming substances, beating the mixture to froth, drying the mixture and mixing it with bicarbonate of sodium.
2. The process of manufacturing baking powder which conslsts in mixing tartaric acid with froth forming substances, beating the mixture to froth, drying the mixture and mixing it with bicarbonate of sodium and components of cakes.
3. The process of manufacturing baking powder which con-* sists in mixing tartaric acid with white of egg, beating the mixture to froth, drying the mixture at temperatures below the coagulation temperature of white of egg and mixing it with bicarbonate of sodium.
4. The process of manufacturing baking powder which consists in mixing tartaric acid with white of egg, beating the mixture at temperature below the coagulation temperature of white of egg and mixing it with bicarbonate of sodium and components of cakes.

## No. 99,845. Shoe Dipping Machine.

## Machine d tremper les chaussures.

John Henry Wall, Bristol, Rhode Island, U.S.A., 3rd July, 1906; 6 years. Filed 26th March, 1906. Receipt No. 134,302.
Claim.-1. In a shoe dipping machine means for supporting a plurality of shoes, means for automatically securing the shoes to the support, mechanism for rotatably holding the support of the shoes, and a tank adapted to hold varnish or similar liquid.
2. In a shoe dipping machine, a slide, a peg bar supporting a plurality of shoes, means for automaticaily locking the shoes to the peg bar, means carried by the sltde for rotating the peg bar, and a tank adapted to hold varnish or similar liquid.
3. In a shoe dipping machine, a frame, a tank adapted to hold varnish or similar liquid in the frame. a slide supported in vertical ways in the frame, means for counterbalancing the slide, means for lowering and elevating the slide, a rotating mechanism on the slide, means in the rotating mechanism for holding a plurallty of shoes, and means for purtly revolving the rotating mechanism, whereby a plurality of shoes are coated with varnish or similar liquid in one operation of the machine.
4. In a shoe dipping machine, a frame, a tank adapted to hold varnish or a simllar liquid supported in the frame, a

slide supported in vertical ways in the frame, means for counterbalancing the slide, means for lowering and elevating the slide, a rotating mechanism on the slide, a bar, a plurality of shoe lasts, a plurality of shoes on the lasts, means for holding the shoe lasts on the bar, means in the rotating mechanism for holding the bar, and means for partly revolving the rotating mechanism, whereby a plurality of shoes are coated with varnish or similar liquid in one operation of the machine.
5. In a shoe dipping machine, a frame having a base and vertical end supports, a tank supported on the base and adapted to hold varnish or a similar liquid, a slide supported in vertical ways in the end supports, means for counterbalancing the slide, means for lowering ond elevating the slide, a rotating meohanism on the slide, a bar, a plurality of shoe lasts holding a plirality of rubber shoes, means for holding the shoe lasts on the bar, means in the rotating mechanism for holding the har and for locking the bar in the reverse position, means for automatically locking the lasts and shoes to the bar in the reverse position, and means for partly revolving the rotating mechanism, whereby a plurality of rubber shoes are coated with varnish or a similar material in one operation of the machine.
6. In a shoe dipping machine a frame $a$ having the base $a^{1}$, the vertical end supports $a^{2} a^{2}$ and the top bar $a^{0}$, a tank $b$ adapted to hold varnish or similar liquid on the base $a^{2}$, a slide $c$ supported in vertical ways in the ena supports $a^{2} a^{2}$. pulleys $c^{s} c^{b}$ on the top bar $a^{5}$, a cord $c^{\prime \prime}$ secured to the slide $c$ and running over the pulleys, a weight $c^{7}$ secured to the end of the cord $c^{d}$, a lever $d$ pivotally secured to the slide $c$ and to the cord $c^{6}$, a rotating mechanism $e$ on the sllde $c$, a crank $f$ operatively connected with the rotating mechanism $e$, a bar $y$ having the pegs $y^{1} y^{1}$, a plurality of lasts having coinciding holes for the legs $g^{1} \ell^{1}$, a plurality of rubber shoes on the lasts, means in the rotating mechanism $c$ for holding the bar 9 , and means for automatically locking the lasts and shoes to the bar in the reverse position, whereby on lowering the slide $c$ by the lever $d$ and partly revolving the rotating mechanism $e$ by the crank $f$. a plurality of rubber shoes are coated with varnish or a similar material in one operation.
7. In a shoe dipping machine, the combination of a frame $a$, a tank $b$ adapted to hold varnish or a simllar liquid, a silide $c$ supported in vertical ways in the frame a, means for lowering or elevating the slide $c$, a rotating mechanism e. consisting of the bearings $c^{1} e^{1}$ each formed on a plate $e^{*}$ secured to the slide $c$ and having a member $c^{4}$ shaped to have the semi-circular concave portion $e^{s}$, the outwardly extending $\operatorname{lip} e^{6}$, the stop $e^{7}$, and the rearwardly extending arm $e^{A}$, the rock shaft $e^{2} \boldsymbol{f}^{2}$ supported in the bearings $e^{1} e^{1}$ and each having the enlarged end $e^{0}$ in which is the elongated recess $e^{10}$ having the closed end $e^{11}$ and the open end $e^{13}$, and an arm $i^{13}$ adapted to engage with the stop $e^{\top}$. a locking bar $e^{14}$ bent at each end to form the arms $e^{15} e^{i b}$ which are pivotally
secured at their ends to the ends of the arms $e^{13} e^{13}$ in a position to engage with the ends of the arms $e^{s} e^{3}$. pulleys $e^{18} e^{16}$ pivotally secured to the top of the slide $c$, cords $p^{17} e^{17}$ secured to the bar $e^{14}$ and extending upwards over the pulleys, weights $e^{18} e^{18}$ secured to the ends of the cords, a crank $f$ secured to a rock shaft $e^{2}$, a bar $g$, a plurality of shoe lasts holding a plurality of rubber shoes, and means for holding the shoe lasts on the bar, whereby on placing the ends of the bar $g$ in the recesses $\boldsymbol{c}^{10} e^{10}$ in the rotating mechanism $e$ and operating the slide $c$ and the crank $f$ a plurality of rubber shoes are coated with varnish or similar liquid in one operation of the machine.
8. In a shoe dipping machine the combination of a frame $a$ a tank $b$ adapted to hold varnish or a similar liquid. a slide $c$, a lever $d$ on the slide, a rotating mechanism $e$, a crank $f$ operatively connected with the rotating mechanism $e$ a bar $g$, a plurality of shoe lasts $h h$ on which are a plurality of rubber shoes, means for holding the lasts $h \boldsymbol{h}$ on the bar $g$, and means in the rotating mechanism $e$ for holding the bar $g$, whereby a plurality of rubber shoes are coated with varnish or a similar liquid in one operation of the machine.

No. 99,846. Curling Iron. Fer à friscr.

François Marcel Wooelffle, New York City, New York, U.S.A., 3rd July, 1906; 6 years. Filed 23rd March, 1906. Receipt No. 134,204.
Claim.-1. A curling iron comprising a heating member which is circular in cross section, and a second heating member which is concavo-convex in cross section, to receive the first member, the said members co-operating to from a clamp for the hair. operating handles fur the said members. and a third heating member operated by one of the said handles and being parallel with the other heating members when the iron is closed, the edge of said concavo-convex nember being adapted to enter between the other two heating members, when the iron is closed, whereby the hair is curved between the concavo-convex member and one of the round members, and is then reversely curved on the edge of the concavo-convex member.
2. A curling iron comprising an annularly curved heating member provided with a handle, and having an aperture therein, a blfurcated second heating member provided with a handle, one of said bifurcated ends passing through the opening in the first heating member and pivoted therein.

## No. 99,847. Railway Shipment Tracer.

Traceur de chargement de mise à bord.
The Registered Tracer Company, assignee of John Thomas Todd, both of Springfleld, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 1st May, 1906. Receipt No. 135,416.
Claim.-1. A shipment tracer comprising a cover, a plurality of record sheets, each of said record sheets being permanently secured at one of its ends to said cover and having spaces appropriately designated for the designation of the agent to which the tracer is to be forwarded. for the billing reference and for information as to transfer of the shipment or any exceptions respecting the shipment, a plurality of mailing cards interposed between and covered by said record sheets. said mailing cards having spaces simitar to those of the record sheets, a final report sheet permanently secured aone of its ends to said cover and having spaces appropriately designated for the registration number of the tracer, for the entrance of the destination to which shipment is made, for the date of arrival and delivery to the consignee, for a memorandum of undelivery and the reason therefor, for the
designation of the agent, the rallroad by which he is employed and the date on which the report sheet is written, and 3

final report mailing card located beneath the report sheet substantially as set forth.
2. A shipment tracer comprising a cover, a plurality of record sheets, each of said record sheets being permanently gecured at one of its ends to said cover and having spaces appropriately designated for the registered number of the tracer for the designation of the agent to which the tracer is to be forwarded, for the billing reference and for information as to transfer of the shipment or any exceptions respecting the shipment, a plurality of mailing cards interposed between and covered by said record sheets, said mailing cards having spaces similar to those of the record sheets, a final report sheet permanently secured at one of its ends to said cover and having spaces appropriately designated for the registration number of the tracer, for the entrance of the destination station to which shipment is made, for the pro. no. reference of the delivery station, for the date or arrival, notification and delivery to the consignee, for a nemorandum of undelivery and the reasons therefor, for notations of exception to the articles in the shipment or condition thereof, for the designation of the agent, the railroad by which he employed and the the date on which the report sheet is written and a final report mailing card located beneath the report sheet, substantially as set forth.

## No. 99,848. Antiseptic Compound.

## Composć antiseptique.

Frederick Stearns and Company, Detroit, Michigan, assignee of Alphonso M. Clover, Manilla, Philipine Islands, both in the U.S.A., 3rd July, 1906; 6 years. Filed 19th March, 1906. Receipt No. 134,036.
Chim.-An antiseptic compound derived from succinic peroxid acid and a basic substance and which is characterized in aqueous solution by being colourless, substantially odorless, and having a powerful germicidal accion, when acidifled with a mineral acid it yields suceinic peroxid acid, upon standing, it hydrolizes with the formation of the salts of succinic acid and succinic mono-peracid and upon long standing yields the salt of succinic acid and hydrogen poroxid.

No. 99,849. Float Valve. Soupape.
The International Harvester Company, Chicago, assignee of Severn C. Anker-Holth, Riverside, Illinois, U.S.A., 3rd July. 1906; 6 years. Filed 12th April, 1906. Receipt No. 134.881.

Whim.-1. In a float valve in combination. a supply inlet having formed integral therewith a valve casing. a hollow plug fitting into said casing, the sail plug being provided with an opening which communicates with the sald supply inlet, a
float chamber formed upon the upper end of said hollow plug, a valve fitted loosely within said hollow pug and arranged to

rcgister to a variable extent with the said opening therein, and by the longitudinal adjustment of said valve, to regulate the amount of liquid admitted therethrough, and a float actuated by the overflow into sald float chamber for effecting the longitudinal adjustment of said valve, substantially as set forth.
2. In a float valve in combination a supply inlet having formed integral therewith a valve casing and an upwardly projecting stop forming lug, a rotatable hollow plug fitting into said casing, said pug being provided with an opening which communicates with the said supply iniet, stops movable with the sald plug arranged to contact the said lug on the valve casing, a sleeve valve fitted loosely within said hollow plug and arranged to register to a variable extent with the said opening therein and, by the longitudinal adjustment of said sleeve, to regulate the amount of liquid admitted therethrough, and a float actuated by the overflow into the said float chamber for affecting the longitudinal adjustment of said sleeve valve, substantially as set forth.

## No. 99,850. Music Leat Turner.

## Tourne-feuille de musique.

Frederick Barfett, assignee of Franklin P. Parker, both of Chicago, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 11th April, 1906. Receipt No. 134,856.
Claim.-1. A music leaf turner having a revolving shaft provided with a screw, in combination with a traveller on said screw, and means to operate said traveller.
2. A music leaf turner having a revolving shaft provided with a screw, a traveller on said screw, means to operate sald traveller to rotate said screw and shaft, a tubular shaft on the first-mentloned shaft and provided with a gear, a screw mounted for rotation and having a gear engaging the gear of the tubular shaft, a traveller on the last-mentioned screw, and means to operate said traveller, substantially as described.
3. A music leaf turner having a shaft mounted for rotation and provided with a screw to rotate therewith, a tubular shaft on said first-mentioned shaft and provided with a gear wheel, revolving screws on opposite sides of the first-menthoned screw and having gears engaging opposite sides of that on the tubular shaft, and independent devices to turn each of sald screws.

7-3
4. A music leaf turner having a standard rod, and a longitudinally extensible arm attached to said standard rod and

provided with means to engage a musical instrument, substantially as described.

## No. 99,851. Locking Mechanism for Loose Leaf Binders.

Mécanisme de fermeture pour reliure de feutlles volantes.
"sig.s.

The J. S. McDonald Company, assignee of John Fleberg, all of Chicago, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 19th April, 1906. Recelpt No. 135,056.
Claim.-1. A loose leaf binder comprising two clamping plates, a lock consisting of two longitudinal co-acting members, one of which is adjustable longitudinally, a screw adjustably securing said member to one of said plates, and a built-up portion on the head of said screw consisting of a circular disc of greater diameter than sald head and fitted into a countersunk portion of the clamping plate engaged thereby.
2. A loose leaf binder comprising two clamping plates, a lock consisting of two longitudinally co-acting members, one of which is adjustable longitudinally, a screw adjustably securing said member to one of said plates, and a built-up portion on the head of said screw consisting of a circular disc of greater diameter than said head, said disc having recesses in its outer surface, and fitted into a countersunk recesses in its outer ourface, and fitted into a
3. A loose leaf binder comprising two clamping plates, a lock consisting of two longitudinally co-acting members one of which is adjustable longitudinally, a screw adjustably securing said member to one of said plates, a bullt-up portion on the head of said screw consisting of a circular disc of greater diameter than said head and fitted into a countersunk portion of the clamping plate engaged thereby, and a centering pin projecting upwardly from the center of said screw and passing through said disc.
4. A loose leaf binder comprising two clamping plates, a lock consisting of two longitudinally co-acting members, one of which is adjustable longitudinally, a screw adjustably securing said member to one of said plates, a built-up portion on the head of sald screw consisting of a circular disc of greater diameter than said head and fitted into a countersunk portion of the clamping plate engaegd thereby, a centering pin projecting upwardly from the center of said screw and passing through said disc, and a loose sleeve on sald pin.
5. A loose leaf binder comprising two clamping plates, a lock consisting of two longitudinally co-acting members, one of which is adjustable longitudinally, a screw adjustably securing said member to one of said plates, a built-up portion on the head of said screw consisting of a circular disc of greater diameter than said head and fitted into a countersunk portion of the clamping plate engaged thereby, a centering pin projecting upwardly from the center of said screw and passing through said disc, a loose sleeve on said pin, and an escutcheon covering said disc and provided with a suitable key hole in its upper face.
6. A loose leaf binder comprising two clamping plates, a lock consisting of two longitudinally co-acting members, one of which is adjustable longitudinally, a screw adjustably securing said member to one of said plates, a built-up portion on the head of said screw consisting of a circular disc of greater diameter than said head and fitted into a countersunk portion of the clamping plate engaged thereby, and an escutcheon covering said disc and provided with a suitable key hole in its upper face.
7. A loose leaf binder comprising two clamping plates, a lock consisting of two longitudinally co-acting members, one of which is adjustable longitudinally, a screw adjustably securing said member to one of said plates, a built-up portion on the head of said screw consisting of a circular disc of greater diameter than said head and fitted into a countersunk portion of the clamping plate engaged thereby, a centering pin projecting upwardly from the center of said screw and passing through said disc, and an escutcheon covering said disc and provided with a suitable key hole in its upper face.

No. 89,852. Locking Mechanism for Loose Leaf Binders.
Mécanisme de fermeture pour reliure de feuilles volantes.

James Stuart McDonald, Chicago, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 19th April, 1906. Receipt No. 135,058. Claim.-1. A baffle for the locks of loose leaf binders consisting of a screw engaging one of the locking members thereof, the head of said screw changed to prevent the engagement of a screw driver therewith, and an escutcheon comprising a mutilated disc provided with an overhanging
tongue and having a central dome guarding the face of said screw and a key hole in its outer surface, said dome passing through the covering of said binder.
2. A baffle for the locks of loose leaf binders consisting of a screw engaging one of the locking members thereof, the head of said screw recessed to receive the end of a special key, and an escutcheon comprising a mutilated disc provided with an overhanging tongue and having a dome guarding the face of said screw and a key hole in its outer surface, said dome passing through the covering of said binder.
3. A baffle for the locks of loose leaf binders consisting of a screw engaging one of the locking members thereof, the head of said screw having a transverse slit which is provided with a circular enlargement mediate its ends, and has a central pin for a key projecting concentric therewith, and an escutcheon comprising a mutilated disc provided with an overhanging tongue, said disc having a central dome guarding the head of said screw, which dome projects through an opening in the covering of said binder and has a key hole in its outer surface.
4. A baffle for the locks of loose leaf binders consisting of a screw engaging one of the locking members thereof, the head of said screw changed to prevent the engagement of a screw driver therewith, and an escutcheon comprising a disc having a portion of its circumference cut away to provide a straight edge, having a tongue projecting laterally therefrom and bent downward at right angles to itself, and a central dume guarding the head of said screw provided with a key hole in its outer surface.
5. A baffle for the locks of loose leaf binders conslsting of a screw engaging one of the locking members thereof, the head of said screw recessed to receive the end of a special key, and an escutcheon comprising a disc having a portion ot its circumference cut away to provide a straight edge having a tongue projecting laterally therefrom and bent downwards at right angles to itself, and a dome guarding the head of said screw provided with a key hole in its outer surface.
6. A baffle for the locks of loose leaf binders consisting of a screw engaging one of the locking members thereof, the face of said screw having a transverse slit which is provided with a circular enlargement mediate its ends and has a centering pin for a key projecting concentric therewith, and an escutcheon comprising a disc having a portion of its circumference cut away to provide a straight edge having a tongue projecting laterally therefrom, and a dome guarding the head of said screw and having a key hole in its outer surface.
7. A baffie for the locks of loose leaf binders consisting of a screw engaging one of the locking members thereof, the head of said screw changed to prevent the engagement of a screw driver therewith, an escutcheon comprising a disc having a portion of its circumference cut away to provide a straight edge having a tongue projecting laterally therefrom and bent downwards at right angles to itself, and a central dome guarding the head of said screw provided with a key hole in its outer surface, and a concentric eye surrounding said dome that binds the contiguous edge of the covering.
8. A baffle for the locks of loose leaf binders consisting of a screw engaging one of the locking members thereof, the head of said screw recessed to receive the end of a special key, and an escutcheon comprising a disc having a portion of its circumference cut away to provide a straight edge having a tongue projecting laterally therefrom and bent downwards at right angles to itself, a dome guarding the head of said screw provided with a keyhole in its outer surface, and a concentric eye surrounding said dome that binds the contiguous edge of the covering.
9. A baffle for the locks of loose leaf binders consisting of a screw engaging one of the locking members of said binder, the head of said screw changed to prevent the engagement of a screw driver therewith, and an escutcheon guarding the face of said screw comprising a circular disc provided with a central dome covering said screw and having an opening in its upper surface corresponding in outline to the shape of the screw engaging device passed through the same.

No. 99,853. Pipe or Conduit. Tuyau ou conduit.
Philip Aylett, Portsmouth, Virginia, U.S.A., 3rd July, 1906; 6 years. Filed 19th March, 1906. Receipt No. 134,013.
Claim.-1. A pipe or conduit composed of laterally and longitudinally separable sectional units, with ends and edges adapted to form scarf joints and provided with grooves along the contiguous faces of said joints to form keyways when the units are assembled, and keys in the transverse and longitudinal keyways composed of a set or hardened material adapted to be introduced into said keyways in a semi-fluid or plastic state, as set forth.
2. A pipe or conduit composed of laterally and longitudinally separable sectional units with edges rorming scarf joints and provided with grooves along the contiguous faces
of said joints to form keyways when the units are assembled. and keys in the same composed of a set or hardened material

adapted to be run into the keyways in a semi-fuid or plastic atate, as described.
3. A plpe or conduit composed of laterally and longitudlnally separable sectional units with ends adapted to interlock and edges forming scarf joints and provided with grooves along the contiguous faces of said joints to form keyways when the units are assembled, and keys in the same composed of a set or hardened material adapted to be run into the keyways in a seml-fluid or plastic state, as described
4. A pipe or conduit composed of laterally and longitudinally separable sectional units provided at the ends and edges with scarf joints containing communicating keyways adapted to recelve a semi-fluid or plastic material which on setting or hardening forms a key, as set forth.
5. A pipe or conduit composed of laterally and longitudinally separable sectional units, assembled so as to break joint transversely, the said units having ends and edges adapted to form scarf joints and containing continuous grooves therein which form communicating keyways when the units are assembled, adapted to recelve a material in a semi-fluid or plastic state which after setting or hardening forms a key for locking the units together, as set forth.
6. The unit for pipe construction herein described consisting of a longitudinal half, more or less, of a pipe section having its ends and edges bevelled to form scarf joints with adjacent sections and provided with a continuous groove extending along its ends and edges in the bevelled faces of the same to form a keyway in said joints, as set forth.
7. A plpe or conduit composed of laterally and longitudinally separable sectional units with ends and edges adapted to form scarf joints and containing grooves along the contiguous faces of said joints which form keyways when the units are assembled, and provided with ducts oommunicating with such keyways to permit a key to be introduced therein in a semi-fluid condition.
8. A plpe or conduit composed of laterally and longitudinally separable sectional units with ends ana edges adapted to form scarf joints and provided with grooves along the contiguous faces of said joints which form keyways when the units are assembled, a set or solidified material which is adapted to be introduced in a seml-fluld or plastic state filling said keyways, and rigid rods or bars embedded in the said material in the longitudinal keyways, as set forth
9. A pipe or conduit composed of laterally and longitudinally separable sectional units with ends and edges adapted to form scarf joints and provided with grooves along the contiguous laces of said joints which form keyways when the units are assembled, a plastic material contained in said keyways and forming a key, rigid bars or rods embedded in the material in the longitudinal keyways and having overlapped ends for tying the sectional units together, as set forth.
10. A pipe or conduit composed of laterally and longitudinally separable sectional units, having ends and ediges
adapted to form scarf joints when assembled, and locked by a continuous key of solldified or set plastlc material reinlorced by metal rods or bars embedded in sald material and extending across the joints, as set forth.
i1. A pipe or conduit composed of laterally and longitudinally separable sectional unlts having ends and edges adapted to form scarf joints when assembled, and locked by a continuous key of solidified or set plastic material, and transverse tie bands surrounding the pipe for reinforcing it against lateral pressure, as set forth.
12. A pipe or conduit composed of laterally and longitudinally separable sectional units having scari joints locked by a key of solidified or set plastlc material extending aleing the said joints, metal rods or bars embedded in the longitudnal keys and extending across the joints between adjacent units and transverse tie bands surrounding the pipe and reinforcing it against lateral pressure, as set forth.

No. 99,854. Conduit Construction.
Construction de conduit.

Philip Aylett, Portsmouth, Virginla, U.S.A., 3rd July, 1906 ; 6 years. Flled 19th March, 1906. Receipt No. 134,014.
Claim.-1. The method of constructing conduits herein described, which consists in forming pipe sections in longitudinally separable units with ends and edges adapted to form scarf joints and provided with grooves in the contiguous faces thereof to form keyways when the units are assembled. laying a series of sald units to form the lower portion of the condult, placing thereon, but so as to break joint with the sections of the same, the units to form the upper portion of the conduit, and inserting keys in the transverse and longitudinal keyways to lock together the abutting ends and edges of said units.
2. The method of constructing conduits herein described, which consists in forming pipe sections in longitudinally separable units with ends and edges adapted to form scarf joints and provided with grooves in the contiguous faces of the joint to form keyways when the units are assembled. laying a series of sald units to form the lower portion of a conduit, placing thereon but so as to break joint with the sections of the same, the units to form the upper portlon of the conduit, and introducing in a semi-fluid or plastle state into the transverse and longitudinal keyways a material capable of hardening to form a key for locking together the abutting ends and edges of the sald units.
3. The method of constructing conduits herein described which consists in forming pipe sections in longitudinally separable units with ends and edges adapted to form scarf joints and provided with continuous grooves in the contiguous faces of the joints to form communicating keyways when the units are assembled, laying a series of said units to form the lower portion of the condult, placing thereon, but so as to break joint with the sections of the same, the ualts to form the upper portion of the conduit, and forcing fato the keyways a material in a semi-fluld or plastic state. which is capable of hardening to form a key and locking together the abutting ends and edges of the said units.
4. The method of constructing conduits herein described, which consists in forming pipe sections in longitudinally separable units, with ends and edges adapted to form scarf joints and provided with continuous grooves in the contiguous faces of the joints to form communicating keyways when the units are assembled laying a series of said units to form the lower portion of the conduit, placing thereon, but so as to break joint with the sections of the same, the units to form the upper portion of the condult, and caulking and locking the joints between the assembled units by introducing into the keyways cement in a semi-liquid or plastic state, as set forth.
5. The method of constructing conduits herein described, which consists in forming pipe sections in longitudinally separable units, with ends and edges adapted to form scarf joints, and provided with continuous grooves in the contiguous faces of the joints, to form keyways when the units are assembled, laying a series of said units to form the lower portion of the condult, placing thereon, but so as to break joint with the sections of the same, the units to form the upper portion of the conduit, inserting in the longitudinal keyways bars or rods of rigid material and fllling the transverse keyways in the ends of the units and the remaining space in the longitudinal keyways with cement in a semifluid or plastic state.
6. The method of constructing conduits herein described, which consists in forming pipe sections in longitudinally separable units with ends and edges adapted to form scarf joints and provided with grooves in the contiguous faces of said joints to form keyways when the units are assembled, laying a series of said units to form the lower portion of said condult, placing thereon, but so as to break joint with the sections of the game, the units to form the upper portion of the conduit, inserting in the longitudinal keyways bars or rods of rigid material, extending across the transverse joints between the units, and filling the transverse keyways and the remaining space in the longitudinal keyways with a plastic material, such as cement.

No. 99,855. Pillow-Sham Holder.
Porte-couvercle de taie d'oreiller.

Robert Mills Balentine, Greenville, South Carolina, U.S.A., 3rd July, 1906; 6 years. Filed 3rd April, 1906. Receipt No. 134,547.
Olaim.-1. In combination with a bedstead, a pair of vertical ways attached to the rear side of the headboard thereof. a vertically movable bar arranged to slide in each of these ways, means for raising and lowering sald bars, bracket arms carried by said bars and extending around to a point in front of the headboard, and a sham carrying bar supported on these bracket arms, substantially as set forth.
2. In combination with a bedstead, of a sham-holding bar extending across in front of the headboard thereof, a bracket arm engaging each end of said bar and extending around behind the headboard, and means for supporting and raising and lowering said bracket arms, said means being supported on the rear face of the headboard.
3. In combination with a bedstead, of a sham-holding bar extending across the front of the headboard thereof, bracket arms attached to this bar and extending around behind the headboard, a vertically slidable bar attached to the rear end of each bracket arm, and means supported on the rear face of the headboard for simultaneously raising and lowering sald bars, substantially as set forth.

No. 99,856. Hammock, Hamac.

Charles Murdock Berrio, Brockton, Massachusetts, U.S.A. 3rd, July, 1906; 6 years. Filed 24th April, 1906. Recelpt No. 135,248.
Claim.-1. A combined hammock and canopy formed from a continuous plece of fabric whereby the strain on the hammock proper is transmitted to the canopy, and means for supporting the hammock, substantially as and for the purpose set forth.
2. A combined hammock and canopy formed from a continuous fabric, whereby the strain on the hammock proper is transmitted to the canopy, rotating braces constructed to receive the supporting ropes through gromet holes located at the top when not under strain and to turn with the fabric when the hammock is in use, and means for supoprting the same, substantialiy as and for the purpose set forth.

## No. 99,857. Bedstead. Bois de lit.

Johannah V. Dougherty, Detroit, Michigan, U.S.A., 3rd July, 1906; 6 years. Filed 3rd May, 1906. Recelpt No. 135,496.
Claim.-1. A bedstead comprising a main frame including rails and connected end pieces and supporting legs, one of the rails having depending portions at its ends, and a supplemental frame comprising a rail, end pieces and supporting legs, the end pleces of the supplemental frame comprising vertically spaced rods, the uppermost rod of each end piece being slidably engaged in a depending portion of the main frame and returned therebelow beneath the lower rod.
2. A bedstead comprising a frame including rails and connected end pleces and supporting legs, a supplemental frame comprising a rail, end pieces and supporting legs, the ends pleces of the supplemental frame comprising spaced rods, the uppermost rod of each end piece being slidably engaged with a portion of the main frame and turned therebelow beneath the lower rod, the said lower rod being movably engaged with the said upper rod to permit of detachment of one frame with respect to the other.
3. A bedstead comprising a main irame including rails and connected end pieces and supporting legs, one of the rails

having depending portions at its ends, and a supplemental frame comprising a rail, end pieces and supporting legs, the end pieces of the supplemental frame comprising vertically spaced rods, the uppermost rod of each end piece being slidably engaged in the depending portion of the main frame and returned therebelow beneath the lower rod, and lazy tongs connecting those portions of the legs above the ralls at earch end, the said tongs including members slidably connected with said legs.
4. A bedstead comprising a frame including ralls and connected end pieces and supporting legs, a supplemental frame comprising a rail, end pleces and supporting legs, end pleces of the supplemental frame comprising spaced rods, the uppermost rod of each end piece being slidably engaged with a portion of the main irame and turned therebelow beneath the lower rod, the said lower rod being movably engaged with the upper rod to permit of detachment of one frame with respect to the other, and lazy tongs connecting those portions of the rails above the ralls at each end, said tongs including members slidably connected with said legs.

No. 99,858. Furniture Joint. Joint de meuble.

Anton F. Gloger, Houston, Texas, U.S.A., 3ra July. 1906; 6 years. Filed 24th April, 1906. Keceipt No. 135,225.
Claim.-The combination of a leg standard having its upper end forced to produce a corner member which is provided in its opposite ends with upright substantially rectangular notches, headed dowel pins carried by the leg standard and also by the notched portions of the corner member, a shelf
recessed to fit the leg member and provided with a keyhole socket in the recessed portion for reception of the dowel pin of the leg, and side rails having their ends fitted in the respective notches of the corner member and provided with keyhole sockets receiving the dowel pins of the corner member, the rails locking the leg against rotation, and said leg capable of rotation when disengaged from the rails to permit disengagement of the leg from the shelf.

No. 99,859. Invalid's Support. Support d'invalides.

Emma Hughes, Washington, District of Columbia, U.S.A., 3rd July, 1906; 6 years. Flled 5th April, 1906. Receipt No. 134,634.
Claim.-1. An invalid sunnort comprising a clamping member, a lower tubular member adjustably connected to the clamping member, a rod having sliding connection with the lower tubular member, an upper tubular member supported on sald rod, a bracket member, a double hinge member adjustably joining the bracket member and the upper tubular member, and a rod slidably mounted in the bracket member.
2. An invalid support comprising a bracket slidably supporting rod, an upper tubular member, a double hinge member adjustably connecting the bracket and upper cubular member, a second rod connected with the upper tubular member to permit relative movement of the latter but not independent vertical movement, and means for adjustably supporting the lower end of the second rod.
3. An invalid support comprising a clamping member formed with a disc, a lower tubular member formed with a disc arranged to co-operate with the disc on the clamping member, a rod having a sliding connection with the lower tubular member, an upper tubular member supported on the rod and formed with a disc, a bracket member including a supporting rod and formed with a disc, and a double hinge member comprising two discs arranged at an angle to each other and cooperating respectively with the disc on the bracket and with the disc on the upper tubular member.
4. An invalid support comprising a clamping member formed with a serrated disc, a lower tubular member formed with a serrated disc co-operating with the disc on the clamping member, a set screw operatively joining the discs, a rod having a sliding connection with the lower tubular member, : set screw operative to said member to lock the rod therein, an upper tubular member formed with a serrated disc, said rod entering said member, means for securing said rod in the upper tubular member to prevent independent vertical movement of sald member without interference with its location, a set screw in said upper tubular member to lock the rod against movement. a bracket member including an adjustable rod and having a depending serrated disc, and a double hlage member comprising two serrated discs arranged at a right angle to each other and co-operating with the disc on the bracket and upper tubular member.
5. An invalid support comprising a clamping member formed with a serrated disc, a lower tubular member formed with a serrated disc co-operating with the disc on the clamping member, a set screw operatively joining the discs, a rod having a sliding connection with the lower tubular member. a set screw operative to ald member to lock the rod therein,
an upper tubular member formed with a serrated disc, said rod entering said member and being formed near its upper end with a circumferential groove, a pin fixed in the upper tubular member and loosely entering said groove, a set screw in said upper tubular member to locate the rod against move ment, a bracket member including a supporting rod and having a depending serrated disc and a double hinge member comprising two serrated discs arranged at a right angle to each other and co-operating with the discs on the bracket and upper tubular member.
6. An invalid support comprising a clamping member, a supporting rod, a connection between the clamping member and supporting rod to permit independent angular and rotary adjustment of said rod, sleeves slidably mounted on the rod, and hangers depending from the sleeves.
7. An invalid support comprising a clamping member, a supporting rod, a connection between the clamping member and supporting rod to permit independent angular and rotary adjustment of said rod, sleeves slidably mounted on the rod, means for securing the sleeves in adjusted positions on the rod and hangers depending from the sleeves.

No. 99,860. Filter. Filtre.

Llewellyn West Jones, Seweckley, Pennsylvania, U.S.A., 3rd July, 1906; 6 years. Filed 21st February, 1906. Receipt No. $133,154$.
Claim.-1. The combination of a fllter bed, a stirrer therein, comprising a net formed of links, and means for withdrawing said net.
2. The combination of a fllter bed, a net extending down irto sald filter bed, and means for moving said net through said filter bed.
3. The combination of a filter bed, a net extending down irto the filter bed, and means for moving said net around a center.
4. The combination of a filter bed, a net composed of links extending down into said bed, and means for moving said net around a center.
$\overline{5}$. The combination of a filter bed, a rotary beam, and a i.ct depending from said beam.
6. The combination of a filter bed, a rotary beam, and a net composed of links depending therefrom.
7. The combination of a fllter bed having a trough extending around same, a rotary net extending down into said bed and projecting under said trough.
8. The combination of a filter bed, a vertical rotary shaft, a beam carried by said shaft, and a net carried by said beam
9. The combination of a fliter bed, a vertical rotary shaft, a beam carried by sald shaft, a net secured to said beam or ol:posite sides of said shaft.
10. The combination of a fllter bed, nets comprising link; extending down therein, means for moving.said nets around a center, one of said nets being closer to said center than the other.
11. The combination of a filter bed, a stirrer comprising a net extending down into said bed, and means for moving said ret through sald bed.
12. The combination of a filter bed, a rotary frame, and a r.et carried by said frame.

No. 99,861. File. Filc.
Fdward B. MoClintock, El Paso. Texas, U.S.A., 3rd July, 1906; 6 years. Filed 8th May, 1906. Receipt No. 135.689.
Claim.-1. In a flle, the combination with a body having cyelets, of flaps carried by the body and foldable upon the stime, and a flexible loop member arranged to surround and sccure the flaps when in folded relation, said loop member baving one terminal secured to the body and the other terminal portion adjustably threaded through the eyelets and being frictionally held in its passage therethrough.
2. In a file, the combination with a body having eyelets, of flaps connected to the body and foldable upon the same, and

fexible loop member formed of a continuous tape, said tape being free from and arranged to surround and secure the fieps when in folded relation, having one terminal secured to the body and the other terminal portion adjustably threaded through the eyelets and frictionally held in its passage therethrough.
3. In a flle, the combination with a body having foldable side and end flaps, said body being provided with a transverse series of eyelets, and a loop member having one end pasing through one of the eyelets and knotted, said loop member being also threaded through the other eyelets and frictionally held against movement thereby.
4. In a file, the combination with a body comprising superposed layers, one of said layers having eyelets therein, of a loop member having a portion threaded through the eyelets and frictionally held thereby.
5. In a file, the combination with a body comprising superposed layers having flaps, one of said layers having eyelets therein, the other layer extending over the eyelets, of a loop member having a portion threaded through the eyelets and frictionally held thereby.
6. In a file, the combination with a body comprising crossed iayers provided with flaps that are located respectively at the side and end edges, the inner of said layers having tiansversely disposed series of eyelets, the other layer having eyelets contiguous to the inner edges of the flaps, and a fiexible tape having one end passing through one of the latter eyelets and secured therein, said tape also passing through the other of said latter eyelet and being threaded through the transverse series of eyelets, forming a loop member.

## No. 99,862. Cord Player for Harmonium-like Inatruments. <br> Joueur de cordes d'instrument de musique.

Fugen Roggenbauch, Stuttgart, Germany, 3rd July, 1906; 6 years. Filed 14th April, 1906. Receipt No. 134,934.
Chim.-1. A chord player for harmonium-like instruments comprising the combination of a frame provided with outstanding flat arms and a series of keys consisting each of a flat longitudinal body provided with a key head on top and with four downward projecting flat faced teeth on the bottom and with longitudinal vertical slots in the flat body by which it hangs and is vertically movable on transverse bars ir the said frame, the said keys beng mounted in parallel range and the said downward projecting teeth being corresponding in size with the width of the keys of the har-monium-like instrument and apart from each other at a distance which corresponds with a chord of the keys of the said instrument.
2. A chord player for harmonium-like instruments comprising the combination of a frame provided with outstand-

ing fiat arms and a series of keys consisting each of a flat lcngitudinal body provided with a key head on top and with four downward projecting flat faced teeth on the bottom and with vertical slots in the said flat body by which it hangs and is vertically movable on transverse bars in the said frame, the said keys being mounted parallel to each other in such way that the right ends form a diagonal line and the said downward projecting teeth being corresponding in size with the width of the keys of the harmonium-like instrument and apart from each other at distances which correspond with the distances at which the several keys of an itstrument constituting a chord are apart from each other.
3. A cord player for harmonium-like instruments comprising the combination of a frame provided with outstanding that arms, a cover and a series of keys consisting each of a flat longitudinal body provided with a key head on top and with four downward projecting flat faced teeth on the bottom and with vertical slots in the said flat body by which it hangs and is vertically movable on transverse bars in the said frame, the said keys being mounted parallel to each other, the said downward projecting teeth being correspondingly in size with the width of the keys of an harmonium-like instrument and apart from each other at distances which correspond with the distances at which the several keys of the instrument constituting a chord are apart from each other, and the said cover being provided with perforations in diagonal range through which the stems of the said keyheads are passed, a symbol representing the chord with which the respective key of the chord player corresponds being marked near each of the eald perforations.
4. A chord player for harmonlum-like instruments comprising the combination of a Prame provided with outstanding flat arms and covered, with a series of keys consisting each of a flat longitudinal body provided with a key head on top and with lour downward profecting flat faced teeth on thte bottom and with vertical slots in the said flat body by which it hangs and is vertically movable on transverse bars in the said frame, the said keys being mounted parallel to each other, the said downward projecting teeth being corresponding in size with the width of the keys of an harmoniumlike instrument and apart from each other in correspondence with the distances at which the keys of an instrument constituting a cord are apart from each other and the cover of the frame being provided with perforations in diagonal range through which the stems of the said key heads are passed, a symbol representing the chord with which the respective key of the chord player corresponds being marked on each key head.

## No. 99,863. Bath. Bain.

Eugen H. Sloman, Detroit, Michigan, U.S.A., 3rd July, 1906; 6 years. Filed 20th April, 1906. Receipt No. 135,103.
Claim.-1. A bath tub made from a single sheet of metal in which the metal is in such a state of rest that it can be reheated without distortion when cooled.
2. A porcelain coated bath tub in which the metal body is formed from a sheet of metal in such a state of rest that on

reheating it to apply the porcelain it was not distorted when cooled.

No. 99,864. Temporary Binder. Reliure temporaire.

Edward C. Suckert, Detrolt, Michigan, U.S.A., 8rd July, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,618.
Claim.-1. In a temporary binder the combination with a back having side flanges, of a series of blading ingers each having an opening at one end and attached at the opposite end to the flange at one side of the back, a slide provided with longitudinal slots, an edge on the flange at the opposite side of the back which is turned over the slide to form a guide therefor and provided with lugs extending inward through the sald slots to secure the slide to the flange, and longitudinally extending fingers formed integral with the slide to engage the openings in the ends of the binding ingers. 2. In a temporary binder the combination of a sheet metal back formed with an integral flange at one side and eyes at opposite side, a member to form a similar flange for the back provided with eyes at one edge, a pintle to extend through the eyes on the back and flange to unite the same, a series of binding fingers rigidly secured at one end to the rigid flange and provided with openings at their opposite ends, a slide having longitudinal slots and longitudinal extending fingers to engage the openings in the ends of the binding fingers, an overturned edge on the free edge of the pivoted flange to form a guide for the sllde, and integral lugs on said flange to engage the slots in the slide.

No. 99,865. Flush Tank. Réservoir à latrines.

Bert Olin Tilden, New York City, New York, U.S.A., 3rd July 1906; 6 years. Filed 3rd May, 1906. Receipt No. 135,503. Claim.-1. In combination with a closet low down flush tank, of a flush valve within sald tank, a rocking lever pivoted within the tank and connected at one side of its fulcrum with the valve and having at the other side of its fulcrum a pair of bearing faces spaced apart, a spindle projecting through the wall of the tank and provided on its outer end with a fixed operating handle located within reach of the user seated on said closet, and having fixed on its inner end a rocking lever, likewise having a pair of bearing faces spaced apart and co-operating with the bearing faces of the valve lever, so that on the swinging of sald operating handle in either direction from its normal straight position the free end of the valve lever will be depressed and the valve operated.
2. In combination with a closet low down flush tank, of a flush valve within said tank, a rocking lever pivoted within the tank and connected at one side of its fulcrum with the valve and having at the other side of its fulcrum a bearing face, a spindle projecting through the wall of the tank and provided on its outer end with a fixed operating handle located within reach of the user seated on said closet, and having fixed on its inner end a rocking lever having a bearing face co-operating with the bearing face of a valve lever, so that on the swinging of said operating handle from its normal position the free end of the valve lever will be depressed and the valve operated.

No. 99,866. Wash Bowl Valve.
Soupape de bol à laver.

David William York, Bridgewater, Massachusetts, U.S.A., 3rd July, 1906; 6 years. Filed 12th April, 1906. Receipt No. 134,866.
Claim.-1. In a valve outlet for wash basins the combination of a basin having discharge and overflow outlets, a valve casing communicating at its upper end with said outlets, and provided at its upper and lower end with outlets, a waste pipe communicating with said outlets, un outlet valve having a stem vertically adjustable in the casing and controlling the main outlet of the basin, said stem being provided at its lower end with a rack, a gear meshing with said rack, a sliding operating rod for actuating the gear, and means for locking said rod in one of its positions.
2 In a valved outlet and overfiow connection for wash basins the combination of a basin having main and overflow outlets, a valve casing communicating with said outlets and having upper and lower exhaust passages, a valve stem ver-
tically adjustable in the casing and having a valve governing the main outlet, means for operating sald stem to open and close the valve, and an auxiliary drain valve fixed to the stem below the outlet valve and having passages for the flow of water to the lower exhaust of the valve casing.
3. In an outlet connection for wash basins the combination of a basin having main and overflow outlets, a valve chamber communicating at its upper end with said outlets and provided with upper and lower exhaust passages, a plug closing the lower end of the valve chamber, and having a bearing extension projecting above the lower exhaust passage, a stem sliding in said plug and bearing extension and carrying at its upper end a valve controlling the main outlet, means for operating said stem and an auxiliary valve or closure carried by the stem and arranged to telescope over the bearing extension to prevent leakage of water between the same and stem.
4. In a valved outlet connection for wash basins the combination of a basin having main and overflow outlets, a valve chamber communicating at its upper end with said outlets and provided with upper and lower exhaust passages, a plug closing the lower end of the valve chamber and having a bearing extension projecting above the lower exhaust passage, a stem slidable in the plug and bearing extension and carrying at its upper end a valve controlling the main outlet, an auxillary valve or closure fixed to the stem delow the main valve and having a perforated body and a tubular portion telescoping over the upper end of the bearing, a spring arranged to exert pressure on said auxiliary valve, and means for sliding said stem to adjust the main valve to open or closed position.
5. In a valved outlet connection for wash basins the combination of a basin having an outlet, a valve casing communicating with said outlet and having an exhaust, a valve in said casing for controlling the outlet, gearing for actuating said valve, a sliding rod for communicating motion to sald gearing, said rod having a limited rotary movement, and locking means connected or disconnected by such rotary movement.

No. 89,867. Method of Maling Metal Wheels.
Methode de faire des roues de métal.
Fig. 1.

Fig. 3.

Fig. 4.

The Bettendorf Metal Wheel Company, assignee of Emil Emfeidt, all of Davenport. Iowa, U.S.A., 3rd July, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,309.
claim.-1. The method of making metal wheels in which the spokes are secured to the hub in two ranks, which method consists in fastening all the spokes of one rank to the members of the wheel and then fastening the spokes of the other rank while hot, the rim being closed at any time prior to the fastening of the second rank.
2. The method of making metal wheels in which the spokes are secured to the hub in two ranks, which method consists

In fastening together the hub, rim and spokes of one rank in such relations that the hub will occupy a position in a longitudinal direction beyond that it will occupy in the completed wheel, then fastening all the spokes of the other rank to the hub and closed rim while said spokes are hot, whereby the contraction of the spokes from cooling will draw the hub to the proder position and will place all the spokes under tension.
3. The method of making metal wheels in which the spokes are fastened to the hub in two rows or ranks, which consists in providing a hub with two rows of holes therearound, and a rim with holes spaced therearound at intervals, fastening all the spokes of one rank in place with their inner euds in the holes of one rank in the hub and their outer ends in every alternate hole in the rim, then fastening all the spokes of the other rank in place while hot with their inner ends in the holes of the second rank in the hub and their outer ends in the holes in the rim, the rim being closed at any timo prior to th: fastening of the second rank.
4. The method of making staggered wheels which consists in fastening one rank of spokes to the hub and rim while the spokes are hot, allowing the secured spokes to contract, and then fastening the spokes of the other rank while hot, to the members of the wheel, the rim being closed at any time prior to the fastening of the second rank.
5. The method of making staggered wheels which consists in providing a hub with two series of holes therearound, a closed rim, and spokes fastening all the spokes of one rank to the hub and rim respectively, and then securing the spokes of the other rank while hot to the hub and rim.

No. 99,868. Machine For Making Metal Wheels. Machine pour faire des roues de métal.

The Bettendorf Metal Wheel Company, assignce of Emil Emfeldt, all of Davenport, Iowa, U.S.A.. 3ra July, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,232.
Claim.-1. In a machine for making metal wheels the comblnation with the spoke fastening means, of a hub support adapted to sustain the hub on end, and cranked arms project ing laterally from said hub support and adjustable around their longitudinal axes and adapted to sustain the rim, whereby the rim support is adjustable vertically with reference to the hub support.
2. In a machine for making metal wheels and in combination with spoke fastening means, a flat frame, means for moving sald prame bodily relatively to the spoke fastening means and in the direction of the axis of the hub, an extension on the end of said frame adjustable in tue direction of the axis of the spoke and adapted to give support to the hub and arms extending laterally from said extension and adapteil to support the rim.
3. In a machine for making metal wheels the combinatior of a support for the hub and rim, movable bodily in the direction of the longitudinal axis of the spoke, mechanism for fastening the inner end of the spoke to the hub, mechanisms for fastening the outer end of the spoke to the rim, said lat-
ter mechanism comprising a spoke clamp and a header movable relatively to the clamp toward the hub, and operative connections between said header and the hub and rim support, whereby when the header advances to perform its functions it will move the hub and rim support in the direction of the longitudinal axis of the spoke.
4. In a machine for making metal wheels the combination of a support for the rim adapted to allow the rim to move in the direction of the axis of the spoke, means for sustaining the spoke in operative relation to the rim, mechanism for fastening the spoke to the rim, a rest adapted to bear against the outer face of the rim and movable in the direction of the longitudinal axis of the spoke, and connections between the rest and spoke fastening means constructed to advance the rest and rim, and maintain the rest in contact with the advancing rim while the spoke is being fastened to the rim.
5. In a machine for making metal wheels, the combination with a support for the rim adapted to allow the rim to move in the direction of the longitudinal axis of the spoke, of means for fixedly sustaining the spoke in relation to the rim to be fastened thereto. a heading device for the outer end of the spoke adapted when advanced to form a head thereon, a rest in position to bear against the outer face of the rim while the head is being formed and movable in the direction of the axis of the spoke, and means controlled by the advance of the heading device for moving said rest relatively to the header and in the direction of the axis of the spoke.
6. In a machine for making metal wheels, the combination with means for sustaining the rim in such manner that it may move bodily in the direction of the axis of the spoke, of neans for sustaining the spoke in operative relation thereto, is heading device adapted when advanced to form a head on the outer end of the spoke, means for advancing said heading device, a rest in position to bear on the outer side of the rim adjacent the heading device, and means for moving said rest simultaneously with the heading device, in the direction of the same, but at less speed.
7. In a machine for making metal wheels, the combination of a support for the rim and hub adapted to allow the rim in move in the direction of the axis of the spoke, means for fixedly sustaining the spoke in operative relation to the hub and rim, means for fastening the spoke to the hub, a header adapted when advanced to form a head on the outer end of the spoke, a rest in position to bear against the outer face of the rim while the head is beling formed, and means controlled by the movement of the header for moving the rest in the direction of the spoke axis and relatively to the header iL the direction of its heading movement.
8. In a machine for making metal wheels, the combination of a support for the rim and hub movable in the direction of the axis of the spoke, means for sustaining the spoke in operative relation to the hub and rim, means for fastening the spoke to the hub, a header adapted when advanced to form a head on the outer end of the spoke, a rest in position to bear against the outer face of the rim, means controlled by the movement of the header for moving the rest in the d!rection of the spoke axis, and operative connections between said rest and the supporting device, adapted to move the support in the same direction as that imparted to the rest.
9. In a machine for making metal wheels, the combination of a hub support adapted to sustain the hub on end and movable transversely of its longitudinal axis, means for supporting the rim in operative relation thereto, means for sustaining the spoke in operative relation to said hub and rim, means for lastening the inner end of the spoke to the hub, a header adapted by its advance to head the outer end of the spoke, a rest in position to bear against the outer face of the rim, and movable in the direction of the axis of the spoke, means for moving said rest, and operative connections between the rest and the hub support, adapted to move the support in the same direction as that imparted to the rest.
10. In a machine for making metal wheels, the combination with a spoke clamp adapted to grasp the spoke adjacent the inner face of the rim and formed to permit the spoke to be moved endwise relatively, a supporting device for the hub and rim adapted to hold said parts in operative relation to the spoke and movable in the direction of the axis of the scoke, means for fastening the inner end of the spoke to the hub, a heading device adapted when advanced to upset the outer end of the spoke, a rest in position to bear against the outer face of the rim, means for moving said rest simultaneously with, in the same drection of, but at less speed than the heading device, and means for moving the supporting device simultaneously with and at the same speed of the rest.
11. In a machine for making metal wheels, the combination of a support for the rim, means for sustaining the spoke, a clamp adapted to grasp the spoke near the inner face of the r.m. means for moving the spoke and rim relatively to said clamp in the dircction of the axis of the spoke, and an abutment independent of the clamp and adapted to bear firmly
against the inner face of the rim as the latter approaches the clamp.
12. In a machine for making metal wheels, the combination ot means for supporting the rim so that it may be moved in the direction of the axis of the spoke, means for sustaining the spoke in operative relation to the same, a heading device adapted by its advance to upset the outer end of the spoke, a rest in position to bear against the outer face of the rim and movable in the direction of the axis of the spoke, and an abutment in position to bear against the inner face of the rim and movable with the rest.
13. In a machine for making metal whecls, the combination with a support for the hub adapted to sustain the same on end, a relatively flxed arm above the support, hub clamping mechanism sustained by the arm, means for supporting the rim on edge around the hub, an arm mounted on the firstnamed arm and formed with an abutment to bear against the inner face of the rim, means for sustaining the spoke in operative relation to the rim and hub, and means for fastening the spoke to the rim and hub.
14. In a machine for making metal wheels, the combination of means for supporting the rim and spoke in operative relations to be fastened together, mechanism for fastening the spoke to the rim, a sustaining device on which the lower fdge of the rim is adapted to rest, and a finger adapted to bear on the upper edge of the rim.
15. In a machine for making metal wheels, the combinat:on with a support for the rim, of means for sustaining the spoke in operative relation to the same, a rest in position to bear against the outer face of the rim, an abutment adapted to bear against the inner face of the rim, a sustaining device on which the lower edge of the rim is adapted to rest, and a finger adapted to bear on the upper edge of the r'm.
16. In a machine for making metal wheels, the çombination of a rim support, means for sustaining the spoke in operative relation to the rim, a rest adapted to bear against the outer face of the rim, and a sustaining device on which the lower edge of the rim is adapted to rest, said sustaining device being carried by the rest.
17. In a machine for making metal wheels, the combina$t$ : on of a hub support movable in the direction of the axis of the spoke, means for sustaining the rim around the hub. means for holding the spoke in operative relation to said parts, a movable header for the outer end of the spoke, a sliding cap plate operatively connected with the header, a rim rest on the cap plate, and links connecting sad cap plate cperatively with the hub support.
18. In a machine for making metal wheels, the combination with a horizontal vertically movable hub holding frame, of a rim support carried by said frame, an actuating device for moving the frame vertically, vertical bars connected to the frame at one end of the same, vertical links connected with the frame at its other end, and operative connections between the bars and links and the actuating device.
19. In a machine for making metal wheels, the combination with the frame having a vertical standard formed with a vertical open guideway, of a hub holding frame adapted to be moved in a direction longitudinally of the spoke, and formed with a guide lug sliding in the guideway, means for moving said frame vertically, means for sustaining the hub and rim in operative relations to the spoke and means for fastening the spoke to the hub and rim.
20. In a machine for making metal wheels, the combination with a horizontal vertically movable hub holding frame, of a rim support carried thereby, an actuating device for moving the frame vertically, and means for adjusting the ends of said frame independently and with relation to the actuating mechanism.
21. In a machine for making metal wheels, the combination of two spoke clamps adapted to act respectively at oprosite ends of the spoke, and each comprising opposing jaws pivoted between their ends on parallel axes and provided on one side of said axis with spoke grasping surfaces, a longitudinally extending rocking member formed on opposite s!des with cam surfaces adapted to engage the inner sides of the jaws of both clamps, and adapted to close the jaws on the spoke, an actuating cylinder and piston, and operative connections between the piston and said rocking memker, whereby the rocking member serves to operate both clamps in unison.
22. In a machine for making metal wheels, the combination with means for supporting the hub and rim in operative relations, said supporting means being movable in the direction of the axis of the spoke to be secured, of a spoke clamp adapted to grasp the spoke adjacent the hub and acting to permit a movement of the spoke endwise toward the hub only, a second spoke clamp adapted to grasp the spoke adjacent the rim and acting to permit the spoke to be moved endwise, a heading device for the hub end of the spoke sdapted to upset the spoke within the hub and against the bolding action of the first-named clamp, a heading device for
the opposite end of the spoke adapted when advanced toward the hub to upset the end of the spoke outside the rim, means controlled by the advance of this header for moving the rim and connected spoke and hub in the direction of the axis of the spoke and with relation to the clamp, and means for forming a shoulder on the spoke at the inner face of the rim when the spoke is moved endwise.
23. In a machine for making metal wheels the combination of a support for the hub and rim movable vertically and horizontally, a cylinder 13, a piston therein operatively connected with said support, spoke clamps, a cylinder 79, a piston thereln operatively connected with said clamps, a hub headed, a cylinder 41, a piston therein operatively connected with the hub header, a rim headed, a cylinder 58, a piston therein operatively connected with the rim headed, valves for the respective cylinders controlling the admission to and exit of fluid under pressure from the same, a common operating means for said controlling valves, and connections between said operating means and the respective valves, said valves and connections being so formed and related that when the common operative means is actuated, cylinder 13 will be first opened to the exhaust, then pressure admitted to cylinder 79, then this cylinder opened to the exhaust, then pressure admitted to cylinder 58 and this cylinder opened to the exhaust, then cylinder 79 opened to the exhaust, and finally pressure admitted to cylinder 13.

No. 99,869. Scraper. Girattoir.

The Kilbourne and Jacobs Manufacturing Company, assignee of Thomas H. Stagg, all of Columbus, Ohio, U.S.A., 3rd July, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135,465.
Claim.-1. The herein described improvement in the art of producing bowls or the like which consists in shaping a sheet of metal between dies constructed to form two bowls connected end to end, and during the shaping operation, stretching the metal of each bowl from the line of prospective seperation of the bowls, whereby the quality of the metal at the edges produced by the separation, is improved.
2. The herein described art of producing scraper bowls or the like, which consists in shaping a sheet of metal between dies constructed to produce two bowls connected at their front or cutting ends, and during such shaping operation, stretching the metal of each bowl from the line of prospective separation of the bowls to improve the metal at the ultimate cutting edges and dividing the blank thus produced.
3. The process of producing scraper bowls which consists in stamping a sheet of metal between dies constructed to form two bowls connected at their open front or cutting ends, and during such stamping operation, stretching the metal of each bowl toward its rear end from the line of connection between the bowls, and thereafter dividing the blank thus produced along such line of connection.
4. The art of producing scraper bowls or the like which consists in stamping a sheet of metal between dies constructed to form two such articles connected at their front or cutting ends, supporting the metal at such line of connection or line of prospective separation, before completion of the stamping operation whereby the metal is stretched from said line toward the opposite ends of the bowls and thereafter dividing the blank thus formed to produce two bowl blanks.
5. The herein described art of producing scraper bowls or the like which consists in stamping a sheet of suitable metal between dies constructed to produce two such articles, connected at their cutting ends, whereby the metal of each prospective bowl sustains the metal of the other bowl at said cutting edge and prospective line of separation, supporting the metal at said line of connection or prospective separa-
tion and with the middle raised portion corresponding in position to such line, and stretching the metal over said raised portion during the stamping operation.
6. The herein described improvement in the art of producing earth scraper bowls or the like which consists in stamping a sheet of metal between dies constructed to form two bowls connected at their front or cutting ends along the line of prospective separation and with the middle raised portion corresponding in position to such line, and stretching the metal over said raised portion during the stamping operation
7. The herein described improvement in the art of producing earth scraper bowls or the like, which consists in stampIng a sheet of metal between dies constructed to produce two bowls connected at their open front or cutting ends, sustaining the edges of the sheet at its ends and sides during the stamping operation, with a pressure that permits the metal to draw inward but which resists such drawing sufficiently to cause stretching of the metal in the ultimate bowls to be produced, and causing such stretching to take place from the line of connection or prospective separation and thereafter separating the blank thus produced along sald line.

No. 99,870. Manniacture of Fish Plates.
Fabrication de plaque pour éclisses.

ITVEs. 8
The Continuous Rail Joint Company of Canada, assignee of Philip J. Dalton, Joliet, Illinois, U.S.A., 3rd July, 1906; 6 years. Filed 12th April, 1906. Receipt No. 134,884.
Claim.-1. In a machine for forming fish plates the combination with dies adapted to engage opposite sides of the vertical portion of a fish plate in vertical position, one of said dies being movable with respect to the other and one of them having a tongue adapted to enter the double portion of the fish plate, of a roll adapted to travel across the upper surfaces of said dies and tongue, a driving shaft, and arms eccentrically connected at one end to said shaft and pivotally connected at the other end to sald roll.
2. In a machine for forming fish plates the combination with die members adapted to grasp the upright portion of a fish plate and hold the same in inverted position with its base member exposed, of a gravity roller arranged parallel to sald die members and adapted to travel across said base member, a shaft carrying eccentrics at opposite ends, and eccentric straps with arms extending to the opposite ends of said roller to reciprocate said roller.
8. In a machine for forming fish plates the combination with means for clamping a fish plate in inverted position with its base member exposed, of a roller adapted to travel across sald base member, of a shaft 14 having eccentrics at opposite ends, eccentric straps extending to the opposite ends of the roller to operate the same and pulleys for rotating said shaft 14 , substantially as set forth.
4. In a machine for forming fish plates, a bed or face providing a horizontal slideway at one end and raised journal bearings at the other, opposite die members, one adjustable in said slideway, adapted to clamp a fish plate in inverted position with its base member exposed, a rotary shaft in said raised bearings, eccentrics on said shaft, arms extending from said eccentrics, and a roller mounted between said arms in position to travel upon said die member in the slideway.

No. 99,871. Dumping Vehicle. Vihicule d bascule.
The F. H. Hieber Wagon Manufacuring Company, McKies Rocks, assignee of August Mertes. Emsworth, both in Pennsylvanla, U.S.A., 3rd July, 1906; 6 years. Filed 25 th April, 1906. Receipt No. 135,251 .
Clain.-1. A locking device for the purpose set forth comprising a rotatable member, means for rotating said member
in one direction, and an element to prevent back rotation of said member, said means when moved to inoperative position adapted to lock said element in operative position.

2. A locking device for the purpose set forth comprising a rotatable member, means for rotating sald member in one direction, an element to prevent back rotation of said member, sald means when moved to inoperative position adapted to lock said element in operative position, and means for shifing said element to permit of the back rotation of said member.
3. A locking device for the purpose set forth comprising a rotatable member, a dog adapled to engage therewith for intermittently rotating the same, means for preventing back rotation of said member, an operating lever carrying sald dog, said lever when moved to inoperative position adapted to move said dog into engagement with sald means, thereby locking the same in operative position, and a lug carried by the lever and adapted to engage and shift sald means from operative position to permit of the back rotation of said member.
4. A locking device for the purpose set forth, comprising a rotatable ratchet whecl, a shiftable dog adapted to engage in the teeth of sald wheel for intermittently rotating it, an operating lev $r$ carrying said dog, means engaging with sald wheel to revent back rotation thereof, and sald lever when moved to inoperative position adapted to move the sald dog in engagement with said means, thereby locking the same in operatlve position.
5. A locking device for the purpose set forth comprising a rotatable ratchet wheel, a shiftable dog adapted to engage in the teeth of said wheel for intermittently rotating it, an operating lever carrying said dog, means engaging with said wheel to prevent back rotation thereof, said lever when moved to inoperative position adapted to move said dog in engagement with said means, thereby locking the same in operative position, and a lug carried by said lever and adapt od to engage the said means for shifting the same out of engagement with the ratchet wheel to permit of the back rotation of the latter.
6. A locking device for the purpose set forth comprising a rotatable ratchet wheel, a shiftable dog adapted to engage in the teeth of sald wheel for intermittently rutating it, an operating lever carrying said dog. means engaging with said wheel to prevent back rotation thereof, sald lever when moved to inoperative position adapted to move said dog in engagement with said means, thereby locking the same in onerative position, a lug carried by said lever and adapted to engage in said means for shifting the same out of engagement with the ratchet wheel to permit of the back rotation of the latter, and means for llmiting the movement of said lever in one direction and for retaining said dog out of engagement with said wheel when the said means is shifted out of engagement with the wheel.
7. A locking device for the purpose set forth comprising a rotatable ratchet wheel, a shiftable dog adapted to engage the teeth of said wheel for intermittently rotating it, a support, means pivoted upon said support and adapted to engago said wheel to prevent back rotation thereof, and an operating lever carrying the said dog and adapted when moved to operative position to move said dog into engagenent with said means, thereby locking it in oeprative position.
8. A locking device for the purpose set forth comprising a rotatable ratchet wherl, a shiftable dog adapted to engage the teeth of said wheel for intermittently rotating it, a support, means pivoted upon said support and adapted to engage sald wheel to prevent back rotation thereor, an operating lever carrying the said dog and adapted when moved to operative position to move sald dog into engagement with said means, thereby locking it in operative position, and a lug
carried by said lever and adapted when the lever is moved in one direction to engage sald means, thereby shifting it out of engagement with the ratchet wheel to permit of back rotation thereof
9. A locking device for the purpose set forth comprising a rotatable ratchet wheel. a shiftable dog adapted to engage the teeth of said wheel for intermittently rotating it, a support, means pivoted upon sald support and adapted to engage said wheel to prevent back rotation thercof, an operating lever carrying the said dog and adapted when moved to operative position to move sald dog into engagement with said means, thereby locking it in operative position, a lug carried by said lever and adapted when the lever is moved in one direction to engage said means, thereby shifting it out of engagement with the ratchet wheel to permit of back rotation thereof, and a lug carried by said support and adapted to limit the movement of the lever in one direction and to retain said dog out of engagement with said ratchet wheel when the said means to prevent back rotation is shifted out of engagement with the said ratchet wheel.

No. 99,87\%. Pump. Pompe.

Thomas H. C. Homersham and the Thwaites Brothers, assignee of a half interest, all of The Vulcan Iron Works, Bradford, England, 3rd July, 1906; 6 years. Filed 29th January, 1906. Receipt No. 132,353.
Claim.-1. In connection with multiple cylinder pumps means for regulating the quantity of fluid pumped by rendering any required part of the stroke of all plungers simultaneously and similarly ineffective for delivery, whilst the length of the stroke remains constant, substantially as hereinbefore described.
2. In a connection with multiple cylinder pumps means for causing valves of the cylinders or in connection therewith, to be simultaneously held open whilst the plungers are making any required part of their stroke, so as to make the required part of the stroke, of all the plungers similarly and simultaneously ineffective for dellvery, substantially as hereinbefore described.
3. In a mutiple cylinder pump, a cam shaft and means for actuating it from the crank shaft, and cams on the said cam shaft, one for each cylinder, and stems from valves in connection with the several cylinders and bearing on such cams respectively, and means for simultaneously and similarly altering the positions of the cams relatively to the angular positions of the cranks, substantially as and for the purpose hereinbefore described.
4. In a multiple cylinder pump, a series of sliding blocks, one for each cylinder, with elevations thereon and means for actuating them from the crank shaft, and stems from valves in connection with the several cyllinders and bearing on such blocks respectively and means for simultaneously and similarly altering the positions of the said blocks relatively to the angular positions of the cranks, substantially as and for the purpose hereinbefore decribed.

No. 89,873. Cement Block. Bloc de ciment.

Corey O. White and Wllliam E. Brewer, both of Jackson, assignees of Ray Wilcox, Detrolt, Michigan, U.S.A., 3rd July, 1906; 6 years. Filed 12th May, 1906. Receipt No. 135,829.
Claim.-1. In a device of the kind described the combination with the ends and sides of a flask, of castings connected to the said ends and sides and a lever pivotally connected to the sald castings.
2. In a device of the kind described the combination with the end castings, said castings being adapted to extend beyond each other, of a lever pivotally connected to the extending portion of one of the castings and also pivotally connected to the other casting.
3. In a device of the kind described the combination with a casting adapted to be secured to the side of a flask and provided with a projection extending beyond the end of said side. of a casting adapted to be attached to the end of the flask and having a bifurcated end portion, a lever pivotally connected to the extended portion of the first-named casting and also pivotally connected to the blfurcated end of the second casting.
4. In a device of the kind described the combination with the side casting having a projecting arm, of the end casting bifurcated and provided with lugs, a bifurcated lever pivotally connected to the arm, and also pivotally connected to the lugs, and a spring latch for holding the lever in a locked position.

No. 99,874. Rein Folder. Porte-rines.

Giles Bowler, John Bigley and Joseph A. Walker, all of Peck, Idaho, each an assignee of a one-third interest, 3rd July, 1906; 6 years. Filed 27th April, 1906. Receipt No. 135,319. Claim.-1. A rein holder consisting of a stem, a base part fixed thereon, and an eccentric pivoted to said stem above the base part for clamping a rein thereon.
2. A rein holder consisting of a stem, a base part fixed theron and having a free end portion provided with an upwardly projecting lip, and an ececntric pivoted to sald stem above the base part for clamping a rein thereon.
3. A rein holder consisting of a stem, a base part fixed thereon, a pin secured to said stem and projecting over the base part, and an eccentric for clamping the reins on said base part, said eccentric at its inner portion being provided with a tubular portion in which sald pin is received and having its outer portion curved upwardly to form a handle.

No. 99,875. Tire Tightener. T'endeur de bandages.

George P. Alten and Arnold Gersbach, Jr., assignee of a onethird interest, both of Bartlett, Texas, U.S.A., 3rd July, 1906; 6 jears. Filed 1st May, 1906. Receipt No. 135,417.
Claim.-In a tire tightener the combination with a sleeve having a tubular socket for engaging with a spoke, a tubular end portion for engaging with a spoke, a tubular end portion for engaging with a felly, a tubular screw-threaded portion at its middle part, a partition between the said tubular portions arranged at the junction of the said socket with the said screw-threaded portion, and an externally projecting shoulder arranged in line with the said partition, of a tightening nut engaging with the said screw-threaded portion of the sleeve and normally bearing agafnst its caid shoulder.

No. 99,876. Go-Cart. Voiturc.

John G. Lohrmann, Elkhart, Indiana, U.S.A., 3rd July, 1906; 6 years. Filed 19th May, 1906. Receipt No. 136,073.
Claim.-1. In a go-cart or like contrivance the combination of a frame, folding handle bars, uprights and side pleces plvotally connected to each other and to said frame and tandle bars, cross pleces connecting corresponding side bars and uprights, and a collapsible body supported between sald uprights and side bars by means of their connecting cross pieces.
2. In a go-cart or like contrivance the combination of a frame, folding handle bars, uprights and side bars pivotally connected to each other and to sald frame and handle bars, cross pleces connecting corresponding uprights and side bars, a collapsible body supported by means of said cross pieces.
and a connection between the front portion of the frame and the front portion of the body, substantially as set forth.
3. In a go-cart or like contrivance the combination of a rigid frame comprising longttudinal and end bars, longitudinal shafts journalled in the end bars, supporting wheels carried by and movable with said longitudinal shafts, handle bars pivoted to the said frame and co-operating trips between the handle bars and said shafts for turning the latter to posltively fold or unfold the supporting wheels and to hold the latter in either extreme position.
4. In a go-cart or like contrivance the combination of a rigid frame comprising longitudinal and end bars, longitudinal shafts journalled in the end bars of the frame and provided with trips, wheels carried by and movable with said shafts, handle bars pivoted to said frame, and trips projected from the handle bars and co-operating with the trips of the longitudinal shafts for positively turning the latter in each direction and holding them in either extreme position.
5. In combination, a frame, companion shafts having lateral extensions and provided with supporting wheels, folding handle bars, tappets projected from the handle bars and adapted to co-operate with said lateral extensions to effect folding of the wheels, and co-operating trips fitted to said shafts and handle bars to effect simultaneous unfolding of the wheels and handle bars, substantially as set forth.
6. In combination, a frame, companion shafts journalled to the frame and provided with supporting wheels, a trip fast to each of said shafts. folding handle bars, and complemental trips applled to the handle bars and adapted to co-operate with the trips fitted to sald shafts to effect upfolding of the wheels and to interlock with the trip of the shafts and hold the latter against casual movement when the wheels are in serviceable position.
7. In combination, a frame, companion shafts provided with supporting wheels, trips applied to said shafts, folding handle bars, and trips of approximately $\square$ form carried by the handle bars and adapted to co-operate with the trips of the aforesaid shafts to effect upfolding of the wheels and to hold them and the shafts in fixed position.
8. In combination, a frame, longitudinal shafts journalled thereto and provided with supporting wheels, folding uprights and side bars, folding handle bars, a collapsible body, an apron extending from the body, a stay plece connected to the front end of the apron and adapted to be fitted to the front bar of the frame and to co-operate with sairl shafts to hold them and the supporting wheels in unfolded position, and co-operating trips between said shafts and handle bars to effect both a positive folding and unfolding of the contrivance, substantially as set forth.
No. 99,877. Smelting Furnace. Fondevic.

Fig.

Walter George Perkins, San Franclsco. Californla, U.S.A., 3rd July, 1906; 6 years. Filex 2nd April, 1!06. Recelpt No. 134,538.
Claim.-1. In a smelting furnace a hollow structure, the interlor of which is contracted between the two divisions.
with means for generating heat from an exterior source in the lower portion of the structure and means for conveying part of said heat to upper part of chamber other than through the mass contained therein.
2. In a smelting furnace a hollow structure, formed in two sections and having an interior contraction, means for generating heat from an exterior source of supply and means for removing the lower section, substantially as and for the purpose described.
3. In a smelting furnace, a hollow structure formed in two sections and having its interior contracted at the point of union of said sections, means for generating heat from an exterior source, and means for removing the lower section.
4. In a smelting furnace, a hollow structure formed in two sections and having its interior contracted at the point of union, means for introducing a blast of air into the upper section above said contracted portion, means for introducing heat from an external source into the lower section, and means for introducing air into the lower section.
5. In a smelting furnace. a hollow structure formed in two sections, the lower end of the upper section being contracted and provided with an opening, and the lower section being provided with a chamber which communicates with said opening, means for introducing a blast of air into the upper section above the contracted portion and means for introducing an inflammable gas into the chamber of the lower section.
6. In a smelting furnace a hollow structure formed in two sections, the lower end of the upper section being contracted and provided with an opening, and the lower section being provided with a chamber and a throat leading therefrom to said opening, means for introducing a blast of air into the upper sehtion above the contracted portion and means for introducing an inflammable gas into the chamber of the lower section.
7. In a smelting furnace a hollow structure formed in two sections, the lower end of the upper section being contracted and provided with an opening, and the lower section being provided with a chamber and a throat leading therefrom to said opening, means for introducing a blast of air into the upper section above the contracted portion and means for introducing an inflammable gas and an air blast into the chamber of the lower section.
8. In a smelting furance a hollow structure formed in two sections, the lower section being removable and provided with a throat which is adapted $t$ register with the lower end of the upper section, a discharge outlet and meanis for introducing jets of gas into said chamber.
9. In a smelting furnace a hollow structure formed in two sections, the lower section being removable and provided with an arched chamber and a throat leading from the top of the arch and adapted to register with the lower end of the c:pper section, a discharge outlet and gas pipes projecting into said chamber, the ends of which are contracted and curved.
10. In a smelting furnace a hollow structure formed in two sections, the lower section being removable and comprising an outer shell and an inner lining, said lining being removable and having a chamber formed therein with an upwardly extending throat adapted to communicate with the lower end of the upper section and means for introducing inflammable gas into said chamber.
11. In a smelting furnace a hollow structure formed in two sections. the lower section being removable and comprising an outer shell and an inner lining, said lining being removable and having a chamber formed therein and throat adapted to communicate with the lower end of the upper section and means for introducing gas into said chamber.
12. In a smelting furnace a hollow structure formed in two sections, the lower section being movable vertically and removable, and provided with a chamber adapted to communicate with the lower end of the upper section. screws for moving said section vertically, wheels for supporring it when it is removed, and pipes adapted to project into the chamber and supply the same with gas or air when the section is elevated into contact with the upper section.
13. In a smelting furnace a hollow body, means for charging and roasting or desulphurizing the material in the upper part thereof and smelting the residue in the lower portion by means of heat applied from a gaseous fuel, said process being continuous and the roasted product passing to the smelting zone by gravity.
14. In a smelting furnace, a hollow receptacle, means for applying heat and introducing air, and means for varying the heat zone within the mass by transferring a portion of the heat from the bottom of the mass to a point abuve the bottom.
15. In a smelting furnace, means for varying the location of the heat zone in the interior of the furnace by transferring a portion of the heat from the bottom to said interior otherwise than by passing it up through the mass of material.
16. In a smelting furnace, means for introducing air into te interior of the furnace and means for heating the same be-
fore it enters the furnace by a portion of the heat from the bottom of the furnace.
17. In a smelting furnace, means for generating heat at or near the bottom of the furnace, means for introducing air to the interior at the side of the furnace, and a conduit from the means at the bottom to the means at the side for conveying heat from the bottom to the interior of the furnace without passing it up through the mass of material.
18. In a smelting furnace, means at the bottom thereof for bottom of a mass of material and means for creating a forced draft upon the exterior of the mass thereby withdrawing heat units and introducing thm into the mass at a point above the bottom.
19. In a smelting furnace, means at the bottom thereof for generating heat from a gaseous fuel, means for introducing air through the side of the upper or lower receptacles, and a valved conduit leading from the heating means at the bottom to the means of introducing said air for conveying said heat and introducing it into the receptacle above.
20. In a smelting furnace, a double chambered receptacle, a wind box around one of the chambers, a condust leading from the other chamber and means for generating heat in said other chamber from a gaseous fuel.

No. 99,878. Saw Clamp, Set, Etc. Serre pour scies, etc.

Camille Baillargeon, Blind River, Ontario, Canada, 3rd July,
1906; 6 years. Filed 11th August, 1905. Receipt No. 127,605. Claim.-1. In a device of the character described, supporting members adapted to receive a saw intermediate thereof, means for clamping the saw, and a block secured to the supporting members and provided with a vertical slot from its under side and provided with intersecting slots from its upper side.
2. In a device of the character described, supporting members adapted to receive a saw intermediate thereof, means for clamping the saw and a block secured to the supporting members and provided with a vertical slot from its under side and provided with intersecting slots from its upper side, each of said intersecting slots having an incnned bottom.
3. In a device of the character described, supporting members adapted to receive a saw intermediate thereof, means for clamping the saw and a guiding block provided with a lug thereon, a securing member connecting the lug to one of the supporting members, a securing member connecting the opposite end of the block to the other of the supporting members, and said block being provided with file and saw guiding slots.
4. In a device of the character described, supporting members, a guide block carried by said members and provided with slots, an insertible stop member carried by the block, and means for clamping a saw.
5. In a device of the character described, supporting members, fle guiding means carried by the supporting members, and a clamp comprising a lug on one of the supporting members and provided with a recess, a thumb screw carried by the lug , and a block disposed on the thumb screw in said recess.
6. In a device of the character described, supporting members one of which is provided with a recess, a slidable member disposed in the recess, means for actuating the slidable member, a bridge across said recess, a screw disposed through the bridge, a block on said screw, and means for clamping a saw.
7. In a device of the character described, supporting members one of which is provided with a recess, a slidable member disposed in the recess, means for actuating the slidable member, means for limiting the movement of the slldable member, a thumb screw disposed through a slot provided in
cine of the aupporting members and engaging the slidable member, and means for clamping a saw.
8. In a device of the character described, supporting members provided with a rectangular depression therein, clamping means on the supporting members, means disposed in said depression for guiding a flle in an inclined and a horizontal plane, means for securing the guiding means in position, means for gulding a saw, and means for clamping a saw.
9. In a device of the character described, supporting members, a slotted block disposed on the supporting members and provided with an inclined face and a horizontal face, screws securing the block in position, a yoke disposed in the block and provided with a long arm and a short arm, the long arm being disposed in an opening and the short arm terminating in a recess in the block, a plurality of nuts on the shont arm, and means for clamping a saw.
10. In a device of the character described, supporting members, means for guiding a flle in a horizontal plane and in a plane at an angle to the horizontal, a clamping member on the supporting members, a setting member, means for actuating the setting member and spreading the clearing teeth of a saw comprising a standard carried by each supporting member, a spacing block intermediate of the standards, a thumb screw disposed through the standards, a handle on the thumb screw, and a hammer on the handle provided with a blunt end and a pointed end.
11. In a device of the character described, supporting members, means for guiding a file in a horizontal plane and a plane at an angle to the horizontal, means for maintaining a saw intermediate of the supporting members, a pivoted hammer carried by the supporting members, and means for supporting the hammer in an inoperative position comprising a rotatable standard provided with an angular extension thereon.

No. 99,879. Vehicle. Véhicule.

William H. F. Blume, Saint Louis, Missourl, U.S.A., 3rd July, 1906; 6 years. Filed 8th May, 1906. Receipt No. 135,675.
Claim.-1. The combiration with a stanhope body, of a supporting bracket hinged to the rear side of said stanhope body, and a coupe constructed to be positioned on the bracket against the stanhope body, substantially as specified.
2. The combination with a stanhope body, of a supporting bracket hinged to the rear end of said stanhope body, and a coupe body detachably secured to the stanhope body and supported by the bracket, substantially as specified.
3. A vehicle body comprising a stanhope body, a bracket h!nged to the rear side of said stanhope body, a coupe body edapted to be positioned against the rear side of the stanhope body upon the bracket, and locking devices for securing the bodies together, substantially as specified.

## No. 99,880. Numbering Mechanism.

 Mécanisme de numéroter.Lavid Carlaw, Sr., David Carlaw, Jr., Alexander Lyle Carlaw and James White Carlaw, co-inventors, all of Glasgow, Scotland, 3rd July, 1906; 6 years. Filed 1st March, 1906. Receipt No. 133,421.
Claim.-1. In numbering mechanism the combination with a surface for receiving impressions of numbering means, said means being automatically moved back rind forward laterally so as to bring the numbers into corect printing position.
2. In numbering mechanism the conibination with a surface for receiving impressions of a vumbering disc having numbers thereon, said disc being automatically moved back and forward laterally so as to bring the numbers into correct printing position.
3. In numbering mechanism the combination with a surface for receiving impressions of numbering discs having

numbers thereon, said discs belng automatically moved back and forward laterally so as to bring the numbers into correct printing position.
4. In numbering mechanism the combination with a surface for receiving impressions of a numbering disc having ridges with members thereon, said disc being automatically moved back and forward laterally so as to bring the numbers into corect printing position.
5. In numbering mechanism the combination with a surface for receiving impressions of a numbering disc having two parallel and circumferential ridges thereon, each ridge having a set of numbers, said disc being automatically moved back ahd forward laterally so as to bring the numbers into correct printing position.
6. In numbering mechanism the combination with a sur face for receiving impressions of a numbering disc, a sleeve, a shaft, and means for automatically moving the sleeve back and forward laterally on the shaft.
7. In numbering mechanism the combination with a surface for receiving impressions, of a shaft, a sleeve on the skaft, a numbering disc adjustably fitted on the sleeve, a lever for moving the sleeve laterally and means for operating the lever.
8. In numbering mechanism the combination with a surface for receiving impressions, of a shaft, a sleeve on the shaft, a numbering disc adjustably fitted on the sleeve, a lever for moving the sleeve laterally, a cam for operating the lever and means for rotating the cam.
9. In numbering mechanism the combination with a surface for receiving impressions of a strip let into sald surface, a raised part on the strip, numbering means, and means for shifting said uumbering means laterally.
10. In numbering mechanism the combination with a cylindrical surface for receiving impressions of a strip let into said surface along a line which is parallel to the axis of the cylindrical surface, a raised part on the strip, numbering means and means for shifting said numbering means laterally.
11. In numbering mechanism the combination with a surface for receiving impressions, of a shaft, a sleeve on the shaft, numbering discs adjustably fitted on the sleeve, a lever for moving the sleeve laterally, a cam for operating the lever, means for sliding the cam and means for operating the said sliding means.
12. In numbering mechanism the combination with an im pression cylinder, of a shaft for sald cylinder, a second parallel shaft, means for driving the second shaft from the first shaft, a sleeve on the second shaft, numbering discs on the sleeve, a lever for moving the sleeve laterally on its shaft. a cam on the cylinder shaft for operating sald lever, means for moving said cam laterally on its shaft, a second cam for operating said moving means and mechanism for rotating the second cam
13. In numbering mechanism the combination with an impression cylinder, of a shaft for said cylinder, a second par allel shaft, means for driving the second shaft from the first shaft, a sleeve on the second shaft, numbering discs on the sleeve, a lever for moving the sleeve laterally on its shaft, a cam with two grooves slidably fltted on the cylinder shaft a bar with pin engaging one of the grooves, a sccond cam adapted to engage a second pin on the said bar and worm gearing for operating said second cam.

No. 99,881. Brake. Freín.

Joseph Carr, Lexington, Missouri, U.S.A., 3rd July, 1906; 6 years. Filed 4th May, 1906. Receipt No. 135,522.
Claim.-1. In a brake of the kind described the combination with a sectional shoe, of a crank connected to said shoe, and operative means connected to said crank, for the purpose described.
2. In a device of the kind described the combination with a hub, of a sectional shoe loosely supported under sald hub and means connected to said shoe for drawing it against the hub, for the purpose described.
3. In a device of the kind described the combination with a hub, of a sectional shoe loosely supported under said hub at one end by a chain, and at the other end by a chain connected to a crank, and means connected to sald crank for operating said shoe, for the purpose described.
4. In a device of the kind described the combination with a wagon provided with a crank, of a sectional shoe adapted to be supported loosely under the hub of the wheel by chains, one of the chains being connected to the wagon, the other chain being connected to the crank, and a lever connected to said crank, for the purpose described.
5. In a device of the kind described the combination with a wagon provided with a crank, of curved blocks pivotally connected together, supported at each end by chains under the hub of the wheel, one chain being connected to the wagon, the other chain to the crank carried by the wagon and a lever carried by the wagon for operating the said crank, for the purpose described.

No. 99,882. Building System.
Système de construction.

George W. Chantigney and Joseph P. Morency, co-inventors, both of Montreal, Quebec. Canada. 3rd July, 1906; 6 years. Filed 25th November, 1905. Receipt No. 130.421.
Claim.-1. A building construction comprising solid foundation walls formed from plastic material, a plurality of vertical walls formed from plastic material and disposed on the foundation walls and provided with a dead air space therebetween and provided with inclined ducts leading from the dead air space, and floor joists formed from plastic material and reinforced with beams.
2. A building construction comprising foundation walls, vertical side walls comprising a plurality of members and provided with a dead air space therebetween, webs connecting the members of the vertical walls at intervals and provided with openings to permit the circulation of air, solfd partitions formed from plastic material, and reinforcing members joining the partitions to the vertical walls.
3. A building construction comprising solid foundation walls formed from plastic material, a plurality of vertical walls formed from plastic material and disposed on the foundation walls and provided with a dead air space therebetween and provided with inclined ducts leading from the dead air space, means for connecting the walls, and floor joists formed from plastic material and reinforced with beams.

No. 99,883. Cigar Vending Machine.
Machine pour la vente des oigares.

Edmond N. Cusson, Montreal, Quebec, Canada, 3rd July, 1906; 6 years. Filed 11th October, 1905. Recelpt No. 129,133. Claim.-1. In a device of the character described, a casting adapted to support a plurality of cigars, a movable member adapted to release one clgar and provided with integral lugs adapted to engage under the rest of the clgars when one cigar is being released, and coin actuated means for sald releasing member.
2. In a device of the character described, a rockable semitubular member provided with projections on its ends, and coin actuated means adapted to rock said member.
3. In a device of the character described a rockably supported semi-tubular member provided with lugs thereon, a rockable member disposed within said semi-tubular member, and coin actuated means adapted to rock sald members.
4. In a device of the character described, a rockable member provided with integral lugs and provided with a slot through one of said lugs, a second rockable member disposed within the first rockable member and provided with a pin disposed through said slot, and coin actuated means adapted to rock sald members.
5. In a device of the character described. a supporting frame provided with depending flanges on its upper transverse member, a rockable semi-cylindrical member carried by the frame and provided with lugs adjacent its ends, a rockable member disposed within said semi-cylindrical member. means adapted to rock said member disposed within said semi-cylindrical member after said semi-cylindrical member has been partly rocked.
6. In a device of the character described, a supporting frame provided with depending flanges. a lockable member carricd by said frame, a member pivotally supported within said rockable member and provided with a lip adapted to engage one of said depending flanges, means normally maintaining said members in one position, and coin actuated means adapted to rock said members.
7. In a device of the character deacribed, a casing, a hinged door thereon, a delivery spout through the door, a coln guide through the door, a coin chute in the casing adjacent the guide and provided with a magnetized bottom, a member adapted to be rocked by a coin deposited in the chute, and releasing members actuated by the rockable member.
8. In a device of the character described, a casing, a rockable shaft provided with a slot adapted to receive a coin, a frame rockably disposed on the shaft, means normally holding the frame in one position a contact member on said frame in the path of movement of a coin deposited in the slot of said rockable shaft, and releasing members connected with the frame.
9. In a device of the character described, a casing, a rockable shaft supported therein and provided with a slot adapted to receive a coin, a frame rockably disposed on the shaft, a spring normally holding the frame in one position, a contact member on the frame in the path of movement of a coin deposited in the slot of said rockable shaft. and releasing members connected with the frame.
10. In a device of the character described, a casing, a rockable shaft provided with a slot disposed within the casing and adapted to recelve a coin, a frame rockably disposed on the shaft, means normally holding the frame in one position. a rotatable contact member on said frame in the path of movement. of the coin deposited in the slot of said rockable shaft, and releasing members connected with the frame.
11. In a device of the character described, a casing, a rockable shaft disposed within the casing and provided with a slot adapted to receive a coin, a frame rockably disposed on the shaft, means normally holding the frame in one position. a spring pressed rotatable contact member carried by said frame in the path of movement of a coin deposited in the slot of said rockable shaft, and releasing members connected with the frame.
12. In a device of the character described, a casing, a supporting frame provided with a vertical partition and secured within the casing, a rockable shaft carried by said frame and provided with a slot adapted to receive a coin. a bracket secured to sald partition, adapted to support sald shaft and provided with a plurality of lugs thereon, a rockable frame disposed on said slotted shaft, a pivoted shaft carried by said frame adapted to contact against said lugs. a roller on said frame in the path of movement of a coin dieposed in said slot in sald shaft, a spring carried by said frame and adapted to depress said shaft carrying said roller, said latter shaft being adapted to ride over said lugs when sald frame is rocked by a coln, and releasing means connected to said rockable frame.
13. In a device of the character described, a casing, a supporting frame disposed in the casing. a slotted shaft carried by the frame, means for preventing rotation of the shaft in one direction, a rockable frame carried by the shaft. a contact member carried by the frame in the path of movement of a coin disposed in the slot in sald shaft, and releasing members connected to sald rockable irame.
14. In a device of the character described, a casing, a supporting frame lisposed in the casing. a slotted shaft carried by the frame and a ratchet on said shaft, a pawl adapted to engage sald ratchat, and a spring adapted to press sald pawl into engagement with the ratchet, a rockable frame carried by the shaft, a contact member carried by the frame in the path of movement of a coln disposed in the slot in said shaft. and releasing members connected to said rockable frame.
15. In a device of the character described. a casing, a rockable irame disposed within the casing, a slotted shaft disposed within said frame to one side of its axis, a contact member carried by the frame in the path of movement of a coin disposed in the slot in said shaft, and rockable releasing means connected to said frame.

## No. 89,884. Core for Concrete.

Noyau pour construction en béton.
dugust Phillip Diescher, Pittsburg, Pennsylvania, U.S.A., 3rd July, 1906; 6 years. Flled 24th March, 1906. Receipt No. 134,237\%
Olaim.-1. A flat metal bar for use as a core or tle rod for concrete structures having pockets or recesses in its opposite sides for the reception of portions of the concrete, said pockets or recesses having walls on all sides.
2. A flat metal bar for use as a core or tie rod for concrete structures having pockets or recesses in its sides and having protuberances along its edges in line transversely with the pockets or recesses.
3. A flat metal bar for use as a core or tie rod for concrete structures having pockets or recesses in its opposite sides, the pockets on one side being opposite these on the other side.
4. A flat metal bar for use as a core or tie rod for concrete structures having pockets or racesses in its sides, said

7-5
pockets being arranged opposite each other and having protuberances along its edges in line transversely with the pockets or recesses.

5. A flat metal bar for use as a core or tie rod for concrete structures, the metal of the bar being displaced at intervals along its length to form pockets or recesses, and protuberances in line transversely with the pockets or recesses.
6. As an improvement in the art of forming cores or tie rods, which consists in depressing portions of the metal at intervals along a metal bar or rod to form pockets or recesses, having walls on all sides, and forcing the depressed metal laterally to form protuberances.

## No. 99,885. Process of Producing Textile Fibres.

 Procédé pour la construction des tissus textiles.Fritz Fuchs, Vienna, Austria, 3rd July, 1906; 6 years. Filed 9th December, 1905. Receipt No. 130,851.
Claim.-1. A process for obtaining textlle flbre from reeds. ruches and other fibrous matter, which process consists of tightly pressing the flbrous matter together and exhausting the air therefrom, then treating the fibrous matter to a bath of caustic lye, then removing the superfluous lye thereform, then washing the flbrous matter, and then drying it.
2. A process for obtaining textile flbre from reeds, rushes and other fibrous matter, which process consists of tightly pressing the fibrous matter together and exhausting the air therefrom, then treating the fibrous matter to a bath of caustic lye, then removing the superfluous lye therefrom, then washing, acidifying and drying the fibrous matter to obtain the textile fibre.
3. A process for obtaining fibre from reeds, rushes and other fibrous matter, which process consists of tightly pressing the fibrous matter together and exhausting the air therefrom, then treating the fibrous matter to a bath of caustic lye, then removing the superflunus lye, then heating the treated vegetable matter to a selected temperature, then iressing, washing, acidifying and drying the fibrous matter to obtain the textile fibre.

No. 99,886. Pianoforte. Piano-forte.

John W. Galloway, Linton, Indiana, U.S.A., 3rd July, 1906; 6
years. Filed 28th May, 1906. Receipt No. 136.323
Claim.-1. A string frame for planoforte and like musical itstruments having an approximately circular opening and a sounding board of corresponding shape fitted in said opening.
2. A string frame for planofortes and like musical instruwents having an opening of approximately circular outline. a sounding board arranged within sald opening, and a rim encircling the sounding board and flling the space between it and the wall of the said circular opening of the string prame.
3. A string frame for pianofortes and like musical instruments having an opening of approximately circular outline, a sounding board arranged within said opening, and a rim encircling the sounding board and filling the space between it and the wall of the said circular opening of the string frame, said rim being firmly attached to both the sounding board and string frame.
4. A string frame for pianofortes and like musical insiruments having an opening of approximately circular outline, a sounding board arranged within said opening, and a rim encircling the sounding board and fllling the space between it and the wall of the said circular opening of the string irame, said rim being of wood and having a circular outline.
5. A string frame for pianofortes and like musical instruments having an opening of approximately circular outline, a sounding board arranged within said opening, and a rim encircling the sounding board and filling the space between it and the wall of the said circular opening of the string frame, said rim being of wood and of a laminated structure, the layers being secured to one another and to the sounding board and the string frame.
6. A string frame for pianofortes and like musical instruments provided with an opening of approximately circular outline adapted to receive a sounding board, and strings extending across the opening of the string frame and attached t.. the latter at opposite points.
7. A string frame for pianofortes and like musical instrun:ents having an opening of approximately circular outline a sounding board of corresponding shape to said opening and fitted therein, and a continuous bridge attached to said sounding board.
9. A string frame for pianofortes and like musical instruments provided with an opening of approximately circular outline, a sounding board of corresponding shape to the opening and fitted therein, and a rim snugly fitting within said opening of the string frame and having its inner wall rabetted to form a seat for reception of the sounding board, the three parts being firmly united or bonded.

No. 99,887. Water Elevator. Elérateur à eau.

James A. Goodner, Rocky Ford, Colorado, U.S.A., 3rd July, 1906; 6 years. Filed 18th January, 1906. Recelpt No. 131,983.
Claim.-1. In a water elevator a casing, a sprocket wheel supported in said casing, the latter being provided with openings for the accommodation of sald sprocket wheel and for downgoing and upgoing pistons, a cylinder having flaring flanged ends, said cylinder being supported upon the casing in alignment with the opening for the upgoing piston members, a conducting pipe connected with the upper end of the cylinder, said conducting pipe being of an interior diameter greater than that of the bore of the cylinder, a lateral exit upon said conducting pipe, separable top members for the latter, having supporting brackets, a shaft journalled in said brackets, a sprocket wheel upon said shaft, an endless chain supported upon the upper and lower sprocket wheels, piston members carried by said chain, and packing rings upon said
piston members, the sprocket wheels being provided with recesses for the accommodation of said piston members.
2. A piston for water elevators consisting of a disc provided on its upper and undersides with aproximately semicircular yokes crossing each other at right angles.
3. A piston for water elevators consisting of a disc provided on its upper and under sides with approximately semicircular bails crossing each other at right angles and means for connecting said bails with adjacent chain links.
4. A piston for water elevators consisting of a disc provided on its upper and under sides with semi-circular yokes or bales crossing each other at right angles, said disc having an annular groove, and a packing ring seated in said groove.
5. A piston for water elevators consisting uf a disc provided on its upper and under sides with semi-circular yokes crossing each other at right angles, a hook member and a link member connected with said yokes at their points of intersection at opposite sides of the disc, and a packing ring seated in a groove in the latter.
6. A piston for water elevators consisting of a disc, two bail members, each comprising two semi-circular yokes crossing each other at right angles and means for connecting said bail members with each other and with the disc.
7. A piston for water elevators consisting of a disc having an annular groove and a packing ring seated in said groove, two bail nembers, each comprising a pair of yokes crossing each other at right angles, said bail members abutting upon opposite sides of the disc and a connecting bolt extending through said bail members at the points of intersection of the yokes composing the same.

No. 99,888. Brake. Frein.

Franklin A. Hawk, Central Point, Oregon, U.S.A., 3rd July, 1906; 6 years. Filed 29th May, 1906. Recelpt No. 136,390. Claim.-1. A brake bar, a brake shoe clip, adjustably mounted on the outer end of the brake bar, a step pendently supported on the said outer end of the brake bar and a means for clamping the clip and the step member to the brake bar, adapted to permit of the adjustment of the clip and the step with respect to the said brake bar, in unison.
2. A brake bar, a brake shoe clip, a step pendently support. ed on the outer end of the brake bar, a single clamping bolt and nut device passing through the step, the brake bar and the brake shoe clip for securing the shoe clip to the step, said brake shoe clip and said step including means for engaging the brake bar to prevent turning of the brake shoe clip and the step on the bolt, substantially as shown and described.
3. In a brake mechanism of the character described the combination with a slotted brake bar end, the shoe clip and the bolt secured to the clip and projected through the slot in the brake bar, of the step member having a clamping head provided with flanges to project with flanges to project over the upper and lower edges of the brake bar and apertured to receive the shank, and the clamping nut.

No. 99,889. Machine for Forming Blooms on Nuts, Tubes, Etc.
Machine potr former des loupes sur les noix, tubes, etc.

John George Inshaw, Church Hill House, Handsworth, near Birmingham, England, 3rd July, 1906; 6 years. Filed 21st November, 1905. Receipt No. 130,280.
Claim.-1. In apparatus for forming hollow metal blooms of the kind hereinbefore referred to the combination of a series of pairs of rolls and a bending or skelping machine, the pairs of rolls being arranged successively one in advance of another and the under rolls being provided with projections to form wedge-shaped or triangular recesses in the underside of the metal operated on and the bending or skelping machine being arranged to receive the rolled metal and bend it downwards and inwards so that detached scale will not be retained in the grooves or between the surfaces to be welded, all substantially as hereinbefore described.
2. In apparatus for forming hollow metal blooms of the kind hereinbefore referred to the combination of a series of pairs of rolls and a bending or skelping machine the pairs of rolls belng arranged successively one in advance of another and the under rolls being provided with projections to form wedge-shaped or triangular recesses in the underside of the metal operated on the first upper roll or rolls having rings or ribs, and the last pair of rolls or pairs of rolls being curved longitudinally, and the bending or skelping machine being arranged to receive the rolled metal and bend it downwards and inwards so that detached scale wil not be retained in the grooves or between the surfaces to be welded, all substanllally as herelnbefore described.
3. In apparatus for forming hollow metal blooms the combination of a series of pairs of horizontal shaping rolls the under rolls of which present a series of annular projections triangular in cross section and a series of pairs of bending or skelping rolls with means for operating said rolls, substantially as described and for the purpose set forth.
4. In apparatus for forming hollow metal blooms the combination of a series of pairs of horizontal shaping rolls, the under rolls of which present a series of annular projections triangular in cross section. and a series of pairs of bending or skelping rolls of which the upper roll of the first pair presents a concave surface and the under roll of such pair presents a convex surface, substantially as described and for the purposes set forth.
5. In apparatus for forming hollow metal blooms the combination of a series of pairs of horizontal shaping rolls, the under rolls of which present a series of annular projections trlangular in cross section, and a series of pairs of bending or skelping rolls of which the upper roll of the first pair presents a concave surface and the under roll of such pair presents a convex surface, while both rolls of the last pair of said skelping rolls present surfaces approximating the external shape in cross section of the bloom to be produced substantially as described and for the purposes set forth.
6. In apparatus for forming hollow metal booms. a series of pairs of shaping rolls A A, B B, C C, and D D. with means for operating same, the under rolls of each pair having a series of annular projections, the upper rolls of the pairs $C$ and $D$ presenting concave or curved surfaces and the lower rolls of such pairs $C$ and $D$ being of convex outline, substantially as described and for the purpose described.

No. 99,890. Wagon Brake. Frein de vagon.

Toris Nells Johnsen, Wilbur, Washington, U.S.A., 3rd July,
1906; 6 years. Filed 7th May, 1906. Recelpt No. 135,625.
Claim.-1. In a wagon brake the combination of the front and rear axles, the coupling poles, bolsters supported on the axles, standards on the bolsters, rollers Journalled in the standards longitudinally of the bolsters, rollers journalled in the individual standards longitudinally thereof, a wagon bed supported by the rollers, brackets on the bed, a cross bar secured to the coupling pole, bolts transversing the ends of the cross bar, and provided with upper and lower eyes, yokes engaging the upper eyes, rollers journalled in the arms of the yokes and engaging the brackets, eye bolts engaging the lower eyes, a brake beam secured to the eye bolts, brake shoes on the ends of the brake beam, bearings on the rear axle, a rock shaft journalled in the bearings, brackets on the sides of the bed and provided with perforations, upwardly extending arms on the ends of the rock shaft for engaging the brackets, a central depending arm on the rock shaft, and a rod connecting the depending arm with the brake beam
2. In a wagon brake the combination with the bed of a front and rear axle, the coupling pole, bolsters supported on the axles, standards on the bolsters, rollers journalled in the standards longitudinally thereof, means connected with the standards for supporting the wagon bed, a brake beam depending from the bed, means for maintaining the brake beam in flxed relation with respect to the coupling pole, brake shoes on the ends of the brake beam, a rock shaft journalled in the rear axles, brackets having a plurality of perforations secured to the bed, arms on the rock shaft for engaging the brackets, whereby the longitudinal movement of the bed may rock the shaft, and a connection between the rock shaft and the brake beam whereby the rocking of the shaft may operate the brake.
3. In a wagon brake the combination of a front and rear axle, bolsters having standards supported on the axles, a bed supported on the holsters. means whereby the bed may move longitudinally upon the bolsters, a brake beam depending from the bed, brake shoes on the ends of the brake beam, a rock shaft journalled on the rear axle, brackets having a nlurality of perforations secured to the bed, arms on the rock shaft for engaging the bracket, and connections between the rock shaft for engaging the bracket, and connections between the rock shaft and the brake beam whereby the rocking of the shaft may operate the brake.
4. In automatic wagon brakes the combination with the front and rear axles having wheels journalled thereon, of the reach connecting the axles, bolsters on the axles, standards on the ends of the bolsters, springs on each side of the holsters, hangers connected with the ents of the springs and the standards, a bed supported by the springs, horizontal
bars pivoted by their centers to the sides of the bed, vertical bars depending from the ends of the horizontal bars, a cross beam connected to the ends of the forward vertical bars above the reach, links on the ends of the cross beam, a brake beam supported by the links and having brake shoes for engaging the wheels, levers pivoted by one end to the ends of the rear pair of vertical bars. brackets depending from the bed and pivoted to the centers of sald levers, plates having perforations engaging the free ends of said levers and connected to the rear axle, and a connection between the bed and the brake beam for applying the brakes upon the forward movement of the bed with respect to the bolster.
5. In automatic wagon brakes the combination with the front and rear axles having wheels journalled thereon, of a bed supported for longitudinal and vertical movement with respect to the axles, horizontal bars pivoted by their centers to the sides of the bed, a brake beam depending from the front ends of the horizontal bars and having brake shoes engaging the wheels below the horizontal diameter thereof, and means connected with the rear ends of the horlzontal bars and engaging the rear axles for maintaining the brake shoes and the rear axle in a fixed vertical relation with respect to each other.
6. In automatic wagon brakes the combination with the front and rear axles having wheels journalled thereon, of a bed supported for longitudinal and vertical movement with respect to the axles, a brake beam supported by the bed and having brake shoes for engaging the wheels, a connection between the brake beam and the bed whereby the forward movement of the bed with respect to the axle will apply the brakes, and means for maintaining a fixed vertical relation between the brake beam and the axles.
7. In automatic wagon brakes the combination with the front and rear axles. of wheels on the axles, a bed movably supported on the axles, a brake beam supported below the bed and having shoes for engaging the neriphery of the rear wheels, means whereby the forward movement of the bed with respect to the axles will apply the brake shoes to the wheels, and means for preventing backward motion of the wheels when the wagon is at rest, comprising bands having ratchet teeth on the hubs of the rear wheels, pawls connected to the brake beams and normally engaging the ratchet teeth, a rock shaft pivoted longitudinally of the rear axle. and having projncifig arms provided with loops engaging the pawls, a handle for manipulating the shaft, and a bracket for retaining the handle in its adiusted position.
8. In automatic wagon brakes the combination with the front and rear axles, of wheels on the axles, a bed movably supported on the axles, breaking mechanism below the bed and adapted to engage the wheels. means whereby the forward movment of the bed with respect to the axles will actuate the breaking mechanism. and means whereby the backward movement of the wheels may actuate the breaking mechanism, comprising bands having ratchet teeth upon the hubs of the rear wheels, pawls connected with said braking mechanism and normally engaging the ratchet teeth, and means for retaining the pawls out of engagement with the teeth.
9. In automatic braking mechanism the combination with the front and rear axles, of wheels on the axles, a bed supported for longltudinal movement on the axles, breaking mechanism, means whereby the forward movement of the bed upon the axle will actuate the braking mechanism. and means whereby the backward movement of the wheels may actuate the braking mechanism, and means for restraining the operation of said last-named means.
10. In automatlc wagon brakes the combination with the front and rear axles and the wheels on the axles, of a bed supported for longitudinal movement on the axles, breaking mechanism, means whereby the forward movement of the bed with respect to the axles will actuate the breaking mech. anism, and means whereby the backward movement of the wheels may actuate the breaking mechanism.
11. In automatic wagon brakes the combination with the bed, of wheels for supporting the bed, breaking mechanism. and means wherebs the backward movement of the wheels will actuate said braking mechanism.
12. In automatic wagon brakes the combination with the front and rear axles having wheels thereon, of bolsters on the axles, standards on the ends of the bolsters, springs on each side of the bolsters, hangers connecting the ends of the springs with the standards, a bed resting on the springs, braking mechanism below the bed, and means whereby the forward movement of the bed with respect to the bolsters may actuate the breaking mechanism.
13. In automatic wagon brakes the combination with the front and rear avles having wheels journalled thereon, of bolsters on the axles, standards on the ends of the bolsters, braking mechanism, and means whereby the forward movement of the bed with respect to the bolsters may operate the braking mechanism.
14. In a wagon the combination with the front and rear axles, of a bed. springs interposed between the bed and the axles, a brake beam supported by the bed and depending therebelow, and means for retaining the brake beam in fixed vertical relation with respect to the axles.

## No. 99,891. Purffer and Soreen for Making Cellulose or Paper.

Epurateur et tamis pour faire du cellulose ou papier.

Leonhard Kruse, Zell in Wiesenthal, Baden, Germany, 8rd July, 1906; 6 years. Filed 27 th October, 1905. Receipt No. 129,574.
Claim.-In a pulp screen the combination with the trough $a$ having an opening $i$ in the end thereof and a conical surface $p$ adjacent said opening and the cylindrical screen adapted to revolve in said trough having a tubular portion $h$ passing through the opening $i$, of a rubber disc $o$ having an opening therein to admit of the passage therethrough of the tubalar portion $h$, means to fasten one portion of the rubber disc to the conical surface $p$ and a ring $r$ adjustably fastened to the tubular portion $h$ forming abutting means for the other portion of the rubber disc, substantially as set forth.

## No. 89,892. Linotype Machine. Machine linotype.

John Raphael Rogers, Brooklyn, New York, U.S.A., 3rd July. 1906; 6 years. Filed 9th March, 1905. Receipt No. 123.200. Claim.-1. In combination a slotted mould to form the lower portion of a linotype body co-operating slotted mat rices to form the upper part of said body, and division plates lying between the matrices and extending beyond the plane of the matrix characters to form slots in the linotype.
2. A slotted mould in combination with a serles of matrices having slots in align with and form a continuation of the mould, and characters or matrices proper at the bottom of the slots.
3. A series of matrices having slots to form the upper portion of a slug body and characters at the bottom of the slots in combination with matrices having like slots and no characters, and non-slotted plates lying between the matrices and extending above the plane of their characters, whereby the edge of the slug may be formed with raised characters, blank surfaces and rule receiving slots.
4. In a linotype machine a mould for a slug consisting of a rigid slotted portion to form the base of the slug, and a series of slotted separable members co-operating with the mould proper and forming jointly a mould for the upper part of the slug.
5. In combination a serles of matrices slot ted to form a mould, and plates siated between the matrices and dividing the slot into lengths or sections.
6. A composed line of table matrices comprising matrices deeply slotied to form a mould with characters at the bottom of the slots and corresponding matrices witn slots but no characters, whereby they are adapted to produce a slug having raised characters thereon with blank surfaces between them.
7. A set of matrices for producing figure tables comprising the deeply slotted matrices with characters therein and complementary matrices or division plates without slots.

8. In a linotype machine, a mould consisting of two cooverating slotted parts, one part consisting of composed rearrangeable members joined on a plane parallel with the printing face of the slug formed therein and separable at will.
9. In a linotype machine a mould consisting of a deeply grooved or slotted part, adapted to form the upper part of the slug body and the characters on its edge, and a co-operating separable part having a slot therethrough, that it may recelve metal at one slde and deliver it at the opposite side to the other mould member and also serve to give form to the base portion of the slug.

No. 99,893. Fleshing Apparatus. Echarnoir.

Laurente Rupp, Montreal, Quebec, Canada. 3rd July, 1906; 6 years. Filed 15th June, 1906. Receipt No. 131,855.
Claim.-1. A fleshing knife comprising the combination of a rotary cylindrical casing having a cutting edge, a casing adjustably disposed over the cylindrical casing, a guard plate disposed adjacent the blade and means for rotating the cylindrical casing.
2. A lieshing knife comprising the combination of a rotary cylindrical casing having a cutting edge, a casing adjustably disposed over the cylindrical casing and provided with a bevelled outer end, a guard plate disposed adjacent the blade and means for rotating the cylindrical casing.
3. A fleshing knife comprising the combination of a rotary cylindrical casing having a cutting edge, a casing disposed over the cylindrical casing, a guard plate adjustably secured adjacent the casing, and means for rotating the cylindrical casing.
4. A fleshing knife comprising the combination of a rotary cylindrical casing having a cutting edge, a casing disposed over the cylindrical casing , a guard plate disposed adjacent the cylindrical casing, and means for adjusting the guard plate laterally and horizontally.
5. A fleshing knife comprising the combination of a rotary cylinder having a cutting edge, a casing disposed over the cylinder. a guard plate disposed adjacent the cylinder and provided with a bevelled edge and a concave flange, and means for rotating the cylindrical casing.
6. A fleshing knife comprising the combination of a rotary cylinder having a cutting edge, a pedestal adjacent the cylinder, a casing disposed on the pedestal, a set-screw adjustably securing the casing, an adjustable guard plate carried by the pedestal, and means for rotating the cylinder.
7. A fleshing knife comprising the combination of a rotary cylinder having a cutting edge, a pedestal adjacent the cyllnder, a casing adjustably secured to the pedestal, a bracket disposed on the pedestal, a set-screw adapted to hold the bracket, a set-screw carried by the bracket, a guard plate provided with a slot adapted to receive the second set-screw, and means for rotating the cylinder.
8. In a fleshing knife the combination comprising a base plate, a rotary knife supported by the base plate, a pedestal on the base plate, a slotted plate on the pedestal, a casing carried by the slotied plate and disposed around the knife, a bracket disposed on the plate, a guard plate carrled by the bracket ,and means for rotating the knife.

No. 99,894. Rein Holder. Porte-rines.

Edward G. Stevens, Cranesville, Pennsylvania, U.S.A., 3rd July, 1906; 6 years. Filed 29th May, 1906. Receipt No. 136,375.
Claim-1. A rein holding attachment for harness consisting of anchoring stems, means for securing them longitudinally upon a portion of the harness, and a rearward extension movably connected to one end of the anchoring stems, sald extension having integral rein recelving portions.
2. A rein holding attachment for harness consisting of elongated anchoring stems having oppositely projecting extensions at one and thereof, parallel integral securing loops at the ends of the extensions, and a rearward extension movably connected to the other end of the stems and having a rein receiving portion.
3. A rein holding attachment for harness consisting of elongated anchoring stems, means for securing said stems at points between their ends, oppositely projecting extensions at one end of the stems and substantially at right angles thereto, parallel strap recelving loops integral with said extensions and at right angles thereto, a rearward extension to the stems, and means integral with said extension for surrounding reins.
4. A rein holding attachment for harness conslsting of anchoring stems, means for securing the stems to the harness
and a laterally adjustable rearward extension mounted upon and adjustably secured to the stems, said extension having a rein holding portion.
5. A rein holding attachment for harness consisting of anchoring stems, means for securing them to the harness, and a longitudinally and laterally adjustable rein holding extension connected to the stems.

No. 99,895. Horse Releaser.
Appareil d deteler les chevauc.

John B. S. P. Twaha, Spokane, Washington, U.S.A., 3rd July, 1906; 6 years. Filed 21st April, 1906. Receipt No. 135,151.
Claim.-1. A horse releaser comprising a singletree, trace engaging arms pivoted at one end to the singletree and lying normally with their other ends against the singletree. collars revolubly engaged with the singletree and extending over the ends of the arms to hold the arms against pivotal movement, said collars having notches therein and being movable to bring their notches into position for the passage of the ends of the arms therethrough, means for holding the collars yieldably with their notches out of such position, fingers carried by the collars, and devices connected with the fingers and adapted for operation to move the collars against the action of the holding means.
2. A horse releaser comprising a singletree, rods engaged in the ends of the singletree and having spaced ears at their outer ends, trace engaging arms having angular end portions pivoted between the spaced ears, said arms lying normally with their opposite ends against the sngletree, collars revolubly mounted upon the singletree and exending over the ends of the arms to hold the latter in their normal positions, said collars having notches therein and being movable to bring their notches into position for the passage of the ends of the arms therethrough, eyes carried by the collars, spring rods secured at one end to the singletree and engaged at the other ends in the eyes, said rods being arranged to hold collars yleldably with their notches out of position for the passage of the ends of the arms therethrough, fingers carried by the collars and extending outwardly therefrom, s.nd cables secured to the fingers, said cables being adapted to be pulled to move the collars against the action of the spring rods.

No. 99,896. Hay Rack. Ratelicr à foin.
Joseph Vogel, Maxville, Missouri, U.S.A., 3rd July, 1906; 6 years. Filed 27th April, 1906. Receipt No. 135,324.
Claim.-1. A rack for hay wagons and the like comprising longitudinally extending main beams, transversely extending beams connecting the same, means sccured to the main beams for detachably engaging the bolsters of a vehicle, a pivoted standard connected to one end of the main beams, a rotatable device connected to the rear ends of the main leams, said device having tapered ends and rope engaging means at the extremities of the tapered portions.
2. A rack for hay wagons and the like comprising longitudinally extending main beams, transversely extending top and bottom beams fastened to the main beams, a pair of longitudinally extending slats secured upon the ends of the top beams, a wheel guard mounted upon each pair of slats, bolster engaging devices secured to and lepending from the
main beams, a standard pivoted to the main beams at one end, a rotatable device mounted upon the beams at the other

end, and having tapered extremities, and rope engaging devices at the small ends of said extremities.

No. 89,897. Mould. Moule.

Nelson A. Austin, Greenville, Illinois, U.S.A., 3rd July, 1906;
6 years. Filed 29th May, 1906. Receipt No. 136,388.
Claim.-1. An implement for shaping plastic material upon walls and the like consisting of a holder and a mould carrier thereby with its outer edge provided with an ornamental configuration.
2. An implement for shaping plastic material upon walls and the like comprising a head constituting a hawk, a handle projected centrally at one side of the head and mould carried by one edge of the head and projected upon the opposte side thereof with its outer edge provided with an ornamental configuration for the support of the plastic material.
3. An implement for shaping plastic material upon walls consisting of a holder having a handle, a mould carried by one edge of the holder with the outer edge of the mould provided with an ornamental configuration, and means to detachably secure the mould to the holder.
4. An implement for shaping plastic material upon walls comprising a holder having a handle, a seat upon one edge of the holder, and a mould having a shank projected at one edge thereof for detachable engagement with the seat of the holder and its opposite edge provided with an ornamental conflguration for the support of the plastic material.
5. An implement for shaping plastic material upon walls comprising a holder having a handle, a pair of spaced laterally offset seats carried by the holder, and a mould having cne edge provided with a shank for detachable engagement with the seats and its opposite edge being provided with an ornamental configuration for the support of the plastic material.
6. An implement for shaping plastic material upon walls comprising a head constituting a hawk, a handle projected centrally from the head and a mould fitting against and detachably connected to one edge of the head, said mould being projected beyond the head opposite the handle with said projected portion provided with an ornamental conflguration.
7. An implement for shaping plastic material upon walls consisting of a polygonal head having edges of different shapes, moulds shaped to fit the respective edges of the head sind provided with ornamental configurations, and means to detachably connect the moulds to the corresponding edges $0^{\circ}$ the head.
8. An implement for shaping plastic material upon walls comprising a polygonal head having a straight edge and a bowed edge, moulds to respectively fit the straight edge and bowed edges of the head and provided with ornamental configurations, and means to detachably connect the moulds to the head.
9. An implement for shaping plastic material upon walls comprising a polygonal head having a straight edge, a convexed edge and a concave edge, a straight mould for application to the straight edge of the head and a bowed mould for alternate application to the concaved and convexed edges of the head, and means to detachably connect the moulds to the head.
10. An implement for shaping plastic materials upon walls comprising a polygonal head constituting a hawk and provded with a straight edge, a concaved edge and a convexed edge, a handle projected centrally from one side of the head, corner brackets upon one and the same side of the head, seats upon the corner brackets, and moulds to fit the respective edges of the head, each mould having a shank to fit a pair of seats with the outer edge of the mould provided with ornamental configuration.

No. 99,898. Wagon Box, Hay Rack, Etc. Boîte de wagon, ratelier d foin.

Elias A. W. Beemer, Scotland, Ontario, Canada, 3rd July, 1906; 6 years. Filed 22nd November, 1905. Receipt No. $130,311$.
Claim.-1. A wagon box in combination with hay rack sides provided with arms extending downwardly and inwardly to
the bottom of the box and adapted to hook on to the upper edges of the box sides, and detachable means securing the lower ends of the arms to the bottom of the box, substant:ally as described.
2. A wagon box in combination with hay rack sides provided with arms engaging the sides of the box and extending downwardly and inwardly to the bottom of the box where they are pivoted together in pairs, a metal tongue secured to each arm extending past the pivot, and a metal plate secured to the wagon bottom and having a slot formed thereis adapted to receive the tongues when parallel to one another, and to engage them when crossed, substantially as described.
3. A wagon box in combination with hay rack sides provided with arms extending downwardly and inwardly to the bottom of the box and adapted to hook into the bottom of the wagon box and over the sides of the box, substantially as described.
4. A wagon box in combination with hay rack sides provided with inner arms dteachably secured to the bottom of the box inside and hooked on to the upper edges of the box sides, and outer arms detachably secured to the inner arms, substantially as described.
5. A hay rack side provided with inner and outer arms, and a socket piece secured to each inner arm into engagement with which the outer arms may be slipped from an outward upper direction, substantially as described.
6. A hay rack side provided with inner and outer arms, the latter notched at their inner ends, and a headed bolt secured to each inner arm and adapted to engage the said notches, substantially as described.
7. In a hay rack side inner arms having their upper sides cut on two different pitches, a headed bolt secured to each inner arm at or below the apex of the two pitches, and outer arms, each slotted to engage the bolt and recessed to receivo the head of the bolt, substantially as described.
8. A wagon box in combination with hay rack sides provided with inner arms suitably secured to the box, outer arms detachably secured at their inner ends to the inner arms and carrying longitudinal slats, rack ends provided with hooks to engage the upper edge of the box enas, a cross bar adapted to rest on the slats of the rack sldes, and latches by means of which the racks may be locked to the box, substantially as described.
9. A wagon box, a tail board having rearwardly facing hooks rigidly secured at one end and simllar hooks at the other end formed on a yoke lever pivoted on the tail board, and slotted plates secured to the sides of th box and with which th hooks may be engaged, substantlally as described.
10. A wagon box provided with sockets on its sides, rack sldes having arms engaged with said sockets, and provided at one end with vertical cleats forming guideways, a holding bar provided with an enlargement or hook at each end passing through apertures in the rack sides and engaging the outer sides of a cleat, and an end adapted to be slipped down between the cleats and hold the said bar in place, substantially as described.

## No. 99,899. Interest-Bearing Instrument of Oblication. $\Delta$ ppareil d calculer l'intóret.

Charles Hall Davis, Petersburg, Virginia, U.S.A., 8rd July, 1906; 6 years. Filed 5th April, 1906. Recelpt No. 134,643. Claim-1. An interest bearing instrument of obligation consisting of a body portion and a plurality of interest coupons, said coupons each provided with like columns of numerals in which may be designated the money value of the coupon at maturity.
2. An interest bearing instrument of obligation consisting of a body portion and a plurality of interest coupons, said coupons each provided with like columns of numerals in which may be designated the money value of the coupons at maturity and indicia associated with said columns of figures Fndicating the meaning or purport thereof.
3. An interest bearing instrument of obligation consisting of a body portion and a plurality of interest coupons, said coupons each provided with like columns of numerals in which may be designated the money value of the coupons at maturity and sald coupons being further provided with columns of figures adapted to be used to designate the face valve of the obligation.
4. An interest bearing instrument of obligation consisting of a body portion and a plurality of interest coupons, said coupons each provided with like columns of numerals in which may be designated the money value of the coupons at maturity and indicia assoclated with said columns of figures indicating the meaning or purport thereof, and said coupon being further provided with columns of figures adapted to be used to designate the face value of the obligation.
5. An interest bearing instrument of obligation consisting of a body portion and a plurality of interest coupons in sheet form, the several coupon sheets being arranged in superposed
-
relation and each coupon provided with like columns of numerals in which may be designated the money value of the coupons at maturity.

6. An interest bearing instrument of obligation consisting of a body portion and a plurality of interest coupons in sheft form, the several coupon sheets being arranged in superposed relation and each coupon provided with like columns of numerals in which may be designated the money value of the coupons at maturity, said coupons also being provided with columns of numerals adapted to be used to designate the face value of the obligation.
No. 99,900. Woll Drill. Fôrets pour puits.
John R. Griffith and Leslie G. Gosper, co-Inventors, both of Independence, Kansas, U.S.A., 3rd July, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,239.
Claim-1. In a well drilling machine a main shaft, a drum upon said shaft extended to form a clutch member, a hub slidable upon and connected for rotation with the shaft and having a clutch member and a sprocket wheel, and a band wheel upon the shaft adapted to receive motion from the source of power.
2. In a well driling machine a driven main shaft, a drum upon said shaft having flanges connected therewith and recesses therein, anti-iriction rollers seated in the recesses, collars upon the shaft to confine the rollers in the recesses, and a bull wheel clamped between one of the flanges and an auxiliary ring.
3. In a well drilling machine a driven main shaft, a drum upon said shaft having flanges connected therewith and recesses.therein, anti-friction rollers seated in the recesses, collars upon the shaft to confine the rollers in the recesses, an auxiliary ring at one end of the drum, a bull wheel clamped between said ring and the proximate flange, a clutch member at one end of the drum, and a hub splined upon the shaft and having a clutch member and a sprocket wheel.
4. In a well drilling machine a main shaft, a band wheel. hub members mounted upon the shaft and clamping the band wheel between them, one of said hub members being composed of segments connected by means of clamping bolts, and a.key or spline cannecting the hub members with the shaft, gald key or spline being clamped upon the shaft by the segments of one of the hub members.
5. In a well drilling machine a main shaft having a bull wheel drum provided with a clutch member, a hub slidable
upon the shaft and having a olutch mamber on the sprocket upon the shaft and having a olutch mamber on the counter-
wheel, a countershaft, a drum loosely engaging the

shaft and having a clutch member, and a clutch slidable upon
countershaft and adapted for engagement with the member on the drum.
6. In a well drilling machine a main shaft having a bull wheel drum provided with a clutch member, a slidable hub spined upon the main shaft and having a clutch member and a sprocket wheel, a countershaft, a sprocket wheel on the countershaft. a link belt connecting the latter with the sprocket wheel of the hub upon the main shaft, a casing line spool upon the countershaft having a clutch member, and a clutch member slidable upon the countershaft between the casing line spool and the sprocket wheel.
7. In a well drilling machine a main shaft, a countershaft, means for transmitting motion to the latter from the main shaft, a casing line spool loosely engaging the countershaft, a spudding crank fixed upon the latter, and a clutch member upon the countershaft adapted for engagement with the casing line spool.
8. In a well drilling machine a main shaft having a band wheel, a sand reel shaft having a friction pulley adapted to engage the band wheel, and a lever affording a bearing for one end of the sand shaft, said lever being longitudinally divided and composed of two suitably connected members and a washer plate intermediate said members.

No. 99,901. Ore Jigger. Tamis d minerais.

Henry Lipson Hancock, Moonta Mines, South Australia, Australia, 3rd July, 1906; 6 years. Filed 29th March, 1906. Recelpt No. 134,414.
Chaim-1. In jigging machinery for dressing ores a device supported upon the ore body and capable of rising and falling with it for the collection and removal from above the moving sleve of any desired grade or strata of material held wholly or partially in suspension in strata according to gravity under the infuence of the pulsating or jlgging motion.
2. In jigging machinery for dressing ores a collector supported upon the ore body and capable of rising and falling With it, having adjusting means so as to receive and draw off from above a moving sleve any desired strata or grade of material which is held wholly or partially in suspension according to its gravity by the pulsating or figging motion, stibstantially as described.
3. In jigging machinery for dressing ores a collector supported upon the ore body and capable of rising and falling upon it, and having one or a series of valves or adjustable mouth pleces for reciving and drawing off from above a moving sleve any desired strata or grade of material held wholly or partially in suspension according to its gravity by the pulsating or jigging motion substantially as described.
4. In jigging machinery for dressing ores, two or more collectors supported upon the ore body and capable of rising and falling with it, and arranged so as to receive and draw off the various strata and grades of material from above a moving sieve by the pulsating or jlgging motion, substantially as described.
5. In jigging machinery for dressing ores, drawing off the slimes and fine sands from the body of material in suspenslon above a moving sieve by a collector supported upon the ore bed and adapted to rise and fall with it and the sieve, substantially as described.
6. In jigging machinery for dressing ores a collector for drawing off the slimes and flne sands from the body or material above the moving sleve or other perforated bed, the said collector being connected with piping passing through the moving sieve and the side of the hutch and having flexible unions so as to rise and fall with the sieve and the material in the sieve, substantially as described.

No. 99,902. Ore Jigger. Tamis d minerais.

Henry Lipson Hancock, Moonta Mines, South Australia, Australia, 3rd July. 1906; 6 years. Filed 2nd April, 1906. Recelpt No. 134,524.
Claim.-1. In jigging machinery providing the screen with a device capable of being ralsed and lowered or otherwise moved so as to regulate the flow of material through the sald screen and to control the discharge of concentrates or middles, substantially as described.
2. In jigging machinery a mechanically operated obstructional device capable of belng raised and lowered or otherwise moved into and out of engagement with openings in the screen, substantially as herein described and for the purpose indicated.
3. In jigging machinery a screen or supplementary perforated device having special openings and a mechanically operated device carrying pieces of material cavable of being ralsed or lowered or otherwise moved to close or partially close, and to regulate the flow of ore stuff through such openlugs, substantially as described.
4. In jlgging machinery a grating having pegs or other projections adapted to be mechanically raised and lowered into and out of engagement with openings in the screen or supplementary perforated device, substantially as herein described and for the purposes indicated.
5. In jigging machinery for dressing ores, apparatus for mechanically raising and lowering an obstructional device into or out of engagement with openings in the screen or supplementary perforated device comprising a screw hand wheel, or other suitable means arranged to operate a rod connect-ir- with hinged arms supporting the obstructional device, substantially as described and for the purposes indicated.
6. In jigging machinery for dressing ores a plate or grating having elongated openings and adapted to slide underneath the screen or supplementary perforated device whereby its openings are obstructed or partly obstructed, substantially as described and for the purposes indicated.
7. In jigging machinery for dressing ores a plece of screen or wire eloth arranged to slide or be mechanically raised upon a hinged joint so as to obstruct or partlally obstruct the flow of material through the screen or supplementary perYorated device, substantially as described and for the purposes indicated.

No. 99,903. Carbureter. Carburateur.

George Henry Holgate, Philadelphia, Pennsylvanla, U.S.A., 3rd July, 1906; 6 years. Filed 17th March, 1906. Recelpt No. 133,990 .
Claim.-1. A carbureter consisting of a font or receptacle, absorbent material contalned within sald receptacle, said absorbent materlal so arranged as to leave a space above and below the same within the receptacle, a stationary tube extending downward through the center of the receptacle open at its upper end and closed at its lower end, a central gas tube arranged within the first-named tube, sald gas tube also closed at its lower end and open at its upper end, means for causing the central gas tube to remain stationary, a middle tube arranged between the two aforesaid tubes, and adapted to revolve around between the same, ports formed through the walls of the two stationary tubes coincldent with one another within the space below the absorbent material, openings formed through the walls of the revolving tube adapted to be brought in and out of register with the ports c: the stationary tube, openings formed through the top of the font, a valve connected to the revolving tube for opening and closing these ports when the tube is revolved, ports for admitting alr through the lower end of the gas tube, means for opening and closing these ports by the revolution of the revolving tube, the bottom of the font provided with an opening for admitting air to the central gas tube, means for closing said opening when the font is to be filled with a liquid, a chimney surrounding the upper end of the gas tube, a burner arranged over the upper end of the tube within the chimney, as and for the purpose specited.
2. In a carbureter for lamps and the like, a font or receptacle, absorbent material contained within said font or receptacle, said absorbent material so arranged within the font as to leave a space above and below the same, a removable top for closing the upper end of the font, a tube open through the top at its upper end extending downward through the absorbent material to a point near the lower end of the font. the lower end of said tube being closed, a gas tube arranged within the other tube, said gas tube extending above the font and open at its upper end, the lower end being closed, means for causing said gas tub to remain stationary, a middle tube arranged between the two other tubes and adapted to revolve in close contact with both of sald tubes, the two stationary tubes provided with ports coincident with one another formed through the walls of the same within the space below the absorbent material, the revolving tubes provided with openings adapted to be brought in and out of register with the ports as the tube is revolved, the top of the font provided with openings, a ring lying flat over said openings, spring arms connecting said ring with the revolving tube so that the ring will be held in spring contact with the tube, said ring provided with openings adapted to be brought $\ln$ and out of register with the openlags through the tube when the tube
is revolved, the lower end of the two stationary tubes being provided with ports formed through the same coincident with one another, the lower end of the revolving tube being provided with openings adapted to be brought in and out of register with said ports when the tube is revolved, means for revolving said tube, the lower end of the font being provided with an opening through which air is admitted to the lower end of the gas tube, a hollow body in which the font is adapted to rest, a valve for controlling the opening through the lower end of the font, means for automatically opening said valve when the font is placed within the body, and means for automatically closing the valve when the font is removed, a chimney arranged around the upper end of the gas tube, and a burner within the chimney arranged above the gas tube, as specified.
3. In a carbureter, a receptacle, absorbent material arranged within the receptacle, said absorbent material formed in the shape of concentric rings nested one inside of the other and spaced a distance apart, means for holding said rings at equal distances apart, a perforated screen arranged within the receptacle a slight distance above the bottom of the same upon which the absorbent rings rest, the absorbent rings extending upward to within a short distance of the top of the receptacle so as to leave a space above the same, means for admitting air to the upper space, means for taking the mixed air and vapour from the lower space, and means for controlling these inlets from the exterior of the receptacle, as specified.

No. 89,904. Card Folder. Porte-carte.

Colin Campbell McPhee, Montreal, Quebec, Canada, 3rd July, 1906; 6 years. Flled 12th May, 1906. Receipt No. 135,835.
Claim.-1. In a magazine card folder the combination with a frame formed with an open face and closed back, of a plurality of leaves superimposed one on the other having the undermost leaf secured to the inner surface of said back, and a slidable cover adapted to turn said leaves over in succession, as-and for the purpose specified.
2. In a device of the class described in combination, a frame having a back formed therewith and an open end, a plurality of leaves having the undermost leaf secured to the back and the other leaves immediately thereabove, a backbone formed by said leaves receding from the lowermost leaf to the uppermost, and means secured to the lowermost leaf for opening said leaves successively at one operation, as and for the purpose specified.
3. In a device of the class described in combination, a frame having a back formed therewith and an open end, a plurality of leaves having the undermost leaves firmly secured to the back within the frame opening and the other leaves receding from that portion of the lowermost leaf to the top leaf and a tail piece joined with the uppermost leaf having an outfold, and a slidable cover dimensioned to fit in said frame and slide between the back and said frame and
having an infold engaging the outfold of said tall piece on the partial withdrawal of said cover, as and for the purpose specified.
4. In a device of the class described in combination, a trame formed with a back plece and having a length of suitable material folded and secured together to form a succession of leaves, said length of material terminating at the uppermost leaf in a tall piece having an outfold, and a cover having an infold at its upper end engaging said outfold on partial withdrawal from the frame, as and for the purpose specifled.
5. In a device of the class described in combination, a length of suitable material arranged in folds, said folds forming two sets of sections of different lengths and alternately arranged, the adjoining sections having their inner surfaces joined together and forming leaves, a suitable backing to which the end section is secured, and means engaging the uppermost section for displaying the pages of said leaves, as and for the purpose specified.

No. 99,905. Chain Securing Device.
Appareil à assujetir des chaines.

Frederick Pikard, Rhinelander, Wisconsin, U.S.A., 3rd July, 1906; 6 years. Filed 11th May, 1906. Receipt No. 135,800. Claim.-1. In a device of the character described the combination with a stationary jaw and means thereon adapted to be engaged by a chain, of a keeper extending from the stationary jaw, a second jaw pivoted to the stationary jaw, and means upon the plvoted jaw for engaging the keeper and locking the jaws.
2. In a device of the character described the combination with a stationary jaw having a keeper at one end and means upon said jaw adapted to be engaged by a chain, of a jaw pivoted to the stationary jaw, and a bolt suitably mounted within the pivoted jaw and adapted to engage the keeper.
3. In a device of the character described the combination with a stationary jaw, a keeper at one end thereof and means extending from the jaw adapted to be engaged by one end of a chain, of a jaw pivoted to the stationary jaw, a bolt slidably mounted therein adapted to engage the keeper, and a stem projecting from the bolt in front of the pivoted jaw.
4. In a device of the character described the combination with a stationary jaw having a keeper at one end and a loop extending from the jaw, of a second jaw pivoted to the stationary jaw, and a bolt slidably mounted within the pivoted Jaw and adapted to engage the keeper.
5. In a device of the character described, the combination with a stationary jaw having a keeper at one end and a loop, of a jaw pivoted to the stationary jaw and having a recess therein, a bolt slidably mounted within the pivoted jaw and extending across the recess and adapted to engage the keeper, and a stem projecting from the bolt and recess.
6. In a device of the character described, the combination with a stationary jaw having a keeper at one end and a loop, of a jaw pivoted to the stationary jaw and having a recess therein, a bolt slidably mounted within the pivoted jaw and extending across the recess and adapted to engage the keep$\in r$, a stem projecting from the bolt and recess, and a ledge within the recess adapted to engage the stem and hold the 'bolt against movement and adapted to support the stem in a raised position.
7. In a device of the character described, the combination with a stationary jaw having a keeper and a loop, of a jaw pivoted to the stationary jaw and having a recess in one face, both jaws having one lace bevelled, a bolt slidably mounted within the pivoted jaw and extending across the recess, said bclt adapted to engage the keeper, and a stem extending from the bolt and recess.

No. 99,906. Wood Distilling Apparatus.
spparell pour la distillation du bois.

George Gilbert Sibbitt, Carleton Place, Ontario, Canada, 3rd July, 1906; 6 years. Filed 20th April, 1906. Recelpt No. 135,123.
Olaim.-1. An improved primary retort for distilling wood tc: produce turpentine comprising a suitable shell, openings therein for the introduction and withdrawal of the wood, a plurality of mixing blades within the shell, means for continuously rotating the same and a plurality of steam injecting nozzles extending through the shell, as and for the purpase specified.
2. An improved primary retort for distllling wood to produce turpentine comprising a suitable shell, an opening at the top thereof for the introduction of the wood, an opening at the bottom for the withdrawal of the same, a plurality of vertically extending shafts within the shell, means for rotating the same, a plurality of mixing blades secured to the shafts and a plurality of steam injecting nozzles extending through the shell, as and for the purpose specified.
3. An improved primary retort for distilling wood to produce turpentine comprising a cylindrical shell, openings therein for the introduction and withdrawal of the wood, a plurality of mixing blades within the shell, means for rotating the same, a plurality of steam injecting nozzles extending through the shell, an incllned conical bottom for the shell, and a tar conducting pipe leading from the center of said battom, as and for the purpose specified.
4. In a wood distilling apparatus the combination with a primary retort comprising a suitable shell having within the same a plurality of mixing blades, and a plurality of steam injecting nozzles, of a valve outlet for the water turrentine and creosote vapours, means for separating and condensing the water turpentine and creosote vapours, a second valved outlet for the tar and tarry vapours and means for c'ndensing and separating the tar and tarry vapours, as and for the purpose specified.
5. In a wood distilling apparatus the combination with the primary retort comprising a sultable shell having therein a plurality of rotating mixing blades and a plurality of steam injecting nozzles, a conical bottom for said shell, an outlet centrally leading therefrom for the tar and tarry vapours and means for separating and condensing the tar and tarry vapours, a valve conducting pipe extending into the side of the retort for the water, turpentine and creosote vapours and means for separating and condensing the water, turpentine and creosote vapours, as and for the purpose specified.

No. 99,907. Mnsic Record. Registre de musique.

James John Walker, London, England, 3rd July, 1906; 6 years. Filed 12th December, 1905. Receipt No. 130,943.
Claim.-1. Apparatus for producing simultaneously, a record of the operations of the controlling members of a musi-
cal instrument, said record being adapted for the purpose of controlling a reproducer, and a companion record of the speed of each of such operations, said companion record being adapted for the purpose of controlling accelerators in the reproducer.
2. Apparatus for producing simultaneously a record of the operations of controlling members of a musical instrument and a companion record of the speed of each of such operations, comprising in combination controlling members, a plurality of recorders for each such member, a plurality of impulse transmitters governing the action of such recorders and means for successively energising such transmitters during one operation of a controlling member.
3. Apparatus for producing simultaneously a record of the operations of controlling members of a musical instrument and a companion record of the speed of each of such operations, comprising in combination a plurality of recorders for each key, a sliding carrier for each recorder, a normally dree reciprocating selector adapted to operatively engage said carrier, and a plurality of impulse transmitters connected with each controlling member for controlling the engagement of said selectors with sald carriers.
4. Apparatus for producing simultaneously a record of the operations of controlling members of a musical instrument and a companion record of the speed of each of such operations, comprising in combination controlling members, a plurality of recorders for each such member, a plurality of impulse transmitters governing the action of such recorders and on each said member a stepwise arrangement of energising devices for the impulse transmitters.
5. Apparatus for producing simultancously a record of the roperations of controlling members of a musical instrument and a companion record of the speed of each of such operat!ons comprising in combination controlling members, a plurality of recorders for each such member, a sliding carrier for each recorder, a normally free reciprocating selector adapted to operatively engage said carrier, a plurality of impulse transmitters governing the engagement of said selectors with said carriers and on each said member a stepwise arrangement of devices for energising said impulse transmitters.
6. Apparatus for producing simultaneously a record of the operations of controlling members of a musical instrument and a companion record of the speed of each of such operations comprising in combination controling members, a plurality of recorders for each such member, a oliding carrier for each recorder, a reciprocating selector adapted to operatively engage said carrier, means for maintaining said selectors normally free of said carriers, means for normally riaintalning said carriers in their lower position, a plurality of impulse transmitters for engaging said selectors with said carriers and on each said member a stepwise arrangement of devices for energising said impulse transmitters.
No. 99,908. Piano. Piano.

Peter Welin New Castle, Indiana, U.S.A., 3rd July, 1906; 6
years. Filed 30th December, 1904. Recelpt No. 121,175.
Claim-1. The automatic piano containing bellows and a storage reservolr located in the panels between the rear posts of the piano frame.
2. An automatic piano having folding pedais comprising pedal links connected to operate the bellows, and a swing-up frame for folding the pedals inside the casing, the pirot of the swing-up frame and the pivots connecting the pedal links having their axis substantially in line when in a position of rest so that the folding of the pedals will not change the reative positions of the frames and the foremost pedal link.
3. An automatic piano having the controlling levers located below the plano keys, and with a fall board which can be folded back to form part of the keyboard rail and conceal the controlling levers when not in use.
4. The combinalion of a piano casing controlling levers for automatic playing attachments with the ends of said levers below and in front of the piano keys, and a fall board or swinging cover for concealing said levers mounted to swing on a pivot located lower than the ends of said levers.
5. The combination of a piano casing controlling levers for automatic playing attachments and a pivoted fall board or rockable member which, when in normal position, conceals the controlling levers and forms part of the ledge or rail which co-operates with the key cover and which when open, forms a ledge or support for the hand of the operator.
6. The combination of a piano casing controlling levers for automatic playing attachments located below the piano keys and having their ends extending forward into a recess or onening in the key rall or ledge of the casing, and a pivoted fall board, which when in normal position conceals the controlling levers and forms part of the ledge or rall which cooperates with the key cover and which, when open, forms a ledge or support for the hand of the operator.
7. In an automatic combination plano, a recessed or hollow key slip composed of an inner member and an outer rockable member, in combination with the key bed, manual keyboard and expression manipulatory devices having their terminals beneath said key sllp.
8. In an automatic combination piano, a recessed or hollow key slip comprising an outer rockable member in combination with the manual keyboard and expression manipulatory devices having their terminals beneath said key slip, sald rockable member being adapted to swing outwardly under said manipulatory devices.
9. An automatic piano having a locking bar for the keys lifted by wedges and connected by a link to a locking lever.
10. An automatic piano having a governor box containing a choked valve, an automatic valve for modulating the action when the choker valve is closed. an automatic governor valve for the motor, a tempo-valve for the motor, a rewinding valve and valves for automatically opening direct connection to the motor and shutting off the action during rewinding.
11. An automatic piano having a pneumatic action in which two striking pneumatics are employed for each note. and means for controlling the action so that a single pneumatic will operate when a note is to be played suftly, and both pneumatics will operate when a note is to be struck more loudly.
12. An automatic piano having a pneumatic action in which two pneumatics are employed for each note, the service pneumatics being controlled by primary valves from a tracker board, and the auxiliary pneumatics being controlled by primary valves from a tracker board, and the auxiliary pneumatics being controlled by switch valves which will admit air from the primary valves to cause both pneumatics to act simultaneously.
13. An automatic piano having a pneumatic action the valves of which each consist of a disc with a stem socket extending down from the under face thereof.
14. An automatic piano having a pivotally mounted motor with connections for disengaging the gearing of the winding roll. tightening the drive chain, throwing in a rewinding connection with the music roll and disengaging the paper tensioning brake when the motor is tipped.

## No. 98,809. Scafiold. Echafaud.

Elljah McCoy and Charles H. H. Wheeler, co-Inventors, both of Detroit, Michigan, U.S.A., 3rd July, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,326.
Claim-1. In a scaffold support the combination with a horizontal supporting member having a hook at one end, of a brace member pivotally attached at one end to the supporting member near its outer end, a connecting member detachably engaging the brace member and connecting said members, and a brace pivotally attached at one end to the supporting member near its inner end and engaging the brace member intermediate its ends.
2. In a scaffold support the combination with a supporting member having a hook at one end, of a brace member pivotally attached at one end to the supporting member near its opvosite end, a connecting member pivotally attached at one end to the supporting member and detachably engaging the brace member at its opposite end, and a brace plvotally attached at one end to the supporting member near the end thereof having the hook and adapted to engage the brace member intermediate the ends thereof, said brace being greater in length than the shortest distance from the pivot of the brace to brace member.
3. In a scaffold support the combination with a supporting member having a hook at one end and a brace member pivotally attached at one end to the supporting member near its opposite end, of a loop pivotally attached at one end to the supporting member near said hook and adapted to receive the brace member at its lower end, a hook on the brace member to engage the loop, and a brace pivotally attached to the
supporting member near its hook and adapted to engage the brace member at its opposite end and force the same into engagement with the loop.

4. In a scaffold support the combination with a supporting member and a hook on said member to engage the inner surface of part of a wall, of a laterally projecting member on said supporting member adjacent to said hook to engage the outer surface of the wall and prevent lateral movement of the support.
5. In a scaffold support the combination with a supporting member and a hook on said member to engage the inner face of part of a wall, of means adjustable toward and from said hook to engage the outer surface of the wall.
6. In a scaffold support the combination with a supporting member and a hook on said member to engage the inner surface of part of a wall, of a foot on said member adjustable toward and from said hook.
7. In a scaffold support the combination with a supporting member and a hook on said member, of an adjustable foot on said member, and means for adjusting and holding the foot.
8. In a scaffold support the combination with a supporting member, a hook on said member, a brace member plvotally attached to said member and a connecting member connecting the said members, of means adjustably supported upon the supporting member adjacent to said hook for engaging the outer surface of a wall, and a brace extending between said means and the brace member to hold said means in contact with the wall.
9. In a scaffold support the combination with a supporting member, a hook on one end of said member, and a brace member pivotally attached at one end to the opposite end of said member, of a connecting member pivotally attached at its upper end to the supporting member and detachably engaging the free end of the brace member at its lower end, an adjustable foot on the supporting member and a brace pivotally attached at one end to said foot and adapted to engage the brace member intermediate the ends thereof at its opposite end.
10. In a scaffold support the combination with a supporting member, a hook on one end of said member, and a brace member pivotally attached at one end to said member near its opposite end, of a loop pivotally attached at one end to the supporting member and through which the free end of the brace member extends, and a hook on the brace member to ongage the loop.
11. In a scaffold support the combination with a supporting member, a hook on one end of said member, and a brace member pivotally attached at one end to said member near its opposite end, of a loop formed of a continuous wire pivotally attached at one end to the supporting member by passing through an eye on said member and adapted to receive the free end of the brace member, a foot adjustable longitudinally on the supporting member toward and from the hook, and a brace pivotally attached at one end to the foot and adapted to extend through the loop to engage the brace member intermediate the ends thereof at its opposite end.
12. In a scaffold support the combination with a supporting member, and a hook on one end of said member, of a brace member pivotally attached to said member at one end, a loop pivotally attached at one end to the supporting member and adapted to recelve the free end of the brace member, and a hook adjustably secured to the brace member to engage the loop.
13. In a scaffold support the combination with a supporting member formed of channel iron, of a hook secured to one end of said member within the channel, a brace member pivotally attached to the supporting member at one end, a connecting member connecting the free end of the brace member with the supporting member, a foot consisting of a sleeve portion slidable on the supporting member and a laterally extending flange on one end of said sleeve, and a brace pivotally attached at one end to the foot and adapted to engage the brace member at its opposite end.
14. In a scaffold support the combination with a supporting member formed of channel iron, of a hook secured to one end of said member within the channel and provided with a spur on its contact face, a casing forming an ear secured within the channel of the supporting member near the opposite end thereof, a brace member formed of channel iron pivotally attached to said ear at one end, a loop pivotally attached at one end to the supporting member, a hook on the brace member to engage the loop, a block in the free end of the channel bar forming the brace member and projecting beyond the end thereof, a foot sleeve on the supporting member and provided with a spur on its contact face, a rod pivotally attached at one end to the foot and having a sharpened end, and teeth on the brace member adapted to be engaged by the sharpened end of the said rod.
15. In a scaffold support the combination with a supporting member formed of channel iron, a hook on said member, a brace member pivotally attached to the supporting member, and a connecting member pivotally attached to the support ing member and engaging the free end of the brace member, of an extension member formed of a channel bar fitting over the supporting member and slidable therein, a loop on said extension member embracing the supporting member, and bolts to secure the adjustable member to the supporting member.

No. 99,910. Gas Combustion Process.
Procédé de combustion du gaz.

Luigi Moreno and Amedeo d'Anthony, co-inventors, both of Turin, Italy, 3rd July, 1906; 6 years. Filed 6th March, 1905. Receipt No. 123,112.

Claim.-A process for obtaining the rapid and complete combustion of any combustible gas which consists in separating the combustive air into its principal components, oxygen and nitrogen, and then separating these two gases by the chemical affinity existing between the oxygen and the combustlble gas, in order to allow the oxygen only to operate the combustion of the combustible gas.

No. 99,911. Lubricator. Graisqcur.

James Archibald Craig, Toronto, and Edward Woolrich Sault Ste. Marie, Canada, assignee of a half interest, 3rd July, 1906; 6 years. Filed 5th January, 1906. Recelpt No. 131,588
Claim.-1. In a lubricator the combination with a bearing, a shaft turning therein and a stationary open casing, supported above said bearing and having an opening in the bottom thereof, of a lining held in sald casing and having an orifice through the bottom thereof, a tube fixedly secured in sald orifice, and a rod extending from the interior of said lining through said tube and abutting said shaft, as and for the purpose speclfied.
2. In a lubricator the combination with a bearing, a shaft turning therein and a stationary open casing, supported above sald bearing and having an opening in the bottom thereof, of a lining held in said casing and formed of a material having less resistance in its heat conductivity than the surrounding material, and an orifice in the bottom thereof, a tube inserted in said orifice, and a rod extending from the interior of said lining through said tube and resting on said shaft and formed of a like material to said lining, as and for the purpose specifled.
3. In a lubricator the combination with a bearing, a shaft turning therein and a stationary open casing, supported above sald bearing and having an opening in the bottom thereof, of a lining held in said casing and formed of a material having less resistance in its heat conductivity than the surrounding material and an orifice in the bottom thereof, a tube fixedly secured in said orifice and having perforations immediately above the bottom of said lining. a false bottom supported above the real bottom of the lining and having a contral orifice, and a rod of like material to sald lining inserted through said tube and false bottom and resting on sald shaft, as and for the purpose specified.
4. In a lubricator the combination with a bearing, a shaft turning therein. and a stationary open casing supported above sald bearing and having an opening in the bottom thereof, of a lining held in said casing and having an orifice through the bottom thereof, a tube having bevelled upper edges fixedly secured in said orifice and perforations above said bottom, a false bottom having a central orifice and supported on downwardly extending flanges on sald real bottom, and a rod having a spread portion intermediate of its length and oxtending from the interior of said lining through said tube and resting on said shaft, as and for the purpose specifled.
5. In a lubricator the combination with a bearing, a shaft turning therein, and a stationary open casing supported above said bearing and having an opening in the bottom thereof, of a lining held in said casing and having a central orifice through the bottom thereof, a tube having bevelled upper edges and fixedly secured in said orifice and perforations above the bottom of said lining. a packing of a resilient material surrounding said lining and abutting the top of said casing and extending downwardly therearound, and a metal covering protecting sald packing, a false bottom supported on downwardly extending flanges therefrom on said real bottom and having a central orifice immediately over said tube, and a rod extending from the interior of said lining through said tube and resting on sald shaft and having a spread portion above said tube, as and for the purpose specified.
6. In a device of the class described in comblnation, a motor, a casing therefor having reduced extending portions at each end thercof and openings through the top of said extending portions, bushings Inserted in said extending portions having openings registering with the aforesald openings and forming bearings for the motor shaft, stationary
open casings forming part with said opening portions and projecting vertically immediately over sald openings, linings to said open casings and formed of a metal having less resistance in its heat conductivity than said casings and having an orifice in the bottom thereof, a tube fixedly secured in each of sald orifices having perforations therethrough immediately above the bottom of the lining, a false bottom in each of sald linings having central orifices and supported by downwardly extending flanges on the real bottom and dividing said oil receptacle into upper and lower chambers respectívely, said lower chambers containing hard grease and said upper chambers a lubricating oil, a packing surrounding each of said oil receptacles and abutting the top of said casings, and a rod like material to said lining extending from the interior through said tube and resting on the motor shaft, as and for the purpose specifled.
7. In a device of the class described in combination, a motor suitably encased, a lining held in a receptacle in the casing of said motor above the bearing and formed of metal having greater heat conducting properties than the surrounding metal and in the interior thereof divided into two compartments and having an orifice in the bottom thereof communicating with the journal, a tube formed of a like material to said lining fixedly secured in said orifice having perforations immediately above the bottom of the lining and forming the means of communication between the upder chamber through said tube and resting on said shaft and formed of a material having the same properties as the metal of said lining, as and for the purpose specified.
8. In a lubricator for a motor bearing the combination with a flxed and open casing secured over said bearing and communicating therewith, of a metal lining to said casing having an orifice through the bottom thereof, a false bottom supported above said real bottom and having a central orifice, a perforated tube fixedly secured in the orifice through said lining and extending upwardly through the orifice in said false bottom, and a rod of lesser diameter than said tube extending therethrough and resting lightly on a shaft and having a spread portion above sald tube, as and for the purpose specified.
9. In a lubricator for a motor bearing the combination with a fixed and open casing secured over said bearing and communicating therewith, of a metal lining to said casing having an orifice through the bottom thereof, a partition forming : false bottom and dividing the chamber contained in said lining into upper and lower compartments, said upper compartment containing oil and said lower compartment containing hard grease and having an orifice in alignment and corresponding with the aforesaid orifice, a perforated tube fixedly secured extending through said partition, lining bottom and hard grease, and a rod having a spread portion above a partition and extending through to the shaft and resting lightly thereon and formed of lesser dlameter than sald tube to permit the free passage of oil therethrough, as and for the purpose specifled.
10. In a lubricator for a motor bearing, the combination with a fixed and open casing secured over said bearing and communicating therewith, of a metal lining to said casing having an orifice through the bottom thereof, a partition having a central orifice and downwardly extending flanges supporting said partition from the bottom of said lining, said partition dividing the interior contained within said metal lining into a lower compartment for hard grease and an upper compartment for oil, a perforated tube fixediy secured and extending through sald partition, hard grease and lining bottom and a rod of lesser diameter than said tube to permit the flow of oil around the rod and through the tube and resting lightly on a shaft, as and for the purpose specified.

No. 89,912. Starting Gate. Barrierc.

John M. Flynn and Thomas Garety, assignee of a half interest, both of New York City, New York, 3rd July, 1306; 6 years. Filed 10 th May, 1906. Receipt No 135,785 .
Claim-1. In a starting gate, guide rods arranged at an upward incline, longitudinal wires along which said guide rods
are movable, elastic devices for causing the movements of the rods along said wires, a barrier movable along the rods and means for moving the barrier upward after its movement lengthwise of the wires.
2. In a starting gate, guide rods, wires along which said guide rods are movable, elastic devices for causing such movements along the wires, runners mounted to move on the guide rods, flexible devices for causing the upward movement of the runners at the end of the movement of the rods along the wires, and a barrier having connection with the runners.
3. A starting gate comprising upright guide rods, longitudinal wires along which the upper portions of said guide rods are movable, longitudinal wires along which the lower portions of the rods are movable. runners movable on the gulde rods, pulleys at the upper ends of the guide rods, elastic devices having connection at one end with the guide rods and passing over said pulleys and connecting at the opposite end with the runners and a barrier having connection with said runners.
4. A starting gate comprising upright guide rods, runners movable on said rods, buffers at the upper portions of the rods against which said runners may strike, pulleys at the upper ends of the guide rods, elastic devices connected at one end to the guide rods and passing over sald pulleys and carried by said runners, the connection between the barrier connecting at the other end with sald runners, and a barrier carried by said runners, the connection between the barrier and one of the runners being elastic.
5. In a starting gate, upper wires arranged along a track at oposite sides thereof, lower wires extended along the opposite sides of the track, guide rods, rollers at the upper ends of said guide rods engaging on the upper sides of the upper wires, rollers at the upper ends of the guide rods for engaing at the outer sides of the wires, rollers at the lower erds of the guide rods for engaging with the outer sides of the lower wires, and a barrier movable along said guide rods.
6. A starting gate comprising upper wires extended along a race track at opposite sides, lower wires extended along the track at opposite sides, guide rods, rollers on the upper ends of said rods for engaging with the upper wires, rollers a) the lower portions of the rods for engaging with the lower wires, runners movable on sald rods, elastic devices for moving said runners upward, and a barrier having connection with the runners.
7. A starting gate comprising guide rods arranged at opposite sides of a race track, runners movable along said guide rods, means for moving the runners upward on the rods. yckes atached to the runners, a roller mounted on one of the yokes, hooks on said yoke having a roller, a barrier having one end extended around said roller. an elastic connection between said hooks and the barrier, and a fold in said barrier, another elastic conncetion engaging in said fold, and also connecting at the ends with the barrier, and cords connecting the opposite end of the barrier with the opposite yoke, the said cords having less strength than the elastic connections.
8. A starting gate comprising guide rods, upper wires arranged along a race track at opposite sides, lower wires arranged at opposite sides of the track. rollers carried by said gulde rods and engaging with the wires, elastic devices for moving the guide rods lengthwise of the wires, means for regulating the speed of movement along the wires, and a barrler movable on said guide rod.
9. A starting gate comprising guide rods, upper and lower wires extended along opposite sides of a race track and on which said guide rods are movable, posts supporting the wires at the ingress end, posts supporting the wires at the egress end, pulleys on said last-named posts, elastic tubes having conection with said guide rods, passing around said pulleys and having their opposite ends anchored at the ingress end of the device, a barrier movable on said rods, and elastic devices for causing the upward movements of the barrier.
10. A starting gate comprising upper and lower wires arranged along the opposite sides of a race track, guide rods, pulleys at the upper ends of sald guide rods engaging with the upper sides of the upper wires, pulleys at the lower ends of the rods for engaging with the lower wires, rollers at the upper ends of the rods for engaging against the outer sides of the wires, rollers movable on the guide rods, pulleys at the upper ends of the guide rods, pulleys at the lower ends of the gulde rods, runners on the guide rods, a cable having connection with said runners and passing around said upper and lower pulleys, means for moving the guide rods lengthWise of the wires, a barrier movable with said runners, and means for causing the vertical movements of said barrier.
11. In a starting gate, upper and lower wires extended along opposite sides of a race track, guide rods, pulleys at the upper ends of the guide rods for engaging with the upper wires, pulleys at the lower ends of the gulde rods for engaging with the lower ends of the wires. other pulleys adjacent
to said upper pulleys, a cable having connection with the guide rods and extending over gaid other pulleys, the said cable having a flexible portion, pulleys on said cable, runners movable on the guide rods, cords having connection with said runners and passing over the pulleys supported by said cable, and a barrier connected to the runners and with which said cords engage.
12. In a starting gate, upper and lower wires extended along a race track and above the same at opposite sides, guide rods movable along sald wires, means for causing said movement along the wires, runners movable on the rods, electrioally controlled locking devices for holding the runners in lowered position, elastc devices for moving the runners upward on the rods, and a barrier carried by said runners.
13. In a starting gate, guide rods arranged at opposite sides of the track, runners movable on said rods, a barrier connecting with the runners, pulleys at the upper ends of the rods, tubular elastic devices connecting at one end with the rods passing over said pulleys and engaging at the other end with the runners, and electrically controlled locking devices for holding the runners in lowermost position.
14. In a starting gate, upper and lower wires arranged along a track at opposite sides, guide rods movable along said wires, elastic devices for moving said rods in one direction, a barrier carried by the rods and movable vertically thereon, a winding drum, and cable connections between sald winding drum, and the rods whereby the rods and barrier may be returned to initial position.
15. In a starting gate, upper and lower wires extended along a track at opposite sides, gulde rods movable along said wires, a barrier carried by the rods and movable along the same, elastic devices for moving the rods toward the egress end, a winding drum, cable connections between said drum and rods, a brake wheel having driving connection with said drum, and a brake shoe for engaging with said brake wheel.
16. In a starting gate, a irame for the gate, comprising opposite posts at the ingress end, opposite posts at the egress end, wires connecting with the upper ends of the posts of a side, wires connecting with the lower portions of eaid pests, guide rods movable along said wires, rollers on the posts at the egress end, rubber tubes passing around sald rollers and engaging at one end with the guide rods, the other ends being anchored near the ingress posts, a barrier movable along the guide rods, elastic tubes for moving the barrier upward, means for moving the guide rods toward the ingress posts, longitudinally controlled locking devices for bolding the barrier in lowered position, and a gong arranged is the electric circuit to be sounded upon the releasing of the barrier.
17. In a starting gate, barrier carrying guides, horizontal wires along which said guides are movable, and elastic devices for moving sald guides in one direction along the wires.
18. In a starting gate, guide rods, horizontal wires along which sald rods are movable, elastic devices for moving the rods along the wires, a barrier movable along the rods, and rueans for moving the barrier upward after its movement along the wires.
19. In a starting gate, opposite supports, a barrier having a fold, an elastic connection between the folded portion and the barrier, and connections between said barrier and the supports.
20. In a starting gate, opposite supports, a barrier having a fold, an elastic connection between said fold and the barrier, an elastic connection between the barrier and one of said supports, and a connection between the barrier and the other of said supports.

No. 99,913. Drawer 8top. Arrête-tiroir.

Herman Henry Borgerding, assignee of William Louis Tuell. both of New Albany, Indiana. U.S.A., 3rd July, 1906; 6 years. Filed 26th February, 1906. Receipt No. 133,351.
Olaim. -The hereindescribed drawer stop comprising a flattened body, relatively thin in one dimension and relatively broad in another dimension, said body being formed with an entering point to be driven into a drawer irame, and a head
at the outer end of said point, said head being broader than the said point and having laterally curved wings projecting beyond and overhanging the edges of the shank or point, said wings being notched in the edges thereof which are contiguous to those of the point or shank.

## No. 99,914. Screwing Die and Tap Spindle.

Disque d̀ vis.

Edward Duncan Cleghorn, Henry Jacob Smith and Charles George Smith, all of England, each an assignee of a third interest, 3rd July, 1906; 6 years. Filed 29th January, 1906. Receipt No. 132,396.
Claim.-1. In a screwing and tapping device, a slidable body, a tool spindle and a sleeve around it rotatable in the said body, a double clutch sleeve and a single clutch sleeve, the former being slidably secured and the latter gartered to the said spindle to rotate with the sleeve in the said body and impart rotary motion to the sald spindle when the sald double sleeve is in engagement therewith, all combined substantially as and for the purpose set forth.
2. In a screwing and tapping device, a slidable body. a tool spindle and a sleeve around it rotatable in the said body, means for kicking the said spindle in the said sleeve in advance of the movement of the sald body to the end of the work and imparting a slight push thereto while making the first thread and means for returning the said spindle to its normal position in the sald sleeve when having left the work, all combined substantially as and for the purpose set forth.
3. In a screwing and tapping device, a slidable body, a tool spindle and a sleeve around it rotatable in and a lever fulcrumed to the said body, one end of which engages the rear end of the said spindle, means for locking the said lever and thereby the said spindle in its back position, and a cam dog to act upon the other end of the said lever and thereby push lorward and a spring for the return of the said spindle, all combined substantially as and for the purpose set forth.
4. In a screwing and tapping device, a slidable body, a tool spindle and a sleeve around it rotatable in the said body, a single clutch sleeve and a double clutch sleeve, the latter being gartered to the said spindle and rotated by the sleeve in the said body, a rod slidable in the said spindle to which the said double clutch sleeve is secured, a rotary stationary clutch sleeve around the said spindle and means for imparting an intermittent reciprocatory longitudinal movement to the sald rod and thereby bring the said double clutch sleeve alternately in and out of engagement with the said rotary and the said rotary stationary clutch sleeve, all combined substantially as and for the purpose set forth.
5. In a screwing and tapping device, a slidable body, a tool spindle mounted therein and moving longitudinally therewith, a double clutch sleeve slidable on and a rod slidable in the said spindle the forward end of which is connected with the said sleeve and the rear end extending through the sald spindle, a trip cone and two adjustable nuts on the latter, a fixed abutment with which the said nuts contact alternately, and trip bolts in the rear end of the said spindle to operate in conjunction with the said trip cone, all substantially as and for the purpose set forth.
No. 99,915. Bed Spring Tightener.
Tendeur pour sommier élastique.
Albert L. Barnum, Pineridge, South Dakota, and Bruce H.
Hewitt and Frank M. Hewitt, asignees of a half Interest.
both of Gordon, Nebraska, U.S.A., 3rd July, 1906; 6 years. Flled 1st May, 1906. Recelpt No. 135,428.
Claim.-1. A bed spring tightener comprising a stationary member provided with a series of chambers or pockets, a series of rolls adapted to turn upon sald statlonary member. and dogs disposed in said pockets and adapted to engage the rolls to hold the same from retrograde rotation, sald dogs being adapted to tilt to permit the rolls to be turned in one direction for tightening a spring.
2. A bed spring tightener comprising a stationary member composed of a bar provided with means of attachment to the

side rails of a spring frame and having a series of pockets, a series of rolls mounted to turn upon said bar, discs or heads mounted upon the ends of the bars and closing the outer ends of the outer rolls, and dogs in said pockets to engage and hold the rolls from retrograde rotation, sald dogs being adapted to tilt to permit adjustment of said rolls in one direction, whereby the rolls may be independently adjusted to tighten the spring.
3. A bed spring tightener comprising a stationary member provided with a pocket having walls arranged approximately at right angles to each other, a roll adapted to turn upon the stationary member, and a segmental dog disposed loosely in said pocket, said tog having a straight bearing edge adapted to rest against one of said walls, a rocking edge adapted to rest upon the other wall, and an abutting tooth to engage and hold the roll from retrograde movement, the construction being such that when the roll is turned forwardly the dog will tilt upon its rocking edge to accommodate such movement and adapt the roll to be turned forwardly to the desired extent, whereby upon a prescribed retrograde movement of the roll the dog will swing back to locking position to hold the roll from further retrograde movement.
4. A bed spring tightener comprising a stationary member provided with a series of chambers or pockets, a series of rolls adapted to turn upon sald stationary member, each of said pockets having walls arranged substantially at right angles to each other, and segmental dogs loosely disposed in said pockets, each of said dogs having a bearing edge to engage one of the walls, a fulcrum edge to tilt upon the other wall, and an abutting tooth to engage the roll, whereby when the roll is turned forwardly the dog will tilt upon its fulcrum edge to accommodate such movement and permit the roll to be adjusted as desired, and upon the prescribed retrograde movement of the roll the dog will swing back to locking position to hold the dog from further retrograde movement.

No. 99,916. Column. Colonne.

The American Column Company, assignee of Frederick P. Angell, all of Battle Creek, Michigan, U.S.A., 3rd July, 1906: 6 years. Filed , 9 th December, 1905. Receipt No. 130,811
Claim.-1. In a tubular column the assemblage of staves joined together at their edges and metallic staples overlapping the adjoined edges of said staves and driven within the same from the interior of the column to secure said staves together.
2. In a tubular column the assemblage of staves joined together at their edges and metallic staples overlapping the adjolned edges of said staves, said staves having double oppo-
itely disposed barbs at either end thereof driven within sald column from the interior thereof in such a manner that said barbs will diverge when driven, and bind the edges of said staves together.
3. In a tubular column the assemblage of staves having oppositely disposed holes formed within their edges and dowel pins inserted within said holes and adapted to connect said staves together, and metallic staples overlapping the adjoined edges of said staves and driven within the same from the interior oi the column to secure said staves together.
4. In a tubular column the assemblage of staves joined together at their edges, and a metallic strip having barbed points adapted to overlap the adjoined edges of the staves and driven within the same from the interior of the column to secure the same together.

No. 99,917. School Desk. Pupitre d'école.

James B. Wall, assignee of Thomas H. Wall, assignee of William H. Stockman, all of Buffalo, New York, U.S.A., 3rd July, 1906; 6 years. Filed 12th April, 1906. Receipt No. 134,863.
Claim.-1. A desk having side standards provided with elevated portions at their inner ends extending above the plane of the upper edges of said standards and having upward and forwardly curved slots opening at the upper edges of said standards, said elevated portions having lateral flanges and a dovetail portion above said flanges. a ledge provided with dovetail grooves to fit the dovetailed portions of said elevated portions and overhanging said elevated portions to lie above the open ends of said slots, and a slidable top having a flexible portion extending into said slots.
2. A desk having standards provided with upwardly and forwardly curved slots opening at the upper ends thereof, a wooden slidable top having a rigid front portion and a flexible rear portion, said flexible portion only being adapted to enter said slots, said top having a groove near each side extending through said entire flexible portion and through said rigid portion to a point near the front edge thereof, each of said grooves having one wall of that part formed in the rigid portion of said top formed of metal, the cop of the standards fitting into said grooves.
3. A desk having standards provided with Inwardly directed flanges at their upper ends and having rearwardly and downwardly curved guide slots at their rear ends, a slidable top lying on said standards and comprising a rigid front portion and a flexible rear portion, said flexible portion only being adapted to enter said guide slots, said top being provided on its underside with guide grooves, and metal strips on the rigid portion of the top only and extending into said grooves and lying underneath the inwardly directed flanges on the standards.
4. A desk having side standards provided with inwardly and outwardly directed flanges near the upper edges thereof and with inwardly directed flanges at said edges, and a slidable top supported on the first-mentioned flanges and having guide grooves on its underside, and metal strips extending into said grooves and lying underneath the second-mentioned flanges.

No. 99,918. Garment Support. Support de vêtement.
Charles Chrysler, Los Angeles, California, U.S.A., 10th July, 1906; 6 years. Filed 14th May, 1906. Receipt No. 135,913.
Claim.-1. A garment supporting device comprising a waist band, one or more waist retaining plates provided with slots by which they are secured on said band and formed between said slots with inwardly extending spurs, and a skirt and belt retainer also provided with slots by which it is mounted on the waist band, said skirt and belt retainer consisting of a plate provided between its slots with a bulged portion formed with spurs at its apex and said plate also having at its upper edge a downwardly facing hook having outwardly facing spurs on its bill portion.
2. In a garment supporter a plate provided with vertical slots and between said slots with a bulge or protuberance

portion having punched out spurs at its apex, said plate being also provided at its upper edge with a downwardly facing hook having outwardly facing punched out spurs on its bill portion, as and for the purpose set forth.

No. 99,919. Box. Boite.

Joseph L. Ware and Z. Roberts, assignee of a half interest, both of St. Paul, Minnesota, U.S.A., 10th July, 1906; 6 years. Filed 13th June, 1906. Receipt No. 136.832.
Claim.-1. A box blank comprising parallel wooden strips fording when cut to the desired length, the top and bottom rails of the box, each of said strips being provided with a diagonal slot extending throughout its length upon its inner side, and a sheet or panel of flexible material having its longitudinal edges secured in said slots and flush substantially with the inner surfaces of said strips, substantially as described.
2. A box blank comprising wooden strips of sultable length to form, when cut, the top and bottom rails of the box, each of said strips having a diagonal slot extending longitudinally in its inner surface, a continuous sheet or panel of flexible material having its longitudinal edges arranged in said slots, substantially as described.
3. A knock down box comprising wooden strips forming the top and bottom rails of the box, each of said strips being provided upon its inner surface with a diagonal slot extending throughout the length of said strip, a continuous sheet or panel of flexible material having its longitudinal edges secured in said slots and bent or folded at right angles to form the corners of the box, and posts fitting the spaces between the contiguous ends of the top and bottom rails at the corner, substantially as described.
4. A knock down box comprising top and bottom rails, each having a slot extending longitudinally therein and a continuous flexible sheet or panel having its longitudinal edges secured in said slots and its inner surfaces flush substantially with the corresponding surfaces of said ralls, said panel being bent to form the corners of the box, posts fitting into the spaces between the ends of the side and end ralls and bearing on said panel corners, and supporting strips secured to said corner posts between the top and bottom rails, substantially as described.
5. A knock down box comprising side and end rails for the top and bottom of the box, each having longitudinal slots thereln, a continuous flexible sheet or panel having its longitudinal edges secured in sald slots, posts fitting into the slots between the contiguous ends of the side and end rails, and metallic straps securing sald posts to said ralls, substantially as described.
$7-7$
6. A box blank comprising wooden strips of suitable length to form, when cut, the top and bottom ralls of the box, each of said strips having a diagonal slot extending longitudinally in its inner surface, and a continuous sheet or panel of flexible material having its longitudinal edges arranged in said slots and clamped therein, substantially as described.
No. 99,920. Metal Hoop. Cerceau en métal.

James E. Wright and John M. Kelton, assignee of a half interest, both of Bay City. Michigan, U.S.A., 10th July, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136.921.
Claim.-1. As an article of manufacture, a hoop comprising a flat body portion, the entire inner tranverse periphery of which engages the receptacle to which it is applied, and an aproximately semi-cylindrical bead formed on the upper edge of the body portion to afford a broad, hollow, driving edge, the bead extending outwardly away from the body portion, thence downwardly and thence inwardly in an approximately straight line toward the body portion constituting a hollow unreinforced arch, the inwardly extending end of the arch abutting directly against the outer periphery of the body portion at substantially right angles thereto to brace the arch and resist distortion by the impact of the driving means.
2. As an article of manufacture, a hoop comprising a flat body portion, the entire inner traisverse periphery of which engages the receptacle to which it is applied, and an approximately semi-cylindrical, hollow, unreinforced bead extending along the upper edge of this body portion and of a predetermined conformation to resist breaking down under the impact of a driving means, the free lower edge of the bead against the body portion at such an angle as to prevent its slipping.
3. The combination with a metallic hoop, of a hollow unreirforced, rigid bead constituting a driving edge for the hoop, the bead being approximately semi-cylinder, the free edge of the bead extending in a straight line toward and abutting the outer face of the hoop at substantially right angles thereto to prevent a slipping or a distortion of the bead.
No. 99,921. Plough and Harrow. Charrue et herse.

Fidouard Marie Quellennec, and Edmond Nicolas Vermond, as signee of a half interest, both of Paris. France, 10th July. 1906; 6 years. Filed 9th June, 1906. Rereipt No. 136,728.
Claim.-1. A rotary automobile ploughing and harrowing inachine constituted by a frame on four wheels at the rear of which there is flxed by the Intermediary of a jib or otherwise. 'o plcking or shovelling tool formed by a certaln number of discs each of which is provided with several picks, shovels or

Digitized by $-\bigcirc \bigcirc$ ?
cutting elements, and mounted upon the same horizontal shaft perpendicular to the direction of translation of the frame, and which receives its rotary movement from a motor of any appropriate kind placed upon the frame, the said machine likewise comprising a cleaning device formed by a row of knives interposed between the different discs of the rotary tool, and likewise a rake arranged at the rear.
2. The special arrangement of the cutting tool which may be employed alone, or in combination with the picks and shovels in order to ensure the digging, breaking up, harrowing and raking of land of any kind and in any condition.

No. 99,922. Side Wall Register. Registre pour murs.

The McClary Manufacturing Company, assignee of Marco $F$. Irwin, all of London, Ontario, Canada, 10th July, 1906; 6 years. Filed 16th June, 1906. Receipt No. 136,960.
Clain.-1. In a device of the class described the combination with a wall plate in which an opening is formed, of a hot air duct or tube, substantially as described and for the purpose specified.
2. In a device of the class described the combination of a wall plate in which an opening is formed, with a register face in which an opening if formed and means for permitting or preventing egress through said openings, substantially as described and for the purpose specified.
3. In a device of the class described the combination with a wall plate in which an opening is formed, of a register face in which an opening is formed, a valve plate secured to said register face and means for operating said valve plate to permit or prevent egress through said openings, substantiall: as described and for the purpose specified.
4. In a device of the class described a register face in which an opening is formed, and a valve plate pivotally secured to said register face, and adapted to permit or prevent egress through said opening, in combination with a lever pirotally mounted on said register face, and a coupling connected at one end to sald valve plate and at the other end to cne end of said lever, substantially as described and for the purpose specified.
5. In a device of the class described a wall plate in which an opening is formed, a register face in which an opening is formed, a register face in which an opening is formed, and a valve plate pivotally secured to said register face, and adapted to permit or prevent egress through said openings in combination with a lever mounted on said register face, a hook secured to said valve plate, and a coupling link connected at one end of said hook and at the other end to said lever, substantially as described and for the purpose specified.

No. 89,923. Car Coupler. Attelage de chars.

Joseph William Robertson and John A. Gun, assignee or a half interest, both of Hot Springs, Virginia, U.S.A., 10th July, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,020.
Claim.-1. In a car coupling the combination of a knuckle provided with a vertical aperture to receive a pivot therefor, a detachable wear plate applied to the working face of said knuckle and an extension projecting from said wear plate and having an aperture through which the pivot of the knuckle may pass.
2. In a car coupling the combination of a pivoted knuckle provided with a dovetailed seat in its working face, a wear plate arranged in said seat. lugs projecting from the knuckle to prevent downward vertical displacement of said wear plate, and an extension projecting from the wear plate and provided with an opening to recelve the pivot of the knuckle.

No. 99,924. Railway Freight Car.
Char d̀ marchandises.

William Redford Mulock, Winnlpeg, Manitoba, Canada, 10th July, 1906; 6 years. Filed 11th'June, 1906. Receipt No. 136,777.
Claim.- 1 . A railway freight car provided with a skeleton bottom with a series of hoppers beneath said bottom and with a removable floor formed of interchangeable sections substantially equal in length to the distance between the car walls.
2. A rallway fright car comprising a skeleton bottom, a flicoring formed of removable sections and a plurality of conoidal hoppers located beneath the floor line of the car, the sloping side walls of said hoppers extending substantially to the side walls of the car body.
3. A rallway freight car provided with a skeleton bottom, with a floor formed of separate interchangeable sections substantially equal in length to the distance between the car walls and with a pluraity of conoidal hoppers located below the floor line of the car, said hoppers having their sloping side walls extending substantially to the line of the side walls of the car body, and the end hoppers having their sloping end walls extending substantially to the end walls of the car body.
4. A railway freight car provided with a skeleton bottom formed of narrow, longitudinal and transverse metal bars, a plurality of conoidal hoppers located beneath said skeleton tottom, the sloping walls of adjacent hoppers being secured to transverse bars of the skeleton bottom and the sloping side walls of said hoppers extending substantially to the side walls of the car body.
5. A railway freight car having its lower portion formed of side and end sllls of angle bars and having a skeleton bottom comprising longitudinal and transverse bars united to sald side and end sills, and having a plurality of conoidal hoppers located beneath said skeleton bottom, the side walls of sai: 1 hoppers being united to the side sills, and a removable flooring formed of detachable sections adapted to rest upon said skeleton bottom.
6. A rallway frelght car having a bottom portion formed of side and end sills and having a skeleton bottom formed of longitudinal and transverse metal bars riveted to said side and end sills, a removable floor formed of detachable sections adanted to rest upon said skeleton bottom, and a plurality of hoppers located entirely beneath said removable floor, the side walls of said hoppers being secured to the side sills of the car bottom and the end walls of sald hopper being secured to the transverse bars of sald skeleton bottom.
7. A railway freight car comprising a skeleton bottom and a floor formed of removable sections adapted to extend transversely of the car and substantially equal in length to the distance between the car walls, the body of the car bein ${ }_{F}$ formed with a doorway and with vertical battens at the sides of said door way, the battens being separated a distance substantially equal to the length of the removable floor sections, whereby one of said floor sections will be set between said battens to serve as a door.
8. A railway frelght car comprising a skeleton bottom, a plurality of conoidal hoppers located beneath the floor line of the car of said hopper being provided at its discharge opening with a slideway, individual gates for closing the hopper bottoms, sald gates fitting in sald slideways, and an operating rod whereby said gates be shifted simultaneonsly.
9. A railway freight car comprising a skeleton bottom, a plurality of conical hoppers located beneath the floor line of the car, each of said hoppers being provided at its discharge opening with a slideway, individual gates for closing the hopper bottoms, sald gates fitting in said slideways, a supporting bracket extending beneath and across each of said hopper bottoms, and an operating rod connected to sald several gates.
10. A railway freight car comprising a skeleton bottom, a plurallty of conical hoppers located beneath the floor line of the car, each of said hoppers being provided at its discharge opening with a slideway, said gates fitting in said slideways and being provided with angular flanges at their front ends to close said slideways.
11. A railway freight car having a plurality of hoppers located beneath the floor line, each of said hoppers being provided at its discharge opening with a sideway, individual gates arranged within said slideways, a common operating rod for said gates and yielding or spring connections between sald gates and said operating rod.
12. A rallway freight car comprising a skeleton bottom, a plurality of hoppers located beneath the floor of the car, gates for closing the lower ends of sald hoppers, a removable floor comprising a number of sections arranged to be supported upon said skeleton bottom and means for jamming said floor sections together.
13. A railway freight car comprising a skeleton bottom, a plurality of hoppers located beneath the floor line of the car, gates for closing the lower ends of sald hoppers, a removable floor comprising a number of sections arranged to be suppcrted upon said skeleton bottom, a movable cross bar at one end of the car for forcing the floor sections together, screws for operating said cross bar and common actuating means for sald screws.

No. 99,925. Car Underframe. Chîssis dc chars.

Anton Becker, Columbus, Ohlo, U.S.A., 10th July, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,898.
Claim.-1. In a car, an underframe composed of a plurality of sills extending lengthwise of the car, a central girder of greater height than the sills, having part of its height extending above the bottoms of the sills and part of its height extending below the bottoms of said sills, a plurality of
cross bearers composed of separate top and bottom plates with intermediate fillers extending cross wise of the car, the top plates of the cross bearings being adjacent to the bottoms of the sills and extending acros the car through slots cut in the central girder, the bottom plates of the cross bearings extending across the bottom of the girder and the fillers being located at each side of the girder between the top and bottom plates, and means engaging the sills and the bottom plates of the cross bearers for securing the whole together.
2. In a car an underframe composed of a plurality of sills extending lengthwise of the car, a central girder of greater height than the sills, having part of its helght extending above the bottoms of the sills and part of its height extending below the bottoms of said sills, a plurality of cross bearers composed of top and hottom plates extending from side to side of the car and triangular fllers between sald top and bottom plates, the top plates of said cross bearers belng adjacent to the bottoms of the sills and extending across the car through slots cut in the central girder and the bottom plates of the cross bearers extending across the bottom of the girders and a plurality of bolts extending through said sills, top and bottom plates and fllers of the cross bearers to secure the whole together, substantially as described.
3. In a car an underframe composed of a plurality of sllls extending lengthwise of the car intermediate between two side sills of greater depth than said first-mentioned sills also extending lengthwise of the car, a central girder of greater height than said intermediate sills having part of its height extending above the bottoms of the sills and part of its height extending below the bottoms of sald sills, a plurality of cross bearers composed of top plates extending across the car adjacent to the bottoms of the intermediate sills, triangular fillers below said top plate as described, and a bottom plate extending crosswise of the car across the bottom of said central girder and along the bottoms of said fillers, means upon the ends of said cross bearers for securing them to the side sills and a plurality of bolts through said first-mentioned sills the top and bottom plates and fllers of sald cross bearers whereby the whole may be detachably secured together as deacribed.
4. In a car the combination of a central plate girder having an inverted $U$-shaped notch 41 extending upward from the bottom of said girder, sald notch being of the same depth as the height of the bolster which is to be inserted therein, a reinforcing plate or plates 43 secured to sald girder adjacent to said notch, a bolster inserted crosswise of the car in said U-shaped notch and unsecured to sald girder, and a flat plate extending along the bottom of said girder secured to the girder proper and to said bolster.
5. In a car the combination of a longitudinal girder made of metal plates or channel irons, a shelf on the side of said girder formed by slitting down a portion of the plate and bending the slitted portion to a position at right angles to the plane of the main plate or channel, and an end sill mounted crosswise of the girder on said shelf and secured thereto.

No. 89,826. Tie Plate. Plaque pour dormants.

George Washington Dennis, Chicago, Illinois, U.S.A., 10th July, 1906; 6 years. Filed 4th June, 1906. Recelpt No. 136,534.
Clatm.-1. In a device of the class described a plate adaptci to project at each end beyond a rail and upwardly and inwardly directed brace laterally offset from one end thereof and adapted to extend beneath the spike head.
2. In a tie plate the combination with a wear plate having a laterally directed web thereon, of a brace extending upwardly and Inwardly from said web and adapted to extend at its lower end beneath the spike head.
3. In a device of the class described the combination with a wear plate of a laterally offset portion and an upwardly directed brace on said portion adapted to engage over a rail flange beneath a spike head.
4. In a device of the class described the combination with a plate comprising interfitting sections each of which is provided with an upwardly and laterally offset portion adapted to overlap the other section and an inwardly facing brace on each section adapted to engage the rail.
5. In a device of the class described the combination with a two-part plate of a laterally directed upwardly offset web thereon and means on said web adapted to engage over the rall flange on each side of a rail.
6. A tie plate comprising interfitting, duplicate sections each having an offset portion overlapping the other.
7. A the plate comprising interfitting sections, a laterally and offiset web on each section adapted to engage over the adjacent end of the opposite section and an inwardly facing brace on each web and provided with a vertical fold therein.
8. A tie plate comprising interfitting oppositely facing sections having registering apertures therethrough and an upwardly and inwardly directed brace on each section.
9. A sectional tle plate comprising in combination metallic strips, a laterally directed web on each adapted to overlap the adjacent strip and an upwardly and inwardly directed brace on each section.
10. In a tie plate the combination with a pair of wear plates of an integral web on one end of each adapted to overlap the opposite end of the other and means on said webs adapted to engage over the rall flanges.
11. In a tie plate a pair of interfitting duplicate sections adapted to engage beneath the rall from opposite sides and each provided with a laterally directed upwardly offset web thereon having an integral upwardly directed brace adapted to engage over the rail flanges.
12. In a device of the class described, the combination with a pair of wear plates adapted to be inserted beneath a rall of laterally directed, upwardly offset, integral webs thereon, each adapted to overlap the adjacent plate and a plurality of braces on said plates, adapted to engage the rail, said webs and plates being provided with apertures so disposed that when in register said braces closely impinge the rail.
13. A tie plate embracing two sections, each extending beneath the rail and having an inwardly directed integral brace thereon overlapping the end of the other and apertured to receive the spikes whereby the spikes lock the sections to the rall.
14. A tie plate comprising two sections each extending beneath the rail, laterally offset upwardly and inwardly directed bracing flanges thereon, that on each section overlying the end of the other section, said flanges and ends being apertured to receive the spikes whereby the spikes lock the sections to the rall.
15. A tie plate comprising two duplicate stamped sections adapted to lie side by side beneath the rail, a laterally offset end on each adapted to overlie and interfit the end of the other section, an integral brace on each offset end adapted t") bear against the opposite sides of the rall, sald sections having registering apertures to receive the spikes whereby the same are locked together.
16. A tle plate comprising two sections eacb adapted to lie beneath the rail laterally of the other, a laterally offset upwardly directed brace on each adapted to overlie the end of the other and engage a rail from opposite sides, said braces having a vertical central fold therein extending bracingly leneath the rall head.

## No. 89,927. Railway Car Stake.

Jalons pour chars de chemin de fer.
Charles M. Funk, Centralia, Washington, U.S.A., 10th July, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,788.
Claim.-1. The combination substantially as herein described of the car bed, the hooks at the opposite sides thereof and provided with shanks, keepers secured to the car bed for said hook shanks, the stakes, the stake plates having staples to which the stakes are secured and provided above said staples with outwardly projecting lugs adapted to receive their respective stakes between them, keepers secured to the car bed for said stake plates, and binders connected at their ends with their respective stakes and engaged between their ends with hooks at the opposite sides of the car from said stakes and having between said hooks latch hooks, and means for securing and releasing the same, all substantially as and for the purpose set forth.
2. In a log binder for car beds a stake combined with a stake plate to which the stake is swivelled at its lower end, and lugs projecting outwardly from the plate above the con. r.ection of the stake therewith and adapted to receive the stake between them, substantially as set forth.
3. The combination with the car having the outwardly facing hooks and stakes at the opposite sides of the car, of a

binder secured to the stakes and extending thence across the car and engaged with the hooks at the oppositie stdas o:' the car, substantially as set forth.
4. A car having at its opposite sides stakes arranged in pairs and provided with outwardly facing hooks between the said stakes, and binders secured at their ends to the stakes at the other side of the car and extending thence across the car and engaging with the outwardly facing hooks at the opposite sides of the car, as set forth.
5. A car platform or bed having transverse upwardly projecting beams, stakes at the sides of the car and outwardly facing hooks at the opposite sides of the car bed from their respective stakes, and load binders connected at their ends With the stakes at the same side of the car and extending thence across the car body and engaging with the hooks at the opposite side of the car bed, substantially as set forth.
6. The combination with a car bed, of a keeper secured thereto, a stake plate fitting removably to the keeper and provided at its upper end with outwardly projecting lugs. and a stake $s$ wivelled to the stake plate below said lugs and adapted to turn up between the same, substantially as described.

No. 99,928. Log Turner. Appareil d tourner les billots.

Fred William Beitner, Traverse City, Michigan, U.S.A., 10th July, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,021.
Cialm.-In a device of the described character, a toothed member, a piston rod plvotally connected with and adapted to impart longitudinal movement to said toothed member, and arother piston rod pivotally and slidably connected with and adapted to impart transverse movement to said toothed nuember.

No. 99,929. Throat Protector. Protecteur pour la gorge:
Henry E. Buttray, London, Ontario, Canada, 10th July, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,585.
Claim.-1. A throat protecting flap secured to and in combination with a hat, cap or other head wear, substantially as shown and described and for the purpose specified.
2. In a device of the class described, the combination with a hat, cap or other head wear, and a band pendent therefiom, of a throat protecting flap secured at its ends to the front edges of said pendent band, substantially as shown and described and for the purpose specified.
3. As a new article of manufacture, a hat, cap or other head wear formed with a throat protecting flap, substantially as shown and described and for the purpose specified.
4. The combination with a hat, cap or other head wear, of a throat protecting flap adapted to be attached to or de-
tached from said hat, cap or other head wear, and means for adapting said throat protecting flap to be attached to or

detached from said hat, cap or other head wear, substantially as shown and described and for the purpose specified. 5. The combination with a hat, cap or other head wear, and a band pendent therefrom, of a throat protecting flap udapted to be secured at its ends to the front edges of said pendent band, and fasteners for adapting said throat protecting flap to be attached to or detached from said pendent band, substantially as shown and described and for the purpose specified.

No. 99,930. Bottle Washer.
Machine d laver les bouteilles.

Edward Travers Dixon, Woolston, Southampton, England, 10th July, 1906; 6 years. Filed 21st May, 1906. Receipt No. 136,104.
Claim.-1. For use in bottle washing machines of the typo described, a contrivance for transmitting a rotary motion to a brush whilst permitting it to undergo longitudinal movement comprising a brush spindle having an elongated keyway formed therein, a hollow power driven shaft within which the brush handle is adapted to slide and fit one end thereof, and a feather key secured to one end of the hollow shaft.
2. For use in bottle washing machines of the type described a contrivance for transmitting a rotary motion to a brush whilst permitting it to undergo longitudinal movement, comprising a brush spindle having an elongated keyway formed therein, a hollow power driven shaft, within which the brush spindle is adapted to slide and fit one end thereof, a slotted nut adapted to fit a screw-threaded and slotted end of the hollow shaft, a feather key adapted to fit the clotways formed in sald shaft and nut and lock nut adapted to enclose and secure the feather key to the hollow shaft.
3. For use in bottle washing machines of the type described and in a contrivance for transmitting a rotary motion to a brush, whilst permitting it to undergo longitudinal movement, which contrivance comprises a brush spindle having an elongated keyway formed therein, a power driven shaft, within which the brush spindle is adapted to sllde and fit one end thereof, and a feather key secured to one ena of the hollow shaft, a sleeve adapted to slide and turn freely relatively to the brush spindle and house the bristles of the brush when the latter is withdrawn from the bottle and an annular space formed within the hollow shaft and extending from one end throughout the greater part of its length, which space is adapted to receive the bristle housing the sleeve and permit its free rotation and longitudinal movement therein.

No. 99,931. Nnt Lock. Arrête-écrou.

Albert L. Eicher, Alliance, Ohio, U.S.A., 10th July, 1906; 6 years. Filed 19th June, 1906. Receipt No. 137,073.
Cluim.-1. A lock nut made of metal having a grain and being bent to concavely curve its inner face in the direction thereof, there being a kerf in the outer face across the grain with the adjacent parts compressed along the grain to approximately close the kerf.
2. A lock nut made of metal having a grain, there being a kerf in the face across the grain with the adjacent parts compressed along the grain to approximately close the kerf.

No. 99,932. Crate. Manne.

Frank J. Hipp, New Brighton, Minnesota, U.S.A., 10th July. 1906; 6 years. Filed 13th June, 1906. Recelpt' No. 136,858. Claim.-1. A crate comprising a bottom having cross strips thereon at each end, sides composed of upright posts and slats connecting them, said sides also having bars parallel with said posts and spaced therefrom, pins passing through the lower end of said bars and posts, and through said strips and hinging sald sides on said strips, the pace between said bars and posts being of sufficient width to receive said strips when said sides are swung down flat upon them, and ends composed of slats and bars connecting them adapted to fit into the spaces between said side posts and bars and locking them in an upright position, substantially as described.
2. A folding crate comprising a bottom having cross strips thereon, sides composed of upright posts and slats connecting them and bars parallel with said posts and spaced therefrom, said posts having rabbeted inner edges, pins passing through the lower ends of said bars and posts, and also through said strips and hinging the sides thereon, ends also having upright posts and slats connecting them and adapted to fit into the spaces between the posts and bars of said sides, and said ends having locking plates adapted to slip into said rabbets when the crate is set up, and means for locking said ends and sides together, substantially as described.
3. A folding chicken crate comprising a close board floor and strips arranged transversely thereon at each end, sides comprising upright posts and slats connecting them and bars spaced from said posts, pins passing through the lower ends of said bars and posts and said strips, and hinging the sides thereon, ends also composed of posts and slats connecting
them and adapted to fit into the spaces between said side posts and bars, means for locking said ends and sides together, means for securing said ends to sald strips, a top also consisting of cross strips and slats connecting them and means for locking said top to said ends.
4. In a folding chicken crate the combination with the hinged sides adapted to swing in toward one another to a horizontal position, said sides having posts with rabbeted inner edges, ends having posts and plates to enter said rabbets and lock said sides and ends together, substantially as described.
5. A folding chicken crate comprising a floor and sides hinged thereon and adapted to swing into a horizontal position, ends removably fitting between said sides and means for locking them together, said ends having upright pins or sides, a top having holes to receive said sides and means for securing said top to said sides and ends.
6. A folding chicken crate comprising a floor, sides hinged thereon and adapted to swing in to a horizontal position, posts and bars provided at each end and the middle of said sides and spaces being provided between said posts and bars and said posts having rabbeted inner edges, ends and a middle partition having bars adapted to enter the spaces between said side posts and bars, plates provided on said ends and partition to enter said rabbets and lock said sides and ends and partition together, means for securing said ends to said floor, a top fitting over said sides and means tor securing said top to said sides and ends, substantially as described.

No. 99,933. Washing Machine. Machine d laver.

George H. Huenergardt, College View, Nebraska, U.S.A., 10th July, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,893 .
Claim. - In a washing machine the combination with a suds box provided with a wringer board, of a handle comprising lever, a hand grip arranged at one end thereuf, a shank disposed at right angles to the lever and in parallelism with the hand grip, and an approximately L-shaped attaching member projecting from the shank and secured to the suds box and to the wringer board.

No. 99,934. Eay Stacker. Anculonneur de foin.

Casper Koehler. Canyon City, Oregon, U.S.A., 10th July, 1906; 6 years. Filed 14th June, 1906. Receipt No. 136,891.
Claim.-1. A hay stacker comprising a base frame, verti-
c. lly swinging stacker arms pivotally supported upon the
frame, a stacker head carried by the free ends of the arms, a mast pivotally rising from the frame, a prop hinged to the frame and straddling the mast, a connection between the frec end of the prop and the stacker arms, a connection between the free ends of the mast and the prop, and a block and tackle connected to the mast and the rear portion of the frame for swinging the mast and elevating the stacker arms.
2. In a hay stacker the combination with a base frame, of longitudinally extensible stacker arms pivotally supported upon the base frame, a stacker head carried by the free ends of the arms, a mast pivotally supported upon the frame, a prop hinged to the base frame and comprising spaced members embracing the mast, an extensible prop member shiftable endwise between the outer end portions of the hinged prop members. a connection between the extensible prop member and the stacker arms, another connection between the top of the mast and the extensible prop member, and a block and tackle extending between the top of the mast and the base frame.
3. In a hay stacker the combination of a base frame made up of spaced sills, and front, intermediate and rear cross bars connecting the same, of a rock bar mounted upon the rear portion of the frame and projected at opposite sides therof, stacker arms carried by the projected ends of the rock bar and extending in front of the base frame, a stacker head carried by the free ends of the stacker arms, a mast pivotally raising from the front cross bar, a prop pivotally supported upon the intermediate cross bar and stradding the mast, a connection between the fres ends of the stacker arms and the free end of the prop, a connection between the free ends of the mast and the prop, and a block and tackle extending between the free end of the mast and the rear cross bar of the base frame.

No. 99,935. Canning Apparatus.
Appareil de mise cn boîte.

Lilford Leland Lawrence, Jackson, Alabama, U.S.A., 1 ath July, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,937.
Claim.-1. The combination of a casing, a fire box therein, a lining within the casing above the fire box and forming an air chamber open at top and in communication with air inlets in the side of the casing, and a vat suspended in the lining and forming an outlet therearound for the products of combustion.
2. The combustion of a casing, a fire box therein a lining within the casing above the fire box, said lining being spaced from the casing to form an air chamber open at top and communicating with inlets in the sides of the casing, a vat supported within the lining and terminating above the bottom of the same, sald vat being of greated diameter or area than the fire box and spaced from the lining to form an intervening outlet therearound for the products of combustion.
3. The combination of a casing, a fire box therein partially spaced from the wall of the casing, an interior lining above the fire box and forming an air chamber therein closed at bottom and open at the top and communicating with inlets in the sides of the casing, a vat supported within the lining above the fire box and bottom of the lining and of greater area than the fire box, and deflectors enclosing the vat and secured to the lining.
4. The combination of a casing. a vat supported therein, a float arranged in the vat and means for conducting steam from the top of the vat to the float.
5. The combination of a casing, a vat therein, a float within the vat, and a weighing plate carried by the float and projecting beyond the same to govern the circulating space between the vat and float.
6. The combination of a casing, a vat therein, a hollow float within the vat and of less diameter than the came, a
steam supply pipe carrield by the float and extending into the top of the vat, and a plate carried by the float and extending beyond the edges of the float.
7. The combination of a casing, a vat therein, a fioat within the vat, pipe connections for supplying and withdrawing water to and from the vat, and a gauge carried by said connections for indicating the amount of water in the vat.
8. In a casing apparatus, a casing having a fire box, and provided with an opening for the insertion of a soldering iron into said box.

No. 99,936. Foraminous Fire Plate and Cover. Plaque et couvercle perforts pour le fer.

Patrick James Mooney, Brazil, Indiana, U.S.A., 10th July, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,018.
Claim.-1. As a new article of manufacture, a foraminous plate designed to be superposed on a bed of fuel, for the purpose specified.
2. As a new article of manufacture, a foraminous plate designed to be superposed on a bed of live fuel and to be supported solely thereby, said plate being provided with means for regulating the area of its openings.
3. The combination with a stove or the like, of a foraminous plate designed for insertion in sald stove, and for superposition upon the fuel therein, said plate being supported directly upon and solely by sald fuel whereby it will sink as the bed lowers, and said plate being spaced from the walls of the stove.
4. The combination with a stove or the like of a cover for the fuel bed, said cover being supported directly upon and by said bed, and being foraminous, as and for the purpose set forth.

No. 99,937. Chnri. Baratte.

Francis Michael Mulligan, Eyeta, Minnesota, U.S.A., 10th July, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,936.
Olaim.-1. A cream vat, a receptacle arranged to receive material from the vat and formed with an open spout, a churn, a communication between the churn and receptacle, a steam ejector device, and a removable connection between said ejector and the churn.
2. A cream vat, a receptacle arranged to receive material from the vat and provided with a spout in open communication with the receptacle, a churn, a pipe connected with the churn and extending within the receptacle, said pipe being supported by the spout and having a tapering elbow where It is connected to the churn, a steam ejector, and a removable connection between sald ejector and churn whereby operation of the ejector will create a partial vacuum within the churn body for drawing into said body the mateiral in the receptacle.

No. 99,938. Spool and Needle Cases.
Bobine et étui d aiguille.

Joseph George Sipoz, East Kootenay, British Columbia, Canada, 10th July, 1906; 6 years. Filed 6th May, 1906. Recelpt No. 135,574.
Claim.-1. A device of the character described, comprising a spool provided with a passage closed at one end and fully open at its other end, and a cap adapted to support needles within said passage and to seal the passage to render the same molsture proof.
2. A device of the character described, comprising a spool having two or more winding faces and a passage closed at one end and open at its other end, and a cap adapted to support needles within and seal the passage to render the same moisture proof.
3. A device of the character described comprising a spool provided with a passage having one end closed and its other end fully open, one end of the spool being provided with an annular recess arranged concentrically with relation to the passage, a cap having the ends of its flange fitted within said recess, said cap being adapted to support needles within and seal the passage to render the same moisture proof.
4. A device of the character described comprising a spool provided with a passage having one of its ends closed and its other end open, a cap adapted to seal the openings and a cushion filling for the cap, said cushion flling being adapted to receive needles.
5. A device of the character described comprising a spool having a passage closed at one end and open at its other end, said spool being provided with an annular recess arranged concentrically with relation to the passage, a cap adapted to seal sald passage and having the edge of its flange disposed within said reecss, and a cushion filling for the cap. said cushion flling being adapted to receive needles.

No. 99,939. Cultivator. Cultivateur.

Alfred T. Westlake, Newburgh, New York, U.S.A., 10th July. 1906; 6 years. Filed 11th June, 1906. Recelpt No. 136,782.
Claim.-1. An article of the class described comprising a blade having ears formed thereon and extending therefrom at an angle.
2. The combination with the shovel beams of a cultivator, of a blade having ears arranged for attachment thereto, said ears being extended at an angle from said blade.

## No. 98,940. Land Gultivating Instrument.

Instrument d'agriculture.
Arthur Jones, Bondoola, Rockhampton, Oueensland, Australialia, 10th July, 1906; 6 years. Filed 14th June, 1906. Recelpt No. 136,897.
Claim.-1. In an implement for cultivating land a plurality of discs mounted on shanks extending from a rotatable beam arranged parallel to said discs, and means for rotating sald beam.
2. In an implement for cultivating land a plurality of discs mounted on shanks extending from a beam parallel to said

discs and fournalled at each end in bearings on the frame, a bar connecting said shanks and a spring toothed lever in engagement with a rack and attached to said beam and bar, substantially as set forth.
3. In an implement for cultivating land a rotatable beam carrying a number of discs and parallel thereto, sald beam being journalled at either end in adjustable bearings, one end of the latter being pivoted to the frame and the other end adjustably secured thereto and means for rotating said beam substantially as set forth.
4. In an implement for cultivating land a plurality of discs mounted on crank-shaped shanks rotatably journalled in a horizontal beam arranged parallel to said discs and means for rotating said shanks, substantially as set forth.
5. In an implement for cultivating land a pluraity of discs revolvably mounted on the bent ends of crank-uhaped shanks rotatably journalled in a horizontal beam arranged parallel to said discs, short cranks on the forward end of said shanks connected together by a bar and means for operating said cranks, substantially as set forth.
6. In an implement for cultivating land a plurality of discs revolvably mounted on the belt ends of crank-shaped shanks rotatably journalled in a horizontal beam arisnged parallel to said discs, short cranks on the forward ends of sald shanks connected together by a bar, a forked arm having a threaded nut at one end and connected at the other end to said bar, a screw extending through said nut and through a vertical standard on the horizontal beam, a crank handle on said screw and collars thereon on either side of said standard, substantially as set forth.
7. In an implement for cultivating land a plurality of discs mounted on crank-shaped shanks rotatably mounted in a rotatable beam arranged parallel to said discs, short cranks on the forward ends of said shanks coupled together by a bar, means for operating said cranks and rotating said beam.
8. In an implement for cultivating land a disc mounted on a crank-shaped shank one end of which fits into a sleeve on the concave side of said disc, substantially as set forth.
9. In an implement for cultivating land, a grader situate behind the discs consisting of a curved plate pivotally connected about the center at elther end to straps pivoted on the frame, lateral lugs on the ends of said plate adapted to abut against said arms, substantially as set forth and as llustrated.
10. In an implement for cultivating land an adjustable furrow wheel having a bent axle the shank of which is adapted to extend up through bearings on the frame in combination with a screw having a crank handle and adapted to pass through a threaded nut on a bracket mounted on the frame and bear against the end of said shank, substantially as set forth.

## No. 99,941. Milking Machine.

Machine d traire les vaches.
Hinrich P: D. Ohlhaver, Sande, near Bergedorf, Prussia, Germany, 10th July. 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,885.
( Claim.-1. In a milking machine the combination with a multiple suction pump having a separate barrel, outlet tub, suction passage and teat cup to each teat of the animal, of a non-return valve interposed between the pump and the suction passage, and an air regulating passage or orifice connecting the suction passage between the non-return valve and the teat with the external air, so that the milk will not exude therethrough owing to the vacuum in the suction passage.
2. In a milking machine the combination with a multiple suction pump having a separate barrel, outlet tube, suction passage and teat cup to each teat of the animal, of a non-return valve interposed between the pump and the suction passage, an air regulating passage connecting the suction
passage between the non-return valve and the teat with the external air, and means for regulating the size of the said

passage so that the suction effect can be regulated without the milk coming into contact with the regulating means.
3. In a milking machine the combination with a multiple suction pump having a separate barrel, outlet tube, suction passage and teat cup to each teat of the animal, of a nonreturn valve interposed between the pump and the suction passage, an air regulating passage connecting the suction passage between the non-return valve and the teat with the external air, a regulating screw adjustable in the said passage, and a tapered slot on the side of the regulating screw whereby the size of the passage can be varied and the suction regulated for each teat, substantially as described.
4. In a milking machine the combination with a multiple suction pump having a separate barrel, outlet tube, suction passage and teat cup to each teat of the animal, of a nonreturn valve interposed between the pump and the suction passage, an air regulating passage connecting the suction passage between the non-return valve and the tent with the external air, a regulating screw, and a coned end or plug adjustable by means of the regulating screw over the end of the passage whereby the size thereof can be varied and the suction regulated for each teat, substantially as described.

No. 99,942. Milk Strainer. Couloir d lait.

Hormidas Leduc, St. Germain de Grantham, Quebec, Canada, 10th July. 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,836.
Claim.-1. In a device of the character described, the combination comprising a receptacle, a perforated cover therefor, a body of foraminous material carried by the receptacle, a removable cap carried by the receptacle, a body of foraminous material carried by the cap, and a perforated supyort for the receptacle.
2. In a device of the character described, the combination comprising a receptacle having a tapered discharge nozzle, a perforated cover therefor, a body of foraminous materiai carried by the receptacle, a removable cap carried by the receptacle, a body of foraminous material carried by the cap. and a support for the receptacle having a tapered hollow sleeve adapted to hold the tapered discharge nozzle by frictional contact, said support being provided with a plurality ci perforations.
3. In a device of the character described, the combination comprising a receptacle, a removable segmental cover therefor provided with perforations, a body of foraminous matcrial carried by the receptacle, a removable straining mem-
ber carried by the receptacle, and a perforated support for the receptacle.
4. In a device of the character described, the combination comprising a receptacle provided with a screw-threaded reduced discharge nozzle, a perforated cover disposed on the receptacle, a screw-threaded cap carried by the reduced end of the receptacle, a body of foraminous material carried by the screw-threaded cap, and a perforated support for said reduced discharge end of the receptacle.
5. In a device of the character described, the combination comprising a receptacle provided with a straining member fixed thereon, and a removable straining member, and a Hanged perforated support for the receptacle provided with supporting legs.
6. In a device of the character described, the combination comprising a receptacle, a removable perforated cover for the receptacle, a fixed straining member carried by the receptacle, a removable straining member carried by the receptacle, a supporting member adapted to carry the receptacle and provided with perforations, and legs secured to the receptacle and provided with hooked horizontal extensions.
7. In a device of the character described, the combination comprising a receptacle, an aerated member carried by the receptacle, straining members carried by the receptacle, a flanged supporting member provided with a perforated domeshaped floor, a perforated sleeve carried by the floor and adapted to engage the receptacle, and supporting members carried by the dome-shaped floor and provided with horizontal extensions.

No. 99,943. Sand Box. Boîte d sable.

Mary E. Langley, Rouse's Point, New York, administratrix of the estate of Lawson C. Ritch, deceased, 10th July,
1906; 6 years. Filed 11th June, 1906. Receipt No. 136,778.
Claim.-1. A device of the class described comprising a receptacle having concaved recesses formed in its bottom and having openings formed through its bottom and opening into said recesses, and spouts leading from said receptacle and communicating with sald opening.
2. A device of the class described comprising a receptacle having inwardly enlarged openings formed through its floor, and spouts leading from said receptacle and communicating with said opening.

No. 99,944. Sander. Machine à sabler.

William Henry Quinn, Swansea, Ontario, Canada, 10th July, 1906; 6 years. Filed 22nd May, 1906. Receipt No. 136,147. Claim.-1. A sander, means for discharging sand therefrom, a rotatable discharge spout adapted to receive sand 7-8
from the sander, and means for rotating the spout, substantially as described.
2. A rotary sander, a rotatable discharge spout adapted to receive sand from the sander, and means for rotating the sander to discharge sand therefrom and for rotating the spout, substantially as described.
3. A rotary sander, an operating shaft therefor, a suitably journalled discharge spout adapted to receive sand from the sander, a bevel gear wheel on the shaft, a bevel gear pinion on the spout with which the bevel wheel meshes, and means tor rotating the shaft, substantially as described.
4. A rotary sander, an operating shaft therefor, a sultably journalled discharge spout adapted to receive sand from the sander, a bevel gear wheel on the shaft, a bevel gear pinion on the spout with which the bevel wheel meshes, means for rotating the shaft, and means for permitting the continued forward rotation of the bevel wheel after the sander has stopped, substantially as described.
5. A rotary sander, an operating shaft therefor, a suitably inיrnalled discharge spout adapted to receive sand from the sander, a bevel gear wheel on the shaft, a bevel gear pinion on the spout with which the bevel wheel meshes, means for rotating the shaft, and a spring actuated ratchet clutch forming and driving connection between the shaft and the bevel wheel whereby the latter may rotate forward independent of the former, substantially as described.
6. A sander, means for discharging sand therefrom, a rotatable discharge spout adapted to receive sand from the sander, means for rotating the spout, and a cone-shaped deflector connected to the spout and held with its apex just in front of the center of the end of the same, substantially as described.
7. A rotary sander, an operating shaft therefor, a horizontal driving shaft geared to the operating shaft, a gear pinion cn the driving shaft, a suitably journalled gear wheel meshing with the pinion. a ratchet wheel secured thereto, a lever provded with a suitable pawl to co-act with the ratchet wheel, a plunger adapted to depress the lever, and a spring adapted to raise the same, substantially as described.
8. A rotary sander, an operating shaft therefor, a horizontal driving shaft geared to the-operating shaft, a gear pinion on the driving shaft, a suitably journalled gear wheel meshing with the pinion, a ratchet wheel sccured thereto, a lever provided with a suitable pawl to co-act with the ratchet wheel, a plunger adapted to depress the lever. a spring adapted to raise the same, a vertical shaft provided with a crank handle, gearing between the vertical and horizontal shafts, and means permitting the forward rotation of the horizontal shaft independent of the vertical shaft, substantially as described.

No. 99,945. Rail Joint. Joint de rails.

William R. Thomas, Watertown, Wisconsin, and Frank E Wire, Libertyville, Illinois, U.S.A.. 10th July, 1906; 6 years. Filed 17th April, 1906. Receipt No. 134,941.
Claim.-1. In a rallway joint the combination with the meeting ends of two railway rails of an integrally formed flah plate and base plate and an integrally formed fish plate and wedge, the horizontal portion of the base plate being provided with a vertical flange formed at an angle to the longitudinal center of the railway rails, whereby an angular space is provided between said vertical flange and the vertical edge of the rails for the reception of said wedge, substantially as set forth.
2. In a rallway joint, an Integrally formed base plate and fish plate provided with a vertical fange formed at an angle to the longitudinal center of the rallway rails. In combination with an integrally formed wedge and fish plate, said wedge being adapted when in place between the angular flange of the base plate and the railway rails to serve the two-fold purpose of a wedge and flsh plate for locking the meeting ends of the ralls-qogether.
3. In a railway rail joint the combination with the meeting ends of two rallway ralls, the webs of which are provided with a plurality of transverse apertures, of an integrally formed fish plate and base plate, the vertical portion of which is provided with a plurality of horizontal projections adapted to register with and engage the apertures of the rails, while thts horizontal portion is provided with a vertical diagonal recessed flange formed at an angle to the railway rails for the reception of a wedge, and an integrally formed fish plate and wedge adapted to be interposed between the diagonal flange of the base plate and the meeting ends of the rails.
4. In a railway rail joint the combination with the meeting ends of two railway rails, of an integrally formed fish plate and base plate, and an integrally formed fish plate and wedge, the horizontal portion of the base plate being provided with a vertical recessed flange formed at an angle to the longitudinal center of the rallway rails, whereby an angular space is left between said vertical recessed flange and the vertical edge of the rails for the reception of said wedge, said wedge being of greater length than the base plate and adapted to project past the front end of the latter, a plurality of rail supporting ties and a spike rigidly secured on an end in one of said ties and having its other end secured against the protruding end of said integrally formed wedge and fish plate.

No. 99,946. Hat. Chapeau.

Gueseppe Melan, Milano, Italy, and the Waldron Drouin Company, Montreal, Quebec. Canada, 10th July, 1906; 6 years. Filed 11th October, 1905. Receipt No. 129,134.
Claim.-1. In combination with a hat provided with ventilating openings, a band disposed on the hat and having loosely woven sections in its body coinciding in position with the ventilating openings in the hat.
2. In combination with $a$ hat provided with ventilating openings, a band disposed on the hat and having foraminated sections in its body coinciding in position with the ventilating openings in the hat.
3. In combination with a hat provided with a plurality of rectangular ventllating openings, a band disposed on the hat and provided with a plurality of rectangular sections of foraminated material which sections are disposed over the ventilating openings in the hat.
4. A hat band provided with loosely woven sections in its body.
5. A hat band provided with sections adapted to permit the Pree passage of air.

## No. 99,947. Pastenrizing Process for Cream.

Procédé à pastcuriser pour la crême.
La Compagnie De Laiterie St. .Laurent, assignee of Hubert Napoleon Rivard, all of Montreal, Quebec, Canada, 10th July, 1906; 6 years. Filed 27th March, 1906. Receipt No. 134,324.
Claim.-1. In a device of the character described, a supporting casing, a pasteurizing drum supported by the casing and provided with discharge spouts, means for applying heat to the drum, and cooling members disposed below the drum.
2. In a device of the character described, a drum having an inclined double bottom, a continuous helical wall disposed in the drum, spouts disposed through the double bottom, said bottom being provided with an upwardly extending flange and provided with a downwardly extending flange of greater width than the length of sald spouts, and means for applying heat to the double bottom.
3. In a device of the character described. a pasteurizing drum comprising a receptacle having an inclined double bottom provided with discharge openings, a continuous helical flange carried by the bottom, a perforated pipe disposed between the members of the double bottom, a feed plpe leading to the perforated pipe, and means for regulating heat applied through the perforated pipe.
4. In a device of the character described, a pasteurizing drum comprising a receptacle having an inclined double bot-

tom provided with discharge openings, a continuous helical flange carried by the bottom, a perforated pipe disposed between the members of the double bottom, a feed pipe leading to the perforated pipe, a valve on the feed pipe, a handle on the valve, a pipe leading from the double bottom, an openended casing carried by the latter pipe and provided with a discharge opening, a float disposed in the casing, a rod connected to the float, and a connection between the rod and the handle on the valve.
5. In a device of the character described, a pasteurizing drum comprising a receptacle having an inclined double bottom provided with discharge openings, a continuous helical flange carried by the bottom, a perforated pipe disposed between the members of the double bottom, a feed pipe leading to the perforated pipe, a valve on the feed pipe, a handle on the valve, a pipe leading from the double bottom, an openended casing carried by the latter pipe and provided with a discharge opening, a float disposed in the casing, a rod connected to the float, and provided with a screw-threaded end, a lever connected at one end to the rod, a fulcrum for the lever secured on the casing, and a rod adjustably secured to the opposite end of the lever and to the handle of the valve.
6. In a device of the character described, a supporting casing, a pasteurizing drum carried thereby and provided with discharge openings, a rotatable corrugated casing disposed below the pastcurizer and provided with outer downwardly inclined flanges and provided with an inner upwardly inclined perforated flange and provided with a horizontal upper flange, a second casing disposed within the movable casing, braces connecting the two latter casings, a bearing for the scond casing, and means for applying a liquid cooling medium to the casings.
7. In a device of the character described, a supporting casing. a pasteurizing drum carried thereby and provided with discharge openings, a rotatable corrugated casing disposed below the pasteurizer and provided with outwardly inclined flanges and provided with an inner upwardly inclined perforated flange and provided with a horizontal upper flange, a second casing disposed within the movable casing, braces connecting the two latter casings and provided with a conical cover and a central bearing and provided with inclined extending flanges, and a shaft carried by the supporting casing and inserted in the bearing.
8. In a device of the character described a supporting casing, a pasteurizing drum provided with staggered discharge spouts and carried by the casing, a plurality of rotatable casings disposed within the supporting casing and provided with flanges, a trough disposed below the flanges, and means for applying a liquid cooling medium to both rotatable casings.
3. In a device of the character described a supporting casing, a pasteurizing drum provided with staggered discharge spouts and carried by the casing, a plurality of rotatable casings disposed within the supporting casing ana provided with flanges, a trough disposed below the flanges, a pump connected with the trough, a clean-out valve on the connection between the pump and the trough, and means for applying a liquid cooling medium to both rotatable casings.
10. In a device of the character described a supporting casing, a pasteurizing drum disposed on the casing, a pair of rotatable connected casings disposed within the supporting casing, a feed pipe leading from the lower part of the supporting casing, a valve on the feed pipe, a pipe leading from the feed pipe back to the casing, a pump on the latter pipe, a strainer in the latter pipe, and a plurality of perforated pjpes connected to the feed pipe and extending upward inside and outside of the rotatable easings.
11. In a device of the character described a supporting casing, a pasteurizing drum thereon, a pair of rotatable casings disposed within the supporting casing, an ice receiving trough projecting from the supporting casing, means for applying a llquid cooling medium to the casing, a cream receiving trough supported adjacent the rotatable casings, and means for removing cream from the trough.
12. In a device of the character described a supporting casing, a pasteurizing drum thereon, a pair of rotatable casings disposed within the supporting casing, an ice receiving trough projecting from the supporting casing, means for applying a liquid cooling medium to the casing, a cream receiving trough supported adjacent the rotatable casings, and means for removing cream from the trough oomprising a pipe leading to the cream trough, a pump connected to the pipe, means for driving the pump, and a clean-out on the pipe.
13. In a device of the character described a supporting casing, a pasteurizing drum thereon, a pair of rotatable casings disposed within the supporting casing, an ice receiving trough projecting from the supporting casing, means for applying a liquid cooling medium in the casing, an overflow pipe connected to the bottom of the supporting casing, a cream receiving trough supported adjacent the rotatable casings, and means for removing cream from the trough.

No. 99,948. Photo-Mechanical Printing. Imprimerie photomécanique.

Albert Henry Walker, assignee of John W. Ippers, New York Clity, New York, U.S.A., 10th July, 1906; 6 years. Filed 28th March, 1906. Receipt No. 134,387.
Claim.-1. The following process of photo-meuhanical printin:, making a sensitive gelatine plate on a flexible celluloid base, which base is temporarily glued down upon a flat and horizontal plate while the gelatine is setting, exposing that sensitive gelatine plate to light through a translucent picture, developing that exposed gelatine plate by bathing it in water, and thereby making numerous irregular and irregularly distributed cracks in its surface, drying that developed gelatine plate in air, stripping that gelatine plate with its flexible base, away from that flat plate, applying glycerine solution to those parts of the surface of that developed gelatine plate which will take it, applying ink to the other parts of the surface of that developed gelatine plate, transferring ink from that inked flexible gelatine plate to a metal surface, by pressing the inked flexible gelatine plate directly against the metal surface, etching away the uninked parts of that metal surface, applying printing ink to the printing parts thus produced on that metal surface, and transfering ink from those printing parts directly to the surface of whatever material constitutes the base of the picture which results from the process, all substantially as described.
2. The following process in photo-mechanical printing, making a sensitive gelatine plate on a flexible celluloid base. which base is temporarily glued down upon a flat and horizontal plate while the gelatine is setting, exposing that sensitive gelatine plate to light through a translucent picture, developing that exposed gelatine plate by bathing it in water, and thereby making numerous irregular and irregularly distributed cracks in Its surface, drylng that developed gelatine plate in air, stripping that gelatine plate, with its flexible base, away from that flat plate, applying glycerine solution to those parts of the surface of that developed gelatine plate which will take it, applying ink to the other parts of the surface of that developed gelatine plate, transferring ink from that inked flexible gelatine plate to a metal surface, by pressing the inked flexible gelitine plate directly against the metal surface, and etching akay the uninked parts of that metal surface, all substantlally as described.
3. The following process in photo-mechanical printing making a sensitive gelatine plate on a flexible celluloid base, which base is temporarily glued down upon a flat and horizontal plate while the gelatine is setting, exposing that sensitive gelatine plate to light through a translucent picture, developing that exposed gelatine plate by bathing it in water,
and thereby making numerous irregular and irregularly distributed cracks in its surface, drying that developed gelatine plate in air, stripping that gelatine plate, with its flexible base, away from that flat plate, applying glycerine solution to those parts of the surface of that developed gelatine plate which will take it, applying ink to the other parts of the surface of that developed gelatine plate, and transferring ink from that inked flexible gelatine plate to a solid surface, by pressing the inked flexible gelatine plate directly against the solid surface, all substantially as described.
4. The following process in photo-mechanical printing. making a sensitive gelatine plate on a flexible celluloid base, which base is temporarily glued down upon a flat and horizontal plate while the gelatine is setting, exposing that sensitive gelatine plate to light through a translucent picture, developing that exposed gelatine plate by bathing it in water, and thereby making numerous irregular and irregularly distributed cracks in its surface, drying that developed gelatine plate in air, and stripping that gelatin plate, with Its flexible base, away from that flat plate, all substantially as described.
5. The following process in photo-mechanical printing, making a sensitive gelatine plate on a flexible celluloid base, having a gelatine coat of uniform thickness, exposing that sensitive gelatine plate to light through a translucent pleture, developing that exposed gelatine plate by bathing it in water and thereby making numerous irregular and irregularly distributed cracks in its surface, drying that developed gelatine plate in air, applying glycerine solution to those parts of the surface of that developed gelatine plate which will take it, applying ink to the other parts of the surface of that developed gelatine plate, transferring ink from that inked fiexible gelatin plate to a metal surface, by pressing the inked flexible gelatine plate directly agalnst the metal surface, and etching away the uninked parts of that metal surface, all substantially as described.
6. The following process in photo-mechanical printing, making a sensitive gelatine plate on a flexible celluloid base, having a gelatin coat of uniform thickness, exposing that sensitive gelatine plate to light through a translucent picture, developing that exposed gelatine plate by bathing it in water, and thereby making numerous irregular and irregularly distributed cracks in its surface, drying that developed gelatine plate in air, applying glycerine solution to those parts of the surface of that developed gelatine plate which will take it. applying ink to the other parts of the surface of that developed gelatine plate, and transferring ink from that inked flexible gelatine plate to a solid surface by pressing the inked flexible gelatine plate directly against the solid surface, all substantially as described.
7. The following process in photo-mechanical printing, making a gelatine plate on a flexible celluloid base having a gelatine coat of uniform thickness sensitized with bichromate of ammonia and chlorid of calcium, exposing that sensitive gelatine plate to light through a translucent picture, developing that exposed gelatine plate by bathing it in water and thereby making numerous irregular and irregularly distributed cracks in its surface and drying that developed gelatine plate in air, all substantially as described.

No. 99,949. Photo-Mechanical Printing. Imprimerie photomécanique.

Albert Henry Walker, assignee of John W. Ippers, New York City, New York, U.S.A., 10th July, 1906; 6 years. Filed 28th March, 1906. Receipt No. 134,388.
Claim.-The following process in photo-mechanical printing. making a gelatine emulsion, sensitized with bichromate of ammonia, applying that gelatine emulsion to a flat base, and drying and baking it thereon, exposing the resulting baked gelatine plate to light through a sheet having a uniformly translucent area and a uniformly opaque area. developinc that exposed gelatine plate by bathing it in water and thereby swelling intosmooth and uniform relief that area thereof which was under the opaque area of that sheet during the exposure, while leaving in smooth and uniform depression that area thereof which was under the translucent area of that sheet during the exposure, drying that developed gelatin plate in alr, applying glycerine solution to the smooth and uniform relief area of that dried gelatin plate, applying printing ink to the smooth and uniform depressed area of that glycerine gelatine plate, and transferring printing ink from that smooth and uniform depressed area to a smooth and solid surface of stone or metal, all substantially as described.

No. 99,950. Printing Frame. Cadre à imprimer.

William Bruce Young, Brandon, Manitoba, Canada, 10th July 1906; 6 years. Filed 29th March, 1906. Receipt No. 134,407.
Claim.-1. In a printing frame comprising a frame provided with flanges to receive the negative, a removable back for holding the sensitive paper against the negative, said back having an opening with transparent material therein, as and for the purpose specified.
2. In a device of the class described the combination with the receiving frame, of a spring pressed removable transparent back, as and for the purpose specified.
3. In a printing frame the combination with the receiving frame, of a spring pressed removable back, said back being composed of two portions hinged together, one portion of which has an opening extending therethrough and a transparent material secured to and flush with the inner face thereof, as and for the purpose specified.
4. In a printing frame the combination with the receiving frame, of a removably secured back, said back being composed of two portions hinged together, one portion of which has an opening extending therethrough and grooves cut in the outstanding sides, so placed and designed to secure and hold the glass flush with the inner face of the back, as and for the purpose specified.

## No. 99,951. Method of Burning Acetylene Gas.

 Méthode de brûler le gaz acétylène.

John B. Carroll, Chicago, Illinois, U.S.A., 10th July, 1906; 6 years. Filed 30th March, 1906. Receipt No. 134,447.
claim.-1. The process of burning acetylene gas, which consists in projecting a jet of the gas through an orifice, burning the gas, and maintaining at the orifice a temperature above that which permits the accumulation of carbon or solid hydro-carbons.
2. The process of burning acetylene gas, which consists in projecting a jet of the gas through an oriflce, causing the gas to burn with the base of the flame at or near said orifice, and heating the air supplied to the base of the flame, thereby maintaining at said orifice a temperature above that which permits the accumulation of carbon or solid hydro-carbons.
3. The process of burning acetylene gas, which consists in projecting a jet of the gas through an orifice, causing the gas to burn with the base of the flame at or near said orifice and shielding the base of the flame, thereby heating the air supplied to the base of the flame and maintaining at said orifice a temperature above that which permits the accumulation of carbon or solid hydro-carbons.
4. The process of burning acetylene gas, which consists in projecting a jet of the gas through an orifice, causing the gas to burn with the base of the flame at or near the orlfice, heating the air supplied to and causing it to move toward the base of the flame, thereby maintaining at the orifice a temperature above that which permits the accumulation of carbon of solid hydro-carbons, and shielding the base of the flame and thereby restraining the escape of heat from the air which is moving toward the orifice.

No. 99,952. Acetylene Gas Burner.
Brûleur à gaz acétylène.

John B. Carroll, Chicago, Illinois, U.S.A., 10th July, 1906; 6 years. Filed 30 th March, 1906. Receipt No. 134,448.
Claim.-1. An acetylene gas burner, consisting of a body of refractory heat insulating material provided with a supply conduit, a recessed flame chamber, preferably cylindrical, of sufficient width to admit air around and to the base of the flame, and a duct, preferably short and in axial allgnment wth said flame chamber, extending from said conduit to said chamber, as set forth.
2. An acetylene gas burner, consisting of a body of refractory heat insulating material, provided with a supply conduit, a cylindrical flame chamber of sufficient width to admit air around and to the base of the flame, and a central duct extending from said conduit to sald chamber, as set forth.
3. An acetylene gas burner, consisting of a body of refractory heat insulating material, provided with a supply conduit, a cylindrical flame chamber of sufficient width to admit air around and to the base of the flame, and a short central duct extending from said conduit to said chamber, as set forth.
4. An acetylene gas burner, consisting of a body of refractory heat insulating material, provided with a supply conduit, a cylindrical flame chamber of sufficient width to admit air around and to the base of the flame, and a short duct extending from sald conduit to sald chamber, said duct and chamber being in axial alignment, as set forth.
5. An acety'ene gas burner, comprising tips of refractory heat insulating material, two supply conduits, two opposed recessed flame chambers of sufficient width to admit air around and to the base of the flame, and ducts extending from said conduits to said chambers, as set forth.
6. An acetylene gas burner, comprising tips of refractory heat insulating material, two supply conduits, two opposed cylindrical flame chambers of sufficient width to admit air around and to the base of the flame, and short central ducts extending from said condults to sald chambers, as set forth.
7. An acetylene gas burner, comprising tips of refractory heat insulating material, two supply conduits, two opposed cylindrical flame chambers of sufficient width to admit air around and to the base of the flame, and short ducts extending from said conduits to sald chambers, the corresponding ducts and chambers being in axial alignment, as set forth.

No. 99,953. Pin Fastener. Attache d'épingle.

Agnes Edmond, Dunedin, New Zealand, 10th July, 1906; 6 years. Filed 28th March, 1906. Receipt No. 134,368.
Claim.-1. In fastenings of the kind indicated, a brooch or other body having mounted movable or hinged thereon a lin, a post having a cap under upward spring pressure, a Ilate having a recess so placed that the pin must be moved angularly to be inserted, and having an arm against which the said cap is pressed closing the gap leading to the recess.
2. In fastenngs of the kind indicated, a brooch or other body having mounted movably or hinged thereon a pin, a post having a cap under upward spring pressure, the said post and cap being hollow and contaning the spring, a plate having an angular passage or recess extending inward and downward, and an arm against which the said cap is pressed closing the gap leading to the recess.
3. In fastenings of the kind indicated, a brooch or other ledy having a movable pin, a post having a member under siring pressure closing the entrance of an angular pin recess provided to restrain the pin from becoming accidentally unfastened.
4. In fastenings of the kind indicated, a brooch or other body having a movable pin, a post having a member under spring pressure closing the entrance of an angular pin recess, having one or more shoulders therein provided to restrain the pin from becoming accidentally unfastened.
5. In fastenings of the kind indicated a brooch or other hody having a movable pin, a post having a flanged cap under spring pressure, and a pin recess formed by a plate having an arm against which the cap closes, the pin being adapted to pass under the flange.

No. 99,954. Keyboard for Mnsical Instruments.
Clavicr pour instruments de musique.

Wilhelm Menzel, Berlin, Germany, 10th July, 1906; 6 years. Filed 28th September, 1905. Receipt No. 128,830.
Claim.-1. In a musical instrument, a reversible keyboard provided with keys on its upper and lower surfaces in such manner that by turning over the keyboard either set of keys can be brought into position for playing, substantially as set forth.
2. In a musical instrument, the combination with a reversible keyboard having keys on its upper and lower surfaces, of an adjustable rod placed over the keys and provided with springs for holding sald keys in position during reversal of the keyboard and for regulating the touch.

No. 99,955. Mould for Cement. Moule pour ciment.

James G. Mills, Toronto, Ontario, Canada, 10th July, 1906; 6 years. Filed 7th April, 1906. Receipt No. 134,701.
Claim.-1. A mould for veneering concrete walls comprising a mould wall, means for attaching it to the surface to be veneered, and battens secured to the back extending down to a short distance from the bottom of the wall and a corresponding distance above the top of it, substantially as described.
2. A mould for veneering concrete walls comprising a mould wall, means for attaching it to the surface to be veneered, battens secured to the back extending down to a short distance from the bottom of the wall and a corresponding distance above the top of it, a plurality of loops for ccupling wedges secured to the back of the mould near its upper edge, and a corresponding number of similar loops stcured to the back near its lower edge, substantially as described.
3. A mould for veneering concrete walls comprising a mould wall, means for attaching the mould wall to the surface to be veneered, an end stop, and a clamp whereby the end stop may be adjustably secured to the face of the mould wall, substantially as described.
4. A mould for veneering concrete walls comprising two mould walls, means for connecting the mould walls in alignment with either uppermost, and a $V$-shaped metal packing strip fitted into the joint between the two mould walls, substantially as described.
5. In a mould for veneering concrete walls, a wall surface, a mould wall secured thereto at a suitable distance there'from, a hopper adapted to discharge into the space between the wall surface and the mould wall supported by and longitudinally movable on the mould wall, substantially as described.
6. A hopper for a cement veneering mould comprising a hopper V-shaped in cross section and open at its inner side. lfgs depending from the hopper, and hooks at the upper ends of the legs facing towards the inner side of the hopper. substantially as descrlbed.

No. 99,956. Step Ladder. Echelle à marches.

regeras:
John G. Socrgee, Dallas, Texas, U.S.A., 10th July, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,580.
Cialm.-1. A step ladder comprising front and rear sections, the front section comprising parallel side pleces arranged in pairs, steps detachably carried by the front section, bolts connecting the side pleces of each pair, U-shaped wire members having their free ends bent around the bolts, screw eyes carried by the front section and adapted to be engaged by the bow portions of the $U$-shaped members, and $U$-shaped wire members pirotally carried by the steps and adapted to engage the U-shaped members first-mentioned.
2. In a ladder of the kind described comprising front and rear sections, notched side members forming part of the rear section, a round having reduced end portions adapted to engage mortises in the side members, a metal loop pivotally connected at its ends to one of the side members, said loon encircling and engaging the round, a lower round longitudinally slotted at each end, the ends engaging notches in the side members, plates secured to the side members intermediate the rounds and bent at each end to form eyes, loops engaging the lower eyes formed on sald plates and the slotted end portions of the lower round, and brace bars pivoted at their upjer ends to the side members and having their lower ends bent to engage the upper eyes of the plates, substantially as set forth.
3. A ladder of the kind described comprising a front step section and a rear supporting section, a step, wire loop frames arranged on the under side of the step and having depending portions. $\mathbf{U}$-shaped wire members having their ends beut to form eyes, said eyes engaging the depending portions of the frames, bolts carried by the side members of the front section transversely to the steps. l-shaped members having: their free ends bent around the bolts, the wire members depending from the frames being adapted to slide in the members connected to the bolts. and screw eyes adapted to be engaged by the wire members connected to the volts, said eyes being carrled by the side members of the front section, as and for the purpose sot forth.

No. 99,957. Bed. Sommier élastique

Willam C. Burdette and Hiram H. Malone, co-inventors, both of Anderson, Indiana. U.S.A., 10th July, 1906; 6 years. Filed 11th May, $1: 06$. Receipt No. 135.802.
Claim.-The bed bottom consisting of the studded side rails the studded cross bars attarhed to said side rails and the single wire embracing the studs of the side rail and cross bars and arranged in longitudinal zigzag branches, each said longitudinal branch overlapping two adjacent longitudinal branches to form a series of mutually supporting large diamond form figures and centrally within the same a series of small diamond form figures and transverse coil springs connecting said branches at the lateral bends of said central diamond form figures, substantially as specifled.

## No. 99,958. Water Polo Apparatus.

Appareil pour jeux de polo.

Jọnn Fremont Conklin, Hawley, Pennsylvania, U.S.A., 10th July, 1906; 6 years. Filed 26th March, 1906. Receipt No. 134,273.
Claim.-1. A frame for use in playing games on water, said frame being composed of parallel side and parallel end members consisting of separate parts detachably connected and provided at their opposite ends with goals which open toward the center of the frame, sald frame being also provided centrally with a transverse raised device for dropping a ball in the middle of the frame, substantially as shown and described.
2. A frame for use in playing games on water, said frame being composed of parallel side and parallel end members consisting of separate parts detachably connected and provided at their opposite ends with goals which open toward the center of the frame, said frame being also provided centrally with a transverse raised device for dropping a ball in the middle of the frame, consisting of upright side members and wires or cords connected with the tops thereof and extending transversely of the frame and connected at the center of the frame with a ring, substantially as shown and described.
3. A frame of the class described designed for use in marking off a field on water within which to play a game, said frame being composed of separate detachably connected parts and being oblong in form and provided at each end with goals which open inwardly, said frame being also provided transversely of the middle thereof with means for dropping a ball centrally thereof, substantially as shown and described.

## No. 99,959. Sewer Inlet. Conduite dégout.

Simon Cameron Corson, Norristown, Pennsylvania, U.S.A., 10th July, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,221 .
Cialm.-1. In a sewer construction the combination with a catch basin and its main, of a fitting for connecting said main and basin, the sale having an inlet branch extending through the wall of the basin below the water level thereof, and $a$
branch arranged opposite the main opening and extending through the wall of the basin above the said water level, said

branches having flanges for engaging the inner face of the wall, substantially as and or the purpose set forth.
2. In a scwer construction the combination with a catcb basin and its main. of a fitting for connecting sald main and basin adapted to be partlally embedded in the wall of said basin from the exterior thereof, the same having an inlet branch extending through the wall of the basin below the water level thereof, and a branch arranged opposite the main opening and extending through the wall of the basin above the said water level, said branches having flanges for engaging the inner face of the wall, substantially as and for the purpose set forth.

## No. 99,960. Post Hole Digger.

Appareil d creuser les trous de poteaux.

John Dunn, Kelso, Roxburgh, Scotland, 10th July, 1906; 6 years. Filed 1st June, 1906. Receipt No. 136,477.
Claim.-1. A post hole digger comprising a hub portion, a disc portion partially split and encircling said hub portion in a helical manner and separating said spllt portions, the lower of said split portions having cutting edges and a shaft extending into and through said hub and forming the handle of the device. as and for the purpose specifled.
2. A post hole digger comprising a hub portion having a squared hole therethrough, a disc portion partially split and encircling said hub portion in a helical manner and separating said split portions, one of sald split portlons having in plurality of teeth bevelled on the upper surface edges and forming knife blades, and a shaft extending through sald hole in the hub and having at the lower end beneath sald hub a spear point and at the upper end a suitable handle, as and for the purpose specified.
3. A post hole digger comprising a hub portion, a disc portion encircling said hub portion and split from one edge thereof to said hub, said split edges being separated for the length of said hub and causing said disc to encircle said hub in a helical manner, the lower of said edges having a plurality of teeth with bevelled upper surfaces forming knife blades, a knife rigidly arranged circumferentially on the underside of said disc in proximity to said teeth and depending downwardly therefrom, and a shaft extending through said hub, as and for the purpose specifled.
4. A post hole digger of disc formation and encircling a central and hub portion, said disc being partially split and having the split edges separated one to each end of said hub and a lower edge formed into a plurality of teeth and a plurality of knives rigid with said disc and depending downwardy therefrom and arranged circumferentially therewith, and a shaft having a spear point projecting below the lower end of said hub and a suitable handle at its upper end, as and for the purpose specifled.

No. 99,961. Cigar Bunching Machine. Machine à lier les cigares.

Alexantder Gordon, Detroit, Michigan, U.S.A., 10th July, 1906; 6 years. Filed 23rd May, 1906. Receipt No. 136,171.
Claim.-1. In a cigar bunching machine the combination with the bunching apron and its front and rear carriers adapted to form a pocket in sald apron and to actuate the same in rolling the bunch, of a bunch former movable toward said front carrier in advance of the movement of the same and operating to confline the filler in the pocket of the apron, and thence to hold the bunch in stationary position while belng rolled.
2. In a cigar bunching machine the combination with the bunching apron, of oscillating front and rear carriers having segmental cylindrical faces and adapted to form a pocket in said apron and to actuate the same by the movement of said carriers, the rear carrier having a movement in advance of the front carrier and being located above the front carrier and adapted to carry the rear end of the apron forwardly over the front carrier and thereby close the pocket in the upron by the movement of sald carrier alone.
3. In a cigar bunching machine the combination with the bunching apron, of oscillating front and rear carrlers having segmental cylindrical faces and adapted to hold the apron in their normal position to form a pocket for the reception of the filler and close the same by an indpendent movement of the rear carrier while the front carricr remains stationary and a bunch former conjointly moving with the rear carrier in advance of the movement of the front carrier and cooperating therewith to close the pocket and confine the filler therein.
4. In a cigar bunching machine the combination with the bunching apron, of oscillating front and rear carriers having segmental cylindrical faces and normally holding the apron in position to form a pocket for receiving the fller, said rear carrler having an independent movement in advance of the front carrier and operating to close the pocket in the apron while the front carrier remains stationary and the front carrier having a conjointed movement with the rear carrier adapted to actuate the apron.
5. In a cigar bunching machine the combination with the bunching apron and its front and rear carrier adapted to form a pocket in said apron and actuate the same in rolling the bunch, of a movable bunch former actuated by the movement of the rear carrier and adapted to close the pocket in the apron in the movement of said carrier in advance of that of the front carrier, said carrier being adapted to maintain the slack in the apron during the movement of the bunch former in closing the pocket.
6. In a cigar bunching machine the combination with the bunching apron, of oscillating front and rear carriers adapted to form a pocket in the apron and to actuate the same in rolling the bunch, the rear carrier having an independent movement in advance of the front carrier and a conjointed movement with the front carrier for actuating the apron in rolling the bunch and a bunch former actuated by the rear carrier in the independent movement thereof and remaining stationary during the conjointed movement of the carrlers.
7. In a cigar bunching machine the combination with the bunching apron and its front and rear carriers adapted to form a pocket in sald apron and to actuate the same in rolling the bunch, of a movable bunch former arrangement to jointly move with the rear carrier in advance of the front carrier and adapted to close the pocket in sald apron, and means whereby the front carrier remains stationary and is locked in position till the pocket is closed and the slack is taken out of the apron.
8. In a clgar bunching machine the combination with the bunching apron and its front and roar carriers adapted to form a pocket in said apron and to actuate the same in roll-
ing the bunch, of a movable bunch former and means for imparting a joint movement to the rear carrier and to the bunch former in advance of the movement of the front carrier and adapted to first close the pocket in the apron and thence to take the slack out of the apron. While the front carrier remains stationary and is locked in position.
9. In a cigar bunching machine the combination with the bunching apron and its front and rear carriers adapted to form a pocket in said apron and actuate the same in rolling the bunch, of means for importing a conjoint movement to said carriers and an independent movement to the rear carrler in advance of the front carrier, and a movement bunch former co-operating with the rear carrier to close the pocket and take up the slack in the apron during the independent movement of sald rear carrier.
10. In a cigar bunching machine the combination with the bunching apron and its front and rear carriers adapted to form a pocket in said apron and actuate the same in rolling the bunch, of a movable bunch former, an actuating spring therefor adapted to move it into operative position, and hold the same in rolling the bunch and means for controlling the movement of said bunch former by the movement of the rear carrier, sald rear carrier having a movement in advance of the front carrier.
11. In a cigar bunching machine the combination with the bunching apron and its front and rear carriers adapted to form a pocket in said apron and to actuate the same in rolling the bunch, of means for Imparting movement to the rear carriers in advance of the front carrier, a movable bunch former, means adapted to move said bunch former into operative position by the advance movement of the rear carrier and to release the same from engagement with said rear carrier when in said position and a spring adapted to hold said bunch former in its operative position independently of said rear carrler.
12. In a cigar bunching machine the combination with the bunching apron and its front and rear carriers adapted to form a pocket in sald apron and to actuate the same in rolling the bunch, of a bunch former, an oscillating frame carrying sald bunch former, a spring adapted to actuate the frame to move said bunch former into operative position and yieldingly ho'd the same in said position and means for controlling the movement of sald frame by the movement of the rear carrier, said means adapted to release sald frame from control when the bunch former has moved into operative position.
13. In a cigar bunching machine the combination with the bunching apron and its carriers adapted to form a pocket In the apron and actuate the same in rolling the bunch, of a bunch former composed in parts of a flexible pressure bar and means applied thereto for shortening or lengthening the portions of said bar subjected to flexure in rolling.
14. In a cigar bunching machine the combination with the bunching apron and its co-operating carriers, of a bunch former composed of a rigid and a flexible portion or pressure bar, and means for supporting sald flexible portion upon the rigid portion at variable points of its length against flexure in rolling the bunch.
15. In a clgar bunching machine the combination with the bunching apron and its co-operating carriers, of a bunch former composed of a rigid bar, a coll spring secured at its ends to the rigid bar and supports carried by the rigid bar slidingly adjustable thereon and adapted to support said coll spring intermediate its ends against flexure in rolling the bunch.
16. In a cigar bunching machine the combination with the frame, of a bunching apron, oscillating front and rear carriers for said apron. each consisting of a rocker mounted upon a shaft journalled in the frame and provided with a segmental cylindrical face for the apron to wind upon. and actuating devices therefor comprising pinions carried by the shafts of the rockers and an oscillating gear segment travelling in continuous mesh with the pinion of the rear carrier and in discontinuous mesh with the pinion on the front carrier whereby said front carrier remains stationary during a portion of the movement of the rear carrier.
17. In a cigar bunching machine the combination with the frame, of a bunching apron, oscillating front and rear carriers for said apron each consisting of a rocker mounted upon a shaft journalled in the frame and provided with a segmental cylindrical face for the apron to wind upon, and actuating devices therefor comprising pinlons carried by the shafts of the rockers and an osclliating segmental rack travelling in continuous mesh with the pinion of the rear carrier and in discontinuous mesh with the pinion of the front carrier, said pinion and rack having mutilated portions adapted to delay the motion of the front carrier and lock the same in position, and means for throwing said rack and pinion into gear at the end of the delay.
18. In a cigar bunching machine the combination with the frame, of a bunching apron, oscillating front and rear car-
riers for sald apron each consisting of a rocker mounted upon a shaft journalled in the frame and provided with a segmental cylindrical face for the apron to wind upon, pinions carried by the shafts of the rockers, an oscillating rack in continuous mesh with the pinion of the rear carrier and in discontinuous mesh with the pinion of the front carrier, means for locking said front carrier in position when not in mesh with the rack and means for imparting one complete oscillation to the oscillating rack under control of a foot lever.
19. In a cigar bunching machine the combination wlth the frame and bunching apron, of oscillating front and rear carriers for said apron consisting of rockers mounted upon shafts journalled in the frame, pinions on said shafts, an oscillating rack actuating said pinions, a continuously revolving pinion, a gear wheel meshing with said pinion and having a hinged section carrying a small portion of the gear teeth of said wheel, a spring for normally throwing said section out of operative position, a foot lever adapted to throw the same into operative position, a crank carried by the shaft of the gear wheel, and a connecting rod connecting said crank with the oscillating rack and adapted to actuate the same, means being provided for frictionally locking the shaft of the gear wheel after each revolution into its prescribed normal position.
20. In a cigar bunching machine the combination with the frame and bunching apron, of oscillating front and rear rockers mounted upon shafts journalled in the frame and adapted to actuate the apron in forming the bunch, pinions mounted tupon the shafts of the rockers, an osciliating rack adapted to oscillate the rockers through the medium of said pinions and impart a conjointed motion thereto and an independent motion to the rear rocker in advance of the front rocker, a movable bunch former actuated by the rear rocker in advance of the front rocker, and means under control of the operator for imparting to the rack one complete oscillation through a prescribed angle of motion.
21. In a cigar bunching machine the combination with the frame and the bunching apron, of front and rear carriers therefor adapted to form a pocket in the apron and actuate the same in rolling the bunch, a movable bunch former actuated by the rear carrier and co-operating therewith to contact the pocket in the apron around the filler and carry it into position for rolling while the front carrier remains stationary, and a stationary table above the front carrier and adapted to support the binder in position.
22. In a cigar bunching machine the combination with the frame and bunching apron, of oscillating front and rear carriers for the apron, each consisting of a segmental cylindrical rocker co-operating with each other in rolling the 'bunch, the one in front forming the bunching table and operating to pay out the apron in a rearward direction and the one in rear operating to take up the apron in an upward and forward direction, the rockers being of like radius and oscillating in opposite directions.
23. In a cigar bunching machine the combination with the frame and bunching apron, of oscillating front and rear carriers for the apron each consisting of a segmental cylindrical rocker co-operating with each other in rolling the bunch, the front rocker adapted to form the table and pay out the apron in a rearward direction and the rear rocker adapted to take up the apron in an upward and forward direction, the two rockers being of the same radius and oscillating alike but in opposite directions, and a movable bunch former cooperating with the rear rocker to take up the slack in the apron in advance of the movement of the front rocker and remaining stationary in rolling the bunch.
24. In a cigar bunching machine the combination with the frame and bunching apron, of a stationary binder table, an oscillating rocker below said table carrying the front end of the apron and forming the table for rolling the bunch, an oscillating rocker above the table carrying the rear end of the apron, the two rockers adapted to form a pocket in the apron adjacent to the rear end of the binder table and to actuate the apron in rolling the bunch by oscillating in opf:osite drections to each other, and a movable bunch former co-operating therewith.

## No. 99,962. Suspender. Bretelles.

Carl Ludolph, Berlin. Ontario, Canada, 10th July, 1906; 6 years. Fi.ed 2nd June, 1906. Receipt No. 136,501.
Ciaim.-1. In suspenders the combination with the shoulder s raps and the trouser back connector provided with suitable tabs and formed of cord, and looped guides pivotally connected to the bottom end bars of the shoulder straps, of a double loop guide through which the two sides of the cord of the trouser back connector extend, and a supplemental loop connected to the shoulder straps at each side and having the end extending downwardly between the shoulder straps and
connected to the double loop of the trouser back connector, as and for the purpose specified.

2. In suspenders the combination with the shoulder straps and the trouser back connector proviled with sultable tabs and formed of cord, and loop guides pivotally connected to the bottom end bars of the shoulder straps, of a double loop guide through which the two sides of the cord of the trouser lack connector extend, supplemental loop arc-shaped guides located at each side and connected to the shoulder straps and through which the supplemental loop extends, the sajd supplemental loop having a guide loop at one end and through which the other end extends down to the double loop of the trouser back connector, as and for the purpose specified.
3. In susp ${ }^{\circ}$ nders the combination with the shoulder straps and the trouser back connector provided with suitable tabs and formed of cord. and loop guides pivotally connected to the bottom end bars of the shoulder straps, of a double loop gulde through which the two sides of the cord of the trouser back connector extend. supplemental loop arc-shaped guides. adjustable bars on the shoulder straps to which the loop guides are pivotally connected. the said supplemental loop extending through the loop guides and having a guide loop at one end through which the outer end extends down to the double loop of the trouser back connector, as and for the purpose specified.
4. In suspenders the combination with the shoulder straps and the trouser back connector provided with suitable tabs and formed of cord, and loop guides pivotally connected to the bottom end bars of the shoulher straps, of a double loop guide through which the two sides of the cord of the trouser back connector extend and a supplemental loop slidably connected to the shoulder straps at each side and at the bottom tc the double loop trouser back connector, as and for the purpose specified.

No. 99,963. Garment Supporter.
support de vêtement.

George Martin, Toronto, Ontario, Canada. 10th July, 1906; 6 years. Filed 1st June, 1906. Receipt No. 136,474.
Claim.-1. In a garment supporter the combination of a length of wire formed into adouble spring loop and forming a central stirrup within the outer wires, and straps of flexible material strung through said stirrup, as and for the purpose specified.
2. In a garment supporter the combination of a length of wire bent at the ends and forming a stirrup, said outer ends
forming a double spring loop, and straps of flexible material strung through said stirrup, as and for the purpose specified. 3. In a garment supporter the combination of lengths of wire having a straight portion forming a stirrup and bent at the ends forming spring loops and extending ends from said loops, means for fastening the extending ends of one length of wire to the extending ends of the other length of wire, and flexible straps strung through said stirrups, as and for the purpose specifled.
4. In a garment supporter the combination of lengths of wire having a straight portion forming a stirrup and bent at the ends forming a double spring loop and extending ends therefrom and eyes formed at the extremities thereof, one of sald double loops being inverted and having the eyes registering with the eyes of the other double spring loop, eyelets or rivets passing through said eyes and flexibly securing them together in pairs, a strap of flexible material strung through one of sald stirrups forming shoulder straps and a strap of flexible material strung through the other of sald stirrups to secure the supporter to the garmnet, as and for the purpose specified.
5. In a garment supporter, the combination of a length of wire bent at the ends and forming a stirrup and having the said bent ends forming a double spring loop and extending ends therefrom, a strap of flexible material strung through sald stirrup, a strap of flexible material secured to the extending ends of said double spring loop to secure the supporter to the garment, as and for the purpose specified.
6. In a garment supporter, the combination of a length of wire bent at the ends and forming a stirrup and having the said bent ends forming a double spring loop and extending cuds therefrom, a strap of flexible material strung through said stirrup, a strap of flexible material to secure sald supporter to said garment having flexible loops therefrom secured to the extending ends of sald double spring loop, as and for the purpose specified.
7. In a garment supporter, the combination of a length of wire bent at the ends and forming a stirrup and having the said bent ends forming a double spring loop and extending erds therefrom, said extending ends having loops formed therein and straight extensions from said loops and hooks fcrmed at the extremities thereof, as and for the purpose specified.

No. 99,964. Game. Jeu.

Charles Adam Miller, Buffalo, New York, U.S.A., 10th July, 1906; 6 years. Filed 25th May, 1906. Receipt No. 136,226.
Claim.-1. A game apparatus comprising a game board having its surface divided into playing spaces, said spaces divided into two fields separated by a center line, and parallel lines passing through the playing spaces diagonally across the board.
2. A game board having its surface laid off in circular playing spaces connected by crossed lines between the spaces, said spaces divided into two fields separated by a center line.
3. A game board having its surface laid off in circular playing spaces, said epaces divided into two fields separated ty a center line, and game pieces of different forms adapted ic be used in connection with the board.
4. A game board having its surface lald off in circular playing spaces arranged in two fields separated by a center line, parallel lines passing centrally through adjacent playing spaces and extending diagonally across the board, and game pieces adapted to be used in connection with the board.
5. A game apparatus comprising a game board having its surfaces divided into playing spaces constituting two fields separated by a center line, means for distinguishing two parallel diagonal series of spaces, and movable pieces associated with the board, said pleces being of different shapes.

No. 99,965. Game. Jeu.

Peter William Nelson, New York City, New York, U.S.A. 10th July, 1906; 6 years. Filed 21st March, 1906. Receipt No. 134,110.
Claim.-The described amusement device consisting in a pack of rectangular separate cards, each having in one corner the representation of a part of a different object' pr animal, so proportioned that when the cards are indiscriminately assembled they will accurately fit together and produce representation of a complete although heterogeneous object.
No. 99,966. Nail Holder. Porte-clous.

John E. Pank, Palmer, Nebraska, U.S.A., 10th July, 1906; 6 years. Filed 11th April, 1906. Receipt No. 134,835.
Claim.-1. A nail holder comprising a series of receptacles aranged in parallel relation and each provided with a nail receiving channel and a slot for projection of the shanks of the nails, transverse supporting elements connecting the re'ceptacles at their lower and upper ends, and attaching devices connected with said supporting elements to adapt the holder to be secured to the person.
2. A nail holder comprising a series of receptacles each provided with a nail receiving channel and a slot for passage of the shanks of the nails to the exterior thereof, supporting plates connected to and holding the serles of receptacles in parallel relation, means for closing the lower ends 0 : the series of receptacles, and means connected with said supporting plates for attaching the device to the person, substantially as described.

## No. 99,967. Hinge. Penture.

Frank Ellsworth Sprague, Nashua, New Hampshire, U.S.A. 10th July, 1906; 6 years. Filed 20th March, 1906. Receipt No. 134,096
Claim.-1. A butt hinge comprising a plurality of members rrovided with interengaging tubular sections, a fastening pin having an annular shoulder and traversing the tubular stctions, and means for engaging the shoulder to prevent the pin from working out of the sections, embodying a slidable plate having therein an opening through which the pin extends.
2. A butt hinge comprising a plurality of members provided with interengaging tubular sections, a fastening pin having an annular shoulder and traversing the tubular sections, and means for engaging the shoulder to prevent the pin from working out of the sections, embodying a slidable plate formed with an eccentric portion and having therein an opening through which the pin extends.
3. A butt hinge comprising a plurality of members provided with interengaging tubular sections, a fastening pin

traversing the tubular sections, and provided with an annular shoulder, and means for engaging the shoulder to prevent the pin from working out of said sections, embodying a slidable plate having an eccentric portion and a projecting tongue, and formed with an opening through which the pin extends.
4. A butt hinge comprising a member provided at'its inner edge with a centrally disposed tubular section having a horizental slot cut therein, another member having tubular sect:ons aligning with the ends of the said sections, a fastening pin extending through all the sections and having an annular shoulder thereon, and a plate having a hole for recelving the pin loosely mounted in the slot for engaging the shoulder.

No. 99,968. Flushing Valve. Soupape.

William Turnbull, Lambton Quay, Wellington, New Zealand, 10th July, 1906; 6 years. Filed 30th May, 1906. Receipt No. 136,415.
Claim.-1. For the purpose indicated a flushing valve comprising in combination, a valve chamber, a downpipe cap secured to the bottom of the valve chamber. a seating upon the cap and entering the valve chamber, a regulating chamber secured to the valve chamber, a perforated bottom to the regulating chamber, a valve rod having a recess in its upper end and radial holes communicating with the recess, the said rod passing through the valve chamber and into the regulating chamber a stop valve within the valve chamber integral with the valve rod, a perforated plunger fitting loosely upon the upper end of the valve rod and resting upon a shoulder formed on the valve rod, a valve seating upon the plunger a regulating valve fixed to the top of the valve rod, means for regulating the flow of water through the recess of the valve rod, and means for operating the valve rod, substantially as set forth.
2. For the purpose indicated a flushing valve comprising in combination, a valve chamber, a downpipe cap secured to the bottom of the valve chamber a seating upon the cap and entering the valve chamber a regulating chamber secured to the valve chamber, a perforated bottom to the regulating chamber, a valve rod having a recess in its upper end and radial holes communicating with the recess, the said rod passing through the valve chamber and into the regulating chamber, a stop valve within the valve chamber integral with the valve rod, a perforated plunger fitting loosely upon the upper end of the valve rod and resting upon a shoulder formed on the valve rod, a valve seating upon the plunger, a regulating valve fixed to the top of the valve rod, a screw having a saw cut through its stem and fitting the recess in the valve rod, a screw cap closing the top of the regulating chambor, and means for operating the valve rod, substantially as set forth.
3. For the purpose indicated, a flushing valve comprising in combination, a valve chamber, a downpipe cap secured to the bottom of the valve chamber, a seating upon the cap and entering the valve chamber, a regulating chamber secured to the valve chamber, a perforated bottom to the regulating chamber, a valve rod having a recess in its upper end and radial holes communicating with the recess, the said rod passing through the valve chamber and into the regulating chamber a stop valve within the valve chamber integral with the valve rod, a perforated plunger fitting loosely upon the upper end of the valve rod and resting upon a shoulder formed on the valve rod, a valve seating upon the plunger, a regulating valve fixed to the top of the valve rod, means for regulating the flow of water through the recess of the valve rod, a shaft entering a recess in the cap of the downpipe, a stuffing box on the downpipe and through which the shaft passes, a handle upon the shaft, an arm within the recess and fixed to the shaft, and a link and pins coupling the arm to the valve rod, substantially as set forth.

No. 99,969. Saw Set. Fer ì contourner.

Frederick A. Wuest. Lawrenceburg, Indiana, U.S.A., 10th July,
1906; 6 years. Filed 21st May, 1906. Recelpt No. 136.137.
Claim. -The combination with a saw blade and a saw frame formed with a slot to receive the saw blade and with a recess intersecting said slot, of a screw connected to said saw blade and seated in said recess, a clip on said screw having lengitudinal arm bearing on opposite sides of said frame and covering said recess and that portion of the screw therein, and a nut on the end of said screw engaging said clip.

## No. 99,970. Rim for Vehicle Wheels.

Joute pour roues de voitures.

Isaac Hodgson, Minneapolis, Minnesota, U.S.A., 10th July, 1906; 6 years. Filed 14th May, 1906. Receipt No. 135,877.
Claim.-1. An elastic rim combining a plurality of channelled plates $f$ flexibly united by cables $g$, the pad $h$, springs $d$ engaging said channelled plates $f$. and the base plates $c$. the latter being secured to the band b, substantially as and for the purpose set forth.
2. An elastic rim combining a suitable cover $i$, secured to the reel plates $f$, by the bolts $j$, its open edges being secured to the band $b$. by the annular clamps $l$, substantially as shown and described.
3. In a resilient tire, a plurality of springs, and a tension band surrounding said springs and holding the same under an initial compression, substantially as described.
4. The combination with a wheel rim, of a plurality of radially disposed circumferentially spaced coiled springs applied around sald rim, and a flexible tension band surrounding said springs and holding the same under an initial compression. substantially as deseribed.

1To. 99,971. Disc Wheels for Road Vehicles.
Roue à disque pour vêhicules.

Fdward Martin, 61 Newland Terrace, Queen's Road, Battersea, London, England, 10th July, 1906; 6 years. Filed 14th May, 1906. Receipt No. 135,905 .
Claim.-1. A pneumatic disc wheel comprising two discs bolted together with an inner middle portion at the hub of the wheel and a circumferential ring portion provided with radial holes, in combination with a pneumatic tire, the cover of which is bolted between the edges of the discs and the circumferential ring portion so that the interior of the disc wheel and the interior of the pneumatic tire may form one air tight chamber in connection with one another for the purposes set forth.
2. The combination with a disc wheel comprising two discs bolted together with an inner middle portion at the hub of the wheel and a circumferential ring portion of a solid tire provided with a $U$-shaped cover, such cover being bolted between the discs and the circumferencial ring portion substantially as described.

## No. 99,972. Wheel. Roue.

Frank P. Pendergast. Dagus Mines, Pennsylvania, U.S.A., 10th July. 1906; 6 years. FHled 9th April, 1906. Receipt No. 134,784.
Claim.-1. In combination, a felly, a channel iron, a tire, and fastenings securing the tire to the channel iron and adapted to interlock the channel iron with the felly by a lateral and circumferential movement of the channel iron on the felly.
2. In combination, a felly, a channel iron, a tire, and fasfenings securing the tire to the channel iron and provided with heads projecting from the inner side of the channel iron, the felly being provided with a circumferential groove tc recelve the fastenings of the tire to interlock the channel iron with the felly.
3. In combination, a felly provided with a circumferential groove, and lateral grooves leading thereto, a channel iron, a tire on the channel iron, fastenings securing the tire to the channel iron and having the heads thereof projecting from one side of the channel iron, the fastenings of the tire being situated at intervals equal to the intervals between the latfral slots on the felly, whereby the heads of the said fastenings may be passed into the lateral slots on the felly, and by circumferential movement of the channel iron caused to interlock in the circumferential groove thereof, and means for preventing circumferential movement of the channel iron after the same has been interlocked with the felly.
4. In combination, a felly, a channel tron thereon, a tire on the channel iron, means carried by the channel iron adapted to interlock the same with the felly, by lateral and circumferential movement of the channel iron on the felly, and reans for preventing circumferential movement of the channel iron after the same has been interlocked with the felly.
5. In combination, a felly, a channel iron, a tire composed of a metallic strip colled upon itself to form a plurality of spring coils, and fastenings securing the coils of the tire at intervals to the channel iron, sald fastenings being adapted to be interlocked with the felly by lateral and circumferential movement of the channel iron thereon.

No. 99,973. Pnoumatic Truck. Camion pneumatique.

A. R. Bannerman, William Summerton and Domald MacDonald, co-inventors, all of Winnipeg, Manitoba, Canada, 10th July, 1906; 6 years. Filed 1st May, 1906. Receipt No. 135,436 .
Claim.-1. An apparatus of the class described comprising a movable truck or base, hollow pistons secured thereto at or near each corner thereof, a vertically movable platform, cylinders secured or attached to said platform and designed to enclose said hollow plstons, and means for controlling fluid to and from said pistons in order to raise and lower sald movable platform.
2. An apparatius of the class described comprising a mova ble truck or base, hollow pistons secured thereto at or near each corner thereof, a vertically movable platform, cylinders secured or attached to sald platform and designed to enclose said hollow pistons, means for controlling fluid to and from said pistons in order to raise and lower eald movable platform, and means carried by sald platform and cooperating therewith so as to move a burden carried by sald platform to one side thereof.
3. An apparatus of the class described comprising a movable truck or base. hollow pistons secured thereto at or near each corner thereof, a vertically movable platform, cylinders secured or attached to sald platform and designed to enclose said hollow pistons, means for controlling fluid to and from said plston in order to raise and lower said movable platform, an endless conveyer carried by baid platform, and means for operating same.
4. An apparatus of the class described comprising a movable truck or base, hollow plstons secured thereto at or near each cornet thereof, a vertically movable platform, cylinders secured or attached to said platform and designed to enclose said hollow pistons, means for controlling fluid to and from said piston in order to ralse and lower said movable platform, rollers journalled to said platform and down each side thereop, an endless conveyer operating around sald rollers and above said platform, and means for operating sald conveyer.
5. An apparatus of the class described comprising a movable truck or base, hollow pistons secured thereto at or near each corner thereof, a vertically movable platform, coflimders secured or attached to said platform and deaigned to fnclose said hollow pistons, means for controlling fluld 10 and from said piston in order to raise and lower said mov'able platform. rollers journalled to sald platform and down each side thereof, an endless conveyer operating around said
rollers and above said platform，friction rollers journalled to said platform and in proximity to each side thereof，over which said endless conveyer passes，and means for operating said conveyer．
6．An apparatus of the class described comprising a mov－ able truck or base，hollow pistons secured thereto at or near each corner thereof．a vertically movable platform，cylin－ ders secured or attacte－to said platform and designed to enclose said hollow pistons，means for controlling fluid to and from said piston in order to raise and lower said mov－ able platform，rollers journalled to said platform and down each side thereof，an endless conveyer operating around said rollers and above sald platform，friction rollers journalled to said platform and in proximity to each side thereof over which sili endless conveyer passes，a plurality of longitu－ dinal slats or strips secured to said conveyer，and means for operating said conveyer．

7．An apparatus of the class described comprising a mov－ able truck or base consisting of longitudinal metallic sup－ ports and upper and lower plates secured at outer ends of same and crosswise thereto，hollow pistons secured to said truck or base by their lower threaded ends extending through said upper and lower plates and the adjacent longitudinal support，nuts screwing on sald threaded ends and against said upper and lower plates，conduits or pipes for a motive fuid opening into sald hollow pistons through an opening in their ends，cylinders secured or attached to said platform and designed to enclose said hollow pistons，and means for controlling fluid to and from pistons in order to raise and lewer said movable platform．
8．In an apparatus of the class described，the combination with a movable platform，of a roller journalled down each side of sald platform，an endless conveyer passed thereover and operating on the upper side of said platform，and means for operating sald conveyer．

9．In an apparatus of the class described，the combination with a movable platform，of a roller journalled down each side of said platform，an endless conveyer passed thereover ard operating on the upper slde of said platform，friction rollers journalled down each side of said platform and in proximity to the side edge thereof in order to keep said end－ less conveyer from contact with the edges of said platiorm， and means for operating said conveyer．
10．In an apparatus of the class described，the combination with a movable platform，of a roller journalled down each side of said platform，an endless conveyer passed thereover and operating on the upper side of said platform，friction rollers journalled down each side of said platform and in proximity to the side edge thereof in order to keep said end－ less conveyer from contact with the edges of said plaform， metallic eyelets secured in said endless conveyer，pins se－ cured to said rollers and operating in said metallic eyelets in order to provide positive means for operating said con－ veyer，and means for operating said rollers．
11．In an apparatus of the class described the combination with a movable platform，of a roller journalled down each side of sald platform，an endless conveyer passed thereover and operating on the upper side of said platiorm，friction rollers journalled down each side of said platform and in proximity to the side edge thereof in order to keep said end－ less conveyer from contact with the edges of said platform， metallic eyelets secured in said endless conveyer，pins secured to said rollers and operating in said metallic egelets in order to provide positive means for operating said conveyer，a plurality of longitudinal slats or strips secured to said con－ veyer，and means for operating said rollers．
12．An apparatus of the class described comprising a mov－ able truck or base，hollow pistons secured thereto at or near each corner thereof and provided with flared heads，a ver－ tically movable platform，cylinders secured or attached to said platiorm and designed to enclose said hollow pistons and provided with small holes in their lower portion，springs within sald cylinders and resting in the bottom thereof and around said hollow piston therein，and means for controlling motive fluid to and from sald pistons in order to raise and lower said movable platform．

## No．99，974．Truck．Camion．

George A．Browne，Tacoma，Washington，U．S．A．．10th July， 1906； 6 years．Filed 5th May，1906．Receipt No．135，589．
Claim．－1．The combination with a rack having side rails and cross beams or bars and whereon lumber or other ma－ terial is placed，of a raising device substantially oval in cross section mounted on said side rails and adapted to rotate thereon，and means for operating said raising device．
2．The combination with a truck having side rails and cross bars whereon the load is placed，of a lifting device provided at one end of said truck and comprising a flattened tubing having a minor transverse axis of less length than the depth of said cross beams，and a major transverse axis of greater length than the depth of said beams，and means for rotating said tubing，substantially as described．

3．The combination with a truck having side rails and cross bars or beams whereon the load is placed，of a lifting device

çムフッ
provided at one end of said truck and comprising a tube sub－ stantlally oval in cross section having reinforcing heads in its ends and sockets therein，and operating levers fitting within said sockets，and said tube being adapted when rotated to lift one end of the load off the truck，substantially as des－ cribed．

4．The combination with a lumber truck having side rails and centrally arranged carrying wheels and cross bars or beams whereon the load is placed，of a lifting device pro－ vided at one end of said truck and consisting of a rotating member substantially oval in cross section，and operating levers provided at the ends of sald member，and said member being adapted when rotated to engage the bottom of the load and lift it off the truck at one end thereof，substantially as described．
5．In a device for transferring lumber from supports onto a truck or from a truck onto suports，the combination with a two whecled truck having cross bearers upon which the load rests when on the truck，of an elevating bolster extending across the width of the truck adjacent to one of the end cross bearers thereof，the thickness of such bolster being approxi－ mately that of the cross bearers of the truck and the width relatively greater，and means for turning sald bolster on its edge so that its greater dimension is interposed between the upper side of the truck and the underside of the load．
6．The combination with a two wheeled truck，of a bolster extending across the width of the truck having a width re－ latively greater than its thickness and having the side and the corner which contact with the load in the act of turning rounded to an appropriate ellipse in cross section，and means for turning such bolster．
7．In a device of the character described the combination with a wheeled truck，of a bolster held across the width of the truck and unattached thereto，the width of such bolster being relatively greater than its thickness and means for turning such bolster on its edge．

No．98，975．Roller Window Screen．
Ecran de fenêtre．

Andrew J．Baker，Adrian，Michigan，U．S．A．，10th July，1906； 6 years．Filed 25 th October，1405．Receipt No．129，553．
Claim．－1．In a window screen the combination of a case，a spring roller therein，a screen upon said roller，guides for embracing the edges of said screen，a sash to which the screen is attached，a movable water shed and means for automatically moving said shed to exclude water from the case when the sash is closed．
2. In a window screen $t\{0$ combination of a case, a spring roller therein, a screen upon said roller, guides for the edges of said screen, a window sash to the bottom of which the screen is attached, a water shed movably mounted upon the case and adapted to close against said sash and means for automatically actuating sald shed when said sash is closed.
3. In a window screen the combination of a spring roller, a screen thereon attachable to the lower rail of a sash, telescovic guides laterally adjustable having ways which embrace the margins of said screen, an adjustable plate extending between the upper ends of said guides and secured to the lower rail of the upper sash, a flexible filed projecting from sald plate into terminal contact with the glass of the lower sash.
4. In a window screen the combination of a case, a roller therein, a screen upon said roller, a window sash to the lower rail of which said screen is attached, a movable water shed mounted on said case, rock shafts having crank arms which engage said shed, projecting ends upon said shafts which lie under said rail of said sash when the sash is closed, whereby upon the closing of the window, the water shed is automatically actuated to close against the outer face of the lower rall of said sash.

No. 99,976. Means of Balancing and Fastening Window Sashes.
Moyen d'assujettir et balancer les croisées de fenêtre.

Anthur Curwood, Campbelltown, Otago, New Zealand, 10th July, 1906; 6 years. Filed 3rd November, 1905. Receipt No. 129,799.
Claim.-1. A device of the character described comprising in combination with a window frame, a sash. racks fixed on the sash, brackets secured to the window frame opposite each side of the sash, toothed wheels revolubly mounted in the brackets and in mesh with the rack, and a balance weight disposed through the bracket and having teeth in mesh with the toothed wheel.
2. A device of the character described comprising in combination with a window frame, a sash, racks fixed on the sash. brackets secured to the window frame at the sides of the sash, toothed wheels revolubly mounted in the brackets and in mesh with the racks, a balance welght having teeth in mesh with the toothed wheels, means for gulding the balance weight, and means for locking the toothed wheels.
3. A device of the character described comprising in combination with a window frame, a sash having a groove formed on each side, a rack fixed in each groove, brackets secured adjacent each side of the sash, toothed wheels revolubly mounted in the brackets and in mesh with the rack, balance weights having teeth in mesh with the toothed wheels, means for guiding the balance weights, locking bars disposed through slots provided in the brackets and passing between the teeth of the toothed wheels, stems upon the locking bars, levers pivoted to the stems, and rods and handles for operating the levers.
4. A device of the character described comprising the combination of a sash, racks secured upon each side of the sash, toothed wheels gearing with the racks, weights disposed at the sides of the sash and having teeth in mesh with the toothed wheels, and means for locking the wheels against rotation.
5. A device of the character described comprising in combination with a window frame, sashes, racks fixed in the sashes, brackets secured to the window frame, toothed wheels revolubly mounted in the brackets, said wheels being in mesh with the racks, balance we ghts disposed through the brackets and having terth in mesh with the toothed wheels. locking bars disposed through slots provided in the brackets and adapted to engage the teeth of the wheels, stems on the lock. ing bars, levers pivoted to the stems, and rods and handles on the levers.

## No. 99,977. Fastener for Window Sashes.

 Attache pour chessis de fendtre.

Arthur Curwood, Campbelltown, Otago, New Zealand, 10th July, 1906; 6 years. Filed 3rd November, 1905. Receipt No. 129,800 .
Claim.-In a device of the character described in combination with a frame and a sash slidably disposed therein, a plate provided with openings and secured to the sash, a casing fixed within the frame and provided with a slot, a toothed wheel rotatably mounted in the casing and in mesh with the rack, a second casing secured within the frame adjacent the first casing, a locking bar disposed in the second casing and in engagement with the toothed wheel and provided with a handle having an integral stem, and a coil spring disposed on the stem.

No. 99,978. Latch. Loquet.

David Cassels, Portage la Prairle, Manitoba, Canada, 10th July, 1906; 6 years. Filed 12th March, 1906. Receipt No. 133,839.
Claim.-1. In a latch the combination with a keeper loop, of a sliding and swinging member having a loop at one end and also having a hook at the opposite side of the sald loop with reference to the romainder of the member.
2. In a latch the combination with a horizontally disposed keeper loop, of an endwise and vertically movable member having a depending loop at one end and also having a hook at the opposite side of the said loop with reference to the remainder of the member.
3. In a latch the combination with a horizontally disposed keeper loop, of a vertically and endwise movable member having a handle at an intermediate polnt of Its length and a closed loop or eye at one end and also having a depending loop at its opposite end and a hook at the opposite side of the depending loop, with reference to the remainder of the member and a loop resting loosely in the loop or eye of the member and adapted for attachment to a gate or the like.
4. The combination in a latch of a kecper and an endwise and laterally movable member, the said keeper and member being provided with co-operating means whereby disconnection of the member from the keeper is prevented when the member is moved in but one of the directions mentioned.
5. The combination in a latch, of a keeper, and an endwisc and laterally movable member, the said keeper and member being provided with co-acting means for preventing disconnection of the two when the member is swung laterally in one direction or the other and for preventing disconnection of the two when the member is moved in the direction of its length.

No. 99,979. Bucksaw Frame. Cadrc de scie.

Jerome C. Dietrich, Galt, Ontario, Canada, 10th July, 1906; 6 years. Filed 25th April, 1906. Receipt No. 135,259
Claim.-1. A bucksaw comprising a saw blade, end pleces and cross brace suitably connected in combination with two diagonal braces each comprising a wire rod doubled on itself around an end piece, and having its ends brought close together, and a plate secured to the upper side of the cross brace to which the ends of the diagonal braces are suitably secured, substantially as described.
2. A bucksaw comprising a saw blade, end pieces and cross brace suitably connected, in combination with two diagonal braces each comprising a wire rod doubled on itself around an end piece, and having its ends brought close together, and bent to form hooks, and a plate secured to the upper side of the cross brace provided with a hole with the ends of which the hooked ends of the diagonal braces may be engaged, substantially as described.

No. 99,980. Tobacco Cutter. Couteall à tabac.

Napoleon Du Brul, Cincinnati, Ohio, U.S.A., 10th July, 1906; 6 years. Filed 5th April, 1905. Recelpt No. 124,014.
Claim.-1. In a tobacco cutting machine, a feeding mechanism comprising a series of compression rolls and means for making these rolls self adjusting about two different centers.
2. In a tobacco cutting machine, a feeding mechanism comprising a plurality of compression rolls in which the one last acting upon the tobacco is self adjusting about a center from which it is driven and in which a primary compression roll is relatively self adjusting about the center of the compression roll last acting upon the tobacco.
3. In a tobacco cutting machine, a feeding mechanism comprising an adjustable frame, a final feeding roll carried thereby, a swinging frame carried by the adjustable frame and a primary feeding roll mounted on the swinging frame and swinging independently of the final compression roll.
4. In a tobacco cutting machine the combination of a reciprocating knife with a continuous feeding mechanism embodying a lower series of rolls, and an upper series of rolls adjustable relatively to the lower series of rolls and to one another.
5. In a tobacco cutting machine the combination with a lower series of rolls, of an upper series of rolls, of which those first acting on the tobacco are automatically selfadjusting in an arc concentric with the axis of, and are gearid to, the roll last acting.
6. In a tobacco cutting machine, a feeding mechanism em bodying a swinging frame, a gear wheel journalled on an axis in alignment with the pivot of the irame, a roll carried by said swinging frame and geared to said gear wheel, a second frame swung on the axis of said roll, a roll or rolls carried by said second frame and geared to the first-mentioned roll and a weight connected to the second-named frame near its fulcrum on the first-named frame and thereby acting on both swinging frames.
7. In a tobacco cutter the combination with the continuous feeding mechanism, of a knife and mechanism for causing the knife to make a draw cut on its down stroke and to move away from the material in the direction of its feed, on its up stroke, so that the material may be continuously fed.
8. The combination with the continuous feeding mechanism, of a knife holder, vibratory links connected to the knife holder in such manner as to cause an endwise reciprocation thereof, and a crank shaft also connected to the knife holder.
9. In a machine for cutting tobacco the combination with the drive shaft, carrying a gear, of feeding rolls, a shaft for operating the feeding rolls, a gear carried thereby, a swinging arm journalled on said shaft, and a reducing gear carried by the swinging end of the arm and geared to the drive shaft and the feed roll operating shaft, and a knife operated cont!nuously from the drive shaft.
10. In a machine for cutting tobacco the combination with the feeding rolls, of a drive shaft. reducing gearing between the drive shaft and the feeding rolls constructed to continuously operate the rolls and a knife operated continuously from the drive shaft.
11. In a tobacco feeding mechanism. a plurality of independently and relatively self adjusting rolls acting successively upon the tobacco.
12. In a tobacco cutting machine. a feding mechanism embodying a swinging frame, a roll journalled thereon, a frame swinging on the first-mentioned frame, and rolls carried by the second frame.
13. In a tobacco cutting machine. a feeding mechanism tmbodying a swinging irame, a roll journalled thereon. a frame swinging on the first-mentioned frame, rolls carried by the second frame and a weight acting on both frames.
14. In a tobacco cutting machine, a feeding mechanism embodying a swinging frame, a gear wheel journalled on an axis in alignment with the pivot of the frame, a roll carried by the swinging frame and geared to said gear wheel, a second frame swung on the axis of said roll, and rolls carried by the second frame and geared to the first-mentioned roll.
15. In a tobacco cutting machine, a feeding machanism embodying a swinging frame, a gear wheel journalled on an axis in alignment with the pivot of the frame, a roll carried by said swinging irame and geared to said gear wheel, a second frame swung on the axis of said roll, a roll or rolls carried by said second frame and geared to the first-mentioned roll and a weight acting on both swinging frames.
16. In a tobacco cutter, the combination with the continuous feeding mechanism, of a knife, and mechanism for causing the knife to make a draw cut on its down stroke and move out of the path of the material on fis up stroke, so that the material may be continuously fed.
17. In a tobacco cutter. the combination of an oscillating frame, and a knife having a draw cut movement on said frame.
18. In a tobacco cutter, an oscillatory frame, a knife holder guided on the frame, a swinging link connected at one end to the frame, and the other end to the knife holder, a lever connected at one end to the knife holder, and mechanism causing the other end of the lever to move in a circular path.
19. In a tobacco cutter, an oscillatory frame, a knife holder guided in an oblique path thereon, a lever connected at one cnd to the knife holder, and mechanism causing the other end of the lever to travel in a circular path.
20. A tobacco cutter comprising a frame, a crank shaft journalled thercon, a lower series of feed rolls, a reducing gear connecting the crank shaft and the lower series of feed rells. an upper series of feed rolls geared to the lower series of feed rolls and adjustable relatively to the lower series oi feed rolls and to one another, an oscillatory frame mount pd on the main frame near the mouth of the feed, a knife tholder guided on said frame and a lever connected at one cond to the knife holder and at its other end to the crank sbaft.
21. In a tobacco cutter, the combination with the cont'nuous feeding mechanism, of a knife, and mechanism causing the knife to make a draw cut and to oscillate out of the way of the material in the direction of its feed.
22. In a tobacco cutter, the combination of an oscillatory frame, and a knife having a reciprocating movement on the frame and a lever connected at one end to the knife and at its other end to a part having a rotary movement.
23. In a tobacco cuttor, an oscillatory frame, a knife holder guided on the frame, a swinging link connected to the frame
and to the knife holder, and mechanism for moving the knife and causing the frame to oscillate.
24. In a tobacco cutter, an oscillatory frame, a knife holder guided in an oblique path thereon, a lever connected at one end to the knife holder and a crank shaft connected to the other end of the lever.
25. A continuous feed reciprocating tobacco cutter comprising continuously revolving feed rolls, a mouth to which tobacco is delivered by said rolls to be cut, a knife mounted at an angle to the plane of said mouth, moving downward in suitable relation to cut tobacco protruding therefrom and mounted to rock upon an axis in a horizontal plane passing through the knife, a crank shaft suitably mounted upon the lower portion of the machine beneath the knife parallel to the rocking axis of the knife, and a connection between the crank of said shaft, and the knife through which the downward cutting movement is imparted to the knife during the downward rotation of the crank, an outward rocking movement to remove the blade from the mouth and an upward movement to said blade is imparted during the upward movement of the crank.
26. The combination with the drive shaft, of a feeding mechanism, reducing gear connecting the drive shaft and the feed mechanism, constructed to cause the continuous operation of the feed mechanism, a reciprocating knife and means for causing it to oscillate about an axis in a horizontal plane intersecting the knife, while it is reciprocated by the crank shaft.
27. In a machine for outting tobacco, the combination with the drive shaft carrying a gear, of feeding rolls, a second shaft parallel to the first for operating the feeding rolls, a gear carried thereby, a swinging arm journalled on said second shaft, and a reducing gear carried by the swinging end of the arm and geared to the drive shaft and the feed loll operating shaft.
28. In a machine for cutting tabacco, the combination with the drive shaft carrying a gear, of feeding rolls, a shaft for operating the feeding rolls, a gear carried thereby, a awinging arm journalled on said shaft, and a reducing gear carried by the $s$ winging end of the arm and geared to the drive shaft and the feed roll operating shaft, and a pitman driven knife operated continuously from the drive shaft.
29. In a machine for cutting tobacco having continuously rotating feed rolls, the tobacco feeding rolls, a drive shaft, a reciprocating cutter operated through an arcuate path by the drive shaft, a pinion secured to the drive shaft, an intermediate reducing gear driven by sald pinion, a reducing gear leading to feed rolls driven by the intermediate reducing gear.

No. 99,981. Door Knob. Bouton de porte.

Joseph T. Henderson, Niagara Falls, Ontario, Canada, 10th July. 1906; 6 years. Filed 7th April, 1906. Receipt No. 134.703.

Claim.-The combination of a knob spindle having a portion of angular form in cross section and also having a threaded end portion, a hollow knob movable on said spindle in the direction of the length thereof and having an extension provided with an angular opening recelving the angular portion of the spindle and also having an exteriorly rounded back wall and a countersunk tapered opening in the center of said back wall, and a tubular follower of circular form in cross section having a threaded bore receiving the threaded end of the spindle and also having a bevelled head at its outer end disposed in the tapered countersink of the knob and provided with an outer side shaped in conformity to and arranged flush with the exterior of the knob.

## No. 89,982. Tobacco Pipe. Pipe ì fumer.

Patrick Alfred Kenna, Sydney, New South Wales, Australia, 10th July, 1906; 6 years. Filed 26th February, 1906. Receipt No. 133,323.
Claim.-1. A tobacco pipe comprising a bowl, a stem, a projection for the free end of the stem and of less dimensions
than the dimensions thereof, a smoke passage through the projection and stem communicating with the chamber of the

bowl, a saliva chamber removably fitted on the free end of the stem and enclosing the projection and having an unobstruced passage therethrough, a sleeve fitted on the free end of the projection having a baffle opposed to the smoke passage and having an aperture in its oottom surface adjacent to the baffle to permit of the egress of the smoke from the smoke passage into the saliva chamber, and a mouth piece fitted to the sallva chamber having a projection extending therein with a smoke passage through the projection and mouth piece.
2. A tobacco pipe comprising a bowl, a stem for the bowl with a smoke passage therethrough, a tube fitted into the smoke passage and extending beyond the free end of the stem, a sleeve fitted on the projecting end of the tube and having a baffle opposed to the end thereof and an opening in its under side adjacent to the baffle to permit of the egress of the smoke therefrom, a saliva chamber fitted on the free end of the stem to enclose the projecting end of the tube and a mouthpiece fitted to the saliva chamber and having a smoke passage therethrough.
3. A tobacco pipe comprising a bowl, a stem for the bowl, with a smoke passage therethrough, a tube fitted into the smoke passage and extending beyond the free end of the stem, a sleeve fitted on the projecting end of the tube anil having a baffle opposed to the bore thereof and an opening in its underside adjacent to the baffle to permit of the egress of the smoke therefrom, a saliva chamber fitted on the free end of the stem to enclose the projecting end of the tube $a$ mouthpice fitted to the saliva chamber and having a projection extending therein with a smoke passage through the mouthplece and projection.
4. A tobacco pipe comprising a bowl, a stem for the bowl having a smoke passage therethrough communicating with the chamber of the bowl, a saliva chamber fitted on the free end of the stem, a tube fitted into the smoke passage of the stem and above the bottom of the saliva chamber and having its bore communicating with said smoke passage, a tubular baffle fitted on the tube with its closed end opposed to the bore thereof and having an opening for the egress of th. smoke into the saliva chamber, and a mouthplece fitted to the saliva chamber having a projection extending therein.

No. 99,983. Vehicle Seat. siège de voiture.

William Samuel Laycock, Sheffeld, England, 10th July, 1906; 6 years. Filed 6th October, 1906. Receipt No. 129,021.
Claim.-In a rallway seat the combination with the seat, back and frame on which the seat normally rests, of arms supporting the back, pins secured thereto extending through slots in the frame, levers pivotally connected to said arms and connected at their opposite ends to the seat, pins or projections secured to sald levers, slots secured in the frame through which said pins or projections extend, cam surfaces on the ends of the arms carrying the seat back and fixed pins secured to the frame which said cam surfaces are adapted to engage, as and for the purpose specified.

No. 99,984. Vestlette for Conductors. Veste pour conducteurs.

Orville Nelson, McClintock. Cleveland, Ohio, U.S.A., 10th July. 1906; 6 years. Filed 2nd April, 1906. Receipt No. 134,513
Claim.-1. In a detachable front for conductor's use the combination of a main or body portion of flexible material, of integral shoulder straps thereon, straps attached thereto and adapted to cross over the back of the wearer, buttons riveted upon the inner edges of the front and eyes upon the outer ends of the straps adapted to engage therewith, a back strap adjustable in length provided with an eye at elther end, buttons upon the inner edges of the front adapted to be engaged thereby, and up upper row of pockets entirely across the front face of the front, a central row of coin pockets on said front face, and a strip covering the lower portion of said front having its upper corners cut away and separated into side and center pockets, and means for reinforcing said pockets consisting of double lines of stitching about the outer edge of the said strip, and double lines of stitches separating the center and side pockets, and intersecting delow the central pocket.
2. In a detachable front for the purposes described the combination with a body portion, of integral shoulder straps, crossed straps attached thereto and provided with eyes at their outer ends, buttons riveted upon the innor edges of the body portion to which the eyes are attached, a back strap adjustable in length and provided with eyes at its outer ends, buttons riveted in the inner edges of the body portion to which eyes in the back strap are attached, a series of ticket pockets across the upper part of the body portion composed of a strip of flexible material having rows of stitches separating the pockets and about the lower margin, means for securing the upper corners of said strip consisting of the riveted buttons in which the cross straps are attached, an intermediate row of coin pockets similarly formed upon the body portion, and a lower row of larger pockers, composed of a strip of material sewed to the lower edge and sides of the body portion and separated into three pockets by means of central seams defining a shield-shaped central pocket and intersecting below said pocket, the upper corners of said lower strip being cut away, a hook secured at said intersecting points of said seams, and a reinforcement for the upper corners of sald lower strip consisting of the riveted buttons to which the back strip is attached.
3. The combination in a vestlette of shoulder straps therefor having terminal metal eyes, buttons upon the edge of the vestlette to which the eyes are secured, a detachable back strap therefor having an adjustable loop, an eye in said loop, an eye secured to the opposite end of the back strad.ralid riveted buttons upon the back of the vestlette, to which said eyes are attached, series of pockets formed transversely across the front of the vestlette, in upper, middle and lower rows, the said rivets to which the back strap is secured being inserted within the outer edges of the outer pockets of the lower row, for the purposes described and the central pockets of the middle and lower row being formed by double rows of vertical stitches coming together and intersecting to form a central loop near the lower edge of the vestlette, as and for the purpose described.
4. In a vestlette for conductor's or analogous uses, a body of flexible material, a transverse row of short upper small pockets for tickets, transfers and similar articles, a central overlapping row of larger pockets for coins and tools, and a lower row of large pockets for bills, rivets within the margins of the outer pockets on the lower row forming stops and reinforcing means therefor, and $V$-shaped seams separating the central pockets of the middle and lower row, said seams intersecting at the lower end to enclose a space, and a metal hook secured within said space, substantially as described.

No. 99,985. Releasing Hook or Block.
Crochet ou poulie d déclic.

Angus A. McIntosh, Alexandria, Ontario, Canada, 10th July. 1906; 6 years. Filed 3rd April, 1906. Receipt No. 134,566 Claim.-1. A releasing hook comprising a rigid shank, offset at one end, a rigid member pivotally connected to the offset end, a latch at the opposite end of the shank, for engaging the free end of the member to retain the hook in locked position, the member when in locked position being inclined relative to the shank and having its free end lying past dead center and nearer the shank than the pivotal point of the member and shank.
2. A device comprising a shank, a member pivotally connected thereto and capable of movement toward and from the shank, means for connecting the free end of the member and the shank to leave a space therebetween and enlargement on the member near its free end for closing the throat of said space.
3. A device comprising a shank, a member pivotally secured at one end thereto, links pivotally secured to the shank, shoulders for limiting the movement of the links and a latch pivotally mounted between the links and adapted to engage and lock the free end of the member in closed position.
4. A device comprising a plurality of members pivotally connected at one end, links pivotally secured to one of the members and adapted to embrace the remaining member and a latch pivotally mounted between the links and adapted to engage the free end of the member to lock the member in closed position.
5. A device comprising a shank recessed at one edge, a member pivotally secured to the shank, a latch. the outer periphery of the head of which is adapted to be received and turn in the recess, the latch adapted to retaln the member in closd position and means for pivotally connecting the latch and shank.
6. A device comprising a shank, a member pivotally secured thereto, a latch suitably conncted to the shank for locking the pivoted member in closed position, the member provided with a recess at its free end and a tooth on the latch adapted to take into the recess to throw the pivoted member outward as the device is unlocked.
7. A device comprising a shank, a member pivotally secured tiereto, a latch suitably connected to the shank and having a recess formed therein to receive the free end of the member and a tooth on the free end of the member adapted to engage one corner of the recess and forming a center about which the latch moves through a part of its path.
8. A device comprising a shank, a member one end of which is pivotally secured thereto, a curved face located on the free end of the member, and a latch pivotally connected to the shank and having a recess formed therein to receive the free end of the member, one wall of the recess being curved in conformity with the curved face to facilitate the entrance of the free end of the member into the recess.
9. A device comprising a shank. a member, one end of which is pivotally secured thereto, connecting means pivoted to the shank, a recessed latch pivotally secured to the connecting means and adapted to receive the free end of the member when in closed position, the latter lying out of allgnment with the pivotal points of the latch and connecting means when in closed position.
10. A device comprising a shank, a member pivoted at one end thereto, links pivoted to the shank, a latch plvoted between the free ends of the links and adapted to lock the member in closed position, the free end of the member when in locked position extending out of allgnment with the pivotal points of the links and latch
11. A device comprising a shank, a member, one end of which is pivoted to the shank, the outer face of the member near its free end being recessed, a latch pivotally connected
to the shank and adapted to engage and lock the member in closed position, a faced portion on the latch received in the recess in the member and a tall on the latch offset from the member and latch.
12. A releasing hook comprising an offset shank, a member pivotally secured at one end to the offiset, a recessed latch pivotally connected with the shank, the free end of the member recelvable in the recess and adapted to be kicked by the rotation of the latch over dead center in one dirction or the other.

No. 99,986. Cream Separator. Séparateur d créme.

Lauchlan Allan McLean, Toronto, Ontario, Canada, 10th July,
1906; 6 years. Filed 3rd April, 1906. Recelpt No. 134,169.
Claim.-1. In a machine of the class described in combination, a base and frame arising therefrom having offset portlons at the top thereof forming a receptacle for the operatIng mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, a vertically adjustable step bearing in said casing, a tubular bowl supported in said bearing, a spindle extending upwardly from said bowl, a vertically adjustable bearing in said receptacle, a spindle journalled in said bearing and extending downwardly and coupled to said bowl spindle, spindle operating means within the aforesaid receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specifled.
2. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, a vertically adjustable step bearing in said casing, a tubular bowl supported in said bearing, a spindle extending upwardly from sald bowl above the top of said casing having lateral projections extending therefrom, a vertically adjustable bearing in said receptacle, a spindle supported in said bearing and extending downwardly therefrom having a reduced portion engaging said bowl spindle, a coupling sleeve slidably arranged on said spindle having slots to engage the lateral projections on said bowl spindle, spindle operating means within the aforesaid receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specifled.
3. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath no of said offset portions, a vertically adjustable step bearing in said casing. a tubular bowl supported in said bearing, a spindle extending upwardly from sald bowl above the top of said casing having a recess in the top thereof and lateral projections extending therefrom, a vertically adjustable bearing in said receptacle, a spindle supported in said bearing and extended downwardly therefrom having a squared portion and flange below said squared portion and reduced lower end engaging the recess in said bowl spindle, a hollow coupling sleeve having a squared opening slidably arranged on the squared portion of sald spindle and L-shaped slots to engage the lateral projections on said bowl spindle, a spiral spring surrounding said upper spindle and engaging said coupling sleeve, spindle operating means within the aforesaid receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specified.

7-10
4. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, discharging compartments enclosing the top of said casing having a vertical central orifice therethrough, a vertically adjustable step bearing in said casing, a tubular bowl journalled in said step bearing, a spindle extending upwardly from said bowl and protruding through and beyond said discharge compartments, a vertically adjustable bearing in said receptacle, a spindle supported from said bearing and extending downwardly and coupled to said bowl spindle, spindle operating means within the aforesaid receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specified.
5. In a machine of the class described in combination, a base and framefarising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, a semi-cylindrical casing projecting upwardly therefrom and forming part with said casing, a semi-cylindrical casing abutting the aforesald semi-cylindrical casing and hinged thereto, annular flanges from said casings forming part with the halves thereof and forming discharge compartments, a suitable packing inserted in the edges of one of said half casings and abutting the other half, means for securing said halves firmly together, a vertically adjustable step bearing secured in the bottom of said longitudinal casing, a tubular bowl journalled in said step bearing, a spindle extending upwardly from said bowl and protruding above the annular flanges in said top casing, a vertically adjustable bearing in said receptacle, a spindle supported from said bearing and extending downwardly and coupled to said bowl spindle, spindle operating means within the aforesald receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specifled.
6. In a machine of the class described in combination, a base and frame arising therefrom having forwardly and rearwardly extending portions forming a receptacle, of a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, discharge compartments enclosing the top of said casing having a vertical orifice therethrough, a vertically adjusiable step bearing in said casing, a tubular bowl having a removable bottom end journalled in said step bearing, a vertical spindle projecting upwardly from said removable bottom havIn a central orifice therein and a plurality of onenings therethrough communicating with said central orifice, a spindle extending upwardly from said bowl and projecting through and beyond said discharge compartments, a vertically adjustable bearing in said receptacle, a spindle supported from said bearings and extending downwardly and coupled to said bowl spindle, spindle operating means within the aforesaid receptecle, and a milk receptacle having communication with said bowl, as and for the purpose specifled.
7. In a machine of the class described in combination, a base and frame arising therefrom having forwardly and rearwardly extending portions forming a receptacle, of a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions. discharge compartments enclosing the top of suld casing having a vertical oriflce therethrough, a vertically adjustable step bearing in said casing, a tubular bowl having a removable bottom and journalled in said step bearing, a vertical spindle projecting upwardly from said removable bottom having a central orifice therein, and a plurality of openings therethrough communicating with said central orifice, and a plurality of vertical slots in the exterior surface of sald spindle arranged alternately with said openings, ribs or wings inserted in said slots and extending outwardly from said spindle, a spindle extending upwardly from said bowl and projecting through and beyond said discharge compartments, a vertically adjustable bearing in said receptacle, a spindle supported from said bearing and extending downwardiy and coupled to said bowl spindle, spindle operating means within the aforesaid receptacle, and a milk receptacie having communication with said bowl, as and for the purpose specifled.
8. In a machine of the class described in combination, a base and frame arising therefrom having forwardly and rearwardly extending portions forming a receptacle, of a casing projecting outwardly therefrom and longitudinally with the standard of sald frame beneath one of sald uffet portions, discharge compartments enclosing the top of said casing having a vertical orifice therethrough, a vertically adjustable step bearing in said casing, a tubular bowl having a removable bottom and journalled in said step bearing, a vertical spindle projecting upwardly from sald removable bottom having a central orifice therein and a plurality of openings therethrough communicating with said central orifice and a plurallty of vertical slots in the exterior surface of said spindle arranged alternately with said openings, ribs or wings in-
serted in said slots and extending radially therefrom and abutting the interior surface of said bowl and downwardly abutting the interior surface of said removable bottom, a spindle extending upwardly from said bowl and projecting through and beyond said discharge compartments, a vertically adjustable bearing in said receptacle, a spindle supported from said bearing and extending downwardly and coupled to said bowl spindle, spindle operating means within the aforesaid receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specified.
9. In a machine of the class described in combination, a base and frame arising therefrom having forwardly and rearwardly extending portions forming a receptacle, of a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, discharge compartments enclosing the top of said casing having a vertical orifice therethrough, a vertically adjustable step bearing in said casing, a tubular bowl journalled in said step bearing having a removable cap at the upper end thereof and a central threaded recess in the underside thereof, an inverted cup having a centrally disposed projection in the top thereof externally threaded to engage the threaded recess in said cap and vertical depending sides in close proximity to the interior surface of said bowl, a spindle rising from said cap and projecting through and beyond said alscharge compartments and having discharge recesses therein communicating with said bowl and the interior of said cup and leading to said discharge compartments, a vertically adjustable bearIng in said receptacle, a spindle supported from said bearing and retending downwardly and coupled to said bowl spindle, spindle operating means within the aforesaid receptacle, and a milk receptacle having communication with said howl, as and for the purpose specified.
10. In a machine of the class described in combination, a base and frame arising from having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath cre of said offset portions, a vertically adjustable step bearing in said casing, a tubular bowl supported in said bearing, a spindle extending upwardly from said bowl above the top of said casing, a ledge or projection in said receptacle having an orifice therethrough, a cylindrical journal box secured in said orifice, a spindle supported in said bearing and extending downwardiy therefiom and coupled to said bowl spindle, spindle operatiing means within the aforesaid receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specified.
11. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of sald offset portions, a vertically adjustable step bearing in said casing, a tubular bowl supported in said bearing, a spindle extending upwardly from said bowl above the top of said casing, a ledge or projection in said receptacle having an orifice therethrough, a cylindrical journal box secured in said orifice and having a central orifice in the bottom thereof, an inverted cup slidably arranged within said cylindrical journal box, a spindle coupled to said bowl spindle having a reduced upper end extending through said orifice, a head fixedly secured to said spindle having a bevelled upperside and a bevelled lower side and located within sald cylindrical journal box, ball bearings inserted in said journal box between the corner of said journal box and the develled lower side of said head and between the corner of said inverted cup and the top bevelled side of said head, yielding means for retaining said inverted cup and its bearings in engagement with said head, a spindle operating means within the aforesaid receptacle, and a milk receptacle having communication with said bowl, as and for the purpose specified.
12. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, a tubular bowl suitably supported in said casing, a spindle extending upwardly from said bowl, a spindle adjustably journalled in said receptacle and extending downwardly and coupled to said bowl spindle, a pulley fixedly secured to said spindle, journal bearings secured in the sides of said receptacle, a shaft journalled in said bearings, journal bearings adjustably arranged in said receptacle, means for adjusting said bearings, a shaft journalled in said bearings, means for rotating said shaft, pulleys mounted on said shafts and connected together and with the aforesaid spindle pulley by suitable belts, and a milk receptacle having communication with said bowl, as and for the purpose specifled.
13. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mech-
anism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, a tubular bowl suitably supported in said casing, a spindle extending upwardly from said bowl, a spindle adjustably journalled in said receptacle and extending downwardly and coupled to said bowl spindle, a pulley fixedly secured to said spindle, journal bearings secured in the sides of said receptacle, a shaft journalled in said bearings, journal bearings adjustably arranged in said receptacle, means for adjusting said bearings, a shaft journalled in said bearings, means for rotating said shaft, a pulley fixedly secured to said shaft, a pulley fixedly secured to the shaft journalled in the fixed bearings and connected with said pulley by a suitable belt, a pulley fixedly secured to the shaft journalled in the fixed bearings, a pulley loosely mounted on the aforesaid shaft journalled in the adjustable bearings and connected with the aforesaid pulley by a suitable belt, a pulley fixedly secured to the said loose pulley and loosely mounted on the adjustable shaft connected with the pulley on said spindle, and a milk receptacle having communication with said bowl, as and for the purpose specified.
14. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, a tubular bowl suitably supported in said cesing, a spindle extending upwardly from said bowl, a spindie adjustably journalled in said receptacle and extending downwardly and coupled to said bowl spindle, a pulley fixedly stcured to said spindle, journal bearings secured in the sides of said receptacle, a shaft journalled in said bearings, journal bearings adjustably arranged in said receptacle, means for adjusting said bearings, a shaft journalled in said bearings, a crank loosely mounted on said shaft at one end thereof having recesses therein and spring-held ratchet pins iv said recesses, a collar fixedly secured to the end of said slaft and abutting said crank and having sloping recesses in the inner face thereof to engage said ratchet pins, pulleys mounted on said shafts and connected together and with the aforesaid spindle pulley by suitable belts and rotated by said crank shaft, and a milk receptacle having communication with said bowl, as and for the purpose specified.
15. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mechanism and slots in the sides thereof, a casing projecting outwardly therefrom and longitudinally with the gtandard of sald frame beneath one of said offset portions, a tubular bowl suitably supported in said casing, a spindle extending upwardly from said bowl, a spindle adjustably journalled in said receptacle and extending downwardly and coupled to said bowl spindle, a pulley fixedly secured to said spindle, journal bearings fixedly secured in the sides of said receptacle, a shaft journalled in said bearings, journal bearings located in the slots in said receptacle, a slidable yoke located within said receptacle and embracing said bearings, means secured to said yoke protruding through the casing of said receptacle for adjusting said yoke, a shaft journalled in said bearings, means for rotating said shaft outside of said receptacle, pulleys mounted on said shafts and connected together and with said spindle pulley by sultable belts and rotated 'by said crank shaft, and a milk receptacle having communication with said bowl, as and for the purpose specifled.
16. In a machine of the class described in combination, a base and frame arising therefrom having offset portions at the top thereof forming a receptacle for the operating mecha nism, a casing projecting outwardly therefrom and longitudinally with the standard of said frame beneath one of said offset portions, a tubular bowl suitably supported in said casing, a spindle extending upwardly from said bowl, a spindle adjustably journalled in said receptacle and extending downwardly and coupled to said bowl spindle, spindle operating means within the aforesaid receptacle, a milk receptacle supported from said frame, a feed tube having communication with said milk receptacle and extending within said casing and terminating near the bottom thereof, a U-shaped tube having one end engaging the end of said feed tube and extending below the said casing and having communication with the said bowl, and adjustable means for retaining said $U$-shaped tube in position, as and for the purrove specified.

No. 99,987. Cess Pool. Puisard.
Edward L. Parsons. St. John, New Brunswick, Canada, 10th July, 1906; 6 years. Filed 9th March, 1906. Recelpt No. 133,716.
Claim.-In a cess pool, the combination of a receiving chamber having sewer connection, an air chamber at the base thereof and extending beyond the same, a blind drain
of an area equal to that of the air chamber and an air circulating pipe connecting the receiving chamber with the air

chamber, substantially in the manner and for the purpose set forth.

## No. 89,888. Arle Nut. Noiه d'essieuc.

William S. Pugsley, London, Ontario, Canada, 10th July, 1906; 6 years. Filed 14th February, 1906. Receipt No. 132,902.
Claim.-1. In an adjustable locking axle nut, a spindle nut provided with an external annular locking shoulder or flange, and an annular ring or ball race adjustable on said spindle rut, in combination with a jam or lock nut adjustable on said annular ring or ball race, and the end of said jam or lock nut adapted to engage with said annular locking flange or shoulder on said spindle nut, to lock sald annular ring or ball race in place.
2. In an adjustable locking axle nut, the combination with a spindle nut provided with an external annular locking flange or shoulder and with a screw thread on its outer face and an annular ring or ball on its internal and external faces, the screw threaded inner face of which is adapted to engage with the screw threaded exterior face of said spindle nut, of a jam or lock nut screw threaded on its Internal face, which is adapted to engage with the screw threaded exterior face o. said annular ring or ball race, and the end of the jam or lock adapted to engage with said locking shoulder or flange of sald spindle nut, to rigidly hold and lock the annular ring or ball race in place.
3. In an adjustable locking axle nut, a spindle nut provided with an external annular locking flange or shoulder and with a screw thread on its outer face, ball races one of Which is formed screw-threaded on its interior and exterior faces, and the other plain and provided with an external annular flange, and ball bearings between said ball races, in combination with a jam or lock nut provided with an internal flange and with a screw thread on its internal face adapted to engage with the screw-threaded ball race and said locking fiange or shoulder on said spindle nut.
4. An adjustable locking axle nut comprising a spindle nut provided with an external annular locking shoulder or flange, an annular ring or ball race adjustable on said spindle nut, and a jam or lock adjustable on sald annular ring or ball race and adapted to engage with said annular locking shoulder or flange on said spindle nut, in combination with an axle spindle formed with a reduced screw-threaded portion and a shoulder on said spindle at the inner end of said reduced screw-threaded portion and an axle box on said spindle.
5. An adjustable locking axle nut. comprising a spindie nut provided with an external annular locking shoulder or flange, ball races adjustable on said spindle nut, bearing balls between sald ball races, and a jam or lock nut adjustable on one of said ball races, and adapted to engage with
said annular locking shoulder or flange on said spindle nut, in comblnation with an axle spindle formed with a reduced screw-threaded portion and a shoulder on said spindle at the inner end of said reduced screw-threaded portion and an axle box on said spindle.
6. In an adjustable locking axle nut, a spindle nut provided with an external annular locking shoulder or fiange, and an annular ring or ball race adjustable on said spindle nut and provided with a right hand screw thread on its outer face, it combinaton with a jamb or lock nut provided with a left hand screw thread on its interlor face and adjustable on said exteriorly screw-threaded annular ring or ball race.
7. In a device of the class described, a vehicle axle, a spindle on each end of sald vehicle axle, and an axle box on each of said spindles, in combination with spindle nuts one of which is secured on the outer end of each of said spindles, and each provided with an external annular locking shoulder or flange, an annular ring or ball race adjustable on each of said spindle nuts, and a jam or lock nut adjustable on each of said annular rings or ball races, and adapted to engage with the locking shoulder or flange on the spindle nut on which it is mounted, and a right hand screw thread formed on the exterior face of the annular ring or ball race at the other end of the axle, and a left hand screw thread formed on the inner face of the jam or lock nut that engages with the annular ring or ball race with the right hand screw thread, and a right hand screw thread formed on the inner face of the jam or lock nut that engages with the annular ring or ball race with the left hand screw thread on its outer face.

No. 99,989. Top Rest for Carriages.
Apput-soufliet de voitures.

William Roland Roote, Guelph, Ontario, Canada, 10th July,
1906; 6 years. Filed 7th May, 1906. Receipt No. 135,621.
Claim.-A top rest for the tops of buggies or carriages, consisting of a suitable shaped rubber cushion or bumper held in position by and in combination with a square metallic sleeve for the purpose of attaching the same to the back prop, substantially as hereinbefore described.

No. 99,990. Canopy for Vehicles.
Couverture de véhicules.

James R. Ryan, Sault Ste. Marie, Michigan, U.S.A., 10th July.
1906; 6 years. Filed 12th May, 1906. Receipt No. 135.847.
Claim.-1. In a canopy in combination with a base irame adapted to rest upon the seat of a vehicle, extensible slde pleces at each end of said base frame and normally rising perpendicularly thereto, adapted to lle therewithin when not in use, coupling pieces adapted to hold the side pieces apaced when raised, a cover adapted to be drawn thereover, and an apron extending across the front of the frame, substantially as described.
2. A canopy frame having in combination a base adapted to retreat on a vehicle seat, jointed standards adapted to fo!d into the base, coupling members adapted to connect the standards, a cover to be drawn over said frame, an apron to engage the cover and enclose the front of said frame, substantially as described.
3. In a canopy frame the combination of a base portion adapted to be placed on the seat of a vehicle a collapsible framewark raising therefrom, and adapted to be folded thereover when not in use, spacing members extending from one sille of said framework to the other, and an enclosing cover portion to be drawn thereover, substantially as described.
4. A canopy frame, having in combination a base portion, jointed side standards hinged thereto and adapted to fold thereover, means for bracing said side standards when raised, means for spacing the same one from the other, a cover portion adapted to be drawn thereover, and an apron extending across the front of the frame, substantially as described.

No. 99,991. Refrigerator Boz. Boite de refrigérateur.

Vondon D. Sibley, Port Hammond, British Columbla, Canada, 10th July, 1906; 6 years. Filed 9th December, 1905. Receipt No. 130,829.
Claim.-1. In a refrigerator of the class described the comfination therewith of an ice chamber, occupying the middle upper portion of the box, a water drain from the lower part of the chamber through one of the slides of the box, sald irain preserving a water seal in the drain aperture, a guard Frotecting the outlet of the drain, and a drip plate from the drain outlet having an outward projection to deliver the water clear of the bottom of the box.
2. In a refrigerator of the class described the combination therewith of an ice tank ocupying the upper middle portion of the box, a drain pipe from the ice tank through one of the sides of the box said drain pipe consisting of a nipple threaded into the ice tank below the level of its bottom and having an aperture through it from the lower edges where it is inserted in the ice chamber to the upper edge at the outer side, whereby a water seal is preserved in the drain pipe.
3. In a refrigerator box of the class described the combination therewith of an ice chamber in the upper middle portion of the box, a gauze strainer above the drain in the ice chamber, a drain pipe from below the bottom of the ice chamber the outlet of the drain being above the inlet to fit in the ice chamber, a guard acrosis the outlet of the drain and a strip from the outlet projecting outward at the lower end to deliver the drip clear of the side of the box.

## No. 99,992. Wooden Sheet Piling. Pilotis.

Henry Louis Zander, New Orleans, Loulsana, U.S.A., 10th July, 1906; 6 years. Filed 19th February, 1906. Receipt No. 133,046 .
Claim.-1. A sheet piling comprising a plurality of sections each having a projecting tongue on one side provided with a laterally enlarged head and having a groove in another side provided with a contracted neck to receive the tongue of the adjoining section, said groove being larger than the head of the tongue, to form a space between the tongue and the opposing face of the groove, means on one of said sections to close the bottom of said space, and a plastic fllling in said space to effect a water tight joint between sald sections.
2. A sheet piling comprising a plurality of sections, each of said sections having along one of its edges a tongue provided with an enlargement or head and along its other edge a groove provided with a contracted neck and adapted to receive the head of the tongue of the adjacent section, said groove being of greater size than said tongue to receive a filing of cement or the like, a bottom closing the lower end
of the groove in each section, and a projection upon the lower end of the head of the tongue of each section, said projection

being adapted to enter the groove in the adjacent section, substantially as described.
3. A sheet plling section comprising a body having along one of its edges a longitudinally extending groove provided with a contracted neck, a bottom closing the lower end of said groove, a longitudinally extending tongue upon the opposite edge of sald section and provided with a longitudinally extending enlargement or head adapted to enter the groove of an adjacent section, and a projection upon the lower end of said head or tongue, substantially as described.
4. A sheet plling section comprising three boards secured to each other in parallel relation with the intermediate one projecting in one direction to form a tongue and the two outer ones projecting in the opposite direction to form a groove, cleats upon said tongue and in said groove, a block in the lower end of said groove and a projection or block upon the lower end of said tongue, substantially as described.
No. 99,993. Sheet Piling. Pilotis on feutlle.

Luther Peter Friestedt, Chicago, Illinois, U.S.A., 10th July. 1906; 6 years. Filed 3rd February, 1905. Receipt No. 122,222.
Claim.-1. In sheet plling, a series of I-beam sections joined edgewise, the face sides of the cross flange abutting, and means for locking all the sections together against displacement when assembled in a wall structure.
2. In sheet piling, a wall structure composed of I-beams joined endwise and angle clamping irons rigidly mounted on alternate sections and overlapping the flanged edges of the joining sections.

## No. 99,994. Metal Piling. Pilotis en métal.

James J. Harold, New York City, New York, U.S.A., 10th July, 1906; 6 years. Filed 22nd December, 1905. Recelpt No. 131,257.
Claim.-1. In piling, flanged beam members and interlocking bolts, said interlocking bolts adapted to receive flanges of said beam members and lock said beam members together.
2. In plling, channel beams and interlocking bolts, said bolts adapted to receive the flanges of said channel beams and lock said beams together.

3. In piling, the flanges of channel beams turned away from each other and the backs of said channel beams locked together by interlocking bolts engaging some of said flanges.
4. In piling, flanged beam members and interlocking boits and said interlocking bolts having looped hooks and adapted to recelve and lock the flanges of said beam members.

No. 99,995. Metal Piling. Pilotis en métal.

James J. Harold, New York City, New York, U.S.A., 10th July, 1906; 6 years. Filed 18th December, 1905. Recelpt No. 131,133.
Claim.-1. In piling, beam members provided with flanges on opposite sides of one face thereof, planks adopted to engage the channels, formed by said flanges, one of the flanges on one beam member adapted to slide between a flange on another beam member and its plank, a plate at the outer edge of each of said planks extending over the back of the adjoining beam member, and said plate secured to sald plank by bolts passing through its beam member.
2. In piling, beam members provided with fianges on opposite sides of one face thereof, planks adopted to engage the channels formed by said flanges, one of the flanges on one beam member adapted to slide between a flange on another beam member and its plank, a plate at the outer edge of each of said planks extending over the back of the adjoining beam member, a plate on the opposite side of the piling extending over the adjoining plank, and sald plates secured by bolts passing through said planks and said beam members.

No. 99,996. Metal Piling. Pilotis en métal.
James J. Harold, New York City, New York, U.S.A., 10th July, 1906; 6 years. Filed 26th April, 1906. Rece1pt No. 135,315.
Claim.-1. In piling, flanged beam members and Interlocking members, said interlocking members tapered toward the bottom of the piling and provided with projecting flanges adopted to retain said flanged beam members in place.
2. In piling, flanged beam members and interlocking mem. bers tapered from the center toward the top and bottom of the piling and provided with flanges adopted to retain said flanged beam members in place.
3. In piling, flanged beam members and reinforced tapered interlocking members, said interlocking members provided

with projecting flanges adopted to retain said flanged beam members in place.

No. 99,987. Metal sheet Piling.
Pilotis en feuille de métal.

Walter Charles Harder, Chicago, Illinois, U.S.A., 10th July, 1906; 6 years. Filed 2nd October, 1905. Recelpt No. 128,912.
Claim.-1. In sheet piling, a beam section provided on one of its edges with an integral cross flange and having a flanged recess in the other edge corresponding to the contour of said cross flange.
2. A beam piling section comprising in its integral structure, a web part, a cross flange on one edge thereof, and a cross flanged recess in the opposite edge.
3. A beam piling section having a straight cross flange on one of its edges, and a C-shaped fiange on the other edge. 4. In sheet piling, a beam section provided with a C-shaped flanged edge and a companion beam provided on its joining edge with a cross flange engaging the recessed C-edge.

## No. 99,998. Metal gheet Pling.

Pilotis en reuille de métal.
Henry Wittekind, Chicago, Illinois, U.S.A., 10th July, 1906 :
6 years. Filed 18th November, 1904. Receipt No. 120.102
Claim.-1. A metal sheet piling composed of interlocked cuplicate sections, each section having an offset laterally projecting flange at one side edge and an angular channel at its other side edge of a cross section to receive the flange on the adjacent section.
2. In a metal sheet piling, a section composed of a plate. an offset laterally projecting fiange at one side edge, and an angular channel at its other side edge conforming in cross scetion to said flange.
3. In a section for metal sheet piling, the combination with a central plate, of a Z-beam having one flange rigidly

secured to one side of sald plate and its other flange projecting laterally, an angle beam spaced apart from said plate and extending around the other side of said plate thereby forming a channel conforming in cross section to the projecting portion of said Z-beam.
4. In a section for metal sheet piling, the combination with a central plate, of a $Z$-beam having one flange rigidly secured to one side of sald plate and its other flange projecting laterally therefrom, an angle beam extending around the oiher side edge of said plate, and a filler strip interposed between said plate and angle beam thereby forming a channel corresponding in cross section to a portion of said $Z$ beam projecting from said plate.
5. In a compound section of metal sheet piling, the combination with a plate, of an angle beam extending around cne side edge of the plate, and a fller bar interposed between said plate and angle beam thereby forming a channel to interlock with the adjacent section of piling.
6. In a metal sheet piling, the combination with a section ccmposed of a plate and an angle beam spaced from the plate and extending around one side edge thereof thereby fcrming a channel, of a co-operating section having an angular side flange adapted to be received within the channel of said first section.

No. 99,999. Metal Piling. Pilotis en métal.

James J. Harold, New York City, New York, U.S.A., 10th July, 1906; 6 years. Filed 4th May, 1906. Receipt No. 135,551.
Claim.-In metal piling, interlocking members and flanged beams, said interlocking members provided with channels and flat surfaces, said flat surfaces of said members fastened together and said channels adapted to engage and retain the flanges of said beams.

## No. 100,000. Sheet Metal Piling.

Pilotis en feuille de métal.
Micharl John Haney, Toronto, Ontario, Canada, 10th July, 1906: 6 years. Filed 4th February, 1905. Receipt No. 122,228.
Claim.--1. A sheet metal piling comprising plates abutting each other at their longitudinal edges, angle bars suitably
riveted adjacent to one longitudinal edge on both sides of the plate and lugs disposcd at desired distances apart at the

opposite longitudinal edge and suitable riveted to the plate in pairs one at each side and having inturned lips designed to receive the outer turned portions of the angle bars of the adjacent plate, as specified.
2. A sheet metal piling comprising plates abutting each other at their longitudinal edges and angle bars secured to one longitudinal edge of the plate on opposite sides thereof and projecting beyond such edge or width of the plate, and angle plates or bars secured to the opposite longitudinal edge of the plate, one on each side and opposite each other and so arranged that the opposite longitudinal edge projects beyond the angle iron bars or plates and provided with irturned lips for gripping the free edge of the angle bars of the next plate, so as to cover the joint or abutting edges os the plate, as specified.
3. In a sheet metal piling, a series of plates abutting each nther, means for interlocking the plates at their longitudinal edges and diagonal strengthening bar extending across the plates, as specifled.

No. 100,001. Metal Sheet Piling.
Pilotis en feuille de métal.

The Duplex Stcel Plate Piling Company, assignee of John Robert Williams, all of East Orange, New Jersey. U.S.A., 10th July, 1906; 6 years. Filed 27th September, 1905. Receipt No. 128,765.
Claim.-1. A metal sheet piling composed of sections each having in one integral piece a transverse member and members extending laterally in opposite directions from the edges thereof and being about equal in extent, one of said lateral members having a locking tongue, and a locking member secured to said transverse member and affording, with the
adjacent walls of the section, at one end a receiving recess and at the other end a locking receiving recess, substantially as set forth.
2. A metal sheet piling composed of sections each having a transverse member and parallel members extending laterally in opposite directions from the edges thereof and at an angle thereto and being about equal in extent, one of said lateral members having a locking tongue, and a locking member secured to said transverse member and affording, with the adjacent walls of the section, at one end a receiving recess and at the other end an angular locking receiving reces, substantially as set forth.
3. A metal sheet plling composed of sections each having in one integral piece a transverse diagonally disposed member and members extending laterally in opposite directions from the edges thereof and being qbout equal in extent, one of said lateral members having a locking tongue, and a locking member secured to said transverse member and affording with the adjacent walls of the section, at one end a receiving recess and at the other end an angular locking receiving recess, substantially as set forth.
4. A metal sheet piling composed of sections each having a diagonally disposed transverse momber and parallel members extending laterally in opposite directions from the edges thereof and at an angle thereto and being about equal in extent, one of said lateral members having a locking tongue, and a locking member secured to said transverse member, and affording with the adjacent walls of the section, at one end a recelving recess and at the other end an angular locking receiving recess, substantially as set forth.
5. A metal sheet piling composed of sections each having in one integral piece a transverse member 11 and oppositely extending lateral members 12,13 , the former having a tongue 14, and a locking member 15 secured to said transverse member and having at one end a flange 16 and at its other end being extended to and along said member 13 so as to form a locking recess, substantially as set forth.
6. A metal sheet piling composed of sections each having in one integral plece a transverse member and parallel members extending laterally in opposite directions from the edges thereof and being about equal in extent, said sections being alternately faced in opposite directions with the adjacent lateral members thereof in face to face contact, combined with means carried by said sections for locking them together in series, substantially as set forth.
7. A metal sheet piling composed of sections each having in one integral piece a transverse diagonally disposed member and parallel members extending laterally in opposite directhons from the edges thereof and at an angle thereto and being about equal in extent, sald sections being alternately faced in opposite directions with the adjacent lateral members thereof in face to face contact, combined with means carried by said sections for locking them together in series, substantially as set forth.

No. 100,002. Liquid Separator.
Séparateur de liquides.

The Massey-Harris Company, Toronto, Ontario, Canada, assignee of Wilbur W. Marsh, Waterloo, Iowa, U.S.A., 10th July, 1906; 6 years. Filed 21st October, 1905. Feceipt No. 129,440 .
Claim.-1. A liner for centrifugal liquid separators comprising a series of superimposed coned separating discs, smooth on the underside, and provided with ribs on their upper surfaces forming helical channels between them, and having their upper edges scalloped, substautially as described.
2. A liner for centrifugal liquid separators comprising a series of superimposed coned separating discs, smooth on the underside, and provided with ribs on thelr upper surfaces forming hellical channels between them, substantially as described.

No. 100,003. Liquid Cooler.
Réfrigérant pour liquides.

The Canadian Dairy Supply Company, Montreal, assignee of Emile Laurin, St. Esutace, both In Quebec, Canada, 10th
July; 6 years. Filed 13th June, 1906. Receipt No. 136,841. Claim.-1. In a cooler for liquids, means for slowly feeding a liquid over moving and stationary surfaces, means for circulating a fluid of low temperature to chlll the moving surfaces and means for circulating a fluid of lower temperature over the stationary surfaces.
2. In a cooler for liquids, means for slowly feeding a liquid spirally in thin layers over chilled corrugated surfaces, and means for circulating the liquid over a further chilled surface until the desired temperature is reached
3. In a cooler for liquids, means for slowly feeding a liquid spirally in thin layers over moving corrugated surfaces, means for cooling said surfaces, and means for collecting and circulating the llquid over a further surface chilled to a lower temperature than the corrugated surfaces.
4. In a two-stage cooler for llquids, means for. slowly feeding a liquid spirally over moving corrugated surfaces, means for circulating a fluid of lower temperateure than the liquid between said corrugated surfaces, means for collecting and circulating the liquid over a further surface, and means for circulating a second fluid of lower temperature than the first to chill said surface.
5. In a two-stage cooler for liquids, a plurality of moving corrugated surfaces, a stationary surface, means for catling the corrugated surfaces, means for chilling the stationary surface to a lower temperature, means for slowly feeding a liquid spirally in thin layers over said corrugated surfaces, and means for collecting sald liquid and circulating it over said stationary surface.
6. In a device of the class described, a reservoir, an annular channel therein, a false bottom in said channel enclosing an annular chamber, a hopper opening in sald annular chamber, a second hopper opening into the reservoir below said annular chamber, an annular channelled cover for said reservoir, apertures in the bottom of said cover, closure means for said aperture, a vertical spindle fixed to the reservoir, a double walled cylinder revoluble on said spindle, $n$ feed pipe, and a plurality of branches from said feed pipe extending downwardly between the walls of sald cylinder.
7. In a device of the class described, a reservoir, an annular channel therein, a false bottom in said channel enclosing an annular chamber, a hopper opening into said annular chamber, a second hopper opening into the reservoir below said annular chamber, an annular channelled cover for said reservolr, apertures in the bottom of sald cover, closure means for sald apertures, a vertical spindle fixed to the reservoir, a cylinder revoluble on sald spindle, inner and outer corrugated walls for said cylinder, an inwardly projecting flange on the inner wall of said cylinder, an outwardly projecting flange on the outer wall of sald cylinder, apertures in both of said flanges, apertures in the cylinder bottom inside the inner wall, a central tube surrounding the spindle, a ball bearing in the upper end of said tube, a feed pipe, a plurality of branches from said feed pipe extending downwardly through the cover into the space between the cylinder walls, and a transverse aperture in the lower end of each of said branches.
8. In a device of the class described, a reservoir, an annular channel therein, a cross diaphragm in said channel, an external drain spout for said channel, a false bottom in said channel, an annular chamber enclosed by said false bottom, a hopper opening into said annular chamber, a drip pipe near the top of sald annular chamber, a second hopper opening into the reservoir below sald annular chamber, a strainer in the bottom of said reservoir, a section plpe extending out-
wardly from said strainer, a central vertical spindle fixed to the reservoir, a conical baffle plate fixed to the spindle below the annular chamber, a cylinder revoluble on said spindle, a feed pipe, and a plurality of branches from said feed plpe extending downwardly between the walls of said cylinder.
No. 100,004. Clothes Pin. Epingle d linge.

Andrew Chandler Brown and Joseph Green Brown, both of Montpeller, Vermont, asignees of Frederick Henry Potter, Beverly, Massachusetts, U.S.A., 10th July, 1906; 6 years. Filed 26th December, 1905. Receipt No. 131,302.
Claim.-1. A clothes pin presenting a wire spring of the class described and two legs shaped at their front ends to present a line space, and a communicating open mouth, each of said legs being provided at their inner faces with a spring receiving recess, the faces of said legs when the pin is not in use contacting between said line space and said spring receiving recess and tipping one on the other when the pin is put in use at a point between the head end of the pin and the central part of the spring.
2. A clothes pin presenting a wire spring of the class described and two legs shaped as shown, said legs at thelr front ends presenting a line receiving space, and normally open mouth leading from the front end of said legs into sald space, sald legs contracting at their outer ends only as they are being separated at their front ends in opposition to the action of the spring as the front ends of the pin are being passed onto clothes on a line.

No. 100,005. Clothes Pin. Epingle à linge.

Andrew Chandler Brown and Joseph Green Brown, both of Montpeller, Vermont, assignees of Frederick Henry Perry, Beverly, Massachusetts, U.S.A., 10th July, 1906; 6 years. Filed 21st March, 1906. Receipt No. 134,141.
Claim.-1. A clothes pin of the class described comprising two legs and a wire spring bent to present a central straight portion disposed between the said legs and from one end of which the wire is bent upwardly, backwardly, downwardly and forwardly in substantially continuous curve, and from the opposite end of sald central portion said wire is bent downwardly, backwardly, upwardly and forwardly in a curve devold of angular bends, said curves forming braces for the legs, the ends of the wire spring each engaging one of the legs.
2. A clothes pin comprising two legs and a wire spring bent to present a central straight portion disposed between the said legs, from which central portion one end of the wire is bent upwardly, backwardly, downwardly and forwardly in a substantially continuous curve devoid of angular bends, said end engaging one of the legs, the other end of the wire being curved downwardly, backwardly, upwardly and forwardly in a curve devoid of angular bends and engaging the other of said legs, said curves forming braces for the legs. said legs being cut away at their inner faces to form a recess within the curve of the wire.

## No. 100,006. Holder for Brooms. Porte-balai.

Charles J. Wren and John F. H. Wyse, assignee of a half interest, both of Toronto. Ontario, Canada, 10th July, 1906; 6 years. Filed 17th April, 1906. Receipt No. 134,956.
Claim.-1. A broom holder comprising a base adapted to be secured to a wall, spring arms connected therewith ad-
facent to one another, and rollers vertically journalled on said arms, substantially as described.

2. A broom holder comprising a base, two adjacent vertical torsion springs held thereby, and arms extending out from said springs and adapted to engage and hold a broom handle, substantially as described.
3. A broom holder comprising a base and a wire held thereby and bent to form two vertical torsion springs and arms extending out therefrom, the arms being adapted to engage and hold a broom handle, substantially as described.
4. A broom holder comprising a wire bent to form two vertical tension springs connected by a bend, and arms extending out therefrom, the arms being adapted to engage and hold a broom handle, in combination with a wire looped round the aforesaid bend, twisted together and having its ends spread and separately connected each with one of the vertical torsion springs, substantially as described.
5. A broom holder comprising a wire bent to form two vertical torsion springs connected by a bend, and arms extending out therefrom, the arms being adapted to engage and hold a broom handle, and upwardly extending journals at the ends of the arms, in combination with a wire looped round the aforesaid bend, twisted together and having its ends spread and separately connected each with one of the vertical torsion springs, and rollers journalled on said journals, substantially as described.

No. 100,007. Spring Wheel for Vehiclem. Roue d ressort pour véhicules.

The Sherola Spring Wheel Company, 5 Watts Avenue, assignee of Percy John Neate. Belsize, Watts Avenue, aforesaid, Rochester, Kent. England, 10th July, 1906; 6 years. Filed 19th May, 1906. Recelpt No. 136,070.
Claim.-1. In a spring wheel the combination of a fixed plate carrying cups for receiving rolling balls, freely suspended plates carrying cups facing the cups on the fixed plate, rolling balls between the opposing faces of the cups. the freely suspended cup carrying plates being capable of permitting unequal movements of the cups approximately parallel to the axis of the wheel as required by the varying conditions of torque and load.
2. In a spring wheel, a hub and rim connected by an arrangement comprising a pair of plates maintained at a fixed distance apart, springs abutting against said fixed plates, a pair of cup carrying plates pressed inwards by said springs. a central cup carrying plate, balls forming a rolling connection between the opposing cups in the cup carrying plates.
3. In a spring wheel, a wheel rim, a cup carrying plate connected to the hub on either side of the cup carrying plate carried by the rim, balls arranged between the cups on the respective rim and hub plates.
4. In a spring wheel, a hub comprising side plates maintalned at a fixed distance, inner cup carrying plates, balls carried in sald cups, a rim, cup carrying plates connected to the wheel rim, springs pressing the inner cup-carrying plates towards the cup-carrying plate, which is connected to the rim.
5. The improved spring wheel for vehicles and cycles comprising independently moving hub and rim members, suspended plates disposed between said hub and rim members. springs pressed on said suspended plates, rolling cup, and ball devices coupling sald suspended plates to one member of the wheel, said suspended plates being so mounted upon the other member of the wheel or driven therefrom as to be free to move along the axis of the wheel and adapted to allow of unequal axial movement of individual cups under the varying relative movement of the cup and ball devices and the laterally disposed springs, substantially as described.
6. The improved spring wheel for vehicles and cycles comprising the combination with independently moving hub and rim members, of suspended plates, springs forcing said suspending plates together, means for suspending and driving said plates from one member of the wheel, said suspended plates being so mounted on said member of the wheel as to have axial movement in regard thereto, with freedom to tilt in regard to the plane of the wheel, but restrained in other directions, rolling cup and ball devices coupling said suspended plates to the other member of the wheel, said cup and ball devices being adapted to convert the relative movements of the nut and rim members into axial or inclined movements of the said spring pressed intermediate plates and which allow of unequal axial movement of the cups in regard to one another, substantially as described.
7. In a spring wheel, the combination of a fixed plate carrysing a group of cups for receiving balls, freely suspended plates each carying a group of cups facing the group of cups on the fixed plate, springs pressing on each group of cups, rolling balls between the opposing faces of the cups, means for maintaining each group of cups in position in relating to the hub and allowing of independent movement of each group of cups parallel to the axis.
8. In a spring wheel, the combination of a fixed plate carrying groups of cups for receiving balls, freely suspended plates each carrying a group of cups facing the group of cups on the fixed plate, springs pressing on each group of cups, rolling balls between the opposing faces of the cups, flexible connections for maintaining each group of cups in pcsition in relation to the hub and aliowing of independent movement of each group of cups parallel to the axis.
9. In a spring wheel, the combination of a hub member, a rim member, a rolling cup and ball connection between said hub and rim members, said members being radially displaceable relatively to each other, and wherein the spring supported cups being carried by the hub portion, so that the vibratory shocks which the rim member receives direct from the road are transmitted to the springs through cups and balls, substantially as described.
10. In spring wheels such as are herein referred to, the combination with an inner cup carrying plate of stops to limit its movement in relation to the outer plates which serve as abutments for the springs, substantially as and for the purpose described.
11. A spring wheel having a plate carrying three cups on each side in combination with treely suspended plates each carrying three cups, springs acting on said freely suspended plates, and balls between the opposing faces of the cups, the arrangement of these cups on each side serving to secure continuous contact between each ball and its pair of enclosing cups when subject to combined load and torque, substantially as set forth.
12. A spring wheel comprising a cup carrying plate connected with the hub in connection with cup carrying plates on either side thereof connected with the rim by means of spokes in tension, said spokes diverging from the rim to said plates, a spring serving to press the plates inward by the tension of the spokes, substantially as described.
13. A spring wheel comprising a hub member and a rim member, a central cup carrying plate connected with the hub, cup carrying side plates disposed on either side of said central cup carrying plate, spokes in tension connecting said side plates with the rim, said tension spokes diverging from them to sald plates and serving to press the plates inwards, springs embodying sald tension spokes and adding to the resiliency thereof.
14. A spring wheel having a hub member and rim member capable of relative movement, in combination with transverse springs coupling said hub member and rim member together, said springs being rigidly fixed at their respective

7-11
ends to the hub and rim members whereby all irictional movement between the springs and sald members is avoided and necessity for lubricating the junction between the springs and the members is avoided, substantially as set forth.
15. A spring wheel having a hub member and rim member capable of relative movement in combination with springs coupling said hub and rim members together and rigidly fixed thereto at their ends, said springs being-formed at or near their ends as flat or conical spirals, portions of which may be formed or flattened, or reduced sections whereby they are enabled to resist the combined tensional and bending stresses due to torque and load, substantially as set forth.
16. A spring wheel having a hub member and a rim member capable of relative movement in combination with transverse or axial springs rigidly fixed at their respective ends : 5 said hub member and rim member, said springs being formed at or near their ends, as flat or conical spirals portions of which may be of flattened or reduced section, the spiral portions being coupled by a stralght part, substantially as set forth.
17. A spring wheel having a hub member and a rim member capable of relative movement in combination with trans$t \in$ rse or axial springs rigidly fixed at their respective ends to said hub member and rlm member, said springs being formed at or near their ends as flat or conlcal spirals, portions of which may be of flattened or reduced section, the spiral portions belng coupled by a straight part whilst the spiral parts are disposed outside the rim and hub members to which they are fixed, substantially as set forth.
18. A spring wheel having a hub member and a rim memher capable of relative movement and transverse springs coupling said members together, sald springs being rigidly fixed to said members at their ends and each spring being in the form of a spiral having its end portions flattened or of ruduced section, substantially as set forth.
19. A spring wheel having a hub member and a rim member capable of relative movement and springs arranged between said members and disposed axially of the wheel, each of said springs being in the form of a spiral and having its ends connected to said hub and rim and having a straight connecting portion between its ends, substantially as set ferth.

No. 100,008. Spring. Ressort.

Fercy John Neate, Belsize, Watts Avenue, Rochester, Kent England, 10th July, 1906; 6 years. Filed 19th May, 1906. Receipt No. 136,077.
Clain.-1. A spring formed of two springs of any known type wherein the section is torsionally stressed, formed in cne plece or joined solidly together at points furthest from their axes and supported at the apex or axis of each spring end loaded at the junction in the center or vice versa, substantially as set forth.
2. A spring formed of two opposite curves or spirals joined in one and adapted to be stressed or supported at their junction and at points on opposite sides of the junction in the curved portions or at the axes thereof.
3. A spring formed of two opposite curves joined in one abutments for said spring disposed on opposite sides thercor an abutment on one side being disposed at the junction of the two curves and abutments on the other side being disfosed at points away from the junctions and in the curved portions, substantially as set forth.

No. 100,009. Hammer Drill. Forit.
The ller Rock Drill Manufacturing Company, assignee of Alfred E. Johnson, all of Denver, Colorado, U.S.A., 10 th July, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,305.
Claim.-1. In a hammer drill the combination of the drill body, an abutment, a rigid fluid condult connecting said drill
and abutment, and means for introducing operating fluid to said fluid conduit at its abutment extremity.

2. In a hammer drill the combination of the drill body, an abutment, a rigid fluid conduit connecting said drlll body and abutment, means for introducing operating fluid to said fluid condult at its abutment extremity, and means for controlling the fluid supply through the connection between said fluid conduit and abutment.
3. In a hammer drill the combination with the drill body, of a hollow crank connected with said body to rotate same and adapted to convey fluid under pressure to said drill body from a suitable source of supply.
4. In a hammer drill the combination with the body of the instrument, of an abutment, a hollow crank journalled in the abutment at one extremity and connected with the body of the device at the other extremity, and suitable means for introducing operating fluid to the said crank ac its abutment extremity.
5. In a device of the class described the combination with the drill body, of a hollow crank and an abutment in which the rear extremity of the crank is journalled. its forward extremity being rigidly connected with the drill body for rotating purposes, the abutment being provided with a forwardly extending sleeve having a chamber into which the rear extremity of the crank protrudes, the rear extremity of the crank being provided with a passage connecting said chamber with the longitudinal passage of the hollow crank, and sultable means for connecting the chamber of the sleeve with a source of operating fluid.
6. The combination with the drill body, of a hollow crank connected therewith at its forward extremity to dellver operating fluid thereto, an abutment in which the rear extremity of the hollow crank is journalled, the said abutment having a forwardly extending sleeve provided with a chamber, the rear extremity of the crank consisting of a hollow spindle or journal for the crank and having ports connecting the chamber of the sleeve with the longitudinal passage of the crank, the sleeve having a shoulder at the forward extremity of its chamber, and the rear extremity of the spindle member of the crank being provided with a bevelled face opposite said shoulder when the abutment is at its rearward limit of movement, the sleeve being provided with an induction port communicating with the space between the bevelled face of the spindle and the shoulder of the sleeve, the rear extremity of the spindle member of the crank being of a size to allow the onerating fluid to pass around it within the chamber of the sleeve.
7. In a hammer drill the combination with the body of the instrument, of an abutment, a hollow crank connecting the body of the tool with the abutment, the crank being revolubly connected with the abutment, the rear extremity of the crank beine also slidable in the abutment to control the supply of operating fluid to the hollow crank.
8. In a hammer drill the combination with the hody of the instrument, of an abutment, a hollow crank having its forward extremity rigidly connected with the body and its rear extremity slidable in the abutment for the purpose of regulat-in- the admission of operating fluid to the hollow crank, the crank being revoluble in the abutment to permit rotation of the tool, and the abutment being provided with a chamber adapted to form a fluid cushion between its rear extremity and the crank.
9. The combnation with the body of the drill, of a hollow crank rigidly connected therewith, and an abutment provided with a chamber into which the rear extremity of the crank protrudes and with which the longitudinal opening in the crank communicates, the rear extremity of the crank being slidable and revoluble in the abutment which is constructed to regulate the admission of the operating fluid as the rear
extremity of the crank slides therein, and at the same time forming an air cushion between the crank a ad the rear extremity of the abutment.
10. The combination with the drill body, of an abutment, a rigid fluid conduit rigidly connected with the rilll body at one extremity, the abutment being proivded with a chamber into which the other extremity of the conduit protrudes and with which it is slidably connected, and means for introducing the fluid to the chamber of the abutment, the latter being constructed to form a fluid cushion between the abutment and the conduit and to control the passage of fluid to the conduit by virture of the sliding connection.

No. 100,010. Machine for Making Nails, Rivets, Etc.
Machine pour faire des clous, etc.

Alfred Charles, Worchester, England, 10th July, 1906; 6 years. Filed 15th February, 1906. Recelpt No. 132,931.
Claim.-1. In a nail making machine the combination of a bed plate, a plunger reciprocating thereon, a plurality of heading dies connected to said plunger, cylindrical dies arranged in pairs in front of the plunger co-operating with the heading dies. cach pair comprising an upper and lower die. said dies having aligned transverse groove $\boldsymbol{e}^{11}$ therein adapted to recelve the wire, means for feeding the wire to the dies, means for cutting the wire, dowel pins $e^{2}$ connecting the dies of each pair together, pins having heads connected to the upper end of the upper die, and the lower end of the lower die, a bed having slots therein in which the pins of the upper dics are rotatably held, a cross bar $f$ having vertical movement in the bed, said bed having slots therein in which the pins of the lower dies engage, mrans for partially rotating the dies, and means for raising the bar $f$ to raise the lower dies to grip the wire, substantially as described.
2. In a mail making machine the combination of the bed plate, upper cylindrical dies having vertical dovetall grooves in their sides, cutters in said grooves, lower eylindrical dies having vertical grooves thercin in alignment with the grooves in the upper dies, sliding cutters in sald givoves, a lifting cross bar $f$ baving vertical movement in the bed plate, sald bar having quadrantal slots therein through which the lower ends of the cutters in the lower dies pass, a cross bar $n$ on which the ends of the sliding cutters rest, means for lifting the cross bar $f$ and $n$ and means for partially rotating the dies.
3. In a nail making machine the combination of a reciprocating plunger, heading dies thereon, cylindrical dies arranged in pairs in front of said plunger and having aligned grooves, means for feeding the wire between the aligned grooves of each pair of dies, means for bringing the dies together to grip the wires, means for cutting the wire, and means for rotating said dies so as to bring the end of the wire opposite the corresponding heading die whereby sald heading die will form the head.
4. In a nail making machine the combination of a reciprocating plunger, heading dies thereon, cylindrical dies arranged in pairs in front of the plunger and having aligned grooves, an upper and lower die in each palr, means for feeding wire into the grooves on said dies, cutters carried by said dies, a cross bar on which the lower dies rest, a second cross bar on which the end of the cutters of the lower dies rest, means operated by the plunger for raising both cross bars to grip the wire and to cut the same, and means for rotating the dies so as to bring one end of the nall opposite the corresponding heading die on the plunger to form the head.
5. In a nail making machine the combination of cylindrical dies $l$, having vertical dovetall grooves therein, cutters $g$ in said grooves, cylindrical dies $c^{1}$ having dovetalled grooved therein, cutters $g^{1}$ having sliding movement in said grooves, a gripping lifting cross bar $f$ having slots therein through which the sliding cutters pass, said bar $f$ carrying the dies $\boldsymbol{e}^{1}$. a lifting cross bar $k$ situated below the bar $f$, the ends of the sliding cutters resting on said bar $k$, a shaft $i$, the parts of levers fulcrumed on said shaft for raising the cross bars.
means for actuating said levers and springs for controlling said levers.
6. In a machine for making nails the combination of a bed plate, cylindrical dies $l$ cylindrical dies $l^{1}$ dowel pins connecting both sets of dies, sald dies $l^{1}$ having teeth on one quarter of their circumference, backing bars $o o^{1}$ having curved recesses within which the dies fit, recejiving dies $t t^{2}$, an axis $t^{2}$ in the die $t$, means for raising said axis $t^{2}$, a lifting cross bar $f$ on which the dies $l^{1}$ and the die $t^{1}$ rest, means for giving said bar vertical movement, a rack bar $m$ having teeth adapted to engage with the teeth of the dies $l^{1}$, a feeding die $s^{6}$ adapted to feed the wire to the receiving dies $t t^{1}$, a contact block $w$ suspended from the die $8^{6}$, a stop $w^{2}$ on die $8^{6}$ for limiting the movement of the block w, a contact block $20^{\circ}$ on the opposite side of the die $8^{6}$, the guide $8^{5}$ for the die $8^{\circ}$, slot $\omega^{2}$ having the curved end $w^{4}$ in which the block 20 engages, an arm $m^{2}$ atached to the rack bar $m$ with which the block $t o$ engages when the die $8^{\circ}$ is moved back from its fceding stroke so as to rotate the dies $l l^{l}$, the curve $w^{4}$ serving to disengage the block $w$ from the arm $m^{2}$ and a lever $x$ fulcrumer at $x^{2}$ and having link connections with the arm $m^{2}$, sald lever being adapted to be engaged by the contact block $20^{6}$ on the backward movement of the die $s^{6}$, so that said lever and its connections will return the rack $m$ to normal position.
7. In a nall making machine the combination of the bed plate, the cylindrical dies carried thereby, each pair of said dies comprising an upper and lower die, means for holding the wire transversely between the dies of each pair, and means for knocking the finishing nail therefrom, said means consisting of a cross bar $n$ knocking out tools $n$ connected thereto, plungers $\boldsymbol{n}^{2}$ having heads $n^{3}$, secured to said bar n, said plungers passing through the bed plate, springs $n^{4}$ between said heads $n^{2}$ and the bed plate, a shaft $p^{1}$ connected to the bed plate, striking levers $p$ carried by said shaft and adapted to contact with the heads $n^{3}$ to force the tools into contact with the nalls, the weight shaft $p^{1}$, a sliding bar $r$ a pin $r^{2}$ thereon, a bell crank $s$ suitably pivoted to the bed plate, one end of said bell crank having a slot therein with which the pin $r^{2}$ engages, a crank, a rod $q^{2}$ connecting the crank with the bar $r$, means for disengaging $q^{2}$ from the bar $r$, a projection $r^{2}$ on the bar $r$, a lever $p^{4}$ secured-to the shaft $p^{2}$ with which the projections $r^{2}$ engages. whereby the shaft $p^{1}$ will be rocked, a feeding die $s^{6}$ for feeding the wire to the cylindrical dies and guides $8^{\circ}$ in which said die $s^{\circ}$ reciprocates, said die $s^{6}$ being operated by the arm $8^{\circ}$ of the bell crank.
8. The combination in a machine for making wire nails and the like, a reciprocating plunger, for forming the nail heads, suitable dies, means for bringing the dies together to grip the wire means for cutting the wire, means for rotating said dies and means for feeding the wire from the side of the machine and at right angles to the plunger to the dies, substantially as described.
9. In combination with a machine for making nails, a reciprocating plunger having a dovetalled recess in its front end, a correspondingly shaped bar fitting in sald recess and dies connected to said bar, substantially as described.

No. 100,011. Gole Ball. Boule d golfe.

Frank Hedley Mingay, Berfield, Bridge of Weir, Renfrewshire, Scotland, 10th July, 1906; 6 years. Filed 26th April, 1096. Receipt No. 135,288 .

Claim.-1. A ball for use in the game of golf, made with a core or nucleus of incompressible fluid forced into and contained within a receptacle of elastic material which, when expanded to the required size, is closed and thereafter wound round with rubber thread or tape. substantially as described.
2. A golf ball comprising in combination incompressible fluid contained in an elastic receptacle, rubber thread or tape wound round about the outer surface of the receptacle and an outer shell or cover, substantlally as described.

No. 100,012. Merry-go-Round. Carrousel.

Ernest James Mitcheson, Toronto, Ontario, Canada, 10th July, 1906; 6 years. Filed 9th April, 1906. Receipt No. 134,747.
Claim.-1. In a merry-go-round, the combination with a base and screw standard, of a platform supported on the screw standard, and a nut connected to the platform the thread of which fits the thread of the standard, as and for the purpose specified.
2. In a merry-go-round, the combination with a base and screw standard, of a platform supported on the screw standard, a canopy connected to the platform by sultable standerds, a nut secured on the top of the canopy, and having the thread thereof fitting the thread of the standard, as and for the purpose specifled.
3. The combination with the base and screw standard and platform, and a divided nut suitably supported on the platform, a swivel top for the standard provided with pulleys, ropes connected to the platform and extending over the pulleys, an upright also connected to the platform and provided with pulleys through which such ropes will extend, and a riel journalled in the bottom of the upright and to which the lower ends of the ropes are connected and a ratchet wheel secured to the end of the reel and engaged by a pawl, as and for the purpose specified.
4. The combination with the base and screw standard and platform, and a dividing nut suitably supported on the platform, a swivel top for the standard provided with pulleys. ropes connccted to the platiorm and extending over the pulleys, an upright also connected to the platform and provided with pulleys through which such ropes extend, a reel journalled in the bottom of the upright and to which the lower ends of the ropes are connected, a ratchet wheel secured to the end of the reel and engaged by a pawl, and means for throwing the nut apart when manipulating the reel, as and for the purpose specified.
5. The combination with the base and screw standard and platform and divided nut sultably supported on the platform. a swivel top for the standard provided with pulleys, ropes connected to the platform and extending over the pulleys, an upright also connected to the plaform and provided with rulleys throush which such ropes extend. a reel journalled ir the bottom of the upright and to which the lower ends of the ripes are connected, a ratchet wheel secured to the end of the reel and engaged by a pawl, means for throwing the nut apart when manipulating the reel, and a flight of steps designed to eviend from the ground to the height of the platform in its raised position, as and for the purpose specited.
6. In combination, a base, a suitable screw standard, a r,latform, a canopy supported on the platform, a divided nut located centrally on the canopy. guideways for the same. springs having a normal tendency to hold the divided nuti apart, pins on one portion of the divided nut and pulleys on the other portion, pulleys on the canopy. a rope connected to the pins of one portion of the divided nut and extending over the pulleys aforesaid, a cross bar to which the ropes aro connected extending through slots in the guideways, a rope connerted to the center of such bar and extending over the pulleys on the upright, a pull bar located to the lower rid of such rope and having a tooth thereon, suitable brackets in which such pull bar is supported, the lower one of which is provided with a tooth, ropes connected to the upper end of the canopy, a swivelled top for the screw standard provided with pulleys over which such ropes extend, an upright secured to the platform and provided with a bearing,
'bracket pulleys over which the raising ropes extend, a spring-pressed lever pawl engaging such ratchet wheel, a lever pivotally connected to one end of the lever pawl and to the lower end of the pull bar, as and for the purpose specifled.

## No. 100,013. Doll. Poupée.

Edward E. Rouech, Detroit, Michigan, U.S.A., 10th July, 1906; 6 years. Flled 23rd April. 1906. Receipt No. 135,181.
Claim.-1. In a doll, the combination of a body composed of two complimentary parts adapted to form the front and back, sald parts being secured together by a seam having the free edges turned inwardly, a separate face and back secured to the front and back of the body respectively at their lower edges, and secured at the remalnder of their edges between the edges of the body portions, the edges of the separate face and back being inturned as are the edges of the body portions, and sheets of soft material placed between the separate face and back and the body portions respectively.
2. In a doll, the combination of a body composed of two complimentary parts adapted to form the front and back, said parts belng secured together at their edges with inturned edges, a separate photographic face secured at the bottom to the outside of the front of the body, and at the remainder of its edge between the inturned edges of the portions of the body, and a sheet of soft material placed back of the separate face.
3. In a doll, the combination of a body composed of two complimentary parts adapted to form the front and back, said parts being secured together with inturned edges, and a separate face secured at its outer edge between the intturned edges of the portions of the body.
No. 100,014. Carbureter. Carburateur.

Elder E. Shiess, Newport, Arkansas, U.S.A., 10th July, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,615.
Claim.-1. A carbureter comprising an ofl tank, a horizontal carbureting clyinder thereunder, containing a lining of capillary material and a series of horizontal transverse sheets of similar material, a series of pipes leading from the tank into the top of the cylinder, a splasher under each pipe arranged to distribute the oil therefrom to a different sheet, and inlet and outlet pipes in opposite ends of the cylinder.
2. In a carbureter the combination with a tank, a carbureting chamber and a series of feed pipes connecting the same, of a series of capillary sheets extending across the chamber at different height and located under the respective pipes. and a splasher arranged under each pipe and arranged to distribute oil theefrom onto each sheet respectively.
No. 100,015. Saw Filing Device.
Apparcil à limer les scies.

Frederlck A. Wuest, Lawrinceburg, Indiana, U.S.A., 10 th July. 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,714.
Claim.-1. In a saw flling device a frame adapted to be slidably engaged with the saw ti be filed, a movable flle holder upon said frame, guided for reciprocating movement in a fixed straight line, and means for mounting a file upon said holder at an angle to the plane of movemnt thereof, whereby said frame will be slid along the saw as said flle holder is operated.
2. In a saw filing device a frame adapted to be slidably engaged with a saw, a reciprocatory flle holder upon said frame, guided for movement in a fixed straight line, and means for securing a file upon said holder at an angle to the plane of movement thereof. Whereby said frame will be slid along the saw as said file holder is reciprocated.
3. In a saw fling device a frame adapted to be slidably engaged with a saw, a guide upon said frame, a file holder mounted to reciprocate in said guide in a fixed straight line. and means for adjusting a flle upon and angularly with respect to the plane of movement of said holder, whereby said frame will be moved longitudinally upon said saw as said fle holder is reciprocated, substantially as described.
4. In a saw filing device a frame adapted to be slidably engaged with a saw, a guide upon said frame, means for adjust ing said guide. a file holder mounted to reciprocate in sald guide in a fixed straight line, means for securing a flle in said holder, and means for adjusting said securing means to hold a flle angularly with respect to the plane of movement of said file holder, substantially as described and for the purpose set forth.
5. The combination of a frame adapted to be slidably engaged with a saw, a swinging element upon said frame, an adjustable means for limiting the movement of said element, an angularly adjustable guide upon said element, a file holder to reciprocate in said guide in a fixed straight line, fle engaging elements upon said holder, and means for adjusting one of said file engaging elements to hold a file angularly with respect to the plane of movement of said holder, substantially as described.
6. The combination of a frame adapted to be slidably engaged with a saw, an arm pivotally mounted upon said frame to $s$ wing in a vertical plane, a screw for limiting the swinging movement of said arm, an adjustable guide plvotally mounted upon said arm to swing in a plane at right angles to the plane of movement of said arm, a file holder mounted to reciprocate in said guide in a fixed straight line, means upon said holder for engaging one end of a file, an element mounted to slide transversely upon said holder and adapted to engage the opposite end of the file, and means for securing said sliding element to hold the filf angularly with respect to the plane of movement of said holder, substantially as described.
7. In a saw filing device the combination with a guide, of a file holder comprising an element slidably mounted in said guide, a transversely extending guide upon one end of said element, a file engaging block adjustably secured in said transversely extending guide, and means upon said elemen: for securing the opposite end of a file, substantially as des. cribed.

8．In a saw fling device the combination with a guide，of a file holder comprising an element slidably mounted in said guide，a transversely extending guide upon one end of sald element，a file engaging block adjustably secured in said transversely extending guide，a clamping band upon said ele－ ment，a file handle in said band，a spacing block in said band between sald element and said handle，and a set－screw in said band for adjustably clamping said element and said handle in said band，substantially as described．

No．100，016．Saw－Set．V＇er ì contourner．

$$
\text { FエG-1. } 100016 \text { Fエロー }
$$

Frederick A．Wuest，Lawrenceburg．Indiana，U．S．A．， $10 t^{h}$ July，1906； 6 years．Filed 8th June，1906．Receipt No． 136，715．
Claim．－The hereindescribed saw－set comprising the anvil block having the shoulder on one side provided with the an－ gularly disposed faces 11,12 ，the arm 8 having its inner end secured to the anvil block，the guide forming the three－sided casing in which the anvil block is placed，and having the guide arms 14 extending from opposite sides of the anvil shoulders，the set－screws carried by the said arms，the handle having one end opposed to the rear side of the anvil block，said handle and guide being secured to the anvil block and said handle being at substantially right angles to the arm 8，and the hammer having its handle pivoted to the outer end of said arm，substantially as described．

No．100，017．Gate Mechanism．Mécanisme de barrièrc．

Charles Joseph Fensom，Toronto，Ontario，Canada，10th July，
1906； 6 years．Filed 19th April，1906．Receipt No．135，048．
Claim．－1．In a lock gate mechanism，the combination with a lock gate，of a connecting rod pivotally connected at one end to the lock gate，a sliding head to which the other end of the connecting rod is pivotally secured，a suitable slide－ way for the head，and means for imparting a backward and ferward movement to the head，as and for the purpose specified．

2．In a lock gate mechanism，the combination with a lock gate，of a connecting rod pivotally connected at one end to the lock gate，a sliding head to which the other end of the connecting rod is pivotally secured，a suitable slideway for the head，an endless chain in the length of which the head is interposed and wheels carrying such chain，and means for imparting movement to one of the wheels，as and for the purpose specified．
3．The combination with the lock gate and connecting rod and sliding head to which the connecting rod is pivotally $\mathrm{s} \in \mathrm{cured}$ ，of the bearing bed plate，the wheel carried thereby， the concrete bed，and subway formed therein，the cross bars in the subway，the slideway carried by such cross bars，the sprocket wheel and gearing and house therefor，the endless chain carried by the aforesaid wheels and having the slid－ ing head interposed in its length and located on the slideway， as and for the purpose specified．
4．The combination with the lock gate and connecting rod， of the slideway suitably supported and the sliding head piv－ otally secured to the inner end of the connecting rod and having a cross bar formed thereon，the draw bolts secured in the cross bar and the endless chain carried by sultable wheels and suitably driven and connected to the draw bolts， as and for the purpose specifled．

5．In a device of the class described，the combination with the lock gate and connecting bar，of a sliding mechanism suitably connected to the inner end of the connecting bar and a casing or housing for the same，as and for the pur－ pose specified．

6．The combination with the lock gate and connecting bar pivotally connected to the same at one end，and sliding mech－ anism to which the other end of the bar is connected，de－ signed to have movement to and from the edge of the canal， of operating mechanism located at a point remote from the side of the canal，whereby the tow path is left unobstructed， as and for the purpose specified．

7．The combination with the lo：k gate and connecting bar pivotally connected to the same at one end，and sliding mech－ nnism to which the other end of the bar is connected，de－ signed to have movement to and from the edge of the canal． of operating mechanism located at a point remote from the side of the canal，whereby the tow path is left unobstructed， and a suitable subway and housing for the mechanism，as and for the purpose specified．

8．In a device of the class described，the combination with the gate and connecting bar，and the shaft suitably jour－ nalled，of a slecve having a central bearing on the shaft and an arm secured to the end of the connecting rod，as and for the purpose specifled．

No．100，018．Means for the Automatic Removal of the Ashes from Gas Generators．
Moyen d＇enlever les cendres des générateurs d gas．

Anton von Kerpely，Vienna，Austria，10th July，1906； 6 years． Filed 5th April，1906．Receipt No．134，654．
Claim．－Means for the automatic removal of the ashes from gas generators provided with a pan－shaped rotatable ash pit， comprising a stationary stowing plate or scraper depending siantingly into the ash pan and extending in one direction to beneath the lower opening of the generator shaft and in the other direction to above the edge of the ash pan and being so arranged as to receive the accumulating ashes，conduct them upwards and discharge the same outwardly，substan－ tially as hereinbefore described．

## No. 100,019. Horseshoe Caulk.

Crampon de fer d cheval.

William A. Comins and Joseph Connor, both of Stafford Springs, Connecticut, U.S.A.. 10th July, 1906; 6 years. Filed 20th April, 1906. Receipt No. 135,115.
Claim.-A horseshoe caulk having a hard metal core and a soft metal exterior, said caulk being bifurcated substantially midway of its ends, and the core being exposed in the bifurcation.

No. 100,020. Toy. Jeu.

Braulio Antonio De Costa, Cardenas, Cuba, 10th July, 1906; 6 years. Filed 16th June, 1906. Receipt No. 136,964.
Claim.-1. In a mechanical toy the combination comprising a casing, a pictorial background carried by the casing, a bar disposed within the casing, means for reciprocating the bar, links and levers connecting with the bar, and representations of animals adapted to be moved by the links and levers.
2. In a mechanical toy the combination comprising a supporting casing, a frame within the casing, a shaft carried by the frame, a gear mounted on the shaft, means for producing a tension on the shaft, a pin carried by the gear, a reciprocable bar provided with a lug in the path of movement of the pin, a spring connected with a bar and having its opposite ends secured, and representations of animals adapted to be rocked by movement of the bar.
3. In a device of the character described the combination comprising a supporting casing, a shaft supported within the casing, a spring coiled about the shaft and having one of its ends secured thereto, a bar adapted to secure the opposite end of the spring, a gear on the shaft, a pawl adapted to engage the gear, a lever plvoted in the casing having one end connected to the pawl and the opposite end projecting from the casing, a pin on the gear, a bar provided with a lug di:3posed in the path of movement of the pin when the gear is rotated, guides for the bar, means for reciprocating the bar in one direction when the pin is disengaged from the lug, and representations of animals adapted to be moved by movement of the bar.
4. In a device of the character described the combination comprising a casing. a spring actuated rotatable gear. a pin on the gear, a bar adapted to be reciprocated in one direction by the pin, a spring secured to the bar adapted to reciprocate the same in an opposite direction, a shaft disposed
adjacent the gear, a pinion on the shaft in mesh with the gear, a gear on said latter shaft, and a pinion in mesh with the latter gear and rotatably supported adjacent thereto, means for locking the first-named gear against rotation, and a plurality of representations of animals udapted to be moved when the bar is reciprocated.
5. In a device of the character described the combination comprising a bar, means for reciprocating the bar, a standard carried by the bar, a link pivoted to the standard, a lever pivoted to the link and to the casing, a representation of an animal secured to the lever. a slotted member carried by the reciprocable bear, a lever pivoted adjacent thereto and provided with a pin disposed through the slotted member, a link pivoted to the lever and provided with a pin disposed in a slot provided in the casing, and a representation of an animal adapted to be moved by the link.
6. In a device of the character described the combination comprising a supporting casing, a pictorial background supported by the casing, representations of two animals disposed above the casing, means for rocking one of the representations, and means for reciprocating the other representation.

No. 100,021. Slack Adjuster.
Appareil d ajuster le mou.

Charles Oscar Anderson and Albert Thomas Austin, assignee of a half interest, both of Omaha, Nebraska, U.S.A., 17 th July, 1906; 6 years. Filed 8th July, 1906. Receipt No. 136,676.
Claim.-1. In a slack adjuster the combination of two internally threaded brake rigging members, a right and left hand threaded screw engaged in the same, a mleeve slidably mounted on the screw and engaged therewith, a ratchet in connction with the sleeve, a pawl co-acting with the ratchet, and means actuated by a part of the brake rigging for driving the pawl.
2. In a slack adjuster the combination with parts of a brake rigging, of an adjustable connection between the same, means for operating said connection including a ratchet, a pawl coacting with the ratchet, and an elbow lever carrying the pawl, the elbow lever having a yoke loosely receiving a part on the swinging member of the brake rigging, for the purpose specified.
3. In a slack adjuster the combination with parts of a brake rigging, of an adjustable connection between the same, means for operating said connection including a ratchet, a pawl coacting with the ratchet, an elbow lever carrying the pawl, the elbow lever having a yoke loosely receiving a part on the swinging member of the brake rigging, for the purpose specified, and an adjustment screw arranged in said yoke.
4. In a brake rigging the combination of a means in connection with a brake beam, a lever, an adjustable connection joined to said means and said lever, a second lever, means connecting the second lever with a second brake beam, a pivot between the two levers, and devices for adjusting the said adjustable connection which devices include a lever, the fulcrum of which is coincident to the joint between the first lever and said adjustable connection.
5. In a brake rigging the combination of a means in connection with a brake beam, a lever, an adjustable connectio: joined to said means and to sald lever, a second lever, at means connecting the second lever with a second brake beam. a pivot between the two levers, and devices for adjusting the said adjustable connection, which devices include an elbow lever, the fulcrum of which is coincident to the joint between the first lever and said adjustable connection.
6. In a brake rigging the combination of a means in connection with a brake beam, a lever, an adjustable connection joined to sald means and to said lever, a second lever, a means connecting the second lever with a second brake beam, a pivot between the two levers, and devices for adjusting the said adjustable connection, which devices include a lever, the fulcrum of which is coincident to the joint between the first lever and said adjustable connection, and a pln colncident to the pivot connecting the two levers, the pin being connected with one end of the last-named lever to have limited movement independently thereof.
7. In a brake rigging the combination of a lever, a means in connection with a brake beam, an adjustable connection pivoted to the lever and sail means, a second lever, a second means in connection with a brake beam to which the second lever is connected, a pivot joining the two levers, and means for adjusting said adjustable connection which means include a lever having its fulcrum coincident to the pivot between the first lever and said adjustable connection.
8. In a brake rigging, the combination of a lever, a means in connection with a brake beam, an adjustable connection pivoted to the lever and said means, a second lever, a second means in connection with a brake beam to which the second lever is connected, a pivot joining the two levers, and means for adjusting said adjustable connection which means include a lever having its fulcrum coincident to the plvot between the first lever and said adjustable connection, and devices actuated by excessive movement of the first-named lever for operating the last-named lever.
9. In a brake rigging, the combination of a lever, a means in connection with a brake beam, an adjustable connection pivoted to the lever and said means, a second lever, a second means in connection with a brake beam to which the second lever is connected, a pivot joining the two levers, means for adjusting said adjustable connection, which means include a lever having its fulcrum coincident to the pivot between the first lever and said adjustable connection, and a pin coincident to the pivot between the two first-named levers, sald pin having connection with one end of the third lever and such connection allowing the pin limited independent movenient for the purpose specifled.
10. In a brake rigging, the combination of a lever, a second lever, a pivot connecting the two, a means in connection with a brake beam, an adjustable connection between the first-named lever and said means, a means in connection with a second brake beam and connected to the second lever, devices for adjusting said adjustable connection, a lever for actuating said devices, and means for operating the third lever by the movement of the first two levers.
11. In a brake rigging, the combination of a lever, a second lever, a pivot conecting the two, a means in connection with \& brake beam, an adjustable connection between the firstnamed lever and said means, a means in connection with a second brake beam and connected to the second lever, devices for adjusting said adjustable connection, a lever for actuating said devices, and means for operating the third lever by the movement of the first two levers, the third lever having its fulcrum coincident to the point of connection between the first lever and the said adjustable connection.
12. In a brake rigging, the combination of a lever, a means connected to a brake beam, an adjustable connection between said means and said lever, a second lever plvoted to the first, a second means connected to a brake beam and to the second lever, a means for adjusting the said adjustable connection, and an elbow lever for operating the last-named nieans, the elbow lever being fulcrumed colncldent to the connection between the first-named lever and the said adJustable connection and engaged with limited Independent movement by the pivot between the two first-named levers.
13. In a brake rigging, the combination with two members thereof, of a screw edjustably connecting them, a sleeve arranged to slide on the screw, the screw turning with the sleeve, a spring bearing between the sleeve and a part of the screw for the purpose specified, and a means for turning the sleeve.

## No. 100,022. Air Brake. Frein d air.

Hans Christian Luck and William Henry Major, assignee of a half interest, both of Telluride, Colorado, U.S.A., 17th July, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,172.
Claim. 1 . An air brake appliance for automatically setting the brakes on the derallment of a car in the train, comprising a fork fixed on the car truck and having its members arranged in a horizontal plane, a branch plpe connected with the train pipe, and a valve controlled by a lever fulcrumed on the car body and normally closing the end of said tranch pipe, the free end of said lever extending between the members of the said fork whereby the rotation of the truck upon the car body beyond a predetermined angle may operate the lever to open the valve.
2. An air brake appliance for automatically setting the brakes of a car in the train, comprising actuating means on

100022
the car truck, a valve discharging air from the train plpe, and a universal conection between the sald actuating means and the sald valve to open the latter on the car moving in any direction out of its normal position in the train.
3. An air brake appliance for automatically setting the brakes of a car in the train, comprising a fork fixed on the car truck, a valve for discharging air from the train pipe, and means connected with the sald valve and controlled by the sald fork for opening the valve on the fork moving sidewise, up or down beyond a predetermined angle.
4. An air brake appliance for automatically setting the brakes of a car in the train, comprising a fork fixed on the car truck, a valve for discharging air from the train plpe, and a spring-pressed connection capable to swing sidewisc and up and down, the said connection being controlled by the said fork and connected with the said valve to open the latter on the fork moving the sald connection sidewise, up $o^{i}$ down beyond a predetermined angle.
5. An air brake appliance for automatically setting the brakes of a car in the train, comprising a fork flxed on the car truck, a valve for discharging air from the train plpe, a rectangular seat on the car body. and a spring-pressed plate normally seated on the said seat and having a shank connected with the stem of the said valve, the shank having vertical and transverse arms adapted to be engaged by the said fork on the latter moving beyond a predetermined angle in a sidewise, up or down direction
6. An air brake appliance for automatically setting the 'brakes of a car in the train, comprising a fork fixed on the car truck, a valve for discharging air from the train plpe, a rectangular seat on the car body. and a spring-pressed plate normally seated on the said seat and having a shank flexible connected with the stem of the said vaive, the shank having vertical and transverse arms adapted to be engaged by the sald fork on the latter moving beyond a predetermined angle in a sidewise, up or down direction.
7. An air brake appliance for automatically setting the brakes of a car in the train, comprising a fork fixed on the car truck, a valve for discharging air from the traln pipe, a rectangular seat on the car body, a spring-pressed plate normally seated on the sald seat and having a shank flexibly connected with the stem of the said valve, the shank having vertical and transverse arms adapted to be engaged by the said fork on the latter moving beyond a predetermined angle in a sidewise, up or down direction, and a spring for holding the valve to its seat.
8. An air brake appliance for automatically setting the brakes of a car in the train, comprising actuating means on the car truck, a plug valve for discharging alr from the train pipe on pulling the plug axially into an open position, and a connection between the said plug and the sald actuating means for pulling the plug open on the car moving out of its normal position in the train.

## No. 100,023. Rolling Drum Plough.

Tambour de charrue
Jehiel P. Smlth, James Loftus Larmer and John Smith McCutcheon, all of Frobisher, Saskatchewan, Canada, 17th
July, 1906; 6 years. Filed 21st June, 1906. Receipt No. 137,116.
Claim.-1. In a device of the class described the combination comprising a wheeled frame, a dependent adjustable frame, a rotatable drum supported by the adjustable frame and cutting blades radially extending about the drum, as and for the purpose specified.
2. In a device of the class described the combination comprising a wheeled frame, a dependent adjustable frame, a
rotatable frame, blades passing transversely across and extending radially from the drum, coulters dependent from the

adjustable frame, and members slidable between the afore said blades, as and for the purpose specified.
3. In a device of the class described the combination comprosing a wheeled frame, a dependent adjustable frame, coulters supported by the frame and a rotatable cutting drum designed to co-operate with the coulters to cut the ground into block strips, as and for the purpose specified.
4. In a device of the class described the combination with a wheeled frame of a dependent adjustable frame, a centrally disposed rotatable drum, cutting blades secured transversely across and extending radially from the drum, slldable normally outwardly pressed bars between the blades, and means for restraining and releasing said bars at predetermined instants, as and for the purpose specified.
5. In a device of the class described the combination with a rectangular wheeled frame, of a dependent rectangular adjustable frame, a shaft centrally disposed across the dependent frame, wheels or supports secured to the shaft, shears bolted to the wheels passing transversely thereacross and extending radially therefrom, cylindrical strips secured to the base of the shears and disposed laterally from the center, sets of rods extending radially from the shaft and bearing at their outer extremity upon the strips midway between the successive shears, plungers slidabe between the shears extending at either end, straps secured to the plungers and guided by the rods, said straps being limited in their outer positions by the cylindrical strips, spiral springs enveloping the rods and abutting upon their inner extremity the shaft, and at their outer the inner face of the straps, guideways dependent from the adjustable frame, co-operative with the extending ends of the plungers, for withholding the plungers in a restrained position, and means for forcing the plungers to their extreme outward position upon their being released from the guideways, as and for the purpose specified.
6. In a device of the class described the combination with a wheeled frame, of an inner frame pivoted thereto and a rotatable cutting drum bearing within the inner frame, of means for raising and means for lowering the pivoted frame, as and for the purpose specified.
7. In a device of the class described the combination with the rotatable cutting drum disposed within the adjustable frame of a shaft disposed transversely across the frame and dependent therefrom, sets of scufliers extending radially from the shaft and means whereby the successive sets of scufflers are brought into position to co-operate with the successive cutting blades of the drum at predetermined intervals, as and for the purpose specified.
8. In a device of the class described the combination with the rotatable cutting drum disposed within the adjustable frame, of a shaft disposed transversely across the frame and dependent therefrom, sets of scufflers extending radially from the shaft, a sprocket wheel secured to the drum, a sprocket wheel secured to the transverse shaft and a chain connecting the sprocket wheels, said wheels being designed so that in their rotation predetermined sets of scufflers are brought into position to co-operate with the successive cutting blades of the drum at predetermined intervals, as and for the purpose specifled.
9. In a device of the class described the combination with the adjustable frame, the revoluble cutting drum and the slidable plungers between the shears of the cutting drum, of guideways concentric with the drum shaft and dependent from the frame, said guideways being designed to receive the extending ends of the plungers and restrain them therein for a predetermined length of time, as and for the purpose specified.
10. In a device of the class described the combination with the adjustable frame and the slidable plungers between the
shears of a rotatable drum, a guideway having an angle bar cross section dependent from the frame and disposed at either side thereof to the rear of the drum, said guideways being concentric to the drum shaft and designed to constrain the extending ends of the plungers for a predetermined length of time, as and for the purpose specified.
11. In a device of the class described the combination with the adjustable frame, the rotatable cutting drum, the plungers and the plunger guldeways, of means whereby the plungers are successively forced to their extreme outer position when released from the guideways, as and for the purpose specified.
12. In a device of the class described the combination with the adjustable frame, the rotatable cutting drum, the plungers and the plunger guideways, of revoluble shafts supported from the frame to the rear of the drum, wheels rigid to the inner ends of the shafts, rollers pivoted circumferentially ufion the inner face of the said wheels, the sucecssive rollers being designed in the rotation of the wheels to engage with the rear face of the extending ends of the sucessive plungers and force them to their extreme outer position when the plungers are released from the guideways, as and for the purpose specifled.
13. In a device of the class described the combination with the adjustable frame, the rotatable cutting drum dependent within the frame, the scufflers, the plungers actuating wheels disposed behind the drum and upon the frame and the plunger guideways, of means whereby contingent with the rotation of the drum, the scufflers and the plunger actuating wheels are revolved, as and for the purpose specified.
14. In a device of the class described the combination with the adjus: able frame of a rotatable cutting drum, a gear wheel secured to the shaft supporting the drum and at the side thereof, a shaft bearing in the frame and behind the drum having scufflers radially extending therefrom, a set of gear wheels at one extremity of the said shaft, a gear wheel at the other extremity, a chain connecting the gear on the drum with one of the opposing gears of the set on the shaft, shafts having bearings, in the frame at either side at the rear of the drum and supporting the plunger actuating wheel, gear wheels secured to the extremeities of the actuating wheels shafts and chains connecting the gears of the actauting wheels with the adjoining gears of the scuffler shaft, as and for the purpose specified.
15. In a device of the class described the comblnation com$\downarrow$ rising the rectangular carriage frame, an inner dependent rectangular frame pivoted rearwardly thereto, bearings exlending upwardly from the carriage frame, shafts within the bearings, carriage wheels rigid with the shafts, racks secured to the dependent frame, pinions revoluble upon the shafts and in mesh with the racks, clutches rigid to the pinions and enveloping the shafts, clutches feathered on the shafts and slidable therealong and means for throwing the slidable clutches into engagement with the pinion clutches, as and for the purpose specified.
16. In a device of the class described the combination comprising the rectangular carriage frame, an inner dependent rectangular frame pivoted rearwardly thereto, bearings extending upwardly from the carriage frame, shafts within the bcarings, carriage wheels rigid with the shafts, racks secured to the dependent frame, pinions revoluble upon the shafts and in mesh with the racks, clutches rigid to the pinions and enveloping the shafts, clutches feathered on the shafts and slidable therealong, bell crank forked levers pivoted at their angle from the carriage frame, the forked arm of the said bell crank levers resting within a groove in the slidable clutch, rods secured to the free arm of the bell cranks, links connected to the rods actuated by a lever, as and for the purpose specified.
17. In a device of the class described the combination comprising a rectangular carriage frame, an inner dependent rectangular frame pivoted rearwardly thereto, an upwardly extending pawl rack secured to the carriage frame, a spring pressed pawi normally engaging the rack and dependent from the inner frame and means for releasing the pawl from active engagement, as and for the purpose specifled.
18. In a device of the class described the combination comprising a rectangular carriage frame, an inner dependent rectangular frame pivoted rearwardly thereto, an upwardly extending pawl rack secured to the carriage frame, a guideway for the rack extending from the pivoted frame, a pawi normally engaging the rack and means for throwing the pawl out of active engagement with the rack, as and for the purpose specified.
19. In a device of the class described the combination with the adjustable frame of an upper dependent platiorm and opposing boxes laterally disposed thereon, as and for the purpose specifled.
20. In a device of the class described the combination with the adjustable frame having the revolvable cutting drum supported therein, of a cross beam extending rearwardly behind the drum and within the frame and a knife or scraper
secured to the face of the cross beam designed to clear the shears on the drum, as and for the purpose specified.
21. In a device of the class described the combination with the main frame having carriage wheels secured thereto and forwardly disposed, and a swivel wheel rearwardly and centrally disposed and a dependent frame rearwardly pivoted to the main frame, of coulters designed to cut longitudinally, and a drum having shears extending peripherally therefrom designed to cut transversely and means whereby the dependent frame may be adjusted relatively from the main frame, as and for the purpose specified.

No. 100,024. Thermostat. Thermostate.

The Petaluma Incubator Company, assignee of Lyman C. Byce, all of Petaluma, California, U.S.A., 17th July, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,078.
Claim.-1. In a temperature regulator the combination of a plurality of thermostatic units each comprising a pair of discs having respective male and female telescoping fianges securely united at their edges to provide a containing chamber, said chambers belng suitably connected centrally, one of said discs having a nipple with an orifice to communicate with one of said chambers and provided with a permanently attached skin of a compressible metal or alloy around the orifice, and a closure for said orifice having a flange to seat on said skin and provide a tight joint.
2. An improved thermostat consisting of pairs of metallic discs each having peripheral flanges, one fitting within the other and rigidly connected, said discs being corrugated in concentric lines, an exteriorly threaded nipple carried by one of the discs and having an internally threaded orifice which communicates with the chamber inclosed by the discs, said nipple having its outer end provided with a permanently attached skin or coating of soft compressible metal, a screw plug fitting said orifice and seating on said metallic coating and being freely removable, a support for the thermostat having an internally threaded socket into which said nipple screws, a sleeve between each pair of discs, said sleeve having two diameters the larger of which fits a corresponding perforation in one of the discs and the smaller fits a like perforation in the other disc, said sleeve having a flange surrounding the base of its larger diameter and adapted to abut against the inner side of its disc, and the portion of the smaller diameter projecting beyond the outside of sald disc and adapted to be permanently fitted to a perforation in the adjacent disc.

## No. 100,025. Hot Air Furnace.

## Fournaise d air chaud.

Arthur Boyce, DesMoines, Iowa, U.S.A., 17th July, 1906; 6 years. Filed 16th June, 1906. Receipt No. 136,969.
Claim.-1. In a furnace the combination of a combustion chamber, an air chamber located under sald combustion chamber and in open communication therewith at a plurality of points, a fire pot located alongside of sald combustion chamber and in open communication therewith, a plurality of tubes, each of said tubes at its lower end being in open communication with said air chamber and having its upper end extended upward into and terminated within the path of the products of combustion as they pass from the fire pot into the combustion chamber and adapted to feed air into the midst of sald products of combustion and means for controlling the supply of air to said air chamber.

7-12
2. In a furnace, a combustion chamber, an air chamber under the combustion chamber provided with air holes in its

top to ald in producing an upward draft in the furnace, means for regulating the passage of air into the air chamber, a fire pot communicating with the front and lower portion of the combustion chamber and means to feed air to the products of combustion as they pass from the fire pot into the combustion chamber.
3. In a furnace, a combustion chamber, an air chamber under the combustion chamber, closed at its front end and provided with air holes in its top to feed air into the combustion chamber at different points to produce an upward draft in the furnace, means for regulating the passage of air into the air chamber, a fire pot in front of the air chamber in a plane above the air chamber, a plurality of open-ended tubes fixed in the air chamber immediately in rear of the fre pot to feed air upward into the products of combustion as they pass from the fire pot into the combustion chamber.
4. In a furnace, a combustion chamber, an air chamber under the combustion chamber closed at its iront end and provided with means to admit air at its rear end, a plurality of open-ended tubes fixed in the top of the air chamber, a fire pot communicating with the lower end and front of the combustion chamber and a fuel magazine on top of the firo pot extending upward and inclining forward, and an air conductor on the back of the magazine communicating with the combustion chamber to mingle air with the products of combustion as they pass from the fire pot into the combustion chamber.
5. A hot air furnace comprising a double walled combustion chamber, an air chamber under the combustion chamber closed at its front end and provided with an air register at its rear end and air holes in its top, a plurality of open-ended tubes fixed in the top and front of the air chamber, a fire pot communicating with the lower end and front of the combustion chamber, a fuel magazine on top of the tire pot extending upward and inclined forward, an air conductor on the back of the magazine communicating with the combustion chamber to mingle air with the products of combustion as they pass into the combustion chamber, a grate in the bottom of the fire pot and an ash chamber under the grate arranged and combined as shown and described to operate in the manner set forth for the purpose stated.
6. A hot alr furnace comprising a double walled combustion chamber, a radiator connected with the top of the combustion chamber, a hot air chamber in the top of the combustion chamber, an air chamber under the combustion chamber closed at its front end and provided with an alr register at its rear end and air holes in its top, a plurality of open-ended tubes fixed in the top and front of the air chamber, a fire pot communicating with the lower end and front of the combustion chamber, a fuel magazine on top of the fre pot extending upward and inclining forward, an air conductor on the back of the magazine communicating with the combustion chamber to mingle air with the products of combustion as they pass into the combustion chamber, a grate in the bottom of the fire pot and an ash chamber under the grate, arranged and combined as shown and described to operate in the manner set forth for the purposes stated.
150. 100,026. Furnace Cadng. Enveloppe de fournaise.

Robert Arthur Somers, Montreal, Quebec, Canada, 17th July.
1906; 6 years. Filed 15th June, 1906. Receipt No. 136,933. Claim.-1. In a portable furnace casing the combination with a furnace, of a plurality of sheet metal sections having vertical corrugations merging into plain surfaces at their upper and lower ends, and jolnt members haviag corresponding plain surfaces engaging by the aforesaid plain surfaces on the sections, as and for the purpose specified.

Digitized by
2. In a portable furnace casing the combination with a furnace, of a plurality of sheet metal sections conforming to the

shape of said furnace and having their peripheries vertically corrugated for a portion of their length, the said corrugations merging into plain surfaces at their upper and lower ends. and joint members having flanges engaging said plain surfaces, as and for the purpose specified.
3. In a portable furnace casing the combination with a furnace, of a plurality of sheet metal sections having vertical corrugations extending to and merging into plain annular surfaces at the top and bottom of said sections and openings in said sections through which the door frames and other parts of the furnaces extend, said openings having plain surfaces therearound into which said corrugations merge, and joint members having annular flanges engaging said annular plain surfaces, as and for the purpose specified.
4. In a device of the class described in combination, a base having an upwardly projecting annular flange, a furnace mounted on said base within said annular flange, a sheet metal section surrounding said furnace and having a plain annular surface engaged by said flange, an opening in the front thereof and plain surfaces surrounding said opening and corrugations vertically arranged and extending to said door opening and to a plain annular surface at the top of said section, a ring having plain annular surfaces and an outwardly extending flange and engaging the upper plain surface of said section with its lower plain surface, an upper section having a plain annular surface engaging the upper plain annular surface of said ring and opening at the front thereof surrounded by the plain surface and corrugations extending from the lower plain surface, and upper plain surface and the said plain surface surrounding the door, a ring having a plain annular surface surmounting said upper section engaging said annular surface and a top mounted on said ring, as and for the purpose specified.

No. 100,027. Feating Apparatus.
Appareil de chauffage.

Joremie Rh'aume, Montreal, Quebec, Canada, 17th July, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,143.
Olaim.-1. In a heating appliance, a combustion chamber, a rotatable grate, a rack on the lower side of said grate, a
pinion meshing with said rack, a shaft for said pinion, a bracket supporting sald shaft, an ash chamber, an ash receptacle therein, and a second door near the lower end of said combustion chamber.
2. In a heating appliance. a combustion chamber, a rotatable grate, a rack on the lower side of said grate, a pinion meshing with said rack, a shaft for said pinion, a bracket supporting said shaft, an ash chamber, an ash receptacle therein, and a second door slidably mounted near the lower end of said combustion chamber.
3. In a heating appliance, a combustion chamber, a feed door near the upper end therof, a second door near the lower end thereof. an angular inwardly extending support below said lower door, a grate mounted on said support, a rack on the lower side of said grate, a pinion meshing with said rack, a shaft carrying said pinion, a bracket supporting said shaft and an ash chamber below said grate.
4. In a heating appliance, a combustion chamber, a feed door near the upper end thereof, a second door slidably mounted near the lower end thereof, an angular inwardly extending support below said lower door, a grate, a pinion said support, a rack on the lower side of said grate, a pinion meshing with said rack, a shaft carrying said pinion, a bracket supporting said shaft and an ash chamber below said grate.

No. 100,028. Water Feater. Chauffeur d'eau.

John Demarest, Binghampton, New York, U.S.A., 17th July, 1906; 6 years. Filed 21st June, 1906. Receipt No. 137,137.
Claim.-1. A domestic water heater comprising an outer chamber provided with means for connecting it to the water front of a range to secure the circulation of heated water therein. a truncated cone-shaped inner chamber within said outer chamber, reaching from the bottom thereof to a point below the top and being open at the top and means to permit the withdrawal of water from the inner chamber so enclosed.
2. The combination with a range and its water front or coil, of a water heater connected thereto and comprising an outer chamber', pipes connecting said chamber to the water front or coil so as to secure the circulation of hot water in said chamber, an open heated water chamber within said first-mentioned chamber and means to permit the withdrawal of water from said Inner chamber.
3. The combination with a range provided with an apertured extension shelf, and its water front or coll, of a water heater secured within the aperture of the said shelf and comprising an outer heating water chamber, connected to the water front or coil and an inner heated water chamber, the latter being of less height than the heating water chamber and open at the top and means to permit the withdrawal of water from said heated water chamber.

No. 100,029. Churn. Baratte.
Alfred J. Anderson, Wylie, Minnesota, U.S.A., 17th July, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,096.
Claim.-In a churn, a body, a dasher shaft journalled in said body, the shaft having a series of enlargements to form,
shoulders arranged one above the other, dashers arranged upon the shaft and supported by the said shoulders, means

for operating the shaft and its dashers, and an outlet at the bottom.

No. 100,030. Harrow. Herse.

ri
or
if

Andrew D. Angele, Hillsdale, Louisiana, U.S.A., 17th July,
1906; 6 years. Filed 20th June, 1906. Recelpt No. 137,097.
Claim.-1. A farm implement comprising a central beam having means at its forward end for attachment of draft appliances, the opposite end face of the beam having a projection, handles attached to the forward end of said beam and extending upwardly and rearwardly therefrom, braces connected between the handles and said beam intermediate the ends of the latter, additional beams at the sides of the firstnamed beam and hinged thereto at their forward ends for movement toward and away from the first-named beam, and for vertical movement, a member connected to the rear end of each side beam and having perforations, the said members overlapping with their corresponding perforations registering, the registering perforations bing adapted for interchangeable connection with the aforesaid projection of the frst-named beam for holding said beams against separation, and other members connected to the rfar ends of the side beams and converting upwardly toward each other and overlapping the aforesaid braces, the last-nnmed members being adjustably assoclated with the braces.

## No. 100,031. Milking Apparatus.

Apparcil d traire les vaches.
Paul E. Bartelmus, Pendleton, Oregon, U.S.A., 17th July, 1906; 6 years. Flled 22nd June, 1906. Receipt No. 137,152.
Claim.-1. A milking implement comprising a main arm, an arm plvoted thereto, both of said arms carrying rollers and arranged to receive a teat between them so that pressure may be exerted theron, and means tending to move sald arms apart.
2. A milking implement comprising a main arm, two supplemental a:ms pivoted to the main arm at opposite sides of the latter, a spring tending to move said pivoted arms away from the main arm, two rollers carried by the main arm, and complementary rollers carried by the pivoted arms.
3. A milking implement comprising a main arm and two supplemental arms pivoted thereto at opposite sides thereof,
means tending to move sald pivoted arms outwardly away from the main arm, and a guide secured to the main arm and

extending around the pivoted arms and arranged to limit the outward movement of the latter.
4. A milking implement comprising a main arm, two pivoted arms connected therewith at one end and each provided with a lug, a spring secured to one lug and passed around the butts of said arms and connected at its outer end to the other lug, said spring tending to move said arms outwardly and each of said pivoted arms provided with a finger hold, and rollers carried by said arms.
5. A milking implement comprising a main arm, and two pivoted arms, all connected together at one end, a bracket secured to the free end of the main arm, two rollers journalled in said bracket and said main arm, and a roller journalled in the free end of each of the other arms.
6. A milking implement comprising pivoted arms, one of which is provided with a longitudinal guideway, and a funnel slidably connected to said arm in the guideway thereof.
7. A milking implement comprising pivoted arms carrying rollers, one of said arms being provided with spaced-apart longitudinal bars, and a funnel provided with a loop receiving one of said bars and retained thereby, the funnel being longitudinally adjustable with respect to the said arm.
8. In a device of the character described, a milking implement designed to exert pressure on the teats, a funnel connected to said implement and longitudinally adjustable with respect to the same, and a neck strap connected to said funnel.
9. In a device of the character described, a milking implement designed to exert pressure on the teats, a funnel connected to said implement and longitudinally disposed with respect to the same, a neck strap connected to said funnel, and a body brace also connected to the funnel.
10. In a device of the character described, a milking implement designed to exert pressure on the teats, a funnel connected to said implement and longitudinally adjustable with respect to the same, a neck strap connected to the funnel, and a body brace provided with a bliurcated end plvotally connected to the funnel and also provided at its other end with a foot designed to bear against the body of the operator.

## No. 100,032. Oil Can. Bidon à huile.

John F. Cody, London, Ontario, Canada, 17th July, 1906; 6 years. Filed 23rd May, 1906. Receipt No. 136,164.
Olaim.-1. In a device of the class described, a removable strainer in combination with and located centrally in an oil can body, to divide the latter into two compartments, substantially as shown and described and for the purpose specified.
2. In a device of the class described, an oil can body and flanges in which grooves are formed secured to the sides and bottom of said body in combination with a removable strainer fitted to and secured in said grooves, substantially as shown and described and for the purpose specified.
3. In a device of the class described, an oll can body, a bottom supported above the lower edge thereof, and openings formed in said body below said bottom, substantially as shown and described and for the purpose specifled.
4. In a device of the class described, an oll can body and a removable strainer located centrally therein, in combination with a bottom supported above the lower edge of said body, and openings formed in said body, below said bottom, substantially as shown and described and for the purpose specifled.
5. In a device of the class described, an oil can body, flanges in which grooves are formed secured to the sides and bottom

of said body, a bottom secured to said body above the lower edge thereof, and openings formed in said body below said bottom, in combination with a strainer secured in the grooves in said flanges, substantially as shown and described and for the purpose specified.
6. In a device of the class described the combination with an oll can, the top of which is composed of a stationary closed portion and an adjustable portion, of a removable strainer secured in said oll can at the junction of said stationary and adjustable portions of sald top, substantially as shown and described and for the purpose specified.
7. In a device of the class described the combination with closed portion and an adjustable portion, and flanges in bottom of the body of said oil can at the junction of said which grooves are formed secured to the opposite sides and botitom of the body of sald oll can at the junction of sald stationary and adjustable portions of said top, of a strainer secured in the grooves in sald flanges, substantially as shown and described and for the purpose specified.
8. In a device of the class described, an oil can body or reservoir, the top of which is composed of a stationary closed portion and an adjustable portion, and a removable strainer secured in said oil can at the junction of said stationary and adjustable portions of said top, in comblnation with a bottom secured to the can body at a point above the lower end thereof, and openings or apertures formed in said body below said bottom, substantially as shown and described and for the purpose specifled.
9. In a device of the class described, an oll can body or reservolr, the top of which is composed of a stationary closed portion and an adjustable portion, flanges in which grooves are formed, secured to the two opposite sides and bottom of said bodv a bottom secured to sald body above the lower edge thereof, and openings or apertures formed in said body below said bottom in combination with a strainer secured in said grooved flanges, substantially as shown and described and for the purpose specifled.

No. 100,033. Baling Press. Presse d'emballage.

James Licurges Coldiron, Loca, Indian Territory, U.S.A., 17th July, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,098.
Claim.-1. In a baling press in combination, a press box having a middle receiving chamber and end baling chambers, the side walls of the middle chamber having slots, and tracks on the outside above and below said slots, a reciprocating
plunger in the box having a bar projecting through sald slots, rollers on the ends of the bar travel on said tracks, and means connected to the ends of the bar to reclprocate the plunger.
2. In a baling press in combination, a press box having a middle receiving chamber and end baling chambers, the side walls of the middle chamber being slotted, a reciprocating plunger in the box having a bar projecting through the slots, a crosshead reciprocating under the box and having upwardly projecting castings rigidly mounted thereon and connected to the ends of the bar, a crank shaft extending across under the box, and a pitman connected to the crank shaft and to the crosshead at the middle thereof.

No. 100,034. Logging Engine. Machinc d billot.

William H. Corbett, Portland, Oregon, U.S.A., 17th July, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,924.
Claim.-1. The combination with a driving shaft, of a drum shaft geared to said driving shaft, a loosely mounted drum on said drum shaft, means for temporarily locking said drum to its shaft, a second drum shaft, gear mounted thereon, a pinion provided on said first-named drum shaft and meshing with said gear, whereby said gear will be driven at a slower speed than said first-named drum, a second drum mounted on said second-named drum shaft, and means for temporarily locking sald second-named drum to said gear, substantially as described.
2. The combination with a driving shaft, of a drum shaft geared thereto, a pinion mounted on said drum shaft, a second drum shaft, gear mounted thereon, and meshing with said pinion, drums loosely mounted on said shafts, and means for temporarily locking them thereon, substantlally as described. 3. The combination with a driving shaft, of a high speed drum shaft geared thereto, a low speed drum shaft having gear connection with said high speed shaft, and drums mounted on said shafts, and operating in the same direction. the drum on said high speed shaft being of less diameter than the drum on said low speed shaft, substantially as described.
4. The combination with a driving shaft, of a high speed shaft geared thereto, a head provided on the outer end of said high speed shaft, a pinion mounted on the opposite end of said high speed shaft, a low speed shaft gear mounted thereon and meshing with said pinion, drums loosely mounted on said high and low speed shafts, and means for temporarily locking said drums on said shafts, substantially as described.
5. An engine comprising in combination, a frame, a driven shaft mounted thercon. a pinion secured on said shaft, a high speed shaft journalled in said frame, a gear macured on said shaft and meshing with said pinion, a pinion provided on one end of said high speed shaft, a low speed shaft also fournalled in said frame, an internal gear mounted on sald low speed shaft and meshing with said last-named pinion, whereby said shafts will be driven in the same direction, winding drums loosely mounted on said shafts, whereon a trip line and a hauling-in cable are wound, and means for temporarily locking said drums on said shafts, substantially as described.
6. The combination with a driving shaft, of a drum shaft geared to said driving shaft, a loosely mounted drum on said drum shaft, means for temporarily locking said drum to ths shaft, a second drum shaft, an internal gear mounted thereon, a pinion provided on said first-named drum shaft and meshing with said internal gear. whereby said internal gear will be driven at a slower speed than sald first-named drum, a second drum mounted on said second-named drum shaft, and means for temporarily locking said second-named drum to said internal gear, substantially as described.
7. The combination with a driving shaft, of a drum shaft geared thercto, a pion mounted on said drum shaft, a second drum shaft, an internal ring gear mounted thereon, and
meshing with said pinion, drums loosely mounted on said shafts, and means for temporarily locking them thereon, substantially as described.
8. The combination with a driving shaft, of a high speed drum shaft geared thereto, a low speed drum shaft having an internal gear connection with said high speed shaft, and drums mounted on said shafts, and operating in the same direction, the drum on sald high speed shaft being of less diameter than the drum on said low speed shaft, substantially as described.
9. The combination in an engine of the class described with a driving shaft, of a direct geared trip drum, a compound geared main drum and a supplementary gipsy winch, and means for causing said drums and winch to revolve in the same direction, substantially as cescribed.
10. The combination in an engine of the class describer with a driving shaft, of a direct geared trip drum, a compound geared main drum, and means for causing said drums to revolve in the same direction.
11. The combination in an engine of the class described with a driving shaft, of a direct geared high speed trip drum. a compound geared low speed main drum, overwound cables for said drums and means for causing said drums to revolve in the same direction. substantially as descrijed.

No. 100,035. Tea and Coffee Pot. Théière et cafetière.

The Right Honourable Douglas MacKinnon Baillie Hamiiton Cochrane, Earl of Dundonald, 34 Portman Square, London, England, 17th July, 1906 ; 6 years. Filed 20th June, 1906. Receipt No. 137,086.
Claim.-1. A tea or coffee pot consisting of a suitably shaped vessel having a hollow top, part of which top in combination with a pervious tray forms a compartment for the leaves or berries, the other part being formed as a lid which closes both the inlet to the pot and the inlet to the compartment, construoted substantially as described.
2. A tea or coffee pot such as described in the first claim, in which the second base on which it is stood for infusion of its contents is formed by means of the handle and two projecting studs, substantially as herein described.

## No. 100,036. Disc Cultivator, Road Machine, and Farm Wagon.

Culticatellr d disquc, machine àchin et cagon.
Abram Larkin Foote, Fayette, Iowa, U.S.A., 17th July, 1906; 6 years. Filed 7th June, 1906. Receipt No. 136,642.
Claim.-1. A carrying frame including side members, obliquely disposed cross members, a hind axle and a front bolster, a front axle pivoted beneath the bolster, a brace member connecting the front axle with the forward oblique cross bar, a disc carrying frame, a disc carrying shaft supported in said frame, draft means connecting sald shaft with the front bolster, flexible means connecting the head of the disc carrying frame with the rear oblique cross bar. a draft tongue connected with the front axle, and means for vertically adjusting and for retaining at varlous adjustments the ends of the disc carrying frame.
2. In a machine of the class described, a carrying frame ircluding side members, a hind axle and a front bolster, a fiont axle pivoted beneath the bolster, an adjustably supported disc carrying frame, a disc carrying shaft in said frame and means connecting said shaft flexibly with the front bolster, a draft tongue connected with the front axle, rearwardly extending downwardly curved beams pivoted upon the side beams of the carrying frame, a scraper carried by said beams, and means for adjusting the scraper carrying beams and for retaining them at various adjustments.
3. In a machine of the class described, a carrying frame itcluding side members, a-hind axle and a front bolster, a.
front axle pivoted beneath the bolster, an adjustably supported disc carrying frame, a disc carrying shaft in said

frame, and means connecting said shaft flexibly with the front bolster to one side of the line of draft, a draft member connected with the front axle, rearwardly extending downwardly curved beams pivoted upon the side beams of the carrying frame, a scraper carried by sald beams, springs disposed to exert downward pressure upon the scraper carrying beams, and means for adjusting said beams and for retaining them at various adjustments.
4. In a machine of the class described, a carrying frame, rearwardly extending downwardly curved beams pivoted upon the side beams of the carrying frame, a scraper carrled by said beams, springs disposed to exert downward pressure upon said beams, adjusting levers plvoted upon the side beams of the frame, links connected pirotally with sald lt vers and supporting the scraper carrying beams, and means ior securing the levers at various adjustments.
5. In a machine of the class described, the combination with a carrying frame, of an obliquely disposed adjustably supported disc carrying frame and an adjustably supported obliquely disposed scraper, the disc carrying frame and the scraper being obliquely disposed in opposite directions.

No. 100,037. Dnmping Vehicle, Machine à bascule.

John Marston Goodwin, Mount Vernon. New York, U.S.A., 17th July, 1906; 6 years. Field 15th June, 1906. Receipt No. 136,957 .
Claim.-1. In a dumping vehicle, a cargo receptacle having a flat horizontal bottom composed of marginal valves pivoted exterior of the said receptacle, and detent valves pivoted centrally of sald receptacle, the pivotal axes of the several valves .being located in substantially the same horizontal piane, in comblation with releasable means located beneath sald detent valves adapted to hold them in horizontal posi-
tion wherein they support the inboard edges of said marginal valves, and inclined discharge chutes below said valves. 2. In a dumping vehicle, a cargo receptacle having side walls, inclined hanger plates secured on the exterior thereof, linge brackets secured between the lower margins of said walls and plates, and dumping valves constituting the floor of said receptacle pivotally carried by said brackets.
3. In a cargo receptacle having upright side walls, longitudinal dumping valves forming a bottom therefor, and means for releasably supponting said valves, in combination with inclined hanger plates secured to the exterior of said s'de walls at about the center thereof and sloping downward and outboard, and hinge brackets secured between the lower margins of said walls and plates, forming the pivotal support for said dumping vehicle.
4. In a dumping vehicle, a cargo receptacle having a side wall, U-shape sheet metal brackets secured to said wall, a longitudinal shaft passing through perforations in said brackets and dumping valves for said receptacle supported to rotate on sald shaft.
5. In a dumping vehicle, the combination with the side wall of the cargo receptacle, and the hanger plate secured thereon, of a hinge bracket interposed between said parts and formed out of sheet metal provided with flanges adapted to be riveted respectively to said side wall and hanger plate.
b. In a dumping vehicle, the combination with the side "all of the cargo receptacle and the hanger plate secured thereto, of a sheet metal hinge bracket interposed between said parts and having perforated ears depending below said hanger plate, and a valve hinge shaft held in said ears.
7. In a dumping vehicle, the combination of the pivoted hinge links, a dumping valve pivotally connected to said l:nks, a shaft located outboard of said valve and means independent of sald links adapted to be operated by said shaft for replacing the valve in closed position.
8. In a dumping vehicle, the combination of a pivotally supported dumping valve, a rotary shaft, an arm on sald shaft and means connecting the free end of sald arm with the valve whereby said parts are constrained to move together.
9. In a dumping receptacle, the combination of a dumping valve adapted to be moved beyond its point of equilibrium by the pressure of the load upon discharge and automatic means for retaining said walve against closure.
10. In a device of the class described, a cargo receptacle provided with a pivoted dumping valve and ratchet mechanism adapted to permit the opening movement of said valve but preventing the closing thereof.
11. In a device of the class described, a cargo receptacle having a pivotally supported dumping valve, in combination with mechanism adapted to prevent the pivotal movement of sald valve in a closing direction and means operatable from the end of the vehicle for controlling the action of said mechanism.
12. In a device of the class described the combination of a cargo receptacle having a gravity dumping valve hinged thereto, an inclined discharging chute beneath said valve and mechanism for automatically retaining sald valve in its opened position.
13. In a device of the class described, a pivotally mounted gravity valve, a rotary shaft, an arm on said shaft connected with said valve and mechanism acting on said shaft for automatically retaining the valve in its opened position.
14. In a device of the class described, a cargo receptacle, links pivotally carried thereon, a dumping valve pivotally connected with said links and adapted to open downwards, in combination with a discharge chute beneath said valve and mechanism for automatically retalning the said valve in its opened position.
15. In a device of the class described, a shaft, links pivotally carried theron, a dumping valve pivotally connected with said links and adapted to open downwards, and an arm on the shaft connected with said valve, in combination with a discharge chute beneath the valve and means acting on said shaft and arm for automatically retaining the valve in an opened position.
16. In a dumping vehicle the combination of a dumping valve, a means of pivotal support therefor, and mechanism adapted to be set in alternative position to prevent either the closing or the opening movement of said valve.
17. In a device of the class described the combination of a cargo receptacle, of a dumping valve, mechanism associated with said valve adapted to prevent either the opening or the closing movement therof, and means located at the end of the said receptacle for setting said mechanism to produce such alternative effects.
18. In a dumping vehicle, a hinged dumping valve and a longitudinal rotary shaft connected to turn with said valve, in combination with means operatable from the end of the vehicle for preventing rotation of said shaft and valve alternatively in either direction.
19. In a device of the class described, a hinged gravity valve, a rotary shaft adapted to turn therewith, a ratchet wheel connected to sald shaft and a pawl co-operating with sald ratchet wheel to hold said valve and shaft in an opened position.
20. In a device of the class described, a hinged dumping valve, a rotary shaft adapted to turn with said valve, doubleacting ratchet wheel mechanism connected to sald shaft, and pawls co-operating with said ratchet mechanism, in combination with means for withdrawing one or the other of said pawls from engagement with its ratchet wheel.
21. In a dumping vehicle, a dumping valve, a rotary shaft, a pair of hinge links supporting said valve from the shaft; in combination with an arm fast on said shaft and located thereon between said links, said arm having its free end adapted to engage said valve.
22. In a dumping vehicle, a releasing dumping valve, a rotary shaft, a ratchet wheel fast on said shaft and provided with an angular hub in combination with a valve engaging arm fitted on said angular hub, and a pawl for engaging said ratchet wheel.
23. In a dumping vehicle, a valve replacing and retaining shaft, a ratchet wheel fast thereon and provided with an angular hub, an oppositely faced ratchet wheel fitted on said angular hub, and a pawl for each ratchet wheel.
24. In a dumping vehicle, a dumping valve formed of flanged sections united by their contiguous flanges, hinge blocks secured to the opposite sides of said united flanges, a pair of hinge links connected to said blocks, and a valve engaging arm located between said hinge links.
25. In a device of the kind described, a valve supporting shaft, a pair of opposite ratchet wheels thereon, and a pawl for each ratchet wheel, in combination with a second shaft, and means carried thereby for throwing elther pawl out of engagement with its ratchet wheel.
26. In a device of the kind described, a dumping valve and means for alternately preventing movement thereof in opposite directions, comprising two opposite ratchet wheels and pawls respectively therefor, in combination with a pawl shaft upon which said pawls are mounted and means carried by said shaft for disconnecting either of said pawls.
27. In a device of the class described, a dumping valve comprised of a plurality of flanged sheet metal sections, united by their contiguous flanges, hinge blocks secured to opposite sides of said united flanges and hinged links, adapt-- d to support said valve, secured to sald hinge blocks.

No. 100,038. Die Lifter.
Appareil d soulever les matrices.

Edwin B. Hawkins, San Francisco, California, U.S.A., 17th July, 1906; 6 years. Filed 27th July, 1905. Receipt No. 127,236.
Claim.-1. A device of the kind described comprising a metal band adapted to encircle a die and a lever pivoted to said band having the lower serrated end adapted to engage the die at a point below the band.
2. A device of the kind described comprising a circular band adapted to flt over a cylindrical object, a lever having a lower serrated end and pivoted to said band at a point adjacent said end, and a fulcrum point for said lever arranged intermediate its ends.
3. A device of the kind described comprising a circular band, said band being cut and the ends turned outward, a lever having a lower serrated end and an upper straight handle portion, said lever being pivoted between the end of the band at a point adjacent its lower end, means secured to the lever intermediate its ends and adapted to lift the same
vertically, said means forming a fulcrum point for the lever.
4. A device of the kind described comprising a metal band adapted to fit over a die, said band having an undercut inner face, and being cut transversely and the ends bent outward, a lever pivoted between sald bent ends, the pivotal point being adjacent the lower end of the lever, and means for lifting said lever vertically, substantially as described.

No. 100,039. Shid Setting Gange. Jauge de sabot.

Felix Hughes, Vancouver, British Columbia, Canada, 17th July, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,147.
Claim.-1. In a device of the class described, two members endwise slidable in relation to one another one of which members has at Its end an outward projection from the face on which the other member is slidable, means for maintaining the slidable allgnment of the members and means for securing them together in any position of endwise extension.
2. In a device of the class described, two members endwise slidable in relation to one another, one of which members has a projection at its foot from the face on which the other member is slidable a band secured to the end of the other member adjacent to the foot projection, which band encircles the other member and retains it in slidable relation, a mounting secured to the upper end of the member which is provided with a foot projection, sald member having projections which laterally engage the other slidable member, and means secured to such mounting for securing the members together in any position of endwise extension.
3. In a device of the class described, two members endwise slldable one on the other, a projection from the contacting face at the lower end of one member, a band secured to the adjacent end of the other member and encircling the firstnamed member, an elongated slot in the member to which the band is secured, and a screw secured to the upper end of the member having the foot projection, which screw projects through the elongated slot and is furnished with a nut by wh!ch the two members may be secured in any position of endwise extension.
4. In a device of the class described, an elongated member having a projection from one face of it at one end and a screw secured in the other end and projecting outward from the face as the projection at the other end, a member having a slot extending lengthwise of it through which slot the screw of the other member projects, a band secured to the lower ent of the member provided with the slot and encircling the other member and a crank handle the eye of which is threaded on the screw and engages the face of the elongated slot.
5. In a device of the class described, the member 10 having the projection 12 at the lower end and the screw 16 secured in and projecting from the other end, the member 11 slldable on the face of 10 and having the elongated slot 21 through which the screw 16 projects, the band 13 secured to the lower end of 11 and encircling the member 10 , and the crank handle 19, the eye 18 of which is threaded onto the screw 16.

## No. 100,040. Triple Valve. Soupape.

David Inches and Edward J. Hosker, Kamloops, British Columbla, Canada, 17th July. 1906; 6 years. Flled 22nd June, 1906. Receipt No. 137.146.

Claim.-1. In a triple valve of the class described, a passage through which air may pass from the auxiliary reservoir
side of the triple valve piston when such is in the normal or feed position to the train line side of the same, and means

for closing such passage by any movement of the triple valve piston that would move the slide valve thereof.
2. In a triple valve of the class described, an air passage from the auxiliary reservoir side of the triple valve piston when such is in the normal or feed position to the train line side of the same, said passage terminating in a port in the triple cylinder the location of which is such that it will be closed by the ring of the piston when such piston is in first contact with the adjacent end of the graduating stem and that will be open to the train line side of the piston when the piston moves back to close the graduating valve of the slide.
3. In a triple valve of the class described, an air passage from the auxiliary reservoir side of the triple valve piston when such is in the normal or feed position to the train line side of the same, such passage terminating on the train line side in a port in the wall of the triple cylinder the location of which is such that it will be open to the auxiliary reservoir side of the piston when such piston is in first contact with the adjacent end of the graduating stem and that will be open to the train line side of the plston when such piston has moved backward a sufficient amount to close the graduating valve of the slide.
4. In a triple valve of the class described, an alr passage from the auxiliary reservoir side of the triple valve piston when such piston $i s$ in the normal or feed position to the train line side of the same, the outlet of such passage on the train line side being such in location and width that it will be closed by the ring of the piston when such piston is in first contact wth the adjacent end of the graduating stem but will be open to the train line side of the plston when the piston has moved back off the graduating stem a sufficient amount to close the graduating valve of the triple valve slide, means for preventing the passage of air through such passage from the train line side to the auxiliary side of the piston, and means for preventing the passage of air through such passage from the auxiliary reservoir side of the piston to the train line side until a predetermined difference of pressure has been attalned.
5. In a triple valve of the class described, an air passage from the auxlliary reservoir side of the triple valve plston when such is in the normal or feed position to the train line side of the same, the outlet of which passage on the train line iside of the piston is so located that it will be closed when the piston is in first contact with the graduating stem, but opened to the auxiliary reservoir side of the plston with any further movement that would compress the graduating spring. a check valve in such passage that will prevent the passage of air therethrough from the train line side to the auxiliary reservoir side of the piston, and means for loading such check valve that it will not open until a pressure exists on the auxiliary reservoir side of the piston slightly over what is required to operate the triple valve piston and its slide when such are in good working condition.

## No. 100,041. Car Sill Remover.

## Appareil d enlever les soléoes des chars.

John Kheil, Fond du Lac, Wisconsin, U.S.A., 17th July, 1906; 6 years. Filed 13th June, 1906. Recelpt No. 136,848.
Claim.-1. In a car sill remover, a support adapted to be braced by the car bottom and a sill pulling member having connection with the support and provided with means for engaging a car sill.
2. In a car sill remover, a support, screw standards carried by the support for bracing the support form the car bottom,

and a sill pulling member connected to the support and having means for engaging a car sill.
3. In a car sill remover, a support, ratchet operated screw standards connected with the suport and adapted to brace it by engaging the car sills, and a sill pulling member connected to the support and having means for engaging a car sill.
4. In a car sill remover, a support and a sill pulling member connected with the support and comprising a screw having means for engaging the car sill.
5. In a car sill remover, a support and a sill pulling member connected thereto comprising a standard, a screw-threaded therein, a ratchet for turning the screw and means carried by the screw for engaging a car sill.
6. In a car sill remover, a support and a sill pulling member connected thereto comprising a standard, a screw-threaded therein, means for turning the screw, and a head swivelled to the screw and provided with means for engaging a car sill.
7. In a car sill remover, a support and a sill pulling member connected thereto comprising a sultably mounted screw, means for turning the screw, a head swivelled to the screw, and hooks carried by the head and adapted to engage a car sill.
8. In a car sill remover, a support and a sill pulling member connected thereto and having a sill engaging means adapted to clamp the sill with increasing force as draft is applied thereto, and means for applying draft to the sill engaging means.
9. In a car sill remover, a support, a sill pulling member connected thereto comprising a suitably mounted screw, - means for turning the screw, a head swivelled to the screw, and a sill engaging hook carried by the head adapted to clamp the sill with increasing force as draft is applied to the head by the screw.
10. In a car sill remover, a support, a sill pulling member connected thereto comprising a pair of hooks adapted to clamp a sill with increasing force as draft is applied thereto, means for applying draft to the hooks, and plates adapted to be arranged on opposite sides of the sill and provided with openings through which the hooks engage the sill, said plates serving to limit the extent of penetration of the hooks into the sill.
11. In a car sill remover, a support, a pulling member connected thereto comprising a pair of hooks adapted to clamp a sill with increasing force as draft is applied thereto, means for applying draft to the hooks, and a pair of plates to be placed on opposite sides of the sill being removed and havin - hooks to be forced between said sill and the decking to which it is attached, said plates being adapted to be engaged by the hooks.
12. In a car sill remover, a support, a sill pulling member connected thereto and comprising a pair of hooks adapted to clamp a car sill with increasing force when draft is applied thereto, and means for applying draft to the hooks, a pair of plates adapted to be placed on opposite sides of the sill to be removed and having hooks to be driven between the upper edge of the sill and the decking to which it is attached, the hooks of the sill pulling member being adapted to enter openings in the plates, and spurs on said hooks to engage the plates and limit the extent of penetration of said hooks into the sill.
13. In a car sill remover, a support, a sill pulling member connected thereto and comprising a suitably mounted screw, means for turning the screw, a head swivelled to the screw and having a pair of opposite plates, a pin slidable in slots of said plates, and a pair of sill engaging hooks pivoted to said pin and having connection to the head.
14. In a car sill remover, a support, a sill pulling member connected thereto and comprising a suitably mounted screw,
means for turning the screw, a head swivelled to the screw and having a pair of opposite plates, a pin slidable in slots of said plates and projecting beyond to form handles, and sill engaging hooks pivoted to said pin.
15. In a car sill remover, a support, a sill pulling member connected thereto and comprisifig a suitably mounted screw, means for turning the screw, a head swivelled to the screw and having a pair of opposite plates, a pin slidable in slots of said plates, a pair of sill engaging hooks pivoted to the pin, one passing through an opening in the other, and links connecting the hooks to the head.
16. In a car sill remover, a support, a sill pulling member connected thereto and comprising a suitably inounted screw, means for turning the screw, a head swivelled to the screw, a pair of sill engaging hooks carried by the head, and a $\mathbf{U}$ shaped member plvoted to the head and adapted to embrace the sill and prevent the head turning with the screw.
17. In a car sill remover a supporting bar, a pair of screw standards connected thereto, a sill pulling member also connected to the supporting bar and comprising a suitably mounted screw, means for turning the screw, and a sill engaging means carried by the screw.
18. In a car sill remover a supporting bar, a pair of screw standards connected thereto and adapted to bear against the car sills, a sill pulling member also connected to the supporting bar and comprising a suitably mounted screw, and sill engaging means connected to the screw.
19. In a car sill remover a supporting bar, a pair of screw standards adjustably connected thereto adapted to bear against the car sills, a sill pulling member also adjustably connected to the supporting bar and comprising a standard, a screw threaded therein, means for turning the screw, a head swivelled to the screw, a pair of sill engaging hooks connected to the head adapted to clamp the sill with increasing force when draft is applied thereto, a pair of plates adapted to be placed on opposite sides of the sill to be removed and having hooks for engaging the sill, said sill engaging hooks being adapted to enter openings in the plates, and a Ushaped member pivoted to the head and adapted to embrace the sill.

No. 100,042. Bntter Cntter. Couteau d beurre.

Edward J. Luhman, San Francisco, California, U.S.A., 17th July, 1906; 6 years. Flled 21st June, 1906. Recelpt No. 137,124.
Claim.-1. In an apparatus for cutting butter and analagous substance the combination with a plurality of cutters spaced apart, of a carrier movable with respect to the plurallty of cutters and comprising members detachably connected together.
2. In an apparatus for cutting butter and analagous substance the combination of a cutter, and a carrier movable with respect to the cutter and having members one of which is movable past the cutter and the other of which is adaptto be positioned so as to pass the cutter and be then restored to its original position relative to the first-mentioned member.
3. In an apparatus for cutting butter and analagous substances the combination with one or more cutters, of a carrier movable with respect to the cutter or cutters, the said carrier being arranged to rock, and being made up of members detachably connected together.
4. In an apparatus for cutting butter and analagous substance the combination with one or more cutters, of a carrier movable with respect to the cutter or cutters, the said carrier being arranged to rock or turn toward the cutter or cutters and being made up of a member having a socket adjacent to one end, and a member having a tongue at one end removably arranged in the socket of the first-mentioned member.
5. In an apparatus for culting butter and analogous substance the combination with a main frame, and a plurality of cutting wires arranged transversely above the main irame, of a carrier movable on the main frame and adapted to be
turned thereon, sald carrier comprising members detachably counected to each other and arranged to rest against different sides of a mass of butter or the like.
6. In an apparatus for cutting butter and analagous substance the combination of a main frame, a sub-frame rising from the main frame and provided with a fastening device a wire frame removably arranged on the main frame and against the sub-frame and having an appurtenance for the engagement of the said fastening device, and a carrier movable on the main frame and adapted to rock and comprising a horizontal member and an upright member detachably engaged with the horizontal member.
7. A carrier for the purpose described comprising members provided with co-operating means whereby they are detachably held together at right angles to each other.
8. In an apparatus for cutting butter and analagous substance the combination with a main frame having side bars provided in their upper edges with notches the outer walls of which are inclined, and a sub-frame rising from the main frame and provided with a fastening device, of a wire frame comprising uprights having lower rabbeted ends, a cross bar arranged in the rabbets of sald side ends and having an edge inclined in conformity with the inclined walls of the notches, a crown bar bearing an appurtenance for engaging with the fastening device, and wires stretching between the uprights.

No. 100,043. Bntter Monld. Moule d leurre.

Edward J. Luhman, San Fransisco, California, U.S.A., 17th July, 1906; 6 years. Filed 21st June, 1906. Receipt No. 137,125.
Claim.-1. A mould for giving shape to butter and other material comprising a bottom, side sections arranged at opposite sides of the bottom and having interlapping end portions provided with opposed grooves, and keys removably arranged in the said opposed grooves of the side sections.
2. A mould for giving shape to butter and other material, comprising a bottom, side sections arranged at opposite sides of the bottom and having interlapping tongues at their ends in the outer sides of which are provided opposed grooves having inclined walls, and tapered keys removably arranged in the said opposed grooves of the side sections.
3. A mould for giving shape to butter and other materials comprising a bottom, side sections arranged at opposite sides of and removable from the bottom and having lapped end portions, and means co-operating with the sald lapped end portions of the sections and detachably connecting the same together.
4. A mould for glving shape to butter and other material, comprising a bottom, and side sections arranged at opposite sides of and removable from the bottom and detachably connected together at their ends.
5. A mould for giving shape to butter and other material, comprising a bottom having ledges connected to its under side and extending beyond its edges, and side sections arranged at opposite sides of the bottom and on the extended portions of the ledges and removable from sald bottom and ledges and detachably connected together at the ends.
6. A mould for giving shape to butter and other material, comprising a bottom having ledges connected to its under side and extending beyond its edges, side sections arranged at orposite sides of the bottom and on the extended portions of the ledges and having interlapping tongues at their ends In the outer side of which are proviled opposed grooves, and taper keys removably arranged in the said opposed grooves of the side sections.
7. A mould for giving shape to butter and other material, comprising a bottom having ledges connected to its under side and extending beyond its ledges, right angle side sections arranged at opposite sides of the bottom and on the extended portions of the ledges and having interlapped tongues at their ends in the outer sides of which are provided opposed grooves, taper keys removably arranged in the sald opposed grooves of the side sections, and a false bottom disposed between the side sections and on the bottom.

7-18
8. A mould for giving shape to butter and other material, comprising a bottom, side sections arranged at opposite sides of and removable from the bottom and detachably connected together at their ends, and a removable false bottom disposed between the side sections and on the bottom.

## No. 100,044. Hot Water Radiator.

- Calorifrre ì cau chaudr.

Henry Theodore Offterdinger. Washington, Dlstrict of Columbia. U.S.A., 17th July, 1906; 6 years. Filed 16th June, 1906. Receipt No. 136,935.

Claim.-1. In combination with a portable hot water radiator, a heating tube having communication with the fluif passages of the radiator and comprising closely associated relatively broad walls to compel the fluid to pass therethrough in a thin fllm, a burner combined with and surrounding said heating tube at the lower end thereof, and a heat confining jacket associated with the burner and surrounding the heating tube.
2. In combination with a portable hot water radiator, a heating tube having communication with the fluld passages of the radiator and comprising closely associated relatively broad walls to compel the fluid to pass therethrough in a thin film, a burner combined with and surrounding said heating tube at the lower end thereof, and a heat confining jacket surrunding and conforming to the shape of said heating tube.
3. In combination with a portable hot water radiator, a heating tube having with the fluid passages conmunication of the radiator and comprising closely assoclated relatively broad walls to compel the fluid to pass therethrough in a thin fllm, a burner combined with and surrounding sald heating, tube at the lower end thereof, a heat confining jacket associated with the burner and a draft regulator connected with the sald heat confining jacket.
4. In combination with a portable hot water radiator, an heating tube associated therewith and having communication with the fluid passages thereof, a burner surrounding said heating tube and provided with plural means for connection to a source of fuel supply.
5. In combination with a portable hot water radiator, an auxillary heating tube associated therewith and having communication with the fluld passages thereof, a burner surrounding said heating tube and provided with plural means for connection to a source of fuel supply, and a heat confining jacket surrounding sald tube.

## No. 100,045. Fire Pot and Grate. Pot d feu et grille.

Stefan Knapp, Detroit, Michigan, U.S.A., 17th July, 1906; 6 years. Filed 4th June, 1906. Receipt No. 136,541.
Claim.-1. In combination with a stove or furnace provided with a magazine, a fire pot, a cover therefor hinged to the stove casing and magazine, an auxiliary fire pot, a series of bars adapted to rest in supports in the stove casing and auxiliary fire pot, said supports being so arranged that the bars, when in position are below the fire pot and equidistant from each other, a grate below the auxiliary fire pot, said grate being in two parts, hinged to opposite sides of the stove casing, earh part being provided with means whereby the position of each part in relation to the auxlliary fire pot may be regulated substantially as shown and described.
2 . In combination with a stove or furnace provided with a magazinc, a fire pot, a cover therefor hinged to the stove casing, said cover having holes therethrough provided with hinged covers, a shield piece so arranged in relation to sald cover and stove casing as to form an inclosed chamber above the fire pot, an auxiliary fire pot, a serles of bars adapted to
rest in supports with which the stove casing and auxiliary fire pot are provided, said supports being so arranged thai

the bars, when in position, are below the fire pot and equidistant from each other, a grate below the auxiliary fire pot, said grate being in two parts, each of which is provided with a perforated hinge member, a hinge pin of greater length than the width of said perforated member and upon which said member is mounted to slide and to turn, said hinge pin being rigidly secured to the stove casing, each part of the grate being provided with means whereby its position in relation to the auxiliary fire pot may be regulated, substantlally as shown and described.
3. In combination with a stove or furnace provided with a magazine, a fire pot, a cover therefor hinged to the stove casing and magazine, an auxiliary fire pot, a series of bars made in two parts, hinged together and adapted to rest in supports with which the stove casing and auxiliary fire pot are provided, said supports being so arranged that the bars, when in position are below the fire pot and equi-distant from each other, a grate below the auxiliary fire pot, said grate being in two parts each of which is provided with a perforated hinge member, a hinge pin of greater length than the width of said perforated member and upon which said member is mounted to slide and to turn, said hinge pin being rigidly secured to the stove casing, each part of the grate being provided with a lug on its underside and a screw threaded through each side of the stove casing below the grate, adapted to bear against the lugs on said grate, substantially as shown and described.

No. 100,046. Grate. Grille.

FIg.2.

John Elmer Parkinson, Denver, Colorado, U.s.A., 17th June, 1906; 6 years. Filed 16th June, 1906. Receipt No. 136,990.
Claim.-1. The combination in a grate, of a supporting rod, and a series of grate sections each with a hollow boss receiving said rod and with terminal clutches whereby the sections are caused to rock together.
2. The combination in a grate, of a supporting rod, a series of grate sections each with a hollow boss, a sleeve secured to and projecting from one section, and a supporting rod extending through the sleeve and bosses, said sections having terminal clutches.
3. The combination in a grate, of a supporting rod, a series of grate sections each with a hollow boss, a sleeve secured to and projecting from one section, and a supporting rod extending through the sleeve and bosses and provided with a socketed bracket to receive a handle, said sections having terminal clutches.
4. The combination in a grate, of a supporting rod, a series of grate sections with terminal clutches rocking on said rod, a sleeve extending from the front section around said rod, and a bracket having a socket secured to said sleeve.
5. The combination in a grate, of a supportng rod, a series of grate sections with terminal clutches rocking on said rod, a sleeve extending from the front section around said rod. a bracket having a socket secured to said sleeve, and a movable detent arranged to engage shoulders of said bracket.
6. The combination in a grate, of a supporting rod, a series of grate sections with terminal clutches rocking on said rod, a sleeve extending from the front section around said rod, a bracket having a socket secured to said sleeve, and a movable detent arranged to engage shoulders of said bracket and to swing out of position by contact with a handle when in said socket.
7. The combination with the supporting rod, series of grate sections, one having a sleeve, a cross bar through which the sleeve and rod extend, and a locking strip arranged between the front grate section and the cross bar.
8. The combination with a series of grate sections provided with hollow bosses and clutches, of supporting hollow rods extending through the bosses, a sleeve connected to the front section and inclosing said rod, and a cross bar with a bearing for said sleeve.
9. The combination with a grate section, of a sleeve on which said section is connected by casting.
10. The combination with a grate section, of a sleeve on which said section is connected by casing, and a cross bar with a bearing for said sleeve.

No. 100,047. Grate. Grille.

John Elmer Parkinson, Denver, Colorado, U.S.A., 17th July, 1906; 6 years. Filed 16th June, 1906. Receipt No. 136,991 . Claim.-1. The combination in a grate, of a series of grate sections, a series of water tubes supporting said sections to rock in respect to the water tubes, and means for supplying the latter with water, substantially as set forth.
2. The combination in a grate, of a series of grate sections, a series of water tubes connected to form a continuous conduit supporting said sections to rock in respect to the water tubes, and means for supplying the latter with water, substantially as set forth.
3. The combination in a grate, of a series of grate sections, a series of water tubes supporting sald sections to rock in respect to the water tubes, means for supplying the latter with water, and means for rocking each section on its tube, substantially as set forth.
4. The combination in a grate, of a series of grate sections, a series of water tubes supporting said sections to rock in respect to the water tubes, means for supplying the latter with water, means for rocking each grate section on its tube, and means for locking each section in its normal position, substantially as set forth.
5. The combination in a grate, of a series of water tubes, and a grate section supported to rock on each water tube and provided with side bars with lower sharpened ribs, substantially as set forth.
6. The combination in a grate, of a series of water tubes, a grate section supported to rock on each water tube and consisting of a plurality of members, and means for connecting said members and for rocking the same together, substantially as set forth.
7. The combination in a grate, of a series of parallel water tubes, a sleeve turning on each tube, and a grate section connected with said sleeve to rock therewith, substantially as set forth.
8. The combination in a grate, of a series of parallel water tubes, a sleeve turning on each tube, and a grate section
consisting of a plurality of members connected with paid sleeve to rock therewith, substantially as set forth.
9. The combination in a grate, of a series of parallel water tubes, a sleeve turning on each tube, and a grate section connected with said sleeve to rock therewith, the sleeves being cut away at the top to permit the grate sections to rest on the tubes, substantially as set forth.
10. The combination with the water tubes, of sleeves each cut away at the top for part of its length, a grate section to each sleeve, and U-shaped conections engaging the sleeve with ends extending upward through the grate section and provided with threads and nuts thereon, substantially as set forth.
11. The combination with the water tubes, of sleeves each cut away at the top for part of its length, a grate section tc each sleeve having lugs below its upper surface, and: a U-shaped connection, the arms of which are threaded and extend upward through the lugs and carry nuts below the surface of the section, substantially as set forth.
12. The combination in a grate, of the front and back cross bars, sleeves rocking in openings of the front cross bar, water tubes extending through the sleeves and through the cpenings of the back croes bar and connected with each other, and grate sections connected with the sleeves to rock therewith, substantially as set forth.
13. The combination in a grate, of the front and back cross bars, sleeves rocking in openings of the front cross bar, water tubes extending through the sleeves and through the openings of the back cross bar and connected with each other, grate sections connected with the sleeves to rock therewith, and heads on the sleeve shaped to permit the engagement therewith of an operating lever, substantially as set forth.
14. The combination in a grate, of the front and back cross bars, sleeves rocking in openings of the front cross bar, water tubes extending through the sleeves and through the openings of the back cross bar and conneoted with each other, grate sections connected with the sleeves to rock
heads on the sleeve shaped to permit the engzoement therewith of an operating lever, and detents plvoted to swing over and engage the heads when the lever is not in rosition, substantially as set forth.
15. The combination with the water tubes, sleeves and grate sections, of a back bar having an upright flange with notches to receive the tubes, and a detachable retaining etrin extending across sald natches, substantially as set forth.
16. The combination with the front bar having bearings for the hollow sleeves and grate sections connected with caid sleeves, of water plpes extending through the sleeves and of less diameter than the openings of the latter, and means for maintaining the said water pipes in an elevated position within the sleeves, substantially as set forth.
17. The combination with a rocking grate bar, of a socreted head and movable detent adapted to engage said head and supported to move from the head on the introduction of a handle into the socket.
18. The combination with the rocking sections of a grate, of supporting bars, a box-like cross bar through which the supporting bars extend, and heads and detents arranged within the cross bar.

No. 100,048. Garment Eupport. Support de ceitement.
Mary Jane Penn, Batavia, Ohio, U.S.A., 17th July, 1906; 6
years. FHled 22nd June, 1906. Recelpt No. 137,151.
Claim.-1. In a skirt supporter and llfter, a belt, means connected to and located above said belt for supporting a skirt, and lifting cords adapted to be fastened on the belt, guides on the belt and said cords passed through the guides, whereby the skirt may be lifted and secured in lifted position.
2. A supporter and lifter consisting of a belt, skirt supporting means projecting above said belt, a buckle at the rear of the belt having loops, and duplicate cords adapted to be detachably connected to the skirt, sald cord being passed through said loops and provided with rings adapted tc be connected to hooks on the belt.
3. A garment lifter consisting of a support, a buckle connecting the support at the rear having guiding loops thereon, duplicate lifting cords passed through said loops having detachable lifting means for connection with the garment and having rings at their free ends to connect the hooks on the support, whereby the garment may be held in llfted position.
4. A garment lifter consisting of a support, a buckle at the rear having guiding loops, duplicate cords passed through sald loops having means for detachable connection with the garment, said cords differing in length and adapted to be attached to the garment at varying heights, and rings on the free ends of the cords adapted to be connected with hooks on the support, whereby the garment may be held in lifted position.
5. A skirt lifter consisting of a belt, a buckle in the rear thereof provided with loops, duplicate lifting cords at each

side of and a lifting cord in the center of the rear of the belt provided with snap hooks adapted to be connected to a skirt, a majority of said cords passing through the loops on sald buckle, and some of said cords connected at the sides of the belt, sald duplicate cords connected to a single cord at each side of the belt, and means for holding said single cord fast to the belt when said skirt is lifted.
6. A skirt lifter consisting of a belt, a buckle at the rear thereof provided with loops, double rings located at each side of the belt, and hooks between said rings and the front center of the belt, duplicate cords having means for attachment to said hooks and connected to a single ring, cords connected to said ring and passed through said double rings and detachably connected to attaching means on the skirt, and a plurality of said cords passing through the loops on the buckle at the rear of the belt.
7. A skirt lifter consisting of a support, a buckle at the rear of said support provided with loops, double rings located on each side of the belt, and hooks between sald rings and the front center of the support, duplicate cords having attaching eyes for connection with sald hooks and connected to a single ring, cords connected to sald ring and passed through double rings and provided with snap hooks at their ends, a plurality of said cords passed through the loops on the buckle, and rings on the inside of the skirt for sald snap hooks.
8. A skirt lifter consisting of a support adapted for adjustment around the walst of a wearer, a buckle at the rear thereof provided with loops, duplicate cords having eyes for attachment to hooks located at the sides of the belt and connected to a ring as J) at the rear of the support. a second ring located on the cord having a cord $r^{2}$ conected thereto, said cord passing through guiding means on the belt, and a cord as I passed through the loops of the buckle at the rear of the support and fastened to ring $D$, and detachable means at the ends of said cords $I r^{2}$ for connection with the skirt.
9. A skirt lifter and supporter consisting of a belt, a buckle at the rear provided with guiding loops, cords adapted to be detachably connected to a skirt passed through sald loops and having means for fastening to the belt, and elastic metallic plates extending above the belt to support a skirt.
10. A belt, a buckle connecting the belt at the rear anit provided with loops, cords passed through said loops with detachable fastening means at one end, means at the other end of said cords for fastening to the belt, elastic plates extending above the belt to support a garment and having a curved portion extending below the belt for the support thereof.
11. A belt, a buckle connecting the belt and provided with loops, cords passed through said loops with detachable fastening means at one end, adjustable fastening means at the other ends of said cords, and metallic plates connected to said belt having an upwardly projecting tongue and a downwardly projecting flexible portion.
12. The combination with a belt having downward extensions at the rear thereof, of curved metallic pleces in said extension provided with tongues extending above the belt. and slotted plates secured to a garment and adapted to recelve sald tongues whereby the garment may be held aboves the belt to prevent sagging at the rear.
13. The combination with a garment supporter of a belt having downward extensions thereon at the rear forming pockets, curved metallic pleces secured in said pockets having tongues extending above the belt, slotted plates secured to a garment and adapted to recelve sald tongues, hooks on
th belt, and a series of loops on a second garment adapted to receive said hooks.
14. The combination with a belt, of curved metallic picces secured thereto provided with tongues ext•nding above the belt, and slotted plates secured to a garment and adapted to receive said tongues.
15. The combination with a garment supporter consisting of a belt having downward extensions at the rear forming pockets, metallic pieces having curved surfaces in said pockets and provided with tongues at one end, said tongues being elongated, additional tongues sccured to the belt, and a garment having plates secured thereon providel with slots to receive said tongues.
16. A belt having downward extensions, curved metallic pieces in said extensions having elongated upper ends, alditional tongues on said belt, and a garment provided with means having a slot therein for recelving said tongues.

No. 100,049. Range and Stove. Poéle de cuisinc.

James W. Provan, Oshawa. Ontario, Canada, 17th July, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,812.
Claim.-1. The combination with a range or slove of a ligh warming closet overchanging the top of the stove, and provided with perforations in its bottom and an oulet at its top adapted for connection with a ventilating pipe, substantially as described.
2. The combination with a range or stove of a high warming closet overchanging the top of the stove, and provided with means for admitting fumes and steam from cooking into the closet, and a fine communicating with the closet through which said fumes and steam may find an exit, subtsantially as described.
3. The combination with a range or stove of a high warming closet overchanging the top of the stove, and provided with means for admitting fumes and steam from cooking into the closet, a flue communicating with the closet through which said fumes and steam may find an exit, and a damper controlling sald closet flue, substantially as described.
4. The combination with a range or stove of a high warming closet overchanging the top of the stove, a partition dividing the closet in two, means for admitung fumes and steam from cooking into one part of the closet, and a flue communicating with the same part of the closet through which said fumes and steam may find an exit, substantially as described.

## No. 100,050. Sugar Beet Seeder.

## Semoir pour betteraves.

Frederick Tiemann, Ordway, Colorado. U.S.A., 17th July, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,094.
Claim.-1. The combination with the frame and its supporting wheels and shaft of a planter, of a plurality of supplemental frames each connected to said shaft to swing independently, each supporting ploughs and seed distributing mechanism, means for operating said mechanisms from said shaft, and independent clutch devices between the shaft and each of said means, substantially as set forth.
2. The combination with the seed box of a planter having a port at the end, of a seed wheel having pockets, means for rotating it to carry said pockets past said port, a closing plate at the opposite side of the wheel having a port, and a conduit leading downward from the latter port, substantially as set forth.
3. The combination with the seed box of a planter having an end piece and port therein of a shaft extending through said end, a seed wheel with pockets secured to said shaft and rotating in contact with the outer face of said end piece, a
plate in contact with the outer face of the wheel having 3 channel, the upper end of which is in position to coincide

with the pockets, a plough and a conduit extending from above the plough to the lower end of said channel, substantially as set forth.
4. In a sced distributcr, a box having a port at one end, a seed wheel with pockets arranged to be brought opposite said port, a plate having a channel with which said pockets may be brought into communication, and a spring arranged adjacent said wheel to spring into each pocket as the latter passes the spring, substantially as set forth.
5. A box for a planter having an end piece with a port therein, a wheel with pockets rotating in contact with the outer face of said end piece, and a plate recessed at the inner face to roceive said wheel and with a channel, the upper end of which is in position to coincide with the said pockets as the whel revolves. substantially as set forth.
6. The combination with the frame of a planter, of a supplemental frame, a seed box carried thereby, seed distributing mechanism at each end of said box, and ploughs carried by said box, each plough on a bar adjustable vertically in said supplemental frame substantially as set forth.
7. The combination with the main frame and driving shaft. of the swinging seed distributing frame, a rock shaft, connections whereby to elevate the rear end of the seed distributing frame, driving mechanism including a clutch device, and connections whereby the clutch device is shifted when the rock shaft is operated to lift the seed distributing frame. substantially as set forth.
8. The combination with the main frame, driving shaft, swinging frame $E$, rock shaft $3:$ connected to the frame $E$, and means for rocking said shaft, of sprocket wheels loose upon the driving shaft, sprocket chains carried by said wheels and extending to pinions on the frames $E$, clutch devices for ronnerting the sprocket wheels to and releasing them from the shaft. and connections whereby the clutch devices are shifted as the rock shaft is turned, substantially as set forth.
No. 100,051. Saw Mill. Ścicric.

William Henry Trout, Milwaukee, Wisconsin, U.S.A., 17th July, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,215.
Claim.-1. In saw mill set works the combination with the setting stand provided with a home stop and the stop shaft
journalled in said stand and having a ratchet wheel fixed thereon, of a gauge plate having a notched rim, a stop arm pivotally mounted on the stand concentrically with the ratchet wheel and provided with a locking device for securing it to the ratchet wheel, and a handle movable mounted on the stop arm for operating said locking device and having a projection adapted to engage with a notch in the gauge plate as the locking device is engaged with the ratchet wheel and thereby exactly determine the set for cutting lumber of the desires dimension, substantially as described.
2. In a saw mill set works the combination with the setting stand provided with a home stop and the stop shaft journalled in said stand and having a ratchet wheel fixed thereon, of a stop arm pivoted concentrically with said ratchet wheel and provided with a pawl or toothed block for locking it to said ratchet wheel, and a graduated gauge plate having a notched rim concentric with the ratchet wheel, and a lever pivoted to the stop arm, connected with said pawl or toothed block and provided with a projection adapted to pass through a notch in the gauge plate and hold said arm in a position exactly corresponding therewith while the pawl or toothed block is being carried into engagement with the ratchet wheel, substantially as described.
3. In saw mill set works the combination with the setting stand provided with a home stop and the stop shaft journalled in said stand and having a ratchet wheel fixed thereon, of a stop arm pivoted concentrically with the ratchet wheel and provided with a pawl or toothed block pivotally connected therewith and adapted to lock it to said ratchet wheel, a graduated gauge plate pivoted on said shaft adjacent to said arm and having a notched rim, means for adjusting said gauge plate with relation to the home stop, a graduated dial journalled on said shaft adjacent to the gauge plate and connected by gears with said shaft, and a lever pivoted to the stop arm, connected with said locking pawl or block and provided with a projection adapted to pass through the notches in the gauge plate and to hold the stop arm in corresponding positions while the locking pawl or block is being engaged with the ratchet wheel, substantially as described.
4. In saw mill set works the combination with the setting stand provided with a home stop and the stop shaft journalled in said stand and having a ratchet wheel fixed thereon, of a stop arm pivoted concentrically with the ratchet wheel and provided with a locking device for securing it thereto, a graduated gauge plate pivoted concentrically with said ratchet wheel for determining the point of locking said stop arm to the ratchet wheel, a tooth or arm pivoted on said stand and engaging said gauge plate, a latch connected with sa'd pivoted tooth or arm, and a stationary rack with which said latch engages, substantially as described.
5 . In saw mill set works the combination with the setting stand provided with a home stop, the stop shaft journalled in said stand and having a ratchet wheel fixed thereon, and a pawl pivoted to the stand for preventing backward movement of the ratchet wheel, of a stop arm pivoted concentrically with the ratchet wheel and provided with a locking device for securing it thereto, a gauge plate pivoted on said stop shaft above the ratchet wheel for determining the point of locking said stop arm to the ratchet wheel, a tooth or arm pivoted on the stem of said pawl and engaging with said gauge plate, a latch connected with said tooth or arm, and a stationary rack with which said latch engages, substantially as described.
6. In saw mill set works the combination with the setting stand provided with a home stop and the stop shaft journalled in said stand and having a ratchet wheel fixed thereon, of a stop arm pivoted concentrically with the ratchet wheel and provided with a locking device for securing it thereto, a graduated gauge plate located above and concentric with the ratchet wheel for determining the point of locking said arm to said ratchet wheel, and a graduated dial pivoted upon said shaft and connected therewith by gears, said gauge plate being recessed on its upper side to receive said dial, the graduated face of which is approximately flush with the raised graduated rim of the gauge plate, substantially as described.
7. In saw mill set works the combination with the setting stand provided with a home stop and the stop shaft journalled in said stand and having a ratchet wheel fixed thereon, of a stop arm pivoted concentrically with said ratchet wheel and provided with a locking device for securing it thereto, a graduated gauge plate for determining the point of locking said arm to said ratchet wheel pivoted on said shaft above the ratchet wheel and recessed on the upper side, a dial having an internally toothed depending rim journalled on said shaft above said gauge plate and connected by gears with said shaft, a pawl for preventing recoil of the ratchet wheel when the stop arm engages the home stop, a tooth or arm pivoted on the stem of said pawl and engaging with said gauge plate, a gear support attached at one end to said stand, extending around said tooth or arm between the gauge
plate and dial encircling the stop shaft and carrying the gears which connect the dial with said shaft, a looped frame attached to the stand, passing around the stop shaft above the dial and provided with a bearing for the stem of said pawl and with a curved rack concentric with said stem, and a latch pivoted to the hub of said tooth or arm and provided with a transversely adjustable tooth adapted to engage with said rack, substantially as described.
8. In saw mill set works the combination with the setting stand provided with a home stop and the stop shaft journalled in said stand and having a ratchet wheel fixed thereon, of a stop arm pivoted concentrically with the ratchet wheel and provided with a locking device for securing it thereto, a graduated gauge plate pivoted on said shaft for determining the point of locking said arm to the ratchet wheel, a graduated dial journalled on said shaft adjacent to said gauge plate, a pawl for preventing recoil when said arm strikes the home stop, a frame piece attached to the stand, extending over the dial, and provided with a bearing for the stem of said pawl and with a rack which is concentric with said stem and terminates at one end in an index or pointer adjacent to a circular scale on the dial, a tooth or arm pivoted on the stem of said pawl and engaging with said gauge plate, and a latch connected with said tooth or arm and adapted to engage with said rack, substantially as described.
9. In saw mill set works the combination of the setting stand provided with a home stop, a stop shaft journalled in said stand, a ratchet wheel fixed on said shaft, a stop arm pivoted concentrically with the ratchet wheel and provided with means for locking it thereto, an adjustable gauge plate provided above and concentric with said ratchet wheel for determining the point of locking said arm to said ratchet wheel, a dial journalled on said shaft and connected therewith by gears above the gauge plate, a pawl for preventing recoil of the ratchet wheel when the stop arm strikes the home stop, a gear support extending from the stand between the gauge plate and dial and having a bearing on the stop shaft, a tooth pivoted on the stem of said pawl and engaging with said gauge plate, a frame piece provided with a bearing for the stem of said pawl and with a rack and extending from the stand over the dial to the stop shaft on which it has a bearing, a latch pivoted to the hub of said tooth or arm and adapted to engage with said rack, a spring actuated bolt for holding said pawl in and out of engagement with the ratchet wheel, and a socket for said bolt having a shank by which said gear support and frame piece are secured to the stand, substantially as described.
10. In saw mill set works the combination with a stationary index, of a rotary dial having a scale on which said index shows the distance of the knees from the sawing plane, and a lumber scale adjustable on said dial with relation to the other scale, substantially as described.
11. In saw mill set works the combination with gauge and stop mechanism, of a rotary dial connected with the setting mechanism and provided with a circular scale for determining the distance of the knees from the sawing plane and with an adjustable ring having circular lumber scales concentric with the dial and with the other scale thereon, and a stationary index with which said scales are read, substantially as described.

No. 100,052. Washing Machine. Machine à laver.

Margaret C. Wilkin, Decatur, Illinois, U.S.A., 17th July, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,583.
Claim.-The combination with the stationary outer vessel 1 , and the cover 2 therefor, of a vertical shaft journalled in the
bottom and in the cover of the outer vessel, an inner revoluble disc carrying vessel secured to said shaft and having a perforated bottom and perforated sides, imperforate radial flanges projecting outwardly from the sides of the inner vessel and disposed parallel with the axis of the shaft, and perforated radial partitions secured to the shaft and to the inner vessel to rotate therewith, whereby compartments are formed in the inner vessel, substantially as specified.

No. 100,053. Railway Rail Joint.
Support de joint de rails de chemin de fer.

Linnaeus Winans, Hood River, Oregon, U.S.A., 17 th July, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,938.
Claim.-In a device of the character described the combination with two adjacent railway rails and the ties for supporting the same, of a rail supported of a width greater than that of the bases of said rails and having its ends turned down at right angles to provide flanges, said flanges being adapted to engage and lie flush with the outer vertical edges of two adjacent ties, and a strengthening rib or web secured to the underside of that part of the rall joint supporter which bridges the space between the two ties and being tapere: from its center towards its ends.

No. 100,054. Rail Joint. Joint de rails.

Charles K. Frecr, Memphis, Tennesste, U.S.A., 17th July, 1906; 6 years. Filed 2丷天nd June, 1,06t. Receipt No. 137,174.
Claim.-1. A rail joint comprising transverse clamping lugs a rall chair, double wedges on the underside of the rail chair. and a support for the double wedges from the said clamping luss.
2. A rail joint comprising transverse clamping lugs, a rail chair, double wedges on the underside of the rail chair, and links hung on the said clamping lugs and supporting the said double wedges.
3. A rail joint comprising transverse clamping lugs, a rail chair having upturned flanges for receiving the terminals of the said lugs, an upper wedge on the underside of the rail chair, a bottom wedge in contact with the upper wedge, and links supporting the bottom wedge from the said clamping lugs.
4. A rail joint comprising transverse clamping lugs, a rail chair having upturned flanges for receiving the terminals of the said lugs, an upper wedge on the underside of the rail chair, a bottom wedge in contact with the upper wedge, links supporting the bottom wedge from the said clamping lugs, and means connected with the said rail chair for holding the upper wedge against movment.
5. A rail joint comprising transverse clamping lugs, a rail chair having upturned flanges for receiving the terminals of the sald lugs, each of the lugs having a pin engaging an aperture in the corresponding flange, an upper wedge on the underside of the rail chair, a bottom wedge in contact with the upper wedge, and links supporting the bottom wedge from the said clamping lugs.

No. 100,055. Railway Tie. Dormant de chomin de fer.

Charles W. Israel, Paris, Illinols, U.S.A., 17th July, 1906; 6 years. Filed 13th June, 1906. Receipt No. 136,850.
r'laim.-1. A railway tie comprising end sections mutually connected, each section comprising a plastic base, a metallic top plate, a brace for the top plate, and a truss wire conmected with the said plate and passed under the brace and having anchors at its ends, said wire brace and anchors being embedded in the base.
2. A railway tie comprising a plastic base, a top plate sesured upon the base and having perforations therethrough. rail clips, bolts engaged with the rail clips and with said perforations, nuts engaged with the lower enas of the bolts, the plastic base having recesses in its sides in which the nuts are received, and a supporting truss for the top plate embedded in the base.
3. A railway tie comprising end sections mutually connected, each section comprising a plastic base, a metallic top plate, depending webs at the ends of the top plate, a brace for the top plate, and a truss wire engaged through the webs and passed under the brace and having anchors at its ends, said wire, brace and anchors being embedded in the base.
4. A railway tie comprising a plastic base, a top plate secured upon the base and having perforations therethrough, rail clips, bolts engaged with the rail clips and with said perforations, and nuts engaged with the lower enas of the bolts, the plastic base having recesses in its sides in which the nuts are received.

## No. 100,056. Sash Balance for Car Windows. <br> Contre-poids de châssis pour fenêtres de chars.

The St. Louis Car Company, assignee of Karl Schllepmann, St. Charles, assignee of the St. Louis Car Company, St. Louis, both in Missouri, D.S.A., 17th July, 1906; 6 years. Filed 22nd May, 1906. Recelpt No. 136,145.
Claim.-1. In a sash balance for street cars the combination of a balance drum, a balance ribbon connected to said drum, a hanger in which sald drum is rotatably mounted, and trackets in which said hanger is swingingly mounted, substantially as set forth.
2. In a sash balance for street cars the combination of a balance drum. a balance ribbon connected to said drum, a
hanger in which said drum is rotatably mounted, pintles extending from said hanger at its upper ends, and supporting

brackets in which said pintles are loosely fitted. substantially as set forth.

No. 100,057. Mower. Faucheuse.

The International Harvester Company, Chicago, Illinols, assignee of George H. Bartlett, Madison, Wisconsin, all in the U.S.A., 17th July, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,635.
Claim.-1. A cutting apparatus for mowers comprising in combination reciprocating devices, a series of pairs of guard fingers having intervening spaces, a reciprocating knife cyomprising a series of sections in operatlve relation with'said fingers, the stroke being such and said sections being so arranged relative to said pairs of fingers that their points, when at the end of strokes of said knife in opposite directions, will be approximately coincident with the medial lines o! the intervening spaces between the members of adjacent pairs of guard fingers.
2. $A$ cutting apparatus for mowers comprising in combination reciprocating devices, a series of groups of guard fingers having substantially equal intervening spaces, a rec!procating knife comprising a corresponding series of sectlons in operative relation with sald fingers, means for reciprocating said knife in a manner whereby the point of each section will register with a medial line of a space between two guards of one group of guard fingers at the end of one stroke, and with a medial line of a space between the guards of an adjacent group at the end of the opposite stroke.

## No. 100,058. Process of Recovering Precious Metals.

## Procédé pour obtenir des métaux précieux.

T'he Just Mining and Extraction Company, assignee of John A. Just, all of Syracuse, New York, U.S.A., 17th July,

1906; 6 years. Filed 9th April, 1906. Reccipt No. 134.759.
Claim.-1. The process of extracting precious metals from ores or materials containing said metals, which consists in treating sald ores or materials with nitro-sulphonic acid.
2. The process of extracting a precious metal from ores or cuaterials containing said metal, which consists in treating said ores or materials with nitro-sulphoric acid to obtain the metal in colution and recovering the precious metal from the solution in any suitable known manner.
3. The process of extracting silver and gold from ores or materials containing sald metal, which consists in treating said ores or materials with nitro-sulphoric acid.
4. The process of extracting silver from ores or materials containing sald metal, which consists in treating said ores or materials with nitro-sulphoric acid.

No. 100,059. Flush Hinge. Penture.

Henry Edward Larcombe, assignee of Thomas Franklin Saling, both of North Yokima, Washington, U.S.A., 17th July, 1906; 6 years. Filed 11th April, 1006. Receipt No. 134,855.
6laim.-1. A flush hinge comprising leaves 4, 4, formed with in:turned flanges 8 having cut-away corners 9, a link 5 adapted to fit between said leaves and having stops 11 at its ends, to engage the cut-away corners of said flanges, and pivots connecting said link to the flanges of said leaves, substantially as described.
2. $\Lambda$ flush hinge comprising leaves 4, 4, formed at their ends with inwardly projecting flanges having bevelled correers and upon their inner sides with longitudinally extending recesses, a link 5 disposed between the flanges of sald leaves and having bevelled edges to co-act with the recesses in said leaves, and wedge-shaped stops at its ends to co-act with the bevelled corners of said flanges. and pivot pins passed through said flanges and into said link, substantially as described.

No. 100,060. Gate Hinge. Penture de barrière.

John A. Jones, Mitehell, Montana, U.S.A., 17th July, 1906; 6 years. Filed 8th May, 1906. Recelpt No. 135,688.
Claim.-A gate hinge consisting of a continuous pintle directly attachable to a post and hinge eyrbolts, rotatively mounted on the pintle and attachable to a gate, in condenatt:on with a guide and brace piear, having a collar iljs.': fitting upon the pintle below the lower hinge bolt, and vertically adjustable thereon by means of a set screw, and of st:ch length as to have the free end in contact with the post

No. 100,061. Door Bolt Mechanism.
Mécanisme de verrou de porte.

William B. Morewood, Elizabeth, New Jersey, U.S.A., 17th July, 1906; 6 years. Filed 30th April, 1906. Receipt No. 135,374.
Claim.-1. In a door lock, the combination of a shaft parallel to and extending across the door, said shaft rotatably mounted in bearings which are fixed to the door, a push plate to rotate the shaft extending across the door and carried by outwardly and upwardly extending arms fixed to said shaft, a circular plate rigidly fixed to the end of the shaft, cne or more links pivotally connected to said circular plate outside the axis of the shaft, a bolt pivotally connected with each of said links, and guides on said door for said bolts.
2. In a door lock, the combination of a shaft parallel to and extending across the door, said shaft rotatably mounted in bearings which are fixed to the door, a push plate f.o rotate the shaft extending across the door and carried: by outwardly and upwardly extending arms fixed to said shaft, a circular plate rigidly fixed to the end of the shaft and having its rim extending within the face of the door into a countersunk opening provided therefor, one or more links pivotally connected to said circular plate outside the axis of the shaft, a bolt pivotally connected with each of said links, and guides on said door for said bolts.

No. 100,062. Door Holder. Arrete-porte.

John Becker, Wichita, Kansas, U.S.A., 17th July, 1906; 6 years. Filed 27th March, 1906. Receipt No. 134,332.
Claim.-1. The combination with a door and its frame, of a rock bar secured to one of said parts and held in a projected or spaced position therefrom with its teeth facing said part, and a spring pressed latch mounted upon the other of said parts and pivotally connected thereto and provided with a dog engaging the teeth of the rack bar.
2. The combination with a door and its frame, of a rack bar secured to one of said parts and held out therefrom with its toothed surface facing the part, and a spring pressed latch mounted upon the other of said parts and pivotally connected thereto so as to move in a plane coincident with the plane of movement of the door and provided at its free end with a dog designed to engage with any one of the teeth of the said rack bar.
3. A door securer or holder comprising a rack bar designed to be secured to a door casing or the like, and a pivoted spring pressed latch arm arranged for attachment to a door casing or the like, and a pivoted spring pressed latch arm arranged for attachment to a door, a pivoted finger carried by said arm and provided with a dog designed for engagement with the teeth of the rack bar, and means for holding said finger in such position relative to the arm that the dog will be held out of engagement with the rack bar, as and for the purpose set forth.
4. A door securer or holder, comprising a rack bar designed to be secured to a door casing or the like, a pivoted latch arm arranged for attachment to a door, a rocking finger carried by said pivoted arm and provided with a dog designed for engagement with the teeth of the rack bar, and means for rocking said finger on the arm whereby to disengage the dog from the rack bar.
5. A door securer or holder comprising a rack bar arranged for attachment to a door casing or the like, a pivoted latch arm adapted for attachment to a door, a rocking finger mounted on the free end of said arm and provided with a dog designed for engagement with the rack bar, and a pull cord secured to said finger and arranged to rock the same so as to carry the dog out of engagement with the rack bar.
6. A door securer or holder, comprising a rack bar arranged for attachment to a door casing or the like, a pivoted spring pressed arm adapted for attachment to a tooth, a finger pivotally mounted on said arm, said finger carrying a dog designed for engagement with the rack bar and also provided with a bearing lug designed to bear against and slide over the teeth of the rack bar when the finger is rocked to carry its dog out of engagement with said teeth, and means for rocking said finger.
7. A door securer or holder comprising a rack bar arranged for attachment to a door casing or the like, a pivoted spring pressed arm designed to be attached to a door, a finger pivotally mounted on the end of said arm and provided with a dog adapted for engagement with the teeth of the rack bar and also provided with a bearing lug arranged to bear against the teeth of the rack bar when the finger is rocked, so as to carry the dog out of engagement with said teeth, a stud on said finger, said stud being adapted for engagement with the arm whereby to limit the rocking or relative movement of the finger thereon, and means for rocking said finger.
8. The combination with a door and its frame, of a rack bar secured to the door frame, a pivoted spring arm attached to the door, a finger pivotally mounted on the end of said arm and provided with a dog designed to engage said rack bar, there being provided on the door guides, and a pull cord or cable secured to said finger and passing through the guides on the door and arranged to rock said finger, as and for the purpose set forth.

No. 100,063. Bolt Lock. Serrure à verrou.

Theodor H. Bauer, Middletown, Ohio, U.S.A., 17th July, 1906 6 years. Filed 12th March, 1906. Receipt No. 133,762.
Claim.-1. In mechanism of the class described the combination with a closure, of a bolt slidably mounted thereon, an actauting bar also slidably mounted on the closure in rear of the bolt and having a resess that receives the rear end thereof, the recess having an inclined wall and the said rear end being likewise inclined and movable into and out of the recess, and a link pivotally connected to the bolt in advance of its rear end and to the bar.
2. In mechanism of the class described the combination with a closure, of oppositely movable bolts slidably mounted on the closure, a sliding actuating bar disposed between the bolts in angular relation thereto and having recesses in its opposite edges that receive the rear ends of the bolts, sets of links pivotally connected to the bolts in advance of the portions that are received in the recesses, and a common pivotal device for connecting the links of each set to the bar.
3. In mechanism of the class described the combination with a closure, of a base plate secured thereto, oppositely extending sets of bolts mounted on the base plate, guldes for sald bolts carried by the plate, an actuating bar extending longitudinally of the base and slidable thereon, sald bar extending between the bolts at substantially right angles thereto, guides for retaining the bar to the base, and oppositely extending sets of links, each set having a common pivotal connection with the bar and being furthermore pivotally connected to the bolts, said bolts and operating mechanism therefor being thereby carried by and removable with the base plate in assembled relation.
4. In mechanism of the class described the combination with a closure, of locking bolt therefor, an actuating device for the bolt having a key-receiving socket, and a holding dog movable into and out of the key-receiving socket and engaging the walls of said socket to hold the actuating device against movement.
5. In mechanism of the class described the combination with a closure, of a locking bolt therefor, an actuating bar for the bolt slidably mounted on the closure and having an opening constituting a key-receiving socket, and a spring pressed holding dog mounted on the closure and movable into and out of the key-receiving socket and engaging the walls of said socket to maintain the bar against its sliding movement.
6. In mechanism of the class described the combination with a closure, of a base mounted thereon, bolts slidably mounted on the base, an actuating bar slidably mounted on the base in angular relation to the bolts, said bar having a key-recelving opening in one end, a spring mounted on the base, and a dog pivotally mounted on the base secured to the spring, said dog being movable into the key-receiving opening and engaging the walls thereof to hold the bar against movement when said bar is in a predetermined position and being furthermore moved out of said opening when the key is inserted therein.
7. In mechanism of the class described the combination with a closure, of a base mounted thereon, oppositely extending bolts slidably mounted on the base, an actuating bar located at right angles between the bolts and slidably mounted on the base, said bar having a key-receiving opening in one end, links pivotally connecting the bar and bolts, and a spring pressed dog secured to the rear side of the base and being movable into the opening when the bar is in a predetermined position and engaging the walls of said opening to hold said bar in said predetermined position.
8. In mechanism of the class described the combination with a box or case having opposite side walls provided with spaced recesses, of curved holding plates secured to the opposite walls of the case and having terminals located over the recesses and provided with bolt receiving seats, a closure for the box or case, sllding bolts mounted on the under side of the closure and being movable into the bolt receiving seats, means located between the bolts for moving the same in opposite directions, and a key arranged to be passed through the box or case and engage sald actuating means.

## No. 100,064. Fastener for Keys, Windows, Ditc.

 Attache de fenĉtre, etc.Addison Calvin Fletcher, New York City, New York, U.S.A., 17th July, 1906; 6 years. Filed 30th April, 1906. Recelpt No. 135,390 .
Claim.-1. A fastening device comprising two hooks of substantially duplicate construction and disposed in a common plane, each hook consisting of two connected approximately U-shaped portions the outer terminals of the outer U-shaped portions being directly opposite each other.
2. A fastening device comprising a shank and two hooks of substantlally duplicate construction at one end of the shank, the hooks facing each other and each consisting of two connected approximately $U$-shaped portions disposed at an angle to each other.
3. A fastening device comprising a body provided at one end with means for securing its loose suspension and at the other end with two stiff hooks of duplicate shape facing each other, each hook being adapted for locking engagement with an eye.
4. A fastening device comprising two hooks of substantially duplicate construction facing toward each other, each hook having interiorly thereof a shoulder arranged substantially opposite the bill thereof.
5. A fastening device comprising a body having an opening at one end, whereby it may be connected with a hook or

equivalent device in a loose manner and two stiff hooks at the opposite end of duplicate construction, said hooks facing toward each other, being of different sizes, and each being adapted for locking engagement with an eye.

No. 100,065. Pump. Pompe.

Carl Suczek, Wsetin, near Brünn, Austria, 17th July, 1906; 6 years. Filed 18th April, 1905. Receipt No. 124,394.
Claim.-A pump having an eccentric provided with a ring carrying a wing working in a guide which is mounted within an extension of the pump casing and oscillates as the eccentric rotates, sald eccentric ring, wing and gulde being of the same width as the interior of the pump casing, all substantially as described.

No. 100,066. Method of Destroying Nozious Fumes or Ganes.

## Méthode do détruire les gas perniotous.

Herbert Walker, the Ginsberg Gold Mining Company. Knight, Transvaal, South Africa, 17th July, 1906; 6 years. Filed 10th April, $1906 . \quad$ Receipt No. 134,799.
Claim.-1. A mixture for destroying or neutralizing the noxious or poisonous fumes or gases in blasting operations in mines and the like, consisting of permanganate of potash and an ingredient which serves as a detonator therefor.
2. A mixture for destroying or neutralizing the noxlous or polsonous fumes or gases in blasting operations in mines and the like, consisting of permanganate of potash and chlorate of potash which serves as a detonator therefor.
3. A mixture for destroying or neutralizing the noxious or poisonous fumes or gases in blasting operatious in mines and the like consisting of permanganate of potash and chlorate of potash which serves as a detonator therefor, and sal-ammoniac.
4. A mixture for destroying or neutralizing the noxious or polsonous fumes or gases in blasting operations in mines and the like, consisting of permanganate of potash, chlorate of potash and sal-ammonlac, in the proportions of permanganate of potash ten pounds, chlorate of potash one to two drams, and sal-ammoniac half to one dram, substantially as described.

No. 100,067. Sash Lock. Arrête-croisée.

Franklin M. Coleman, Moultrie, Georgia, U.S.A., 17th July, 1906; 6 years. Filed 14th May, 1906. Recelpt No. 135,916.
Claim.-1. A sash lock comprising a plate, a plurality of bolts carried by the plate and arranged at an angle to each other for engagement with the window frame and one of the window sashes respectively, a flexible connection between said bolts for simultaneously moving the bolts to inoperative position, and means carried by the flexible connection and engaging the plate for locking said bolts in inoperative position.
2. A sash lock comprising a bolt mounted upon and extending through one sash for engagement with the opposite sash, a second bolt mounted upon the same sash and adapted to engage the window frame, and a flexible connection between the bolts for simultaneously moving said bolts to inoperative position.
3. A sash lock comprising a plate provided with a lateral lip, a plurality of bolts mounted on the plate and arranged at an angle to each other for engagement with the adjacent sash and window frame respectively, a flexible connection between the bolts for moving the same to noperative position, and a hook carrled by the flexible connection and adapted to engage the lip for locking said bolts in inoperative position.
4. A sash lock comprising a bolt mounted upon and extending through one sash and engaging the other sash, a bolt mounted upon the same sash at right angles to the first bolt and engaging the window frame, meaus whereby a rotary movement of the frame engaging bolt moves sald bolt to inoperative position and means connecting the two bolts for disengaging both bolts simultaneously.
5. A sash lock comprising a spring actuated bolt mounted upon and extending through one sash and engaging the other sash, a second bolt mounted at right angles to the first bolt and adapted to engage the window frame, a member provided with a cam slot for engagement with the second bolt and so arranged that a rotary movement moves the bolt longitudinally out of engagement, pulleys mounted between the bolts, a cord passing over the pulleys and connecting the bolts whereby a rotary movement of the frame engaging bolt moves the other bolt longitudinally to Inoperative position, means carried by the cord for maintaining the bolts in inoperative position, and means for maintaining the cord.

## No. 100,068. Sash Fastener. Arrête-croiséc.

Joseph Hunt, Miami, Manitoba, Canada, 17th July. 1906; 6 years. Filed 2nd April, 1906. Receipt No. 134,517.
Claim.-1. In a sash fastening device the combination comprising a casing provided with a sleeve, a perforated plate disposed over one end of the sleeve, a rod disposed in the sleeve and projecting through the perforated plate, a plunger secured on the rod, means for locking the rod in a plurality of positions, and a spring disposed around the rod.
2. In a sash fastening device the combination comprising a casing provided with a sleeve, a perforated plate disposed over one end of the sleeve and provided with a fiange adapted to engage the sleeve, a rod disposed in the sleeve and projected through the perforated plate, a plunger secured on the rod, a spring disposed around the rod, and means for locking the rod in a plurality of positions.
3. In a sash fastening device the combination comprising a casing provided with a sleeve, a perforated plate disposed over one end of the sleeve, a rod disposed in the sleeve and projected through the perforated plate, a hook disposed on
one end of the rod, a screw adapted to secure the hook on the rod, a spring disposed around the rod, and means for locking the rod in a plurality of positions.

4. In a sash fastening device the combination comprising a casing provided wtin a sleeve, a perforated plate disposed over one end of the sleeve, a rod disposed on the sleeve and projecting through the perforated plate, a plunger provided with a shank secured on the rod, a spring disposed around the rod, and means for locking the rod in a plurality of positions.
5. In a sash fastening device the combination comprising a casing provided with a sleeve, a perforated plate disposed over one end of the sleeve, a rod disposed in the sleeve and projected through the perforated plate, a plunger secured on the rod and provided with a reduced end, a body of resilient material on the reduced end, pins adapted to maintain the resllient body in position, a spring disposed around the rod, and means for locking the rod in a plurality of positions.
6. In a sash fastening device the combination comprising a casing provided with a sleeve, a perforated plate disposed over one end of the sleeve, a rod disposed in the sleeve and projected through the perforated plate and provided with a slot having lugs projecting therein, a plunger secured on the rod, a sprine disposed around the rod, and a collar disposed on the rod and provided with a lug adapted to enter sald slot and engage said projections.
7. In a device of the character described the combination comprising a window casing having a recess therein, a metallic lining for the recess, a sash movable with relation to the casing and provided with a recess and having an opening thercthrough merging into the recess, a casing disposed in the recess in the sash and provided with a sleeve projecting through said opening, a plate disposed over one end of the recess and provided with an opening, a rod disposed through said opening and extending into said sleeve. a shank formed on a plunger head and secured to the rod, and means for locking the rod in a plurality of positions.

No. 100,069. Sash Weight. Contre-poids de chassis.

Ferdinand Charles Schwadtman, St. Louis, Missouri, U.S.A., 17th July, 1906; 6 years. Filed 6th April. 1906. Regeipt No. 134,667.
Claim.-1. As a new article of manufacture, a weight composed of a core of ground barytes and a bonding agent surrounded by a shell of metal which fills the surface pores of said core, substantially as described.
2. As a new article of manufacture, a weight composed of a shaped core which consists of ground barytes mixed with a bonding agent, and having a fugitive coating of impervious material, and a shell of metal which fills the pores of the core formerly occupied by the impervious coating, substantially as described.

## No. 100,070. Window Sash. Chassis de fenêtre.

Frederick Kling, St. Louis, Missouri, U.S.A., 17th July. 1906; 6 years. Filed 24th April, 1906 . Receipt No. 135,222
Claim.-A window sash anti-rattler comprising a block adapted to be secured to the window frame, a nose on sald block adapted to overlap the stop bead of the frame, said stop bead being yieldingly mounted to said frame, and a flexed spring at the base of the nose adapted to bear with its free end against the adjacent edge of the stop bead and force the latter against the sash, substantially as set forth.

No. 100,071. Window Sash Fastener. Arrête-croisée.

Charles Hoyt Williams, Buffalo, New York, U.S.A., 17th July, 1906; 6 years. Filed 3rd April, 1906. Recelpt No. 134,564.
Claim.-1. The combination in a window sash fastener with a locking plate adapted to be attached to and extend beyond a side bar of the upper sash having a slot and a bolt hole therein and provided with a cam, such slot, bolt hole and cam being in and on that portion of said locking plate which projects beyond said side bar, of a bolt provided with a lug adapted to pass through said bolt hole and slot and sald lug engaging said cam when said bolt is turned, and a keeper for the bolt capable of being attached to the upper rail of the lower sash.
2. The combination in a window sash fastener with a locking plate adapted to be attached to and extend beyond a side bar of the upper sash having a slot and a bolt hole therein and provided with a cam, a casing adapted to be attached to the upper rail of the lower sash and having longitudinal and transverse slots therein, and a bolt operating in said casing and provided with a lug adapted to pass through said bolt hole and said slot in said locking plate and the lug engaging sald cam when sald bolt is turned, the bolt being also provided with a thumb piece arranged to operate in the slots in the casing.
3. A bolt casing for a window sash fastener comprising a longitudinally and transversely slotted barrel and a hood at one end of larger diameter than said barrel, a slot being provided in the vertical wall of said hood and opening into the longitudinal slot in the barrel.
4. A bolt keeper for a window sash fastener consisting of an independent base plate provided with a ribbed guide for the bolt, and a casing adapted to be superimposed on said base plate and comprising a longitudinally and transversely slotted barrel, and a hood at one end of larger diameter than said barrel, a slot being provided in the vertical wall of said hood and opening into the longitudinal slot in the barrel.

No. 100,072. Binder. Lieuse.

Albert Williams, Joliet, Montana, U.S.A., 17th July, 1906; 6 years. Filed 19th April. 1906. Receipt No. 135,063.
Claim.-1. The combination of the binder deck inclined downwardly toward its outer edge, the binding devices and the trip, and the box provided at its upper edge with an inwardly projecting flange secured beneath the binder deck at the lower edge of the latter, the said box being also provided in its upper edge at its inner side with a notch adapted to receive the trip while the bundle or sheaf is being discharged from the binder, substantially as set forth.
2. The combination with the binder deck, the box having an end gate or door, cross braces extending over the top of the box, flanges at the upper inner edge of the box and arranged to underlie the binder deck, means securing the flunges to the deck, the box being notched in its upper edge tu receive the trip, and means for bracing the box from the binder frame, substantially as set forth.

No. 100,073. Grain Elevator. Elíratcur d grain.

Fig. 1.
Fred W. Cooley and George T. Houstain, assignee of onethird interest, both of Minneapolis, Minnesota, U.S.A.. 17th July, 1906; 6 years. Filed 14th April, 1906. Receipt No. 134,922 .
Claim.-1. In a device of the kind described, the combination with a cup equipped elevator belt and co-operating leg. of a pan forming a bottom to said leg, sald pan having an open accumulation chamber or space at one side, of a pit taving an inclined bottom directly secured to one end of sald pan and arranged to deliver grain directly into eaid pan. substantially as described.
2. In a device of the kind described, the combination with an elevator leg. of a pan secured to and forming a bottom to said leg, a wheel at the lower end of said leg, working in said pan, a cup equipped elevator belt working in said leg and running under sald wheel, an open accumulation chamber in one side of said pan, an open pit leading upward from said accumulation chamber, and an in-pit having an inclined bottom directly secured to one end of said pan and arranged ic deliver grain directly into said pan, substantially as described.
3. In a device of the kind described, the combination with $\therefore r$ elevator leg, and a pan secured to the lower portion of said leg and having a bottom thereto, a wheel journalled at the lower portion of said leg and working in said pan, a cup eçupped elevator belt running under said wheel and through said leg. accumulation chambers at the sides of said pan.
intermediate open pits leading upward from said accumulation chambers, and positively disposed end pits having inclined bottoms directly secured to the ends of said pan and arranged to deliver grain directly into said pan, substantially as described.
4. The combination with elevator legs 1, a pulley 3, and a cup equipped elevator belt 2, of a pan or boot 6 below said pulley 3, guard plates 18 embracing the lower side portions of said pulley and forming said pan with accumulation, chambers 20 , grain pits 7 opening into the front and'rear ends of said pan 6, and intermediate pits 16 opening into sald accumulation chambers 20 , substantially as described.
5. The combination with elevator legs 1, a pulley 3, a cup eaulpped elevator belt 2, of a pan 6 below said pulley, the veams 5 secured with respect to said pan and supporting bearings for the shaft of said pulley, the inclined end pits 7 cpening into the front and rear ends of said pan 6 through cpenings 8, the guard plates 18 secured to said beams 5 and embracing the lower side portions of said pulley and forming said pan 6 with upwardly extended accumulation chambers 20 , and the intermediate side pits 16 opening into said accumulation chambers 20 , sald pan 6 affording a boot to the eievator, and a common boot to the said pits 7 and 16 , substantially as described.

## No. 100,074. Elevator Belt Drive.

Mise en mourement de courroie d'élévateurs.

Fred W. Cooley and George T. Houstain, assignee of a twothirds interest, both of Minneapolis, Minnesota, U.S.A., 17th July, 1906; 6 years. Filed 14th April, 1906. Receipt No. 134,930 .
Claim.-1. In a device of the kind described, the combination with a pulley having a peripheral groove, of a driving rape or cable running in the peripheral groove of said pulley, and a belt running over the face of said pulley, said rope or cable and sald belt having independent frictional engagement with said pulley, substantially as described.
2. In a device of the kind described, the combination with a pulley having a $V$-shaped peripheral groove, of a driving rope or cable running in the peripheral groove of said pulley. and a belt running over the face of said pulley and over that portion of sald rope or cable which is within said groove, said rope or cable and said belt having independent frictional engagement with said pulley, substantially as described.
3. The combination with an elevator leg and a pulley mounted therein, said pulley having a peripheral groove, of ar endless driving rope or cable running in the groove of said cable, and a cup equipped belt running over the face of said pulley and over that portion of said rope or cable which is within said groove, said rope or cable and said belt having independent frictional engagement with said pulley, substantially as described.

## No. 100,075. Submarine Sound Signal.

 Signal sous-marin de son.The Submarine Signal Company, assignee of Horace Biglow Gale, all of Boston, and Arthur Joseph Mundy, Newton, both in Masachusetts, U.S.A., 17th July, 1906; 6 years. Filed 26th May, 1906. Receipt No. 136,269.
Claim.-1. In an apparatus for producing sound vibrations in water, by which they are transmitted, the combination of an under water sound producing device, a buoyant supporting body adapted to float upon the surface of the water, an attached tube extending downward below the buoyant support and open at its lower end and a motor element adapted t' be immersed in the water in the tube and to move responsively to relative axial movements of the water therein, said
motor element being operatively connected to said under water sound producing device, substantially as set forth.

2. In a signal buoy, the combination of an under water sound producing device, a motor element operatively connected thereto and adapted to have a reversing movement responsive to the up and down movement of the body of the buoy by the waves, and a tube, open at its lower end, extending downward below the buoy and enclosing the said motor element, substantially as set forth.
3. In an apparatus for producing sound signals in water, by which they are transmitted, the combination of a buoyant stipport adapted to float upon the surface of the water and tc be moved up and down by the waves, an attached tube, open at its lower end, extending downward from the buoyant support and adapted to enclose a mass of water practically unaffected by the wave movement, a motor element adapted to be immersed in the water in the tube and to be act.eddi upon by the inertia of said mass of water, and an under water sound producing device operatively connected to said motor element, substantially as set forth.
4. In an apparatus for producing sound signals in water. by which they are transmitted, the combination of a buoye.nt support adapted to float upon the surface of the water and to be moved up and down by the waves, an attacheid tube, open at its lower end, extending downward below the buoyant support so as to enclose a mass of water comparatively unaffected by the surface movement, a piston movably supported in the tube and adapted to be immersed in the said mass of water and acted upon by the inertia, and an under water sound producing device operatively con ${ }^{L}$ nected to said piston, substantially as set forth.
5. In an apparatus for producing sound signals in water, by which they are transmitted the combination of a buoyant support adapted to float upon the surface of the water and to be moved up and down by the waves, an attached tube open at its lower end extending axially downward below the buoyant support so as to enclose a mass of water comparatively unaffected by the wave movement. a buoyant piston movably supported in the tube and adapted to be immersed in the sai. mass of water and acted upon by its inertia, and an under water sound producing device operatively connected to saill piston, substantially as set forth.
6. In an apparatus for producing sound vibrations in water, by which they are transmitted the combination of an under water sound producing device, a buoyant body, a tube with its axis extending up and down supported thereby and open to the water at its lower end, means for supporting the said sound producing device upon the tube, and a motor element adapted to be immersed in the water in said tube and to havo a reversing movement responsive to the relative up and down movements of the water therein, operatively connected to said under water sound producing device.
7. In a signal buoy, an attached tube with its axis extending up and down. said tube being open to the water at its lower end, an under water sound producing device, means for supporting the said sound producing device under the buoy comprising an open frame attached to the tube and adapted to permit a relative up and down movement of the column of water therein, and a motor element adapted to have a reversing movement responsive to said up and down movment of the water in the tube and operatively connected to said under water sound producing device, substantially as set forth.
8. In a signal buoy, an atatached tube with its axis extending up and down. said tube being open to the water at its lower end, an under water sound producing device, means for supporting the said sound producing device comprising an open frame, attached to the bottom of the tube and adapted
to permit a relative up and down movement of the column of water therein, and a piston adapted to have a reversing movement responsive to said up and down movement of said column of water in which it is immersed, and operatively connected to said under water sound producing device, substantially as set forth.
9. In an apparatus for producing sound signals in water, by which they are transmitted the combination of a buoyan support adapted to float upon the surface of the water and to be moved up and down by the waves, an attached tube, open at its lower end, extending axially downward below the buoyant support, so as to enclose a mass of water comparatively unaffected by the wave movement, a motor element adapted to by which they are transmitted, the combination of an under water sound producing device operatively counected to said motor element, and a central oxial guide for said motor element, substantially as set forth.
10. In an apparatus for producing sound signals in water by which they are transmitted the combination of an under water sound producing device, a buoyant body, a tube attached thereto at or near its upper end and extending downwari therefrom so as to reach comparatively still water, an open supporting frame for the operating parts attached to the tube and adapted to permit a relative up and down motion of the water therein, and axial guide for the motor element supported by sald frame, and a motor element operatively connected to said under water sound producing device, and adapted to have a reversing movement upon said axial guide responsive to said up and down motion of the water in the tube.
11. In an apparatus for producing sound signals in water b- which they are transmitted, the combination of a buoyant body. a tube attached thereto extending downward under the. water and open at its lower end. an under water sound producing device within or below said aube, a motor element in the tube operatively connected to said sound producing device, and adapted to move responsively to relative axial movements of the water therein, and an open frame attached to the tube and adapted to support the sound producing de vice at a point blow the said motor element.
12. In an apparatus for producing sound signals in water. by which they are transmitted the combination of a buoyant bodv. a tube attached thereto extending downward under the water and open at its lower end, an under water sound producing device within or below said tube. a motor element in the tube operatively connected to said sound producing device, and adapted to move responsively to relative axial movements of the water therein, an axial guide for the said motor element, and an open frame attached to the tube and supporting the said guide and sound producing device at a point below the said motor element.
13. In an apparatus for producing sound signals in water. by which they are transmitted, the combination of a buoyant supporting body. a tube attached thereto extending downward below the same and open at its lower end. an under water sound producing device within or below said tube. a motor element oneratively connected to said sound producing device and adapted to move respons'vely to rclative axial movements of the water in the tube, an axial guide for the said motor element, and an open irame attached to the tube and supporting the said guide and sound producing device at a point between the latter and the said motor element.
14. In an apparatus for producing sound signals in water. by which they are transmitted, the combination of a buoyant supporting bodv, a tube attached thereto extending axially downward below the same and open at its lower end, an under water sound producing device within or below sald tube, a piston operatively connected to said sound producing device, and adanted to move responsively to relative axial movements of the water in the tube, an axial gnide for the said piston, and an open frame attached to the tube and supportin me the sald guide and sound producing device at a point between the latter and the said piston.
15. In an apparatus for oroducing sound signals in water by which thev are transmitted the enmbination of a buovant support adapted to float upon the surface of the water and to be moved up and down by the waves, an attached tube open at its lower end extending axlaly downward below the buoyant support and adapted to enclose a mass of water comparatively unaffected by the wave movement. a motor element adapted to be immersed in the water in the tube to be acted upon by the inertia of sald mass of water, an under water sound producing device and means comprising a power storIng mechanism. operatively connecting the motor element with the sald under water sound producing device.
16. In an apparatus for nroducing sound signals in water by which they are transmitted, the combination of a buoyant body. a tube attached thereto extending axlally downward under the same and open at its lower end, an under water sound producing dvice within or below said tube, a piston in the tube. means comprising a power storing mechanism, operatively connecting the pist on with the said under water sound producing device and adapted to move responsively to rela-
tive axial movements of the water in the tube, an axial guide for the said piston, and an open frame or spider attached to the tube supporting the said guide and sound producing device at a point between the latter and the said piston.
17. In an apparatus for producing sound signals in water open at its lower end extending downward from the buyant support adapted to float upon the surface of the water and to be moved up and down by the waves, an attached tube. open at its lower end, extending downward from the buoyant support and adapted to enclose a mass of water comparatively unaffected by the wave movement, a piston movably supported in the tube and adapted to be immersed in the said mass of water and acted upon by its inertia, an inwardly projecting circumferential ring in the tube at or near the midstroke position of said piston and an under water sound producing device operatively connected to said piston, substan tially as set forth.
18. In a signal buoy the combination of a buoyant support adapted to float upon the surface of the water and to be moved up and down by the waves, an attached tube open at its lower end extending axlally downward from the said buoyant support so as to inclose a mass of water comparatlvely unaffected by the wave movement, an under-water sound signalling device supported in or below said tube, an atmospheric sound signalling device carried on the buoyant support and means adapted to be acted upon by the inertia of the water in said tube whereby both signalling devices are operated simultaneously, substantially as set forth.
19. In a signal buoy, a whistle, a downward tubular extension of the buoy, an under water sound slgnalling device supported by said tubular extension, and means for operating said whistle and sald under water sound signalling device simultaneously by the relative movements of the buoy and the mass of water enclosed in said tubular extension thereof.
20. In a signal buoy, a buoyant support adapted to float upon the surface of the water, a tube open at its lower end extending downward therefrom, an open frame or spider attached to the said tube and adapted to permit relative axial movement of the column of water therein, an under water sound producing device supported by said open frame, an atmospheric sound producing device mounted on said buoyant support, and means for operating both sound producing devices simultaneously by the relative movement of the buoy and the mass of water enclosed in said tube, substantially as set forth.
21. In a signal buoy, a buyant support adapted to float upon the surface of the water, a tube open at its lower extending downward therefrom, an open frame or spider attached to the sald tube and adapted to permit relative axial movement of the column of water therein, an under water sound producing device supported by sald open frame, an atmospheric sound producing device mounted on said buoyant support, a piston movable supported in the tube, and an anwardly projecting circumferential ring in the tube at or near the midstroke position of sald piston, whereby both said sound producing devices are operable simultaneously by the relative movement of the buoy and the mass of water enclosed in said tube, substantially as set forth.
22. In a signal buoy, a buoyant support adapted to float upon the surface of the water, a tube open at its lower end extending downwardly therefrom, an open frame or spider attached to the sald tube and adapted to permit relativo axial movement of the column of water thereln, an under water sound producing device supported by said open frame, an atmospheric sounu producing device operable by compressed air, mounted on said buoyant support, a piston movably supported in the tube, and an inwardly projecting circumferential ring in the tube at or near the midstroke position of said piston, whereby both said sound producing devices are operable simultaneously by the relative movement of the buoy and the mass of water enclosed in sald tube, substantially as set forth.
23. In a signal buoy, a buoyant support adapted to float upon the surface of the water, a tube open at its lower end extending downward therefrom, an enlarged sectlon at the lower end of said tube, an open frame or spider attached thereto and adapted to permit relative axial movement of the column of water in the tube, an under water sound producing device supported by said open irame, an atmospheric sound producing device operable by compressed air mounted on sald buoyant support, and means for operating both sound producing devices simultaneously by the relative movement of the buoy and the mass of water enclosed in said tube, substantially as set forth.
24. In a signal buoy, a buoyant support adapted to float upon the surface of the water, a tube open at its lower end extending downward therefrom, an under water sound producing device supported on sald tube, an atmospheric sound producing device operable by compressed air mounted on said buoyant support, a piston movably supported in the tube, and an inwardly projecting circumferential ring in the tube at or near the midstroke position of said pistion, where-
by both said sound producing tevices are operable simultaneously by the relative movement of the buoy and the mas of water enclosed in said tube, substantially as set forth.
25. In a signal buoy the combination of an under water sound signalling device, a motor element operatively connected thereto and adapted to have a reversing movement responsive to the up and down movement of the buoy by the waves, a tube below the buoy open at its lower end enclosing the said motor element, and an extension of said tube of smaller diameter connecting the same with the body of the buoy, substantially as set forth.
26. In a signal buoy the combination of a buoyant support adapted to be moved up and down by the waves, an atmospheric sound signalling service operable by compressed air mounted on said buoyant support, a tube extending downward therefrom enclosing a mass of water comparatively unaffected by the wave movement, a compressed air chamber above the water at the top of said tube variable by the relative movement of the buoy and the column of water enclosed in the tube and connected with said atmospheric sound signalling device, the lower section of said tube being of larger diameter, a motor element enclosed in said enlarged section and an under water sound signalling device supported at the bottom of said enlarged section and operatively connected to said motor element.
27. In a signal buoy the combination of a buoyant support adapted to be moved up and down by the waves. an atmospheric sound signalling device operable by compressed air mounted on said buoyant support, a tube extending downward therefrom adapted to enclose a mass of water comparatively unaffected by the wave movement, a compressed alr chamber above the water at the top of said tube variable by the relative movement of the buny and the column of water enclosed in the tube and connerted with said atmospheric sound signalling device, the lower spetion of said tube being of larger diameter, a motor element enclosed in said enlarged section, an axial guide for the said motor element. and an under water sound signalling device supported at the bottom of said enlarged section and operatively connected to said motor element.
28. In a signal buoy the combination of a buoyant support adapted to be moved up and down by the waves, an atmospheric sound signalling device operable by compressed air mounted on said buoyant support, a tube extending downward therefrom enclosing a mass of water comparatively unaffected by the wave movement, a compressed air chamber above the water at the top of said tube variable by the relative movement of the buoy and the column of water enclosed in the tube and connected with said atmospheric sound signalling device, the lower section of said tube being of larger diameter, a motor element enclosed in said enlarged section, an axial guide for the said motor element, a frame or spider attached to said enlarged section adapted to permit axial movement of the water in the tube, and an under water sound producing device supported by said frame, and operatively connected to said motor element.
29. In a signal buoy the combination of a buoyant support adapted to be moved up and down by the waves, an atmospheric sound signalling device operable by compressed air mounted on said buoyant support, a tube extending downward therefrom adapted to enclose a mass of water comparatively unaffected by the wave movement, a compressed air chamber above the water at the top of said tube variable by the relative movement of the buoy and the column of water enclosed in the tube and connected with said atmospheric sound signalling device, the lower section of sain tube deing of larger diameter than the upper, a piston movably supported therein, an inwardly projecting circumferential ring on said enlarged section of tube through which the said piston travels in the operation of the device and an under water sound producing device operatively connected to said piston.
30. In a signal buoy the combination of a buoyant support adapted to be moved up and down by the waves, an atmospheric sound signalling device operable by compressed air mounted on said buoyant support, a tube extending downward therefrom enclosing a mass of water comparatively unaffected by the wave movement, a compressed air chamber above the water at the top of said tube variable by the relative movement of the buoy and the column of water enciosed in the tube and connected with said atmospheric sound signalling device. the lower section of said tube being of larger diameter than the upper, a piston movably supported therein, an axial guide for the said piston, an inwardly projecting circumferential ring on said enlarged section of tube through which the said piston travels in the operation of the device and an under water sound producing device operatively connected to said piston.
31. In a signal buoy the rombination of a buoyant support adapted to he moved "1p and own by the waves, an atmospheric sound signalling device operable by compressed air mounted on said buoyant support, a tube extending downward therefrom adapted to enclose a mass of water comparatively
unaffected by the wave movement, a compressed air chamber above the water at the top of said tube variable by the relative movement of the buoy and the column of water enclosed in the tube and connected with said atmospheric sound signalling device, the lower section of said tube being of larger diameter than the upper, a piston movably supported therein, an axial guide for the said plston, an inwardly projecting circumferential ring on said enlarged section of tube through which the said piston travels in the operation of the device, a frame or spider attached to the tube and adapted to permit relative axial movement of the water therein, and an under water sound producing device supported by said frame and operatively connerted to said piston, substantially as and for the purpose set forth.
32. In a signal buoy the combination of a buoyant support adapted to be moved up and down by the waves, an atmosphoric sound signalling service operable by compressed air mounted on said buoyant support, a tube extending downward therefrom and adapted to enclose a mass of water comparatively unaffected by the wave movement, a compressed air chamber above the water at the top of said tube variable by the relative movement of the buoy and the culumn of water enclosed in the tube and connected with said atmospheric sound signalling device, an open frame or spider attached to the said tube and adapted to permit relative axial movement of the column of water therein, an under water sound producing device supported by said frame, and means for operating both said sound producing devices simultaneously by the relative movement of the buoy and the column of water enclosed in said tube, substantially as set forth.
33. In an apparatus for producing sound signals in water. by which they are transmitted the combination of a buoyant support adapted to float upon the surface of the water and to be moved up and down by the waves, an attached tube open at its lower end, extending downward from the buoyant support and adapted to enclose a mass of water comparatively unaffected by the wave movement, a piston movably supported in the tube and adapted to be immersed in the said mass of water and acted upon by its inertia, stops for the piston. an inwardly projecting circumferential ring in the tube at or near the midstroke position of said piston and an under water sound producing device operatively connected to said piston, substantially as set forth.
34. In a signal buoy the combination of a buoyant support, a tube open at its lower end extending downward therefrom, a motor element operable by the relative movement of the water in said tube, an under water sound producing device, a frame attached to said tube adapted to support sald sound producing device and to permit axial movement of the water in the tube, and means comprising a power storing mechanism, operatively connecting the said motor element with the said under water sound producing device, substantially as set forth.
35. In a signal buoy the combination with the supporting body of an attached tube below the same, a piston movably supported in the tube, a contracted ring inside the tube through which the piston travels, and an under water sound producing device operatively connected to the piston.
36. In a signal buoy the combination with the supporting body of an attached tube below the sime, a piston movably supported in the tube and operatively connected with the signalling device, stops for the piston and means adapted to return the piston to an intermediate position between said stops, substantially as set forth.
37. In a signal buoy the combination of a tube with its axis extending up and down below the buoy open co the water at its lower end, a piston enclosed in said tube and movable by the relative motion of the water therein, and an under water sound producing device actuated by such movement of the piston, substantially as set forth.
38 . In a signal buoy the combination of a tube below the body thereof open to the water at its lower end, a movable piston enclosed in said tube, a central axial guide for said piston, an open frame connecting said guide and the sides of the tube and adapted to permit a free vertical movement of the water therein, and an under water sound producing device operatively connected with the piston, substantially as set forth.
39. In a signal buoy the combination with the supporting body of a tube extending axially downward therefrom and open to the water at its lower end. a whistle operable by the relative movement of the water in said tube, a piston in the tube movable by the relative motion of the water therein, an under water sound signalling device operatively connected with the piston, stops limiting the stroke of the piston and an enlarged passage for the water past the plston at each end of the stroke, whereby the whistle and under water sound signal are operable conjointly by the relative movement of the water in the tube, without mutual interference, substantially as set forth.
40. In a signal buoy the combination with the supporting body of a tube extending below the same. a piston movably supported in the tube, a bell in or below the tube operatively
connected with the piston, and an open frame adapted to support the bell on the tube and to permit axial movement of the water therein, substantially as set forth.
41. In a signal buoy, the combination with the supporting body of a tube extending below the same, a piston movably supported in the tube, an axial guide for the piston, a bell in or below the tube operatively connected with the piston, and an open frame adapted to support the bell on the tube and to permit axial movement of the water therein, substantially as set forth.
42. In a signal buoy the combination with the supporting body of a tube extending below the same, a plston movably supported in the tube, an axial guide for the piston, a bell in or below the tube operatively connected with the piston, an open frame adapted to support the bell on the tube and to permit axial movement of the water therein, a closed air chamber above the water at the upper end of the tube, and a whistle operatively connected thereto, substantially as set forth.
43. In a signal buoy the combination with the supporting body of an attached tube below the same, a piston movably supported in the tube and operatlvely connected with the signalling device, dash pots to check the motion of the piston at the ends of the stroke, and means adapted to return the piston to a position intermediate the ends of the stroke, substantially as set forth.
44. In a signalling apparatus, a buoy, a tube extending downwardly therefrom open at its lower end, a motor located within said tube and adapted to have a motion with relation thereto, and a sounder having a movable element, and connections between said motor and the movable element of said sounder, as described.
45. In a signalling apparatus, a buoy, a tube extending downwardly therefrom, said tube being open at both ends to the water, a sounder connected with said tube, and a motor located within said tube, and connections between said motor and said sounder whereby said sounder will be operated by the relative movement between it and said motor.
46. In a signalling apparatus, a buoy, a tube extending downwardly therefrom and open at both ends to the water, a sounder connected to said tube, and a motor located within said tube and adapted to operate said sounder, the walls of said buoy approaching each other below the normal water line, whereby the waves engaging the under surface of the buoy in approaching and receding from it, will be effective to magnify the relative movement of the buoy and motor, as described.
47. In a signalling apparatus, a buoy, a tube extending downwardly therefrom and adapted to be entirely submerged in water and open at both ends, a sounder connected to said tube, and a motor located within said tube, and means whereby the movement of the motor within said tube causes the operation of said sounder, as described.

No. 100,076. Phonograph. Phonographc.

Edwin Walker, New York City, New York, U.S.A., 17̈th July 1906; 6 years. Filed 2nd June, 1905. Receipt No. 125,673.
Claim.-1. In a phonograph or simllar machine, a reproducing horn having a stylus attached directly thereto.
2. In a phonograph or similar machine, a reproducing horn closed at one end, and a sty!us connected directly to a vibratory part of said horn.
3. In a phonograph or similar machine, a reproducing horn having a vibratory part and a stylus conected directly to sald vibratory part.
4. A phonograph reproducing device, having a curvilinear vibratory member, a part of said member being composed of a different material from the main body thereof, and a stylus connected with said vibratory part.
5. A phonograph reproducing device, having a vibratory member, a part of said member being composed of a different material from the main body thereof, and a stylus attached directly to said vibratory part.
6. A phonograph sound reproducer, a part of which is a curvilinear surface forming a vibratory diaphragm, and a stylus attached rigidly and directly to said diaphragm.
7. A phonograph horn baving a curvilinear surface which forms a vibratory member, and a stylus projecting directly from the member and adapted to impart vibrations thereto.
8. A phonograph horn having a non-metallic vibratory part or member continuous with the horn and composed of a different material from the main body of the horn, and a stylus adapted to impart vibrations to said part or member.
9. A phonograph horn having a non-metallic stylus at tached directly to a side wall of said horn.
10. A phonograph horn having a non-metallic vibratory part located in the side of the horn, and a non-metallic stylus connected directly to said part.
11. A reproducing horn, a part of said horn being under tension, and a stylus attached directly to sald part under tension.
12. A phonograph reproducing device, the diaphragm of which is a curvilinear surface, and a stylus secured directly to said curvilinear surface.
13. A phonograph reproducing device, the diaphragm of which is a conical surface, and a stylus projecting from said surface and adapted to impart vibrations directly thereto.
14. A phonograph reproducing device consisting of a flexible horn and a stylus for imparting vibrations directly to said horn.
15. A phonograph reproducing device comprising a paper horn, having a stylus connected directly to the same near one end thereof.
16. A phonograph reproducing tlevice comprising a nonmetallic horn, having the edges united along a longitudinal seam or joint, and a stylus secured directly to a part of the horn laterally of the seam or joint.
17. A phonograph reproducing device comprising a nonmetallic horn united detachably at its edges, and a stylus for imparting vibratory movement directly to a part of the horn.
18. A phonograph reproducing device comprising a horn, having a vibratory section in one side thereof, and a stylus for vibrating the section.
19. A phonograph reproducing device comprising a horn, having a vibratory diaphragm made of a different naterial from the body of the horn and extending around the same. and a stylus for vibrating the diaphragm.
20. A phonograph reproducing device having a vibratory curvilinear diaphragm at one end composed of a different material from the main body thereof, and a stylus attached rigidly to the diaphragm.
21. A phonograph reproducer having a vibratory conlcal member made of a different matcrial from the body thereof, and a stylus for imparting vibrations to said member,
22. A sound reproducer composing a horn having a stylus rigid!y attached to the material of said horn and projecting therefrom intermediate its ends.
23. A sound reproducer comprising a horn made of flexible material, and a stylus attached directly to said flexible material and projecting therefrom intermediate of its ends.
24. A phonograph reproducer provided with a plurality of styluses arranged and adapted for use respectively in connection with graphophone and gramophone records.
24. A phonograph reproducer provided with two styluses, one being arranged for use in connection with a praphophone record, and the other with a gramophone record.
26. A phonograph reproducer having a stylus adapted for use on a graphophone record, and also provided with a stylus arranged to operate on a gramophone record, said styluses being in different planes and adapted to be brought, by a change in the position of the reproducer, into co-operative relation to one of the specified types of records.
27. A phonograph reproducer provided with two styluses, said reproducer being rotable whereby one stylus may bo brought into co-operative relation to a graphophone record, and the other into like relation to a gramophone recond.
28. A phonograph reproducer having a member provided with a stylus adapted to co-operate with a graphophone record, and provided also with a stylus adapted to co-operate with a gramophone record.
29. A phonograph reproducor provided with a plurality of styluses. said reproducer being capable of being positioned to place either of said styluses into co-operative relation to a record

## No. 100,077. Phonograph. Phonogrophe.

Fdwin Walker. Erin. Pennsylvania, l'S.A.. 1ïth July, 1906: 6 years. Filed 2nd June. 1905. Receipt No. 125,6ss.
Cluin.-1. A composite sound producer having a horn of flexible material, the cross sectional form of said horn, sub-
stantially throughout its entire length, having a base of greater curvature than its top and a stylus attached to the base of the horn.

2. A composite sound producer hving a flexible horn approximately egg-shaped in cross section throughout its entire length, one end of sald horn being closed, and a stylus attached to the under side of the horn and near the closed end thereof.
3. A composite sound producer having a horn of flexible material, said horn being approximately egg-shaped in cross section for substantially its length, and having one end thereof larger than the other, and a stylus attached to said horn, intermediate the ends thereof.
4. In a composite sound producer a horn, the plane of one of the ends of which is inclined at an angle to the plane of the other end, and a stylus connected with said horn.
5. A horn having one of its ends in a plane inclined at an angle to the longitudinal axis of the horn, and a stylus connected with said horn.
6. A horn having one of its ends in a plane inclined at an angle to the longitudinal axis of the horn, and a closure for said inclined end.
7. A horn having one of its ends in a plane inclined at an angle to the longitudinal axis of the horn, and a flexible c!osure for said inclined end.
8. A horn having one of its ends in a plane inclined at an angle to the longitudinal axis of the horn, and a flexible closure for said inclined end, parts of which closure occupy dif$f \in r e n t$ planes.
9. A composite sound producer having a horn composed of fexible material and one of the ends of which is in a plane inclined to the longitudinal axis of the horn and a stylus. istermediate the ends of the horn.
10. A composite sound producer having a horn composed 0 flexible material, and a plurality of styluses attached to said horn and in substantially the same longitudinal plane.
11. A composite sound producer having a horn composed of flexible material and a plurality of styluses intermediate the ends of the horn and attached thereto, and in substantially the same longitudinal plane.
12. A composite sound producer having a horn composed of flexible material, said horn having a less area in cross section above the horizontal plane of its longitudinal axis than the area below said plane, for substantially the entire $\mathrm{l} \in \mathrm{ng}$ th of the horn, said horn being closed at one end.
13. A composite sound producer having a horn composed oi flexible material, said horn having a less area above the horizontal plane passing through its axis than below said plane, said horn being closed at one end and having a stylus attached to said horn.
14. A composite sound producer comprising a horn, the bcdy of which is made of thin press board, one end of said horn being in a plane inclined at an angle to a horizontal Flane through the axis of the horn, and a stylus attached to the horn near said inclined end.
15. A sound producer provided with a plurality of styluses in substantially the same plane.
16. A sound reproducer adapted for endwise movement, and provided with a plurality of styluses in substantially the same plane.
17. A sound reproducer composed of flexible material and provided with a plurality of styluses, the latter being att:iched to said flexible material.
18. A flexible sound reproducer having a plurality of styluse located at different points longitudinally of the reproducer.
19. A comprosite sound producer consisting of a flexible horn having a plurality of styluses located in different positions intermediate its ends.
20. A composite sound producer comprising a flexible horn, having a plurality of styluses located at different positions longitudinally of the horn.
21. A composite sound producer comprising a horn composed of flexible material and having a less area above the horizontal plane passing through its axis than below said plane, the material of the horn being lapped at the upper tdge thereof.
22. A composite sound producer comprising a horn compased of flexible material and having a less area above the horizontal plane passing through its axis than below said plane, the sides of the horn being arched in cross section from the upper edge to the base thereof.

No. 100,078. Gramophone. Gramophone.

Horace Sheble, Philadelphia, Pennsylvania, and Ellsworth Adam Hawthorne, Springfield, Massachusetts, all in the U.S.A., 17th July, 1906; 6 years. Filed 23rd May. 1906. Receipt No. 136,185.
Claim.-1. A horn supporting crane for talking machines. having a vertical post, a bracket projecting from said post below the projecting portion of the crane and in a reverse direction therefrom, sald bracket being provided with means for securing it to the motor box of the machine at a point above the bottom of the same, and a supporting foot projecting outwardly from the post below said bracket and having a bearing upon the same support as that upon which the motor is mounted.
2. A horn supporting crane for talking machines, having a vertical post, a bracket projecting from said post below the projecting portion of the crane and in a reverse direction therefrom. sald bracket being provided with means for securing it to the motor box of the machine at a point above the bottom of the same, and a supporting foot projecting both outwardly and inwardly from the post below sald bracket, the outwardly projecting portion of the foot bearing upon the same support as that upon which the motor box is mounted, and the inwardly projecting portion of the foot bearing upon the side of the motor box above the bottom of the same.
3. A horn supporting crane for talking machines, having a vertical post, and a support therefor comprising a foot bearing upon the side of the motor box of the machine and projecting outwardly therofrom, and a bracket also bearing upon the outer side of said motor box and supported upon the foot, said bracket having a projecting element secured to the upper portion of the motor box, substantially as specified.
4. A horn supporting crane for talking machines having a projecting post and a support therefor comprising a foot bearing upon the side of the motor box of the machine and projecting outwardly therefrom, and a bracket supported by and vertically adjustable on said foot, said bracket also bearing upon the outer side of the motor box and deing provided with a projecting element secured to the upper portion of the box, substantially as specified.
5. A horn supporting crane for talking machines having a vertical post and a support therefor comprising an outwardly projecting foot, a bracket supported thereon and bearing against the outer side of the motor box of the machine, and a clamp jaw mounted on said bracket, substantially as specinied.
6. A horn supporting crane for talking machines having a vertical post, and a support therefor comprising an out-
wardly projecting foot, a bracket supported thereon and bearing against the outer side of the motor box of the machine and a clamp jaw adjustably mounted on said bracket, substantially as specifled.
7. A horn supporting crane for talking machines having a vertical post, and a support therefor comprising an outwardly projecting foot, a bracket vertically adjustable thereon and bearing against the outer side of the motor box of the machine, and a clamp jaw mounted on said bracket, substantially as speciffed.
8. A horn supporting crane for talking machines having a vertical post and a support therefor comprising an outwardly projecting foot, a bracket vertically adjustable thereon and bearing against the outer side of the motor box of the machine, and a clamp jaw adjustably mounted on said bracket. substantlally as specified.
9. A horn supporting crane for talking machines having a vertical post and a support therefor comprising a foot projecting outwardly from the side of the motor box of the machine and having a socket thereon, a tubular guide for the post vertically adjustable in said socket, and having a bracket which bears upon the side of the motor box, and means for securing said bracket to the upper portion of the box, substantially as specified.
10. A horn supporting crane for talking machines having a vertical post and a support therefor comprising a foot projecting outwardly from the side of the motor box of the machine and having a socket thereon, a tubular gujde for the post vertically adjustable in said post, and having a bracket post vertically adjustable in said socket and having a bracket which bears upon the side of the motor box, and a clamp jaw on said bracket having a portion projecting into the box, substantially as specified.
11. A horn supporting crane for talking machines having a vertical post, and a support therefor comprising a foot projecting outwardly from the side of the motor box of the machine and having a socket thereon, a tubular guide for the post adjustably mounted in sald socket, and having a bracket bearing on the side of the motor box, a plate slidably mounted on sald bracket and having a clamp jaw projecting into the box and a yoke embracing the tubular guiae, and a clamp screw carried by said yoke and bearing upon said tubular guide, substantially as specified.
12. In a horn support for sound reproducing machines, a support or holder, means on sald support or holder for carrying a horn supporting post, a supporting hook at the upper end of said support or holder adapted to be brought in frictional and separable holding engagement with the upper end of a panel of the sound reproducing machines, and a lower foot -lece connected with means for carrying a horn supporting post, substantially as and for the purposes set forth.
150. 100,079. Switch Signal. Signal d'aiguille.

John C. Wigman, Green Bay, Wisconsin, U.S.A., 17th July, 1906; 6 years. Filed 30th May, 1906. Receipt No. 136,405.
Claim.-1. A circuit closer for switch signals comprising in combination with the switch point, a bar secured to said switch point, a lever mounted to oscillate in a horizontal plane and positioned to be struck by said bar, electrical connections with sald lever and a contact post in the path of the oscillation of said lever, and means to normally hold said lever out of contact with said post, substantially as shown and described.
2. A circuit closer for switch signals comprising in combination with the switch point, a bar secured to sald switch polnt, a lever mounted to oscillate in a horizontal plane and be struck by sald bar, a contact post arranged in the path of said lever, a suitable signal, electrical connections between
said signal and the lever and contact post, and an expansible coll spring to normally hold said lever out of contact with sald contact post, substantially as shown and described.
3. A circuit closer for switch signals comprising in combination with the switch point, a bar secured to said switch point, a base suitable mounted adjacent to the switch, a lever mounted on said base and adapted to oscillate in a horizontal plane, the end of said bar adapted to strike said lever, a set screws mounted in said posts, a suitable signal and batteey for energizing said signal, the lever in circuit with the battery and one of the contact posts with the signal, and a coil spring to hold the lever out of engagement with the set screw in the last-named contact post, substantially as shown and described.

No. 100,080. Electric Signal. Signal électrique.

Charles C. Blake, Brookline, Massachusetts, U.S.A., 17th July, 1906; 6 years. Filed 7th May, 1906. Receipt No. 135,649.
Claim.-1. A selective signal system consisting of a transmitting station having a series of pendulums adapted to send electric impulses of different periodicy over a line wire when connected thereto, a series of way stations each provided with a pendulum device adapted to respond to the vibrating of one only of said transmitting pendulums, an electric lamp signal and a semaphore arm which become operative when the unison of vibrations is estabished between the transmitter and recelver.
2. A selective signal system consisting of a transmitting station having a series of independent pendulums adapted to send electric impulses of different pertodicy over a llne wire when connected thereto, earh pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line wire and when unlocked to operate a circult closing device and send characteristic impulses to line, a series of way stations each provided with a pendulum device arranged to respond to the vibrations of one ony of the transmitting pendulums having a signal lamp in a normally open circuit and a semaphore arm locked to safety position, with means when sald pendulum device becomes responsive to said characteristic impulses, to close the lamp circuit and unlock the semaphore arm.
3. A selector signal system consisting of a transmitting station having a series of independent pendulums adapted to send electric impulses of different periodicy over a line wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line wore, and when unlocked to operate a circuit closing device and send characteristic impulses to line, a local and second sircuit closing device with means for actuating the same and for maintaining the pendulum vibrations a series of way stations each provided with a pendulum device arranged to respond to the vibrations of one only of tife transmitting pendulums having a signal lamp in a normally open circuit and a semaphore arm locked to safety position with means when said pendulum device becomes responsive to said characteristic impulses to close said lamp circuit, and unlock the semaphore arm.
4. A selective signal system consisting of a transmitting station having a series of independent pendulums adapted to send electric impulses of different periodicy over a line wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line wire, and when unlocked adapted to operate a circult closing device and send characteristic impulses to line, a series of way stations each provided with an elec-tro-magnetic device arranged to respond to the vibrations of one only of the transmitting pendulums having a signal lamp in a normally open circult, and a semaphore arm locked to safety position with means, when said electro-magnetle de-

Vice becomes responsive to said characteristic impulses, to close the lamp circuit and unlock the semaphore arm, and ground the electro-magnet of the device at the selected station
5. A selective signal system consisting of a transmitting station having a series of independent pendulums adapted to send electric impulses of different periodicy over a line wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected directly to the line wire and when unlocked to operate a circuit closing device and send characteristic impulses to line, a local and second circuit closing device with means for intermittently actuating the same and for maintaining the pendulum vibrations, a series of way stations each provided with an electro-magnetic pendulum device arranged to respond to the vibrations of one only of the transmitting pendulums, having a signal lamp in a normally open circult and a semaphore arm locked to safety position, with means when said pendulum device becomes responsive to said characteristic impulses to close the lamp circuit, unlock the semaphore arm, and ground the electro-magnet of the device, at the selected station.
6. A selective signal system consisting of a transmitting station having a series of independent pendulum devices adapted to send electric impulses of different periodicy over a line wire when connected thereto and means for maintaining the said impulses at a uniform rate of vibration, a series of way stations each provided with an electro-magnet penduum device arranged to respond to the vibrations of one only of the transmitting pendulums, a lamp in a normally open grounded circuit from a trolley wire, a, semaphore arm locked to safety position, and means to close the lamp circuit, unlock the semaphore arm, and ground the electro-magnet of the selected device.
7. A selective signal system consisting of a transmitting station having a series of independent pendulum devices adadapted to send electric impulses of different periodicy over a line wire when connected thereto, means for maintaining the impulses at a unlform rate of vibration, the pendulum of each device being held in a retracted position and provided with a releasing mechanism arranged to be operative when connected to the line wire a series of way stations each provided with an electro-magnetic pendulum device arranged to respond to the vibrations of one only of the transmitting pendulums, the magnets of each device being included in the line circuit, a source of current a lamp in an open circuit to ground from the source of current, a semaphore arm locked to safety position, with means to close the lamp circuit, unlock the semaphore arm and ground the magnet of the selected device.
8. A selective signal system consisting of a transmitting station having a series of independent pendulum devices adapted to send electric impulses of different periodicy over a line wire when connected thereto, means for maintaining the impulses at a uniform rate of vibration, the pendulum of each device being held in a retracted position and provided with releasing mechanism arranged to be operative when connected to the line wire, a series of way stations each provided with an electro-magnet pendulum device arranged to respond to the vibrations of one only of the transmitting pendulums, the magnets of each device in the line circuit, a source of current, a normal lamp in an open circuit to ground from the source of current, a second lamp in a branch circuit which means for automatically including the latter lamp in the said open circuit and for intermittently shunting the same, a semaphore arm locked to safety position with means to close the lamp circult, unlock the semaphore arm and ground the magnet at the selected device.
9. A selective device consisting of a base part upon which rests a frame part, having concave and convex portions fitting into each other secured by a bolt and nut, thte base part provided with means for attachment to a support or foundation, the frame part provided with a shaft carrying a semaphore arm and a sam, a locking device, circuit switches, an electro-magnet, its combined armature and adjustable spring lever, a pendulum with latching means for engaging with and operating a circuit closer, the locking device and the said circuit g witches.
10. A selective sigaal system consisting of a transmitting station having a series of independent pendulum devices adapted to send characteristicc electric Impulses over a line wire, each penduluin normally held in a retracted position by a locking device, and having latching mechanism independently operating two circult closers whereby said impulses are sent to line when a pendulum device is connected therewith and unlocked, and a local magnet is energized to cause the pendulum to maintain its maximum rate of vibration, a line wire normally disconnocted at the transmitting station, extending to a series of way stations each provided with an electro-magnetic device arranged to respond to the vibrations of one only of the transmitting pendulums pro-
vided with a magnet its armature combined by an elestic connection with a lever for vibrating the receiving pendulum provided with latching means, a lamp in an open and grounded circuit from a source of current, a semaphore arm held to safety position by a locking device, with means to close the lamp circuit, unlock the semaphore arm and ground the magnet at the selected device.
11. The combination with a circuit closer having a depending pawl, of a pendulum in the form of a lever of the first order provided with a catch on its short arm, and an adjustable weight upon its long arm, means for vibrating the pendulum consisting of an electro-magnet, an armature therefor with a lever attached thereto whose lower end bears upon the long arm of the pendulum.
12. The combination with a circuit closer having a dependIng pawl, of a pendulum in the form of a lever of the first order provided with a catch on its short arm, and an adjustable weight upon its long arm, means for vibrating the pendulum consisting of an electro-magnet, an armature therefor with a lever in eleastic connection therewith whose lower end bears upon the long arm of the pendulum.
13. Means for closing an electric circuit, consisting of a pendulum provided with a bevelled catch, a pivoted lever whose free end is adapted to bear upon a circult closer and to carry a suspended pawl or latch, an electro-magnet, its armature with a lever attached thereto whose lower end bears upon the pendulum.
14. Means for closing an electric circuit consisting of a pendulum provided with a bevelled catch, a pivoted lever whose free end is adapted to bear upon a circuit closer and to carry a suspended pawl or latch, an electro-magnet, its armature with a lever in elastic connection therewith whose lower end bears upon the pendulum rod.
15. A double closing device consisting of a pendulum provided with two bevelled catches, two levers from which are suspended a pawl or latch, an electro-magnet, its armature and a lever attached thereto whose lower end bears upon the pendulum rod.
16. A locking and releasing device for signals, composed of a semaphore arm upon a shaft secured to a frame with a cam having a pin or spline, a long lever pivoted to the frame, a short lever pivoted to the center of sald long lever having an abutment or projection and a rod attached to its free end, a latch pivoted to the free end of the long lever whose free end is adapted to rest upon the abutmont with a slot in the heel of the latch to embrace the said spline.
17. A pendulum locking and releasing device, consisting of a frame, a rod provided with a hole at its upper end out of center with a hole in the frame, its lower end connected to a lever pivoted to a support, sald lever provided with notches to engage the end of the pendulum rod, with a plug adapted to enter said holes and raise said rod.
18. A selective signal system consisting of a transmitting station provided with a plurality of independent and normally detached means for transmitting electric impulses of different periodicy over a normally open line wire, a series of way stations each provided with a pendulum device adapted to respond to one of said transmitted periodicities only, and a semaphore arm which becomes operative when the unison of frequencies is established between the transmitter and recelver.
19. A selective signal system consisting of a transmitting station having a series of independent pendulums adapted to send electric impulses of different periodicity over a line wire when connected thereto, each pendulum normally locked in a retracted position and adapted to be unlocked and connected to the line wire, and when unlocked to operate a circuit closing device and send characteristic impulses to line, a series of way stations each provided with a pendulum device arranged to respond to the vibrations of one onlp of the transmitting pendulums, having a normally locked signal adapted to be displayed when said pendulum device becomes responsive to its characteristic impulses.
20. Means for closing an electric circuit responsive to characteristic impulses, consisting of an electro-magnet, a pendulum provided with a lifting catch adapted to be vibrated by the armature of said magnet and a circuit closing device having a suspended pawl in the path of said catch, whereby when said pendulum becomes responsive to said impulses its catch will engage with the pawl and operate the circuit closing device.
21. A selective signal system consisting of a transmitting station provided with means for transmitting electric impulses of different periodicy over a line wire, a serles of way stations each provided with a pendulum device consisting of an electro-magnet, a pendulum provided with a lifting catch adapted to be vibrated by the armature of said magnet, and a circuit closing device having a suspended pawl in the path of the catch, whereby when said pendulum becomes responsive to said impulses its catch will engage with the pawl and operate the circuit closing device.
22. Means for closing an electric circuit responsive to characteristic impulses, consisting of an electro-magnet, a pendulum provided with a lifting catch adapted to be vibrated by the armature of said magnet, a circuit closing device having a suspended pawl in the path of said catch, and a semaphore arm, whereby when said pendulum becomes responsive to said impulses its catch will engage with the pawl, operate the circuit closing device, and display the semaphore arm.

No. 100,081. Fecentic. Excentrique.

Francis Marcus Berger, Basin, Montana, U.8.A., 17th July, 1906; 6 years. Filed 21st March 1906. Receipt No. 134,139.
Claim.-1. An interchangeable throw device, consisting of a two-part disc having an eccentrically arranged transverse opening therethrough, and openings extending from aforesaid transverse opening, to near the outer edge of the disc, substantially as described.
2. As an article of manufacture, a bushing or throw device, consisting of a disc having an eccentrically arranged transverse opening therethrough, and openings extending into the body of the bushing or disc from aforesald transverse opening, to near its outer edge, whereby to facilitate converting the disc into two separate parts, substantially as described.
3. The combination in an eccentric, of a hub having a transversely disposed flange at one end, a bushing on the hub consisting of a disc having a transverse opening therethrough, and openings extending from aforesaid opening, Into the body portion of the disc to near its outer edge, and the disc divided into two parts, a two-part strap encircling the disc, a plate whereby to confine the two-part disc in place, and bolts extending through the hub flange, disc and confining plate, substantially as described
4. The combination in an eccentric, of a hub having a fiange at one end, a two-part throw device on the hub, the throw device consisting of a body portion having an eccentrically arranged transverse opening therethrough, and openings extending outwardly from aforesaid opening, a securing plate having a lateral flange adapted to overlie the adjacent side of the throw device, a strap arranged encircling the throw device, and securing bolts extended through the hub flange, throw device and securing plate, substantially as described.

## No. 100,082. Double Tree. Palonnier.

Benjamin Clinton Crowley, Idaho Falls, Idaho, U.S.A., 17th July, 1906; 6 years. Filed 9th April, 1906. Receipt No. 134,783.
Claim.-1. A doubletree provided with draft attachments at opposite ends arranged to shift automatically to compensate for difference of draft
2. In combination, a doubletree, draft attachments at opposite end portions of the doubletree arranged to move to automatically compensate for difference of draft, and means connecting said draft attachments to effect simultaneous movement thereof.
3. In combination, a doubletree, a hitch pivotally connected thereto, and draft attachments at opposite ends of the doubletree connected to the hitch at a distance from the pivotal connection of said hitch with the doubletree, whereby the draft attachments will automatically and simultaneously move to compensate for difference of draft.
4. In combination, a doubletree, a hitch pivoted thereto, draft attachments at opposite ends of the doubletree and longitudinally movable with reference thereto, and a rod connecting said draft attachments to each other and to the said hitch.
5. In combination, a doubletree, draft attachments at opposite ends of the doubletree and movable longitudinally

thereof, a hitch pivoted to the doubletree, and a rod pivotally connected at its ends to the draft attachments and deflected intermediate of its ends and pivotally connected at a middle point to said hitch.
6. A hollow doubletree, slides located within opposite end portions thereof and provided with means for coupling the draft thereto, a hitch pivoted to the doubletree, and a rod connecting the slides to said hitch to effect simultaneous movement thereof.
7. A hollow doubletree having the terminal portions of its enclosing sides bent and overlapped and secured, slides ar ranged within opposite end portions of the doubletree and provided with draft coupling means, a pivoted hitch, and a rod connecting the slides to the hitch.

No. 100,083. Flue Block. Bloc de tuyaux.

Frank Jordan, Ashland, Oregon, U.S.A., 17th July, 1906; 6 years. Filed 4th June, 1906. Receipt No. 136,531.
Claim.-1. A flue block comprising the plastic block having an intrior channel and offsets or recesses from said channel, and a sheet metal pipe having portions embedded in the said block and thereby secured to the block, the said sheet metal pipe constituting the wall of the interior channel of the block and forming the inner walls closing the said recesses, substantially as described
2. A flue block comprising the plastic block having an interior channel and offsets or recesses from said channel, and a rectangular sheet metal pipe having corners embedded in said block and thereby secured to the block, the said pipe constituting the wall of the interior channel of the block, and forming the inner walls closing the said recesses, substantially as described
3. A flue block comprising the plastic block having a rectangular interior channel and offsets or recesses from said channel, and a rectanguar sheet metal pipe having its corners embedded in said block between the said recesses and thereby secured to the block, the said pipe constituting the wall of the interior channel of the block and forming the inner walls closing the said recesses, substantially as described.
4. A flue block comprising the plastic block having an interior channel and offsets or recesses from said channel, and a sheet metal pipe having portions embedded in said block
and thereby secured to the block, the said pipe constiftuting the wall of the said interior channel of the block and forming the inner walls closing the said recesses, the upper end of the pipe projecting beyond the block, and the lower end of the pipe being constructed and arranged to engage the pipe of the block next below whereby the pipes of succeeding blocks may be connected, substantially as described.

No. 100,084. Whistle. Siflet.

Albert Franklin Kuhl, Vanwert, Ohio, U.S.A., 17th July, 1906; 6 years. Filed 20th February, 1906. Receipt No. 133,080.
Claim.-1. In an alarm, a whistle baving a sounding chamber the upper end of which is normally open, means for forcIng a continuous current of fiuld through said chamber, a valve pivoted to the whistle, means for normally holding the valve in elevated position, and means for forcing the valve in engagement with the open end of the sounding chamber for diverting the current of fluid to thereby sound the alarm.
2. In an alarm, a whistle having a sounding chamber, a fan casing, a fan revolubly mounted in said casing and provided with radial dished blades for forcing a continuous current of air through the sounding chamber without affecting the whistle, a pipe connecting the fan casing and whistle, and a pivoted spring actuated valve for diverting the current of air to thereby permit the sounding of the whistle.
3. A whistle formed of a plurality of telescopic sections the upper one of which is open at the top to permit the continuous passage of a current of air withoul affecting the whistle, and a spring actuated valve pivoted to the upper telescopic section for closing the opening in the top thereof to thereby permit the sounding of the whistle.
4. In an alarm the combination with a car and its motor, of a fan driven by the motor, a fan casing having detachable slde walls provided with centrally disposed air inlet openings, pivoted dampers for controlling the admission of air to the fan casing, and inclined deflector mounted in said casing. an air conducting pipe comminicating with the interior of the fan casing, a whistle tube having oppositely disposed blowing orifices carried by the opposite end of the pipe, a sleeve or collar mounted on the whistle tube, a bracket secured to the collar, a valve pivoted to said bracket, and a spring interposed between the collar and the valve for holding the latter normally out of engagement with the whistle tube.

## No. 100,085. Assay Fnrnace. Fourneau d'essai.

Amos M. Macnuffee, Chloride, Arizona. U.S.A., 17th July, 1906;
6 years. Filed 8th May, 1906. Receipt No. 135,679.
Claim.-1. A muffle for an assay furnace, said muffle having a separate bottom adapted to be detached from the muffle and removed through an opening in the furnace whereby sald mutfle is adapted for both melting and cupeling operations.
2. An assay furnace having a muffie chamber and means for admitting heat thereto, and a muffle fitting the chamber and

having a bottom which is detachable and readily separable from the balance of the muffle whereby the muffe is adapted for both melting and cupeling operations.
3. In an assay furnace the combination with a furnace casine or shell having a muffle chamber and means for admitting flame thereto, of a muffe fitting said chamber and having its bottom open, and a normally disconnected readily separable bottom fitting the opening in the bottom of the mume and formine a removable closure therefor.
4. An assay furnace comprising a base and ends and a body portion forming a muffle chamber, one of sald ends having a projection on its inner face inclosing an air space, a muffe in said chamber having an opening in its back end to connect said air space with the interior of the muffle, said muffe havhaving a normally loose, readily separable bottom thereby adapting the muffle for both melting and cupeling operations, means for admitting flame to the muffle, and means whereby the spent products are allowed to escape from the furnace.
5. An assay furnace having a base and ends and a connecting shell, said shell including an inner lining composed of heat resisting material and forming a muffle chamber, a heat resisting lagging surrounding the lining and an exterior metallic jacket, said base having a longitudiual open fue or channel into which heat is admitted and delivered directly into the muffe chamber, and a removable muffe having a normally disconnected and readily separable bottom whereby the muffle is adapted for both melting and cupeling operations.
6. An assay furnace comprising a base and ends and an arch-shaped body portion, sald body portion having a fire clay lining, an exterior metallic jacket, and an asbestos lagging between the lining and jacket, a muffle in the body portion and separated from said lining to form a passage for the escape of heat products, said muffle having a bottom which is normally disconnected and readily separable from the main portion whereby the muffie is adapted for both melting and cupling operations, means for admitting flame to the furnace, and means for admitting fresh accretions of air to the mufle chamber.
7. An assay furnace comprising a base and ends and a shell or casing forming a muffie chamber, a muffe in said chamber and sunnorted above the floor of the base, sald muffe having a false bottom which is normally disconnected and readily separable to permit the muffle to be used for melting and cupeling operations, and open top flue in the base below the muffle, and a door for closing the open front end of the muffie, sald door having a portion of reduced diameter to project into the open end of the muffle and form a tight closure therewith, and said projecting portion serving to admit fresh air beneath the lower edge of the door when said door is only partially removed.

No. 100,086. Hook for Plough Ohaing.
Crochet pour chaînes de charrues.

John Henry Robèrts, Waipiata, New Zealand, 17th July, 1906; 6 years. Filed 20th April, 1906. Receipt No. 135,097.
Claim.-A hook having an eye portion, a nut at one end thereof, a bill portion having a straight shank sliding in said nut, a crosshead at inner end of said shank, and a projecting tongue on sald nut adapted to engage with the point of the bill portion when the hook is under strain.

No. 100,087. Singletree. Palonnier.

John Heury Roberts, Waipiata, New Zealand, U.S.A., 17th July, 1906; 6 years. Filed 20th April, 1906. Recelpt No. 135,096.
Claim.-1. A pair of brackets pivotally joined end to end and adapted to recelve a swingletree and draw bar respectively, substantially as and for the purposes set forth.
2. A pair of brackets pivotally joined end to end, and adapted to receive a swingletree and a draw bar respectively, and a collar on one bracket to keep the ends apart, substantially as and for the purposes set forth.
3. A pair of brackets pivotally joined end to end and apapted to receive a swingletree and draw bar respectively and a curved guard at the inner end of each bracket, substantially as and for the purposes set forth.
4. A pair of brackets pivotally joined end to end and adapted to receive a swingletree and a draw bar respectively, a collar on one bracket to keep the ends apart, and a curved guard at the inner end of each bracket. substantially as and for the purposes set forth.

No. 100,088. Vehicle. Véhicule.

$\rightarrow$

George Seator Stevenson, Dundee, New Zealand, U.S.A., 17th July, 1906; 6 years. Filed 20th April, 1906. Receipt No. 135,098.
Claim.-In a vehicle having an axle pivoted thereto, a transverse bar connected to the axle in front thereof there being a series of keyhole slots in the bar adapted to receive a draft cable attached to the vehicle near the pivotal point. substantially as and for the purposes set forth.

No. 100,089. Ear Drum. Tambour d'oreille.

Michael David Tugendhaft, Hamilton, Ontario, Canada, 17th July, 1906; 6 years. Filed 28th May, 1906. Receipt No. 136,317.
Claim.-1. In an ear drum an elongated tube attached to the outward end of the largest cell of the drum, for the purpose specified.
2. In an ear drum. an elongated outward tube formed integral with the largest cell of the drum, for the purpose specified.
3. In an ear drum the combination of three different sizes of the drum and an elongated tube formed integral with the drum, for the purpose specified.

No. 100,090. Gate. Barrièrc.
Clayton Millard Richardson, Toronto, Ontario, Canada, assignee of Peter C. Forrester, Tacoma. Washington, U.S.A., 17th July, 1906; 6 years. Filed 9th March, 1906. Receipt No. 133,689.
Claim.-1. The combination with a gate post, of a hinge plate, link connections between said plate and the post, a weighted lever mounted to swing on the post, a yoke pivoted to said lever between its free end and fulcrum, a gate having a pintle stile extending through said hinge plate and yoke, a bearing for the lower end of the pintle stile, and means for swinging said lever.
2. The combination with a gate post, of a band secured to the post, a hinge plate, link connections between said band

and plate at opposite sides of the post, a weighted lever mounted to swing on the post above the hinge plate, a yoke pivoted to said lever between its free end and fulcrum, a gate having a pintle stile, the upper end of which above the gate extends loosely through said hinge plate and the yoke, and a bearing on the gate post receiving the lower end of the pintle stile.
3. The combination with a gate post and a gate, of a hinge plate through which the gate stile loosely passes, links plvoted to the hinge plate and having swinging connection with the gate post, a weighted lever mounted to swing on the gate post, and a yoke pivoted to the lever and through which the gate stile loosely passes.

No. 100,091. Electro-Magnotic Signal.
Signal électro-magnétique.

Frank Oliver Sutton Chapman, Brantford, Ontario, Canada, assignee of Alfred Julius Stecker, Detrnit, Michigan, U.S.A., 17th July, 1906; 6 years. Filed 31st January, 1906. Receipt No. 132,455.
Claim.-1. In-a rallway signalling system the combination of a ratchet wheel, a signalling device actuated by said wheel, an electro-magnet having its armature arranged to actuate said wheel, an additional electro-magnet having its armature arranged to hold said wheel from retraction, an electric circuit connected with said magnets, and means actuated by the movement of the wheel to open said circuit and thereby cut out one of sald magnets.
2. In a railway signalling system the combination of a ratchet wheel, a signalling device actuated by said wheel, an electro-magnet having its armature arranged to actuate said wheel, an additional electro-magnet having its armature arranged to hold said wheel fro mretraction, an electric circuit connected with said magnets, a switch interposed in said circuit, and means actuated by the advancement of the wheel to open sald switch and thereby cut out one of said magnets.
3. In a railway signalling system the combination of a ratchet wheel, a signalling device actuated by said wheel, an electro-magnet, a lever carrying the armature of the magnet, a pawl carried by sald lever to actuate sald wheel, an additional electro-magnet, a lever carrying the armature of the additional magnet, a retaining pawl carried by the lastnamed lever, an electric circuit with said magnets, and means actuated by the advancement of said wheel to open said circuit and thereby cut out one of said magnets.
4. In a railway signalling system the combination of a ratchet wheel, a signalling device actuated by sald wheel, an electro-magnet, a lever carrying the armature of the magnet, a pawl carried by said lever to actuate said wheel, an additional electro-magnet, a lever carrying the armature of the additional magnet, a retaining pawl carried by the lastnamed lever, an electric circuit connected with said magnets, means actuated by the advancement of sald wheel to open said circuit and thereby cut out one of said maenets, and means to adjust the movements of sald lever.
5. In a rallway signalling system the combination of a ratchet wheel, a signalling device actuated by said wheel, an electro-magnet, a lever carrying the armature of the magnet, a pawl carrled by said lever to actuate said wheel, an additional electro-magnet, a lever carrying the armature of the additional magnet, a retaining pawl carried by the lastnamed lever, an electric circuit connected with said magnets, actuated by the advancement of said wheel to open said circult and thereby cut out one of said magnets, and means to adjust the movement of the pawl of the first-named magnet.
6. In a rallway signalling system the combination of a ratchet wheel, a signalling device actuated by said wheel, an electro-magnet having its armature arranged to actuate said wheel, an additional electro-magnet having its armature arranged to hold said wheel from retraction, an electric circuit connected with said magnets, and a lever to open sald circult through one of said magnets, said wheel provided with means to trip sald lever.
7. In a railway signalling system the combination of a ratchet wheel, a signalling device actuated by said wheel, an electro-magnet having its armature arranged to actuate sald wheel, an additional electro-magnet having its armature arranged to hold the wheel from retraction, an electric circuit connected with said magnets and means actuated by the movement of the wheel to open said crcuit and thereby cut out one of said magnets, and means to retract the ratchet wheel when the other of said magnets is out of the electric circuit.
8. In a railway signalling system tbe combination of a ratchet wheel, a rotatable shaft rotated by said wheel, a signalling device carried by said shaft, an operating electromagnet having its armature arranged to advance said wheel, an additional electro-magnet having its armature arranged to hold said wheel from retraction, an electric circuit connected with said magnets, and means actuated by the movement of said wheel to open the circuit through the operating magnet.
9. In a railway signalling system, the combination of a ratchet wheel, a signalling device actuated by said wheel, a rotatable shaft rotated by said wheel, a signalling device carried by said shaft, an electro-magnet having its armature arranged to actuate said wheel, an additional electro-magnet havings its armature arranged to hold said wheel from retraction, an electric circuit connected with said magnets. means actuated by the movement of sald wheel to open said circuit through one of said magnets, a lighting device, and means carried by said shaft to disclose a danger signal by said light when the said signal is moved in the position of danger.
10. In a rallway signalling system, the combination of a ratchet wheel, a signalling device actuated by said wheel, an operating electro-magnet having an armature provided with a driving pawl, an additional electro-magnet having an armature provided with a retaining pawl, an electric circuit connected with said magnet, a switch in said circuit, means actuated by the advancement of said wheel to open said switch and thereby cut out the operating magnet, and means to return the ratched wheel to normal position when both magnets are cut out.
11. In a railway signalling system, the combination of a ratchet wheel, a signalling device actuated by sald wheel, an operating electro-magnet having an armature provided with a driving pawl, an additional electro-magnet having an armature provided with a retaining pawl, an electric circuit
connected with said magnets, a switch in said circuit, means actuated by the advancement of sald wheel to open said switch and thereby cut out the operating magnet, means to return the ratchet wheel to normal position when both rachets are cut out, and means to hold the current on the corresponding magnet until the armature carrying the driving pawl has nearly completed its stroke and then to release sald armature.
12. In a railway signalling system the combination of a registering instrument, a track instrument, an electric circuit connected with said instrument, and signalling mechanism electrically connected with the registering instrument, sald machine comprising a ratchet wheel, a signalling device actuated by said wheel, an electro-magnet having its armature arranged to actuate said wheel, an additional electromagnet having its armature arrxnged to hold the wheel from retraction, an electric circuit connected with said magnets, and means actuated by the movement of the wheel to open sald circuit and thereby cut out one of said magnets.
13. In a railway signalling system the combination of registering mechanisms, located at desired distances, the one from the other, an electric circuit connected with each of said mechanism to be controlled by a track instrument, and a signalling mechanism electrically connected with each of the registering mechanisms, each of said mechanisms comprising a ratchet-wheel, a signalling device actuated by said wheel, an electro-magnet having its armature arranged to actuate said wheel, an additional electro-magnet having its armature arranged to hold said wheel from retraction, an electric circult connected with said magnets, and means actuated by the movement of the wheel to open said circuit and thereby cut out one of said magnets.
14. In a rallway signalling system the combination of two electro-magnets, an electric circuit connected with said magnets, a switch interposed in said circuit to govern said circuit, signalling mechanism actuated by one of said magnets and held by the other of said magnets and means to cut out one of said magnets to permit the signalling mechanism to be restored to normal position.

No. 100,092. Railway System. Systime de chemin de fer.

William H. Dammond, Detroit, Michigan, U.S.A., 17th July 1906; 6 years. Filed 13th July, 1905. Receipt No. 126,862.
Claim.-1. In a safety system for railroads, suitable track circults, electro-mechanical means mounted in the locomotive or car, said means operated by the track circuits and being capable of controlling the locomotive or car on any block, by which it may be stopped, slowed down, or operated at full speed as warranted by the condition of the track ahead, substantially as described.
2. In a safety system for rallroads, suitable track circuits, electro-mechanical means in the locomotive or car. said means operated by the track circuits and being capable of
signalling the engineer, three distinct instructions for each block, substantially as described.
3. In a safety system for rallroads, suitable track circuits, electro-mechanical means in the locomotive or car operated by the track circuits, said means being capable of signalling the engineer on any block to stop, to slow down, or to go ahead at full speed, as justified by the track condition ahead, substantially as described.
4. In a safety system for railroads, a track containing insulated sections, a locomotive or car thereon carrying insulated contacts adapted to travel on the track rails, electric circuits on the locomotive or car containing the sections of the rails and uninsulated portions of the locomotive or car and alternately completed and broken by the insulated contacts, electro-magnetic means on the locomotive or car for producing definite results thereon and controlled by the circuits on said locomotive or car and alternately completed and broken by the contacts, track sections and uninsulated portions of the locomotive or car, substantially as described.
5. In a safety system for rallroads, a track containing insulated sections, a locomotive or car thereon carrying insulated contacts, partial electric circuits on the locomotive or car alternately completed and broken by the contacts and including track sections and uninsulated portions of the locomotive or car for producing definite results thereon and controlled by the circuits aternately made and broken by the contacts, partial circuits supplied by a source of electricity extraneous to the locomotive or car and including portions of track on each side of the track said circuits being completed by the contacts and uninsulated portions of the locomotive or car to independent means thereon for controlling the circuit supplying the electro-magnetic means for producing definate results thereon, partial circuits adapted to be completed by short circuits between uninsulated track sections in advance of the locomotive or car for the purpose of shunting current from the extraneous electric source away from the circuits through the contacts and independent controlling means on the locomotive or car, substantially as described.
6. In a safety system for railroads a track containing insulated sections, a locomotive or car thereon carrying insulated contacts adapted to travel on the track rails, elec-tro-magnetic means for producing on the locomotive or car definite and distinct results corresponding to the conditions clear, caution and danger of predetermined portions of the track rails determining which results shall at definite times duced when current from sald electro-magnetic means ceases, circuits from an electric source on the locomotive or car and including the insulated contacts controlling the current to the electro-magnetic means for producing the clear, danger and caution results thereon, and electrical means on the track and extending between insulated sections of the track rails determining which results shall at definite times be produced on the locomotive or car, substantially as described.
7. In a cafety system for rallroads, a track divided on one rail by insulated sections into blooks the opposite rail of which is made electrically continuous between blocks, mo signalling point on each rail in each block and insulated from the portions of the rall adjacent thereto, a source of electricity in each block connected to the track ralls on opposite sides thereof and to insulated signalling sections ex'traneous to the block containing said electrical source in such manner that apparatus completing any two of the partial circuits thus established shall be supplied by independent circuits from said electrical source, a locomotive or car on the track carrying an insulated contact through which while touching an insulated signalling point current from the track circuit may be delivered to a circuit on the locomotive or car, and including uninsulated portions of the locomotive or car, means on the car for producing certain results thereon when a contact while touching a signalling section recelves from the electrical source extraneous to the locomotive or car and different results when said contac, t: while touching said signalling points fails to receive current from said electrical source, substantially as described.
8. In a safety system for railroads, a locomotive or car, a source of electricity thereon, a awithching device for causing the electric source alternately to supply current to e:ther or both of two cincuits for producing certain results on the locomotive or car and to open circuit said electric source, electro-magnetic means on the locomotive or car supplied from an electrical source thereon for controlling sald switching device, electro-magnetic means on sald locomotive or car for diverting the current from said electrical source to one or both of the circuits for producing said results, insulated contacts on the locomotive or car and in the circuits controlling said switching and diverting device by which said circuits may be completed through ralls of the track and uninsulated portions of the locomotive or car, sub. stantially as described.
9. In a safety system for railroads, a diverting device on a locomotive or car by which current from an electrical source thereon may be supplied to either or both of two devices for producing results corresponding to the conditions clear and caution ahead, electro-magnetic means for controlling said diverting device in such a manner that when said controlling means is energized it will cause the diverting device to send current to the devices for producing the results corresponding to clear ahead and when said controlling menas is deenergized it will cause the diverting means to send current to the devices for producing the results corresponding to caution ahead, a switching device in said controlling circuit that when circuit to said controlling means is once more opened at any other point, will itself open and thus prevent subsequent closing of said circuit at said other point from again completing the circuit to said controlling means, elec-tro-magnetic means on the locomotive or car supplied with current thereon which, when energized, will close said switching device in said controlling means and thus close said open circuit at said switch, electro-magnetic means on said locomotive or car adapted to receive current from an electrical source extraneous to the said locomotive or car which, when energized, will close circuits through said devices for controlling said diverting device when the circuit by way of said diverting switch is open at any other point end will cause said diverting device to remain closed until said other open circuit shall have become closed, substantially as described.

No. 100,093. Railway Signal Pulley.
Poulie pour signaux de chemin de fer.

Hiram Lomas, 6 River View, New Ferry, Chester, England, 17th July, 1906; 6 years. Filed 27th February, 1906. Recelpt No. 133,386.
Claim.-1. In a device of the character described, a housing, a plurality of rotatably mounted pulleys in the housing, adapted to form roller bearings for a flexible member, a slipporting member, a bracket secured to the supporting member and pivotally connected with the housing, and means for limiting the movement of the housing.
2. In a device of the character described, the combination comprising a supporting member a frame hinged to the supporting member, pulleys carried by the frame, and means for securing the free end of the frame to the supporting member.
3. In a device of the character lescribed, the combination comprising a post, a frame pivotally connected with the post, anti-friction pulleys rotatably disposed in the frame, a flexible member disposed between the opposing faces of the rulleys. and a removable pin adapted to form an axis for one of the pulleys.
4. In a device of the character described, the combination comprising a supporting member a bracket fixed on the supporting member, a frame hinged to the bracket, pulleys rotatably mounted in the frame, one of which is removable,
and securing means disposed through the frame and the removable pulley.
5. In a device of the character described, the combination comprising a supporting member, a frame pivotally conrected to the supporting member, pulleys rotatably disposed if the frame, a flexible member disposed between the opposing faces of the pulleys, and a removable pin disposed through one of the pulleys and provided with a head fitting into a recess provided in the supponting member and adapted to hold the pin against rotation, and a nut on the pin.
6. In a device of the character described, the combination comprising a supporting member, a housing pivotally secured to the supporting member, and pulleys rotatably disposed in the housing in alignment and having their peripheries oppositely disposed to each other.

No. 100,094. Fireproof Window.
Fenêtre à l'épreuve du feu.

Daniel Bradford Bodger, Winchester, and Arthur Campbell Bodger, Newton, both in Massachusetts, U.S.A., 17th July, 1906; 6 years. Filed 9th April, 1906. Receipt No. 134,770.
Claim.-1. In a fireproof window, a sheet metal sash having a cross rail composed of two strips having the edges of one overlapped and folded together with the edges of the other, the strips being separated from each other at their intermediate portions and indented longitudinally to form pane receiving grooves.
2. In a fireproof window, a sheet metal sash having a cross rail composed of two strips having the edges of one overlapped and folded together with the edges of the other, the strips being separated from each other at their intermediate portions and indented longitudinally to form pane receiving grooves and an internal stiffening member extended across said rail between the edges of said strips.
3. A cross rail for a fireproof window sash consisting of two strips of sheet metal arranged with the edges of one adjacent those of the other and interlocked and their intermediate portions separated, each of said strips being bent to provide grooves for recelving the window panes, and a lengitudinal stiffening web located within the rail extending across the same and in engagement with the interlocked edges of said strips.
4. A fireproof window sash having exterior ralls, a hollow cross rail, and connecting members held at their ends in the exterior rails and extending into and through said cross rail.
5. In a fireproof window, a sheet metal frame having a sash guide provided with an openingo a rigid plate extending across such opening and secured to the frame, and a pulley frame located in the opening and fastened to said plate.
6. In a fireproof window frame, a sheet metal side rall, a rigid metal plate secured to a wall of the side rail on the interior of the rail, the said wall and plate having registering openings, webs formed on said plate extending across the ends of said openings, and a pulley irame located in the openings carrying a pulley projected into the interior of the rail and comprising in part a face plate secured at its ends to said webs, and covering said openings.
7. In a fireproof window frame, a sheet metal side rail, a rigid metal plate secured to a wall of the side rail on the interior of the rail, the said wall and plate having registering openings, webs formed on said plate extending across the ends of said openings, a pulley frame comprising a face plate and laterally extending pulley supporting wings located in said openings, the face plate being secured at its ends to said webs and covering the openings and the pulley supporting wings extending through the openings into the interior of the side rail, and a pulley pivoted to said wings.
8. A fireproof window sash having exterior rails of sheet metal with indented portions forming pane-receiving grooves, a hollow cross rail, strips located within the cross rail and extending longitudinally thereof, projections extending from said strips into the interior of the adjacent exterior rail and bent over on their ends to form hooks, and a cross plece extending transversely of sald exterior rail in engagement with the indented portion thereof and engaged by said hooks.
9. A fireproof window sash having exterior rails of sheet metal with indented portions forming pane-receiving grooves, a hollow cross rail, transverse tie members located in the exterior rails engaging the indented portions, a strip located within the cross rail and extending across and longitudinally thereof, and projections extending from the ends of the strip into the interior of the exterior rails adjacent the ends of the cross rail, on opposite sides of the indented portions of the exterior rails, and connected with the transverse tie members.
10. A fireproof window sash having exterlor rails of sheet metal with indented portions forming pane-receiving grooves, a hollow cross rail, transverse tie members located in the exterior rails extending across the same in engagement with the indented portions thereof, and a plurality of strips extending longitudinally of the cross rail in the interior thereof and having projecting portions extending into the interior of the exterior rails on opposite sides of the tie members, the ends of sald projecting portions being bent around the outer edges of the tie members.
11. In a window, a sash having a tubular side rail formed with an external channel on the side toward the adjacent rail of the window frame, a sash supporting cord or chain located In sald channel, and a hanger having a portiou located in the channel engaged with the cord or chain and detachably connected to the sash rall.
12. In a window, a sash having a tubular side rail formed with an external channel on the side toward the adjacent rail of the window frame, a sash supporting cord or chain located in said channel, and a hanger having an eye located in the channel engaged with the cord or chain and a holding portion extending into the interior of and detachably engaged with the sash rail.
13. In a window, a sash having a tubular side rail and provided with an elongated slot in the portion adjacent the window frame, and a hanger having an eye adapted to be engaged with a sash supporting weight chain or cord and havinc also an offset portion and a lateral retaining bar adapted to extend through the sash rail and engage the same in the interior thereof.

No. 100,095. Wire Fence. Clôture de fll de fer.

Frank S. Frost. Charlottetown, Prince Edward Island, Canada, 17th July, 1906; 6 years. Filed 22nd February. 1906. Receipt No. 133,172.
Claim.-1. A fence comprising straight longitudinal wires, corrugated stay wires and binding means passed three times around the stay wires to the longitudinal wires.

7-16
2. A fence comprising straight longitudinal wires, corrugated stay wires having their upper ends provider with round loops, and binding means wound on the longitudinal wires and crossed three times over the stay wires.
3. A fence comprising longitudinal wires, stay wires and binding wires crossed thrice around one side of the stay wires and having their opposite ends bent around the longitudinal wires on opposite sides of the stay wires.

No. 100,096. Vessel Cover and Shaker.
Couvercle et appareil à secousse pour valsseaux.

Hugh Paton, Montreal, Quebec, Canada, 17th July, 1906; 6 years. Filed 8th January, 1906. Receipt No. 181,632.
Claim.-1. A cover for shaking purposes adapted to be held upon the rim of a vessel by the presence of the index finger while the vessel is held in the hand and consisting of a flexible disc, a carrier containing such disc and constructed to, when borne upon by the finger, force the central portion of the said disc into the vessel while the disc rests upon the rim, substantially as described and for the purpose set forth.
2. A cover adapted to rest upon the rim of a vessel and consisting of a carrier having a convexed interior and a flexible disc supported in such carrier, substantially as described and for the purpose set forth.
3. A cover adapted to rest upon the rim of a vessel and comprising a carrier of circular box-like form with one end open, the closed end of such carrier having the central portion of its interior convexed, an elastic disc within the carrier, a series of legs secured to the interior of the parimetical wall of the carrier, and a series of feet upon such legs, substantially as described and for the purpose set forth.
4. A disc for the purpose set forth consisting of two layers of cork each faced on one side with an asceptic waterproof fabric and an adhesive film attaching the said faced layers together, substantially as described and for the purpose set forth.
5. A cover adapted to rest upon the rim of a vessel and consisting of a carrier having a convexed interior and a flexible disc supported in such carrler and consisting of two layers of cork with an aseptic film of adhesive substance between them, substantially as described and for the purpose set forth.
6. A cover adapted to rest upon the rim of a vessel and consisting of a carrier having a convexed interior and a flexible disc supported in such carrier, and consisting of two layers of cork each faced on one side with an aseptic waterproof fabric and an adhesive film attaching the said faced layers together, substantially as described and for the purpose set forth.
7 A cover adapted to rest upon the rim of a vessel and comprising a carrier of circular box-like form with one enis open, the closed end of such carrier having the central por-
tion of its interior convexed, an elastic disc within the carrier, a series of legs secured to the interior of the perimetrical wall of the carrier, and a series of feet upon such legs, one of such feet being secured to its leg by a screw thread connection, substantially as described and for the purpose set forth.

No. 100,097. Metallic Thimble or Tube. Tube ou dé métallique.

James Pratt, Woodstock, Ontario, Canada, 17th July, 1906; 6 years. Filed 18th April, 1906. Receipt No. 135,011.
Claim.-1. In a fence post or other article composed of plastic material. a metallic thimble or tube firmly imbedded in said material and a removable wooden plug inserted in sald thimble or tube, substantially as described
2. In a fence post or other article composed of plastic material which is eventually hardened, a metallic thimble or tube firmly imbedded in said post or other article, a removable wooden plug inserted in said thimble or tube, a staple, nail, or spike driven into said plug capable of securing a fence or other article or substance thereto, substantially as set forth in the specifications herein.

## No. 100,098. Threading Die. Filière.

The Standard Screw Company, assignee of Walter Beverly Pearson, all of Detroit, Michigan, U.S.A., 17th July, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,030.
Olaim.-1. In a threading die the combination of a dle body provided with guides or ways, die chasers fitted to and movable along said guides or ways towards and from the axis of the die body, a head movable towards and from said die body, arms pivoted on sald head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when said head is moved in the other direction, means to secure said locking arms against pivotal movement and means for advancing and retracting said die chasers comprising engaging parts on said die, chasers and on said locking arms comprising cam surfaces on one thereof.
2. In a threading die the combination of a die body provided with guides or ways, die chasers fitted to and movable along said guides or ways towards and from the axis of the die body, a head movable towards and from said die body, arms pivoted on said head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release the said dip chasers when said head is moved in one direction and are withdrawn to release the said die chasers when said head is moved in the other direction, means for adjustably limiting the outward movement of sald arms and means for supporting said arms against inward pivotal movement.
3. In a threading die the combination of a die body provided with guides or ways, die chasers fitted to and movable

along said guldes or ways towards and from the axis of the die body, a head movable towards and from said die body, arms on sald head which engage sald die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when said head is moved in the other direction, and a casing supported concentric with said die body which extends over said locking arms, said locking arms and casing being provided with engaging surfaces to provide a rigid support or backing for said arms.
4. In a threading die the combination of a die body provided with guides or ways, die chasers fitted to and movable along said guides or ways towards and from the axis of the die body, a head movable towards and from sald die body, arms on said head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when said head is moved in the other direction, and a casing adjustably secured concentric with the die body which extends over said locking arms, said locking arms and casing belng provided with engaging surfaces comprising inclined or bevelled surfaces on said locking arms.
5. In a threading die the combination of a die body provided with guides or ways, die chasers fitted to and movable along said guides or ways towards and from the axis of the body, a head movable towards and from said die body, arms on said head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when said head is moved in the other direction, and a casing on sald head which extends over said locking arms, said locking arms and casing being provided with engaging surfaces to provide a rigid support or backing for said arms.
6. In a threading die the combination of a die body provided with guides or ways, die chasers fitted to and movable along said guides or ways towards and from the axis of the die body, a head movable towards and from said die body, arms pivoted on said heads which engage sald die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when said head is moved in the other direction, means to secure said arms against inward pivotal movement and a casing adjustably secured to sald head which extends over said locking arms, said casing and arms being provided with engaging surfaces comprising inclined or bevelled surfaces on said locking arms.
7. In a threading die the combination of a die body provided with guides or ways, die chasers fitted to and movable along said guldes or ways towards and from the axis of the die body, a head movable towards and from said die body. arms pivoted on sald head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release sald die chasers when said head is moved in the other direction, means to secure said arms against inward pivotal movement, a casing adjustably secured to said head which extends over said locking arms, said casing and arms being provided with engaging surfaces comprising inclined or bevelled surfaces on said locking arms, and springs applied to said locking arms for maintaining the bearing surfaces therof in engagement with their co-operating surfaces on said casing.
8. In a threading die the combination of a die body pror vided with guides or ways, die chasers fitted to and movable along said guides or ways towards and from the axis of the die body, a head movable towards and from said die body. arms on said head which engage said die chasers to lock them in operative position when said head is moved in one
direction and are withdrawn to release sald die chasers when sald head is moved in the other direction, and a casing on sald head which extends over said locking arms, said locking arms and casing being provided with engaging surfaces to provide a riild support or backing for sald arms and said casing being provided also with a bearing slidably fitted to a cylindrical bearing on the die body.
9. In a threading die the combination of a dle body provided with guides or ways, die chasers fitted to and movable along said guldes or ways towards and from the axis of the die body, a head movable towards and from said die body. arms pivoted on said head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when sald head is moved in the other direction, means to secure said arms against inward pivotal movement. and a casing adjustably secured to said head which extends over said locking arms, said locking arms and casing being provided with engaging surfaces comprising inclined or bevelled surfaces on said arms to provide an adjustable rigid supnort for said locking arms. and said casing being also provided with a bearing slidably fitted to a cylindrical bearing on the die body.
10. In a threading die the comblnation of a die body provided with guldes or ways, die chasers fitted to and movable along sald guldes or ways towards and from the axis of the die body, a head movahle towards and from said die body. arms on said head which engage sald die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when said head is moved in the other direction. a casing supported concentric with said die body which extends over sald lockIng arms, sald locking arms and casing belng provided with engaging surfaces to provide a rigid sunoprt or backing for said arms and means for advancing and retracting sald die chasers consisting of co-operating parts on said die chasers and on sald head.
11. In a threading die, the combination of a die body provided with guldes or ways, die chasers fltted to and movable along sald guides or ways towards and from the axis of the die body, a head movable towards and from said die body, arms on said head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when sal head is moved in the other direction, a casingers on salit head which extends over said locking arms, said locking arms and casing being provided with engaging surfaces to provide a rigid support or backing for sald locking arms and means for advancing and retracting sald die chasers comprising engaging parts on said die chasers and on sald locking arms comprising suitable cam surfaces on one thereof.
12. In a theading die the combination of a die body provided with guides or ways, die chasers fitted to and moving along sald guides or ways towards and from the axis of the die body, a head movable towards and from said die body arms pivoted on sald head which engage sald die chasers to lock them in operative position when said head is moved In one direction and are withdrawn to release said die chasers when said head is moved in the other direction, stops which limit the inward nivotal movement of said arms, a casing adjustably secured to said head which extends over said locking arms, sald locking arms and casing being provided with engaging surfaces comprising inclined or bevelled surfaces on said arms for adjustably limiting the out ward pivotal movement of said locking arms and means for advancing and retracting said die chasers comprising engaging parts on said die chasers and on said locking arms comprising suitable cam surfaces on one thereof.
13. In a threading die the combination of a die body, provided with guldes or ways, die chasers fitted to and movable along sald guides or ways towards and from the axis of the body, a head movable towards and from said body, arms pivoted on said head which engage said die chasers to look them in operative position when said head is moved in one direction and are withdrawn to release said die chasers when sald head is moved in the other direction, stops which limit the inward plvotal movement of said arms, a casing threader to sald head which extends over said locking arms, sain locking arms and casing being provided with engaging surfaces comprising inclined or bevelled surfaces on said arms for adjustably limiting the outward pivotal movement of said locking arms and means for advancing and retracting sald die chasers comprising engaging parts on said die chasers and on said locking arms comprising suitable cam surfaces on one thereof.
14. In a threading die the combination of a die body provided with holes or openings, a block of less thickness than the width of said holes or openings removably secured to a side of each of said openings, die rhasers slidably fitted to the spaces between said blocks and the opposite sides of said holes or openings and movable therein towards and from the axis of the dic body, engaging tongues and grooves
on said die chasers and removable blocks, means for advancing and retracting said die chasers and means for securing sald die chasers in operative position.
15. In a threading die the combination of a die body proFided with holes or openings, a block of less thickness than the width of said holes or openings inserted against a slde of each of sald holes or openings, clamping screws threaded into said die body, the heads of which are fitted to counterbores formed partly in sald blocks and partly in the die body shoulders on which engage corresponding shoulders on said blocks, die chasers slidably fitted to the space between said blocks and the opposite sides of said holes or openings and movable therein towards and from the axis of the die body, engaging tongues and grooves on said die chasers and removable blocks, means for advancing and retracting said die chasers and means for securing said die chasers in operative position.
16. In a threading die the combination of a die bodv provided with guides or ways, and a rearward axial bore, die chasers fitted to and movable along sald guides or ways towards and from the axis of said die body, a ring fitted to the axial bore in said die body which projects into the path of travel of rigid portions of sald die chasers, means to advance and retract sald die chasers and means to secure said chasers in operative position.
17. In a threading die the combination of an arbour, a die body and a head itted to and longitudinally movable on said arbour, means to secure said die body against rotation on said arbour, a stop which limits th emovement of said die body and head lengthwise of sald arbour. ylelding connection between sald die body and head whereby said head is maintained normally at one. limit of its movement relatively to sald die body, guldes or ways on said die body, die chasers fitted to and movable along said guides or ways towards and from the axis of said die body. rigidly supported arms on said head which engage said die chasers to lock them in operative position when sald head is moved in one direction and are withdrawn to release said die chasers when sald head is moved in the other direction, and means for advancing and retracting said die chasers comprising engaging parts on sald dle chasers and on sald locking arms comprising suitable cam surfaces on one thereof.
18. In a threading die the combination of an arbour, a die body, a head fitted to and longitudinally movable on sald arbour, a collar on said arbour between sald die body and sleeve, pins secured in sald die body which are fitted to and longltudinally movable in holes of osenings in said collar. rods secured to said pins, springs inserted between shoulders on sald rods and the bottom of recesses formed in said head whereby sald springs will maintain sald head normally at one limit of its movement relatively to said die body, guides or ways on said die body, die chasers fitted to and movable along said guides or ways towards and from the axis of said dle body. rigidly supported arms of sald head which engage said die chasers to lock them in operative position when said head is moved in one direction and are withdrawn to release sald die chasers when said head is moved in the other direction, and means for advancing and retracting said die chasers comprising engaging parts on said die chasers and on said locking arms comprising suitable cam surfaces on one thereof.
19. The combination of an arbour, a threading die comprising connected sections fitted to and movable longitudinally for said arbour, a flange on said arbour between the sections of sald die, and means for securing said die againgt rotation relatively to said arbour.

## No. 100,099. Pasteurising Apparatus.

 Apparcil d pasteuriser.Niels Frederick Nissen, Gentofte, and Frederick C. L. Sodemann, Lyngby. both in Denmark, 17 th July, 1906; 6 years. Flled 9th April, 1906. Receipt No. 134,743.
Claim.-1. An apparatus for pasteurizing substances enclosed in bottles or other receptacles, and of the kind where the bottles remain at rest, while the water or other heat conveying medium circulates, and comprising a number of communicating chambers, means for heating each chamber separately and independently of the circulation, and means for utilizing the water level variations produced, in the apparatus, when inserting the bottles therein or extracting them therefrom, to effect the desired circulation through all the chambers, substantially as described and for the purpose set forth.
2. An apparatus for pasteurizing substances enclosed in bottles or other receptacles, and of the kind where the bot ties remain at rest while the water, or other heat conveying medium circulates and comprising a number of communicating chambers, means for heating each chamber separately and independently of the circulation, ineans for preventing back flow of the medium, and means fer producing a difference in water level of two adjacent chambers, thus effecting.
as back flow is prevented, a circulation of the medium through all the chambers and in the desired direction.

3. An apparatus for pasteurizing substances enclosed in bottles or other receptacles, and of the kind where the bottles remain at rest while the water or other heat conveying medium circulates, and comprising a number of communicating chambers, means for heating each chamber separately and independently of the circulation, means for preventing back flow of the medium and means for supplying water to any one of the chambers and for discharging a corresponding amount of water from the adjacent chamber on the opposite side of the gate, for the purpose of producing the desired circulation through all the chambers.
4. An apparatus for pasteurizing substances enclosed in bottles or other receptacles and of the kind where the bottles remain at rest, while the water or other heat conveying medium circulates, and comprising a number of communicating chambers, means for heating each chamber separately and independently of the circulation, means for preventing back flow of the medium, and a pump serving to transfer the water from one chamber into the adjacent one for the purpose of producing the difference in water level of these two chambers necessary to effect the desired circulation through all the chambers, these two chambers being temporarily or permanently disconnected.

No. 100,100. Hermetic Sealing Apparatus.
Appareil à sceller hermétiqucment.

William Albert Lorenz and William Heary fonlss, co-inventors, both of Hartford, Connecticut, U.S.A., 17th June, 1906; 6 years. Filed 28th April, 1906. Receipt No. 135,350.
Claim.-1. In a jar sealing apparatus the combination of a jar chamber, a plurality of jar carrying slides and a table provided with guideways for the slides, and mounted to carry the slides transversely, whereby they are successively carried
into horizontal alignment with the jar chamber to permit them to be transferred horizontally from the table to the chamber.
2. In a jar sealing apparatus. the combination of a jar chamber, a plurality of jar carrying slides and a turntable provided with a guldeway for each of the slides, the turntable being pivoted at one side of the center of the pathway of the sald slides, whereby the slides may be brought successively into horizontal alignment with the jar chamber.
3. In a jar sealing apparatus the combination of a jar chamber, a plurality of jar carrying slides, a turntable provided with a guide for each sllde, and a pivotal support for the turntable located between the guldeways, and at one side of the center line of the jar chamber whereby the slides are by rotation of the table carried successively into horizontal alignment with the jar chamber.
4. In jar sealing apparatus the combination of a jar chamber, a pair of jar carrying slides, a turntable for supporting one of the slides in alignment with the jar chamber, and supporting the other slide in position to be brought into similar alignment by swinging the turntable, means for locking the turntable when either slide is in allgnment with the jar chamber, and stops for stopping the movement of the slldes when they are drawn out of the jar chamber.
5. In jar sealing apparatus the combination of a jar chamber, a door for hermetically sealing the jar chmber, far carrying slide. guideways for supporting and guiding the slide through the doorway into the jar chamber, jar holding trays supported by the slide, and substitutable filling pleces resting upon the bottom of the slide, and supporting the trays to ralse the tops of jars of different heights to a predetermined level.
6. In jar sealing apparatus the combination of a jar chamher. a pair of jar rarrving slides, rollers on which the slides rest, and a turntable for carrying the rollers and supporting one of the slides in alignment with the jar chamber while supporting the other slide in position to be brought into similar alignment by swinging the turntable.
7. In jar sealing apparatus the combination of a jar chamber, a pair of jar carrying slides, a turntable for supporting one of the slides in allgnment with the jar chamber and for supporting the other slide in position to be brought into similar alignment bv swinging the turntable, and side guides on the turntable to keep the moving slides in alignment with the jar chamber.
8. In jar sealing apparatus the combination of a jar chamher. a door carriage, a door suspended from the carriage and snrings to yieldingly hold the door away from the jar chamber.
9. In far sealing apparatus the combination of a jar chamber. a door carriage. a door suspended from the carriage. springs tending to hold the top of the door out of contact with the jar chamber, and a guide rail parallel to the path of the door to confine the bottom.
10. In jar sealing apparatus. door mechanism therefor having in combination a door for hermetically closing the jar sealing chamber, togele mechanism acting upon different portinns of the door. and a floating supoort for the toggle mechanism for substantially equalizing its pressure upon the different portions of the door.
11. In jar sealing apparatus the combination of a jar chamber, a door. clamping devices operating on different portions of the door, and means including an equalizing toggle device for distributing the clamping pressure on the different portions of the door.
12. In jar sealing apparatus, door mechanism therefor having in combination a door for hermetically closing the jar sealing chamber of the apparatus. togele mechanism acting in different directions upon different portions of the door, and a floatine support for the togele mechapism, located between the opposing portions thereof. for distributing the pressure of the toggle mechanism with substantial equality upon the different portions of the door.
13. In jar sealing apparatus, door mechanism therefor having in combination a door for hermetically closing the jar sealing chamber of the apparatus, togale devices acting in opposite directions from a common center, upon different portions of the door, and a floating support for the toggle device mounted to yield substantially in the line of the opposing pressures to substantially equalize them.
14. In jar sealing apparatus the combination of a far chamber. a door carriage, a door supported by the carriage, and means including a toggle joint device for clamping the door against the jar chamber.
15. In far sealing apparatus, the combination of a jar chamber, a door carriage, a door supported by the carriage. and means iocluding an adjustable toggle jolnt device for clamping the door against the jar chamber.
16. In far sealing apparatus, the combination of jar chamber, a door carriage, a door supported by the carriage. and means including two toggle foint devices acting from a common center for clamping the door against the jar chamber.
17. In far sealing apparatus, the combination of a jar chamber, a door carriage, a door supported by the carriage, and means including two toggle joint devices acting from a pivotally supported common center for clamping the door against the Jar chamber.
18. In jar sealing apparatus, the combination of a jar chamber, a door carriage, a door supported by the carriage, means including two toggle joint devices acting from a common center for clamping the door against the jar chamber, and means for supporting the said center for equalizing movement.
19. In far sealling apparatus, the combination of a jar chamber, a door carriage, a door supported by the carriage. dogs engaging the door, and means for moving the dogs to clamp the door against the jar chamber.
20. In jar sealing apparatus, the combination of a jar chamber, a door carriage, a door supported by the carriage, cogs engaging with the door, and a toggle joint device for moving the dogs to clamp the door against the jar chamber.
21. In far sealing apparatus, the combination of a jar chamber, a door carriage, a door for the jar chamber supported by the carriage, dogs engaging with the door, and two toggle joint devices which act on the dogs from a common center to clamp the door against the jar chamber.
22. In far sealing apparatus, the combination of a jar chamber, a door carriage, a door supparted by the carriage, dogs engaing with the door, two toggle joint devices which act on the dogs from a common center to clamp the door against the jar chamber, and means for supporting the common center for equalizing movement.
23. In jar sealing apparatus, the combination of a jar chamber, a door carriage, a door supported by the carriage, dogs engaging with the door, and two toggle joint devices which act on the dogs from a pivotally supported common center, to clamp the door against the far chamber.
24. In jar sealing apparatus, the combination of a jar chamber, a door carriage, a door supported by the carriage, dogs engaging with the door, two toggle joint devices which act on the dogs from a common center to clamp the door against the jar chamber, and a lever for operating the toggle joint devices.
25. In jar sealing apparatus, the combination of a jar chamber, a door carrlage, a door supported by the carriage, dogs engaging with the door, two toggle joint devices which act on the dogs from a common center to clamp the doo'f against the jar chamber, and counterbalancing means for the weight of the toggle joint devices.
26. In far sealing apparatus, the combination of a jar chamber, a door carriage, a door for the jar chamber supported by the carrlage, dogs engaging with the door, two toggle joint devices which act on the dogs from a common center to clamp the door against the jar chamber. and ad. justing means for the toggle joint devices and their connected parts.
27. In Jar sealing apparatus, the combination of a jar chamber. a door carriage, a door supported by the carriage. two toggle joint devices and connections acting on the dogs from a comon center, and means for varying the length of the connegtions.
28. In jar sealing apparatus, the combination of a jar chamber and a sealing carriage removably contained within the jar chamber, comprising a base and a presser chamber provided with a plurality of independently movable pressers operated by atmospheric pressure.
29. In jar sealing apparatus, the combination of a jar chamber, a plurality of independently movable jar pressers. a carriage removably contained within the jar chamber, and having the jar pressers attached thereto, and fluid pressure actuated means for operating the pressers.
30. In jar sealing apparatus, the combination of a jar chamber, a plurality of independently movable jar pressers. a carriage removably contained within the jar chamber and having the far pressers attached thereto, and an inclined cap levelling surface adjacent to the pressers, to level the individual caps as they are moved toward the pressers.
31. In far sealing apparatus, the combination of a jar chamber and a sealing carriage removably contained within the far chamber, and comprising a base and a presser chamber having attached thereto independently movable far pressers operated by atmospheric pressure, and a cap levelling device located near the front of the presser chamber to level the caps as they are moved toward the pressers.
32. In jar sealing apparatus, the combination of a jar chamber, a sealing carriage removably contained within the jar chamber, and comprising a base and a presser chamber provided with a plurality of independently movable jar pressers operated by atmospheric pressure, and means for connecting the presser chamber to exhausting apparatus.
33. In vacuum sealing apparatus, a valve having an ex haust port 255 . an atmospheric port 258 , and two chamber ports 256 and 257 , said valve being provided with means for closing the exhaust port and the atmosphere port Indepen-
dently of each other, and for connecting the two chamber ports either with the exhaust port or with the atmosphere port.
34. In vacuum sealing apparatus, a valve having an exhaust port 255, an atmosphere port 258, and two chamber ports 256 and 257, said valve being provided with means for closing the ehaust port and the atmosphere port independently of each other and for connecting the two chamber ports either with the exhaust port or with the atmosphere port, said means being adapted also to connect the chamber port 256 either with the exhaust port or with the atmosphere port while keeping the other chamber port 257 closed.
35. In vacuum sealing apparatus, the combination with a valve having an exhaust port, an atmosphere port and two chamber ports, of means for bringing the ports into proper coincidence and means for arresting the operating movements at predetermined positions.
36. In vacuum sealing apparatus, the combination with a valve having an exhaust port, an atmosphere port and two ckamber ports, of means for bringing the ports into proper coincidence, and means for limiting the valve operating movement in both directions and for arresting it at predetermined intermediate positions.
37. In jar sealing apparatus, the combination of a jar chamber, a presser chamber, a valve, a passage connecting the valve to the jar chamber, a passage connecting the valve to the presser chamber, a passage connecting the valve to an exhausting apparatus, a passage connecting the valve to the atmosphere, and means for operating the valve to close the exhaust passage and the atmosphere passage independently of each other and to connect the two chamber passages either with the exhaust passage or with the atmosphere passage.
38. In jar sealing apparatus, the combination of a jar chamber, a presser chamber, a valve, a passage connecting the valve to the jar chamber, a passage connecting the valve to the presser chamber, a passage connecting the valve to an exhausting apparatus, a passage connecting the valve to the atmosphere, means for operating the valve to close the exhaust passage and the atmosphere passage independently of each other and to connect the two chamber passages either with the exhaust passage or with the atmosphere passage, sald means being adapted also to connect the presser chamber passage either with the exhaust passage or with the atmosphere passage while keeping the jar chamber passage closed.
39. In a jar sealing apparatus the combination of a jar chamber, a presser chamber, a valve, a passage connecting the valve to the jar chamber, a passage connecting the valve to the presser chamber, a passage connecting the valve to an exhausting apparatus, a passage connecting the valve to the atmosphere, means for operating the valve to bring the passages into proper coincidence, and means for arresting the valve operating movement at predetermined positions.
40. In jar sealing apparatus the combination of a jar chamber, a presser chamber, a valve, a passage connecting the valve to the jar chamber, a passage connecting the valve to the presser chamber, a passage connecting the valve to an exhausting apparatus, a passage connecting the valve to the atmosphere, means for operating the valve to bring the passages into proper coincidence, and means for limiting the valve operating movement in both directions and for arresting it at predetermined intermediate positions.
41. In jar scaling apparatus the combination of a jar chamber, a presser chamber, a passage for connecting with air exhausting apparatus, a valve comprising a plug and casing. a lever to oscllate the plug, a latch connected with the lever, and a peripherally shouldered plate to co-operate with the latch in limiting the oscillation of the plug in both directions and to arrest the movement of the plug at predetermined intermediate points.
42. In vacuum sealing apparatus the combination of a jar chamber, a presser chamber, passages connecting with means for exhausting both chambers, means for readmitting air first to the presser chamber and subsequently to the jar chamber.
43. In a vacuum sealing apparatus the combination of a jar chamber, a presser chamber, a valve controlled connection between the two members, passages connecting with means for exhausting the two chambers, means for operating the valve to readmit air first to the presser chamber and subsequently to the jar chamber.
44. In jar sealing apparatus, door mechanism therefor, havIng in combination a door carriage mounted to travel in the general direction of the plane of the door, a door mounted on the carriage for movement toward and from the plane of the door seat, and a guide rall for holding the door away from the plane of its seat during the movements of the carriage.
45. In jar sealing apparatus, door mechanism therefor having in combination a door carriage mounted to travel in the general direction of the plane of the door, a door mounted on the carriage for movement toward and from the plane of
the door seat, and a guiding rail for holding the door away from the plane of its seat during the travel of the carriage, the guiding engagement between the rail and the door being discontinued when the door stands opposite its seat.
46. In jar sealing apparatus, door mechanism therefor havIng in combination a door carriage mounted to travel in the general direction of the plane of the door, a door mounted on the carriage for movement toward and from the plane of its seat, a dog for moving the door toward and from its seat, and a rail for guiding the door to hold its sealing face in a plane away from the plane of its seat, during the travel of the carriage.
47. In jar sealing apparatus, door mechanism therefor having in combination a door carriage mounted to travel in the general direction of the plane of the door, a door suspended on the carriage for swinging movement toward and from the plane of its sealing seat, dogs for moving the door toward and from its sealing seat, and a guide rall engaging with the door during its travel with the carriage to hold the sealing face of the door at one side of or away from the plane of the sealing seat.
48. In jar handling devices, the combination of a jar tray, open at its lateral sides, and a detachable locator consisting of a sheet metal plate, provided with apertures for locating and maintaining a plurality of jars in predetermined positions on the tray, the plate being also provided with means for reversibly registering it upon the tray and maintaining the jars in their same predetermined positions upon the tray in both of the positions of the locator.
49. In jar handling devices the combination of a jar tray, comprising a flat bottom portion provided with standards rising from opposite sides of the bottom, a handle appurtenant to each of said standards, a detachable locator provided with openings for locating a series of jars in a predeterminel position in the tray, the ends of the locator being provided with means for registering with the said standards, with portions of said locator adjacent to the said handles, whereby the tray and its locator are arranged in manipulative relation to the hand of the operator.
50. In jar handling devices the combination of a jar tray, comprising a flat bottom portion having upwardly projecting standards at its opposite sides. leaving the other opposite lateral sides open, and a detachable locator provided with openings for locating a series of jars in a predetermined position in the tray, and having its ends provided with means for supporting and registering the locator upon the standards.
51. In jar handling devices the combination of a reversible tray, comprising a flat bottom having standards extending upwardly from its opposite sides, leaving the tray open on its other opopsite sides, and a detachable locator provided with openings for registering a serles of jars in symmetrical relation on the tray, the locator being provided with means for reversibly registering it upon the said standards.
52. A leveller for a plurality of flaring or shouldered jar caps, provided with a plurality of openings for engaging the cap rims, whereby the leveller is supported.
53. A leveller for a plurality of flaring or shouldered far caps, comprising a plate having a plurality of openings for engaging the cap rims, whereby the leveller is supported.
54. In jar handling devices the combination with a jar, of a jar having a flaring or shouldered rim, and a leveller resting upon the said flaring or shouldered portion of the rim.
55. In jar handling devices the combination with a plurality of jars each having a removable cad with a flaring or shouldered rim, of a cap leveller provided with openings, the edges of which rest upon the said rim.
56. In jar sealing apparatus, means for bringing the loose caps to an approximately general level, comprising a plate supported by the caps at a level below the general level of the tops of the caps, the plate being provided with apertures through which the tops of the caps protrude.
57. In jar sealing apparatus, means for levelling and pressing down a plurality of loose caps comprising cap pressers, a plate supported by the rims of the caps, and provided with apertures through which the tops of the caps project to a level above that of the general level of the plate, for independent engagement with cap pressers.
58. In jar sealing apparatus the combination with means for supporting a plurality of jars having their caps loosely placed thereon, of independent cap pressers, means for bringing the loose caps to an approximately general level, comprising a plate having a plurality of apertures through which the caps protrude for engagement with the pressers, the plate being supported by the margins of its said apertures, resting upon the rims of the respective caps.

No. 100,101. Machine for Making Expanded Motal. Machine pour faire du métal dilate.

Fig. 1

Oscar Bradford, Chicago, Illinois, U.S.A., 17th July 1906: 6 years. Filed 13th June 1906. Receipt No. 136,846.
Claim.-1. The combination in a metal expanding machine, of moving devices adapted to engage and hold the edges of the shcet, With an expanding device consisting of an incline over which the central portion of the sheet is carried by the edge-holding devices, substantially as specified.
2. The combination in a metal expanding machine, of sheet fecding devices adapted to engage and hold the edges of the sheet, and an expanding device constructed and arranged to force the center of the sheet from the plane of the feeding devices, substantially as specifled.
3. The combination in a metal expanding machine of sheet fecding devices adapted to engage and hold the edges of the sheet, and a stationary incline constructed and arranged to force the center of the sheet from the plane of the edges and thus to open its slits, substantially as specified.
4. The combination in a metal expanding machine of sheet feeding devices adapted to hold the edges of the sheet, and a stationary expanding device located between the sheet feeding devices and constructed and arranged to force the center of the sheet away from the plane of the feeding devices, substantially as specified.
5. The combination in a metal expanding machine, of horizontally moving sheet feeding devices adapted to engage and hold the edges of the sheets, and an expanding device constructed and arranged to force the center of the sheet away from the plane of the feeding device, substantially as specifled.
6. The combination in a metal expanding machine, of means adapted to hold the edges of the moving sheet in a fixed plane, and means for displacing or forcing the middle portion of the sheet away from that plane, subtantially as specifled.
7. The combination in' a metal expanding machine of a support for the middle portion of the sheet, and sheet feeding devices adapted to take hold of the edges of the sheet and draw it over, and away from the plane of said support, substantially as specifled.
8. The combination in a metal expanding machine of a support for the center of the shect and sheet feeding devices adapted to take hold of the edges of the sheet, said feeding devices arranged to move in a plane diverging from the plane of the support, substantially as specified.
9. The combination in a metal expanding machine of a support for the center of the sheet and sheet feeding devices adapted to take hold of the edges of the sheet, said sheet feeding devices arranged to move in a plane diverging in a vertical direction from the plane of the support, substantially as specifled.
10. The combination in a metal expanding machine of a stationary support for the center of the sheet provided with
devices for relieving the friction, and sheet feeding devices adapted to take hold of the edges of the sheet, said feeding devices arranged to move in a plane diverging from the plane of the support, substantlally as specified.
11. The combination in a metal expanding machine of a stationary support of less width than the sheet and over which it may be fed, and feeding devices adapted to take hold of the edges of the sheet and force it over said support, but moving in a plane diverging from the plane of the support, substantially as specified.
12. In a machine for expanding slitted metal sheets, feeding mechanism for gripping the sheet at its marginal portions and a support for the center of the sheet, the plane of the feeding mechanism and the plane of the support gradually separating in a direction at right angles to the plane of the sheet, substantially as specified.

No. 100,102. Mackine for Expanding Sheet Metal. Machine pour dilater le métal en feuille.

Oscar Bradford, Chicago, Illinois, U.S.A., 17th July 1906; 6 years. Filed 13th June, 1906. Recelpt No. 136,847.
Claim.-1. The combination with a machine for expanding slitted sheet metal, of continuously driven controlling rolls receiving the sheet from the expanding machine and acting to hold it in position so that its edges cannot get free of the feeding devices of the expanding machine before the expansion is fully completed.
2. The combination with a machine for expanding slitted sheet metal, of continuously driven controlling rolls adapted to receive the sheet as it passes from the expanding machine and to control its position therein.
3. The combination with a machine for expanding slitted sheet metal, of continuously driven rolls adapted to receive the sheet from the expanding machine and acting both to control its position in the expanding machine and also to level the sheet.
4. The combination with a machine for expanding slitted sheet metal consisting of continuously driven controlling rolls arranged in an inclined position and driven at a speed unlform with the speed of the sheet at the time it leaves the expanding machine.

## No. 100,103. Machine for Mannfacturing Metal.

 Machine pour la fabrication du métal.Lewis E. Curtis, Chicago, Illinois, U.S.A., 17th July 1906; 6 years. Filed 13th June 1906. Recelpt No. 136,845.
Claim.-1. In a machine for expanding slitted sheets, the combination of two discs mounted to rotate in diverging
planes, and provided on their peripheries with means to engage the edges of the sheets.

2. In a machine for expanding slitted sheets, the combination of two discs mounted to rotate in planes diverging from the point at which the sheets are received, and provided with means to engage the edges of the sheets, and guards for holding the edges down on the discs.
3. In a machine for expanding slitted sheets, the combination of two discs mounted to rotate in planes diverging from the point at which the sheets are recelved, and provided with hooks to engage the edges of the sheets.
4. In a machine for expanding slitted sheets, the combination of two rotating discs mounted upon shafts arranged at an angle to each other, so that their peripheries at one point are near together ald diverge from that point, said discs being provided with means for holding the edges of the sheets, subtantially as specified.
5. The machine for expanding slitted sheet metal having in combination two discs mounted to rotate in the same direction but in diverging planes, and provided on their peripheries with means whereby they engage both edges of the sheet.
6. The machine for expanding slitted sheet metal having rotating diverging expanders provided with peripheral means for engaging the edges of the sheets, guards for holding the edges on the expanders, and a roller bearing on the sheet where it enters under the guards.
7. The machine for expanding slitted sheet metal having rotating diverging expanders provided with peripheral means for engaging the edges of the sheets, guards for holding the edges on the expanders, a roller bearing on the sheet where it enters under the guards, and rollers for lifting the sheet from the expanders.

No. 100,104. Dental Engine. Machine dentaire.

William C. K. Buchanan, Kansas Clty, Missouri, U.S.A., 17th July, 1906; 6 years. Filed 5th Aprll, 1906. Receipt No. 134,633.
Claim.-1. In a device of the class described a shank provided with threaded portions separated by a smooth bearing surface and clamping members carried by said threaded portions.
2. In a device of the class described a shank provided with exterior threaded portions separated by a smooth bearing surface and clamping members and carricd by said threaded portions.
3. In a device of the class described the combination of a shank having a pair of exterior clamp bearing portions sep-
arated by a disc bearing portion, and suitable disc and clamp members.
4. In a device of the class described the combination of a clamp bearing portion, an adjacent disc bearing portion of less diameter than said clamp bearing portion and a second clamp bearing portion of less diameter than and extending from said disc bearing portion, and suitable clamp and disc members carried by said shank.

No. 100,105. Astigmatic Cabinet. Cabinet astigmatique.

George Ewing Holmes, Newark, New York, U.S.A., 17th July, 1906; 6 years. Filed 11th April, 1906. Recelpt No. 134,860.
Claim.-1. An astigmatic cabinet having an opening in its front side, a scale on its front side, an arbour in the cabinet, a face disc having a tubular axle revoluble on the arbour, and a pinion on said tubular axle, the said face disc being further provided with radial openings and with a pointer, the latter co-acting with the scale on the front side of the cabi-: net, an astigmatic disc in rear of the face disc and having a tubular axle revoluhle on that of the face disc and provided with a pinion, vertically movable racks mounted and guided in the cabinet and engaging the respective pinions, and operating cords for the respective racks to co-act with the racks and pinions to independently turn the said dics to any desired angle, substantially as described.
2. An astigmatic cabinet having an opening in its front side, and a scale, and further provided with a removable back, a face disc, an astigmatic disc, supports therefor, and means to independently turn them to any desired angle, said discs. supports and turning means being mounted on and carried by the removable back of the cabinet, substantially as described.

No. 100,106. Holder for Nuraing Bottles. Porte-bouteilles de nourrices.

Alfred Harold Oberg, Sheridan, Wyoming, U.S.A., 17th July, 1906; 6 years. Filed 6th April, 1906. Receipt No. 134,690. Claim.-1. A holder for nursing bottles constructed of one piece of wire comprising legs, semi-circular loops between the legs, open at the top and a connecting member for the legs at one side of the holder.
2. A holder for nursing bottles constructed of one piece of wire bent upon itself to form a horizontal side member, legs at each end of the side member, each of said legs being formed with two members, semi-circular loops formed from the wire. constituting the inner members of said legs, and single legs formed irom the wire at the opposite side of the loop, the single legs having their legs rounded off and all of the cornors of the device being rounded, as described.

## No. 100,107. Process of Rendering Lithopone more

 Stable Against Light.Procédé pour rendre le lithopone plus stable d l'épreuve de la lumicre.
Wilhelm Ostwald, Leipzig, Germany, 17th July, 1906; 6 years. Filed 2nd April, 1906. Receipt No. 134,511.
Claim.-1. The process of rendering lithopone more stable against light, which consists in adding salts of non-acid reaction, precipitating zinc compounds from the solutions of zinc salts to lithopone.
2. The process of rendering lithopone more stable against light, which consists in adding salts of non-acid reaction, precipitating zinc compounds from the solutions of zinc salts to lithopone and lixiviating the added salts.
3. The process of rendering lithopone more stable against light. which consists in adding phosphates of alkalies to lithopone.

No. 100,108. Railway Tamp. Lampe.

Hiram Lucas Piper, Montreal, Quebec, Canada, 17th July, 1906; 6 years. Filed 31st March, 1906. Receipt No. 134,478. Claim.-1. A combined classification and marker railway lamp having a pair of colourless lenses and a permanently ccloured lens, and means for at times colouring the colourless lenses, substantially as described.
2. A combined classification and marker railway lamp comprising a supporting member having a plurality of coloured glasses mounted rigidly thereon, a shell encircling the coloured glasses and rotalably mounted upon the base, a plurality of lenses carried by the shell, and an illuminating device within such shell, substantially as described.
3. A combined classification and marker railway lamp comprising a base, a bracket horizontally rotatably supporting such base, means detachably retaining the base in different angular positions relatively to the bracket, a member carried by the base, coloured glasses carried by such member, a shell encircling such member and mounted rotacably upon the base, means detachably retaining the shell in different angular positions relatively to the base, a plurallty of lenses carried by the shell, and illuminating means within the shell, substantially as described.
4. A combined classification and marker railway lamp comprising a base, a bracket horizontally rotatably supporting such base, means detachably retaining the base in different angular positions relatively to the bracket, a curved member secured rigidly upon the base concentrically thereto and near its periphery, a pair of coloured glasses carried by such member, a shell encircling such member concentrically and mounted rotatably upon the base, means detachably retaining the shell in different angular positions relatively to the base. a pair of colourless lenses and a permanently coloured lens, ali of such lenses being carried by the shell, and Illuminating means within the shell, substantlally as described.
5. In a combined classification and marker railway lamp. the combination of a base consisting of two members secured together and presenting a horizontal annular recess, a shell, a horizontal annular interiorly projecting fiange at the lower end of such shell and contained revolubly in the said recess, a plurality of colourless lenses mounted in the perimeter of such shell, illuminating means within the shell, a device mounted rigidly upon the base between the shell and illuminating means and having coloured glasses mounted therein, means locking the shell in different positions to which it may be revolved relatively to the base, substantially as described.
6. In a combined railway lamp the combination with the shell and lens rings having lenses secured to their outer
ends, of means securing the inner ends of such rings to the edges of openings in the shell, such means consisting of flanges formed upon the said inner ends of the rings, and circumferential beads formed upon the perimeters of such rings, for the purpose set forth.
7. In a rallway lamp the combination with a base, a shell revolubly mounted thereon, of a bracket upon the interior of the shell, an oil reservoir mounted in such bracket, a burner mounted in the reservoir and a wick operating spindle carried by the burner and projecting through a hole in the shell, substantially as described.

No. 100,109. Inhaler. Inhalatenr.

David L. Sprague, Clear Lake, Iowa, U.S.A., 17th July 1906; 6 years. Filed 30th March 1906. Recelpt No. 134,456 .
Claim.-In a device of the character described the combination with a heater and a chimney supported thereby, said chlmney having an annular flange at one end, of a hood, legs extending therefrom and bearing upon the flange, an air receiver mounted within the hood and extending there above, an inlet tube extending through the chimney into the receiver, an outlet tube extending from the receiver above the hood, a removable cap upon the receiver and means upon the cap for indicating the temperature thereof and of the contents of the receiver.

No. 100,110. Toilet Article. Article de toilette.

Frederick Albert Steele, New Rochelle, New York, U.S.A., 17th July, 1906; 6 years. Filed 3rd April, 1906. Received No. 134,584.
Claim.-1. A toilet article for treating diseases of the anus, comprising two paper backing sheets connected to each other by an integral tongue, a mass of dry absorbent medicated material engaged with each backing sheet, and a woven fabric covering for each mass of absorbent material, said coverings having their edges secured respectively to the backing sheets to hold the absorbent material in place whereby the pad may be moistened to render the medicant active.
2. A tollet article for treating diseases of the anus comprising two paper backing sheets connected by a narrow integral tongue and adapted to fold the one over the other, a mass of absorbent medicated material located on the upper side of each backing sheet and a woven fabric covering for each mass of absorbent material, said coverings having their edges secured to the upper surfaces of the respective backing sheets to hold the absorbent material in place.
3. A new article of manufacture for treating diseases of the anus, comprising a backing or body of sheet material, a mass of medicated absorbent material lying against one side of the backing or body, and a thin woven fabric covering for said absorbent material, said covering having its edges secured to the backing sheet, to hold in place the absorbent material, whereby upon moistening the absorbent material and covering, the medicament will be allowed to act through the covering, and the backing or body sheet will serve to retain the form of the article and permit manipulation thereof.

No. 100,111. Gas Lamp Burner. Bec de lampe d gaf.

Erlch H. O. Werwath, Linden, near Hanover, Germany, 17th July 1906 ; 6 years. Filed 6th April 1906. Receipt No. 134,661.
Claim.-1. Arrangement for regulating the combustion in incandescent gas lamp burners by means of slldes for the supply of the combustion air, in which both the outside air conducted Into the lower opening of the chimney as also the mixture air entering the burner tube are regulated by means of a mutual regulating device, substantially as and for the purpose described.
2. Arrangement for regulating the combustion in incandescent gas lamp burners by means of slides for the supply of the combustion air, in which both the outside air conducted into the lower opening of the chimney as also the mixture air entering the burner tube are regulated by means of a mutual regulating device, said mutual regulating device for the two air supply tubes being made in form of two rotary slides combined to one body turning around the Bunsen burner tube, substantially as and for the purpose described.
3. Arrangement for regulating the combustion in incandescent gas lamp burners by means of slides for the supply of the combustion air, in which both the outside air conducted into the lower opening of the chimney as also the mixture air entering the burner tube are regulated by means of a mutal regulating device, said mutual regulating device for the two air supply tubes being made in form of two rotary slides combined to one body turning around the Bunsen burner tube, the said combined regulating device for the two air supplies being mechanically connected with the gas cock in such a manner that it correctly adjusts the suitable supply of combustion air both for the inside as for the outside air passage according to the position of said gas cock, substantially as and for the purpose described.

No. 100,112. Brake. Frein.
The Simplex Railway Appliance Company of Canada, Montreal, Quebec, Canada, assignee of Carl Edward Bauer Hammond, Indiana, U.S.A., 17th July, 1906; 6 years. Flled 20th June 1906. Receipt No. 137,076.
Claim.-1. A two-plece fulcrum for a flanged brake beam comprising similar malleable members with the faces of the
depending ends oblique to the axis of the beam, and their upper ends shaped to embrace the flange of the brake beam

and extending diagonally of the web of the beam in opposite directions.
2. A two-plece fulcrum for a flanged brake beam comprising similar malleable members with the depending ends secured together and formed with a lever axis oblique to the axis of the beam, and having their upper ends shaped to embrace the flange of the brake beam and extending diagonally of the web of the beam in opposite directions.
3. A two-piece fulcrum for a flanged brake beam comprising flat forged steel bars with their depending ends provided with a lever fulcrum at an acute angle to the axis of the beam and their upper ends shaped to embrace the flange of the brake bream and extending diagonally of the web of the beam in opposite directions.
4. A two-piece fulcrum for a flanged brake beam comprising flat malleable members with the faces of the depending ends oblique to the axls of the beam and their upper ends shaped to embrace the flange of the brake beam and extending diagonally of the web of the beam in opposite directions.

No. 100,113. Brake. Fircin.

The Simplex Railway Appliance Company of Canada, Montreal, Quebec, Canada, assignee of Carl Edward Bauer, Hammond, Indiana, U.S.A., 17 th July, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,077.
Claim.-1. A cast brake beam fulcrum for flanged beams comprising two flat pieces oppositely placed with their depending portions at an angle to the web of the beam, and fitted to encircle the beam flange and bear against the web of the beam, and each provided opposite the deam edge and at the edge of the fulcrum which least encircles such beam flange with a tapering edge turned at an obtuse angle to the flat portion of the fulcrum.
2. A brake beam culcrumed for flanged beams, comprising two flat pieces oppositely placed with their depending portions at an angle to the web of the beam, and fitted to encircle the beam flange and bear against the web of the beam, and each provided opposite the beam edge and at the edge of the fulcrum which least encircles such beam flange with a
turned up edge at an obtuse angle to the flat portion of the iulcrum, which edge portion is highest at the point of curvature and tapered down to the center of the depending portion of the fulcrum.
3. A cast brake beam fulcrum for flanged beams comprising two flat pieces oppositely placed with their depending portions at an angle to the web of the beam and fitted to encircle the beam flange and bear against the web of the beam and each having a stiffening annulus for the pivot hole, and each provided with a tapering edge turned at an angle to the flat portion of the fulcrum and engaging at the lower end the sald annulus.

No. 100,114. Grain Cleaner. Nettoyeur d grain.

The Economy Grain Cleaner Company, assignee of Joseph Wilhelm, Moosejaw, Saskatchewan, Canada, 17th July, 1906; 6 years. Filed 28th November, 1905. Receipt No. 130,488.
Claim.-1. In apparatus of the class described the combination of a rotary bolt, a hopper discharging into its upper end, and a shield held within the bolt in front of the mouth of the hopper, substantially as described.
2. In apparatus of the class described the combination of a rotary bolt, a hopper discharging into its upper end, and a shield secured to and depending from the mouth of the hopper, and adapted to prevent grain from falling out of the end of the bolt, substantially as described.
3. In apparatus of the class described the combination of a rotary bolt, a hopper discharging into its upper end, a shield secured to and depending from the mouth of the hopper, and adapted to prevent grain from falling out of the end of the bolt, and an inwardly extending rim or flange on the bolt adapted to retain the shield in place, substantially as described.
4. In apparatus of the class described the combination of a rotary bolt, a trough in which said bolt is journalled, and an endless screw conveyer in the bottom of the trough, substantially as described.
5. In apparatus of the class described the combination of a rotary bolt provided with a screening surface of different mesh at different parts of its length, a trough in which said bolt is journalled. an endless conveyer in said trough, and discharge outlets in the trough for the screenings from each section of the bolt, substantially as described.
6. In apparatus of the class described a rotary bolt decreasing in diameter from its inlet to its discharge end, and provided with a screening surface of different mesh at different parts of its lefgth, substantially as described.

No. 100,115. Acetylene Gas Generator. Générateur de gaz à acétylène.

The Old Colony Light Company, assignee of Albert Forbs Chase, all of Boston, Massachusetts, U.S.A., 17th July, 1906; 6 years. Filed 9th April, 1906. Recelpt No. 134,756.
Claim.-1. An acetylene gas apparatus comprising a closed water receptacle, means for supplying water thereto, a generator, connections between the receptacle and generator, a gas receiver, connections between said recelver and generator, and a connection between said gas receiver and the top of the water receptacle, said connection being independent ol the water supply connection, whereby when the receptacle is being flled with water, gas in said receptacle will be forced toward the receiver without escaping to the atmosphere.
2. An acetylene gas apparatus comprising a tank, a plurality of independent generators situated therein, a water receptacle containing a plurality of compartments, each compartment being separately connected to one of the generators, a gas receiver and connections between each of the generators and gas receiver and between sald receiver and all the compartments of the water receptacle.

## No. 100,116. Window Shade and Oloth Painting Machine.

## Abat-jour de fenêtre et machine à peinturer la toile.

George H. Hees, Son and Company, Toronto, Ontario, Canada, assignee of William Rathbun Hees, New York City, New York, U.S.A., 17th July, 1906; 6 years. Filed 10th April, 1905. Recelpt No. 124,110.

Claim.-1. In a window shade and cloth painting machine the combination with the laterally moving endless brushes carried on suitable wheels and sultably driven and adjustable to and from each other, of two sets of endless chains provided with longitudinally arranged brushes, sprocket wheels carrying the chains, the spindles for the sprocket wheels, the journal bearings carrying the same and means for adjusting each set of endless chains on each side of the cloth parallelly to and from each other, as and for the purpose specified.
2. In a window shade and cloth painting machine the combination with the laterally moving endless brushes carried on suitable wheels and suitably driven and adjustable to and from each other, of two sets of endless chains provided with longitudinally arranged brushes, sprocket wheels carrying the chains, the spindles for the sprocket wheels, the journal bearings carrying the same, and screw spindles provided with right and left hand threads where they extend through the bearings for the spindles on each side of the cloth and means for turning the screw spindles, as and for the purpose specified.
3. In a window shade and cloth painting machine, the combination with the laterally moving endless brushes carried on suitable wheels and suitably driven and adjustable to and from each other, of two sets of endless chains provided with lcngitudinally arranged brushes, sprocket wheels carrying
the chains, the spindles for the sprocket wheels, the journal bearings carrying the same, and screw spindles provided with

right and left hand threads where they extend through the bearings for the spindles on each side of the cloth, and bevel p!nions on the end of the screw spindles, a longitudinal spindle provided with evel pinions meshing with the aforeeaid spindles and a hand wheel on such spindle, as and for the purpose epecifled
4. The combination with the laterally moving endless brushes carried on suitable wheels and sultably driven and adjuetable to and from each other, of two sets of endless chains provided with longitudinally arranged brushes, sprocret wheels carrying the chains, the spindles for the sprocket wheels, the journal bearings carrying the same, means for adjusting each set of endless chains on each side of the clath parallelly to and from each other, pressure bars deslgned to come in contact with the endless chains, suitable bearings supporting the same, and means for adjusting such pressure bars parallelly to and from each other, as and for the purpose opecified.
5. The combination with the laterally moving endless brushes carried on suitable wheels and suitably driven and adjustable to and from each other, of two sets of endless chains provided with longitudinally arranged brushes, sprocket wheels carrying the chains, the spindles for the sprocket wheels, the journal bearings carrying the same, means for adjusting each set of endless chains on each side of the cloth parallelly to and from each other, pressure bars designed to ccme in contact with the endless chains, sultable bearings supporting the same, screw spindles extending through the bearings and having right and left hand threads on opposite sides where they extend through the bearings and means for turning such spindles, as and for the purpose specified.
6. The combination with the laterally moving endless brushes carried on sultable wheels and sultably driven and adjustable to and from each other, of two sets of endless chains provided with longitudinally arranged brushes, sprocket wheels carrying the chains, the spindles for the sprocket wheels, the journal bearings carrying the same, means for adjusting each set of endles chains on each side of the cloth parallelly to and from each other, pressure bars designed to come in contact with the endless chains, suitable bearings supporting the same, screw spindles extending through the bearings and having right and left hand threads on opposite sides where they extend through the bearings, bevel pinions on the ends of the screw spindles, spindles suitably journalled on the frame and provided with bevel plalons meshing with the aforesald pinions and a hand wheel for turning such longitudinal spindles, as and for the purpose specilled.
7. The combination with the laterally movable endless brushes located on each side of the path of the cloth, of the vertically movable brushes located at each side of the cloth and means for adjusting the same parallelly to and from each other, as and for the purpose specified.
8. The combination with the laterally movable endless brushes located on each side of the path of the cloth, of the vertically movable brushes located at each side of the cloth, .the endless chains supporting the brushes, and means for adjusting the same parallelly to and from each other, as and for the purpose specified.
9. In a machine of the class described, two pairs of endless chains vertically disposed and carried by eprocket wheels fournalled in suitable bearings, and brushes longltudinally arranged and connecting each pair, a set of two fairs being located on each side of the path of the cloth and deriving movement, as and for the purpose specified.

No. 100,117. Box. Boîte.

The American Paper Box Company, assignee of William A. Jack, all of Grand Rapids, Michigan, U.S.A., 17 th July, 1906; 6 years. Filed 20th January, 1905. Receipt No. 121,762.
Claim.-1. In a folding box the combination with the bottom, of side pieces creased obliquely to indicate the place of folding, hinged flaps at the upper edge of the side pieces, also creased to fold with the said pieces, and end pieces adapted to fold inwardly and over the side pieces, sald flaps when the box is unfolded assuming substantially a position at right angles to the side pleces for the purpose of bracing and strengthening the side pieces.
2. In a folding box the combination of a bottom made substantially in one piece, side pieces $A$ and $B$ hinged thereto end provided with ablique creases, flaps hinged to the upper edges of the side pieces and adapted to fold with the side pieces, and end pleces hinged to the bottom plece and adapted to fold over the side pieces, substantially as described.
3. In combination with the bottom E provided with hinged extensions $K K$, the end pieces $F$ and $G$ secured to said hinged extensions, the side pieces $A$ and $B$ provided with creases $H$ and hinged extensions $J$, said hinged extensions $J$ being secured to the respective end pieces, and flaps $C$ and $D$ hinged to the upper edge of the side pieces and provided with creases and adapted to fold inwardly upon the side pieces, and when the box is opened to assume a position to brace and strengthen the said side pleces, substantially as described.

## No. 100,118. Machine for Printing and Iseuing Tickets.

## Machine d imprimer et émettre des billets.

Chester Benton Weeks, Paris, France, assignee of Ruffin North, 5 Wells Street, Oxford Street, London. England, 17th July, 1906; 6 years. Filed 17th December, 1904. Recelpt No. 120,830 .
Claim.-1. In a tlcket printing, issuing and recording machine, a segmental carrier wherein the printing type are
mounted, a roller for effecting the printing, and means for moving the roller against the printing type, substantially as herein described.

2. In a ticket printing, issuing and recording machine, a segmental carrier wherein the printing type are mounted, a roller for effecting the printing, two pivotally mounted arms formed with cam grooves for the reception of the spindle of the printing roller, and means for vibrating said arms, the cam grooves serving to move the printing roller towards or away from the type when the pivotally mounted arms are vibrated.
3. In a ticket printing, issuing and recording machine furnished with a paper strip on which the ticket is printed, the combination with means for feeding forward the paper strip of a pivotally mounted cutter and means for operating said cutter to sever or partially sever each ticket.
4. In a ticket printing, issuing and recording machine, a counter, a reciprocally mounted slide in connection with said counter, and a lever in engagement with said slide and mounted upon the spindle of the printing device.
5. In a ticket printing. issuing and recording machine, a counter for recording the total number of tickets issued, a series of counters for independently recording the number of differently priced tickets issued, a slide reciprocally mounted in permanent engagement with the first-mentioned counter, a second slide adjustably mounted on the first slide and formed with projections for independently engaging the counters pertaining to the differently priced tickets, a fare sftting device, and means connecting said fare setting device to the second slide whereby the latter is brought into engagement with the counter corresponding to the fare set.
6. In a ticket printing, issuing and recording machine, the combination with a series of counters for recording the number of differently priced tickets issued and a slide indeyendently engaging said counters of a spindle whereon the fare printing type are mounted, a cam mounted on said spindle, and a pivotally mounted arm engaging said cam and the slide for operating the counters, the cam sarving to move said slide into engagement with each counter independently as the type setting spindle is rotated.
7. In a ticket printing, issuing and recording machine, the combination of two parallel station printing rollers freely mounted on spindles adapted to slide in the rollers, a toothed wheel secured to each of the said spindles, a fare printing roller arranged between the two station printing rollers, and means for engaging each station printing roller separately with the fare printing roller.
8. In a ticket printing, issuing and rocording machine, a pair of feed rollers in pressing contact for feeding forward the paper after having been printed, one of sald rollers being
mounted in stationary bearings and the other roller in an eccentrically mounted rotatable bearing whereby the one feed roller may be moved out of contact with the other feed roller to permit of the free withdrawal of the paper.
9. In a ticket printing, issuing and recording machine, the herein described means for adfusting the printing type, said means compriaing a hollow shaft whereon the type rollers and freely mounted, a longitudinal slot in said shaft, a spindle passing through the shaft and furnished with a feather or projection, slots formed in the type rollers and adapted to be engaged by the sald feather, and means for rotating the hollow shaft.
10. In a ticket printing, issuing and recording machine, the herein described means for indicating the position of the type in the machine, same comprising a hollow shaft whereon are mounted the type rollers, a longitudinal slot in said shaft, Indicator rollers freely mounted on said shaft, a spindle passing through the hollow shaft, two projections on the spindle one of which engages slots formed in the type rollers whilst the other engages slots formed in the indicator rollers, and means for rotating the hollow shaft.

No. 100,119. Game. Jeu.

Emil Heinrich Bock, Hamburg, Germany, 17th July, 1906; 6 years. Filed 12th February, 1906. Receipt No. 132,834.
Claim.-1. An apparatus for playing a game of skill comprising in combination a box having a glass front, a wall in sald box dividing the same into two compartments and havng a hole, and a pivoted sickle-shaped lever in the front compartment having a handle extending outside the box. said lever being intended to be operated by the player in such a way that a rolling object such as a coin placed on the lever is at will ejected through the above-mentioned hole in the above-mentioned wall, substantially as described.
2. An appartus for playing a game of skill comprising in combination a box having a glass front, a wall in sald box dividing the same into two compartments and having a hole, a pivoted sickle-shaped grooved lever in the front compartment having a bandle extending outside the box, losing and winning passages in the back compartment of the box and means adapted when the box is tilted to prevent an object after passing through the above-mentioned hole from entering the winning passage, said lever being intended to be operated by the player in such a way that a rolling object such as a coin placed on the lever is at will ejected through the above-mentioned hole in the above-mentioned wall into the winning passage, substantially as described.
150. 100,120. Perforator. Perforatcur.

Henry Upton, Gananoque, Ontario, Canada, 17th July, 1906; 6 years. Filed 28th June, 1905. Recelpt No. 126,447.
Claim.-1. A paper perforator comprising a punch, a member projecting laterally from such punch, a lever fulcrumed a short distance from one end opon a stationary part of the perforator and adapted to at times have its short end project beneath and in lifting relation to the laterally projecting member, and at other times have its short end project
beneath and in lifting relation to the laterally projecting member, and at other times have its long end ride upon and

in bearing relation to the said member for the purpose set forth.
2. A9 perforator comprising a pair of punches, a bar connecting such punches rigidly together, means whereby the punches are guided, means independent of the said bar and rigidly supporting a fulcrum bar adjacent to the guiding means, and a lever fulcrumed a short distance from one end upon the fulcrum bar, and adapted to at times have its short end project beneath and bear upwardly upon the first-mentioned bar and at other times, have its long end ride the said bar, for the purpose set forth.
3. A perforator consisting of a bed plate having a pair of holes therein, a pair of punches consisting of round bars equa in cross section to the diameter of the holes in the bed plate and each having one end diametrically concaved, a bar connecting such punches rigidly together, means whereby the punches are guided, and means rigidly supporting a fulcrum bar adjacent to the guiding means, and a $\mathbf{U}$-lever fulcrumed a short distance from its ends upon the fulcrum bar and adapted to at times have its short end project beneath and bear upwardly upon the first-mentioned bar and at other times have its long end ride the said bar, substantially as described and for the purpose set forth.
4. A perforator consisting of a base having u pair of openings therethrough, a bed plate secured to the top of such base and having a pair of perforations in line with the openings in the base, a pair of guiding brackets mounted rigidly upon the bed plate, a pair of punches having concave lower ends, and gulded in the gulding brackets, a bar rigidly connecting the punches together, a $\mathbf{C}$-lever fulcrumed a short distance from the ends of its legs to the pair of brackets, and adapted to at times havie its short end project beneath and bear upwardly upon the first-mentioned bar end at other times have its long end ride the said bar, a plate pivoted to the underside of the base and adapted to extend across and close the lower end of the openings therein, substantlally as described and for the purpose set forth.

## No. 100,121. Bnilding Method. <br> Méthode de construction.

E. Beaumont Jarvis, Toronto, Ontario, Canada, 17th July, 1906; 6 years. Filed 2nd May, 1906. Receipt No. 135,471.
Claim.-1. In building construction a member having a metal socket plece secured thereto having a socket formed in one side, in combination with a beam having a metal shoe secured to one end, and provided with a metal tongue adapted to engage the socket, substantially as described.
2. In bullding construction a member having a metal socket piece secured thereto having a socket formed in one side. comprising a slot and a recess wider than the slot, in combination with a beam having a metal shoe secured to one end, and provided with a headed metal tongue adapted to engage the socket, substantially as described.
3.. In building construction a member having a metal socket piece secured thereto having a socket formed in one side in

combination with a reinforced concrete beam provided with a metal shoe secured to one end and engaged with the reinforcement, and a tongue adapted to engage the socket, substantially as described.
4. In building construction a member provided with a socket in combination with a reinforced concrete beam provided with a metal shoe secured to one end and engaged with the reinforcement and adapted to engage the socket, substantially as described.
5. In building construction a reinforced concrete girder having embedded therein two connected socket pieces one at each side of the girder, and provided with sockets, combined with stringers of reinforced concrete, each provided with a shoe adapted to engage one of the sockets, substantially as described.
6. In building construction, a column, a metal cap therefor provided at one side with a plurality of sockets, a girder, a metal shoe connected to one end of the girder, and a plurality of tongues each adapted to engage one of the sockets, substantially as described.
7. In building construction a member having a metal socket piece secured thereto having a socket formed in one side comprising a slot and a recess wider than the slot, in combination with a beam having a metal shoe secured to one end and provided with a headed metal tongue adapted to loosely engage the socket, and a grouting of cement filled into the interstices, substantially as described.
S. In building construction, concrete members provided with metal connecting pieces projecting beyond the ends of the members and forming the sole connection between them, substantially as described.
9. In building construction a reinforced concrete beam provided with a metal shoe secured to one end and connected with the reinforcement, substantiallv as described.
10. In building construction a concrete column. a metal cap secured thereto. beams connected to the cap, if flange at the upper side of the metal cap, an upper concrete column and a metal heel piece at the lower end of the column provided with a flange by means of which it may be secured to the flange of the cap, substantially as described.
11. In building construction a concrete column having a metal cap fitted thereon, a metal reinforcement projecting from the column within the cap, and a fllling of concrete locking the cap to the reinforcement, substantially as described.
12. In building construction two adjacent concrete floor beams each having a floor slab formed integral therewith, the meeting edges of the slabs being rabbeted together, substantially as described.
13. In building construction two adjacent concrete fioor beams each having a floor slab formed integral therewith, the meeting edges of the slabs being rabbetted together and provided with a vertically engaging tongue and groove connection, substantially as described.

No. 100,122. Acetylene Gas Generator. Générateur d gas à acétylèno.

Charles William Beck, New York Clity, New York, U.S.A. 17th July, 1906; 6 years. Filed 4th May, 1906. Receipt No. 135,565 .
Claim.-1. In a generator for producing acetylene gas, the ccmbination of a liquid receptacle provided with a duct for delivering the liquid therefrom, means for controlling the flow of liquid through said duct, a plurallty of carblde seceptacles, and means for moving said receptacles relatively to the duct whereby the outlet of the latter is caused to transverse the carbide receptacles and said receptacles are brought successively into communication with said outlet.
2. In a generator for producing acetylene gas the combination of a liquid receptacle of a liquid receptacle provided with an outlet passage, a carbide receptacle provided with a plurality of compartments and automatic means controlled by reaction of the gas producing ingredients, for rotating one of said receptacles relative to the other whereby said different compartments of the carbide receptacle are sucessively brought into immediate communication with the liquid outlet.
3. In a generator for producing acetylene gas, the combination of a liquid receptacle provided with an outlet passage, a rotary carbide receptacle provided with a plurality of cotmpartments to be successively brought into communication with the outlet passage and means for rotating said receptacle.
4. In a generator for producing acetylene gas, the combination of a liquid receptacle provided with an outlet passage, a rotary carbide receptacle provided with a plurality of compartments adapted to be successively brought into communication with the outlet passage and means for rotating said receptacle automatically, controlled by the pressure of gas generated.
5. In a generator for producing acetylene gas the combination of a liquid receptacle provided with an outlet duct, a generator with which said duct communicates, a carbide receptacle provided with a plurality of compartments revolubly mounted within said generator, a spring arranged to rotate said carbide receptacle, a gas cylinder arranged to communicate with the gas space of the generator, a piston working in sald cylinder, an escapement arranged to control the movement of the carbide receptacle and operative connections between said escapement and said piston whereby the carbide receptacle will be automatically rotated by change of pressure acting upon said piston.
6. In a generator for producing acetylene gas the combination of a liquid receptacle provided with an outlet duct. a generator with the upper part of which said duct communicates, a circular carbide receptacle provided with a plurality of compartments revolubly mounted within sald generator so as to rotate upon a vertical axis located at one side of the
outlet of said duct, a spring arranged to rotate said carbide receptacle, a gas cylinder arranged concentrically with the axis of rotation of the carbide receptacle and comunicating with the gas space of the generator, a piston working in said cylinder, a spring arranged to act upon said piston in opposition to the gas pressure, an outlet passage affording communication with the end of the cylinder opposite that subject to the internal gas pressure, an escapement rod extending axially through the carbide receptacle and connected with said piston, two series of oppositely directed ratchet notches upon said carbide receptacle and ratchet pawl arms upon said escapement rod adapted to co-operate with said ratchets to form an escapement.
7. In a generator for producing acetylene gas the combination with a carbide receptacle provided with a plurality of open topped carbide compartments, of a cover plate supported adjacent to the open parts of said carbide receptacles and provided with an inlet aperture adapted to admit liquid at one place only.
8. The combination with a generator for producing acetylene gas and the like, of an inverted funnel-shaped inlet for the admission of slaking fluid and a porus wick wedged at one end within sald inlet so as to form a previous closure for the latter, adapted to convey the fluid to the carbide gradually.
9. In a generator for producing acetylene gas the combination of a chamber within which the gas is generated, a liquid receptacle, a rotary carbide holder comprising a plurality of normally closed separate carbide chambers adapted to be successively brought into communication with the generating chamber and a shifting mechanism automatically controlled by the gas generated for effecting the conflux of gas producing materials.
10. In combination in an acetylene gas lamp, the water receptacle, a valve controlling the flow of water therefrom and the carbide receptacle below the water receptacle and adapted to receive the water therefrom, said carbide receptacle comprising a rotary part contalning compartments and adapted to be brought in succession below the water discharge opening, the other compartments being entirely shut off therefrom, substantially as described.
11. In a generator for producing acetylene gas the combination of a chamber within which the gas is generated, a liquid holder, a carbide holder, and means for bringing the contents of sald carbide holder into position for the reception of liquid to generate gas, said means consisting of an independent motor mechanism, a controller therefor, said controller being operated by the pressure of the gas generated.
12. In a generator for producing acetylene gas the combination of a chamber within which the gas is generated, a liquid receptacle, a rotary carbide holder comprising a plurality of separate carbide chambers adapted to be successively brought into communication with the liquid supply, and a shlfting mechanism automatically controlled by the gas generated for rotating the carbide holder.
13. The combination to form a portable generator for producing acetylene gas, of a liquid holder, a carbide holder, means for mechanically conveying one of said gas producing elements to bring them into generating contact, a spring motor for actuating said means, and means controlled by the pressure of the gas generated for controlling said spring motor.
14. In a generator for producing acetylene gas the combination of a chamber within which the gas is generated, a liquid receptacle, a carbide holder consisting of a set of compartments adapted to be precharged and to be successively brought into contact with the liquid supply and means for shifting the carbide holder.
15. In a generator for producing acetylene gas the combination of a liquid receptacle provided with an outlet passage, a carbide holder formed with imperforate carblue holding walls and open at one point, and an escapement automatically controlled by the pressure of gas generated for moving one of said parts relatively to the other whereby different portions of the carbide are successively subjected to the action of the liquid.
16. In a generator for producing acetylene gas the combination of a chamber within which the gas is generated, a liquid receptacle and a rotary carbide holder formed with imperforate carbide holding walls, said carbide holder being open at one point and adapted by its rotatinn to bring successive portions of the carbide into communication with the liquid supply.
17. In a generator for producing acetylene gas the combination of a chamber within which the gas is generated, a liquid receptacle, a rotary carblde holder formed with walls adapted to hold slaked and unslaked carbide and adapted to bring successive portions of the carbide into communication with the liquid supply, and a shifting mechanlsm automatically controlled by the gas generated for rotating the carbide holder.
18. In a generator for producing acetylene gas the combination of a chamber within which the gas is generated, a liquid receptacle, a movable carblde holder formed with walls adapted to hold slaked and unslaked carbide and adapted to bring successive portions of the carbide into communication with the liquid, and means automatically controlled by the gas generated for moving the carbide holder.
19. In an acetylene generator the combination of a liquid holder, a carbide holder formed with imperforate walls adapted to hold slaked or unslacked carbide and open at one side, and a motor mechanism automatically controlled by the pressure of the gas generated for moving the carbide holder whereby different portions of the carbide are sucessively subjetel to the action of the liquid.
20. In an acetylene generator the combination of a carblde holder, formed with imperforate carbide holding walls, and a liquid chamber one of said parts being rotatable with respect to the other, and each of said parts being provided with a single opening through which one element is moved to the cther element to generate gas, whereby successive portions ot carbide may be subjected to the action of the liquid.
21. In an acetylene generator the combination of a carbide holder formed with imperforate carbide holding walls, and a liquid chamber sald parts being arranged one above the other and the upper one being provided with a single discharge through which one element is moved by gravity to the other to generate gas, one of said parts being rotatable with respect to the other to cause the discharged element to enter the lower receptacle on different vertical planes whereby successive portions of the carbide may be subjected to the action of the liquid.
22. In an acetylene generator the combination of a carbide holder formed with imperforate carbide retaining walls,. and a liquid chamber, said parts being provided with a single opening through which one element is moved to the other to generate gas, mechanism for rotating one of said parts, and means actuated by gas pressure for controlling said mechanism whereby successive portions of carbide will be subjected to the action of the liquid.
23. In a generator for producing acetylene gas the combination of a chamber within which the gas is genorated, a liquid receptacle and a movable carbide holder formed with imperforate carbide holding walls, said carbide holder belng open at one point and adapted by its movement to bring successive portions of the carbide into communication with the liquid supply.
24. An acetylene gas generator comprising two integral parts or sections detachably connected together one above the other, one of said parts constituting a carbide holder and the other a water holder, a movable diaphragm in one of said parts, a dry gas tight connection being formed between said diaphragm and the part contalning it, said movable diaphragm being subject on one side to gas pressure, a device acting on said diaphragm agalnst gas pressure, mechanism within the part containing the movable diaphragm and connected to and operated thereby for successively bringing carbide into conflux with water to generate gas in response to changes in gas pressure.
25. An acetylene gas generator comprising two integral parts or sections detachably connected together one above the other, one of said parts constituting a water holder and the other a carbide holder, a movable diaphragm in the carbide holder above the carbide, a dry gas tight connection being formed between said movable diaphragm and the part containing it, said movable diaphragm belng subject on its lower side to gas pressure, mechanism connected to the movable dlaphragm and operated thereby and within the carbide holder for successively bringing carbide into conflux with water to generate gas in response to changes in gas pressure.
26. In an acetylene generator the combination of a liquid receptacle, a carbide holder comprised of a plurality of independent compartments, and means for rotating one of said parts to bring the compartments in succession in communlcation with the liquid receptacle, and means actuated by the gas generated to control the rotating means.
27. In an acetylence generator the combination of a liquid receptacle, a carbide holder comprised of a plurality of independent compartments one of sald parts being above the other and the upper part being provided with a discharge opening through which one element is moved by gravity to the part below to generate gas, means for rotating one of said parts to bring the gas generating elements together and mechanism actuated by the gas pressure to control the rotating means, whereby the contents of the compartment will be in succession subjected to the action of the liquid.
28. In an acetylene gas generator the combination of a liquid holder, a series of carbide compartments adapted to contain charges of carbide, a motor for moving the carbide holder and successively bringing together the charges of carbide and the liquid, and means actuated by gas pressure to control said motor.
29. In an acetylene gas generator the combination of a liquid holder, a series of carbide compartments adapted to contain charges of carbide, a motor for moving the carbide compartments horizontally and successively bringing together the charges of carbide and the liquid, and means controlled by gas pressure to control said motor.
30. An acetylene gas generator comprising a liquid holder, an endless carbide conveyer having a series of independent compartments for transferring successive portions of the carbide horizontally, means for operating said conveyer, and means operated by the pressure of the gas generated for controlling said conveyer.
31. An acetylene gas generator comprising a source of liquid supply and a carbide conveyer, means controlled by gas pressure for moving the conveyer to transfer the carbide laterally to the liquid supply.
32. In a generator for producing acetylene gas the combination of a liquid holder, a carbide conveyer to move the carbide laterally, an independent motor mechanism for moving sald conveyer, and means operated by gas pressure for controlling the motor.
33. In a generator for producing acetylene gas the combination of a liquid holder, an endless carbide conveyer, one of said parts being above the other, means to pormit the contents of the upper part to drop into the lower part, a motor connected to and adapted to move the conveyer horizontally, whereby successive portions of the carbide will be subjected to th action of the liquid, and means actuated by gas pressure to control the motor.
34. In a generator for producing acetylene gas the combination of a liquid holder, a carbide conveyer, one of said parts being above the other, means to permit the contents of the upper part to drop into the lower part, a motor connected to and adapted to move the conveyer horizontally whereby successive portions of the carbide will be subjected to the action of the liquid, and means actuated by gas pressure to control the conveyer.
35. In a generator for producing acetylene gas the combination of a liquid holder, an endless carbide holder having a series of compartments adapted to receive carbide, one of said holders being above the other, means whereby the contents of the upper holder may pass into the lower holder at a determined point to generate gas, and an independent motor for moving the endless carbide holder horizontally whereby the carbide in successive compartments of the carbide holder will be subjected to the action of the liquid.
36. In a generator for producing acetylene gas the combination of a liquid holder and endless carblde holder having a series of compartments adapted to receive carbide, one of sald holders being above the other, means whereby the contents of the upper holder may pass into the lower holder at a determined point to generate gas, and an independent motor for moving the endless carbide holder horizontally whereby the carbide in successive compartments of the carbide holder will be subjected to the action of the liquid, and means actuated by gas pressure for controlling the motor.
37. The combination to for a generator for producing acetylene gas, of a liquid holder, a carbide bolder, one of said holders being above the other, means for moving one of said parts to mechanically convey one of said gas producing elements laterally to bring them into generating contact whereby successive portions of the carbide may be subjected to the action of the liquid.
38. In an acetylene gas generator the combination of a liquid receptacle, a carbide holder provided with a plurality of independent compartments, and means for rotating one of said parts horizontally to bring the compartments in succession in communication with the liquid receptacle.
39. In an acetylene gas generator the combination of a liquid holder, a carbide holder formed with a plurality of independent compartments, one of said parts being above the other and the upper part being provided with a discharge opening through which one element is moved to the other to generate gas, and means for moving one of said parts horizontally to bring the gas generating elements together.
40. An acetylene gas generator comprising a liquid receptacle, and a horizontally rotatable carbide holder formed with imperforate carbide holding walls and adapted to bring successive portions of the carbide to the liquid supply.
41. In an acetylene gas generator the combination of a liquid holder formed of an outer casing and an inner horizentally rotatable carbide receptacle formed with independent carbide compartments, said carbide receptacle being smaller than the outer casing whereby a cooling space is formed between the two casings, and a water supply.
42. In an acetylene gas generator the combination of a carbide holder formed of an outer casing and an inner horizontally rotatable receptacle formed with independent carbide compartments, and a water supply.
43. In a generator for producing acetylene gas the combination of a liquid receptacle and a horizontal rotary carblde holder formed with imperforate carbide holding walls
and adapted by its rotation to bring successive portions of carbide into communication with the liquid supply.
44. An acetylene generator comprising two integral parts or sections detachably connected together, one of said parts constituting a carbide holder and the other a water holder, a movable diaphragm in one of said parts, a dry gas tight connection being formed between said diaphragm and the part containing it, said diaphragm being subject on one side to the pressure of the gas generated and to the action of a device operating against said gas pressure, and mechanism operatively connected to said movable diaphragm for successively bringing carbide into confiux with the liquid to generate gas.
45. An acetylene gas generator comprising two integral parts or sections detachably connected together one above the other, one of said parts constituting a water holder and the other a carbide holder, a movable diaphragm in the carbide holder above the carbide, a dry gas tight connection belng formed between said movable diaphragm and the part containing it, said movable diaphragm being subject on its lower side to gas pressure, mechanism connected to the movable diaphragm and operated thereby and within the carbide holder for successively bringing carbide into conflux with water to generate gas in response to changes in gas pressure, a burner carried by the carblde holder above the movable diaphragm, a passage being provided to connect sald burner with the gas space below the diaphram and a fller interposed in the path of the gas from said gas space to the burner.

No. 100,123. Method of Cutting Metal Artioles.
Mithode de couper les objets en métal.

Felix Jottrand, Uccles, near Brussels, Belgium, 17th July,
1906; 6 years. Filed 3rd October 1905. Receipt' No. 128,919.
Claim.-1. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in heating the object to be cut and directing upon the heated part an oxydizing jet.
2. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in heating the object to be cut along the line of section and directing upon said line an oxydizing jet.
3. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in heating the object to be cut along the line of section and directing upon said line an oxydizing jet a distance from the heating medium.
4. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in directing upon the object to be cut a suitable heating jet and an independent oxydizing jet.
5. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in directing a suitable heating jet upon the object to be cut along the life ot section and an independent oxydizing jet.
6. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in directing a suitable heating jet upon the object to be cut, along the line of section and an independent oxydizing jet at a distance from the heating jet.
7. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in directing a heating jet upon the object to be cut, upon the line of section and an independent oxydizing at a distance from the heating jet and displacing both jets along the line of section.
8. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in directing a heating jet upon the object to be cut, along the line of seclion so as to raise the metal to a temperature enabling oxidation without fusion of the metal and in directing simultaneously upon the heated part of the object a jet of oxygen under pressure.
9. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in directing a heating jet upon the object to be cut, along the line of seclion so as to raise the metal to a temperature, enabling oxidation without fusion of the metal, in directing simultaneously a jet of oxygen under pressure upon the heated part of the object and in displacing simultaneously both jets along the line of section.
10. The hereinbefore described method of cutting plates, pipes and other metal articles consisting in directing a heating jet upon the object to be cut, along the line of secton so as to raise the metal to a temperature enabling oxidation without fusion of the metal, in directing simultrneously a jet of oxygen under pressure at a distance of the trneously a jet of oxygen under pressure of the object and in displacing simultaneously both jets along the line of section.

No. 100,124. Mould for Sewers, Conduits, Etc.
Moule pour égouts, conduits, etc.

Jacob Benjamin Blew, Pittsburg, Pennsylvania, U.S.A., 17th July, 1906; 6 years. Filed 10th February, 1906. Receipt No. 132,784.
Claim.-1. A mould and centerer of the character stated having a plurality of brackets secured to the interior therecf, screw rods extending inwardly from said brackets, bolts connecting said rods and brackets and a buckle engaging said rods, said brackets having eyes and said rods having bifurcations with perforations therein, said bolts entering said eyes and perforations.
2. In combination a tubular mould comprising parti-tubular sections of flexible material having adjacent their edges longitudinal stiffening brackets, and rigid adjusting means extending transversely of the mould and engaging opposite brackets whereby the edges may be sprung in and out.
3. In combination a tubular mould comprising parti-tubular sections of flexible material having adjacent their edges longitudinal stiffening brackets, and turnbuckles extending transversely of the mould and engaging opposite brackets whereby the edges may be sprung in and out.
4. In combination a tubular mould comprising parti-tubular sections of flexible material having adjacent their edges longitudinally extending angle irons, and rigid adjusting means extending transversely of the mould and engaging opposite angle irons whereby the edges may be sprung in and out.
5. In combination a tubular mould comprising parti-tubular sections of flexible material, angle irons secured to the edge of one section and one leg overlapping the edges of the other section, and rigid adjusting means extending transversely of the mould and secured adjacent the edges of the sections whereby the edges may be sprung in and out.
6. In combination an exterior mould member comprising opposing parti-tubular sections spaced apart at the top, and means connecting the two parts whereby they are held in their relative positions and a space for the introduction of material is provided.
7. In combination an exterior semi-cylindrical mould member comprising opposing parti-tubular sections spaced apart at the top, and means conecting the two parts whereby they are held in their relative positions and a space for the introduction of material is provided.
8. In combination an exterior mould section comprising a parti-tubular member, projecting blocks $Q$ for steadying the ends of side braces, and means whereby the mould section may be supported.

No. 100,125. Gas Mixer. Mćlangeur de gaz.

Marcus Scott, Jacksonville, Florida, U.S.A., 17th July, 1906;
6 years. Filed 23rd April, 1906. Receipt No. 135,159.
Claim.-1. A mixing chamber having a branch connected with a source of gas supply, a branch connected with a source of air supply, a branch connected with a service pipe, said gas and air supply pipes being extended into the mixing chamber past each other and past the branch connected with the service pipe, the several supply pipes and the service pipe being provided with independent regulating valves, and the gas supply pipe and the service pipe being provided with check valves intermediate the regulating valves and the mixing chamber.
2. A mixing chamber having a branch connected with a plurality of independent sources of gas supply, a branch connetted with a source of air supply, and a branch connected with a service pipe, the gas and air supply pipes being extended into the mixing chamber past each other and past the inner end of the branch connected with the service pipe, the sources of gas supply having independent valves controlling their connection with the mixing chamber.
3. A mixing chamber, sources of supply of gas and of atmosphere air connected with said mixing chamber by means or pipes having regulating valves, said pipes being extended into the mixing chamber past each other, a valved service pipe extending from the mixing chamber, at a point intermediate the inner ends of the gas and air pipes, a check valve in the service pipe intermediate the regulating valve and the mixing chamber, and a foraminous diaphragm in the pipe adjacent to the check valve.

## No. 100,126. Linotype. Linotype.

William Hermann Scharf, Montreal, Quebec, Canada, 17th July, 1906; 6 years. Filed 8th September, 1906. Receipt No. $128,297$.
claim.-1. In a linotype machine, the combination with the keys, of matrix releasing mechanism operated directly through the keys, said mechanism including escapements and means for prolonging the action of the escapements after the releasing has taken place.
2. In a linotype machine, the combination with a key, of mechanism for releasing a matrix, said mechanism including a spring so arranged that. the movement of the key is transwitted through it to effect the releasing.
3. In a linotype machine, the combination with a key, of mechanism for releasing a matrix, said mechanism including a spring interposed between two members thereof so that the movement of one member is transmitted through the spring to the other member.
4. In a linotype machine, the combination with a key, of mechanism for releasing a matrix, said mechanism including
an escapement pawl and a spring so arranged that the movement of the key is transmitted through it to the pawl.

5. In a linotype machine, the combination with a key, of mechanism for releasing a matrix, said mechanism including an oscillating escapement pawl, means to oscillate the pawl, and means to arrest momentarily its return movement.
6. In a linotype machine, the combination with escapement pawls for the matrices, of an actuating rod for each escapement pawl, and a spring operatively connected with each actuating rod and so arranged that the movement of said rod is effected through its corresponding spring.
7. In a linotype machine, the combination with the keys und with escapement pawls for the matrices, of an actuating rod for each pawl, a key rod for each actuating rod, and a yielding connection between each key rod and its corresponding key.
8. In a linotype machine the combination with the keys an 1 with escapement pawls for the matrices, of an actuating rod for each pawl, a key rod for each actuating rod, a lever pivoted upon each key rod, and a spring for each actuating rod connecting one end of the corresponding lever with said rod, the other end of the lever being adapted to be engaged by the corresponding key.
9. In a linotype machine the combination with the keys and with oscillating escapement pawls for the matrices, of a pivoted actuating rod for each pawl, a key rod for each actuating rod, a link connection between each key rod and a fixed part of the machine, and a link connection between each key rod and the corresponding actuating rod.
10. In a linotype machine the combination with the keys and oscillating pawls for the matrices, of a pivoted actuating rod for each pawl, a key rod for each actuating rod, a connection between each key rod and the corresponding actuating rod whereby the key rod may move the actuating rod on its pivot to actuate the corresponding pawl, and means to arrest momentarily the return movement of each pawl.
11. In a linotype machine the combination with the keys. magazine and oscillating escapement pawls for releasing the matrices in the magazine, of actuating rods for the pawls, said rods being pivoted to oscillate upon a fixed portion of the machine and engaging the pawls at one end while the other ends of the rods are operatively connected with the keys.
12. In a linotype machine the combination with the keys and with escapement pawls for the matrices, of actuating rods, and operative connections between the rods and keys, the actuating rods and pawls having the one projection and the other grooves in which the projections operate, and said pawls and rods being mounted so as to be separable from each other in the direction in which the projections extend.
13. In a linotype machine the combination with the Keys and with escapement pawls for the matrices, of actuating rods pivoted to oscillate and formed with projections to engage the pawls, sald pawls being removable from the machine and being mounted so that the direction of their removal as
they are disengaged from the projections is substantially the direction in which the projections extend so that the separation of the pawls and rods does not require the unfastening of any connections between them.
14. In a linotype machine the combination with the keys and with escapement pawls for the matrices, of actuating rods freely engaging the pawls, a bar upon which said rods are pivoted, arms movable upon a flzed part of the frame upon which the bar is secured, means to clamp said arms in the desired position, and operative connections between the rods and keys.
15. In a linotype machine the combination with the keys and with escapement pawls for the matrices of actuating rods engaging the pawls, a slotted plate to guide the rods and longitudinally adjustable upon a fixed part of the machine, to align said rods with the pawls, and operative connections between the rods and keys.

No. 100,127. Apparatus for Destreying Weeds and Rabbita.
Appareil pour détruire les mauvaises herbes, etc.

Benjamin Locking, Tennyson Street, Napier, Hawkes Bay. New Zealand, 17th July, 1906; 6 years. Filed 17th March, 1905. Receipt No. 123,455.

Claim.-1. In a device of the character described the combination comprising a combustion chamber, means for cooling the combustion chamber, means for forcing air through the combustion chamber, and an outlet tube connected with the interior of the combustion chamber.
2. In a device of the character described the combination comprising a combustion chamber, means for forcing air through the combustion chamber, and an outlet tube connecting with the interior of the combustion chamber.
3. In a device of the character described the combination comprising a combustion chamber, a casing disposed arourd the combustion chamber and adapted to receive a body of cooling matter, means for forcing air through tne combustion chamber, and an air outlet tube connecting with the interior of the combustion chamber.
4. In a device of the character described the combination comprising a combustion chamber, a fan operatively connected with the combustion chamber. means for operating the fan, and an air outlet tube connecting with the interior of the combustion chamber.
5. In a device of the character described the combination comprising a combustion chamber, an alr inlet pipe connecting with the interlor of the combustion chamber, a fan casing connected with the inlet pipe, a fan in the casing, a shaft projecting into the casing and adapted to support the fan, means for rotating the shaft, and an outlet tube connecting means for rotating the shaft, and an outlet
with the interior of the combustion chamber
6. In a device of the character described the combination comprising a combustion chamber, means for forcing air through the combustion chamber, and an outlet tube connecting with the interior of the combustion chamber, and a wire shield on the free end of the outlet tube.
7. In a device of the character described the combination comprising a combustion chamber having a charging tube, a removable closure for the charging tube, means for forcing air through the combustion chamber, and an outlet tube connecting with the interior of the combustion chamber.
8. In a device of the character described the combination comprising a wheeled frame, a combustion chamber od the frame. an air outlet pipe connected with the interior of the combustion chamber, a fan casing on the frame, a tubular member connecting the fan casing and the combustion chamber, a fan within the casing, a fan supporting shaft project-

Ing from the casing, a pulley on the fan shaft, a driving wheel on the frame, and a belt connecting the driving wheel and the pulley.
9. In a device of the character described the combination comprising a wheelbarrow, a combustion chamber carried by the wheel barrow, an air outlet tube connecting with the interior of the combustion chamber, a fan carried by the wheelbarrow and operatively connected with the interior of the combustion chamber, and means carried by the wheelbarrow for operating the fan.

No. 100,128. Apparatme for Pastenrising Milk, Etc. Appareil pour pasteuriser le lait, etc.

Pierre Marie Maze, Paris, France, 17th July 1906; 6 years. Filed 30th May 1905. Receipt No. 125,610.
Résumé.-Un appareil pour pasteurlser et stériliser les liquides, consistant en une capacite dans laquelle se degagent a la pression atmospherique ou non, des vapeurs saturantes d'un liquide convenable qui chauffent le liquide a traiter, lequel traverse, après son echauffement, un recuperateur dans lequel il cede sa chaleur au liquide a traiter, avant de s'ecouler dans un réfrigerant d'ou il est recuelli, les vapeurs alcooliques ou autres passant dans un condenseur ou elles se liquefient pour etre utilisees à nouveau, ce condenseur communiquant avec un apparell de sareté permettant les rentrees d'air provenant d'un dessicateur et pouvant cependant maintenir la vapeur a la pression atmospherique, le tout substantiellement ainsi qu'il a été décrit.

No. 100,129. Nnt Lock. Arrête-écrou.
L. E. L. Themke, Joseph Dittrich, both of Strathcona, and Franz Scheibal, Edmonton, all in Alberta, Canada, each an assignee of a fourth interest, 17th July, 1906; 6 years. Filed 20th June, 1906. Receipt No. 137,101.
Claim.-1. In a device of the character described, a socket member provided with lugs on one side, and recesses on its opposite side, and a washer disposed on the socket member and provided with lips adapted to engage in the recesses and provided with a flange.
2. In a device of the character described, a socket member provided with lugs on one surface and provided with downwardly extending recesses on its opposite side, and a locking washer disposed thereon and provided with lips adapted to engage said recesses and provided with a flange.
3. In a device of the character described the combination comprising a headed bolt having a spline on its body, a washer provided with engaging lugs and provided with an opening through which said spline is adapted to pass, a
socket member disposed on the bolt and provided with engaging lugs, a locking washer disposed on the bolt, means

for locking the washer to the socket member, and a nut disposed on the bolt and adapted to rotate the locking washer before it is engaged with the socket member.
4. In a device of the character described, a bolt, a socket on the bolt provided with recesses, a washer disposed on the bolt adjacent the socket and provided with lips, and upwardly projecting lugs, and a nut on the bolt provided with recesses adapted to receive the lugs.

No. 100,130. Switch. Aiguille.

L. E. L. Themke, and Joseph Dittrich, both of Strathcona, and Frank Scheibal, Edmonton, all in Alberta, Canada, each an assignee of a fourth interest, 17th July, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,192.
Claim.-1. In a switch operating device, a base provided with bearings, shafts disposed in the bearings, gears on the shafts in mesh with each other, means normally maintaining the shafts in one position, means for rocking the shafts in one position, means for rocking the shafts to another position, a switch rod and means for connecting the rod to one of the gears.
2. In a switch operating device, a pair of rockable shafts, gears eccentrically keyed on the shafts and in mesh with each other, means normally maintaining the shafts in one position, means for rocking the shafts to another position. a switch rod, and means for connecting the rod to one of the gears.
3. In a switch operating device, a pair of rockable shafts. gears eccentrically keyed on the shafts and in mesh with each other, resillent means normally maintaining the shafts
in one position, means for rocking the shafts to another position, a switch rod, and means for connecting the rod to one of the gears.
4. In a switth operating device, a pair of rockable shafts, gears secured on the shafts and disposed in mesh with each other, a gear on one of the shafts, means for partly rotating the gear, means for rocking the shaits to another position, a switch rod, and means for connecting the rod to one of sald gears.
5. In a switch operating device, a pair of rockably supported shafts, gears disposed, on one of the ends of said shafts and in mesh with each other, a gear disposed centrally of one of the shafts, a rack in mesh with the latter gear, means normally maintaining the rack in one position, means for rocking the shafts to another position, a switch rod, and means for connecting the rod to one of the gears.
6. In a switch operating device, a pair of rockably supported shafts, gears secured to the ends of said shafts and disposed in mesh with each other. a gear secured centrally of one of the shafts, a rack in mesh with the gear, a rod connected to the rack, a casing secured adjacent the end of the rod, a coil spring in the casing. a head on the rod adapted to compress the spring, a bushing carrled by the casing in which bushing the rod is slidably disposed, means for rocking the shafts to overcome the tension of the spring, a switch rod, and means for connecting the rod to one of the gears.
7. In a switch operating device, a pair of rockably supported shafts, gears secured to the ends of said shafts and disposed in mesh with each other. means adapted to normally maintain the shafts in one position. a lever secured on one of the shafts, a switch rod, and means for connecting the rod to one of the gears.
8. In a switch operating device, a pair of rockably supported shafts. means secured to the shafts and disposed in mesh with each other. means normally maintaining the shafts in one position, means for automatically locking the shafts in said position. means for rocking the shafts to another position when unlocked, a switch rod, and means adapted to connest the rod to one of the gears.
9. In a switch operating device, a pair of rockably supported shafts, gears set eccentrically on the ends of said shafts and dispnsed in mesh with each other, means normally maintaining the shafts in one position, a lever secured to one of the shafts and provided with a lug having a slot therein, a spring lock secured adjacent the lever and adapted to engage In the slot. a switch rod, and means for connecting the rod to one of the gears.
10. In a switch operating device, a pair of rockably supported shafts, gears secured on the shafts and disposed in mesh with each other, means normally maintaining the shafts in one position, means for rocking the shafts to another position, a pin carried by one of the gears, a switch rod connected to the pin, and means for securing the pin to the gear.
11. In a switch operating device, a pair or rockably supported shafts, gears eccentrically set on the ends of said shafts and disposed in mesh with each other, one of which gears is provided with an eccentrically arranged slot having teeth on its wall, means normally maintaining the shafts in one position, means for rocking the shafts to another positlon, a pin disposed through the slot in the gear, a rod connected to the pin, discs on the pin provided with teeth, a nut on the pin adapted to force sald teeth into engagement with the teeth on the wall of the slot, and a switch rod secured to the plo.
12. In a switch operating device, a pair of rockably supported shafts, intermeshing gears on the shafts, resilient means for rocking the shafts to one position, means for overcoming the tension of the resilient means and for rocking the shafts to another position, and means for balancing the tension of the resilient means when the shafts are rocked to the second position.
13. In a switch operating device, a pair of rockably supported shafts, intermeshing gears secured on the shafts, resillent means for rocking the shafts to one position, means for overcoming the tension of the resilient means and for rocking the shafts into another position, a grooved wheel on one of the shafts, a band on the wheel, an eccentric on the other shaft, an ececntric strap on the ececntric, and means for connecting the band with the eccentric strap.
14. In a switch operating device the comblnation comprising a pair of rockably supported shafts, intermeshing gears on the ends of the shafts, resilient means for rocking the shafts to one position, a lever secured to one of the shafts, a weight on the lever, and means for balancing the tension of the resilient means, when the shafts are rocked by the lever.
15. In a switch operating device, a pair of rockably supported shafts, interreshing gears secured on the shafts, resilient means for rocking the shafts to one position, a lever keyed to one of the shafts, a spring pressed plunger in the
path of movement of the lever, and means for balancing the tension of the resilient means when the shafts are rocked by the lever.
16. In a switch operating device, a pair of rockably supported shafts, intermeshing gears secured on the shafts, a switch rod connected with one of the gears, a gear disposed centrally of one of the shafts, a movable rack disposed in mesh with the latter gear, manually operated means for moving the rack in one direction, resilient means for moving the rack in an opposite direction, and an indicating member operated by movement of the rack.
17. In a switch operating device a pair of rockably supported shafts, intermeshing gears secured on the shafts, a switch rod connected with one of the gears, a gear disposed centrally of one of the shafts, a movable rack disposed in mesh with the latter gear, manually operated means for moving the rack in one direction, resilient means for moving the rack in an opposite direction, a vertical shaft disposed adjacent the rack, a gear on the vertical shaft in mesh with the rack, and an indicating member on the vertical shaft.
No. 100,131. Saddle Tree. Bois de selle.

Fraser u. Lockhart, assignee of George John Theobald, both of Boston, Massachusetts, U.S.A., 24th July 1906; 6 years; Filed 3rd July, 1906. Receipt No. 137,473.
Claim.-1. A saddle tree having side arms forming between them a space for the back band, a turret bridge connecting said side arms, laterally extending flanges extending from said arms and terminating at said bridge, and rests 10 for the skirt extending laterally from the side arms beyond the turret bridge, sald rests being situated on a lower plane than the flange.
2. A saddle tree, side arms forming a space between them for the back strap, a turret bridge connecting said side arms, flanges extending laterally from the upper edges of sald side arms and terminating at the turret bridge, skirt rests 10 extending laterally from the arms beyond the turret bridge, said skirt rests being on a lower plane than the flanges, a skirt supported by said skirt rest and having flanges underlying said flanges, and a box through which the back strap secured to said skirt rests.
3. In a saddle tree, two side arms, a turret bridge connecting said side arms, skirt rests extending laterally from the side arms adjacent to the turret bridge, a skirt supported by said skirt rests, and a box adjacent the bridge and secured to said rests.
4. In a saddle tree, two side arms connected by a turret bridge, a back strap passing under the turret bridge and a box through which said strap passes, said box being situated adjacent to the turret bridge whereby a short jockey is sufficient to cover the exposed parts of the saddletree.

No. 100,132. Nat Lock. Arrêté-écrou.
The Universal Nut Lock Company, assignee of William Ghigliere, both of Stockton, California, U.S.A., 24 th July, 1906; 6 years. Filed 11th June, 1906. Receipt No. 136,764. Claim.-1. The combination with a bolt of a nut mounted thereon, teeth upon the inner face of said nut, a washer mounted upon the bolt and secured stationary in respect
thereto, a spring forming a component part of such washer and adapted to engage with the said teeth on the inner face of said washer, as set forth.

2. A nut lock comprising the combination with a bolt of a washer attached stationary thereto, sald washer having a spring as a component part thereof, a nut mounted on said bolt a threaded neck to said nut having teeth at its foot and a shoulder, such teeth adapted to engage with the spring of the washer, and an auxiliary nut mounted upon the threaded portion of the nut and adapted to move axially independent thereof and bear against the entire washer.
3. The combination of a bolt, a nut mounted thereon, a washer secured stationary on said bolt, and provided with a spring formed component therewith, teeth upon the inner face of tre nut, sald spring adapted to engage with said teeth, and means movably mounted on the nut for throwing said spring out of engagement with said teeth, substantially as set forth.
4. The combination of a bolt, a nut mounted thereon having teeth on its inner face, a means for engagement with sald teeth and means mounted movably on the nut and adapted to move inwardly and throw said first-named means out of engagement with the said teeth.
5. The combination of a bolt, a nut mounted on said bolt, and provided with teeth on its inner face, a spring member carried by the said bolt and adapted to engage the teeth of said nut, as and for the purpose set forth.

## No. 100,133. Dish Washing Machine.

Machine d laver la vaisselle.
George W. Powers, Sherman W. Price and Carl W. Swanson. each an assignee of a third interest of Oscar Kitchell and Carl W. Swanson, all of Chicago, Illinoss, U.S.A., 24th July, 1906; 6 years. Filed 28th June, 1906. Receipt No. 137,384.
Claim.-1. In a dish washing machine the combination with a casing providing a disc space and a water space at a lower level than the dish space, of a rotatable blade wheel withlia the casing and without the disc space, disposed with its side toward the dish space, and arranged to throw water into the dish space.
2. In a dish washing machine a casing providing a dish space and a water well, a blade wheel having an open side, disposed within the casing with its open side coward the dish space, sald wheel being arranged to dip into the water well and adapted to throw water from the well into the dish space.
3. In a machine of the character described, a casing providing a dish space and a water space, a shaft extending throughout the casing and blade wheels on said shaft at opposite ends of the casing, each arranged to throw water from the water space into the dish space.
4. In a machine of the character described, a casing providing a dish space and a water space therebelow, a blade whecl within the casing arranged transversely of the casing
with its side toward the dish space, said wheel extending into and out of the water space, and said wheel being arranged

when rotated to throw water from the well upward and inward Into the dish space.
5. In a machine of the class described, a casing providing a dish space and a water space, and a blade wheel arranged transversely of the casing with its side toward the dish space, extending into and without the water space and provided with a part closing its side away from the dish space and a series of blades each comprising portions at different radial distances from the center of the wheel, disposed in substantial parallellsm, but out of alignment, and a curved portion connecting said substantlally parallel portions.
6. In a machine of the class described, a casing providing a dish space and a water space, a blade wheel within the casing arranged transversely thereof, to prevent its side toward the dish space, and extending into and without the water space, sald wheel having its largest diameter on the side adjacent the dish space, and decreasing in diameter toward its other side, and being closed throughout its smaller side and periphery, and said wheel being further provided with blades each comprising substantially parallel non-aligning portions extending in a generally radial direction, ana curved portions connecting said non-allgning straight portions.
7. In a machine of the character described, a casing providing a dish space and a water space, conironting blade wheels each disposed with its side toward the dish space and arranced to throw water from the water space into the dish space and means for s!multaneously driving said blade wheels.
8. In a machine of the character described, a casing providing a dish space and a water space, oppositely disposed blade wheels without the dish space, arranged to present their sides toward the dish space and adapted to throw water from the water space into the dish space, a shaft common to said wheels and means for rotating the shaft.
9. In a machine of the character described, a casing, a falso bottom in said casing providing wells at opposite ends thereof, whecls at opposite ends of the casing arranged transverscly thereof each to present its side toward the center of the casing, each of said wheels being arranged to dip into the well at its end of the casing and adapted to throw water from sald well into the space intermediate the wheels, and means in sald space intermedlate the wheels for supporting dishes above the level of the water well.
10. In a machine of the character described, a casing, a shaft extending through sald casing, wheels mounted upon oppositc ends of sald shaft and disposed to throw water from the bottom of the casing into the space betwoen said wheel, and means for supporting dishes in the space between said wheels above the bottom of the casing comprising a bottom member having an elevated portion adapted to straddle the wheel driving shaft.
11. In a machine of the character described, a casing providing a dish space, wheels within the casing for throwing water from the bottom of said casing into said dish space. and means for supplying a water spray to the interior of said casing independent of and in addition to said wheels.
12. In a machine of the class described the combination with a casing of wheels arranged therein, adapted to throw water from the bottom of the casing upon the dishes, and $s$ sprayer 36, arranged at the top of the casing and adapted to be connected with an extrancous source of water supply.
13 In a machine of the class described, the casing 11, the whecls 27 and the top 33 provided with the splash ribs 34 , substantially as described.
14. In a machine of the class described, a casing provided at its end with recesses 12 opening into the interior of the casing, wheels disposed in said recesses with their sides con-
fronting each other, means for driving wheels simultaneously and means for supporting said dishes between the wheels above the level of the water into which sald wneels dip, substantially as described.

No. 100,134. Guard for Street Car Windows. Garde-fenttre de chars de rue.

The St. Louis Car Company, assignee of Hubert Witte, all of St. Louis, Missouri, U.S.A., 24th July, 1906; 6 years. Filed 19th June, 1908. Receipt No. 137,052.
Claim. -The combination with the window posts, of brackets secured to the outer faces of the window posts, a window guard comprising a series of uprights having their lower ends hinged to said brackets. longitudinal rods mounted in said uprights and extending over a series of windows and means for securing the upper ends of the uprights to the outer faces of the window posts, said means being releasable to permit of the uprights and the rods being swung outwardly from the window posts, substantially as set forth.

Fo. 100,135. Cement Railway Tie and Fastener. Dormant et attache en ciment pour chemins de fer.

Fig. $z$

Figa
F!g. 7

100133

Herbert Elmer Percival, Houston. Texas, and Brewer W.
Key Woodwark, Oklahoma, assignee of a half interest,
24th July, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,388 .
Claim. -1. A cement tie of the character specifled having a kroad head, the respective ends of the tie made to present a
relatively broad bearing base, and between the ends of the tie the body sides thereof inclining from the very head of the tic and converged to form a base presenting a narrow cutting surface or edge.
2. A cement tie of the character specined, having a broad Lead, inwardily inclined sides for the body varying in the amount of their inclination from the ends of the tie formed with a relatively broad bearing base towards the center thereof by the inclined body sides between the ends converged to form a base presenting a narrow cutting surface or edge.
3. A cement tie of the character specified having relatively broad bearing end bases, and along the middle of the tie the sides of the body thereof inclined inward and converging to form a base presenting a narrow cutting surface of edge.
4. A tie of the character specified having a reinforcement ccnsisting of a plurality of rigid metal bars inserted in the head of the tie, a reinforcing bar inserted in the base of the tie, and rods or wires connecting said bars.
5. A tie of the character specified having a plurality pof rigid metal bars inserted longitudinally in its head, a like bar in its base, and means connecting said bars, whereby they cannot be bent towards or from one another.
6. A tie of the character specified having a reinforcement consisting of bars $D, D^{1}, D^{2}$, inserted longitudinally in the head of the tie, a reinforcing bar $D^{2}$ in the base, likewisei longitudinally arranged, and sets of rods or wires connecting said bars and disposed at periodical distances along the same.
7. A tie of the character specified having a reinforcement consisting of a series of bars set into the head of the tie, a bar set into the base thereof, and a serles of individual rods or wires connecting said bars, each making such connection with the bars which it connects as to be adjustable along the same.
8. A tie of the character specified having a reinforcement consisting of a plurality of rigid metal bars inserted in the head ofthe cle, a reinforcing bar inserted in the base of the tie, rods or wires connecting sald bars, and a screen of woven wire wound around the same, substantially as described.
9. In combination with a cement railroad tie having a recess cut in the top thereof, a cushion fitting within said recess, a rail resting on said cushion and fitting into a slot cut therein. which slot is cut so deep that the upper surface thereof will be on a line with the upper surface of said cushion and a spike alongside the flange of sald rall fastening down through said cushion into said tle, the head of which spike is adapted to engage partly with the flange of said rail on the inside and the zurface of said cushion on the outside, whereby it may be supported by said cushion so as to be held in permanent engagement with the flange of said rall.
10. A fastening for securing a rall to a cement tie cons:sting in a hard, metallic filling set into a hole formed in the cement tie, and a rail holding member embedded therein.
11. A fastening for securing a rail to a cement tie consisting in a hard, metallic flling set into a hole formed in the cement tie, and a rail holding member embedded therein. which member is adapted to be turned in or out.
12. A fastening for securing a rail to a cement tie consisting in a hard, metallic fllling set into a hole formed in the cement tie, said meta!lic filling comprising hard particles of matter, the interstices between which are filled with a softer metal, and a rail holding member embedded in said filling.
13. The process of making a fastening between a rail and a cement tie consisting in placing in a hole formed in the $c \in m e n t ~ t i e, ~ a ~ r a i l ~ h o l d i n g ~ m e m b e r, t h e n ~ p o u r i n g ~ i n t o ~ s a i d ~$ hole around sald member a hard metallic fllling.
14. The process of making a fastening between a rail and a cement tie consisting in placing in a hole formed in the tie, a rail holding member, than placing hard particles of matter within the hole arocind said member and then pouring in a softer, metallic filling.

## No. 100,136. Railway Switch.

## Aiguille de chemin de fer.

Linza M. Dawson, Hugh L. Marshall, Eduard H. Allison and William C. Ivins, all of Stronghurst, assignee of Louis Robert Parsons, Raritan, both in Illinols, U.S.A., 24th July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,276.
Claim.-1. The combination with a main track and a siding, of a movable switch point, means for moving said point, and a Y-shaped lever for actuating sald means, the arms of said lever having bevelled outer faces and vertical inner' faces.
2. The combination with a main track and a siding, of a movable switch point, means for moving said point, a rotary
element for actuating said point, a $X$-shaped lever, guides, a bar slidable in said guides, and links pivoted to the ends of said bar and to said lever and said rotary element.

3. The combination with a main track and a siding, of a novable switch point, means for moving eaid point, a rotary element for actuating said means, guides, a sliding bar in gaid guides, links pivotally connecting the inner ends of said bars to said rotary element, Y-ehaped levers having their arms formed with bevelled outer faces and vertical inner faces, and links pivotally connecting said levers to the outer ends of said bars, substantially as deecribed.
4. The combination with a main track and a siding, of a movable switch point, a switch stand, a trip device mounted adjacent to the track, means for causing said trip device, said switch point and switch stand to operate simultaneously, and means for permitting said switch point and said switch stand to operate independent of said trip device.
5. The combination with a main track and a siding of a movable switch point, a switch stand. a trip device mounted adjacent to the track, independently movable elements connected respectively to said trip device. said switch point and switch stand, and means for locking said elements together.
6. The combination with a main track and a siding, of a movable switch point, a switch stand, a trip device mounted adjacent to the track, independently movable elements conrected respectively to said trip device, said switch point and switch stand, and a lateh for detachably connecting said elements to cause them to move together.
7. The combination with a main track aud a siding, of a movable switch point, a switch stand, a trip device mounted adjacent to the track, superposed rotary discs or elements, cne being connected to said trip device and the other to said switch point and said switch stand, and means for connecting said discs or elements to cause them to move together.
8. The combination with a main track and a siding. of a movable switch point, a switch stand, a trip device mounted adjacent to the track, superposed rotary discs or elements, one being connected to said trip device and the other to said switch point and said switch stand, and a latch or lever pivoted upon one of said discs and adapted to enter a seat it: the other to lock them together, substantially as described.
9. The combination with a main track and a siding, of a movable switch point, a switch stand, a trip device mounted adjacent to the track. superposed rotary discs or elements, one being connected to said trip device and the other to said ewitch point and said switch stand, a locking means for secciring said discs together, and means for retaining said means in its locked position.

## No. 100,137. Rallway Rail Joint.

Joint de rails de chemins de fer.
Flaviem Bombadier, Valcourt, Quebec, Canada, 24th July, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,144.
Claim.-1. A rail joint comprising a rail having a thickened shoulder with its end cut away to leave vertical inwardly converging faces and to leave a projecting tongue having a plurality of locking lugs on its opposite sides, and a second rail having a thickened shoulder with a central slot provided with recesses in the wall therof, to receive said locking lugs, and sald second rall having inwardly converging faces adapted to bear on the inwardly converging faces of the first rall.
2. A rail joint comprising a rail having a thickened shoulder with its end cut away to leave vertical inwardly

converging faces ant to leave a profecting tongue having a plurality of rectangular locking lugs on its opposite sldes, and a second rail having a thickened shoulder with a central slot provided with rectangular recesses in the wall thereof to receive said locking lugs, and said second rail having inwardly converging faces atapted to bear on the inwardly converging faces adapted to bear on the inwardly converging faces of the first rall.
3. A rall joint comprising a rail having a thickened shoulder with its end cut away to leave vertical inwardly converging faces and to leave a projecting tongue having a plurality of rectangular locking lugs on its opposite sides, and a second rall having a thickened shoulder with a central slot provided with rectangular recesses of greater dimenslons than the locking lugs in the wall thereof to receive said locking lugs, and said second rall having inwardly converging faces adapted to bear on the inwardly converging faces of the first rail.
4. A rall joint comprising a rall having a thickened shoulder with its end cut away to leave vertical inwardly converging faces and to leave a projectlng tongue having a plurality of locking lugs on its opposite sides and having its base cut out to leave a lip, and a second rall having a thickened shoulder with a central slot provided with recesses in the wall thereof to receive said locking lugs, and said second rail having inwardly converging faces adapted to bear on the inwardly converging faces of the first rail, and said second rail having two cut out portions, the surfaces of which are disposed respectively on the base and the top of the first rall.
5. A rall joint comprising a rail having a projecting tongue provided with laterally projecting vertical locking lugs, and a second rail having its end bifurcated and provided with recesses to receive the locking lugs.
6. A rall joint comprising a rall having a projecting tongue formed with a plurality of locking lugs on each side, and a second rail provided with a bifurcated end having recesses therein, each of said recesses being of greater dimensions than the lug disposed thereln.
7. A rail joint comprising a rail having a thickened shoulder and having a projecting tongue formed with a plurality of locking lugs on each side, and a second rail provided with a bifurcated end having recesses therein, each recess being of greater dimensions than the lug disposed therein, and said second rail being provided with shoulders on each side of its bifurcated end.

## No. 100,138. Rail Joint. Joint de rails.

Charles E. Christian, Oma Bradford and John William Cruse, each an assignee of a fourth interest, all of Oak Hill, West Virginia, U.S.A., 24th July, 1906; 6 years. Filed 30th June, 1906. Receipt No. 137.433.
Claim.-A rall joint comprising two members, one of said members having an integral basal splice tongue co-extensive In width with the base thereof and formed with a transversely convexed upper face, and the other member a bacal recess to receive said tongue, said recess being substantially co-extensive in length and width with said tongue and formed
with a curved wall to rest upon the curved face of the tongue, the latter named member also being provided with thickened

attaching fianges overlying the sides of the tongue and formed with spike notches.

No. 100,139. Elevated Railway. Chemin de fer aérien.

Charles Thompson Harvey, Toronto, Ontario, Canada, 24th July, 1906; 6 years. Filed 29th May, 1306. Receipt No. 136,384.
Claim.-1. A system of constructing elevated rallways, principaily of wood, consisting of transverse bases of moulded reinforced concrete containing sockets for posts, timber bents consisting of a pair of posts socketed in said bases and of cap beams and cross braces, metallic saddles secured upon said caps, built-up plank girders set in said saddles, flanged plate ties bolted through the flanges to said girders at intervals, flooring supported on the bottom flanges of said ties and flanged footed rails supported upon and overlapping the upper edges of the girders and secured in place, substantially as set forth.
2. A system of constructing elevated railways, principally of wood, consisting of moulded reinforced concrete foundations placed transversely to the line to form the bases of the bents and containing sockets for the posts, bents of timber consisting of posts, cap beams and cross braces. the posts socketed into the bases, longitudinal cross braces between pairs of bents at intervals, saddles secured to the caps adapted to receive the girders, built-up wooden girders placed In said saddles, flanged plate ties bolted to the girders at
intervals, flooring carried on the bottom flanges of said ties, flange footed rails carried on the upper edge of the girders and secured thereto and conduits carried by the webs of the ties, substantially as set forth.
3. A system of constructing elevated railways principally of wood consisting of moulded reinforced concrete foundations placed transversely to the line to form the bases of the bents and contalning sockets for the posts, bents of timber consisting of posts, cap beams and cross braces, the posts socketed into the bases, longltudinal cross braces between pairs of bents at intervals, saddles secured to the caps adapted to receive the girders, bullt-up wooden girders placed in said saddles, flanged plate ties bolted to the girders at intervals, flange footed rails carried on the upper edge of the girders and secured thereto, a series of brackets, bolted to the girders near the upper edge and an electrical conductor carried on said brackets, substantially as set forth.
4. In an elevated rallway the combination of a series of transverse foundations consisting of moulded and reinforced concrete bases, a bent of timber on each foundation, longitudinal cross braces between pairs of bents at intervals, built-up timber girders supported on the caps of the bents, flanged plate tles connecting said girders at intervals, flanged footed rails secured to the girders, flooring carried on the bottom flanges of the ties, conduits carried in the webs of the ties and an electrical conductor carried on brackets secured to the girder, substantially as set forth.
5. In an elevated railway the combination with a timber cap beam and a wooden girder set on edge, a metallic saddle bedded upon and checked into said cap and provided with a pair of flanges forming a groove for the reception of the girder bottom, substantially as set forth.
6. In an elevated railway the combingtion with a round timber cap beam and a wooden girder set on edge, a metallic saddle having a concaved seat fitting the shape of the cap timber and checked into a recess therein and a pair of flanges forming the longitudinal groove for the reception of the girder bottom, substantially as set forth.
7. In an elevated rallway the combination with a moulded reinforced concrete base formed with conical sockets and bevelled offset faces, timber posts having conical tenons fiting said sockets and being round at the upper part, a round cap beam joined to said posts by receiving the offset round tenons of the round upper parts of the posts, brackets having concaved backs secured to the posts in the cap angles and a pair of cross braces footing on the bevelled offsets of the base and into the said brackets at the upper end, substantially as set forth.
8. In an elevated railway the combination with a round timber post and cap beam connected at a right angle, or nearly so, of a metallic bracket having its back concaved to fit against post and cap and adapted to be secured to said post and having its face recessed to receive the shaped end of a brace, substantially as set forth.
9. In a mounlded concrete foundation for an elevated railway the combination of a block having tapering sides and be-velled-off tops of reinforcing bars embedded longitudinally and transversely and having enlargements extending laterally and upwardly with bevelled offsets to recelve the ends of the timber braces and formed with a central tapering socket for the reception of the timber post, substantially as set forth.
10. The combination of a moulded reinforced concrete block having enlargements containing conical sockets, timber posts having tenons received and fitting in said sockets, a cap beam connected to the top of said posts by bore holes sunk therein and receiving the offset round tenons of the round upper part of the posts, brackets secured to the posts in the inner angles of the posts and cap and cross braces received in said brackets at the top and setting upon the bevelled offsets of the concrete base, substantially as set forth.
11. In a girder for an elevated railway the combination of a series of planks connected edge to edge, said edges being grooved and tongued and a series of dowels in said edges having their ends split and wedges inserted which are driven in as the joint closes up, substantially as set forth.
12. The combination with a pair of wooden girders set on edge, a series of flanged plate ties connecting said girders transversely, a filling strip between each end flange and girder, a vertical continuous plate washer on the outside of said girders and bolts passing through the flanges of the ties, flling strips, girders and washer plates, substantially as set forth.
13. The combination with a pair of wooden girders set on edge, of a series of flanged plate ties bolted to said girders at intervals and a rall on each girder having a flauged foot overlapping the edges of said girders and screws securing said rail to said girders, substantialy as set forth.
14. The combination with a pair of wooden girders set on edge, of a series of flanged plate ties bolted to said girders at intervals, a rall secured to the top of each girder and flooring carrled on the bottom flanges of the ties, substantially as set forth.
15. The combination with a pair of wooden girders set on edge, of a series of flanged plate ties bolted to said girders at intervals, a rail secured to the top of each girder and a conduit carried by the web of said ties, substantially as set forth.
16. The combination with a wooden girder set on edge, of a rail secured to the top thereof, a series of brackets secured to the upper part of said girder and an electric conductor carried by said brackets, substantially as set forth.
17. The combination with a wooden girder set on edge, a metallic sheet covering overlapping the top and bottom edges of said covered girder, subtsantially as set forth.
No. 100,140. Railway. Ohemin de fer.

Stephen E. Jackman, New York City, New York, U.S.A., 24th
July, 1906; 6 years. Filed 30th June, 1906. Receipt No. 137,452.
Claim.-1. A railway having a continuous track consisting of an up-track, a home stretch leading back to the foot of the said up-track and an intermediate track section conrecting the upper end of the up-track with the beginning point of the home stretch, the sald intermediate track section having a loop portion and a figure 8 portion, of which one connects with the up-track and the other connects with the home stretch.
2. A railway having a continuous track consisting of an up-track, a home stretch leading back to the foot of the said up-track, and an intermediate track section connecting the upper end of the up-track with the beginning point of the home stretch, the sald intermediate track section having a loop portion and a figure 8 portion, of which the loop portion crnnects with the up-track and leads to the said figure 8 portion, and the latter connects with the said home stretch.
3. A rallway having a continuous track consisting of an up-track, a home stretch leading back to the foot of the said up-track, and an intermediate track section connecting the :ipper end of the up-track with the beginning point of the home stretch, the said intermediate track section having a loop portion and a figure 8 portion, of which one connects with the up-track and the other connects with the home stretch, and end loops of the loop portion and the end loops of the figure 8 portion being arranged one above the other.
4. A rallway having a contlnuous track consisting of an up-track, a home stretch leading back to the foot of the said up-track, and an intermediate track section connecting the upper end of the up-track with the beginning point of the home stretch, the said intermediate track section having a loop portion and a figure 8 portion, of which one connects with the up-track and the other connects with the home stretch, and the middle members of the figure 8 portion crossing each other in different horizontal planes.

7-19

No. 100,141. Rallway 8witch 8tand.
Plateforme d'aiguille de chemin de fer.

Edward Lawrence Morgan, Little Rock, Arkansas, U.S.A., 24th July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,228.
Claim.-1. In a switch stand, the combination with the supporting frame, of a member for operating the switch points, an operating lever for said member, means for locking the lever in the positions to which the switch may be thrown, a signalling device, and means for operating the latter automatically and independently of the operating lever when the switch is fully thrown.
2. In a switch stand, the combination with the supporting frame, of a member for operating the switch points, a plvoted operating lever for said member, means for locking said pivoted lever in the positions to which the switch may be thrown, a signalling device, and means for operating the latter automatically when the pivoted lever is in position to be locked and to hold the signalling device in an operative position during the movement of the switch operating member from one position to another.
3. In a switch stand, the combination with a supporting frame and signalling device, of a movable member for operating the switch points and provided with recesses in the under side thereof, and a pivoted member counterbalanced so as to operate the signalling device and so that one end thereof will engage the under side of the aforesaid member and enter the recesses therein.
4. In a switch stand, the combination with the supporting frame having notches therein, a disc for operating the switch points lotatable on said frame and provided with a slot, a lever pivoted in said slot and adapted to engage the notches in the supporting frame, a pivoted member one end o! which is adapted to engage the disc and enter the slot therein, and a signalling device connected to said pivoted member.
5. In a switch stand, the combination with the supporting frame having notches therein, a disc for operating the switch points rotatable on said frame and provided with a slot, a lever pivoted in said slot and adapted to engage the rotches in the supporting frame, a member pivoted beneath the rotatable disc with one end engaging the under side thereof and having a portion adapted to enter the slot therein, and a signalling device connected to the pivoted member.
6. In a switch stand, the combination with the supporting frame having notches therein, a disc for operating the switch points rotatable on said frame and provided with a slot and a recess at different points, a lever pivoted in the slot, a member pivoted beneath the disc so that one end of the former will engage the under side of the latter and enter the slot and recess therein, and a signalling device connected to the pivoted member.
7. In a switch stand, the combination with the supporting frame having notches therein, a disc rotatably mounted on the frame and adapted to operate the switch points, said disc having a slot and a recess at different points, a lever pivoted

Digitized by 工OO
in the slot and adapted to engage the notches in the supporting frame, a yoke plvoted under the disc so that one end thereof will engage the under side of the disc and enter the slot and notch therein, said end of the yoke belng adapted to be engaged by the lever when the latter is swung upon its pivot, and a signalling device connected to the yoke.
8. In a switch stand, the combination with the platform having notches therein, a disc rotatable on the platform and adapted to operate the switch points, sald aisc having a slot therein, a lever pivoted in the slot and adapted to engage the notches in the platform, a yoke pivoted under the dise and having a portion adapted to enter the slot in the disc in the path of the movement of the pivoted lever, a lug on said lever adapted to engage the yoke, and a pivoted signal blade or semaphore connected to the yoke and operated thereby.
9. In a switch stand, the combination with the supporting frame comprising a platform and an upright or post, said platform having notches therein, a disc rotatably mounted on the platform for operating the switch points and having a slot therein, a lever pivoted in said slot and adapted to engage the notches in the platform, a yoke pivoted under the platform with one end thereof bearing against the under side of the disc and adapted to enter the slot therein, a reflecting medium on the upright, a signal arm pivoted on the upright and connected to the yoke, and a shutter on the signal arm adapted to screen the reflecting medium, substantially as herein shown and described.

No. 100,142. Clamps for Rails. Crampe pour rails.

Issac N. Spald, Tippecanœ City, Ohio, U.S.A., 24th July, 1906; 6 years. Filed 25th June, 1906. Recelpt No. 137,237.
Claim.-1. In a clamping device for connecting and bracing rails the combination of the inner sectional brace provided with a groove, and holes or cylindrical depressions, and adapted to receive a flange of the rails, the outer sectional brace provided with a tongue, and pins or prongs and adapted to receive a flange of the rails, all substantially in the manner and for the purposes described.
2. The combination in a clamp for bracing and connecting track rail sections, of an inner sectional brace formed with a slot to recelve the flange of the rails, and having its base or underside provided with holes or cylindrical depressions, an outer sectional brace formed with a slot to receive the flange of the rails, a tongue adapted to fit in the groove in said inner sectional brace, pins or prongs adapted after passing through the bolt eyes in the rails, to rest securely in the holes or cylinderical depressions in said intersections, all substantially as described.
3. In a clamp for bracing and connecting track rall sections the combination with the rails of the track, of the inner sectional brace formed with a slot and having holes or cylindrical depressions in its inner face or wali and a groove across the base, the outer sectional brace formed with a slot and having prongs or pins projecting from its inner face or wall, and a tongue projecting from the base, all substantially in the manner and for the purposes described.

## No. 100,143. Street Car Fender.

Défense de chars de rue.

Vasilie Vladutz, Homestead. Pennsylvania, U.S.A., 24th July, 1906; 6 years. Filed 25th June, 1906. Recetpt No. 137,234.
Claim.-1. A car fender embodying a plurality of arc-shaped arms, said arms being pivotally mounted in adjacent pairs, bearing for the several adjacent pairs secured to the body of the car, means for retaining said arms against movement and adapted to be engaged by an obstacle in the progress of the car to release said arms, rearward extensions carried upon the ends of said arms. and means adapted to engage said extensions to force said arms to swing inwardly upon their pivot when released.
2. A car fender embodying a plurality of arms disposed in horizontal tiers and pivotally mounted, bearings in which said arms are pivotal secured to the body of the car, rearward extensions carried by said arm, means for engaging said extensions and causing said arms to swing inwardly upon their pivots, and means adapted to be engaged by an obstacle for holding said arms against inward movement.
3. A car fender embodying horizontally disposed tiers of gripping arms pivotally mounted in pairs bearings for said arms secured to the body of the car. a second series of arms plvotally mounted spring controlled arms located upon the adiacent ends of said first-named arms, brackets in which said second-named series are mounted, rearward extensions carried by said first-named series, an expansive spiral spring interposed between said extensions and adapted to force sald arms together, means for retaining first-named series of arms from movement under the influence of said spring, said retaining means being released from engagement with saij arms by contact with an obstacle, means for forcing sald last-named series of arms to swing together upon their pivots and means for holding said last-named arms from movement. said holding means being adapted to be released from locking engagement therewith by contact with an obstacle.
4. A car fender embodying in combination with a series of plvotall ymounted spring controlled arms located upon the front of the car and means for normally maintaining the same against movement, a second series of arms depending from the floor of the car, and pivotally mounted in bearings provided therefor, means for causing the arms of said second serles to swing together upon their pivots, and means for locking said arms against inward movement, said locking means being obstacle operated and embodying a pivotally mounted depending arm having connection at its pivotal end with sliding bolts adapted to normally enter Into locking engagement with said first-named arms.

## No. 100,144. Car Coupler. Attelage de chars.

William August Engel, Split Rock, Wisconsin, U.S.A.. 24th July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,250.
Chaim.-In a car coupler the combination with a bollow drawhead, of a knuckle 3 pivoted to swing horizontally therein, a locking finger 7 formed on said knuckle, said finger having in its inner end a recess 5, and an inclined wall 6, a lock-
ing dog 12 plvotally mounted on a horizontally axis in sald drawhead, and a crank shaft 9 connected to said locking dog

to move the same to an unlocked position, substantially as described.

No. 100,145. Rallway Car. Char de chemin de fer.

Hanford L. Kerr, Kansas City, Kansas, U.S.A., 24th July, 1906; 6 years. Filed 29th June, 1906. Recelpt No. 137,406.
Chaim.-1. In a device of the character described, a car body having an air opening in the end thereof, a $V$-shaped central air shaft taking alr from the opening and discharging it in the upper part of the car, an air fan located at the discharge end thereof. side air shafts also taking alr from the opening and discharging beneath the discharge of the central air shaft, a pair of fans for facilitating the passage of air through the side shafts and means connected with the car axle for driving the several fans, substantially as described.
2. In a device of the character described, a car body, water troughs located between the carrying beams thereof, sliding perforated covers for the water troughs, sald car body having an opening in its end, a central air shaft taking air from the opening and discharging it near the top of the car, side air shafts also taking air from the opening and discharging it below the discharge of the central air shaft, fans located in the several air shafts, a shaft sultably journalled, means for driving the fans from the shaft, a pump operated by the shaft and adapted to take water from the troughs and spray it across the air shafts, and gutters to carry off water from the sprays and return it to the troughs, substantially as described.
3. In a device of the character described, a car body having an air opening in the end thereof, a V-shaped central air shaft taking air from the opening and discharging it in the upper part of the car, an air fan located at the discharge end thereof, side air shafts also taking air from the opening and discharging beneath the discharge of the central air shaft, and a pair of fans for facilltating the passage of air through the side air shafts.
4. In a device of the character described, a car body, water troughs located between the carying beams thereof and open to the interlor of the car, said car body having an opening in its end, a central air shaft taking air from the opening and discharging it near the top of the car, side air shafts also taking air from the opening and discharging it below the discharge of the central air shaft, fans located in the several air shafts, a pump adapted to take water from the troughs and spray it across the air shafts, and gutters in the air shafts to return the water to the troughs.

No. 100,146. Ditching Plough. Charrue d fossoyer.

John Frantisek Mikolasek, Vodnany, South Dakota, U.S.A., 24th July. 1906; 6 years. Filed 26th June, 1906. Receipt No. 137,311.
Claim.-A ditching plough comprising a beam, a yoke vertically adjustable at the front end of the beam, a roller mounted in said yoke, and an arm pivotally connected to the yoke and also plvotally connected to the beam, an upwardly and rearwardly inclined trough suspended from the beam and having a lateral extension at the rear end, a cutting blade on the front end of the trough, a yoke depending from the beam. and a shoe attached to said depending yoke.

No. 100,147. Plough Colter. Coutre de charruc.
John P. Abernathy and James W. Heitt, co-inventors, both of Jonesboro, Arkansas, U.S.A., 24th July, 1906; 6 years. Filed 25th June, 1906. Recelpt No. 137,230.
Claim.-1. A device of the character described comprising a spring locking bar or member for insertion into the colter shank receiving mortise, and a dog or lever member eccentrically connected or pivoted to said bar and effective to obtain a binding or clamping action upon said colter shank. 2. A device of the character described comprising a spring
locking bar or member having an angular lower end terminal, with its opposite end terminating in an eye, and a dog

or lever member having a lateral blfurcated terminal receiving said eye, and a clenched pivot bolt or rivet for effecting connection between said bar member and sald dog or lever member.
3. In a plough the combination of a colter shank with the carrying beam therefor having a mortise receiving said shank, means for securing in place and effecting the adjustment of said shank in said mortise, and a locking contrivance for said colter shank comprising a resillent bar or member insertlble in said mortise, and a dag or lever member having an eccentric or cam connection with the latter, and effective for securing a binding or clamping action thereof upon said colter shank.

No. 100,148. Hay Fork. Fourche d foin.

Anton Anderson and Wilford Palmer, co-inventors, both of Grantsville, Utah, U.S.A., 24th July, 1906; 6 years. Filed 29th June, 1906. Receipt No. 137,395.
Olaim.-A fork comprising a head, a handle connected to said head, tynes engaged through the head, eyes carried by the head, a bale engaged in the sald eyes on the head and having an eye formed in its free end for the attachment of a hoisting cable, a link including arms at one of its ends, said arms having their ends pivotally connected to the opposite Inner sides of said bale near the upper end of the latter, the other end of sald link being curved laterally, a second link having apertured lugs formed on each of its ends, the curved end of the first-named llak being pivoted between the lugs of the ends of the last-named link, the other end of said lastnamed link being pivoted to the said handle, a pin carried by said first-named link and extending from each side thereof to engage the lugs of the last-named link, and a drop line connection formed on the pivot of the two links.

No. 100,149. Forseshoe Caulk.
Crampon de fer à cheval.

William B. Cole and Frank H. Thornley, both of Rhinebeck, New York, U.S.A., 24th July, 1906; 6 years. Flled 26th June, 1906. Recelpt No. 137,306.
Claim.-1. A horseshoe having detachable toe caulks in combination with a coupling device having recesses in its ends to engage the opposing ends of the toe caulks and prevent the latter from turning, substantially as described.
2. A to caulk comprising a body having substantially parallel sides, outwardly extending base flanges, strengthening webs in the angles between the sides and base flanges, a recess between the sides, and a blade in said recess, substantially as described.
3. A horseshoe having toe caulks provided with base flanges, in combination with a coupling device bearing on the base flanges of the caulks and having recesses in its ends to receive the opposite end portions of the caulks, said coupling device preventing the caulks from turning, substantially as described.

## No. 100,150. Mail Bag Crane.

Grue pour sacs de malle.
James Cole, Superior, Wisconsin, U.S.A., 24th July, 1906; 6
years. Filed 25th June, 1906. Receipt No. 137,268.
Olaim.-1. A mail bag crane comprising a post, bag holding arms projecting laterally therefrom, means for automatically withdrawing said arms when the bag is disengaged therefrom, and means for reversing the direction in which said arms project, whereby they may be alternatively used in connection with trains travelling on adjacent tracks.
2. In a mail bag crane, a base, a vertical post revolubly secured in said base, a foot on sald post arranged within a chamber in said base, and a supporting member for said foot having a bearing of llmited area therefor, and an adjacent incline for rotating said post when disengaged from said bearing.
3. In a mail bag crane the combination of a chambered base, a vertical post revolubly secured in said base, a foot for sald post within the chamber in the base and having a narrow under face, and a support for said foot within a limited flattened area at their upper ends for supporting the narrow under face of said foot, whereby the descent of said foot when disengaged from said flattened area will cause a partial rotation of the post.
4. A mall bag crane comprising a revoluble post, a foot at the lower end thereof, a support for said foot having an inclined face for causing a partial rotation of the foot and post, a base in which said post is journalled, a lever pivotally connected to said post, and an annular flange on said base forming a fulcrum for said lever in different points of rotary adjustment about the axls of said post.
5. A mall bag crane comprising the base $B$, the vertical post journalled therein, the foot $C$ at the lower end of sald

post, and the co-operating cam supporting member $D$, the annular flange $h$ at the upper end of said base and the lever G pivoted to said post and fulcrumed upon said flange, substantially as and for the purpose set forth.

No. 100,151. Hoist and Conveyer.
Ascenseur et transport

Christopher C. Dolan, Gultport, Mississippi, U.S.A., 24th July, 1906; 6 years. Filed 30th June, 1906. Recelpt No. 137,429.
Claim.-1. In a device of the class described, a load receiving device comprising a pair of relatively movable sections, a guide, a member slidably mounted upon the guide and operatively connected with the sections, a head slidably engaged with the guide, a movable latehing member for conrecting the head with the slidable member, a track or way, a carriage movable thereon and a holsting cable operatively connecting the load receiving device with the carriage, sald cable being adapted for actuating the lateh to release the cablable member from the head.
2. In a device of the class described, a load recelving device including a pair of relatively movable sections, a guide, a cross piece slidably engaged therewith and operatively connected with the sections, a head slidable on the gulde and operatively connected with the sections for moving the
latter to closed position, a movable latch adapted for concecting the head and cross piece, a track or way, a carriage movable thereon, and a flexible hoisting element or cable operatively connecting the load receiving device with the carriage, said cable being adapted for actuating the latch to release the cross plece and permit movement of the sections tc. open position.
3. In a device of the class described, a load receiving device including a pair of relatively movable sections, a guide, a member slidably engaged with the guide, and operatively connected with the sections for moving the latter to open position, a head slidably engaged with the guide and operatively connected with the sections for moving the same to closed position, a movable latch member connecting the head and slidable member, and a flexible hoisting element operatively engaged with the load recelving device and adapted for actuating the latch to release said slidable member.
4. In a device of the class described, a load receiving device including a pair of relatively movable sections, a guide, a member slidably engaged with the guide and operatively connected with the sections for moving the same to open pasition, a head slidably engaged with the guide and operatively connected with the sections for moving the same to closed position, a movable latching member adapted for connecting the slldable member and head, a fiexible hoisting element operatively engaged with the load receiving device, and a tripping member carried by sald element and adapted to contact with and move the latch to releasing position.
5. In a device of the class described, a head, a load receiving device operatively connected therewith and movable to dumping position, a guide pulley journalled in the head, a movable latch member carried by the head, a flexible operating element arranged to travel on the guide pulley and provided with a latch operating member, an element connected with the load receiving device and adapted for engagement by the latching member to hold the device in non-dumping position, said latch being operable by the latch operating member for engagement by the latching member to hold the device in non-dumping position, said latch being cperable by the latch operating member for releasing the element and springs acting on the latch to maintain the same normally in engaging position.

No. 100,152. Saddle. Selle.

Patrick H. Fontalne, Bethel Hill, North Carolina, U.S.A., 24th July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,229.
Claim.-1. The combination with a caddle having a loop and a girth, of an attachment connected to the girth and having a loop slidably mounted within the loop of the saddle, and a stirrup strap connected to one end of and supported by the loop of the attachment.
2. The combination with a saddle having a loop extending therefrom, and a girth, of an attachment connected to the girth and having a loop engaging and slidably mounted within the loop of the saddle, a stirrup strap connected to and supported by the end of the loop of the attachment, dand. means for holding said strap in position at the end of the loop.
3. The combination with a saddle having a loop extending therefrom and a girth supported upon the saddle, of a stirrup strap, a strap connected to the girth and having a loop engaging and slldably mounted upon the loop of the saddle, a keeper within the loop of the strap and a link interposed hetween sald keeper and the end of its loop, said link engaging the stirrup strap.
4. An attachment of the character described, comprising a girth strap having a loop at one end, a keeper positioned within the limit of the edges of cald strap and within the
looped portion, and a link mounted within one end of the looped portion of said strap.
5. An attachment for saddles, comprising a strap provided with a looped portion at one end thereof, a keeper secured within the looped portion, and stirrup supporting means assembled with the looped portion of said strap and normizilly engaging the keeper within the same.
6. The combination with a saddle provided with a depending member, and a girth, of an adjustable member provided with a loop portion positioned upon said depending member and connected to sald girth, and looped means positioned within the looped portion of said adjustable member and being capable of movement for causing adjustment of said adjustable member.
7. The combination with a saddle, and a girth, of an adjustable member supported by said saddle and connected to said girth, said member provided with means for limiting the girth against downward movement, and a stirrup supported by the upper end of said member.
8. The combination with a saddle provided with a depending member, and a girth, of a slidable strap supported upon said depending member and connected at its lower end to said girth. and a stirrup strap secured to the upper end of said slidable strap and capable of moving said strap upon the depending portion of the saddle for adjusting said girth.
9. The combination with a saddle and a girth, of an adjustable member carried by said saddle and connected to said girth, said member provided with a loop formed upon its upper end, a stirrup strap provided with looped means carried by said member, the looped means of said stirrup strap engaging the looped means of said member.
10. The combination with a saddle and a girth, of an adjustable member positioned upon said saddle and connected to said girth, a keeper. said member inclosing said keeper, and stirrup supporting means positioned upon said member and capable of engaging said keeper, said stirrup supporting means being capable of causing adjustment of sald member and girth.

No. 100,153. Water Feater. Chauffeur d'cau.

Fig. 1

Joseph Foster, New York City, New York, U.S.A., 24th July. 1906; 6 years. Filed 18th June, 1906. Rece1pt No. 137,014.
Claim.-1. In a system the combination of two valves, means for closing the said valves and a means for interlocking the said closing means when the valves ure closed and when they are opened.
2. In a system the combination of two valres. means for closing the said valves and a means for interlocking the said (losing mrans when the sadid valves are closed and for preventing the opening of one of the said valves.
3. In a system the combination of two valves, means for closing the said valves and a means for interlocking the said closing means when the valves are closed and for preventing the opening of one of said valves until the otner of the said valves is opened.
4. In a system the combination of a plurality of valves, means for closing the said valves and a means for interlocking the said closing means when the said valves are closed and for preventing the opening of one of said valves until another of the sald valves is opened.
5. In a system the combination of a plurality of valves. means for closing the said valves and a means for interlocking the said closing means when the said valves are closed and for preventing the opening of one of the said valves until another of the said valves is opened and to prevent the closing of one of the said valves until another of the said valves is closed.
6. In a system the combination of two valves, means for closing the said valves and a means for interlocking the sail closing means when the valves are closed and when the valves are opened and for preventing the opening of one of the said valves until another of the said valves is opened and for preventing the closing of the first valve opened untll after the second valve opened is closed.
7. In a system the combination of two valves, each valve having a plug adapted to be pressed against the valve seat, means for closing the said valve, means for interlocking the said closing means when the said plugs are forced against the said seat.
8. In a system the combination of a plurality of valves. each of said valves having a plug and a valve seat, the said plugs adapted to be forced against the sald valve seats, a means for closing the said valves, a means for interlocking the said closing means and a means for adfusting the said closing means so that the valves will be interlocked when the said valves are closed.
9. In a system the combination of a plurallty of valves, each valve consisting of a valve chamber, a valve seat and a valve plug located in the said chamber, stenus connected to the said valve plugs, a dise having radiating teeth connected t1) each of the said stems, handles adjustably connected to the said discs, a part connected to one of the said handles having a curved portion, a flange connected to another of the said handles, the said flange adapted to register with the said curved portion.
10. In a valve the combination of a plug having a slot, a stem having a head and a neck adapted to be inserted in the said slot of the said plug and adapted to be turned within the said slot.
11. In a water heater a circular mixing chamber having oppositely arranged inlet and outlet, a deflecting plate parallel to the wall of said mixing chamber opposite said inlet, curved guiding plates extending outward from the wall of said mixing chamber on either side of said outlet, said guiding plates extending around the ends of said deflecting plate to cause impingement of water against said deflecting plate, an injector connected with the inlet of said mixing chamber and provided with a heating nozzle in line with said inlet to discharge water against sald deflecting plate, a curved water passage communicating with said heating nozzle, and adjustable interlocking water and heating valves controlling the supply of fluids to said injector.
12. In a water heater, a circular mixing chamber having diametrically arranged inlet and outlet, a deflecting plate concentric with the wall of sald mixing chamber opposite said inlet, curved guiding plates extending outward from the wall of said mixing chamber on either side of the outlet of the same, said guiding plates extending around the ends of said deflecting plate to cause impingement of the water against said deflecting plate, an injector connected with the inlet of said mixing chamber and adjustable interlocking valves to govern the admission of water and heating fluid to said injector.
13. In a water heater a circular mixing chamber having diametrically arranged inlet and outlet, there being a concentric deflecting plate in said mixing chamber opposite said inlet and curved guiding plates extending from the wall of said mixing chamber around the ends of said deflecting plate, a water valve and a heating valve connected to said mixing chamber and an adjustable interlocking water handle and heating handle to govern said valves.
14. In a water heater a circular mixing chamber having a concentric deflecting plate opposite the inlet of said chamber and guiding plate extending out from the wall of said mixing chamber around the ends of said deflecting plate to cause eddifs in the space between said guiding plates, the outlet of said mixing chamber being situated between said guiding plates and an injector connected with the inlet of said mixing chamber and provided with a heating nozzle in line with said inlet.
15. In a water heater a mixing chamber, an injector in line with the inlet of said mixing chamber and an adjustable in-
terlocking apparatus for the admission of fluids to said injector in varying proportions.
16. In a water heater a circular mixing chamber having diametrically arranged inlet and outlet, a deflecting plate concentric with the wall of said mixing chamber opposite said inlet, curved gulding plates extending outward from the wall of said mixing chamber on either side of the outlet of the same, said guiding plates extending around the ends of said deflecting plate to cause impingement of water against said deffecting plate and an injector connected with the inlet of said mixing chamber the heating nozzle of said injector being in line with the said inlet, and an adjustable valve.
17. In a water heater a mixing chamber provided with an inlet and an outlet, an injector connected with the inlet of said mixing chamber and provided with a heating nozzle in line with said inlet, valves having adjustable handles to control the supply of fluids to said injector, an incurved deflecting plate opposite the inlet of said mixing chamber against which the fluld from sald injector impinges, and guiding plates extending around the ends of said deflecting plate to sause eddies in the space between the said guiding plates to thoroughly mix the fluid issuing from the outlet of said mixing chamber.
18. In a water heater a mixing chamber having an inlet and outlet, an injector connected to said inlet and having a heating nozzle in line with the same, an incurved deffecting plate opposite to the inlet in said mixing chamber against which fluid from said injector impinges and guiding plates extending around the ends of said deflecting plate to thoroughly mix the fluid issuing from the outlet of said mixing chamber, and an adjustable valve.
19. In a water heater a mixing chamber having an inlet, a curved deflecting plate opposite said inlet and guiding plates co-operating with said deflecting plate to produce eddies in said mixing chamber, an injector connected to said inlet and having a steam nozzle in line with the same to cause hot water to impinge upon said deflecting plate, and adjustable interlocking valves to control the supply of steam and water to said injector.
20. In interlocking valves for a water heater, valve stems having valve plugs secured thereto and co-acting with seats to control the admission of fluids to said heater, a heating handle and a water handle secured to said stems, said water handle formed with a circular adjustable cam and said heating handle being provided with an adjustable stop to engage said cam, a projection on said water handle to prevent the excessive operation of the same and extensions and grips on said handles.
21. In interlocking valves for a water heater, valve stems to operate valve plugs to control the admission of fluids to said water heater, a water handle and a heating handle secured to said stems, an adjustable cam on said water handle and an adjustable stop on said heating handle to engage sald cam.
22. In interlocking valves for a water heater, an injector, valve stems provided with valve plugs to govern the admission of fluids to said injector, an adjustable water handle and an adjustable handle for controlling the supply of heat provided with interlocking members secured to said stems, means to limit the extent of movement of said handles and a drain pipe connected to said injector.
23. In interlocking valves for a water heater, valve stems having valve plugs mounted thereon to control the admis. sion of flulas to said water heater, an adjustable water handle and an adjustable heating handle having interlocking members secured to said stems and means to limit the movement of said handles.
24. In interlocking valves for a water heater, valve stems, valves actuated therevy to govern the admission of fluids to said heater, an adjustable water handle and an adjustable heating hande secured to said stems and interlocking members on said handles to govern the movement of the same.
25. In interlocking valves for a water heater, valve stems to operate valves to govern the admission of fluids to said heater, and adjustable interlocking members secured to said stems to govern the movement of the same and adapted to lock one of the stems when closed and to lock the other of the stems when opened.

## No. 100,154. Snow Melting Apparatus.

## Appareil à fondre la neige.

Louis T. Frigon and Andre C. Rousselle, assignee of a half interest, both of Montreal, Quebec, Canada. 24th July, 1906; 6 years. Filed 3rd July 1906. Receipt No. 137,488.
('laim.-1. In a snow melting apparatus, the combination comprising a snow receiving receptacle, means for subjecting snow to the direct action of a flame, means for subjecting snow to the indirect action of a flame, and means for conducting the melted snow from the receptacle.
2. In a snow meling apparatus the combination comprising a frame, closures hinged on the sides of the frame,
hinged closures for a portion of the top of the frame, removable closures for the remainder of the top of the frame,

solld closures for the remainder of the top of the frame, hinged closures for the remainder of the ends of the frame, means for subjecting snow within the apparatus to the direct and the indirect accion of flame, and means for conducting melted snow from the frame.
3. In a snow melting apparatus the combination comprising a receptacle, a grate in the receptacle, burners above and below the grate, troughs disposed adjacent the edges of the grate and projecting from the receptacle, and means for permitting the insertion of a nozzle adjacent the ends of the troughs.
4. In a snow melting apparatus the combination comprising a receptacle, a segmental grate having a flange and provided with vertical openings and with horizontal openings in the flange, burners disposed above and below the grate, troughs disposed adjacent the edges of the grate and projecting from the receptacle, and means for permitting the insertion of a nozzle adjacent the ends of the troughs.
5. In a snow melting apparatus the combination comprising a receptacle, a removably supported grate in the receptacle, burners above and below the grate, troughs removably supported adjacent the edges of the grate and projecting from the receptacle, and means for permitting the insertion of a nozzle adjacent the ends of the troughs.
6. In a snow melting apparatus the combination comprising a receptacle, a grate supported within the receptacle, burners above and below the grate, troughs disposed adjacent the edges of the grate and projecting from the receptacle, means for permitting the insertion of a nozzle adjacent the ends of the troughs, and inwardly and downwardly inclined snow deflector plates extending to the grate.
7. In a snow melting apparatus the combination comprising a receptacle, a grate in the receptacle, burners above and below the grate, funnel shaped flame deflectors around the burners, troughs disposed adjacent the edges of the grate and projecting from the receptacle, and means for permitting the insertion of a nozzle adjacent the ends of the troughs.
8. In a snow melting apparatus, the combination comprising a receptacle, a grate in the receptacle, burners above and below the grate, longitudinally disposed troughs, inclined from one end to the other of the receptacle and arranged adjacent the edges of the grate and projecting from the receptacle, anu means for permitting the insertion of a nozzle adjacent the ends of the troughs.
9. In a snow melting apparatus the combination comprising a receptacle, supporting straps having curved arms disposed in the receptacle, a grate removably disposed on the supporting straps, burners above and below the grate, troughs removably disposed in the arms and around and adjacent the edges of the grate, and projecting from tho receptacle, and means for permitting the insertion of a nozzle adjacent the ends of the troughs.
10. In a snow melting apparatus the combination comprising a receptacle, a removable grate disposed within the receptacle, snow deflector plates extending to the grate, inclined troughs arranged adjacent the edges of the grate, said receptacle being provided with openings adjacent the upper ends of the troughs, hinged closures for the openings. burners above and below the grate, and a downwardly arched heat deflector plate disposed above the grate.
11. In a snow melting apparatus the combination comprising a receptacle, a downwardly arched heat deflector plate carried in the receptacle, a segmental grate disposed below the deffector plate and provided with a flange and
having drainage openings in the flange and in the grate, a plurality of hydro-carbon burners above the grate, a plurality of hydro-carbon burners below the grate, oil and compressed air supply pipes connected to the burners, and water conducting members disposed adjacent the edges of the grate beneath the openings therein and extending outside of the receptacle.

No. 100,155. Frying Pan. Poćlon.

Peter A. Hanegraaf, Rossville, Illinols, U.S.A., 24th July, 1906; 6 years. Filed 28th June, 1906. Recelpt No. 137,370.
Claim.-1. In a device of the class described the combination with the pin, of the cover therefor hinged thereto and adapted to be turned back to support a dripping tray, means for holding the dripping tray in position on the turned back cover, and means for permitting the drippings to flow back from the cover into the pan.
2. In a device of the class described the combination with the pan, of the cover therefor hinged thereto, means for holding the cover open and in an inclined position relative to the pan and in position to receive a dripping tray, means for holding the dripping tray thereon, and means for permitting the drippings to flow from the cover over the edge of and into the pan.
3. In a device of the class described the combination with a pan, of the cover therefor hinged thereto and provided with the interior flange, and means for holding the cover open and in an inclined position, said flange being provided with an opening adapted to allow the drippings to flow from the cover over the edge of and into the pan.
4. In a device of the class described the combination with the pan, of the cover therefor hinged thereto and provided with an interior flange, means for holding the cover open and in an inclined position relative to the pan, an extension on the cover adjacent an opening provided in the flange, and an offset in the side of the pan to permit of the cover turning, all substantially as and for the purpose described.

No. 100,156. Overhead Tramway. Tramuay aérien.

William Heffron, Cincinnati, Ohio, U.S.A., 24th July, 1906; 6 years. Filed 26th June, 1906. Receipt No. 137,330.
Claim.-1. A portable overhead tramway comprising a set of uprights, diverging from their upper ends, members or
bars for connecting the upper ends of the oppositely placed
uprights, two horizontally disposed members or tracks suspended from said connecting members, one of said members or tracks being circuitous or endless, travellers adapted to move along said tracks or members, and means for controlling the operation of the same, substantially as shown and for the purposes described.
2. A portable overhead tramway comprising a set of uprights diverging from their upper ends, members or bars secured to the upper ends of the uprights, the member on the one upright adapted to overlap the member on the oppositely placed upright, two horizontally disposed members or tracks adjacent each other, means for securing the connecting members or bars at their upper ends of the uprights and for suspending the tracks, one of sald tracks being circuitous or endless, a rack secured to the other track, travellers adapted to ride along on said tracks, and means for controlling the operation of the same, substantially as shown and for the purposes described.
3. A portable overhead tramway comprising a set of uprights, members or bars connected at their upper ends of the uprights, the member or bar on the one upright adapted to overlap the member or bar on the oppositely placed uprights, transverse brace rods for connecting the lower ends of the oppositely disposed uprights, longitudinal members for connecting the lower ends of the adjacent uprights, horizontally disposed member or tracks adjacent each other, one of said members or tracks being circuitous or endless, and the other track provided with a rack, travellers adapted to ride along on said tracks, the traveller on the one track provided with a pawl or dog normally held in mesh with the rack on the track, and means for controlling the operation of said traveller, substantially as shown and for the purposes described.
4. A portable overhead tramway comprising a set of uprights diverging from their upper ends, members or bars connected to the upper ends of the uprights and transversely disposed, two horizontally disposed members or tracks suspended from the transversely nisposed members at their upper ends of the uprights, one of said tracks being circuitous or endless, the other track provided with teeth rack on its under side, a hoist block or traveller adapted to ride along on said track, said hoist block or traveller provided with a pawl or dog normally held in mesh with the rack, and means for controlling the operation of said traveller or hoist block from one end of the tramway, substantially as shown and for the purposes described.
5. A portable overhead tramway comprising a set of uprights, transversely disposed members or bars for connecting the upper ends of the oppositely placed uprights, transverse connecting rods or bars whereby the lower ends of the uprights are braced, longitudinally disposed members for connecting the lower ends of the adjacent uprights, two horizontally disposed tracks suspended from the transversely disposed members or bars at their upper ends of the uprights, one of said tracks provided with teeth or rack on its under side, the other track being circuitous or endless and extending about the outside of the uprights, brackets secured to the uprights and having connection with the part of the circuitous track to the outside of the uprights, a holst block or traveller adapted to ride along said track with the rack, said hoist block provided with a pawl or dog normally held in mesh with the rack on said track, and means for controlling the operation of the hoist block from one end of the tramway, substantially as shown and for the purposes described.
6. A portable overhead tramway comprising a set of uprights diverging from their upper ends at which the oppositely placed uprights are connected, two horizontally disposed members or tracks suspended between the uprights, one of sald tracks being circuitous or endless and extending around about the outside of said uprights, a holst block or traveller adapted to move along on said tracks, means intermediate of said hoist block and its track whereby it is normally held from movement in one direction, and means connecting with said hoist block or traveller, whereby its operation is controlled from one end of the tramway, substantially as shown and for the purposes described.

No. 100,157. Egg Crate. Manue pour les arufs.
Andrew D. Imrie, Andover, South Dakota, U.S.A., 24th July,
1906; 6 years. Filed 26th June, 1906. Receipt No. 137,308.
Claim.-A collapsible crate comprising a bottom inside hinged to sald minor member of said bottom, ends each comprising a major and minor member hinged together, the major member of one end being hinged to the satd side at one of its ends and the minor member of the other end being hinged to the said side at the other of its ends, a second side hinged to the major member of the first-named end, a lid comprising a minor section hinged to the last-named side and a major member hinged to the minor section, the said
major member of the bottom being adapted to lle with one of its faces against one of the faces of one of the major por-

tions of one of the ends and a portion of one of the faces of one of the sides.

No. 100,158. Form for Trousers.
Tendeurs de pantalons.

Alice Jones, Dehesa, California, U.S.A., 24th July, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,188.
Claim.-A trouser form having substantially the outline of a pair of trousers and adapted to be inserted in the leg thereof, said form comprising a body piece, a hip plece and a bottom plece, said hip plece and bottom piece having a flexible connection with said body piece whereby they may be folded thereupon.

No. 100,159. Nut Lock. Arêtr-ćrrou.

Henry Leonard Jinks. Crowell, Texas, U.S.A., 24th July, 1906; 6 years. Filed 26th June, 1906. Recelpt No. 137.310.
Clnim.-1. A nut lock comprising a nut, a bolt, sald bolt being provided with a transverse groove having inclined walls connected with a longitudinal groove, a locking pin adapted to flt into said grooves and having a flexible end adapted to lock said nut, substantially as described. 7-20
2. A nut lock comprising a nut, a bolt having a longitudinal groove, and a transverse groove, said transverse groove being provided with inclined walls, a locking pin adapted to fit into said grooves, and engaging one of sald inclined walls whereby said pin will be firmly locked to the bolt, and means for locking said nut, substantially as described.
3. A nut lock comprising a nut, a bolt having a longitudinal groove terminating at its inner end in a transverse proove, said transverse groove terminating in recesses, a locking pin having a resilient crosshead, said crosshead being provided with a pair of projections engaging recesses on opposite sides of said bolt, substantially as and for the purpose described.
4. A nut lock comprising a nut, a bolt having a longitudinal groove terminating in a transverse groove, sald transverse groove having inclined walls, an approximately $T$ shaped locking pin adapted to fit into said grooves, substantially as described.

No. 100,160. Nut Lock. Arréte-écrou.

Jerome Landry and Thomas O'Brien, co-inventors, both of Newcastle, New Brunswick, Canada, 24th July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,272.
Claim.-1. In a device of the character described, a bolt, a uut disposed on the bolt, and a split washer disposed on the bolt having its ends projecting beyond the medial plane of its body.
2. In a device of the character described, a bolt, a nut disposed on the bolt and provided with a recess therein, and a split washer disposed on the bolt and provided with a lug disposed in said recess and having its ends projecting beyond the medial plane of its body.
3. In a device of the character described, a bolt, a nut disposed on the bolt and provided with a recess extending from cne of its exterior faces, and a split washer disposed on the bolt and provided with a lug on one of its sides adapted to engage in said recess and having its ends projecting beyond the medial plane of its body.
4. In a device of the character described, a bolt, a nut disposed on the bolt, and a split washer disposed on the bolt, adapted to engage with the nut, and formed of flexible material, the ends of which project beyond the medial plane of its body.

## No. 100,161. Process of Obtaining Copper. <br> Procédé pour obtenir du cuivre.

Lucien Jumau, Parih, France, 24th July, 1906; 6 years. Filed 10th April, 1906. Recelpt No. 134,805.
Claim.-1. A process for obtaining pure copper trom a solution of copper, which consists in treating the solution with sulphurous acid or a sulphite, separating the cuprous sulphite thus obtained, treating it with an acid that cannot form a cuprous salt, collecting the metallic copper thus precipitated and melting or compressing this preclpitated copper into the form of ingots.
2. A process for obtaining pure copper from a solution of copper, which consists in treating the solution with sulphurous acid or a sulphite, separating the cuprous sulphite thus obtalned, treating it with an acid that cannot form a cuprous salt, collecting the metallic copper thus precipitated, comfressing the precipitated copper into a form suitable to constitute anodes and subjecting these anodes to electrolysis in an electrolytic refining bath.
3. In a process for obtaining pure copper wherein the copper is precipitated from a solution, a process of refining this precipitate electrolytically which consists in compressing
the precipitated copper to a form suitable to constitute anodes, and subjecting these anodes to electrolysis in an electrolytic refining bath.
4. A process for obtaining pure copper from a solution of copper, which consists in treating the solution with sulphurous acid or a sulphite, separating the precipitate of cuprous sulphite thus obtained, treating part of he precipitate with an acid which cannot form a cuprous salt, compressing into the form of plates on a suitable conducting support the cuprous sulphite, mixed or not with the precipitated copper, and subjecting these plates as anodes to electrolysis in an electrolytic refining bath.

No. 100,162. Desulphurizing Process.
Procédé à désulphuriser.

Miranda Malzac, Paris, France, 24th July, 1906; 6 years. Filed 26th July, 1904. Receipt No. 117,233.
Claim.-1. The herein described process of treating supphurous ores of metals by the combined action of ammonia gas, water and air at the ordinary pressure, with consecutive extraction of the metals, soluble in ammonia by the action of an ammoniacal solution at atmospheric pressure.
2. The herein described process of treating sulphurous ores of metals which consists in the consecutive hydration and dissolution of the metals by the combined action of ammonia gas and water at the ordinary pressure.
3. The herein described process of treating sulphurous ores of metals which consists in moistening the same with ammonia, treating the damp mass with air and lixiviating the mass.
4. The herein described process of treating finely pulverized sulphurous ores of metals, which consists in molstening the same with ammonia, treating the damp mass with air, and lixiviating the mass.
5. The herein described process of treating sulphurous ore 3 of metals, which consists in moistening the same with ammonia, treating the damp mass with air, and lixiviating the mass with ammoniacal solution.
6. The herein described process of treating sulphurous ores of metals, which consists in moistening the same with ammonia, treating the damp mass with alr, lixiviating the mass, precipitating the metals, and collecting and drying the precipitates.
7. The herein described process of treating sulphurous ores of metals, which consists in moistening the same with ammonia, treating the damp mass with air and lixiviating the mass, precipitating the metals, collecting and drying the precinitates and treating the mass with hydro-sulphuric acid.
8. The herein described process of treating sulphurous ores of metals, which consists in moistening the same with ammonia, treating the damp mass with air and lixiviating the mass and recuperating the ammonia.
9. The herein described process of treating sulphurous ores of metals, which consists in moistening the same with ammonia, treating the damp mass with air, lixiviating the mass and recuperating the ammonia by heat.
10. The herein described process of treating sulphurous ores of metals. which consists in moistening the same with ammonia, treating the damp mass with air, lixiviating the mass and recuperating the ammonia by heat and a vacuum.

## No. 100,163. Spavin Medicine.

## Médecine pour éparvin.

Edward Kidby Mahon, Peterborough, Ontario, Canada, 24th
July, 1906; 6 years. Filed 15th May, 1906. Receipt No. 135,954.
Claim.- 1 . The herein described composition of iodine, potassium iodide, water, liquor antimony chloride, glycerine, oll red cedar, alcohol, substantially as described and for the purpose specified.
2. The herein described composition of the matter for curing and removing spavins from the legs of horses consisting of lodine 4 parts, potassium lodide 2 parts, water 1 part, liquor antimony chloride 6 parts, glycerine 5 parts, oll red cedar 12 part, alcohol 15 parts.

No. 100,164. Churn Dasher. Batte de baratte.

James R. Merrell, Chelsea, Indian Territory, U.S.A., 24th July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137.241. Claim.-1. A churn dasher comprising two reversely rotatable dasher members, each dasher member having a propeller wheel made up of a hub and two radial blades and substantially parallel side bars rising from the outer ends of the blades with their upper ends converged, the parallel portions of the side bars being set obliquely at corresponding angles to radil and convolute in form, the side bars of one dasher member being disposed reversely to those of the other dasher member, a hub connecting the upper ends of the side bars of each dasher member, and a tle bar connecting the lower ends of the hubs, the distance between the hubs being less than the width of either dasher member, and said members being set at substantially right angles to one another, whereby the opposite side bars of the dasher members work successively in the space between the axis of the members.
2. A churn dasher comprising a pair of radial propeller blades, side members rising from the ends of the propeller blades in substantial parallelism with their upper ends converged, said side members being set obliquely at corresponding angles to radii and convolute in form, and a journal connecting the upper ends of the side members of the dasher.

## No. 100,165. Wheel. Roue.

David Alexander Moore, Kalamazoo, Michigan, U.S.A., 24th July, 1306; 6 years. Filed 27th June, 1906. Receipt No. 137,338.
Claim.-1. A wheel formed from plate or sheet metal and comprising a web portion and a rim portion integrally connected with the web portion and having tread and flange portions each of which is of greater thickness than the body of said rim portion.
2. A wheel having a rim portion formed from sheet or plate metal having an integral flange produced along one of

Its sides and having at said flange an integral tread portion of greater thickness than the body of said rim portion.
3. A wheel formed from plate or sheet metal and comprising a web portion, a rim integrally connected with the web portion and a flange produced at one side of the rim, said flange and the adjacent portion of the wheel rim being of greater thickness than the body of the rim portion.
4. A wheel comprising a hub, a web portion formed from plate or sheet metal and having at its central part means of attachment to one end of the hub, the outer part of sald web portion being flared towards the opposite end of the hub, a rim portion also formed from plate or sheet metal and integrally connected with the outer part of the web portion at one side but at other points out of contact with said web portion and having at its opposite side a flange and adjacent to said flange a tread portion of greater thickness than the body of the rim portion.

No. 100,166. Bag Handler. Appareil d manier les sacs.

Horace Sanborn and Ellet Sanborn, Portland, Maine, U.S.A., 24th July, 1906; 6 years. Filed 23rd June, 1906. Receipt No. 137,213.
Claim.-1. In a bag handler, a base plate provided with a sultable handle, the upper surface of stid base plate being provided with a multiplicity of fine teeth and held in position on said base plate in any suitable manner.
2. In a bag handler, a base plate having a handle attached thereto, the upper surface of said base plate being convex, a multiplicity of fine teeth on sald base plate and means for holding said teeth in position.
3. In a bag handler, a base plate provided with a suitable handle, the upper surface of sald base plate belng convex, a multiplicity of fine teeth removably attached to sald base plate and a suitable frame removably attached to said base for holding sald teeth in position.

No. 100,167. Harvester. Moissonneuse.
Fritz Wilhelm Schmidt, New Holstein, Wisconsin, U.S.A., 24th July, 1906; 6 years. Filed 30th May, 1906. Recelpt No. 136,412.
Claim.-1. A reaping machine comprising a vertically adjustable platform, cam controlled rakes supported by the
platform, and a cutting apparatus in floating connection with the latter, in combination with an attachment comprising an

apron in hinge connection with the floating cutting apparatus, and arranged at its free end to rest upon the reaper platform, and a series of reciprocatlve forks carried by the platiorm and disposed above the apron, whereby the material cut is delivered to the aforesaid rakes.
2. A reaping machine comprising a platform, cam controlled rakes, and a floating cutting apparatus in combination with an attachment comprising an apron in hinge connection with the cutting apparatus and arranged at its free end to rest upon the platform, a guard in hinge connection with the outer end of said cutting apparatus and reaper platform, a series of reciprocative forks disposed above the apron and the aforesald cutting apparatus, and driving means for the forks.

No. 100,168. Rack for 8toves. Ratelier pour poêles.

Joshua Terry, Draper, Utah. U.S.A., 24th July, 1906; 6 years. Flled 23th June, 1906. Recelpt No. 137,368.
Claim.-1. A rack attachment for stoves comprising plates depending members carried by the plates and having hooks at their lower ends adapted for engagement beneath the edge portion of a stove top, members slidably mounted upon the first-named members above the hooks and adapted for movement into and out of position to rest against a stove top with whlch the hooks are engaged to hold the latter against dis-

Digitized by
IT
)
d
engagement from the stove top, means for holding the second-named members in operative position, and article recelving devices carried by the plates.
2. In a rack attachment for stoves the combination of two supporting members each consisting of a plate and a plurallty of hooked members arranged at an angle to the plate, each hooked member being constructed and arranged for interlocking engagement with the rim of a stove and to bear upon the upper surface of said rim, and means for mutually connecting the supporting members and for holding said members against displacement when interlocked with the rim of a stove on opposite sides of a stove.

## No. 100,169. Preparation of Pyritic Ore Contain-

 ing Precious Metal.Préparation de mincrais pyitique contenant des métaux précieur.
The I. R. Refractory Ore Syndicate. assignee of William Blackmore and Alfred Howard, all of London, England, 24th July, 1906; 6 years. Filed 29th March, 1906. Receipt No. 134,401.
Claim.-1. A process for the treatment of pyritic ores fo: the recovery of valuable metals contained therein, consisting, of the roasting of the pulverized ore at a tomperature of about $800^{\circ}$ Fahrenhelt in the presence of an oxidizing agent consisting of air and steam so as to convert the sulphide of iron into normal or basis sulphate, of the leaching of the ore in acid liquors to dissolve the iron sulphate and of the separation of the solution from the solid residue containing the valuable metals, substantially as described.
2. In a process for the treatment of pyritic ores for the recovery of valuable metals contained therein consisting of the roasting of the pulverized ore at a temperature of about $800^{\circ}$ F. In the prosence of an oxidizing agent cousisting of air and steam so as to convert the silphite of irun into normal or basic sulphate, of the leaching of the ore in acid liquors to dissolve the iron sulphate and of the separation of the solution from the solid residue containing the valuable metals, the collection of the sulphurous gases evclved by the roasting treatment and their absorption by water to be used as the acid liquors in the process of solution of the iron sulphate, substantially as described.
3. A process for the treatment of pyritic ores containing cobalt, copper or nickel consisting of the roasting of the pulverized ore at a temperature of about $800^{\circ} \mathrm{F}$. in the presence of an oxidizing agent consisting of air and steam so as to convert the iron, copper, cobalt or nickel into sulphates, the leaching of those sulphates in liquors containing sulphuric acid and the treatment of the said liquors by precipitants to recover the metals therefrom, substantially as described.

No. 100,170. Loader. Chargeur.

D. Maurice Hartsaugh, James McCabe and Frank Crane, each an assignee of a third interest, all of Minneapolis Minnesota, U.S.A., 24th July, 1906; 6 years. Filed 7th May, 1906. Recelpt No. 135,642.

Claim.-1. In a device of the class described, a frame having carrying wheels, a receptacle supported upon the frame, a hingedly supported fork, arms pivoted upon the frame, pulleys on said arms, pulleys connected with the carrying wheels,
bands connecting the pulleys, means for manipulating the pulley carrying arms to tighten the bands, and flexible members connecting the bands with the fork.
2. In a device of the class described, a frame having carrying wheels, a receptacle supported upon the irame, a shaft journalled upon the frame, a fork connected with said shaft. and means for transmitting motion from the currying wheels to the fork to tilt the latter from a load receiving to a load discharging position.
3. In a device of the class described, a frame having carrying wheels, a receptacle supported upon the frame, a hingedly supported fork, arms pivoted upon the frame, pulleys upon said arms, pulleys upon the carrying wheels, bands connecting the pulleys, flexible members connecting the bands with the fork, adjusting levers, links connecting said levers with the pulley carrying arms, and means for retaining the levers at various adjustments.
4. A tubular axle carrying wheels journalled upon the axle, a flexible member guided through the latter, und draft members attached to the ends of the flexible member.
5. A tubular axle having guide members near its outer extremities carrying wheels upon sald axle, a flexible member extending through the axle and guide over the guide members, and draft members connected with the ends of the flexible member.
6. A tubular axle a frame connected therewith, a tiltable box supported thereon carrying wheels upon the axle, a fork hingedly connected with the frame, means for transmitting motion from the carrying wheels to the fork to tilt the latter from a load recelving to a load discharging position, a flexible member extending through the tubular axle and draft members connected with the ends of tho flexible member.
7. In a device of the class described, an axle having carrying wheels, a frame connected with the axle and having steering wheels, a tilting box hingedly connected with the frame, arms pivoted upon the sides of the box and carrying an end gate, brackets extending rearwardly from the sides of the frame, and links connecting said brackets with the side edges of the end gate.

## No. 100,171. Reaper and Binder.

Moissonncuse at liense.

George Devey Farmer, Ancaster, Ontario, Canada, 24th July, 1906; 6 ycars. Filed 11th April, 1906. Receipt No. 134, 840. Claim.-1. In a reaper and binder machine, a frame, vertical shafts mounted on the frame, sprockets on the shafts, eudless belts one above the other connecting the sprockets, cutting knives on the frame, vertical rods connecting the belts, cranks on the rods. rollers on the cranks adapted to follow a predetermined course and bent or curved fingers on the rods and extending over, said knives.
2. In a reaper and binder a frame, vertical shafts mounted thereon, sprockets on the shafts, endless belts on the sprockets, vertical rods connecting the belts, cranks or arm3 on the rods, rollers on the opposite ends of the cranks, a predetermined track for the rollers, a shield on the frame, grain knives on the frame, fingers on the rods and extending through the shield and over the knives.
3. In a reaper and binder a frame, vertical shafts mounted on the frame, sprockets on the shafts, belts on the sprockets, vertical rods connecting the belts, cranks on the rods, rollers on the cranks, a predetermined track for the rollers, grain cutting knives on the frame, a shield on the frame and in rear of the knives, and one end circling rearward, curved fingers extending from the rods, slots in the shield for the fingers, stops in the shield to reverse the operativeness of the sets of fingers in succession, and means in the track to adjust the sets of fingers in succession to operative position.
4. In a reaper and binder, a frame, vertical shafts mounted thereon, wheels on the shafts, belts on the wheels, vertical rods connecting the belts, cranks on the rods, rollers on the
cranks, sets of fingers extending horizontally from the rods, a track for the rollers, means to reverse the course of the sets of fingers in consecutive order, and means to reinstate said fingers.
5. In a reaper and binder, a irame, vertical shafts mounted thereon. wheels on the shafts, belts on the wheels, vertical rods connecting the belts, a track on the irame, means on the rods to traverse the track, fingers extending from the rods, means to reverse the course of the fingers on each conscutive rod, and means to reinstate the fingers.
6 In a reaper and binder a frame, vertical shafts mounted thereon, wheels on the shafts, belts on the wheels, vertical rods connecting the belts, a track on the frame, means on the rods to traverse the track. fingers extending from the rods, means to reverse the course of the fingers on each consecutive rod, and means to reinstate the fingers, and means to rotate binding mechanism.

## No. 100,172. Carbide Manufacture.

## Fabrication de carbure.

Herman Lewis Hartenstein, Constantine, Michigan, U.S.A., 24th July, 1906; 6 years. Filed 26th April, 1906. Recelpt No. 135.291 .
Claim.-In the manufacture of carbide, the method which consists in fusing lime and carbon containing elements to reduce the same to molten condition, and finally running off the molten mass into thin shects to chill the same.

No. 100,173. Carbureter. Carburatetr.

Stephen P. Sanders, Cupertino, California, U.S.A., 24th July, 1906; 6 years. Filed 26th June, 1906. Receipt No. 137,309.
Claim.-1. A carbureting machine having in combination iwo water contalning tanks, a bell in each tank, a receptacle submerged in one of said tanks and containing a llquid hydrocarbon, two tubes fixed to the bottom of the other tank and rising above the water level thereof, one of sald tubes containing an absorbent flling, means connecting the hydrocarbon receptacle of the one tank with one of the tubes of the other tank, an air supply connecting with the lube containing the flling, a pivotally mounted bucket suspended from the bell and operatable in the tube which receives the hydro-carbon from the receptacle, a pipe connection between the two tubes, and means whereby on the raising of the bell the bucket is elevated to deliver its charge of hydro-carbon into the pipe connection for saturating the filling of the other tube said bell in its descent forcing the carbureted air out of said filled tube, and means conducting the carbureted air to the bell of the other tank.
2. In a gas machine the combination of a water containing tank, a bell therein. a carbureter comprising a tube fixed in the tank and provided with an absorbent flling, said tube cpening into the top of the bell, a second tube in said tank and means for delivering hydro-carbon to sald second tube, a transverse connection between the two tubes, and means including a pivotally suspended bucket operatable in the hydro-carbon and connected with the bell. for delivering predetermined quantities of liquid from the second tube into the first tube above the filling thereof.
3. In a gas machine, the combination of a source of liquid hydro-carbon supply, a gas receiver, a tank to contain water, a bell in said tank a carburcter in the tank and discharging irto the bell, said carbureter comprising a tube submerged in the tank and containing an absorbent filling, said tube having its upper end open, means for delivering predetermined quantities of liquid from said source of supply into the carbureter, said delivery means including a pivotally suspended bucket operatable in the hydro-carbon and connected with the bell, means whereby on the lifting of the
bell a charge of air is drawn thereinto and through the carbureter, and connections between the interior of the bell and said receiver and through the carbureter whereby on the falling of the bell the air previously drawn thereinto is made to pass again through the carbureter.
4. A carbureting machine having in combination two water tanks placed side by side, a receiver for liquid hydro-carbon submerged in one of said tanks, two open-ended tubes fixed in the other tank and substantially submerged therein, and extending above the water level thereof, one of said tubes containing a flling of absorbent material, and the other tube coninecting with and adapted to hold liquid hydro-carbon, a bell for each tank, a tiltable bucket operatable in the liquid holding tube and connected to move with the bell of that tank, a pipe forming a transverse connection between the two tubes and into which pipe the bucket emptles its charge at intervals, means for vapourizing the liquid delivered to the tube containing the fllling, and means for delivering the carbureted air to the bell of the other tank.
5. In a gas machine, the combination of a carbureter having an absorbent filling, a carbureted alr receiver, connections between the carbureter and receiver, means for delivering a predetermined quantity of liquid into sald carbureter, said means including a tubular hydro-carbon receiver being ovoidal in cross section and a tubular bucket closed at one end and open at the other end and operable therein to make periodic delivery of hydro-carbon to the carbureter, and means for inducing a current of air through said carbureter in one diroction and for returning the same through the carbureter in an opposite direction to the receiver.
6. In a gas machine, the combination of a water tank, a bell therein, a carbureter in the tank and opening into the top of the bell, a gas receiver connected with the carbureter, an oil well in the tank, means for delivering liquid Into said well, means operated by the bell to discharge the quantity ot liquid from the well into the carbureter, said last-named means including a pipe connecting the oll well with the carbureter. a suspended bucket operatable in the oil well and tiltable to discharge into said connecting pipe, and means connecting the bucket with the bell, connections between the carbureter and a source of air supply, means for lifting the bell to induce a current of air through the carbureter and means to permit the bell to fall to expel the alr so induced through the carbureter.
7. In a gas machine, a carbureter, a gas receiver connected therewith, an oll well connected with a source of supply, connections between the well and carbureter above the normal level of the liquid in the well, means for alternately creating suction and compression in the carbureter, and means operated by said suction and compresion means for delivering a predetermined quantity of liquid from sald well into the carbureter, said last-named means Including a bucket connected to move with the bell and operatable in the oll well, said bucket being tiltably mounted wheroby it automatically discharges into the connection between said well and carbureter.
8. In gas machine construction, the combination of a tank, a bell therein, a carbureter, a recelver connected with the carbureter, means to reciprocate the bell, an oll well conrected with the carbureter and means to deliver a predetermined quantity of liquid into said carbureter, said well being of greater diameter in one direction than in the other and said means for delivering liquid from said well into the carbureter including an clongated bucket supported intermediate $o$ : its ends and suspended from the bell. and trip means in the path of the bucket to effect its discharge.

## No. 100,174. Tidal Motor. Moteur de vague.

George Whitman, Round Hill, Nova Scotia, Canada, 24th July,
1906; 6 years. Filed 12th April, 1906. Recelpt No. 134,869.
Claim.-1. In a tidal motor the combination with a pler head having a plurality of sluices at varying depths therethrough, of a plurality of water wheels suitably journalled and in the path of the water flowing through said sluices, shafts extending from said water whecls and rotated thereby, reservoirs arranged at different levels in proximity to said pier head, turbine wheels operated by the discharge from said reservoirs, a pump operated by one of sald water wheels and pumping water to the high level reservolr, and a main shaft rotated by said wheels and turbines, as and for the purpose specified.
2. In a tidal motor the comblation with the pierhead having a plurality of sluices at varying depths extending laterally therethrough, of a plurallty of water wheels sultably journalled and in the path of the water flowing through said sluices. shafts extending vertically through the platform of said heavl and rotated by said water wheels, a bigh level reservoir, a reservoir having its walls reach a helght slightly below the high tide level, a basin adjoining sald plerhead
and into which said sluices empty, turbines operated by the water force discharge from sa:d reservoirs respectively, a

pump operated by the lowermost of said water wheels and pumping water to the high level reservoir, and a main shaft rotated by said wheels and turbines, as and for the purpose specified.
3. In a tidal motor the combination with the pierhead having a plurality of slices at varying depths. of a plurality of water wheels sultably journalled and in the path of the water flowing through said sluices, shafts extending from said water wheels and rotated thereby, a high level reservoir feeding a suitable headrace. a turbine suitably journalled and in the path between said headrace and its tailrace, a reservoir having its walls reach a height slightly below high tide level and feeding a headrace, a turbine suitably journalled and in the path betwern said headrace and its tailrace, a basin adjoining said pierhead and into which said sluices empty on the inflow of the tide. a pump operated by the lowermost water wheel and pumping water to the high level reservoir, and a main shaft operatively connected to the water wheels and to the turbines, as and for the purpose specifled.
4. In a device of the class described in combination, a high level reservoir feeding a headrace, a lower level reservoir feeding a headrace and fed by the flow of water at high tide over its walls, a pierhead having sluices therethrough arranged at varying depths, a solid bed within its walls, and a platform thereabove, a basin adjoining the side of said pierhead and into which said sluices empty on the inflow of the tide, water wheels supported over said solid bed and suitably journalled and in the path of the water flowing through said sluices. shafts extending from said water wheels and rotated thereby, turbines suitably journalled between said headraces and their tailraces. a main shaft journalled in suitable bearings supported from said pierbead, and transmitting connections between said shafts from said water wheels and said turbines to the main shaft, as and for the purpose specified.
5. In a device of the class described in combination, a pierhead suitably enclosed by walls or bulwarks and having a platform thereover, and sluices through said walls at varying depths, a basin adjoining one side wall of said pierhead into which said sluices empty on the inflow of the tide bearings in said platform and sluice walls, shafts journalled in said bearings and extending above said platform, water wheels mounted on said shafts and arranged in the path of the water flowing through said sluices and rotating said shafts, reservoirs at different levels feeding suitable headraces, turbines suitably journalled and arranged between said headraces, and their tailraces, transmitting devices connecting said turbines and said main shaft and said water wheel shaft and said main shaft. and a pump driven by one of said water wheels and pumping water to the high level reservoir, as and for the purpose specified.
6. In a devlec of the class described in combination a pierhead having side and end walls and a platiorm closing in said walls from above, and slices through said side walls. a basin adjoining one of said side walls into which said sluices head having side and end walls, and a platform elosing in said platform and the sluice walls, shafts jurnalled in said bearings and extending above the platform. water wheels mounted on said shafts towards their lower ends in the path of the water flowing hrough said sluices and rotating said shafts, gear wheels mounted at the top of said shafts, a high level resproir feming a headrace and a lower level roservoir feeding a headrace, beariugs supported from said platform betwern said headraces and their tailraces, turbines mounted on and rotating sald shafts and arranged in the path of the llow of water belween said headraces and said tailraces.
gear wheels secured on said shafts, a main shaft journalled in bearings supported from said platiorm, gear wheels mounted on said main shaft, shafts suitably journalled and having gear wheels mounted at each of the ends thereof coacting with the gear wheels at the ends of the turbine and water wheel shafts. and the gear wheels on the main shaft, a suitable clutch mechanism securing said gears to the shaft, and a pump driven by one of said water wheels and pumping water to the high level reservoir, as and for the purpose specifled.

No. 100,175. Construction of Subaqueous Tunnels. Construction de tunnels sous l'eau.

Fig. 1

William John Wilgus, New York City, New York, and Howard Adams Carson, Malden, Massachusetts, U.S.A., 24th July, 1906; 6 years. Filed 8th May, 1906. Receipt No. 135,703.
Claim.-1. The herein described method of constructing subaqueous tunnels. the same consisting in locating an outer shell or mould at the bottom of the water on a suitable foundation, making the same substantially watertight, removing the water therefrom, and finally forming the tunnel walls proper within said shell or mould.
2. The herein described method of constructing subaqueous tunnels, the same consisting in locating an outer shell or mould on a suitable foundation at the water bottom, removing the water therefrom and preventing its return by the aid of compressed air. and then forming the tunnel walls prope: within said shell or mould.
3. The herein described method of constructing subaqueous tunnels, the same consisting in locating an outer shell or mould on a suitable foundation at the water bottom, removing the water therefrom and preventing its return by the aid of compressed air. then rendering the interior surface of said shell or mould waterproof, and finally forming the tunnel walls proper within said shell in contact with said waterproof surface.
4. The herein described method of constructing subaqueous tunnels, the same consisting in locating an outer shell or mould on a suitable foundation at the water bottom. remoring the water therefrom and preventing its return by the aid of compressed air, and finally forming of concrete the tunnel walls proper within said shell.
5. The herein described method of constructing subaqueons tunnels, the same consisting in locating an outer shell or mould on a suitable foundation at the water bottom, making said shell or mould more or less watertight, removing the water therefrom and preventing its return by the aid of compressed air, coating the inner surface of said shell with a waterproofing material, and finally forming the tunnel walls proper of concrete in contact with said coating.
6. The herein described method of constructing subaqueous tunnels, the same consisting in first locating an outer shell or mould on a suitable support at the water bottom but allowing a space between said bottom and the under surface of said shell or mould, fllling said space with foundation material, removing the water from said shell or mould and preventing its return by the aid of compressed air, and then forming the tunnel walls proper within said shell or mould.
7. The herein described method of constructing subaqueous tunnels. the same consisting in locating a series of outer shell sections on suitable foundations at the water bottom. temporarily preventing the passage of water from one to another of said sections, removing the water from successive sections and preventing its return by the aid of compressed air , and then forming the tunnel walls proper in the successivo sections.
8. The herein described method of constructing subaqueous tunnels. the same consisting in first locating an outer shell or mould on suitable slightly elevated supports at the water bottom. constructing a foundatinn between said shell and water botom. removing the water from said shell, coating the interior of said shell with a waterproofing material, and
then forming of concrete the tunnel walls proper within said shell.
9. The herein described method of constructing subaqueous tunnels, the same consisting in first locating a series of saddles along the water bottom in the line of the proposed tunnel, placing a series of longitudinal sections of outer shells on said saddles; making the joints between adjacent ends of the sections subtantially water tight by wrapping flexible material thereabout, and covering with concrete or grout, surrounding the shells with foundation and filling material, removing the water from said outer shells, and finally forming the tunnel walls proper within said shells.
10. The herein described method of constructing subaqueous tunnels, the same consisting in first locating a series of saddles along the water botton in the line of the proposed tunnel, placing a series of longitudinal sections of outer shells on said saddles, making the joints between adjacent ends of the sections substantially water tight by wrapping flexible material thereabout and covering with concrete or grout, surrounding the shells with foundation and filling material, removing the water from said outer shells and preventing its return by the aid of compressed air, and finally forming the tunnel walls proper within said shells.

No. 100,176. Mould. Moule.

Erastus H. Van Natta, assignee of Lewis M. Pratt, both of Belleville, Kansas, U.S.A., 24th July 1906; 6 years. Filed 26th May, 1906. Receipt No. 136,271.
Claim.-1. In a moulding machine the combination with a mould, of a reciprocatory head against which the plunger detachably bears, an actuating hand lever fulcrumed beneath the head and having an angularly disposed link member rigidly carried thereby, another link member pivoted at one end to the said angularly disposed link member and pivoted at its other end to the head, and independently manually operated means engaging the plunger to move the same away from the head.
2. In a moulding machine the combination with a mould, of a reciprocatory plunger movable therein, a reciprocatory head detachably bearing against the plunger, toggle lever mechanism pivotally connected to the head for moving the same and thereby the plunger, a rod interposed between the head and plunger and bearing against the latter to carry the same away from the head, said rod being detachable from the head, and a lever having a link connection with the rod.
3. In a moulding machine the combination with a table having a mould therein, of means mounted on the table for feeding material to the mould, a reciprocatory plunger movable in the mould, a reciprocatory head against which the plunger detachably bears, an actuating hand lever fulcrumed beneath the head and having an angularly disposed link. member rigidly carried at its inner end, the outer end of said lever projecting beyond the table, another link member pivoted at one end to said angularly disposed link member and pivoted at its other end to the head, another manually actuated lever fulcrumed bencath the table and projecting beyond the same, and means connected to the inner end of the latter lever and associated with the plunger for moving the same away from the head.
4. In a moulding machine the combination with a mould, of a reciprocatory pressing and ejecting plunger movable therein, spaced guldes located beneath the mould, one of said guides having a slot, a reciprocatory head slidably
mounted on the guides and detachably engaging the plunger, toggle links pivoted to each other and to the head for reciprocating the same, a lever having a fixed connection with the lower set of links for moving the same, a reciprocatory device passing through the slot of the guide and engaging the plunger to carry the same away from the head, and a lever having a link connection with said device.

No. 100,177. Apparatus for Recovering Precious Metals.
Appareil pour obtenir des métaux précieus.

The Garvin Cyanide Extracton Company, assignee of Edward J. Garvin, all of Portland, Oregon, U.S.A., 24th July, 1906; 6 years. Filed 24th January, 1906. Receipt No. 132,212.
Claim.-1. In an apparatus of the class described, the combination with a main tank for receiving the pulverized ore and solvent, of a separate tank, including means for separating the material, attached to the main tank near its top, and an amalgamating tank including means for amalgamating the material suspended above the main tank, a hopper or funnal suspended within the main tank, and a spreading cone on the bottom of the main tank, and means for causing a continuous circulation of the materials and solution through said tanks.
2. In an apparatus of the class described, the combination with a main tank and a precipitating tank into which the main tank discharges and an amalgamating tank which discharges into the main tank, and means for causing a continuous circulation of fluids through said tanks, of a funnal shaped hopper suspended within the main tank and discharging within the main tank and discharging at a point below the outlet to the main tank, substantially as shown and described.
3. In an apparatus of the class described, the combination with a main and a precipitating tank into which the main tank discharges and an amalgamating tank which discharges into the main tank, and means for causing a continuous circulation of fluids through said tanks, of a funnel-shaped hopper suspended within the main tank and discharging at a point below the outlet to the main tank, and a coneshaped spreader supportable in the bottom of the main tank directly under the suspended funnel, substantially as shown and described.
4. In an apparatus of the class described, the combination with a main tank and a precipitating tank into which the main tank discharges, and an amalgamating tank which discharges into the main tank and means for causing a contlnuous circulation of fluids through said tanks, of a concshaped spreader supportable on the bottom of the tank, substantially as shown and described.
5. In an apparatus of the class deseribed. a tank having a conical bottom and a central disiharge from said bottom, and an outlet near the fop of said tank, a funnel-shaped hopper suspended within the tank and discharging at a point below the upper discharge aperture of the tank, substantially as shown and described.
6. In an apparatus of the class described, a tank having a conical bottom and a rentral discharge from said bottom, and an outlet near the top of said tank, a funnel-shaped hopper suspended within the tank and discharging at a point below the upper discharge aporture of the tank, and a cone-shaped spreader supported on the conical bottom of the tank within the same, substantially as shown and described.
7. In an apparatus of the elass described a tank having a conical bottom and a central discharge from said bottom,
and an outlet near the top of said tank, a funnel-shaped hopper suspended within the tank and discharging at a point below the upper discharge aperture of the tank, a cone shaped spreader supported on the conical bottom of the tank within the same, and directly under the discharge spout of the funnel-shaped hopper, substantially as shown and described.
8. In an apparatus of the class described the combination with a main tank and a supplemental tank discharging into the main tank, of a separating tank into which the main tank discharges, said separating tank comprising a rectangular casing, a pair of shafts spaced apart and rotatably mounted; in the casing, sprocket wheels carried by said shafts, endless chains taking over said sprocket wheels, a plurality of metallic strips connecting said endless chains, means for turning said shafts on their axis, a pair of anode plates projected downwardly into said casing with their lower edges above the bottom thereof, a supplemental anode plate projected upward from the bottom of said casing with its upper edges below the upper edge of the casing, a mercury pocket at the bottom of said casing into which the endless chains and the metallic strips are adapted to dip, an outlet for said casing, and means for causing a continuous circulation of fluids through all of said tanks, substantially as shown and described.
9. In an apparatus of the class described, a tank or receptacle, said tank or receptacle having a concaved bottom, a rotatable shaft mounted within said receptacle near the bottom, a similar shaft mounted in said receptacle near the top, sprocket wheels carried by said shafts, endless chains passing over said sprocket wheels, and a plurality of metallic strips carried by said endless chains, said concaved bottom adapted to hold an amalgamating substance, said strips adapted to be passed through said amalgamating substance, and means for rotating said shafts to carry said strips through said amalgamating substance, substantially as shown and described.
10. In an apparatus of the class described, a tank or receptacle, said tank or receptacle having a concaved bottom, a rotatable shaft mounted within said receptacle near the bottom, a similar shaft mounted in said receptacle near the top, sprocket wheels carried by said shafts, endless chains passing over said sprocket wheels, and a plurality of metallic strips carried by said endless chains, said concaved bottom adapted to hold an amalgamating substance, said strips adapted to be passed through said amalgamating substance, means for rotating said shafts to carry said strips through said amalgamating substance, a pair of anode plates held within said receptacle and spaced from the bottom thereof, a supplemental anode plate held within said receptacle with its upper edge below the upper edge of the flrst-mentioned anode plates and its lower edge engaging the bottom of the receptacle, substantially as shown and described.

No. 100,178. Press. Presse.

John Albert White, Denver, Colorado, assignee of George Patchett White, Wallace, Idaho, U.S.A., 24th July, 1906; 6 years. Filed 19th May, 1906. Receipt No. 136,075.
Claim.-1. A press comprising a pair of sliding heads, a sliding presser head mounted between said sliding heads. means for drawing one of said sliding heads and the said presser head together.
2. A press comprising a pair of reciprocating heads, a reciprocatirg presser head mounted between said first-mentioned heads, means for drawing one of said first-mentioned heads and the said presser head together.
3. A press comprising a pair of horizontally reciprocating hears, a pressure rod connecting said reciprocating heads, a horizontally reciprocating presser head mounted between said first-mentioned heads, means for drawing one of said first-mentioned heads and the said presser head together.
4. A press composed of a pair of heads, a reciprocating presser head mounted between said heads, means for forcing said presser head toward one of said first-mentioned heads.
5. A rress comprising a pair of heads, a moable presser head mounted between said heads, and means for reciprocating said presser head.
6. A press comprising a pair of heads slidably mounted on a frame, pressure rods connecting said heads, a presser head slidably mounted between said heads, a mould box pivoted to said frame between one of said heads and the said presser head, means for drawing one of said heads and said presser head toward each other adapted to compress material placed in said mould box.
7. A press comprising a pair of heads, a reciprocating presser head between said heads, toggles pivoted to said reciprocating heads and to one of said first-mentioned heads, a compound presser crank adapted to impart a movement to said toggles.
8. A press comprising a pair of heads, a movable presser head mounted between them, a toggle connecting said movable presser head with one of the first-mentioned heads, crossheads, connected with said toggle, and a toggle for operating said crossheads.
9. A press comprising a pair of heads, a movable presser head mounted between them, a toggle conecting said movable presser head with one of the first-mentioned neads, a crosshead connected with said toggle, a toggle for operating said crosshead, a crank shaft having presser cranks, the said presser cranks pivoted to the last-mentioned toggle, and means for oscillating the said crank shaft.
10. A press comprising slidably mounted heads, pressure rods connecting said heads, a presser head slidably mounted between said first-mentioned heads, a set of toggles adapted to provide means for actuating said heads and said presser head, and means for actuating said toggles.
11. A press comprising a pair of heads slidably mounted on suitable guide bars secured to a frame, pressure rods connecting said heads, a presser head also mounted on said guide bars between said heads, toggle mechanism pivotally attached to said presser head and to one of said first-mentioned heads, and means for operating said toggle mechanism.
12. A press comprising a pair of heads mounted in a horizontally slidable manner on suitable guide bars, pressure rods connecting said heeads, a presser head mounted in a reciprocating manner on said guide bars between said heads, toggle arms pivoted to one of said first-mentioned heads and to said reciprocating head, crossheads to which the opposite ends of the toggle arms are pivoted, guides ior said crossheads, a crosshead shaft attached to said crossheads, connecting arms pivoted to said crosshead shaft, presser cranks secured to a crank shaft and to said connecting arms, and means for imparting an oscillating movement to said crank shaft.
13. A press of the character described comprising a pair of sliding heads mounted on a frame, pressure rods connecting said heads, a sliding presser head mounted between said sliding heads, means for drawing one of said sliding heads and the said presser head toward each other.
14. In a press, a pair of heads slidably mounted on a frame, pressure rods connecting said heads, a pressure head mounted between said heads, a mould box placed between said presser head and one of said slidable heads adapted to be supported on the said frame, toggles connecting said presser head with one of said sliding heads, a crank shaft operating in bearings secured to the frame, presser cranks secured to said crank shaft, a starting crank shaft operating in eyes provided in said presser cranks, starting cranks secured to said starting crank shaft, connecting bars pivoted to said starting cranks and to the shaft to which said toggles are connected, and means for imparting an oscillating movement to said crank shaft.
15. A press comprising a suitable frame, heads slidably mounted on said frame, adjustable pressure rods connecting said heads, a presser head slidably mounted on said frame between said first-mentioned heads, means for drawing one of said sliding heads and said presser head toward each other, a mould mounted on said frame between one of said sliding heads and said presser head, a lowering stand adapted to receive the moulded product as it comes from the mould, said lowering stand comprising vertical guide rods, a frame mounted in a vertically reciprocating manner on said guide rods, and means for actuating said frame, an angle device adapted to provide means for turning the moulded product from the position it occupies when it comes from the mould. said angle device comprising angle bars and cross tie rods recesses provided in said angle bars at the angles thereof adapted to engage the tie rods of the frame of the lowering stand.
16. The combination in a moulding machine of a frame, 1cngitudinal guide bars attached to the sides thereof, reciprocating heads mounted on said guide bars, pressure rods connecting said heads, a reciprocating presser head also mounted on said guide bars between said first-mentioned
heads, divers toggles pivoted to one of said reciprocating heads and to said presser head, vertical cross head guldes secured to said guide bars, crossheads operating therein and having said toggles pivoted thereto, a crosshead shaft connecting said crossheads, a chank shaft operating in bearings secured to the base of said frame, presser cranks secured to said crank shaft, a starting crank shaft operating in eyes provided in said presser cranks, starting cranks secured to said starting crank shaft, connecting bars pivoted to said starting cranks and to said crosshead shaft, means Yor imparting an oscillating movement to said starting shaft adapted to start the toggles in their movement and to draw one of said reciprocating heads and said presser head toward each other, and means for imparting an oscillating movement to said crank shaft adapted to fully operate sald toggles and draw the last-mentioned reciprocating head and said presser head nearer together.
17. The combination in a moulding machine of a frame suitable presser mechanism mounted on said frame, a mould box mounted in a revoluble manner between said presser mechanism, a pallet adapted to be clamped upon the top of said mould box over the material to be moulded, means for holding said mould box in the desired position, and a lowering stand adapted to receive the moulded product as it comes from the mould box and to provide means for removing it a sufficient distance to allow the mould box to be revolved
18. The combination in a moulding machine of a frame, longitudinal guide bars secured thereto extending beyond the front leg or supporting frame thereof, heads mounted in a slidable manner on said guide bars, pressure rods connecting said heads, an adjustable hand wheel operating sprockets adapted to adjust one of said heads which is attached: to said pressure rods, a presser head adapted to reciprocate upon said guide bars between said first-mentioned heads. suitable means for actuating said heads adapted to draw one of said first-mentioned head's and said presser head toward each other, a mauld box mounted on said guide bars, a pallet placed over the top of said mould box, clamping devices adapted to hold said pallet in a fixed position, means for manipulating said clamping devices, recesses provided in the ends of said mould box, a plunger pin adapted to operate in said recesses manipulated by a spring, a lever providing means for releasing said plunger pin from said recesses, a lowering stand to receive the moulded product as it comes from the mould box, and an angle device comprising angle bars and tie rods adapted to facllitate the removal of the pallet from beneath the moulded article, substantially as described.
19. The combination in a moulding machine of a frame, a mould mounted thereon, means for inverting the mould, and a lowering stand having a platform adapted to be moved under the mould and to receive the moulded article therefrom.
150. 100,179. Spark Arrester. Arrête-étincelles.

William Charles John Hall and Murray Kennedy, assignec of a half interest, both of Quebec, Quebec, Canada, 24th July, 1906; 6 years. Filed 25th May, 1906. Recelpt No. 136,204.
Claim.-1. The combination with a locomotive smoke stack, or a spark arresting hood formed of wire mesh supported a short distance above the top of the stack and separated therefrom by an open space, and a cinder basket carrled by the stack adapted to recelve the sparks or cinders imping-
ing upon and falling from the hood, substantially as des cribed.
2. A spark arrester comprising a wire mesh hood supported a short distance above the stack, and a wire mesh basket of greater circumferential measurement than the hood and encircling and carried by the stack with its upper edge on a level with the top thereof, substantially as described and for the purpose set forth..
3. A spark arrester comprising a wire mesh hood of inverted saucer form, means displaceably supporting said hood a short distance above the stack, and a wire mesh basket of greater circumferential measurement than the hood and encircling and carricd by the stack with its upper edge on a level with the top thereof, substantially as described and for the purpose set forth.
4. A spark arrester comprising a wire mesh hood of inverted saucer form, a strap supporting said hood a short distance above the stack, bolts securing such strap to the stack and a wire mesh basket of greater circumferential measurement than the hood and encircling and carried by the stack with its upper edge on a level with the top thereof, substantially as described and for the purpose set forth.
5. A spark arrester comprising a wire mesh hood of inverted saucer form, a strap supporting said hood a short dis tance above the stack, bolts securing such strap to the stack and a wire mesh basket of greater circumferential measurement than the hood and encircling the stack with its upper edge on a level with the top thereof and a clamp displaceably securing the basket in place, substantially as described and for the purpose set forth.
6. A spark arrester comprising a collapsible wire mesh hood supported a short distance above the stack, and a displacement wire mesh basket of greater circumferential measurement than the hod and encircling and carried by the stack with its upper edge on a level with the top thereof, substantially as described and for the purpose set forth.
7. The combination with a locomotive smoke stack, of a spark arresting hood, mounted so as to be movable to a fosition above but allowing an open space between it and the stack, or movable to one side of the stack, with means for retaining the hood in its operative position, substantially as described and for the purpose set forth.
8. The combination with a locomotive smoke stack, of a spark arresting hood, and a cinder receiving basket, the hood being mounted so as to be movable to a position above but allowing an open space between it and the stack, or movable to one side of the stack, and the basket being slidable up and down the stack, with means for retaining both hood and basket in their operative positions, substantially as described and for the purpose set forth.
9. The combination with a locomotive smoke stack, of a spark arrester in the form of a hood of wire mesh extending completely across the top of the stack and means for supporting same a short distance above such stack so as to leave an open space between stack and hood, substantially as described.

## No. 100,180. Nodules of Metalliferous Material. Nodules de maticres métallifères.

The National Metallurgic Company, Jersey City, New Jersey, assignee of Tom Cobb King, New York City, New York. U.S.A., 24th July, 1906; 6 years. Filed 27 th April, 1906. No. 135,325 .
Claim.-As a new article of manufacture, a permanently anhydrous and porous nodule, adapted for the subsequent reduction of its contained metallic oxides, made from finely divided natural or artificially prepared metalliferous materials, concentrates or by-products, in which the metals exist in the form of oxides, cohered by partial fusion, and uncontaminated by any added foreign deleterious substance, or any binder materially reducing the per centum of metallic constituents in the original finely divided material nodulized.

## No. 100,181. Desulphurising Method.

Méthode de désulphuriser.
The Natíonal Metallurgic Company, Jersey City, New Jersey, assignce of Tom Cobb King, New York City, New York, U.S.A., 24th July, 1906; 6 years. Filed 27th April, 1906. Receipt No. 135,326 .
Claim.-The herein described method or process of treating finely divided substances containing iron compounds, which consists in subjecting such compounds, when moistened sumcient to mass the same to heat varying or ranging from degrees or temperatures sufficient to desulphurize, to degrees or temperatures sufficient to agglomerate or sinter, and imparting thereto during the application of sadd heat a rotary progressive movement in any suitable manner, whereby the sald material is converted into numerous nodules or lumps.

No. 100,182. Electric Arc Furnace.
Fournaise ćlectrique à arc.

La Socitété Anonyme de Métallurgie Electro-Thermique Paris, assignee of Antoine Henri Imbert, 75 Avenue de la Republique, Grand Montrouge, France, 24th July, 1906 6 years. Filed 27th June, 1905. Receipt No. 126,416.
Claim.-1. An electric furnace exclusively heated by radiation comprising one inclined charging flue, a fusing chamber closed at the back by a wall, and one electric arc situate near the entrance of the charging flue to the fusing chamber, the electrodes entering the fusing chamber through opposite walls, substantially as specified.
2. An electric furnace exclusively heated by radiation comprising one inclined charging flue, narrowing as it rises, a fusing chamber, one electric arc with electrodes entering the fusing chamber through opposite walls about half way up the fusing chamber, and a tapping hole for the meial in the back wall of the fusing chamber, substantially as specified.
3. An electric furnace comprising one inclined charging flue, narrowing as it rises, a charging table, a fusing chamber closed at the back by a wall, a double arch enclosing an air space over the fusing chamber and charging flue one electric arc with electrides passing through the side walls of the fusing chamber, and cold water coolers about the holes, a tapping hole in the back wall of the fusing chamber, an auxilliary tapping hole for the slag in the side wall of the fusing chamber, and a passage for carrying off the gases to the chimney, substantially as specifled.

No. 100,183. Sill and Lintel Machine.
Moule pour seuils et linteaux.

Frank A. Borst, South Bend, Indiana, U.S.A., 24th July, 1906 6 years. Filed 9th June, 1906. Receipt No. 136,735.
Claim.-1. In a concrete moulding machine the combination of a frame, a top for the same and a knockdown mould comprising a rear side plate adjustably secured to the top, a front side plate hinged to the top, end plates hinged to the front side plate, and a bottom plate carried by the end plates.
2. In a concrete moulding machine the combination of a frame, a top for the same, a mould comprising a rear side plate adjustably secured to the top, a front side plate hinged to the front of the top, end plates hinged to the ends of the front side plate, and a bottom carried by the end plates, and means for securing the parts together.
3. In a concrete moulding machine the combination of a frame, a mould mounted on said frame comprising a iront
plate hinged to the frame, a back plate secured to the frame and adjustable with reference to the front plate, end plates and a bottom plate carried by the end plates.
4. In a concrete moulding machine the combination of a frame. a top for the same and a knockdown mould comprising a rear side plate, a front side plate hinged to the top, end plates and a bottom plate carried by the end plates.
5. In a concrete moulding machine the combination of a frame and a mould mounted on said frame comprising a front plate hinged to the frame, a back plate secured to the frame and adjustable with reference to the front plate, end plates, a removable bottom plate mounted on the end plates and means to adjust the position of the bottom plate.
6. In a concrete moulding machine the combination of a irame and a mould mounted on said frame comprising a front plate hinged to the frame, a back plate secured to the frame. end plates hinged to the front plate and a removable bottom plate and means adjustably secured to the ind plates for carrying said bottom plate
7. In a concrete moulding machine the combination of $a$ frame, a mould mounted thereon, projecting side bars connected to said frame, a shaft mounted in the forward ends of the side bars, and carrier bars pivoted to the frame at their rear ends and adjustably supported at the front ends by said shaft, said mould in part adapted to be turned to discharge the moulded article onto the carrier bars.
8. In a concrete moulding machine the combination of a frame, a mould mounted thereon, projecting side bars connected to said frame. a shaft mounted in the forward ends of the side bars, carrier bars pivoted to the frame at their rear ends and adjustably supported at the front ends by said shaft. said mould in part adapted to be turned to discharge the moulded article onto the carrier bars, and means connected to said shaft and adapted to move the moulded articles forward.
9. In a concrete moulding machine the combination of a frame having a main and a forwardly projecting portion, a shaft journalled in said forwardly projecting portion, a hinged mould mounted on said portion and adapted to be swung forward to discharge the moulded article onto the forwardly projecting portion, and means connected to said shaft for conveying article forward.
10. In a concrete moulding machine the combination of upright legs, a top connecting the same, a hinged mould mounted on said top, said mould adanted to be swung forward to discharge the moulded article onto the side bars connected to said legs, a shaft mounted in the forward ends of the side bars, and means connected to said shaft and carried by said side bars for conveying the article forward.
11. In a concrete moulding machine the combination of an upright frame, a hinged mould mounted thereon, projecting side frames connected to said upright frame, a shaft mounted therein, and vertically movable bars pivoted at one end on the frame and supported at the other end by said shaft and adapted to receive the moulded article from the mould when the same is turned to discharging position, and lower the article onto the side frames.
12. In a concrete moulding machine, the combination of an upright frame, a mould mounted on the same comprising a stationary back plate, and front, end and bottom plates adapted to be swung to carry the moulded articles to discharging position, said end plates provided with means to secure the gallet to the mould, forwardly extending frames connected to the main frames, a shaft carried by said forwardly extending frames, cams carried by said shaft, carrier bars mounted on pins on said upright frame and resting on said cams and adapted to receive the moulded articles from said mould and lower the same onto the forwardly extending frames, and means connected to said shaft for conveying said moulded article forward.

## No. 100,184. Corn Shock Binder.

```
Licuse à blé-d'inde.
```

John C. Crosin, Philadelphia, Pensylvania, U.S.A., 24th July $1906 ; 6$ years. Fiied 13th June, 1906. Receipt No. 136,856.
Claim.-1. In combination, a casing open at both ends, one of its faces having a portion removed and having a perforation in its opposite face, a sheave within the casing. a flexible connection engaging the casing at one end and secured at its opposite end to a pin adapted to pass througla the perforation of the casing, said flexible connection passing around the sheaver within the casing, and means carried by the casing for engaging and holding the connection against displacement.
2. In combination a casing having both ends open, said casing having a notch in one end of its top, and having the opposite end portion of the top removed, said casing having an aperture or opening in the bottom, sain aperture being near the end of the casing having a top portion removed, a sheave within the casing near the end having the notch' in its top, a hook at the opposite end of the casing, a connec-
tion engaging the hook and passing exteriorly of the casing and entering the casing at the opposite end, passing around

the sheave and extending to the exterior of the casing, a pin secured to the end of said conncction, said pin being adapted to pass through the aperture of the casing, and a cleat carried by the top of the casing.
3. In combination a casing open at both ends, one of its faces having a portion removed and having a perforation in its opposite face, a sheave within the casing, a flexible connection engaging the casing at one end and secured at its opposite end to a pin adapted to pass through the perforations of the casing, said flexible connection passing around the sheave within the casing.
4. In combination a casing open at both ends, one of its faces having a portion removed and having a perforation in its opposite face, a sheave within the casing, a flexible connection engaging the casing at one end and secured at its opposite end to a pin adapted to pass through the perforation in the casing, said flexible connection passing around the sheave within the casing, sald casing having a notch in one of its faces to receive the connection.

## No. 100,185. Carbide Manufacture.

 Fabrication de carbure.Herman Lewis Hartenstein, Constantine, Michigan, U.S.A., 24th July, 1906; 6 years. Filed 26th April, 1906. Receipt No. 135,290 .
Cloim.-1. In the manufacture of carbide the method which consists in first fusing lime and carbon containing elements to reduce the same to liquid or fluid condition, and finally supnlying carbonaceous material to the mass in a molten condition, to complete the conversion of metaliic elements or particles of the mass.
2. In the flanufacture of carblde the method which consists in first fusing lime containing material with only a small percentage of carbon, to reduce the same to liquid or fluid state, and them applying carbonaceous material to the molten mass while in fluid or liquid condition to complete the conversion.
2. In the manufacture of carbide the method which consists in first fusing lime containing material in the presence of only a small amount of carbon, to reduce the same to liquid or fluid state, then beating a mould or other receptacle, and applying thereto carbon in a finely divided state, and finally delivering the molten mass while still in a liquid or fluid condition into such mould, whereby the finely divided carbon completes the conversion of any unconverted metallic particles of the mass.

## No. 100,186. Carbide Manufacture.

## Fabrication de carbure.

Herman Lewis Hartensteln, Constantinc, Michigan, U.S.A., 24th July, 1906; 6 years. Filed 26th April, 1906. Receipt No. 135,292 .
Claim.-1. In the production of carbide, the method which consists in applying to the interior surface of a suitable mould a material impervious to water, and then flowing the molten carbide in fluid state directly from the furnace into such mould, whereby the carbide is uniformly coated and impregnated superficially with the said material while fluld and in a state of incandescence, as and for the purpose set forth.
2. In the production of carbide, the method which consists In applying to the interior surface of a suitable mould a preparation of tar. and then flowing the molten carbide in fluid state directly from the furnace into such mould, whereby the carbide is uniformly coated and superficially impregnated wth the tar while fluid and in a state of incandescence, as and for the purpose set forth.
3. In the production of carbide, the method which consists ir. applying to the interior surface of a suitable mould a preparation of tar, then heating such mould and finally flowing the molten carbide in fluid state directly from the furnace into such heated mould, whereby the carbide is uniformly coated and superficially impregnated with the tar while in a state of incandescence, as and for the purpose set forth.
4. It the production of carbide. the method which consists in applying to the interior surface of a suitable mould a combined plastic and pulverulent material impervious to water, and finally flowing the molten carbide in fluid state from the furnace directly into such mould, whereby the carbide is uniformly coated superficially impregnated with the said material while fluid and in a state of incandescence, as and for the purpose set forth.
5. In the production of carbide, the method which consists in applying to the interior surface of a suitable mould a preparaton of tar and pulverulent material, and finally flowing the molten carbide in fluid state from the furnace directly into such mould, whereby the carbide is uniformly coated and superficially impregnated with the tar while fluld and In a state of incandescence, as and for the purpose set forth.
6. In the production of carbide, the method which consists is applying to the interior surface of a suitable mould a preparation of tar and carbonaccous material, and then flowing the molten carbide in fluid state from the furnace directly into such mould, whereby the carblde is uniformly coated and superficially impregnated with the tar while fluid and in a state of incandescence, as and for the purpose set forth.
7. The method which consists in coating the interior surfaces of moulds with tar mixed with coke in a finally divided condition, then heating such moulds and finally delivering carbide in melted and fluid condition into the heated mould, whereby a protecting coating is applied to the surface of the carbide, as and for the purpose set forth.

## No. 100,187. Mould for Cement Blocks. <br> Moule pour blocs de ciment.

John Millin, Toronto, Ontario, Canada, 24th July, 1906; 6 years. Filed 15th June, 1906. Recelpt No. 136,932.
Claim.-1. In a cement block machine, the combination with a table having a central opening therethrough, of a plurality o: folding members hinged at the edges of said opening and forming the sides of a mould, a vertically slldable frame carrying a platform below said opening, and means for raising and lowering said frame, as and for the purpose specifled.
2. In a cement block machine, the combination with a trble having a central opening therethrough, of a plurality of folding members hinged at the edges of said opening and forming the sides of a mould, a vertically movable platform helow said opening, means from said movable platform for engaging and swinging the said folding members, and means tor raising and lowering said movable platform, as and for the purpose specified.
3. In a cement block machine, the combination with a table having a central opening therethrough, of a pair of fulding side plates and a pair of folding end plates forming the sldes of a mould and hinged at the edges of said opening, a vertically movable platlorm below the said opening, a plurality of angular uprights secured to sald movable platform and extending upwardly beyond the said table and engaging the edges of the folding side and end plates at each corner of the mould, means for securing the upper ends of said uprights in their relative positions, and means for raising and lowering said movable platform and opening and closing said mould, as and for the purpose specified.
4. In a cement block machine, the combination with a table having a central opening therethrough, of a pair of colding side plates and a pair of folding end plates forming the sides of a mould and hinged at the edges of said opening, a vertically movable platform below the said opening, a clurality of angular uprights secured to said movable platform and extending upwardly beyond the said table and having outwardly flaring tops and engaging the ends of the side and end plates at each corner of the mould, tie rods adjustably secured to said uprights and holding them in their relative positions, a core removably secured to said movable platform, means for securing said core to said platform, means for releasing said core, a mould board or palette surrounding said core and forming a bottom to said mould, means for raising and lowering said movable platform and withdrawing said core and releasing the sides of said mould, and means for swinging the sides of said mould outwardly, as and for the purpose specified.
5. In a cement block machine, the combination with a table having a central opening therethrough, of a pair of folding side plates and a pair of folding end plates forming the sides of a mould hinged at the edges of said opening, a vertically movable platform below the said opening, a plurality of angular uprights secured to said movable platform and extending upwardly beyond the said table and having outwardly flaring tops and engaging the ends of the side and cnd plates at each corner of the mould, tie rods adjustably secured to said uprights and holding them in their relative positions, a core removably secured to said movable platform having prejecting lugs from the base thereof, a bracket secured to said movable platform and engaging one of said lugs, a spring latch secured to said movable platform for engaging the other of said lugs, means for releasing said lstch, a mould board or palette surrounding said core and forming a bottom to said mould, means for raising and lowcring said movable platform and withdrawing said core from said mould and releasing the sides of said mould, and means for swinging the sides of said mould outwardly, as and for the purpose specified.
6. In a cement block machine, the combination with a table having a central opening therethrough, of a pair of folding side plates and a pair of folding end plates forming the sides of a mould hinged at the cdges of said opening. a vertically movable platform below the said opening, a vertically movable platform below the said opening, a plurality of angular uprights secured to said movable platform and extending upwardly beyond the aforesaid table and having outwardly flaring tops and engaging the ends of the side and end plates at each corner of the mould, tie rods adjustably secured to said uprights and holding them in their relative positions, a core removably secured to said movable platform having projecting lugs from the base thereof, a bracket secured to said movable platform and engaging one of said lugs, a spindle journalled in brackets secured to said movable platform having a handle secured to the outer end thereof, a spring latch fixedly secured to said spindle and engaging the other of the lugs on the base of said core, a mould koard or palette surrounding said core and forming a bottom to said mould, means for raising and lowering said movable platform and withdrawing said core from said mould and releasing the sides of said mould, and means for swinging the sides of said mould outwardly. as and for the purpose specifled.
7. In a cement block machine, the combination with a table having a rectangular central opening theretbrough and cpenings to the outside of said central opening. of hinge brackets secured to said table at the edges of said central opening, folding side and end plates hinged to said hinge brackets and forming a mould. a vertically movable platform supported beneath the said opening, angular uprights secured to said movable platform and extending upwardly through the openings in the said table and engaging the said side and end plates at the corners of the mould and having outwardly flaring upper ends, adjustable rods connecting the upper ends of said uprights and holding them in their relative positions, a core removably secured to said movable platform. a mould board or palette surrounding said core and forming a bottom to said mould, a shelf secured to the frame of the aforesaid table below the said movable platfirm, journal bearings on said shelf, a rock shaft journalled in said bearings, a gear segment fixedly secured to said rock shaft, a gear rack secured to the said movable platform and meshing with said segment, means for rocking said rock shaft, and means for holding said movable platform in different positions, as and for the purpose specified.
8. In a cement block machine, the combination with a table having a rectangular central opening therethrough and epenings to the outside of said central opening, of hinge brarkets sccured to said table at the edges of said central opening, folding side and end plates binged to said hinge

Ibrackets and forming a mould, a vertically movable platform supported below the said table, a plurality of angular uprights secured to said movable table and extending upwardly through the openings in the aforesaid table and engaging the said side and end plates at the corners of the mould and having outwardly flaring upper ends, adjustable rods connecting the upper ends of said uprights and holding them ir their relative positions, a core removably secured to said movable platform, a mould board or palette surrounding said core and forming a bottom to said mould, a shelf secured to the frame of the aforesaid table below the sald movable platform, journal bearings on said shelf, a rock shaft journalled in said bearings, a gear segment flxedly secured to said rock shaft, a gear rack secured to the said movabla platform and meshing with said segment, a quadrant secured ts the frame of the said table, and a lever secured to said rock shaft having a spring catch engaging the teeth of said quadrant, as and for the purpose specified.
9. In a cement block machine the combination with a table having a rectangular central opening therethrough and openings to the outside of faid central opening, of hinge brackets secured to said table at the edge of said central opening, folding side and end plates hingedly supported on said hinge brackets and forming a mould, a vertically movable platform supported bencath said opening, angular uprights secured to said movable table and extending upwardly through the openings in the aforesaid table and engaging the said side and end plates at the corner of the mould and having outwardly flaring upper ends, adjustable rods connecting the upper ends of said uprights and holding them in their relative positions, a core removably secured to said movable platform, a mould board palette surrounding said core and forming a bottom to said mould, a shelf secured to the frame of the aforesaid table below the said movable platform, means supported on said shelf for raising and lowering said movable platform, a plate supported from said shelf and removably secured to one of said end plates of the mould, means for adjusting the height of said plate, a hopper slidably arranged on said plate and adapted to surround the top of said mould, as and for the purpose specified.
10. In a cement block machine the combination with a table having a rectangular central opening therethrough and openings to the outside of said central opening, of hinge brackets secured to said table at the edges of said central opening. folding side and end plates hingedly suported on said hinge brackets and forming a mould, a vertically movable platform supported below the aforesaid table, angular uprights secured to said movable platform and extending upwardly through the openings in the aforesaid table and engaging the said side and end plates at the corners of the mould and having outwardly flaring upper ends, adjustable rods connecting the upper ends of said uprights and holding them in their relative positions, a core removably secured to said movable platform, a mould board or palette surrounding said core and forming a bottom to said mould, a shelf secured to the frame of the aforesaid table below the said movable platform. means supported on said shelf for raising and lowering said movable platform, a plate flexibly secured at one end to one of the end plates of the mould, an adjustable arm pivotally secured to the under side of said plate and an arm fixedly secured to said shelf and supporting said adjustable arm, and a hopper slidably arranged on said plate and adapted to surround the top of said mould, as and for the purpose specifled.
11. In a cemept block machine the combination with a table having a central opening therethrough, of side and end plates hinged at the edges of said opening and forming a mould, one of said side plates having projections from the back thereof forming jaws, a lever having arms pivotally secured in said jaws and recesses in said arms intermediate of their length, a plate having projections from the back thereof and pivoted in the recesses in said arms and a plurality of $V$ shaped grooves in the face thereof, a plurality of blocks having suitable faces and V-shaped projections on the back thereof to engage the grooves in the said plate, a vertically movable platform beneath the opening in the said table, a plurality of angular guides secured to said movable platform and extending upwardly above the aforesaid table and engaging the said side and end plates, a plurality removably secured to said movable platform having a plurality of vertical cross plates extending upwardly therefrom, a mould board or palette supported below said side and end plates and forming a bottom to said mould and having a plurality of cross slots therethrough to register with the said vertical cross plates, and means for raising and lowering said movable platform, as and for the purpose specified.
12. In a device of the class described, a table having a central opening therethrough, wings hinged at the edges of said opening, and means rising through said opening for completing the mould in readiness for the materlal, as and for the purpose specified.

No. 100,188. Mould. Moule.

Elmo H. Reed, Wichita, Kansas, U.S.A., 24th July, 1906; 6 years. Filed 28th May, 1906. Recelpt No. 136,331.
Claim.-1. In a block moulding machine the combination with a fixed frame, of a core, a mould having sides and a bottom plate, the bottom plate and one of the sides being tiltable together and away from the remaining side, means for adjusting the tlltable bottom and side laterally relative to said core, means for laterally adjusting the remaining side relative to said core, end plates for the mould, and means for adjusting sald end plates toward and from said core, whereby the relative position of the core to the walls of the mould may be maintained in moulding blocks of different sizes.
2. In a block moulding machine the combination with a fixed frame, a mould having a tilting side and bottom plate, a relatively fixed side, a sliding core adapted to pass through an aperture in the non-tiltable side wall and to extend to the opposite side, means for shifting sald core toward and from said tiltable side wall, means for adjusting the tiltable bottom and side laterally relative to said core, means for adjusting the remaining side wall laterally relative to said core, end plates for the mould, and means for adjusting said plates toward and from said core, whereby the relative positlon of the core to the walls of the mould may be maintained in blocks of different sizes.
3. In a device of the class described, a mould box having an apertured side wall and insertable members adapted to enter said apertures, supporting rods for said members at opposite ends of the machine, a bar carrying said members and slidably mounted upon said rods, a rock shaft and operating handle, a slotted arm carried by sald rock shaft to engage a member carried by said bar. an outwardly swinging bottom and side wall to said mould, a rock shaft for said swinging walls, an operating handle carried by said rock shaft, means for adjusting sald side walls toward and from each other, and insertable slotted moulding walls extending above said side and end walls of the mould.
4. In a device of the class described, a mould box comprising slde walls adjustable toward and from each other, insertable moulding walls extending above the top of said side walls and there provided with a series of slots, division plates connected together and disposed in said slots, and a vertically adjustable follow board disposed in said mould.
5. In a device of the class described, a mould box comprisIng side walls adjustable toward and from each other, insertable moulding walls extending above the top of said side walls and there provided with a series of slots, division plates connected together and disposed in said slots, a vertically adjustable follow board disposed in sald mould, a depending stem from said follow board, a rock shaft provided with an arm, a pivoted link extending between sald arm and stem and an operating lever carried by said rock shaft.
6. In a device of the class described, a mould box comprising side walls adjustable toward and from each other, insertable moulding walls extending above the top of said side walls and there provided with a serles of slots, division
plates connected together and disposed in said slots, a vertically adjustable follow board disposed in said mould, a depending stem from said follow board, a rock shaft provided with an arm, a pivoted link extending between said arm and stem, an operating lever carried by said rock shaft, a telescoping rod extending within sald stem, and an adjustable set collar carried by the rod for retaining the stem in adjusted position.
7. In a device of the class described, a mould box comprising side walls adjustable toward and from each other, insertable moulding walls extending above the top of sald side walls and there provided with a series of slots, division plates connected together and disposed in said slots, a vertically adjustable follow board disposed in said mould, a depending stem from said follow board, a rock shaft provided with an arm, a pivoted link extending between sald arm and stem, an operating lever carried by said rock shaft, a latch carried by said operating lever and engaging projections extending from the end of the machine to co-operate with sald lever.
8. In a device of the class described, a mould box comprising opposite end walls, a rock shaft extending at one side thereof, a bottom and side walls pivotally mounted upon said rock shaft, bearings for said rock shaft provided with upwardly extending standards, supporting rods beyond the ends of the box and mounted in said standards, an insertable member carried by said rods, and an oppositic side wall of the mould box.
9. In a device of the class described, a mould box comprisIng opposite end walls, a rock shaft extending at one side thereof, a bottom and side walls pivotally mounted upon said rock shaft, bearings for said rock shaft provided with upwardly extending standards, supporting rods beyond the ends of the box and mounted in said standards, an opposite side wall of the box having apertures through which sald rods extend, and a carrier bar slldably mounted upon said rods and carrying insertable members adapted to pass within the mould box.

## No. 100,189. Apparatus for Sorting Chips.

Appareil à tricr les copeauce.

Howard Powers, Lincoln, and The Jolbert Construction Company. Berlin, both in New Hampshire, U.S.A., assignee of four-fifths of the interest. 24th July, 1906; 18 years. Filed 9th June, 1906. Receipt No. 136,724.
Claim.-1. An apparatus for separating chips comprising a receptacle for a body of water and a series of jet plpes arranged near the water level but above the level of the same and having their orifices all faced in one direction for progressively feeding the chips along the surface of the water.
2. An apparatus for separating chips comprising a receptacle for a moving body of water, made deep at one end to retain the heavy sinkable pieces and having a shallow spillway at the other end. and jet pipes arranged above the level of the spill-way and having their orifices all faced in one direction for producing a current along the surface.
3. An apparatus for separating chips comprising a tank, a spill-way at the upper level of the tank, a water supply pip: having a plurally of branches with valves, one of sald branches serving to supply the tank for maintaining the spillway, and the other branches having jet pipes arranged above the level of the spill-way and having their orifices all faced in one direction to maintain a surface current toward th. spill-way.
4. An apparatus for separating chips comprising a tank, a spill way at the upper level of the tank inclining downwardly and outwardly, a water supply pipe having jet pipes located above the level of the spili-way for maintaining a surface current toward the spill-way, and one or more jet pipes located on the spill way to keep it from clogging.

No. 100,190. Mail Cap Plate.
Fruille pour tites de clous.

$0^{2}$

F. W. Bird and Son, assignte of George Russell Wyman, all of East Walpole. Massachusetts. C'S.A., 24th July, 1906; 6 years. Filed esth June, 1906 . Receipt No. 137.280.
rlaim.-A nail cap plate formed of sheet metal having a rectangular plain marginal bearing surface and a rectangular raised center of less diameter than the marginal portion, the corners of said center forming strengthening ribs.

No. 100,191. Tile. T'uile.

The American Loktile Company, assignce of Alfred Du Montier, both of Washington, District of Columbia, U.S.A., 24th July, 1906; 6 years. Filed 8th June, 1906. Receipt No $136,693$.
Claim.-1. As an improved article of manufacture, a tile provided with a projection at one edge. said projection being bent upon itself and provided with cement receiving spaces. and at the opposite edge with a lip of less width than said projection whereby the cement is received in said spaces between the outer edge of the projection and the lip enclosed by said projection.
2. As an improved article of manufacturc, a tile formed with a bent over portion at one edge with openings, in sai. 1 bent over portion and a lip at the opposite edge, the said bent over portion being of a greater width than the said lip whereby the said openings extend over and beyond the lip of an adjacent tile when engaged in the space between the bent over portion and the body of the tile.
3. A till formed with a projection at one edge with cement receiving spaces and at the opposite edge with an offset lip, of less width than said projection, the said projection beinc bent upon itself with the said spaces adabted to extend over and beyond the lip of the adjacent tile to receive cement in said spaces between the outer edge of the projection and th. li* enclosed thereby.
4. As an improved article of manufacture a tile formed at one edge with a projection bent upon itself and the bent over portion provided with cement recoiving spaces and with a space to receive a lip on an adjacent tile, the said spaces bring of greater width than the said lip and the latter formed with means for interlocking with its adjoining tile
5. Tiles formed upon their adjaront edges with a slide lock joint, one member of the said lock joint having cement rebeiving spaces extending beyond the other member to receive the cement and allow the latter to contact with the other member of said lock joint.
f. As an improved article of manufacture, a tile forme 1 unon one side with a bent over projection having cement receiving spaces and a space for the reception of a lip on an
adjacent tile, said spaces being of greater width than an overlapping said lip, and at one end with a bent over projection with openings and at the opposite end with a lip which latter is offset.
7. A tile having at one edge a bent-over portion with cement receiving spaces and a space to receive a lip on an adjacent tile, and at the other edge with an offset lip, said lip being of less width than the bent over portion whereby when engaged with another tile the cement will enter said spaces beyond the lip and bind the same in place.
8. A tile formed at one edge with a bent-over portion having openings to receive the cement and with a space to recrive a lip on an adjacent tile, and at the opposite edge formed with a lip of less width than the bent-over portion and having bendable tongue.
9. A tile formed at one edge with a bent-over portion having spaces to receive the cement and openings to receiv tongues on the edge of the adjacent tile, and at the opposite edge formed with an offset lip of less width than the bent over portion and having bendable tongues aaapted to enter said openings.
10. Tiles interlocked with each other and formed with slide lock joints with one member narrower than the other and with bonding spaces overlapping the sald narrower portion for the reception of the cement whereby the cement may encage the tongue portion of the lock.
11. A tile formed with a bent-over portion of a slide lock joint of greater width than the co-operating portion of the joint and with spaces through said portion to serve as clings for the cement upon the co-operating portion of the joint and means for the reception of means on an adjacent tile to lock the two together before laying in a wall.

No. 100,192. Tire. Pnew.

The Salisbury Tire Company, and Oliver D. Salisbury, both of Owosso, Michigan, U.S.A., 24th July, 1906; 6 years. Filed 23rd April, 1906. Recept No. 135,156.
Claim.-1. A tire comprising an inner tube, an outer casing of leather inclosing said inner tube upon the sides and adjacent the tread and having outwardly turner edges, 'a base band connceting and having its edges secured to said out turned edges, and means for securing said edges rigidly to the rim of a wheel.
2. A tire comprising an inner tube, an outer casing of lather inclosing said inner tube upon the sides and adjacent the tread and having outwardly turned edges, a base band connocting and having its edges secured to said out turned edges and means for securing sald edges rigidly to the rim of a wheel.
3. A tire comprising a casing with outwardly turned edges, a base band connecting and having its edges secured to said out turned edges, a rigid binding strip disposed upon said cut turned edges and provided with openings registering with openings in the edges of the casing and the base band and adapted to permit the passage therethrough, of bolts to secure the tire to the rim of a wheel and means for inflating the casing.
4. A tire comprising an inner tube, a flexible outer casing inclosing said inner tube upon the sides and adjacent the tread and having outwardly turned edges, a filling material interposed between the tube and the casing, a base band connecting and having its edges secured to the out-turned edges and a rigid binding strip disposed upon said out-turned edges and provided with openings registering with openings in the edg's of the casing and the base band and adapted to promit the passage therethrough of bolts to secure the tire to the rim of a wheel.
5. A tire comprising an inner tube, a leather outer casing inclosing said inner tube upon the sides and adjacent the tread and having outwardly turned edges, a fabric interposed between the filling and the casing, a strengthening strip of leather with bevelled edges interposed brtween the fabric and the casing and adjacent the tread, a base band of leather connecting and having its edges secured to the outturned edges of the casing, a rigid binding strip disposed upon the out-turned edges and provided with openings registering with openings in the edges of the casing and base band and adapted to permit de passage therethrough of bolts to secure the tin to the rim of a wheel and a tread strip of leather removably secured to and without the casing.

No. 100,193. Tire. Pucu.

William J. Storrs, assignee of William A. Field, both of Chicago, Illinols, U.S.A., 24th July, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,i10.
Claim.-1. In a wheel the combination with a felloe having in its periphery an annular groove, of a tire in the outer portion of said groove, a loosely mounted rim within said groove for supporting said tire, a series of segmental plates or blocks within said groove and beneath said rim, springs for elastically supporting said segmental blocks, radially disposed studs projecting inwardly from the inner face of said rim and through openings in said felloe, coil springs upon the free ends of said studs, and adjusting devices upon said studs.
2. In a wheel the combination with a felloe having in its periphery an annular groove, of a tire in the outer portion of said groove, a loosely mounted rim within said groove for supporting said tire, a series of segmental plates or blocks within said groove and beneath said rim, springs for ciastically supporting said segmental blocks, means for varying the tension of said springs, radially disposed studs projectIng inwardly from the inner face of said rim and through slots in said felloe, nuts upon the threaded ends of said studs, coil springs upon said studs between said nuts and zaid felloe, and means for centering said studs in said slots and holding them in a radial position.
3. In a wheel the combination with a felloe having in its periphery an annular groove, of a tire in the outer portion or said groove, a loosely mounted rim within said groove for supporting said tire, a series of segmental plates or blocks within said grooves and beneath said rim, springs for elastically supporting sald segmental blorks. m.ans for varying the tension of said springs, radially disposed studs projectIng inwardly from the inner face of said rim and through slots in said felloe, nuts upon the threaded ends of said studs, coil springs upon said studs between said nuts and said felloe, pins slidable in recesses in said felloe and disposed upon opposite sides of said studs, hads upon said pins and engaged with sald studs, and coil springs surrounding said pins and confined between their heads and shoulders in said recesses, substantially as described.
4. In a wheel the combination with a felloe having in its periphery an annular groove and a series of radially disposed slots, of a tire in the outer gortion of said groove, a rim in said groove for supporting said tire, a series of studs projecting inwardly from the inner face of said rim and through the slots in said felloe, adjusting nuts upon the threaded ends of said studs, coll springs upon said studs between said nuts and said felloe, and coil springs adjustad upon opposite sides of said studs for centering the latter in their slots and maintaining them in radial position, substantially as described.

No. 100,194. Pneumatic Tire. Pneu pneumatique.

('harlas R. Twichell and James M. Brennan, assignee of a half interest, both of Los Angeles, California, U.S.A., 24th July. 1906; 6 years. Filed 30th April, 1906. Receipt No. 135,401.
Claim.-1. The combination with a wheel rim having opposite edge flanges, of a tire casing of substantially uniform thickness and having two sories of hooks secured thereto al or near its edges, cach of said hooks having an inner secured portion and an outer flange engaging portion, which latter is spaced away from the casing so as to accommodate and interlock with the rim flanges, the connecting portions between said inner and outer portions of the hooks being designed to contact with the edges of the rim as the casing is expanded.
2. The combination with a wheel rim having opposite edge flanges, of a tire casing having two series of hooks secured thereto near the edges thereof, one series being located a greater distance from one edge of the casing than the other series is in respect to the other edge, sald former edge constituting a flap, and all of said hooks being spaced away from the casing so as to accommodate and interlock with said edge tlanges, and means for preventing the casing from creeping on the rim.
3. The combination with a wheel rim having opposite flanges formed with edge recesses. of tire casing having two series of hooks secured thereto near the edges thereof, one stries being located a greater distance from one edge of the casing than the other series is in respect to the other edgo, said former edge constituting a flap. and all of said hooks being spaced away from the casing, and of width subctantially equal to that of said recesses, the interlocking of the hooks with the recessed edges of the wheel rim preventing the casing from creeping on the latter.
4. The combination with a wheel rim having opposite flanges formed with spaced apart edge recesses, of a casing o: substantially uniform thiekness from edge to edge, and two serias of hooks secured to the casing near its edges, one series being located a greater distance from one edge of the casing than the other series is in respect to the other odge, said former edge constituting a flap, said hooks being designed to enter said recesses of the rim flanges, the interlocking of the hooks with the lattor preventing the easing from creeping on the rim.

## No. 100,195. Rubber Tire Guard.

Garle pour pucu de caoutchoue.
The Slama Tire Protector Company, assigner of Lewis Slama. all of Humboldt, Nebraska. U.S.A.. 2tth July, 1906; if years.. Filed 25th May, 1:4nt. Receipt No. 136.234.
Cluim. 1. A rubber tire guard compristing a network of attornating cruciform links and ring like links and means for securing the guard to a tire.
2. A rubber tirc guard comprising a network of alternating - ruciform and ring-like links the arms or members of th. cluciform links being extended through the ring-like links and folded upon themsclios
8. A rubber tire guard comprising a notwork of alternating rruciform and ring-like links, the arms or members of th. cruciform links being extended through the ring-like links and folded upon themselves. and rivels extending through the cruciform links end engaging with the folded ends of th, arms.

1. A rubber tire guard comprising a network of alternating cruciform links and ring-like links, wires for securing the guard to a tire, and tightening devices on said wires.
2. A rubber tire guard comprising a network of alternating cruciform links and ring like links, the arms or members of

the cruciform links being extended through the ring-like links and folded upon themselves, supplemental links connected to the side links of the guard, wires extended through said supplemental links, and turn buckles for tightening said wires.

No. 100,196. Tire Inflating Device. Apparcil à gouftcr les pneus.

Gabriel Alexander Bobrick, Los Angeles, California, U.S.A., 24th July, 1906; 6 years. Filed 17th April, 1906. Receipt No. 134,951.
CLaima-1. A tire inflating means comprising a truck or wheeled support, a charging tank for holding liquefled or compressed gas, said tank being detachably supported on said truck to enable substitution of a charged tank for an exhaust tank, a reducing valve connected to said tank through a union, a pressure gauge connected to said reducing valve, a manual valve connected to the reducing valve, a flexible tube connected to the said manual valve and provided with a coupling for attachment to the inflating valve of a pneumatic tire to enable connection of the charging tank to any one of a number of tires of a vehicle, substantially as shown and described.
2. Inflating means for automobile tires comprising a truck or wheeled support, a frame thereon provided with an adjustable clamp, a tank detachably supported by said clamp and adapted to hold liquefied or compressed gas, sald tank having a safety device for relief of excessive pressure, and an outle: valve, a reducing valve connected to said outlet valve to reduce the pressure to the amount required for tire inflation, a gauge connected to the reducing valve for indicating the pressure thereon, a manual valve connected to receive gas at the reduced pressure from the reducing valve, and a flexible tube connected to said last-named valve and provided with a coupling for connection to the valve of a pneumatic tire, substantially as shown and described.

## No. 100,197. Apparatus for Placing Pneumatic Tires on Wheel Rims.

Apparcil pour placer les pneus pneumatiques sur les roues.
Cecil Beckwith, Cave-Brown-Cave. Chesham Boie Place, Chesham, Buckingham, England, 24th July, 1906; 6 years. Filed 1st May, 1906. Receipt No. 135,433.
Claim.-1. In a vehicle wheel having a detachable metallic rim holding a beaded edge pneumatic tire the combination
with the felloe, of a metallic tire carrying rim, a pair of side flanges one of which is detachable, and a plurality of divided

security bolts, each being composed of a shank passing radially through the felloe and rim and a detachable head situated between the beaded edges of the tire cover, the whole being constructed and adapted to operate, substan$t$ :ally as described and for the purpose specified.
2. In a vehicle wheel having a detachable metallic rim holding a beaded edge pnoumatic tire the combination with the folloe, of a metallic tire carrying rim, a pair of detachable side tlanges adapted to be pressed against the sides of the rim and a plurality of divided security bolts, each of which is comnosed of a shank passing through the rim and felloe and a detachable head situated between the edges of the tire cover and adapted to rest on the circumference of the rim.
3. In a vehicle wheel having a detachable metallic rim holding a beaded edge pneumatic tire the combination with the felloe, of a pair of side flanges, one of which is detachable and a plurality of divided security bolts passing radially through the felloe and rim, the bolt holes being wider in a direction parallel with the wheel axis, than at right angles thereto, substantially as and for te purpose described.
4. In vehicle wheels with detachable rims and pneumatic tires, a security bolt composed of a shank passing radially through the felloe and rim and a detachable head situated between the edges of the tire cover and adapted to fit the circumference of the air tube, the bolt head having a cavity facing the air tube and a narrower central opening for admitting tine shank to the said cavity. the said opening having a radial recess and the extremity of the shank having a lateral projection adapted to pass through the said recess into the said cavity and then to be turned in the same, substantially as described.
Ј. A security bolt for detachable pneumatic tire carrying rims composed of a shank passing radially through the rim and felloe and having at its extremity a lateral projection, with a detachable head situated between the edges of the tire cover and adapted to touch the circumference of the air tube, the said bolt head having a cavity facing the uir tube, and a narrower central opening adapted to admit the extremity of the shank into the said cavity, the base of the said cavity having a radial slot adapted to admit the lateral projection of the shank and a radial recess adapted to recelve and support the said projection, after the bolt has made a partial turn in the said cavity, substantially as described.
6. A security bolt for detachable pneumatic tire carrying rims composed of a shank passing radially through the rim and felloe and having at its extremity a lateral projection, with a detachable head situated between the edges of the tire cover and adapted to touch the circumference of the air tube, the said bolt head having a cavity facing the air tube and a narrower central opening adapted to admit the extremity o? the shank into the said cavity, the base of the said cavity having a radial slot adapted to admit the lateral projection of the shank and a series of helically inclined surfaces arranged round the central opening like a series of ratchet teeth, which surfaces serve to support the lateral projection of the shank and to impart to the shank a helical motion, when the shank is turned after the introduction of its extremity into the cavity of the bolt head, substantially as described.
7. A security bolt for detachable pneumatic tire carrying rims composed of a shank passing radially through the rim and felloe and having at its extremity a lateral projection, with a detachable head situated betpeen the edges of the tire cover and adapted to touch the circumference of the air tube, the said bolt head having a cavity facing the air tube and a narrower central opening adapted to admit the extremity of the shank into the said cavity, the base of the said cavity having a radial slot adapted to admit the lateral pro-
jection of the shank, and a radial recess adapted to receive and support the sald projection after the bolt has made a partial turn in the said cavity, and the cavity of the bolt head being covered with a flexible sheet adapted to distribute the pressure of the shank upon the air tube, substantially as described.
8. A security bolt for detachable pneumatic tire carrying rims, composed of a shank passing radially through the rim and felloe and having and having at its extremity a pair of lateral projections, with a detachable head situated between the edges of the tire cover and adapted to touch the circumference of the air tube, the said bolt head having a cavity facing the air tube and a narrower central opening adapted to admit the extremity of the shank into the sald cavity, the base of the said cavity having a radial slot adapted to admit the lateral projections of the shank, and a series of helically inclined surfaces arranged round the central opening like a series of ratchet teeth, which surfaces serve to gupport the lateral projections of the shank and to impart to the shank a helical motion, when the shank is turned after the introduction of its extremity into the cavity of the bolt head, substantially as described.
9. A vehicle having in combination a wooden felloe armed with a bonding hand, an ordinary tire carrying rim, a beaded edge pneumatic tire held in the said rim, a pair of side flanges facing the felloe and rim, a plurality of bolts adapted to press the side flanges against the sides of the felloe rim, and a pluraity of divided security bolts, composed of a bolt head situated between the edges of the tire cover and a shank adapted to be introduced radially through the felloe and rim and then t.j be secured to the head by a turning motion of the shank, substantially as described.

No. 100,198. Antomobile Tire Casing.
Fonte de pneus d'automobile.

Charles Leander Higgins, Montreal, Quebec, Canada, 24th July, 1906; 6 years. Flled 9th April, 1906. Recelpt No. 134,748.
Claim.-1. In the manufacture of coverings for tire casings and the like, cementing a strip of leather with its side edges skived to a layer of frictioned stock, cementing a pair of narrow strips of frictioned stock along such skived edges, coating the exposed surfaces of frictioned stock with uncured rubber, and finally vulcanizing the whole.
2. In the manufacture of coverings for tire casings and the like, cementing an inter tire with its side edges skived to a layer of frictioned stock, cementing a pair of narrow strips of frictioned stock along such skived edges, stitching the said strips in place, folding a portion of each strip over the lines of stitching, coating the exposed surfaces of frictioned stock with uncured rubber, securing an outer tread upon the exterior of the intertread, and finally vulcanizing the whole.
3. An outer wall of a tire comprising a layer of frictioned stock, a strip of leather cemented to such layer along the middle thereof, strips of frictioned stock extending along the edges of such leather strip and overlapping the portions contiguous thereto of the frictioned stock, llnes of stitching connecting the said layer, the intertread and last-mentioned strips together, a coating of vulcanized rubber covering the exposed outer surfaces of the frictioned stock, an outer tread, and means securing the latter upon the exterior of the intertread.
4. An outer wall of a tire comprising a layer of frictioned stock. a strip of leather cemented to such layer along the middle thereof and having its side edges skived, strips of frictioned stock cemented to the skived edges of such lea-
thern strip and overlapping the portions contiguous thereto o: the frictioned stock llnes of stitching connecting the eald layer, the intertread and last-mentioned strips together, such lines of stitching extending along the inner edges of the skived portlons and adjacent to the outer edges thereof, and such strips being folded over the said lines of stitching, a coating of uncured rubber covering the exposed outer surfaces of the frictioned stock, an outer tread, and means securing the latter upon the exterior of the intertread.
5. An outer wall of a tire comprising a layer of frictioned stock, a strip of leather cemented to such layer along the middle thereof, strips of frictioned stock extending along the edges of such leathern strip and overlapping the portions contiguous thereto of the friction stock, lines of stitching connecting the sald layer the intertread and last-mentioned strips together, a coating of vulcanized rubber covering the exposed outer surfaces of the frictioned stock, and means securing the latter upon the exterior of the intertread.

No. 100,199. Pneumatic Tixe. Prou proumatique.

Edward Brice Killen, London, England, 24th July, 1906; years. Filed 12th January, 1906. Receipt No. 181,805.
Claim.-1. In a pneumatic tire the combination of suitable parts $A, B$ and $C$, as herein described, which part $A$ becomes under load automatically eccentric in effect in use to wheal to which it is attached, substantially as specifed.
2. The construction of this pneumatic tire sultably bullt from suitable parts $A, B$ and $C$, as herein described, which part A can have a sultable concentric chaln wheel, or equivalent rigidly attached to it , substantially as specitied.
3. The pneumatic tire built from parts $A, B$ and $C$, as herein described, with wearing parts all interchangeable and easly replaced, the pneumatc part beng never subjected to driving, braking or any other severe strain, cubstantially as specified.

No. 100,200. Vehiale Tire. Prou de wintouk.

John Hewetson Lorimer, Philadelphla, Pennsylvania, U.8.A. 24th July, 1906; 6 years. Filed 9th April, 1906. Receipt No. 134,767.
Claim.-1. In a vehicle wheel, a supporting ring, a pair of flanges, and a series of independent transversoly arranged spiral spring tread units.
2. A vehicle wheel comprising a hub, spokes, a rim, and a series of independently removable transversely arranged spiral spring tread units.
3. In a vehicle wheel a rim and a series of independent alternately reversed trapsversely arranged spiral spring tread units.
4. In a vehicle wheel, a rim, and a series of spiral spring tread units embodied in resilient material and held in place by pins passing through the units.

No. 100,201. Pneumatic Tire Shield. Bouclier de pneu pneumatiquc.

Joseph Henry Lowrey, Neola, Iowa, U.S.A., 84th July, 1906; 6 years. Filed 1st March, 1906. Recelpt No. 133,436.
Claim.-1. A pneumatic tire shield having means for connecting the same to a rim including an elastically yieldable tension device to maintain the shield in snug engagement with the tire.
2. A pneumatic tire shield having means for connecting the same to a rim including a spring pressed tension element, and connections between opposite sides of the shield and the tension element.
3. A pneumatic tire shield having means for connecting the same to a rim including a spring pressed crosshead, and connections between opposite ends of the crosshead and the respective edges of the shield.
4. A pneumatic tire shield having means for connecting the same to a rim including a spring pressed tension device, and connections extending between opposite edges of the shield and the tension device and detachably connected to one of these elements.
5. A pneumatic tire shield having means for connecting the same to a rim including a spring pressed crosshead, and connections between opposite ends of the crosshead and the respective edges of the shield, said connections being detachably associated with the crosshead.
6. The combination of a rim and a pneumatic tire, of a shield embracing the tire, a crosshead disposed across the inner side of the rim, connections between the crosshead and opposite edges of the shield, and a spring interposed between the crosshead and the rim and tending to force the former towards the center of the wheel.
7. A pneumatic tire shield having means for connecting the same with a rim including a spring pressed crosshead, and flexible connections between the crosshead and opposite edges of the shield and detachably engaged with one of these elements, the crosshead capable of being forced back against the tension of the spring to remove strain from the connections and permit removal thereof.
8. The combination with a pneumatic tire shield, of a case for application to the inner side of a rim, a spring pressed crosshead having its ends projecting through slots in the case, and connections between the ends of the crosshead and the respective edges of the shield.
9. The combination with a wheel having a pneumatic tire, of a case mounted between adjacent spokes at the inner slde of the rim of the wheel, a shield embracing the tread of the tire, a spring pressed crosshead within the case with its ends projecting through slots therein, and connections between the ends of the crosshead and the respective edges of the shleld.
10. The combination of a pneumatic tire shield, a case for application to the inner side of the rim and provided in opposite sides with slots, a spring pressed crosshead within the case with its ends projecting through the slots, connections between the ends of the crosshead and the respective edges of the shield, and elastic closure flaps covering the slots and connected to the crosshead and the case.
11. The combination with a rim and a pneumatic tire, of a shield applied to the tire, and crossed anti-creeping braces connected to the rim and to he shield.
12. The combination with a rim and a pneumatic tire, of a shield, brackets upon the rim, and anti-creeping braces between the brackets and the shield.
13. The combination with a rim and a pneumatic tire, of a shield, a spring pressed crosshead at the inner side of the rim, connections between the crosshead and the shield, and unti-creeping braces between the rim and the shield, the braces and the connection at each side of the tire having a common point of attachment to the shield.
14. The combination with a wheel and a pneumatic tire, of a shield for the tire, a pair of spring pressed crossheads at the inner side of the rim and between adjacent spokes, connections between the respective crossheads and the shield, and anti-creeping braces connected to the rim at the ends of the spokes and crossed substantially midway of the spokes with their outer ends connected to the shield.
15. A pneumatic tire shield comprising a plurality of annular bands, each band being made up of a series of sections, each section consisting of a plate folded upon itself to form terminal eyes, links connecting the eyes of successive sections, and links connecting the coresponding sections of adjacent bands.
16. A pneumatic tire shield comprising a plurality of annular bands, each band being made up of a series of sections, each section including a plate having end and side portions folded to form terminal and lateral eyes, links connecting the terminal eyes of successive sections, and other links connecting the eyes of corresponding sections of adjacent bands.
17. As a new article of manufacture, a section of a pneumatic tire shield consisting of a plate having its end and side portions folded upon one side of the plate to form eyes, and a caulk secured to the other side of the plate.
18. The combination with a rim and a pneumatic tire, of a shield applied to the tire, a spring pressed crosshead at the Inner side of the rim, detachable connections between the shield and the crosshead, a jack having a base for applica. tion to the tread of the tire, a lever fulcrumed upon the base. and means for connecting the lever with the crosshead to retract the latter against the tension of the spring by manipulation of the lever.
19. The combination with a rim and a pneumatic tire, of a shield applied to the tire, a spring pressed crosshead at the inner side of the rim, detachable connections between the crosshead and the shield, a jack having a base for application to the tread of the tire, a rock bar mounted upon the base and having terminal cranks, connections carried by the cranks for engagement with the ends of the crosshead, and a handle connected to the shaft for rocking the same.

No. 100,202. Resilient Tire. Pneu d rebondissement.

Etienne L. A. Olivier, Paris, France, 24th July, 1906; 6 gears. Filed 4th May, 1906. Receipt No. 135,547.
Claim.-1. A resilient tire for vehicle wheels comprising two rigid annular bands or rings one of which is located around the other and one or more rims of rubber or other resilient or elastic material maintained in a state of tension between the said rings.
2. A resilient tire for vehicle wheels comprising two rigid rings one of which is located around the other, a flat rubber rim having two concentric circular enlarged portions on each of its sides, the inner ring having ribs or shoulders to engage the outside of the inner enlarged portions of the rim and the outer ring having ribs or shoulders to engage the inside of the outer enlarged portions of the rim.
3. A resilient tire for vehicle wheels comprising two rings one of which is located around the other and two flat rubber rims secured in a state of tension, by their edges, on the sides of the rigid rings
4. A resilient tire for vehicle wheels comprising two rigld rings one of which is located around the other, and a rubber rim U-shaped in cross section the bight of which passes on the outer ring and the resilient sides of which are held stretched by the edges secured to the inner ring.
5. A resilient tire for vehicle wheels comprising two rigid rings one of which is located around the other, a $U$ shaped rubber rim the bight of which passes on the outer ring and the edges of which are secured to the inner ring, the sides of the rim being in a state of tension, and inner rubber flanges on the rim, adapted to be compressed between the two rings.
6. A resilient tire for vehicle wheels comprising a rigid ring having a web the outer edge of which is provided with slots, a rigid ring having a U-shaped web, one of the sides of the sald web being provided with corresponding slots for the passage of the solld portions of the other ring, and a U-shaped rubber rim the bight of which passes on the outer ring and the edges of which are secured to the inner ring, the sides of the rim being stretched.
Nio. 100,203. Tixe. Prew.

Benjamin Coplln Seaton, St. Louis, Missouri, U.S.A., 24th July, 1906; 6 years. Flled 12th March, 1906. Recelpt No. 133,787.
Clatm.-1. A wheel tire comprising two rims having allgning walls, the edges of which are in the form of sinusoidal curves. the projections formed by said curves alternating with each other, and transversely arranged tension springs connected to the transversely opposite projections, substantially as described.
2. A wheel tire comprising two rims spaced apart, the adjacent edges of the rims forming a sinous slot, coil springs connecting the projections on one rim with those on the other, and protector plates carried by one of the rims and overlapping the other to close the slot, substantially as described.
3. A wheel tire comprising two rims spaced apart, the adjacent edges of the rims forming a sinuous slot, coil springs connecting the projections on one rim with those on the other, protector plates carrled by one of the rims and overlapping the other to close the slot, and a resilient tread carried by the outer rim, substantlally as described.
4. A wheel tire comprising two rims each of which is provided with outstanding projections arranged in transverse alternating series, each projection on one of the rims transversely aligning with those on the opposite side of the other rim, and coil springs connecting the transversely aligning projections, substantially as described.
5. A wheel tire comprising two rims one within the other and both of said rims having vertical walls aligning with each other, springs arranged within the rims and having their opposite ends connected to the vertical walls of the in ner and outer rims respectively, so that all of the springs will be in tension under load, substantially as described.
6. A wheel tire consisting of inner and outer rim portions, the walls of which align with each other, said inner and outer rim portions having diametrically opposite overlapping projections on their respective sides, and horizontally arranged coil springs connected to the oppositely arranged overlapping projections and normally under tension, substantially as described.
7. A wheel tire comprising spaced rims whose walls align with each other, and a series of coil springs connecting said rims, which springs are alternately opositely inclined under a bnormal tension, substantially as described.
8. A wheel having a tire comprising two sections, one of which is the inner section and approximately $\mathbf{U}$-shaped in cross section with side flanges disposed outwardly, the other section being the outer section and having side flanges which align with those on the inner section, the flanges on the side walls of one section having projections which align with those on the opposite section, the projections on the inner rim overlapping those on the outer rim, and said projections on each side of the inner rim transversely aligning with the projections on the opposite side of the outer rim, and a spring connecting each projection on the outer rim with the transversely aligning projection on the inner rim, substantially as described.
9. A wheel tire comprising an inner rim and an outer rim, the outer rim having side walls which align with the slde walls of the inner rim, sald outer and inner rims being spaced apart, and transversely arranged springs conflned within the rim, one end of each spring being connected to the inner rim, while the outer end is connected to the outer rim, substantially as described.

No. 100,204. THre Case. Etui de pncu.

Howard Richardson Teel, Medford, Massachusetts, U.S.A.. 24th July, 1906; 6 years. Flled 12th May, 1906. Receipt No. 135,843.
Olaim.-1. A tire case having a main portion to fit over the tread and sides of the tire, a supplemental portion at one edge of said main portion and of sufficient width to extend across to the opposite side of the case to cover the rim portion of the tire, and a retaining device at the opopsite edge only of said supplemental portion adapted to engage the other side of the main portion at the side of the case to hold the case in position about a tire, substantialy as described.
2. A tire case having a main portion to fit over the tread and sides of the tire, a flap extending beyond the edge of sald main portion to project across and cover the rim portion of the tire, and a retaining hoop for the outer edge of sald flap.
3. A tire case having a main portion to fit over the tread and sides of the tire, a fiap along each edge of said main portion, and a retaining hoop connected with the outer edge of each flap, substantially as described.
4. A tire case having overlapping portions adapted to oxtend across the tire from one side to the other, retaining hoops connected with the edges of sald overlapping portions, and means for connecting the opposite ends of each hoop. substantially as described.
5. A tire case, the main portion of which is adapted to be Itted over the body of the tire, said case being extended at the edge to form a flap, a pocket formed along the outer edge of said flap, a hoop contained in said pocket, and means for maintaining said hoop distended to fasten the flap in position.
6. A tire case having a main portion adapted to fit over the iread and sides of the tire, a supplemental portion to cover the rim portion of the tire, a retaining hoop connected with the outer edge of sald supplemental portion and means for uniting the ends of sald hoop to keep the hoop distended, substantially as described.
7. A tire case having a main portion to fit over the tread and sides of the tire, a flap extending beyond the edge of said main portion to project across and cover the rim portion of the tire, a retaining hoop secured to the outer edge of said flap, and a ball and socket connected with the ends of said hoop respectively.
8. A tire case having a main portion to fit over the tread and sides of the tire, a flap extending beyond the edge of sald maln portion to project across and cover the fim portion of
the tire, a retaining hoop secured to the outer edge of said fiap, a ball and socket screw-threaded on the ends of said hoop respectively, and finger pleces connected with said ball and socket.
9. A tire case having a main portion to fit over the trea. and sides of the tire, a supplemental portion at one edge of the main portion to cover the rim portion of the tire and overlapping the opposite side of the main portion, and a water shed connected with the main portion in position to ccver and protect the overlapping edge of said supplemental portion.

1To. 100,205. Rubber Tired Wheel. Roue d pneu de caoutchouc.

Richard Mulholland, Dunkirk, New York, U.S.A.. 24th July 1906; 6 years. Filed 13th March, 1906. Receipt No 188,872.
Clatm.-1. In a wheel of the class described, a felly, a rim on said felly, a tire on said rim, one or more retalning bands extending through said tire and a plate for locking the ends of sald bands having a series of tire retalning projections which are tadered to present a sharpened surface transversely and comparatively broad and blunt surface longitudinally, for the purposes set forth.
2. In a wheel of the class described, a felly, a rim on said felly, a tire on said rim, one or more retaining bands extending througb sald $t$ re and a plate for lockine the ends of said bapds having a series of integral rivet projections on one face and a geries of tire retaining projections o.a auviher face.
8. In a wheel of the class described, a lelly, a rim on said felly, a tire on said rim, one or more retaining bands extending through said tire, and a plate for locking the ends of said bands having a series of integral rivet projections on one face and a series of tire retaining projections on another face which are tapered to present a sharpened surface transversely and a comparatively broad and blunt surface longitudipglly, for the purposes set forth.
4. In a wheel of the class described, a felly, a rim on sald fally, a tire on said rim, one or more retaining bands extendine through said tire and a plate for locking the ends of said hends having a plurality of sets of Integral projections, one of said sets servi. $g$ as rivets and another of sand sets extending onnositely to said first-mentloned set and constituting tire retaining devices, substantially as set forth.
5. In a wheel of the class described, a telly. a rim on said felly, a tire on said rim, one or more retaining bands extending through said tire, a plate for locking the ends of said bands having integral rivet projections on one face and tire retalning projections on the other face, and one or more projections entering the under surface of the tire from the inside of the felly or rim to prevent longitudinal movement
6. In a wheel, a rim, a tire on said rim. two parallel channelled retalaing bands $U$-shaped in cross section, extending longitudinally through said tire, plates with integral rivet projections on one face and tire retalning projections on the other face, fitting into the channel of said bands for locking the ends in place and a bolt having a broad head extending over both bands pasaing through a portion of the tire through the rim and secured to same.
7. In a wheel, a rim. a tire on sald rim, two parallel channelled retaining bands $U$-shaped in cross section extending
longitudinally through said tire, plates with Integral rivet projections on one face, and tire retaining projections on the other face, fitting into the channel of sald bands for locking the ends in place, and a bolt having a broad head extending orer both bands passing through a portion of the tire through the rim and secured to same, one or more lag screws passing from the inside of the rim into the inner surface of the tire to prevent creeping.
8. In a wheel of the class described, a rim, a felly on said rim, a tire on said rim, one or more retaining bands extendlng through said tire, a plate for locking the ends of said band having integral rivet projections on one face, and integral tire retaining projections on the other tace and means for securing said plate to the rim and felly Including a shank or rod passing through a portion of the tire and having a screw-threaded end passing through the rim and felly and secured thereto by a screw nut and one or more screw bolts passing from the inside of said rim and felly and entering the lower surface of the tire, after the tire is secured to the rim to prevent longitudinal movement.

## No. 100,206. Artificial Silk. Soie artifctelle.

Henry Bernstein, Philadelphia, Pennsylvania, U.S.A., 24th July. 1906; 6 years. Filed 14th May, 1906. Receipt No. 135,875.
Claim.-1. Artificial silk containing cellulose and gum from the liquid obtained by bolling raw silk.
$\therefore$ Artificial silk containing cellulose, gum from the llquor obtained by boiling raw silk and a gelatinous substance.
3. As a step in the process of making artifial silk the treatment of dissolved cellulose with a liquor obtained by boiling raw silk.
4. As a step in the process of making artificial silk the treatment of dissolved cellulose at a gradually Increasing temperature with a liquor obtained by the boiling of raw silk.
5. In the process of manufacturing artificial silk the treatment of cellulose with a solution of cupric hydrate in aquaammonia and the liquid obtained by boiling raw sllk.
6. In a process of manufacturing artificial silk the treatment of cellulose with cupric hydrate dissolved in acquaammonla in the presence of the solution obtained by bolling raw sil and the subjecting of the solution obtained to a rising temperature.
7. In the process of manufacturing artificial silk the treat ment of dissolved cellulose besinning in a comparatively coo condition, with a liquor obtained by boiling raw silk, gradually increasing the temperature thereof, forming it into threads and treating it with a gelatinous substance.
8. In a process of manufacturing artificial silk, mixing cupric hydrate with aqua-ammonia. adding cellulose and a liquor obtained by boiling raw silk and raising the products from a comparatively cool condition gradually to the maximum temperature of treatment.
9. In a process of manufacturing artificial silk the addition of ammonia to cupric hydrate, adding cellulose and a liquor obtained by boilng raw silk thereto in a comparatively cool condition, subjecting the solution to a gradually rising temperature forming the same into flaments and treating it in an acid bath.
10. In a process of manufacturing artificial silk forming a concentrated solution of copper sulphate, adding sodium hydrate, pouring off the sodium sulphate thus formed, adding aqua-ammonia to the precipitate, dissolving cellulose in the solution thus formed and adding a liquid obtained by the boilling of raw silk thereto.
11. In a process of manufacturing artificial silk, dissolving cellulose in a solution of cupric hydrate and ammonla, adding the liquor oblained by boiling raw silk thereto, treating the product to obtain threads and washing the threads in a solution of castor oil, sulphuric acid and sodium hydrate.
12. In a process of manufacturing artificial silk the dissolving of cellulose in cupric hydrate and aqua-ammonia, the addition of a liquor obtained from boiling raw silk thereto, forming the same into threads, treating the threads with a preparation of castor oil, sulphuric acid and sodium hydrate and subsequently treating with an acid bath.

No. 100,207. Combination Tool. Outil à combinaison.
Robert H. Bowman, Canyon City, Colorado, U.S.A., 24th July.
1906; 6 years. Filed 28th June, 1906. Receipt No. 137,369.
Claim.-1. A combination tool comprising a driving head, a straight longitudinal side, and a lateral projection on the driving face of the head forming with sald stralght side a try square.
2. A combination tool comprising a driving head, a straight longitudinal side normal to the driving face, and a shoulder projecting laterally of and behind the driving face to form with said straight side a try square.
3. A combination tool comprising a head having a driving fice and a cuting edge at opposite ends thereof, a straight

longitudinal side between said face and edge, and a lateral projection adjacent to the driving face forming with the straight side a try square.

No. 100,208. Cornice Brake. Frein.

George Christopher Keene, Cincinnati, Ohio, U.S.A., 24th July, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,001.
Claim.-1. A device of the character described comprising clamping jaws, an end frame, actuating means for moving one jaw toward the other, a lever pivoted on the end frame with one end connected with the movable jaw and a countertalancing spring having one end connected with the end frame and its opposite end connected with said lever.
2. A device of the character described comprising clamping jaws one of which is movable toward and from the other, lifting rods engaged beneath the ends of the movable jaw, bearing members having adjustable pins on which the lifting bars are supported and means for operating the bear'ing members in unison.
3. A device of the character described comprising stationary and movable jaws, a lifting rod engaged beneath the movable jaw, a bearing member having a socket, a pin adjustably held in said socket and whereon the lifting bar is supported, a screw carried by the bearing member and engaged beneath the said pin for adjusting the same and means for rocking the bearing member.
4. A device of the character described comprising stationary and movable jaws, a lifting rod engaged beneath the movable jaw, a bearing member having a socket extended downwards in it and open at the upper part of sald member. a screw having threaded engagement in the lower part of the said socket and provided with a slotted upper end, a pin adjustably held in the socket with its lower end rested on said screw and its upper end engaged beneath the lifting rod and means for rocking the bearing member.
5. A device of the character described comprising stationary and movable jaws, an end frame, a bearing plate vertically adjustable at the lower part of the end frame and having screws for holding it in adjusted position, a lifting rod engaged beneath the movable jaw, a bearing member mounted to rock in the bearing plate and having an adjustable pin engaged beneath the lifting rod and means for rocking the bearing member.
6. A device of the character described comprising stationary and movable jaws, a counterbalancing device connected with the movable jaw for counterbalancing the same, a lifting rod engaged beneath the movable member, a bearing member mounted to rock and having a projection engaged beneath the lifting rod, a treadle lever connected to operate the bearing member and a retracting device connected with the treadle lever for retracting the same.
7. A device of the character described comprising stationary and movable jaws, a counterbalancing device connected with the movable jaw for counterbalancing the same, a lifting rod engaged beneath the movable jaw, a bearing member mounted to rock and having a projection engaged beneath the ifting rod, a treadle lever connected to operate the bearing member and a retracting device having a compensating connection with the treadle lever and arranged to partially retract the same when fully depressed.
8. A device of the character described comprising stationary and movable jaws, a counterbalancing device connected with the movable faw to counterbalance the same, a lifting rod engaged beneath the movable jaw, a bearing member mounted to rock and having a projection engaged beneath the lifting rod, a treadle lever connected to operate the bearing member, an arm pivoted on the treadle lever and adapted to depend therefrom when said lever is uplifted and a retracting spring connected with the depending part of said arm and arranged to partially retract the treadle lever when the same is fully depressed.

No. 100,209. Velocipede, Etc. Vélocipide, etc.

James Archer, Manchester, England, 24th July, 1906; 6 years. Flled 11th July, 1904. Recelpt No. 116.817.
Claim.-1. In variable speed gear for velocipedes and road motor vehicles, a fixed axle with longitudinal boring and transverse slot also with a planet pinion on its exterior and a screw thread at each end, a cone bearing fixed on sald axle near one end, and a further cone bearing loosely screwed on to the other end of the axie, a driving member fitting over said axle from the left hand end and against the said fixed cone bearing, a wheel hub a bush in each end of the hub and and thus axially support the hub, the driving member, the and the other designed to lie around the loose cone bearing, and thus axially supoprt the hub, the driving member, the hub, its bushes and the loose cone nut all being adjusted against the fixed cone bearing, in combluation with a planet cage, planet gear wheels and a gear ring, movable longitudinally within the wheel hub, and means whereby the planet cage and gear ring only on being moved to various positions, serve individually or collectively to transmit the motion of the driving member to the hub at three different speeds, and allow of free wheeling with each speed and the planet cage and gear to remain stationary whilst free wheelling, substantially as set forth.
2. In variable speed gear for velocipedes and road motor vehicles, a fixed axle with longitudinal boring and transverse slot, also with a planet pinion on its exterior and a screw thread at each end, a wheel hub with bush at one end. and said bush having ratchet teeth on its inner periphery, being bevelled inwardly at its inner end, and at its outer end formed to serve as one of the hub cun bearings, a further bush in the other end of the hub and forming the other cup bearing, pawls pivotally carried by said further bush, and springs for forcing the pawls slightly beyond the inner periphery of the bush. a driving member surrounding the axle and projecting into the hub and within the said bush with the ratchet teeth, and also having a series of open ended recesses of ratchet tooth-shape in a part of its periphery, the other part being left plain, and also having a series of open-ended onenings in its inner end, means for supporting the driving member and hub bushes centrally around the axle, a planet
cage and gear ring capable of being moved longitudinally and the planet cage having ratchet teeth designed to engage the pawls on the hub bush, planet gear carried by the cage and meshing with the gear ring and with the planet pinion on the fixed axle, a set of pawls pivotally carried by the gear ring and one set designed to press outwards and engage the teeth in the said hub bush, and the other set press inwards and thus project into the recess in the driving member, when opposite, thereto, or press against the plain surface of the driving member, substantially as set forth.

No. 100,210. Wrench. Clé àécrou.

Frank Williams and Jack Davis, both of Kelvin, Arizona, U.S.A., 24th July, 1906; 6 years. Filed 12th April, 1906. Receipt No. 134,867.
Claim.-1. A wrench for application to a plpe or other device comprising a handle, a stationary jaw, a swinging jaw, and means movably mounted adjacent to one of said jaws adapted to be engaged by the plpe or other device to move the swinging jaw toward the stationary jaw to grip said pipe.
2. A wrench for application to a pipe or other device comprising a handle having a stationary jaw and a swinging jaw, and means carried by the swinging jaw and movable adjacent to the stationary jaw and adapted to be engaged by the pipe or other device which acts to move the swinging jaw toward the stationary jaw to grip the pipe or other device between the same.
3. A wrench for application to a plpe or other device comprising a handle having a stationary jaw, a yoke pivoted thereto, a swinging jaw carried by the yoke, and means on the yoke adapted to be engaged by the pipe or other device for swinging the yoke and throwing the swinging jaw toward the stationary jaw.
4. A wrench for application to a pipe or other device comprising a handle having a stationary jaw and a swinging jaw, a pivoted yoke connecting said jaws, and an auxiliary jaw carried by the yoke and adapted to project slightly beyond the working face of the stationary jaw to be engaged by the pipe or other device, whereby the pipe acts on the auxilary jaw and thereby causes the swinging jaw to move toward the stationary jaw.
5. A wrench for application to a pipe or other device comprising a handle having a stationary jaw and a swinging jaw, a pivoted yoke connecting said jaw, and connected auxiliary jaws carried by said yoke, and having toothed edges which project beyond the working face of the stationary jaw to be engaged by the pipe or other device, said pipe acting on the auxiliary jaws to move the swinging jaw toward the stationary jaw.

## No. 100,211. Rotary Bngine. Machine rotatoire.

Orin Williams, Des Moines, Iowa, U.S.A., 24th July, 1906; 6 years. Filed 3rd July, 1905. Recelpt No. 126,553.
Claim.-1. In a rotary engine the combination of a cylinder, a hub rotatably mounted within the cylinder, eccentric relative to the cylinder and adjacent to the cylinder at one point. a piston slidingly mounted in the cylinder, and means for guiding the piston to engage the cylinder during the rotation of the piston.
2. In a rotary engine the combination of a cylinder, a hub rotatably mounted within the cylinder eccentric relative to the cylinder and adjacent to the cylinder at one point, a piston slidingly mounted in the cylinder, means for guiding the piston to engage the cylinder during the rotation of the piston, and a pressure blade slidingly mounted in the cylinder to engage the periphery of the rotary hub.
3. In a rotary engine the combination of a cylinder, a recess in the cylinder wall, a rotatable hub within the cylinder arranged eccentrically and having a portion of its periphery
projected beyond the inner wall of the cylinider and into said recess, a piston slidingly mounted in the hub, and means for

guiding the piston in a true circle concentric with the interior of the cylinder.
4. In a rotary engine the combination of a cylinder, a segmental recess formed in the cylinder wall outside of the circle of the interior of the cylinder, a rotary hub mounted eccentrically within the cylinder and having a portion of its periphery projected beyond the cylinder line into the segmental recess, a plston slidingly mounted in the hub, and means for guiding the piston to follow the true circle of the interior of the cylinder throughout the rotation of the hub.
5. In a rotary engine the combination of a cylinder, a segmental recess formed in the cylinder wall outside of the circle of the interior of the cylinder, a rotary hub mounted ececntrically within the cylinder and having a portion of its periphery projected beyond the cylinder line into the segmental recess, a plston slidingly mounted in the hub, means for gulding the piston to follow the true circle of the interior of the cylinder throughout the rotation of the hub, and a pressure blade projecting into the segmental recess to engage the periphery of the hub.
6. In an engine the combination of a cylinder, a segmental recess formed in the cylinder wall outside of the circle of the interior of the cyllnder, a rotary hub mounted eccentrically within the cylinder and having a portion of its periphery projected beyond the cylinder line into the segmental recess, a piston slidingly mounted in the hub, and means for guiding the piston to follow the true circle of the interior of the cylinder throughout the rotation of the hub, sald cylinder formed with an Induction port therein adjacent to the segmental recess.
7. The combination of a cylinder, a concentric annular groove in the cylinder head, a rotatable hub mounted eccentrically within the cylinder, a piston slidingly mounted in the hub, and a guiding means connected with the piston and inserted in the annular grooves.
8. The combination of a cylinder formed with a recess extended outside of the inner wall of the cylinder, the cylinder head formed with a concentric annular groove, a rotary hub mounted within the cylinder with a portion of its periphery projecting into the recess, a plston slidingly mounted in the hub, and a guiding means connected with the piston and inserted in the annular groove for guiding the piston in a true circle around the interior of the cylinder.
9. The combination of a cylinder formed with annular concentric grooves in the cylinder heads, rings rotatably mounted in said grooves, an eccentrically mounted rotatable hub within the cylinder, a piston slidingly mounted in the hub, means for connecting the piston and the rings, a counterbalancing weight slidingly mounted in the hub diametrically opposite from the piston, and means for connecting the counterbalancing weight with the rings.
10. The combination of a cylinder formed with annular concentric grooves in the cylinder heads, rings rotatably mounted in said grooves, an eccentrically mounted rotatable hub within the cylinder, a piston slidingly mounted in the hub, means for connecting the piston and the rings, a counterbalancing weight slidingly mounted in the hub diametrically opposite from the piston, means for connecting the counterbalancing weight with the rings, and a pressure blade mountod in the cylinder to engage the periphery of the hub.
11. The combination of a cylinder formed with concentric annular grooves in the cylinder heads and also formed with a segmental recess in the cylinder wall, said recess extending outside of the cylinder line, rings rotatably mounted in the anular grooves, a rotary hub mounted eccentrically within the cylinder with a portion of its periphery projecting outside of the cylinder line and into the said recess, a piston slidingly mounted in the hub, a shaft connected with the
piston and rotatably mounted in the rings, a counterbalanceing welght alidingly mounted in the hub and a shaft conneci ing the counterbalancing weight with the rings.
12. The combination of a cylinder formed with eccentric annular grooves in the cylinder heads and also formed with a segmental recess in the cylinder wall, said recess extending outside of the cylinder line, rings rotatably mounted in the annular grooves, a rotary hub mounted eccentrically within the cylinder with a portion of its periphery projecting outside of the cylinder line and into the said recess, a piston slidingly mounted in the hub, a shaft connected with the piston and rotatably mounted in the rings, a counterbalancing weight slidably mounted in the hub, and a shaft connected with the counterbalancing weight and slidingly connected with the rings.
13. An improved rotary engine comprising a cylinder, its inner wall forming a true circle, a segmental recess in thi inner wall outside of the true circle, a pressure blade projecting into the segmental recess with its end substantlally in line with the periphery of the hub, said cylinder also formed with an Induction port adjacent to the segmental recess and with an exhaust port, and the cylinder heads formed with annular concentric grooves, a shaft eccentrically mounted in the cylinder heads, a rotary hub on the shaft with a part of its periphery projecting into the segmental recess beyond the true circle of the cylinder, a piston slidingly mounted in the hub, a weight slidingly mounted in the hub diametrically oppositet from the piston, annular rings rotatady mounted in the grooves in the cylinder heads, means for connecting the piston with the weight and a shaft connected with the weight and inserted in the said rings.
14. In a rotary engine a rotary piston block formed with a radial groove at one side and a radial groove at a point diametrically opposite from the first, a radially movable piston mounted in one of the radial grooves, a radially movable counterbalancing weight mounted in the other groove, and rods extended through the piston block to connect the piston and weight.
15. In a rotary engine a rotary piston block formed with a radial groove at one side and a radial groove at a point diametriclly opposite from the first, a radially movable piston mounted in one of the radial grooves, a radially movable counterbalancing weight mounted in the other groove, rods extended through the plston block to connect the piston and weight, and steam packing devices surrounding said rod.
16. In a rotary engine a piston having radjal grooves at diametrically opposite points, plates on the ends of the piston formed with radial notches adjacent to one of said grooves and with radial openings adjacent to the other groove, a piston slidingly mounted in one of said grooves with its ends in the adjacent notches, a counterbalancing weight slidingly mounted in the other groove, rods connecting the weight and piston and passing through the plates at the ends of the piston, a shaft extended through the counterbalancing welght and through the plates, and means for guiding said shaft to move radially relative to the piston block.
17. In a rotary engine the combination of a cylinder, two steam chests adjacent to the cylinder, ducts for admitting steam from the chests to opposite sides of the cylinder, valves for controlling the admission of the steam, exhaust ducts communicating with the said admission ducts, and means for controlling the passage of steam through said exhaust ducts.
18. In a rotary enugine the combination of a cylinder, two steam chests adjacent to the cylinder, ducts for admitting steam from the chests to opposite sides of the cylinder, valves for controlling the admission of steam, exhaust ducts communicating with the said admission ducts, means for controlling the passage of steam through said exhaust ducts, and means for automatically operating the means for controlling the exhaust ducts in unison with the means for controlling the steam admission.
19. In a rotary engine a body portion formed with a cylindrical chamber, a cylinder head formed with an annular shoulder adjacent to the cylindrical body portion, a rotary piston block head fixed to the cylindrical plston block, and packing rings on the cylindrical piston block head in engagement with the annular shoulder of the cylinder head.
20. In a rotary engine the combination of a cylinder and rotary piston block, of a radially movable piston formed with a groove at its ends and outer edge, a packing bar slidingly mounted in the groove at the edge of the piston, and two packing bars mounted in the grooves at the ends of the plston, slidingly connected with the bar at the outer edge of the piston, springs for holding the end bars at their outer limit of movement relative to the bar in the edge of the piston, and independent springs for holding the inner ends of the end bars to their outer limit of movement.
21. In a rotary engine a rotating platon block, a piston sildingly supported in the piston block and formed with a groove in its outer edge and its ends, a packing bar slidingly mounted in the outer edge groove of the piston, two packing bars slidingly mounted in the end groove of the piston, and two extensible coil springs, each having one end resting upon the
piston and extended outwardiy radially and outwardly toward the end of the rotary piston block, its outer end engaging the end packing bars, said springs yieldingly holding the end packing bars to their limit of movement toward the ends of the rotary piston block and toward the periphery of same.
22. A rotary engine comprising a cylindrical body portion having a flat surface on its interior, a rotary piston block, a radially movable piston carried by the rotary piston block, a counterbalancing weight carried by the rotary plston block and connected with the piston.
23. In a rotary engine a rotary piston block, a radially movable piston at one side of the plston block und a counterbalancing weight carried by the rotary piston block diametrically opposite from the rotary piston and concected therewith.
24. In a rotary engine a plston block formed with a radial groove at one side and a radial groove at the opposite side, a radially movable piston in one groove and a radially movable weight in the groove, and means for connecting them.
25. In a rotary engine a cylindrical body portion formed with a flat surface on its interior and also formed with a slot open at the central portion of said fiat surface, a packing plate slidingly mounted in said slot, a shielding strip on top of the packing plate, a rigid bar on top of the yielding strip, and a screw engaging the top of the rigid bar to force the packing plate downwardly, and a rotary piston block in the cylinder engaged by sald packing plate.
26. In an engine the combination of a steam chest, a rotary valve in the steam chest, a valve stem rotatably supported and slidingly connected with said valve.
27. In an engine, a steam chest, a rotary valve formed with a steam port running through it, a valve seat formed in the steam chest at the point where the valve would be pressed against it by steam pressure within the steam chest, a rotary valve stem and means for connecting the valve stem with the valve to permit a movement of the valve toward ita seat without moving the valve stem.
28. In an engine, a steam chest, a cylindrical valve chamber in the steam chest having an inlet at its top and an outlet at its bottom, a rotary valve on the valve seat formed with a steam passage way running through it and also formed with a groove at one end, a packing box in one end of the steam chest, a valve stem passed through the paoking box and formed with a T-head slidingly mounted in the groove in the end of the rotary valve.
29. In an engine, a steam chest, a cylindrical valve chamber in the steam chest having an inlet at its top and an outlet at its bottom, a rotary valve in the valve seat rormed with a steam passageway running through it and also formed with a groove at one end, a packing box in one end of the steam chest, a valve stem passed through the packing box and formcd with a $T$-head slidingly mounted in the groove in the end of the rotary valve, and a set screw in the other end of the rotary valve with its head in engagement with the adjacent portion of the steam chest.
30. In an engine, the combination of a rotatable engine shaft, two rotary valves for controlling the admission of steam to the engine, means driven by the engine ahaft for actuating said valves, a lever and means operated by the lever for adjusting both of said valves at the same time to control their period of cut-off relative to the movement of the engine shaft.
31. In an engine the combination of a rotatable engine shaft, two independent valves for controlling the admission of steam to the engine, one operating to drive the engine in one direction and the other in a reverse direction, means driven by the engine shaft for actuating either one of said valvos, a lever, and means actuated by the lever for controlling the period of cut-off of both valves, so that when efther valve is used, the period of cut-off will be the same.
32. In an engine the combination of a rotatable engine shaft, two indepndent valves for controlling the admission of steam to the engine, one operating to drive the engine in one direction and the other in a reverse direction, means driven by the engine shaft for actuating either one of said valves, a lever and means actuated by the lever for controlling the period of cut-off of both valves, so that when either valve is used, the period of cut-off will be the same, and independent means for throwing elther one of the valves into operation and the other out of operation without effecting the cut-off controlling means.
33. In a rotary engine the combination of an engine shaft, a rotary piston on the shaft, two independent valves for controlling the admission of steam to the engine, one for turning the piston in one direction and the other in a reverse direction, a valve stem connected with each valve, a slotted arm connected with each valve stem, two eccentrical mount ed on the engine shaft, eccentric straps mounted on the eccentrics, arms connected with the eccentric straps and slidingly connected with said slotted arms, and means for simultaneously moving both of the eccentric arms relative to tbe slotted arms.
34. In a rotary engine the combination of an engine shaft. a rotary piston thereon, two rotary valves controlling the admission of steam to the engine, one for turning the piston in one direction and the other in a reversed direction, a valve stem for each of said valves, a rotatable clutch on each valve stem, a sliding clutch on each valve stem, a slotted arm on each rotary clutch formed with a slot, an eccentric arm slidingly mounted in the slot of each slotted arm, an eccentric strap connected with each eccentric arm, an eccentric fixed to the engine shaft and operating in each eccentric strap, two sliding blocks, links connected with the sliding blocks and also with the ends of the eccentric arms that are in the slotted arms; a single lever for moving both of said sliding blocks at the same time, a reversing lever, and means actuated by this reversing lever for throwing either one of the sliding clutches into engagement with its mating rotary clutch, and the other pair of clutches out of engagement at the same time.

No. 100,212. Stone Saw. Scic d pierre.

Isaac Matheson McKay, Fruitvale, California, U.S.A., 24th July, 1906; 6 years. Filed 12th June, 1906. Recelpt No. 136,816.
Claim.-1. An improved saw having a blade of uniform thickness with a sinuous cutting edge, the opposite sides of the blade being corrugated in corresponding lines which extend sinuously from said cutting edge to the back of the blade, said side sinuous corrugations communicating with the sinuations of said cutting edge.
2. An improved saw havigg a blade of uniform thickness and with a sinuous cutting edge, said blade having its sides provided with other sinuous corrugations which communicate with the sinuations of said cutting edge.

## No. 100,213. Floor Sweeper. Balayeuse.

Peter H. Melander, assignee of William A. Dunaway, both of Tacoma, Washington. U.S.A., 24th July, 1906; 6 years. Filed 9th January, 1906. Receipt No. 131,704.
Claim.-1. In a floor sweeper the combinatiun of a casing, an axle centrally mounted in said casing, supporting wheels on said axle, a rotary brush driven from said axle and lolated near one end of said casing, a rotary mop driven from said axle and located near the other end of said casing, a ro-
tary mop driven from said axle and located above it, dust flues leading from said brush and mop to said fan, and a dust pan adapted to receive the dust from sald fan.
2. In a floor sweeper the combination of a casing, an axle centrally mounted in said casing supporting wheels near brush driven from said axle and located near one end of said casing, a rotary mop driven from said axle and located near the other end of said casing, a rotary fan driven from said axle and located above it, dust flues leading from said brush and mop to said fan, dust spouts connecting with said fan, a movable plate adapted to close one of said dust spouts and to open the other, and means for operating and controlling said plate.

## No. 100,214. Pedestal for Hanging Paper.

Picdestale pour poser le papier de tenture.

John Richmond Brown, Yalesville, Connecticut, U.S.A., 24th July, 1906; 6 years. Filed 15th June, 1906. Receipt No. 136,923.
Claim.-1. In a paper hanger's pedestal, the combination with a clamp, of a horizontal arm having swivel connection therewith so as to swing on a vertical axis, an upright attached to the outer end of the arm, and a paper holder adjustably connected with the upper end of the upright.
2. In a paper hanger's pedestal, the combination with a clamp, of a horizontal arm having swivel connection thereWith so as to swing on a vertical axis, an upright pivotally' attached to the outer end of the arm, a brace between the arm and the upright, and a paper holder adjustably connected with the upper end of the upright.
3. In a paper hanger's pedestal, the combination with a clamp, of a horoizontal arm having swivel connection therewith so as to swing on a vertical axis, an upright attached to the outer end of the arm, a rod entered into the upper end of the upright in which it is adjustable, and a paper holder adjustably connected to the outer end of the said rod.
4. In a paper hanger's pedestal, the combination with a clamp, of a horizontal arm swivelled thereto so as to swing on a vertical axis, an upright pivotally attached to the outer end of the said arm, a folding brace between the said arm and upright, and a paper holder adjustably connected to the upper end of the said upright.
5. In a paper hanger's pedestal, the combination with a clamp adapted to be applied to a platform, of a horizontal arm having its inner end swivelled to the said clamp so as to swing upon a vertical axis, an upright pivoted to the outer end of the said arm, a brace between the sald arm and upright, a rod entered into the upper end of the upright in which it is adjustable, and a paper holder adjustably connected to the upper end of the said rod.
6. In a paper hanger's pedestal, the combination with a frame, of means for swivelling the same to a platform so as to swing on a vertical axis, a collapsible paper holder adjustably connected with the upper end of the said frame and stencil grippers for the said paper holder.
7. In a paper hanger's pedestal, the combination with a frame. of means for swivelling the same to a platform so as to swing on a vertical axis, and a collapsible paper holder adjustably connected with the upper end of the said frame and consisting on the principle of lazy tongs.
8. In a paper hanger's pedestal, the combination with a clamp, of a frame having swivel connection with the sa'd clamp so as to swing on a vertical axis, a collapsible paper holder comprising a top bar, a corresponding bottom bar, two pairs of side bars respectively having their outer ends pivoted to the ends of the said top and bottom bars and having their inner ends pivoted together, whereby the said paper holder is rendered collapsible on the principle of lazy tongs, and a short folding arm pivotally connected to the said lower bar of the paper holder with it connects to the sald frame.

No. 100,215. Sash Bar. Barre de fenêtre.

James P. Comstock, Tacoma, Washington, U.S.A., 24th July, 1906; 6 years. Filed 2nd January, 1906. Receipt No. 131,492.
Claim.-1. A sash bar comprising a pair of angle frons placed back toward back and securely fastened together through separators.
2. In a sash bar, the combination of a pair of parallel angle irons placed back toward back and securely fastened together through separators, a metallic strip curved to form an ornamental exterior covering for said bar, and means for securing said metal strip to said bar.
3. In a sash bar, the combination of a pair of parallel angle irons placed back toward back and securely fastened together through separators, a metallic strip curved to form an ornamental exterior covering for said bar, and clips engaging the inner side of said metallic strip and having screws securing said clips to said bar.
4. In a sash bar, the combination of a pair of parallel angle irons placed back toward back and securely fastened together through separators, a metallic strip curved to form an ornamental exterior covering for said bar, the sides of said metallic strip being inwardly folded, and clips engaging between the curved portion and the inwardly folded sides of said metallic strip and having screws securing said slips to said bar.
5. In a sash bar, the combination of a pair of parallel angle irons placed back toward back and securely fastened together through separators, and end castings adapted to be independently secured to the window frame and having extensions engaging between said angle irons and being secured thereto.
6. In a sash bar, the combination of a pair of parallel angle irons placed back toward back and securely fastened together through separators, and independent castings secured to the ends thereof between said angle irons and having lateral flanges adapted to be screwed to the window frame.
7. In a sash bar, the combination of a pair of parallel angle irons placed back toward back and securely fastened together through separators, Independent castings secured to the ends of the bar between the angle irons thereof and having lateral flanges adapted to be screwed to the window frame, a metallic strip curved to form an ornamental exterior covering for said bar, the sides of said metallic strip being inwardly folded, and clips engaging between the curved portion and the inwardly folded sides of said metallic strip and having screws securing said clip to said bar.
8. In a sash bar, the combination of a pair of parallel angle irons placed back toward back and securely fastened together through separators, and a clamp strip adapted to press the panes of glass against the legs of said angle irons and being formed to extend parallel with said angle irons and on each side thereof, and screw controlled clamping heads engaging said clamp strip and said angle irons to draw said clamp strip against the glass.
9. A window frame consisting of sash bars each formed of a pair of parallel angle irons placed back toward back and securely fastened together and secured at their ends to the building, similarly constructed transom bars extending between the sash bars, and clamping plates clamped to the sash bars and clamping the transom bars.
10. In a sash bar, the combination with a pair of angle irons placed back toward back and securely fastened together through separators and forming a stiff support with their backs between the panes of glass and lateral supports for the glass with their legs, of a keeper adjustably secured to said angle frons and clamping the glass between it and the legs thereof.

No. 100,216. Brick Mould. Moule d brique.

Peter Dierlamm, Stratford, Ontario, Canada, 24th July, 1906; 6 years. Filed 7th April, 1906. Recipt No. 134.723.
Claim.-1. In a machine of the class described the combination with a frame of a vertically movable currier thereon, means for operating said carrier, a pallet carried on the carrier, a plurality of longitudinal and transverse plates carried on the frame and means adapted to simultaneously reciprocate the transverse plates.
2. In a device of the class described the combination with a frame of a vertically movable carrier thereon. means for operating said carrier, a pallet on said carrier, a plurality of longitudinal plates supported on the framo adjacent the pallet and provided with slots therethrough, a plurality of transverse plates slidably engaged in said slots and means adapted to simultaneously move said transverse plates longitudinally.
3. In a device of the class described the combination with a frame of vertically reciprocating carriers thereon, means for operating said carriers, pallets on said carriers, longitudinal plates on said frame provided with vertical slots therein, a plurality of transverse division plates adapted to engage in said slots when at the inner limit of their movement and means for simultaneously reciprocating said plates transversely of the pallets.
4. In a device of the class described the combination with a frame of vertically movable carriers thereon, pallets on said carriers, intersecting transverse and longitudinal division plates carried on said frame and adapted to form compartment above the pallets, parallel ways on said frame, a head slidably engagen thereon and connected with sald transverse plates, means for moving said head along the ways, and tamping means hinged on the frame and adapted to tamp material in said compartments.
5. In a device of the class described the combination with a frame f verti all/ movabl pallets thereon, means for operating said pallets, means affording a plurallty of compartments above the pallets, a hopper adapted to rest on said plates and partitions therein adapted to divide sald compartments.

## No. 100,217. Electric Drill. Foret électrique.

William Obed Duntley, Chicago, Illinois, U.S.A., 24th July, 1906; 6 years. Filed 28th July, 1905. Receipt No. 127,271. Claim.-1. In an electric drill the combination of a tool shaft or driven spindle, a plurality of electric motors grouped about the axial line of said shaft and operatively connected therewith, and a casing and supporting said motors.
2. In an electric drill the combination of a tool shaft or driven spindle, a plurality of electric motors grouped about the axial line of said shaft and operatively connected therewith, a casing enclosing and supporting said motors, and grasping handles connected with such casing.
3. In an electric drill the combination of a tool shaft or driven spindle, a plurality of electric motors arranged equidistantly of the axial line of said shaft and operatively connected therewith, and a casing forming the field frame of the motors and enclosing and supporting the latter.
4. In an electric drill the combination of a tool shaft or driven spindle, a plurality of electric motors arranged equidistantly of the axial line of sald shaft and geared thereto, and a casing enclosing and supporting sald motors.
5. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors grouped around the

axial line of said spindle, a casing surrounding and supporting sald motors, pinions on the armature shafts of the motors, and a plate having an internal gear or curved rack with which each of the pinions mesh, said plate being connected with the tool spindle.
6. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors grouped around the axial line of said spindle, said motors being operatively connected with the tool spindle, and a feed adjusting screw arranged axially of the tool spindle and of the series of motors.
7. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors grouped around the axial line of said spindle, said motors being operatively connected with the tool opindle, a fixed screw-threaded shaft arranged axially of the series of motors, and a feed screw engaging the said fixed shaft.
8. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors equidistantly disposed around the axial line of said spindle said motors being operatively connected with the tool spindle, and end heads having a plurality of bearings for the armature shafts of the motors.
9. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors equidistantly disposed around the axial line of said spindle, said motors being operatively connected with the tool spindle, end heads having a plurality of bearings for the motor armature and a feed screw entering said head centrally thereof.
10. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors grouped around the axial line of said spindle, said motors being operatively connected with the tool spindle, end heads having a plurality of bearings for the motor armatures and provided with central openings, and a feed device comprising a fixed shaft recelved by the central opening of the lower end head and projecting upwardly therefrom and screw-threaded at its upper end, and a movable feed screw proper engaging sald shaft and passing through the central opening of the upper ena head.
11. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors grouped around the axial line of sald spindle, said motors being operatively connected with the tool spindle, end heads having a plurality of bearings for the motor armatures and provided with central openings, and a feed device comprising a fixed shaft received by the central openings of the lower end head and projecting upwardly therefrom and screw threaded at its upper end, and a movable screw-threaded sleeve forming the feed screw proper and engaging said shaft, said sleeve passing through the central opening of the upper end head.
12. In an electrlc drill the combination of a shell or casing forming the field frame of a series of electric motors, a series of fleld magnets arranged within the shell and connected therewith, a series of armatures disposed equidistantly with respect to the axial line of the shell, a tool spindle, and a gear plate connected with the spindle and to which said armatures are geared.
13. In an electric drill the combination of a shell or casing forming a field frame common to a serles of electric motors, a serics of field magnets arranged within the shell and connected therewith but forming ventilating spaces therebetween, a serles of armatures grouped about the axial line of the shell, a series of fans on the armatures to force air through the casing and through said ventllating spaces, and a tool spindle with which sald armatures are operatively connected.
14. In an electric drill the combination of a shell or casing. an electric motor therewithin, a tool spindle with which such motor is operatively connected, an electric switch on one sids of the shell or casing, and two handles arranged at oppositg sides of the casing, one of the handles being a dead handle with a passage therethrough, and the other being a live and rotatable handle having means for operating said switch, the leading in wires entering said dead handle and rim to the switch.
15. In an electric drill the combination of a shell or casing. an electric motor therewithin, a tool spindle with which such notor is operatively connected, an elctric switch on one sids Cl the shell or casing, and two handles arranged at opposit? sides of the casing, one of the handles being a dead handl? with a passage therethrough and the other being a live handle comprising a stationary socket portion or box fitting over the switch and a portion rotatable in said cocket portion, said rotatable portion being arranged to operate said switch, the leading-in wires passing in through the deal handle and extending to the switch.
16. In an electric drill the combination of a shell or casing, an electric motor therewithin, a tool spindle with which such motor is operatively connected, an electric switch on one side of the shell or casing, and two handles arranged at opposite sides of the casing, one of the handles being a dead handle with a passage therethrough and the other being a live handle comprising a stationary socket portion or box fitting over the switch and a portion rotatable in said socket portion and operatively connected with the switch, said socket portiou belng connected with the casing and removable therefrom and from the switch without interference with the wires, and leading-in wires passing trough the dead handle and across the body of the drill to the switch.
17. In an electric drill the combination of a shell or casing, an electric motor therewithin, a tool spindle with whlch such motor is operatively connected, an electric swltch on one side of the casing, a live and a dead handle, a split band clamped to the casing and connected with said hanales, said dead handle being hollow and receiving the leading-in wires which are run to the switch.
18. In an electric drill the combination of a shell or casing. an electric motor therewithin, a tool spindle with which such motor is operatively connected, an electric switch on one side of the casing, a live and a dead handle, a split band clamped to the casing and connected with said handles, and screws engaging the adjacent ends of the portions of the band for clamping them to the casing.
19. In an electric drill the combination of a shell or casing, an electric motor therewithin, a tool spindle with whith ssch motor is operatively connected, an electric switch on one side of the casing, a live and a dead handle, a split band clamped to the casing and connected with said handles, said band being outwardly expanded to form grooves for the reception of the wires, sald dead handle being hollow and receiving the leading-in wires which are run through the grooves in the band and to the switch.
20. In an electric drill te combination of a shell or casing, an electric motor therewithin, a tool spindle with which such motor is operatively connected, an electric switch on one side of the casing, a live and a dead handie, a split band clamped to the casing and connected with said handles, one portion of said band having a tubular extension to receive the dead handle, and the other portion thereof having a socket to fit over the switch.
21. In an electric drill the combination of a shell or casing, an electric motor therewithin, a tool spindle with which such motor is operatively connected, an electric switch on one side of the casing, a live and a dead handle, a split band clamped to the casing and connected with said handles, said band being outwardly expanded to provide a groove or channel for the leading-in wires one portion of said band having a tubular extension to receive the dead handle, and the other portion thereof having a socket fitting over the switch and means for clamping the band to the casing, said dead handle being hollow and arranged to permit the passage of the leading in wires through the channel to the switch.
22. In an electric drill the combination of a casing, end heads therefor, an electric motor arranged in the casing and having its bearings in such heads, and means whereby the motor may be bodily removable together with one of the end heads.
23. In an electric drill the combination of a casing, end heads therefor, an electric motor arranged in the casing and having its bearings in such heads, the motor buing removable as to one of jts bearings and fixed as to its other bearings to enable the motor to be bodily removed with one of the end heads.
24. In an electric drill the combination of a casing, end heads therefor, an electric motor arranged in the casing and having its bearings in such heads, one of the bearings having a bearing collar actuated by the armature shaft which is removable therefrom.
25. In an electric drill the combination of a casing, end heads therefor, an electric motor arranged in the casing and having its bearings in such heads, one of the bearings comprising a socket piece fitting in its end head, balls therein and a bearing collar actuated by the armature shaft which is bodily removable therefrom.
26. In an electric drill the combination of a casing, end heads therefor, an electric motor arranged within the casing and having its bearings in such heads, one of the bearings having a bearing collar actuated by the armature shaft which is removble therefrom, and a fan mounted on said collar.
27. In an electric motor the combination of a casing, top and bottom end heads therefor, a series of electric motors arranged within the casing and having bearings in the end heads, a tool spindle to which the motors are operatively connected, the bottom and head having bearing collars actuated by the armature shafts which are bodily removable therefrom, and fans mounted on the collars for circulating air through the casing to keep the parts air cooled.
28. In an electric drill the combination of a tool shaft or driven spindle, a plurality of electric motors arranged about the axial line of said shaft, a gear connected with said spindle and arranged to be engaged and actuated by each of sald motors, and a casing enclosing and supporting said motors.
29. In an electric drill the combination of a tool shaft or driven spindle, a plurality of electric motors arranged about the axial line of said shaft and having pinions on their armature shafts, a plate having a circular rack which is conrected with the spindle and with which sald pinions mesh, and a casing enclosing and supporting said motors.
30. In an electric drill the combination of a tool shaft or spindle, a plurality of electric motors arranged equidistantly of such shaft and operatively connected therewith, and a force feed device having a thrust bearing against the inner end of the tool shaft
31. In an electric drill, the combination of a tool shaft or spindle, a plurality of electric motors grouped about such shaft and operatively connected therewith, and a force feed device comprising a feed screw arranged axially of the tool shaft or spindle and having a thrust bearing against the inner end of the latter.
32. In an electric drill, the combination of a tool shaft or spindle, a plurality of electric motors grouped about such shaft and operatively connected therewith, and a force feed device comprising a fixed screw-threaded shaft arranged axlally of the tool shaft or spindle and having a thrust bearng against the inner end of the latter, and a feed screw also aranged axially of the tool shaft or spindle and engaging the fixed shaft.
33. In an electric drill, the combination of a shell or frame, a series of electric motors aranged therein, a series of fans operatively connected with said motors for causing a circulation of air among the parts of the different motors.
34. In an electric motor, the combination of a casing, an electrlc motor, a collar operatively connected with the armature shaft which is removable therefrom when the motor is lifted from casing, and a fan connected with such collar.
35. In an electric motor, the combination of a casing, an electric motor, a tool spindle to which the motor is operatively connected, bearings in the casing for the armature skaft of the motor, to one of which bearings the armature is operatively connected with said last-named bearing.
36. In an electric motor, the combination of a casing, a tool spindle, an electric motor arranged therein, and operatively connected with the tool spindle, a fan device operatively connected with the motor, and means whereby the rotor may be bodily removed without disturbing the fan device.

No. 100,218. Electric Drill. Foret électrique.
William O. Duntley, Chicago, Illinois, and Henry J. Kimman, Cleveland, Ohio, both in U.S.A., 24th July, 1906; 6 years. Filed 19th Sepetmber, 1905. Receipt No. 128,560.
Claim.-1. In an electric drill, the combination with an electric motor and a tool spindle operatively connected therewith, of means for breaking said connection when the load on the spindle reaches a predetermined amount.
2. In an electric drill, the combination with an electric motor and a tool spindle, of operating connections between the motor and the spindle for actuating the latter and governed by the load thereon.
3. In an electric drill, the combination with an electric motor and a tool spindle operatively connected therewith, of means for stopping the operation of the tool spindle when the load thereon reaches or exceeds a predetermined amount.
4. In an electric drill, the combination with an electric motor and a tool spindle operatively connected therewith, of means for interfering with said connection when the load on the spindle reaches a predetermined amount without interfering with the running of the motor.
5. In an electric drill, the combination with an electric motor and a tool spindle, of an operating connection there-

between arranged to drive the tool spindle up to a predetermined load thereon.
6. In an electric drill, the combination with an electric motor and a tool spindle, of a frictionally controlled drive connection between the motor and the spindle.
7. In an electric drill, the combination with an electric motor and a tool spindle, of a train of gearing between said motor and tool spindle, one of the members of the train being rendered inoperative when the load reaches a predetermined amount.
8. In an electric drill, the combination with an electric motor and a tool spindle, of a train of gearing between said motor and tool spindle, one of the members of the train being arranged to slip and thereby prevent actuation of the tool spindle when the load reaches a predetermined amount.
9. In an electric drill, the combination with an electric motor and a tool spindle, of a train of gearing between said motor and tool spindle, one of the members of the train being a rack normally stationary but arranged to rotate and thereby destroy the operating connections between the motor and tool spindle when the load on the latter reaches a predetermined amount.
10. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle, one nember of the train being arranged to become inoperative when the load reaches a predetermined amount.
11. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle, and comprising a rack and pinions, said rack being normally stationary but arranged to rotate when the load on the tool spindle reaches a predetermined amount.
12. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinions, and a casing or support with which said rack has frictional resistance up to a predetermined amount to resist a predetermined load on the tool spindle.
13. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinions, a casing or support, and a friction ring between said rack and casing whereby said rack will resist a load on the tool spindle substantially equalling the frictional resistance with said ring.
14. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a curved rack and pinions, and means for clamping said rack to resist a predetermined load on the tool spindle.
15. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinions, and means for imparting a predetermined frictional resistance to the rack to resist a predetermined load on the tool spindle.
16. In an electric drill, the combination with an electric motor and a tool spindle, of train of gearing forming the operating connection between the motor and spindle, one of
the members of the train being a rack, and means for imparting to the rack a resistance adjustable in degree.
17. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle, one of the members of the traln being a rack, and means for imparting thereto a frictional resistance adjustable in degree to resist any predetermined load on the tool spindle.
18. In an electric drill, the combination with an electric motor and a tool spindle, of a train of gearing between said motor and tool spindle, and means for imparting to one of the members of the train a resistance equalling the maximum load on the tool.
19. In an electric drill, the combination with an electric motor and a tool spindle, of a train of gearing between said motor and tool spindle, and means for imparting to one of the members of the train a frictional resistance adjustable In degree to prevent slipping thereof untll the load on the tool reaches or exceeds a predetermined amount.
20. In an electric drill, the combination with an electric motor and a tool spindle, of a frictional drive connection between the motor and the spindle, and means for varying the degree of the irictional resistance.
21. In an electric drill, the combination with an electric motor and a tool spindle, of operating connections betwecu the motor and spindle for actuating the latter and governed by the load thereon, and means co-operating with said connections for varying the amount of power capable of being transmitted therethrough.
22. In an electric drill, the combination with an electric motor and a tool spindle, of a train of gearing between said motor and tool spindle. one of the members of the train having a frictional resistance substantially equalling the maximum load on the tool spindle and arranged to slip when the load reaches or expeods said amount, and means for adjusting the degree of said resistance.
23. In an electric drill. the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinions and springs imparting a frictional resistance to the rack.
24. In an electric drill. the combination with an electric motor and a tool snindle. of planetary gearing forming the operating connection between the motor and snindle, and comprising a rack and pinlons, springs imparting a frictional resistance to the rack, and means for varying the tension of the springs.
25. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinlons, friction rings bearing against the rack and means for varving the friction of such rings.
26. In an electric drill. the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spladle and comprising a rack and pinions. and a series of spring pressed studs exerting prescure against the rack to hold the same with a predetermined irictional resistance.
27. In an electric drill, the combination with an electric motor and a tool soindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinions, a friction ring bearing against the rack and a series of spring pressed studs bearing against the ring to hold the rack with a predetermined resistance.
28. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinions, a friction ring bearing against the rack, a series of spring pressed studs bearing against the ring to bold the rack with a irlctional resistance, and means for adjusting the degree of tension exerted by such studs.
29. In an electric drill, the combination with an electric motor and a tool spindle, of planetary gearing forming the operating connection between the motor and spindle and comprising a rack and pinlons, a casing or support having a socket to recelve such rack, and means for holding said rack therein with an adjustable frictional resistance.
30. In an electric drill, the combination with a casing and with the electric motor armature arranged thereln, of a fan within the casing which is provided with openings for the passage of air, and fuse arranged in the electric motor circuit and located adjacent one of said openings for ready inspection and replacement.
31. In an electric drill, the combination with a casing and with the electric motor armature arranged therein, of a force leed device comprising a screw-threaded yoke, and a screw-threaded wheel or ring engaging said yoke and bearing against the casing.
32. In an electric drill, the combination with a casing and with the electric motor armature arranged thereln, of a
force feed device comprising a yoke whose parallel members are screw threaded and enter the casing, and a screwthreaded ring engaging said yoke and bearing against the casing.
33. In an electric drill, the combination with a casing and with the electric motor armature arranged therein, of a force feed device comprising a U-shaped frame whose parallel screw-threaded members enter the casing and whose crosspiece extends diametrically across the outer end of the casing, and a screw-threaded ring engaging said yoke and bearing against the casing.
34. In an electric drill, the combination with a casing and with the electric motor armature arranged therein, of a force feed device comprising a yoke whose parallel members are screw threaded and enter the casing, said yoke having a centering point, and a screw-threaded ring or wheel engaging said yoke and bearing against the casing.
35. In an electric drill, the combination, with a casing and with the electric motor armature arranged therein, of a force feed device comprising a screw-threaded yoke, and a screw-threaded wheel engaging said yoke and rotatably mounted on the casing and having a flxed relation thereto with respect to the longitudinal axis thereof.
36. In an electric drill, the combination with the casing and the motor armature therein, of an electric switch for controlling said motor, and grasping handles connected with the casing, said switch having contact parts within said casing and an actuating part on the outside thereof adjacent a handle and within reach of the operator's hand.
37. In an electric drill, the combination with the casing and the motor armature therein, of grasping handles on the casing, an electric switch for controlling said motor, said switch comprising contact parts within said casing, a button for operating said contact parts, and another button for restoring said parts to their normal condition, sald buttons proiecting through the casing to the outside thereof and adjacent one of the handles.
38. The combination with an electric drill, of grasping handles on the casing, a controlling switch therefor, said switch being mounted upon said drill, and comprising contact parts, a part adapted to be moved to oderate said contact parts. and a part adapted to be moved to restore sald operating part to its normal position.
39. In an electric drill, the combination with the casing and the motor therein, of a handle on said casing, and a switch for controlling said motor, said switch being mounted on said casing, and having two actuating parts, one located on either side of sald handle.
40. In an electric drill, the combination with the casing and the motor therein, of a handle secured on said casing. and a switch for controlling said motor, sald switch being mounted on said casing and having an operating button, and a restoring button, said buttons being arranged for movement in the direction of the longitudinal axis of the drill, and being located one on either side of sald handle.
41. The combination with an electric drill, of a switch for controlling the same mounted upon sald drill, said switch having an actuating part arranged for movement in the direction of the longitudinal axis of the motor, whereby the drill may be controlled without disturbing its position with relation to the work.
42. In an electric drill, the combination with the casing and the motor therein, of a handle secured to the outside of the casing, and an electric switch for controlling said motor, said switch having its contact parts within said casing, and Its actuating part or button projecting through the casing in proximity to sald handle said button being movable substantially in the direction of the line of thrust of the drill.
43. In an electric drill, the combination with the casing and the motor therein, of a handle secured to the casing. and an electric switch for controlling said motor, said switch comprising contact parts within said casing and an actuating part outside of said casing in proximity to sald handle, sald actuating part being so disposed as to require a movement transverse to the longitudinal axis of said handle to actuate the same.
44. In an electric drill, the combination with the casing and the motor therein, of an electric switch for controlling said motor, sald switch comprising contact parts and an actuating part, said actuating part being located upon the outside of said casing and being so disposed as to require a movement thereof in the direction of the longitudinal axis of the motor to operate the switch.
45. In an electric drill the combination with the casing, and the motor therein, of a handle secured to the outside of said casing, an electric switch for controlling the circuit of said motor, sald switch being mounted on sald casing and having two actuating parts arranged in proximity to said handle, sald parts being movable substantially in the direction of the line of thrust of the drill, one of sald actuating parts operating to make the circuit and the other to break the circuit.
6. In an electric drill the combination with the casing, and the motor therein, of a handle secured to the outside of said casing, an electric switch for controlling the circuit of sald motor, contact parts for said switch within said casing, and actuating parts for said switch proferting through said casing in proximity to sald handle, said actuating parts being disposed one on either side of said handle and being arranged to be moved in the direction of the longitudinal axis of sald drill.
47. In an electric drill the combination with a casing, and a motor therein, of two handles rigidly secured to the outside of said casing at diametrically opposite points, and an electric switch for controlling said motor, said switch comprising contact parts located within said casing, an actuating key or button co-operating with said contact parts, a restoring key or buttom, and a link connecting sald buttons projecting through said casing in proximity to said handle and belng so disposed with relation to the drill that their operating movement is in the direction of the longitudinal axis thereof.
48. In an electric drill the combination with the casing and a switch for controlling said motor, said switch being mounted on said casing, and having an operating button. a restoring button, said buttons being moved in the direction of the lline of thrust of the drill. and means for holding the buttons in one position or the other with a yielding pressure.
49. In an electric drill the combination with the casing and the motor therein. of a handle secured on said casing, and a switch for controlling said motor, sald switch being mounted on said casing, and having an operating button. a restoring button, sald buttons being movable in the direction of the line of thrust of the drill, and a spring-pressed pin co-operating with said buttons to hold them in one position or the other.
50. In an electric drill the combination with the casing and the motor therein of a handle secured on said casing, and a switch for controlling said motor, said switch being mounted on sald casing, and having an operating button. a restoring button, a connecting rocking lever between the buttons having a propecting finger, and a spring-pressed pin co-operating with said finger to hold the lever and the buttons in one position or the other, said buttons being movable in the direction of the line of thrust of the drill.

No. 100,219. Electric Drill. Foret élcctrique.

John Maclean, 50 Wellwood Road, Goodmayes, Ilford, Essex. England, 24th July, 1906; 6 years. Filed 1st March, 1906. Recelpt No. 133,420.
Claim.-1. A portable electric drill comprising in combination, a frame, a fixed shaft in the frame, a magnet on the shaft, an armature arranged externally of the magnet, a commutator and an enclosing framework, said framework belng driven by gear from the armature and being adapted to rotate the drill, substantially as described.
2. A portable electric drill comprising in combination, a frame, a fixed shaft in the frame, a swilch, feeding mechanlsm, a magnet on the shaft, an armature arranged externally of the magnet, a commutator, a skeleton frame driven by gearing from the armature, an enclosing framework driven from the skeleton frame aforesaid, said enclosing framework having a socket in which the drill is fitted, the several working parts running in ball bearings, substantially as described.
3. A portable electric drill comprising in combination, a frame, a fixed shaft in the frame, a magnet on the shaft, an armature arranged externally of the magnet, a commutator, an enclosing framework, gear for driving the cylinder from the armature, means connected with the cylinder for rotating the drill, means for feeding the drill forward automatically and also for feeding it by hand, substantially as described.
4. A portable electric drill comprising in comblnation a frame, a fixed shaft in the frame, a switch, feeding mechanism, a magnet on the shaft, an armature arranged externally of the magnet, a commutator, a skeleton frame running upon ball bearings on the shaft, internal teeth on this frame, a gear wheel gearing witr the teeth and with a pinion carried on a sleeve running in ball bearings on the shaft, said sleeve being connected to the armature, and means connected with the skeleton frame for rotating the drill, substantially as described.
5. A portable electric drill comprising in combination, a frame, a fixed shaft in the frame, a switch, feeding mechanism, a magnet on the shaft. an armature arranged externally of the magnet, a commutator, a skeleton frame having internal teeth thereon, a gear wheel gearing with sald teeth on the one hand and with a pinion connected with the armature on the other hand, a bracket for supporting the gear wheel, an enclosing cylinder fitted on the shait at one end and connected with a socket adapted to receive the drill at the other end, internal teeth on the enclosing cylinder, a gear wheel, a pinion running in ball bearings and connected with a skeleton frame, and a brackt for supporting the gear wheel, substantially as described.
6. A portable electric drill comprising in combination, a frame, a fixed shaft in the frame, a magnet on the shaft, an armature arranged externally of the magnet, a commutator, a1: enclosing cylinder, gear connected with the armature for rotating the cylinder, a socket connected with the cylinder, a bracket on the frame, a short shaft with a second socket therein carried by the bracket, teeth on this socket, external teeth on the socket of the enclosing cylinder and an intermediate pinion adapted to engage with sald teeth and with the teeth of the second socket, substantially as described.
7. A portable electric drill comprising in combination, a frame, a fixed shaft in the frame, a magnet on the shaft, an armature arranged externally of the magnet, a commutator, an enclosing cylinder driven by gear from the armature, a socket connected with the cyllinder, teeth on the socket, a bracket on the frame, a shaft having a socket at one end thereof carled by the bracket, teeth on both sockets, an intermediate pinion, a screw for feeding the drill, ratchet mechanism for oparating the screw, a second bracket with screw hole thereln which is in line with the second socket and which is adacted to receive a feed screw, substantially as described.

No. 100,220. Fruit Gatherer.
Appareil d cuolllir les fruits.

George Henry Roberts, Richburg, New York, U.S.A., 24th July. 1906; 6 years. Filed 14th May, 1906. Recelpt No. 135,918 .
Claim.-1. In a fruit gatherer, an apron constructed from a plurality of fabric members having their side cdges converging and united along all of said edges except one by sewing. a binding strip folded over the outer ends of the united fabric members and sewed thereto, a rope binder within the folled outer binding strip, straps folded centrally upon themselves and riveted to the binding strips at points where the seams betweon the fabric members occur and extended over said seams and secured by rivets passing through the overlapping portions of the fabric members at the seams, and rings supported by said strap.
2. In a frult gatherer, an apron contructed from a plurality of fabric members having thelr alde edges converging and
united along all of said edges except one by sewing, a binding strip folded over the outer ends of the united fabric members and sewed thereto, a rope binder within the inner binding strip, a band for enclosing the trunk of the tree from which the fruit is to be gathered, guy members connecting said band to said apron at the points where the seams occur, straps folded centrally upon themselves and riveted to the outer binding strip at points where the radial seams odcur and extended over said seams and secured by rivets passing through the overlapping portions at the seams, and rings supported by said straps.

## No. 100,221. Method of Making Roads.

Méthode de faire les chemins.
Leonard Schade van Westrum, Berlin, Germany, 24th July, 1906; 6 years. Filed 25th November, 1903. Receipt No. 110,408.
Claim.-1. A method of making roads and like surfaces consisting in binding together the materials such as broken stones, sand, dust, earthy materials and the like used for forming the street body and the like with an emulsion consisting of water and oily substances emulsionized with water, substantially as described and for the purpose specified.
2. A method of making roads and like surfaces consisting in binding together the materials such as broken stones, sand, dust, earthy materials and the like used for forming the street body and the like with an emulsion of water and oflv substances, as mineral oil, tar or asphalt emulsionized with a more volatile agent such as ammonia.
3. A method of making roads and like surfaces consisting in binding together the materials such as broken stones, sand, dust. earthy materials and the like used for forming the street body and the like with an emulsion of water and oily substances saponified with resin oil, olein and ammonia.

No. 100,222. Circular Saw Gear.
Engrenage de scies circulaires.

James Harrison Martin and Charles Newman, assignee of a half interest, both of Springfield, Missouri, U.S.A., 31st July, 1906; 6 years. Filed 3rd July, 1906. Recelpt No. 137,475.
Claim.-1. In a portable sawing machine the combination with a vertical shaft and suitable supports therefor, of a beam connected with the said shaft by a universal joint, and a circular saw journalled in the outer end of said beam, and means for driving the saw at any lateral inclination thereof, or at any vertical or horizontal angle at which the beam may be held, substantially as described.
2. In a portable sawing machine a movable beam carrying a circular saw for being operated perpendicularly and laterally, also at any desired angle by means of a universal joint at the heel or fixed end, and a swivel joint connecting the parts of the beam, all substantially as shown and described.
3. In a portable sawing machine a beam divided into two parts, one part forming a socket, the other entering the same to form a swivel joint for turning the saw in different planes, said beam having a spring provided with a nut for tightening the same for adjusting the tension of the belt, substantially as shown and described.
4. In a portable sawing machine, a movable beam carrying a circular saw provided with handles at its outer end for the operator. and its opposite end having a double hinge or universal joint, one axis formed by a bolt passing through the end of the beam and a strap passing around the shaft and a bushing, permitting a perpendicular motion of the saw, and the said bushing on the shaft giving lateral motion to the saw. substantially as shown and described.
5. In a portable sawing machine, a beam carrying a circular saw provided with a hinge joint at its heel giving perpendicular motion and also lateral motion combined with a swivel joint formed in the beam for adjusting the saw in different planes, combined with a belt passing around sheaves for guiding and giving tension to the belt, all substantially as shown and described.
6. In a portable sawing machine the combination with a suitable guide and a shaft whilch is adjustable vertically therein, of a beam swivelled to the said shaft, a circular saw carried at the outer end of the beam, and means adapted for driving sald saw at whatever angle the beam may be held, substantially as described.
7. In a portable sawing machine the combination of a motor, a wagon frame and a belt with a movable beam carrying saw, sald movable beam having a universal joint at its heel for permitting same to have perpendicular and lateral motion, and a swivel joint in the beam for rotating the end carrying the saw to the desired plane for cutting, combined with a counterweight, supported from the said frame for supporting the sald beam which carries the saw, all substantially as specified.

No. 100,223. Rail Chair. Coussinet.

William H. J. Clifton, West Point and Anna M. Holland, assignee of a half interest, Loretto, both in Tennessee, U.S.A., 31st July, 1906; 6 years. Filed 7th July, 1906. Recelpt No. 137,591.
Claim.-1. A device of the class described comprising a chair plate and rail clamping plates slidably disposed upon the chair plate to engage a rail supported thereby.
2. A device of the class described comprising a chair plate and rail clamping plates slidably disposed upon the chair plate to engage a rall supported thereby, and including portions arranged to underlie the said rail.
3. A device of the class described comprising a chair plate, and rail clamping plates slidably disposed upon the chair plate to engage a rall supported thereby, and including portions arranged to underlie the said rail, said portions having their ends bevelled.

No. 100,224. Plectric Furnace. Fournaisc électrique.

La Societé Electro-Metallurgic Francaise, Froges, Isere, assignee of Paul Louis Toussaint Heroult, La Praz, Savoie, all in France, 31st July, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,i03.

Claim.-1. An electric furnace having a jacket of magnetic material divided by a picce of non-magnetic material to break the lines of force around the furnace.
2. An electric furnace having a body $A$ of carbon and a jacket surrounding the same comprising a portion $E$ of iron, sald portion being divided and its ends connected by a portion $F$ of copper to break the lines of force around the furnace.
3. An electric furnace having a base plate of cast iron with rods of wrought iron projecting into the body of the furnace and having their lower ends cast into the base plate.
4. Means for attaching electric cables to a cast plate comprising a contact block of highly conductive material, said plate being cast about said block and intimately welded thereto.
5. Means for attaching electric cables to a cast plate comprising a contact block of highly conductive material, said plate being cast about said block, and a cable block in which the end of the cable is cast, the two blocks being strongly clamped together
6. Means for attaching electric cables to a cast iron plate $C$, comprising a contact block $J$ of copper, said plate being cast about said block and intimately welded thereto.
7. Means for attaching electric cables to a cast iron plate C comprising a contact block $J$ of copper, said plate cast about said block, and a cable block $L$ in which the end of the cable is cast, said blocks having their contact faces planed and being bolted together.

No. 100,225. Holder for Mlectrodes. Porte-électrodes.

La Société Electro-Métallurgique Francals, Froges, Isère, assignee of Paul Louis Toussaint Hérault" La Praz, Savoie, both in France, 31et July, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,705.
Claim.-1. A holder for electrodes including a head adapted to be fastened to the end of the electrode and having a serfes of ribs for effecting a rapid radiation of heat therefrom.
2. A holder for electrodes including a head $B$ having a lower portion $C$ adapted to be fastened to the end of an electrode and having its upper portion formed with ribs $E$ for effecting a rapid radiation of heat.
3. A holder for electrodes including a head $B$ having a lower portion $C$ adapted to be fastened to the end of an electrode, and having its upper portion formed with ribs E for effecting a rapid radiation of heat, and a plpe fior the circulation of a cooling fiuid embedded in the lower portion of said head.
4. $\boldsymbol{A}$ holder for electrodes including a jacket adapted to surround the electrode, a ring outside of said jacket, and a serles of wedges adapted to be driven between said ring and said jacket to clamp the latter strongly against the electrode.
5. A holder for electrodes including a jacket $G$ of sheet copper adapted to surround the electrode, a ring $H$ of steel outside of said jacket, and a series of wedges $J$ adapted to be driven between said ring and said jacket to clamp the latter strongly against the electrode.
6. A holder for electrodes including a head fitting in the end of the electrode, and means for clamping he parts of the electrode together about sald head.
7. A multiple electrode composed of several parts having, when clamped together, a socket in the end, in combination with a head having a portion fitting in said socket, and means for clamping the parts of the electrode together with said head embraced in sald socket.
8. A holder for electrodes including a head $B$ fitting in the end of an electrode, a jacket $G$ surrounding the electrode and adapted to be clamped agalnst the same, and a yoke $L$ connected to the upper ends of said head and jacket respectively.
9. The combination with the electrode of an electric furnace, of a protecting case therefor insulated therefrom.
10. The combination with the electrode of an electric furnace, of a protecting steel casing $P$ therefor provided with an inner layer $Q$ of insulating material.
11. The combination of the electrode of an electric furnace, of a protecting casing therefor, a jacket surrounding the upper end of the electrode, a ring $H$ outside of said jacket, and a series of wedges adapted to be driven between said ring and said facket to clamp the latter strongly against the electrode, and means for supporting said protecting casing from said ring and insulating the same electrically from the ring.

No. 100,226. Flectric Fumase. Fournaise électrique.

La Societe Electro-Métallurgique Francais, Froges, Isere, assignee of Paul Louls Toussaint Héroult, La Praz, France, 31st July, 1906; 6 years. Filed 8th June, 1906. Recelpt No. 136,706.
Claim.-1. A contract for an electrode comprising divided rings of conducting material adapted to surround the electrode, the adjacent rings having contacting faces which are wedge-shaped so that the pressing of the adjacent rings together makes a more intimate contact between them, and also a more intimate contact of one ring with the electrode.
2. A contact for an electrode comprising divided rings $G$ and $H$ of conducting material adapted to surround the electrode, the ring GG having an upper conical face $J$ and the ring $H$ having a lower conical face $K$ in engagement therewith, so that the pressing of the adjacent rings together makes a more intimate contact between them, and also a more intimate contact of one ring with the electrode.
3. The combination in an electric furnace, of an electrode, a stuffing box surrounding the electrode at the point where it enters the furnace, and means for making a contact between said furnace and said electrode comprising divided rings $G$ and $H$ made up of a series of carbon blocks $G^{1}$ and $H^{1}$ adapted to surround the electrode, the ring $G$ having an upper conlcal face $J$ and the ring $H$ having a lower conical face $K$ in engagement therewith, the inner face $L$ of the lower wall of the stufing box belng correspondingly conical, a copper ring $M$ above said carbon rings, a ring $Q$ of packing material above said copper ring, and a gland $N$ fur exerting pressure upon said packing ring and thereby upon sald copper and carbon rings, said gland having a flange $R$ protecting the packing ring $Q$ from the heat of the electrode.

No. 100,227. Process of Preparing Copper Ores. Procédé pour préparer les minerais de cuivre.

La Société Métallurgique Françals, Froges. Isère, assignee of Paul Louls Toussaint Héroult, La Praz. Savoie, France, 31st July, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,707 .
Claim.-1. The method of treating copper ore which consists in freding it into an electric furnace and fusing it there.
in and simultaneously injecting oxygen into the ore to oxidize part of the sulphur.
2. The method of treating copper ore which consists in feeding it into an electric furnace and fusing it thereln and simultaneously injecting oxygen in sufficient quantity to oxidize a large part of the sulphur and iron and to leave only a black copper melt with a slag of gangue and iron.

No. 100,228. Tie Plate. Plaque de dormant.

Eernard James Coghlin, Montreal, Quebec, Canada, 31st July,
1906; 6 years. Filed 10th July, 1906. Receipt No. 137,670.
Claim.-1. A brace tie plate cast and being of oblong configuration and having a vertical brace at diagonally opposite corners, each of said braces being adapted to bear upon the web of the rail and one of said braces supporting the head of the rall and the other brace being of less height than the head of the rail, the braces having laterally projecting reinforcing ribs extending along the edge of the bearing face of same, substantially as described.
2. A brace tie plate cast and being of oblong conflguration and having a vertical brace at diagonally opposite corners, each of said braces being adapted to bear upon the web of the rail and one of said braces supporting the head of the rail and the other brace being of less height than the head of the rail, the braces having laterally projecting reinforcing ribs extending along the edge of the bearing face of same, the inside ribs being supplemented by wing projections, substantially as described.
3. A tie plate the upper surface of which is inclined from the outer end inward.
4. A tie plate one end portion of which is thicker than the other.
5. A tie plate of tapering thickness from the outer to the inner end.
6. A brace tie plate of oblong conflguration and having a vertical brace at diagonally opposite corners, each of said braces being adapted to bear upon the web of the rail and one of said braces supporting the head of the rail and the other brace being of less height than the head of the rall, the base of the plate having a serles of ribs on its under surface, substantially as described.
7. A brace tie plate of oblong conflguration and having a vertical brace at diagonally opposite corners, each of said braces being adapted to bear upon the web of the rail and one of said braces supporting the head of the rail and the cther brace being of less height than the liead of the rall, the base of the plate being of tapering thickness and having a serles of ribs on its under surface, substantially as described.
8. A brace tie plate of oblong configuration and having a vertical brace at diagonally opposite corners, each of sald braces being adapted to bear upon the web of the rall and one of said braces supporting the head of the rail and the other brace being of less height than the head of the rail, the base of the plate being of tapering thickness and having a series of ribs on its under surface and the braces having laterally projecting reinforcing ribs, substantially as des. cribed.
9. A brace tie plate cast of iron and rendered malleable and being of oblong configuration and having a vertical brace at diagonally opposite corners, each of said braces being adapted to bear upon the web of the rail and one of said braces supporting the head of the rall and the other brace being of less height than the head of the rail, the base of the plate being of tapering thickness and having a series of ribs on its under surface and the braces having laterally projecting relnforcing ribs with wing projections from the inside ribs, substantially as deseribed.

No. 100,229. Steol Cross IYe. Dormant on acder.

Samuel B. Ferguson and Charles Calhoun, both of Rome, Mississlppi, U.S.A., 31st July, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,009.
claim.-1. The combination with a channelled metallic tie having rail engaging tongues integral therewith, of rall supporting blocks within the tie, means thereon for engaging the rails, and adjustable means connecting the blocks.
2. The combination with a channelled metallic tie having mieans thereon for engaging the inner flanges or ralls, of rail supporting blocks within the tie, means thereon for engaging the outer flanges oi rails, and an adjusting device connecting the blocks and within the tie.
3. The combination with a channelled metallic tie having ictegral rail engaging means, of rail supporting blocks withis the tie, ears thereon adapted to co-operate with the rail engaging means on the tie for clamping the rails in position, and an adjustable device connecting the blocks.
4. The combination with a channelled metallic tie having integral rail engaging tongues upon the sides thereof and braces connecting the sides, of rail supporting blocks adjustably mounted within the tie, rail engaging ears upond said blocks adapted to co-operate with the tongues to clamp the rails in position, and means connecting the blocks to hold them against displacement.
5. The combination with a channelled metallic tie having rail seats thereon and rail engaging tongues overlapping the seats, of rail supporting blocks within the tie and adjacent the seats. ears integral with the blocks for engaging the rails and adapted to co-operate with the tongues for securing the rails to the tie, and means for adjusting the blocks toward each other and holding them against movement.

No. 100,230. Cross Tie Cutter. Coupe-dormant.

Richard Sloan Wright, Nelson, Arkansas, U.S.A., 31st Julyo 1906; 6 years. Filed 9th July, 1906. Receipt No. 137,643. Olaim. -1 . A cross tie cutter comprising a frame, a carriage movable horizontally along the frame, racks on said carriage, gear wheels co-acting with said racks, and two pairs of segmental blades mounted on the carriage at opposite sides, the blades of each pair being spaced apart, the blades of one pair being closer together than the blades of the other pair.
2. A cross tie cutter comprising a frame, upper and lower bars extended longitudinally through the frame, tracks on the under sides of the upper bars, tracks on the upper sides of the lower bars, a carriage, rollers on said carriage for engaging with the upper and lower tracks, a gear mechanlim for causing back and fonth movements of the carriage, and two pairs of segmental blades mounted on the carriage at opposite sides, the blades of one pair being closer together than the blades of the opposite pair.

No. 100,231. Track Clearer. Nettoyeur de voies.

William E. Knowlton, Portland, Maine, U.S.A., 31st July, 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,501.
Claim.-1. In a track clearer for removing ice, the combination of a car or other vehicle provided with a series of pivoted discs set at an acute angle to the line of motion of the car and adapted to roll on the ice.
2. In a track clearer for removing ice, the combination of a car or other vehicle provided with a series of pivoted discs with thickened centers and sharpened edges set at an acute angle to the line of motion of the car and adapted to roll on the ice.
3. In a track clearer for removing ice, the combination of a car or other vehicle, a beam beneath said car, means for raising and lowering said beam and a series of discs pivoted on the underside of said beam and set at an acute angle with the line of motion of the car and adapted to roll on the ice.

No. 100,232. Track Brake. Frein.

Nels Edward Knutzen, Manitowoc, Wisconsin, U.S.A., 31st July, 1906; 6 gears. Filed 11th July, 1906. Receipt No. 137,696.
Claim.-1. In a track brake to be used in connection with the usual train pipe, the comblnation with the usual automatic system for wheel brakes of an auxiliary reservolr, a cylinder and piston, means for connecting sald auxiliary reservoir with the train pipe, means for connecting the said auxiliary reservoir with the said cylinder and means for allowing pressure in the auxiliary reservoir to enter the sald

7-24
cylinder when there is an emergency application of the wheel brakes, and brake shoes adapted to engage the track, substantially as described.
2. In an emergency track brake the combination with the train pipe of the usual automatic system for wheel brakes, of a valve connceted thereto, an auxiliary reservoir connected to said vaive, a cylinder connected to said valve, a piston in said cylinder, brake shoes connected to said piston and adapted to be operated thereby, means in said valve for establishing communication between the auxiliary reservoir and the said piston operated by an emergency reduction of pressure in the train pipe, substantially as described and for the purposes set forth.
3. In an emergency brake the combination with the train p'pe of the usual automatic system for wheel brakes, of a valve connected thereto, an auxiliary reservoir connected to said valve and a cylinder and piston connected to sald valve, brake shoes connected to the piston, means for allowing communication between the train pipe and the said auxiliary reservoir for charging said reservoir and means in said valve for allowing a direct communication between the said auxiliary reservoir and the said cylinder during an emergency application of the wheel brakes and means in said valve for allowing direct communication between the sald cylinder and the atmosphere, substantlally as described and for the purposes set forth.

No. 100,233. Brake Shoes for Locomotives. Sabot de frein pour locomotives.

Henry H. Urquhart, Paducah, Kentucky, U.S.A., siat July 1906; 6 years. Filed 5th July, 1906. Recerpt No. 187,545. Claim.-1. In a device of the class described the combination with a brake block or head, of a brake shoe provided in its rear face with a recess receiving the brake block or head, said brake shoe being provided at the said recess with side and end walls, whereby it is held against lateral and longitudinal movement, and means for securing the brake shoe to the brake block or head.
2. In a device of the class described the combination with a brake block or head, of a brake shoe provided in its rear face with a recess receiving the brake block or head, said brake shoe being provided at the said recess with side and end walls, whereby it is held against lateral and longitudinal movement, and means for securing the brake shoe to the brake block or head, said means being located in rear of the brake shoe to permit the latter to be worn out without affectIng the securing means.
3. In a device of the class described the combination of a brake block or head provided with a socket having side and end walls, a brake shoe provided at its rear face with a recess recelving the brake block or head and having side and end walls for engaging the same, said brake snoe being also provided with a lug extending into the socket of the brake block or head, and fastening means for securing the lug to the brake block or head.
4. In a device of the class described the combination of a brake block or head provided with a socket having side and end walls, a brake shoe provided at its rear face with a recess receiving the brake block or head and having side and end walls for engaging the same, said brake shoe belng also provided with a lug extending into the socket of the brake block or head, and a transverse fastening device piercing the brake block or head and the lug and having exteriorly arranged means for detachably holding it in poaition.

Digitized by uOOgle

No. 100,234. Barrel. Baril.

Chauncey D. Crandal, St. Louis, Missouri, U.S.A., 31st July, 1906; 6 years. Filed 10th July, 1906. Receipt No. 137.673.
Claim.-1. A knock-down barrel constructed of a plurality of uniformly sized and shaped vencered staves, vencered heads located in the ends of the barrels and means whereby said staves and heads are held together, substantially as specified.
2. A knock-down barrel comprising a plurality of uniformly sized veneered sections, metallic binders located on the ends of said sections, and veneered heads positioned in said binders in the ends of the barrels, substantially as specified.
3. A knock-down barrel comprising a series of uniformly sized veneered sections, metallic binders enclosing the ends of said sections when set up in barrel form, veneered heads removably located in the ends of the barrel and engaged by the binders, means carried by one of the heads whereby it is detachably secured to one of the binders, and metallic heads located upon the barrels, substantially as specified.
4. A knock-down barrel constructed of a scries of uniformly sized sections adapted to form the body of the oarrel, metallic binders positioned upon the ends of the sections when set up in barrel form, there being flanges formed integral with the inner walls of each of the binders, heads seated upon said flanges, and a series of keepers carried by one of said heads for detachably securing said head in position, substantially as specified.
5. A knock-down barrel constructed of a series of uniformly sized stave sections adapted to form the body of the barrel, binders located upon the ends of the sections when set up in barrel form, there being flanges formed integral with the edges of said binders for engaging the stave sections. heads for the barrel engaging upon tho flanges of the binders, metallic hoops bent from a single piece of material and encircling the barrel, and metallic clamps for engaging the meeting ends of said hoops, substantially as specified.

No. 100,235. Skirt Gange. Jauge pour jupes.

Frances Moise De Leon, New York City, New York, U.S.A., 31st July, 1906; 6 years. Files 29th June, 1906. Receipt No. 137,422.
Claim.-1. In a skirt gauge in combination a base plate, a stafif carried thereby, and a plate carried by said staff, the inner edge of the said base plate having a projecting portion adapted to be applied to the side of one's foot, and a receding portion adapted to be applied to the toe of one's foot.
2. In a skirt gauge in combination a base plate, a staff projecting upwardly therefrom, a marking plate, means for
locking sald marking plate to said staff in a plurality of positions, the inner edge of sald base plate presenting a projecting edge, substantially centrally disposed with respect to said staff, with recesses beyond said projecting edge.
3. A skirt cange comprising a base plate adapted to rest upon a horizontal support, and having a socket formed thereupon, a staff having a foot removably received in said socket, and a marking plate adjustably mounted on said staff.
4. In a device of the class described, in combination a base plate adapted to rest upon the floor, a stafl projecting upwardly therefrom, said base plate having recesses formed therein adapted to receive the toes, and a marking plate adjustably mounted on said staff and having recesses in the edge thereof in substantial alignment with sald first recesses.
5. In a device of the class described, in combination a base plate having a socket formed therein, a staff having a laterally projecting foot adapted to be slid longitudinally into said socket and retained thereby. a marking plate having a sleeve received over said staff, and a clamping screw mounted in said sleeve, for clamping said marking plate on said staff.
6. In a skirt gauge. in combination a base plate having a projecting nose at substantially the middle point thereof, adapted to be applied to the heels of a person being fitted, and presenting oppositely disposed notches adapted to be applied to the toes, said base plate further having concave portions connecting the said notches and said nose, adapted to be applied to the arch of the foot, and a marking plate mounted upon said base plate.

No. 100,236. Animal Foist. Ascenseur pour animaus.

Oliver P. Hurford, Chicago, Illinois, U.S.A., 31st July, 1906; 6 years. Filed 28 th June, 1906. Receipt No. 137,387.
Claim.-1. In a hog hoisting device, in combination with an endless chain and an upper and lower sprocket wheel on which said chain is alone mounted. depending hog shackles carried by said endless chain, said lower sprocket wheel having a diameter greater than that of the upper sprocket wheel and of sufficient length to form a comparatively long receiving stretch of chain whereby the hogs may be readily shackled thereon, and said lower wheel also providing a lateral support for the receiving stretch of chain throughout the shackling pen, said wheels providing a substantially triangular arrangement of the chain conveyer and both being inside a vertical line tangent to the upper wheel whereby an upwardly inclined ascending leg is formed and also a descending leg from which the hog upon release therefrom will be carried directly away from the chain and space enclosed thereby and a sticking rail extending at an angle to sald conveyer and adapted to receive the shackle from the descending leg, substantially as described.
2. In a hog hoisting device, in combination with an endless carrier chain, depending shackles carried thereby, two sprocket wheels, one above the other, on which said chain is supported, the lower wheel being of greater diameter than the upper wheel, said wheels arranged to bring the ascending leg of said chain in a path inclined upwardly toward an adjacent slaughtering room, and the descending leg of said chain in a vertical path adjacent the slaughtering room, and a sticking rail having a member intersecting the plane of the vertical leg of said chain and inclined therefrom toward the slaughtering room, substantially as described.
3. In a hog holsting device, in combination with an endless chain an upper and a lower sprocket wheel therefor whereby only two stretches of chain between the sprocket wheels are formed, the lower wheel of greater diameter than the upper wheel but each having one of its vertical tangents in the same plane, whereby an ascending incline leg of said chain and a vertical descending and dellvering leg of said chain are formed, and a lateral support for the chain in the shackling pen is provided, substantially as described.
4. In a hog hoisting device in combination with an endless chain conveyer, depending flexible hog shackies secured to said conveyer, a sprocket wheel at the upper part of said chain on which said conveyer is supported, and a larger sprocket wheel at the lower part of said chain and forming a positive lateral support for the entire length of the receiving leg of the chain which extends through the shackling pen, said wheels having their centers out of alignment with the center of the lower wheel farther away from the delivery side of the pen, whereby a substantially triangular hoist is formed having only two stretches of chain between the spocket wheels and with an ascending leg of the conveyer inclined toward the delivery side of the pen is provided, and a continuous straight descending leg of said chain from the top sprocket wheel to the lower sprocket wheel is provided, and a sticking rall intersecting the plane of said descending leg and having a shackle receiving mem ber which extends away from said chain on a downward incline, substantially as described.
5. In a device of the class described, the combination with a conveyer, means for actuating the same, means for shackling animals thereto, and a suitable receiving rail, of an inclined delivery block adjustable along and upon said rail. and means for securing said block upon said rail.
6. In a device of the class described, the combination with an endless conveyer adapted to travel in a vertical plane and having a forwardly inclined ascending leg, and means for shackling animals thereto, of a receiving rail arranged adjacent to the path of travel of said conveyer, and an inclined delivery block adjustable upon and along said rail.
7. In a device of the class described, the combination with an endless conveyer having a forwardly inclined ascending leg, an auxiliary guide and support for said ascending leg, and means for shackling animals to said conveyer, of a receiving rail arranged adjacent to the path of travel of said conveyer, and an inclined delivery block adjustable upon and along said rall.
8. In a device of the class described, the combination, with a pair of conveyer wheels arranged one above the other in the same vertical plane and the lower thereof being of greater diameter than the upper, of an endless conveyer mounted thereupon, said wheels being relatively disposed to provide a forwardly inclined ascending leg of said conveyer, means for preventing lateral movement of said ascending leg, an animal shackle detachably suspended from said conveyer, a suitable receiving rail, and a guard insuring engagement between said shackle and said rail.
9. In a device of the class described the combination with an endless chain conveger, of a large chain supporting sprocket wheel, and a small chain supporting sprocket wheel above the large wheel, the centers of the wheels being out of alignment and forming a forwardly inclined ascending leg, and a series of small loose guide sprocket wheels with which said ascending leg of the chain engages. substantially as described.

## No. 100,237. Flectric Flour Purifier.

Appareil électrique pour purifler la fleur.
John Lawson Lawson, Caledonia Mills, Leith, Midlothian, Scotland. 31st July, 1906; 6 years. Filed 7th June, 1906. Recelpt No. 137,594.
Claim.-1. The method of purifying flour, grain, rice and like cereals, consisting in subjecting these cereals to the action of high tension, electricity on plates charged with same and whereby the bran chaif and other impurities are separated from the best material, substantially as herein set forth.
2. Apparatus for the treatment of flour, rice, and like cereals, and the separation of the offals therefrom, consisting of insulated conducting plates charged witb high tension electricity and working transversely over reciprocating or moving trays with alternate channels and spaces, substantially as set forth.
3. Apparatus for the treatment of flour, rice and like cercals, and the separation of the offals therefrom, consisting of a series of insulated plates charged with high tension electricity and arranged on an incline alternately from opposite ends, trays correspondingly arranged below these plates. and having these parts combined and operated in the manner herein set forth.
4. In an apparatus for the treatment of flour, rice, and like cereals, parallel electrified and insulated wires with spaces

between the wires of sufficient size to admit of impurities freely passing between them to the trays above, substantially as set forth.

No. 100,238. Hoe. Ноис.

William A. Nyswonger, Diamond Fields, Nevada, U.S.A., 31st July, 1906; 6 years. Filed 11th July, 1906. Recelpt No. 137.703.

Claim.-1. An implement of the class described comprising a shank provided with an integral flat portion of greater width than said shank, a concavo-convex blade secured intermediate its length to the flat portion of said shank, said blade provided with a curved cutting edge extending its entire length, a curved and a straight cutting edge formed upon one end of sald blade and a straight cutting edge formed upon the opposite end.
2. An implement of the class described comprising a handle, an upwardly and outwardly curved shank provided with a ferrule, carried by said handle, said shank provided with an integral flat portion, and a concavo-convexed blade axedly secured to the fiat portion of said shank, said blade positioned at an oblique angle to said handle, said blade provided With a main cutting edge of substantially the same length as said blade and with a substantially straight auxiliary cutting edge, said main and auxillary cutting edges constituting a trowel structure, and said blade provided at one end with a curved cutting edge.

## No. 100,239. Heating Apparatus.

Appareil de chauflage.
Mathew Rapp, Morton, Illinois, U.S.A., 31st July, 1906; 6 years. Filed 11th July, 1306. Recelpt No. 137,695.
Claim.-1. In a hot water heater the comblnation of a casing, an annular water chamber supported within the casing, a pair of cylindrical manifolds consisting of a series of segmental chambers which are supported by the annular chamber, a cone-shaped water jacket depending within the manifolds and communicating therewith, and a fuel magazine supported within the cone-shaped jacket.
2. In a hot water heater the combination of a casing, a pair of seml-circular water jackets connected by tubular
grate bars, a series of pairs of intercommunicating water chambers disposed in cylindrical arrangement supported by

the aforesald jackets, a water jacket depending within the inner circle described by the pairs of chambers aforesaid and communicating therewith, and a fuel magazine depending within the last-mentioned jacket.
3. In a hot water heater the combination of a casing made of several sections with overlapping portions detachably connecting means for securing the said sections, an annular water chamber supported within the casing, a pair of cylindrical manifolds consisting of a series of segmental chambers which are supported by the annular chamber, a cone-shaped water jacket depending within the manifolds and communicating therewith, and a fuel magazine supported within the cone-shaped jacket.
4. In a hot water heater the combination of a casing, a pair of semi-circular water jackets, a series of tubular bars connecting the said jackets, an annular water chamber supported upon and communicating with the said semi-circular jackets, one or more cylindrical manifolds composed of a series of segmental chambers supported upon and communicating with the annular water chamber, a cone-shaped water jacket, depending within the ring formed by the segmental chambers, and a fuel magazine supported within the coneshaped Jacket.
5. In a hot water heater the combination of a casing, a pair of semi-circular water chambers, a series of tubular grate bars connecting the said chambers, a flat annular water jacket supported by the said semi-circular water chambers, the inner wall of the said annular jacket serving as the lower wall of the fire box, a series of pairs of segmental chambered sections forming a substantially annular manifold supported by the annular water jacket, the inner wall of the said sections being bevelled and serving as the upper wall of the fire box, a fuel magazine depending within the circle described by the manifold, feed pipes attached to one or the other of the semi-circular water chambers, and outlet pipes suitably connected with the manifold.
6. In a hot water heater the combination of a casing, a fuel magazine supported within the casing, one or more water jackets beneath the lower end of the magazine, feed pipes connected with said jackets, a pair of substantially cylindrical manifolds, one encircling the other and both surrounding the said magazine, said manifolds composed of a series of segmental chambered sections, connections between said sections and the said jackets, an outlet pipes suitably connected with the said sections.
7. In a hot water heater the combination of a casing, a flat annular water chamber, its inner wall serving as the lower wall of a fire box, and Its upper wall formed with an annular projected ring, grate bars suitably supported beneath the chamber and the sald fire box, a series of pairs of sections supported by the said chamber and upon opposite sides of its annular projecting ring, the same having intercommunicating chambers, a depending cone-shaped water jacket communicating with the aforesaid sections, means for securing the sections at their upper ends to the cone-shaped jacket and at their lower ends to the ring of the chamber aforesaid, a iuel magazine, feed pipes communicating with the flat annular chamber, lead pipes communicating with the cone-shaped water jacket, substantially as specified.
8. In a hot water heater the combination of a casing an annular water chamber supported therein, a series of segmental chambered sections supported in circumferential rows one within the other upon and communicating with the an-
nular chamber, the outer row of sections being taller than the inner row, a water chamber supported within the circle described by the said sections and attached to and communicating with said sections, a fuel magazine supported within the circle described by the inner wall of said last-mentioned chamber, feed pipes to the first-mentioned chamber, and outlet pipes from the chamber surrounding the fuel magazine.
9. In a hot water heater the combination of a casing, an annular water chamber supported therein, a series of segmental chambered sections supported in circumferential rows one within the other upon and communicating with the annular chamber, the disposition of the sections forming annular passageway between the two rows, also radial passageways extending between each of the sald segmental sections, a water chamber supported within the circle described by the said sections and attached to and communicating with said sections, a fuel magazine supported within the circle described by the inner wall of said last-mentioned chamber, food pipes to the first-mentioned chamber, and outlet pipes from the chamber surrounding the fuel magazine.

No. 100,240. Means of Separating Stone Irom Claj. Moyen de síparer la pierre de la glaise.

Axel Sabroe, Aastrup. near Hadersleben, Germany, 31st July, 1906; 6 years. Filed 11th July, 1905. Recerpt No. 126,795. Claim.-1. In a device of the character described, a casing provided with inlet and outlet openings and an outlet opening at an angle to the inlet opening, means for feeding clay into the casing, a separating member disposed across one of the outlet openings, and means for removing foreign bodies separated by a separating member.
2. In a device of the character described, a casing provided with inlet and outlet openings and provided with an outlet opening at an angle thereto, a worm press disposed in the inlet opening, a separating member disposed across one of the outlet openings. and means for removing foreign bodies scparated by the separating member.
3. In a device of the character described a casing provided with an inlet opening and a plurality of outlet openings, means for feeding clay into the casing, a reciprocable separating member disposed across one of the outlet openings, and means for removing foreign bodies separated by the separating member.
4. In a device of the character described, a casing provided with an inlet opening and provided with a plurality of outlet openings, means for feeding clay into the casing through the inlet opening, a scparating member provided with projections and disposed across one of the outlet openings, and means for removing through the other outlet opening foreign bodies separated by the separating member.
5. In a device of the character described, a casing provided with an inlet opening and provided with a plurality of outlet openings, means for feeding clay into the casing through the inlet opening, a grating comprisng a plurality of bars each having a projection disposed in alignment with the inlet opening, and means for removing foreign bodies separated by the separating member.
6. In a device of the character described, a casing provided with an inlet opening and provided with a plurality of outle: openings, means for freding clay through the inlet opening into the casing, a movable separating member disposed in the casing in alignment with the inlet opening, a crank shaft carried adjacent the casing, rods connected to the crank shaft and the separating member, and means for removing foreign bodies separated by the separating member.
7. In a device of the character described, a casing provides with an inlet opening and provided with a plurality of outlet openings, means for feeding clay into the casing, a recipro-
cable separating member disposed in the casing across one of the outlet openings, means for reciprocating the separating member, rollers disposed on the casing on which the separating member is adapted to bear, and means for removing through one of the outlet openings a foreign body separated by the separating member.
8. In a device of the character described, a casing provided with an inlet opening and a plurality of outlet openings, means for feeding clay into the casing, a separating member disposed across one of the outlet openings, and a worm conveyer disposed in the other outlet opening.
9. In a device of the character described, a casing provided with an inlet opening and a plurality of outlet openings, means for feeding clay into the casing, a separating member disposed across one of the outlet openings, a worm conveyer disposed in the other outlet opening, a disc on the worm, and a driven disc adapted to engage said disc when pressure is exerted against the worm.

No. 100,241. Rubber Footwear.
Chaussure de caoutchouc.

Daniel Smith and Frederick William Smith, both of Christchurch, New Zealand, 31st July, 1906; 6 years. Filed 13th July, 1906. Receipt No. 137,813.
CLaim.-1. In the manipulation of goloshes, gum boots and other rubber footwear, a strip or strips of leather or like material secured upon the insole of the article and covering the portions corresponding to the wearing surfaces thereof, and a rubber outer sole moulded upon the surfaces of suci strips, substantially as specified.
2. In the manufacture of goloshes, gum boots and other rubber footwear, a strip or strips of leather or like material secured upon the insole of the article provided with projections upon the outer face thereof, and a rubber outer sole moulded upon the surface of such strip or strips and so formed that its outer face forms a uniform surface with the surfaces of the projections, substantially as specified.
3. In the manipulation of goloshes, gum boots and other rubber footwear, a strip or strips of leather or like material secured upon the insole of the article, provided with recessed and (or) cut-away portions at intervals in its outer surface, and a rubber outersole moulded upon the surface of the strip or strips, substantially as specified.

No. 100,242. Coal Chnte. Chute d charbon.
James M. Triggs, Morenci, Michigan, U.S.A., 31st July, 1906; 6 years. Filed 11th July, 1906. Receipt No. 137.705.
Claim.-1. The combination with a chute, of a hopper portion pivoted thereto and adapted to be placed in operative or laoperative position relative thereto.
2. The combination with a chute, of a hopper portion removably pivoted therein adjacent its mouth and adapted to be placed in operative or Inoperative position relative thereto.
3. The combination with a chute, of a trlangular shaped hopper removably pivoted therein and adapted to be entirely enclosed therein or drawn out to act as a hopper for the mouth of the chute.
4. The combination with a chute, of a door hinged to normally close the mouth thereof. and a member pivoted within the chute and adapted to be placed in inclosed position when the door is closed and be drawn out to act as a hopper therefor when the door is in open position.
5. The combination with a chute, of a door and a hopper each having separate pivotal connection therewith, and the latter being locked in inoperative position therein by a closing of the door.
6. The combination with a chute, of a door adapted to be elevated above the mouth thereof when open, and a member
normally inclosed within the chute and adapted to be drawn out to act as a hopper for its mouth when the door is open.

7. The combination with a chute, of a door pivoted above its mouth and having means associated with its pivot for automatically locking it in elevated position.
8. The combination with a chute, of a member pivoted within and adjacent the top of the mouth thereof, sald member being adapted to be swung outwardly relative to the chute to act as a hopper therefor and provided with slotted bearings having one end open to permit a removal of the member from its pivot.
9. In combination a chute, a door hinged at the top of the chute mouth and having slotted bearing ears for the purpose described, a hook on the door for locking within the mouth of the chute when the door is closed, and a hopper comprising triangular side portions and a curved base portion connecting the side portions and provided with spurs for coacting with the lower outer portion of the chute frame when the hopper is in open position, said side portions being pivoted witin the chute mouth and having open slotted bearings, substantially as described.
10. In combination, a chute, a door therefor, and a hopper associated therewith and adapted to be placed in operative or inoperative position relative thereto.

No. 100,243. Standard for Lumber Cars. Fleche pour chars d bois.

Joseph Malone, Muscogee, Florida, U.S.A., 31st July, 1906; 6 years. Filed 5th July, 1906. Recelpt No. 137,548.
Claim.-1. In combination with a bunk, a plate secured to the face thereof and having a slot in its edge, a standard pivotally mounted upon the bunk, a pivotal standard support mounted upon the bunk and adapted to swing underneath the standard and into sald slot, and means for holding said bar in said slot, as set forth.
2. In combination with a bunk, a plate secured to the face of the bunk with a space intervening between a portion of the plate and the bunk, a pin passing through said plate and secured to the bunk, an angled standard pivotally mount-
ed upon said pin and between the plate and face of the bunk, and a horizontally pivoted standard supporting bar carried by the bunk and adapted to swing underneath the standard and support the latter, as set forth.
3. In combination with a bunk, a plate secured to the face of the bunk with a space intervening between a portion of the plate and the bunk, a pin passing through said plate and secured to the bunk, an angled standard pivotally mounted upon said pin and between the plate and face of the bunk, a pivotal and horizontally swinging bar mounted in a recess in the bunk and adapted to swing into a slot in the edge of said plate to form a support to the standard, and a hook pivotally mounted upon the plate and adapted to hold said bar within the slot of the plate, as set forth.

No. 100,244. Bolster for Railway Cars.
Traversin pour chars de chemin de fer.

John Oscar Neikirk, Chicago, Illinois, U.S.A., 31st July, 1906; 6 years. Filed 9th July, 1906. Receipt No. 137,658.
Claim.-1. A bolster for rallway cars having compression and tension members composed of angle iron bars arranged in pairs, said compression and tension members being rigidly secured together at their ends, and a strut separating the compression and tension members and secured thereto.
2. A bolster for railway cars having compression and tension members composed of angle iron bars arranged in pairs, said compression and tension members being rigidly secured together at their ends, and an angle iron strut separating the compression and tension members.
3. A bolster for railway cars having compression and tension members, said tension members being composed of angle irons having upwardly extending vertical flanges and said compression members being composed of angle irons having downwardly extending vertical flanges, and a strut separating the tension and compression members, said strut composed of angle iron members having adjacent flanges received between the vertical flanges of the compression member, and said strut being separated at its ends and receiving the vertical flanges of the tension member between its separated parts.
No. 100,245. Dump Car. Char à bascule.

Spencer Otis, Chicago, Illinois, U.S.A., 31st July, 1906; 6 years. Filed 9th July, 1906. Receipt No. 137,659.
Claim.-1. In a car of the class described the combination of a dumping door, a reciprocatory door supporting shaft
movable upward and outward at an incline transversely of the car, and operating mechanism mounted beneath the door substantially in alignment with the path of movement of such reciprocatory shaft for operating it and thereby the dumping door.
2. In a car of the class described the combination of a dumping door, a reciprocatory shaft movable transversely of the car for supporting such door, inclined tracks extending upwardly and outwardly at an incline transversely of the car for supporting such reciprocatory shaft and thereby the door, and a crank shaft below the door provided with cranks having their swinging ends movable substantially into alignment with the path of movement of such reciprocatory shaft and operatively connected therewith.
3. In a car of the class described the combination of a dumping door, reciprocatory door supporting mechanism movable transversely of the car toward and from the swinging edge of the door, and a crank shaft below the door provided with crank arms having their swinging end movable substantially into alignment with the path of movement of such reciprocatory door supporting mechanism and operatively connected therewith.
4. In a car of the class described, the combination of a dump door, a reciprocatory shaft in operative engagement with the door movable upward and outward at an incline toward the swinging edge thereof, crank mechanism below the door for operating such reciprocatory shaft, and connecting arms connected at one end with the reciprocatory shaft and having their opposite ends connected with such crank mechanism and movable into substantial alignment with the path of movement of the reciprocatory shaft.
5. In a car of the class described the combination of a dump door, a reciprocatory door supporting shaft movable upward and outward at an incline beneath the door, crank arms operatively connected with such reciprocatory shaft and having their swinging ends movable into position below the lower limit of movement of the reciprocatory shaft and operatively connected therewith, and inclined track mechanism for supporting such reciprocatory shaft.
6. In a car of the class described the combination of a car frame provided with end sills, dumping doors mounted in such car frame, door operating shaft mechanism mounted beneath such dumping doors, gear mechanism mounted beneath the end sill mechanism for operating such shaft mechanism and thereby the doors, and shaft operating mechanism mounted outside of the end framework and operatively connected with such gear mechanism.
7. In a car of the class described the combination of a car frame provided with end sills, dumping doors mounted in such car frame, door operating shaft mechanism operatively connected with such dumping doors, gear mechanism mounted beneath the end sill mechanism for operating such shaft merhanism and thereby the doors, and hand wheel and shaft mechanism mounted outside the framework and operatively connected with such gear mechanism.
8. In a car of the class described the combination of a car frame, dumping doors mounted in such frame, door operating shafts operatively connected with such dumping doors, and shaft operating mechanism mounted outside the inner face of the end framework and operatively connected with such door operating shaft mechanism.
9. In a car of the class described the combination of a car frame provided with longitudinal sills, transverse beams provided with upright web portions, and side stakes secured to the ends of such transverse beams and having upright web portions secured to the upright webs of the transverse beams.
10. In a car of the class described the combination of transverse beams, side stakes provided with depending web portions extending below the upper edges of such transverse beams and secured thereto, and angle irons secured to the transverse beams and to such depending web portions of the side stakes.
11. In a car of the class described the combination of transverse beams provided with web portions, angle iron members forming side wall portions of such transverse beams, and side stakes mounted upon such transverse beams and provided with depending web portions extending between the side wall portions and the upright web portions of the transverse beams and secured thereto.
12. In a car of the class described the combination of a car frame provided with longitudinal sills mechanism, a central floor portion mounted over such longitudinal sill mechanism dumping doors mounted on opposite sides of the longitudinal center of the car, supporting plates extending transversely of the car beneath such central floor portion for supporting it, and dumping door hinges secured to such transverse supporting plates and to the dumping doors.
13. In a car of the class described the combination of a pair of body bolsters. and longitudinal sills each formed of a central section having upright web portions extending be-
tween the body bolsters and the end sections extending beyond the body bolsters, such end sections having upright web portions of greater thickness than the upright web portions of the central sections.
14. In a car of the class described the combination of a body bolster provided with upright side plates, a top plate connecting the upper portions of such side plates, a bottom plate mounted between the side plates near the lower edges thereof and provided with depending flanges, and angle irons having uprigat flanges mounted betwe :n the depending flanges of such bottom plate and having lateral flanges extending outward beneaih the depending flanges of such bottom plate
15. In a car of the class described the combination of a body bolster provided with upright side plates having a space therebetween, upright filler plates extending transversely across such space and secured to the inner sides of such plates, a top plate connecting the upper portions of the side plates, a bottom plate mounted between the lower portions of the side plates and having depending, flanges flush with the lower edges of surch plates, angle iron members provided with upright flanges secured to such bottom plate and side plates and having transverse flanges extending outward beyond the side plates, and a gusset plate mounted beneath such angle iron members and extending transversely of the bolster beyond the side plates.
16. A car provided with a suitable track, a drop door, a wedge member on the under face of said door, an operating bar travelling on the track and in engagement with the wedge member on the door, and operating mechanism for the operating bar, the parts being entirely beneath the door when the 'latter is in both open and closed position.

No. 100,246. Grain Car Door.
Porte de chars d grain.

William Pratt, Penetanguishene, Ontario, Canada, 31st July, 1906; 6 years. Filed 11th July, 1906. Recelpt No. 137,707.
Claim.-1. In a grain car door the combination with the side posts, of guideways secured to the side posts and boards adapted to lie horizontally on each other edge on edge and provided with horizontally disposed laps, as and for the purpose specified.
2. In a grain car door the combination with the side posts, of guideways secured to the side posts and boards adapted to lie horizontally on each other edge on edge and provided with horizontally disposed laps located partially on one side and partially on the opposite side of each board, as and for the purpose specifled.
3. In a grain car door the combination with the side posts, of guideways secured to the side posts and boards adapted to lie horizontally on each other edge on edge and provided with horizontally disposed laps located partially on one side and partially on the opposite side of each board, and pins suitably connected to the frame and designed to extend through holes immediately above the uppermost board, as and for the purpose specifled.
4. In a grain car door the combination with the side posts and guideways terminating at the top on a curved and horlzontally disposed portion under the roof, of boards horizontally disposed and set edge on edge and located in such guideways, as and for the purpose specifled.
5. In a grain car door the combination with the side posts and guldeways terminating at the top in curved portions and end buckets under the roof, of boards horizontally disposed and set edge on edge and located in such guideways, as and and set edge on edge and
for the purpose specified.

No. 100,247. Tide Power System.
Sustème de pouroir de marse.

Walter Fred Cove, George H. Cove and Frank R. Kimball, Boston, Massachusetts, U.S.A. 31st July, 1906; 6 years. Filed 8th June, 1906. Receipt No. 136,694.
Claim.-1. In a tide water power system a dam fitted with gates whereby water may be supplled thereto or near flood tide, a tide water channel below sald dam, a second dam, a turbine, turbines or other water wheel beyond said second dam, flumes or tubes passing through said socond dam and leading to sald turbine, turbines or wheels respectively, a discharge basin beyond said turbine of greater area than said reservoir, a third dam fitted with gates whereby water may be discharged from said basin at ebb tide, and a channel beyond said last-mentioned dam communicating with the sea.
2. In a tide water power system the combination of an upper and a lower dam disposed in a continuous channel, an intermediate dam whereby a reservoir and a discharge. basin is formed in the channel between said first-mentioned dams, gates in said dams respectively whereby water may be stored in said reservoir and excluded from said basin at flood tide, and water may be discharged from said basin at ebb tide, water wheels arranged beyond said intermediate dam, and sluices or tubes passing through said intermediate dam and establishing communication between said reservoir and saill wheels.
3. In a tide water power system the combination of an upper and a lower dam disposed at different points on the bend of a tide water stream and a channel connecting the channel of said stream at a point above said upper dam with a point below said lower dam whereby a continuous channel is formed, an intermediate dam whereby a reservoir and a discharge basin is formed in the channel between said firstmentioned dams, gates in said dams respectively whereby water may be stored in said reservoir and excluded from said basin at flood tide, and water may be discharged from said basin at ebb tide, water wheels arranged beyond said intermediate dam, and sluices or tubes passing through said Intermediate dam and establishing communication between said reservoir and said wheels.

No. 100,248. Cooling System for Internal Combustion Engines.
Sustème de refrigeration pour machines a combustion interne.

Gustavus Green, F. P. C. Hope and Joseph Miler, all of Bex-hill-on-Sea, Sussex, England, 31st July, 1906; 6 years. Filed 21st September, 1905. Recelpt No. 128,626.
Claim.-1. In an internal combustion engine, the combination with the cylinder and water jacket, of members pro-
fecting from the facket and adapted to form channels for the circulation and cooling of the water, substantially as described.
2. In an internal combustion engine, the combination with the cylinder and water jacket, of piping projecting from the jacket and adapted to form channels for the circulation and cooling of the water, substantially as described.
3. In an internal combustion engine, the combination with the cylinder and water jacket, of tubing around said jacket communicating therewith at a plurality of points, means for filling the jacket with water and means for allowing for expansion of the water.
4. In an internal combustion engine, the combination with the cylinder and water jacket, of tubing around said jacket communicating therewith at a plurality of points, means for filling the jacket with water and means for allowing for expansion of the water for allowing of escape of steam if required.

No. 100,249. Bottle. Boutcille.

Rudolph Sauer, Minneapolis, Minnesota, U.S.A., 31st July, 1906; 6 years. Filed 19th February, 1906. Recelpt No. 133,051.
Claim.-1. A bottle comprising a body with a hole at one side adapted to be corked and sealed, and a neck solid in its top and having two opposite side openings, and suitable means for closing said side openings, said openings in the neck forming ducts extending on a slant out and downward from the regular inner canal of the neck.
2. A bottle comprising a body with a hole at one side adapted to be corked and sealed, and a neck solid in its top and having two opposite side openings, and suitable means for closing said side openings, said openings in the neck forming ducts extending on a slant out and downward from the regular inner canal of the neck, and the annular shoulder 11 below said openings to form a recess for the purposes set forth.
3. A bottle comprising in combination a body with a hole at one side adapted to be closed and sealed, a neck with a head solid in its top and having two opposite out and downwardly slanting side openings communicating with the interior of the bottle neck, and an elastic cap adapted to be fcreed downward upon the head and keep said side openings closed.
4. A bottle comprising in combination, a body with a hole at one side adapted to be closed and sealed, a neck with a head solid in its top and having two opposite out and downwardly slanting side openings communicating with the interior of the bottle neck, the shoulder 11 at the base of said head, and an elastic cap adapted to be forced snugly downward over said head and to engage with its edges below said shoulder.
5. A bottle comprising a body with a hole at one side adapted to be corked and sealed, and a neck solid in its top and having two opposite side openings, and an elastic cap adapted to be forced downward upon the neck to cover said openings.

No. 100,250. Separator Sieve. Tamis à séparation.
William C. Black, Plymouth, Ohio, U.S.A., 31st July, 1906; 6 years. Filed 6th February, 1906. Receipt No. 132,650.
Claim.-1. A screen for separators comprising a frame, a sieve secured thereon, tongues struck from the surface of
the sieve and bent downward, thus forming apertures, draw bars positioned above sald sieve, a series of slats located

below said sieve adjacent said apertures and tongues, straps secured to said slats and passing through slots in the sieve engaging said draw bars, and a movable crank shaft with which said draw bars are connected to permit an adjustment of the mesh of the sieve by the reciprocation of the slats.
2. A screen for separators comprising a suitably supported plate, inclined tongues cut from said plate and projecting downward, slats mounted for movement below sald plate, a draw bar mounted for longitudinal movement above said plate, straps extending through slots in said plate to connect the draw bar and slats, means for actuating said draw bar, and a guard secured to said plate and extending over said draw bar and the slots for the connecting straps.
3. A screen for separators comprising a frame, a perforated plate having downwardly projecting tongues stationarily mounted thereon, a series of imperforate slats slidable below the plate, the slats formed independent of each other, means connected with the slats for moving them to adjust the mesh of the screen, and guards to inclose the connecting means.

No. 100,251. Device for Hanging Wall Paper.
Appareil pour poser le papier de tenture.

Carl F. Caswell, Coon Rapids, Iowa, U.S.A., 31st July, 1906; 6 years. Filed 14th March, 1906. Receipt No. 133,879.
Claim.-1. A device for hanging wall paper comprising a support, a handle removably supported thereon, a paper receiving tray carried by the handle, and a smoothing bar upon the upper end of the handle.
2. A device for hanging wall paper comprising a support, a handle removably supported thereon, a longitudinally adjustable paper receiving tray carried by the handle, and a smoothing bar upon the upper end of the handle.
3. A device for hanging wall paper comprising a foldable support, a handle removably supported thereon, a foldable peper receiving tray carried by the handle, and a smoothing bar detachably connected with the upper end of the handle.
4. A device for hanging wall paper comprising a support having a central bar, and provided with legs, a handle having a socket adapted to receive the upper end of the central bar of the support and having on is upper end a tongue, a smoothing bar having a socket adapted to receive the tongue
or. the upper end of the handle, a paper supporting tray comprising a flange having a shelf on its lower end, parallel bars and cross pieces pivotally connected to each other and to said shelf, uprights on the outer portions of the tray, a band attached to the flange and encircling the handle, and a thumb screw extending through the band.
110. 100,252. Pen Fiolder. Porte-plume.

James Osborne Dodge and Herbert Egbert Dodge, both of Williams, Arizona, U.S.A., 31st July, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 187,173.
Claim.-1. In a pen holder the combination with the stub ur forward end of same, of a ferrule encircling said stub, a rigid bearing point within the ferrule and a rigid bearing point on the stub, said rigid bearing points being longitudinally separated, and a single yielding or spring bearing iccated longitudinally beyond said rigid bearing points.
2. In a pen holder the combination with the stub or for ward end of same, of a ferrule encircling the same, a rigid bearing point within the ferrule and a rigid bearing point on the stub, said rigid bearings being longtudinally separated, and a ylelding member secured at one end to the ferule and adapted to bear at its irec end against a pen body secured between the ferrule and stub to cause the pen body to be firmly seated against the aforesaid rigid bearings, whereby releasing pressure of the yielding member will cause the pen to be released from the ferrule by gravity.
3. A pen holding and releasing device consisting of a stub and a ferrule encircling sald stub to recelve the epn, a rigid braring point within said ferrule near jits forward end, said and a ferrule encircling said stub to recelve the pen, a rigid bearing point on the stub beneath said cut-out portion and adjacent thereto, and a yielding spring member secured at cne end to a rigid portion of the ferrule, and adapted to bear at its free end on a pen inserted in said ferrule to cause the I.en to have a rigid bearing at two points within the ferrule whereby releasing pressure of the yellding spring against the pen will cause the pen to be released from the ferrule by gravity.
4. A pen holding and releasing device consisting of a body or handle portion having a reduced forward or stub end, a ferrule fitted on the stub end of said handle, said ferrule having a cut-out portion or slot in its upper wall adjacent to the stub end of said handle, and a yielding spring member secured at its lower end within the ferrule and adapted to bear at its free upper end against the lower face of a pen ir:serted in sald ferrule, whereby releasing pressure of the Tree end of the spring member will cause the release of the pen from the ferrule by gravity.

## No. 100,253. Photographic Mailing Card.

 Carte photographique pour la malle.Sarnuel Aaron Markoff, Providence, Rhode Island, U.S.A., 31st July. 1906; 6 years. Filed 2ith April, 1906. Receipt No. 135,344.
Claim.-A mailing card comprising a body portion having a display opening, a flap or sheet of thin material capable of being rolled back upon itself and of having the position of the display opening defined thereon, said flap being attached In part to said body portion and loosely overlying the display
opening, and an adhesive on said flap serving to attach the back of a photograph or the like to said flap so that the

photograph will register with the display opening, and to seal the flap to the body portion.

No. 100,254. Envelope Marker. Marqueur dentcloppe.

Edwin Neron, Dover, New Hampshire, U.S.A., 31st July. 1906; 6 years. Filed 1st May, 1906. Receipt No. 135.421.
Claim.-1. An envelope marker consisting of a thin flate adapted to be inserted within an envelope or the like and having a series of slightly raised ridges arranged for temporarily marking address lines or the like on the envelope, substantially as described.
2. An envelope marker consisting of a thin plate of resilient material adapted to be inserted within an envelop or the like and having a series of slightly ralsed resilient ridges arranged for temporarily marking address lines or the like on the envelope, substantially as described.
3. An envelope marker consisting of a shert of thin celluloid having a series of fine corrugations arranged according to the desired lining effect to be produced in the envelope or the like. said corrugations forming on the upper surface thereof slightly raised resilient ridges, as and for the purpose set forth.

## No. 100,255. Furnace for Ore

rournaise pour minfrais.
Peter A. Wagner, San Francisco, California, U.S.A., 31st July. 1906; 6 years. Filed 9 th May, 1906. Receipt No 135.715.

Claim.-The combination with an ore roasting apparatus, of a collecting chamber interposed between the roasiing chamber and the furnace stack, a conduit for corveying tho hot products of combustion into the collecting chamber, of means for maintaining a water level within said chamber above the discharge end of the conduit during the working
of the ore and a pipe extending from the outside of the collecting chamber into the discharge condult of the roasting

chamber, through which pipe an inspection of the interior of the roasting chamber may be had.

No. 100,256. Car Coupler. Altclage de chars.

The National Malleable Castings Company, assignee of Arthur James Bazeley, all of Cleveland, Ohio U.S.A., 31st July, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,843.
C'laim.-1. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock, and means for engaging the bottom of the lever to lift it, and thereby lift the lock.
2. A coupler having a knuckle, an upwardly moving lock, knuckle throwing lever journalled on the lock, constructed to move in a substantially vertical plane, and means for engaging the bottom of the lever to lift it, and thereby lift the lock.
3. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock, having a projection adapted to engage the knuckle and to lock-set the lock, and means for engaging the bottom of the lever to lift it, and thereby lift the lock.
4. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock, a shoulder on the coupler adapted to engage the lever when in its bottom position and to lock the lock, and means for lifting the lever and thereby lifting the lock.
5. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing levir journalled on the lock by a trunnion and guided by a grooved portion of the coupler, and means for lifting the lever and thereby lifting the lock.
6. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock in a hooked supporting portion therrof, and means for lifting the lever and thereby lifting the lock.
7. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock, a shoulder by which the lever is restrained in its lower position, a stop portion on the lever adapted to limit its initial forward motion, a lock-setting projection on the lever, and means for lifting the lever and thereby lifting the lock.
8. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock, a shoulder by which the lever is restrained in its lower position, a locksetting projection on the lever, and means for lifting the lever and thereby lifting the lock.
9. A coupler having a knuckle, an upwardly movable lock having a head, an intermediate recessed portion, and a gulding surface 15 on the coupler head arranged to guide the lock rearwardly.
10. A coupler having a knuckle, an upwardly movable lock having a head, and a lateral projection on the head adapted to engage the knuckle tail in locking position, said lock also having a bottom hook.
11. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock, and a lifting finger entering the bottom of the coupler head and to engage the lever.
12. A coupler having a knuckle, an upwardly moving lock a knuckle throwing lever journalled on the lock and adapted to tilt rearwardly by gravity when the parts are in locked position.
13. A coupler having a knuckle, an upwardly moving lock, a knuckle throwing lever journalled on the lock, a shoulder by which the lever is restrained in its lower position, a lock setting projection on the lever, and means for lifting the lever and thereby lifting the lock, sald lever being adapted to tilt rearwardly by gravity when the parts are in locked position.
14. A knuckle throwing lever having trunnions, a projection $6 b$ and a stop portion adapted to engage the coupler head to guide it in its upwardly movement.
15. A coupler lock having a head with a lateral projection, an intermediate recessed portion, and a bottom hook.
16. A coupler lock, a knuckle throwing lever journalled therein, said lock having an engagement with the coupler head to hold it in place relatively to the lever.
17. A coupler lock, a knuckle throwing lever with which it is loosely engaged, said lock having a projection engaging with a groove in the coupler head to hold the lock in place relatively to the lever.

No. 100,257. Paper Slitter. Tendettr de papier.

William John Lupton. Lockport, New York, U.S.A.. 31st July. 1906; 6 years. Filed 3rd July, 1906. Receipt No. 137,494.
Claim.-1. A paper slitter comprising two frames arranged on opposite sides of the path of the web to be cut and each pivoted on an axis parellel to the plane of said web and capable of making a complete turn, two sets of cutters mounted on cach frame, and means for turning said frames and bringing the companion sets of cutters therof into co-operative relation, substantially as set forth.
2. A paper slitter comprising two rotary frames pivoted on onnosite sides of the path of the web to be cut, two sets of cutters mounted on each of said frames on opposite sides of its pirot, and means for turning said frames for bringing each of its sets of cutters between the two plvots of the two frames. substantially as set forth.
3. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, co-operating cutters mounted respectively on said frames, and connecting mechanism between said frames operating to turn the same together, substantially as set forth.
4. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to cut, co-operating cutters mounted respectively on said frames, und connecting mechanism between said frames operating to turn the same together, and consisting of an intermediate shaft and bevel gearing connecting said shaft with the pivot of said frames, substantially as set forth.
5. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, two co-operating cutters mounted respectively on said frames, and a locking device for holding both of said frames against turning consisting of locking discs arranged on the pivots of said frames and each having notches or recesses in its perphery, a reciprocating locking bar, and pawls arranged on said bar and constructed to enter the notches or recesses of said discs, substantially as set forth.
6. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, co-operating cutters mounted respectively on said erames, and a locking device for holding both of sald frames against turning consisting of locking discs arranged on the plvots of said frames and each having notches or recesses in its periphery, a reciprocating locking bar and pawls arranged on said bar and constructed to enter the notches or recesses of said discs, a spring for moving said bar in one direction and a shifting rod connected by an elbow lever with said bar and operating to move the same in the opposite direction, substantially as set forth.
7. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, cutter shafts journalled on each of said frames on opposite sides of its plvot and parallel therewith, cutters mounted on each of said cutter shafts, and a gear wheel mounted on each cutter shaft, the gear wheel of the companion cutter shaft of the two frames being movable into and out of engagement with each other upon rotating sald frames, substantially as set forth.
8. A paper slitter comprising two rotary frames pivoted on a nosite sides of the path of the web to be cut, cutter shafts journalled on each of said frames on opposite sldes of its pivot and parallel therewith, cutters mounted on each of said cutter shafts, gear wheels mounted on said cutter shafts, and the gear wheels of the companion shafts of both frames being movable into and out of engagement upon rotating said Crames, and a driving gear wheel arranged to be engaged by one of each pair of companion gear wheels upon turning sali frame into an operative position, substantially as set forth.
9. A paper slitter comprising two rotary irames pivoted on opposite sides of the path of the web to be cut, cutter shafts arranged on said frames and parallel therewith, swivelling bearings pivoted on one of said frames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on said last-mentioned frame supporting the opposite end of one of its cutter shafts, and a gear wheel secured to the last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel on the other cutter shaft, substantlally as set forth.
10. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, cutter shafts arranged on sald frames and parallel therewith, swivelling bearings pivoted on one of said irames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on said last-mentioned frame supporting the opposite end of one of its cutter shafts, and a gear wheel secured to the last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of ongagement with a gear wheel and the other cutter shaft, and springs operating to hold said radially movable bearing yieldingly in its normal position, substantially as set forth.
11. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, cutter shafts arranzed on sald frames and narsilel therewith, swivelling bearings pivoted on one of said frames and each supporting one end of its cutter shafts, a radially movable bearing guided on said last-mentloned frame supporting the opposite end of one of its cutter shafts, a gear wheel secured to the lastmentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel on the other cutter shaft, and radially adjustable pivots mounted on one of said frames and supporting said swivelling bearing, substantially as set forth.
12. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, cutter shafts arranged on said frames and parallel therewith, swivelling bearings pivoted on one of said frames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on sald last-mentioned frame and supporting the opposite end of one of its cutter shafts, a gear wheel secure
o last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel on the other cutter shaft, and pivots for said swivelling bearing arranged on bolts which are adjustable radially in slots formed in one of sald frames, substanfially as set forth.
13. A paper slitter comprising two rotary frames pivoted on oposite sides of the path of the web to be cut, cutter shafts arranged on said frames and parallel therewith, swivelling bearings pivoted on one of said frames and each supportins one end of one of its cutter shafts, a radially movable bearing guided on said last-mentioned frame supporting the opposite end of one of its cutter shafts, a gear wheel secured to said last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with gear wheel and the other cutter shaft, pivots for said swivelling bearing adjustable radially on one of said frames and adjusting screws mounted on sald last-mentioned frame and engaging with the inner and outer sides of sali swivelling bearing, substantially as set forth.
14. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, cutter shafts arranged on said frames and parallel therewith, swivelling bearings pivoted on one of said frames and frames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on sald last-mentioned frame supporting the opposite end of one of its cutter shafts, a gear wheel secured to last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel and the other cutter shaft, a spring arranged on said last-mentioned frame and bearing against the inner slde of said radially movable bearing, and an adjusting screw arranged on said last-mentioned frame and bearing against the outer side of said radially movable bearing, substantially as set forth.
15. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut. cutter shafts arranged on said frames and parallel therewith, swivelling bearings pivoted on one of said frames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on said last-mentioned frame and supporting the onnosite end of one of its cutter shafts, a gear wheel secured to the last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel on the other cutter shaft, and a locking device for holding said radially movable bearing in its normal position, substantially as set forth.
16. A paper slitter comprising two rotary irames pivoted on onnosite $^{n}$ sides of the path of the web to be cut, cutter shafts arranged on said frames and parallel therewith, swivelling bearings pivoted on one of ald frames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on said last-mentioned frame and supporting the $0^{n n o s i t e}$ end of one of its cutter shafts, a gear wheel secured $t$ the last-mentioned cutter staft odjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel on the other cutter shaft, and an automatic locking device for holding said radially movablo bearing in its normal position and operated by the rotation of said last-mentioned frame. substantially as set forth.
17. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, cutter shafts arranged on said frames and parallel therewlth swivelling bearings pivoted on one of sald frames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on sald last-mentioned irame and supporting the opposite end of one of its cutter shafts, a gear wheel secured to the last-mentioned cutter shaft adJacent to its radially movable bearing and adapted to move into and ou of engagement with a gear wheel on the other cutter shafi a a a locking device for holding said radially movable bear ing in its normal position consisting of a latch mounted on the last-mentioned frame and engaging with an abutment on said radially movable bearing, and a cam operatively connected with said latch, substantially as set forth.
18. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut, cutter shafts arranged on said frames and parallel therewith. swivelling bearings pivoted on one of said frames and each supporting one end of one of its cutter shafts, a radially movable bearing guided on sald last-mentioned frame and supporting the opposite end of one of its cutter shafts, a gear wheel secured to the last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel on the other cutter shaft, and a locking device for holding said radially movable bearing in its normal position consisting of latches pivoted on the frames and normally engaging abutments on said last-mentioned bearings, a slide guided on said lastmentioned frame and having a cam slot engaging with a pin on said latch, a spring for shifting sald slide in a direction
for moving said latch Into Its normal position and an actuating cam operating to move said slide in the opposite direction, substantially as set forth.
19. A paper slitter comprising two rotary frames pivoted on opposite sides of the path of the web to be cut., cutter shafts arranged on said frames and parallel therewith, swivelling bearings pivoted on one of said frames and each supporting one end of one of its culter shafts, a radially movable bearing guided on said last-mentioned frame and supporting the opposite end of one of its cutter shafts, a grar wheel secured to the last-mentioned cutter shaft adjacent to its radially movable bearing and adapted to move into and out of engagement with a gear wheel on the other cutter shaft, and a locking device for holding, said radially movable bearing in its normal position consisting of a latch pivoted on the last-mentioned frame and normally engaging an abutment screw on said radially movable bearing, a stop arranged on said last-mentioned frame and limiting the movement of said latch in one direction, a slide arranged on said last-mentioned frame and having a cam slot which receives a pin on said latch, a spring operating to move said slide in the direction for moving the latch into its normal operative position, a stationary guide ring which receives a shifting finger on said slide, and a pivoted cam engaging its free end with said guide ring and arranged to be engaged by said shifting finger for moving said slide in the direction for retracting the latch from said abutment screw, substantially as set forth.
20. A paper slitter comprising a supporting frame, a cutter shaft journalled on said frame and capable of axial movement, a plurality of cutters mounted on one end of said shaft so as to normally move axially therewith, a single cutter mounted on the opposite end of said shaft but constantly free to move axially independent thereof, an adjusting shaft journalled on said frame and baving screw threads inclining in opposite directions and screw nuts engaging said threads and operatively connected with said shaft and with said single cutter, substantially as set forth.
21. A paper slitter comprising a supporting frame, a cutter shaft journalled on said frame and capable of axial movement, a plurality of cutters mounted on one end of said shaft so as to normally move axially therewith. front and rear stop collars secured to said shaft on opposite sides of each of said plurality of cutters, a spring interposed between each front stop collar at the front side of the adjacent cutter, a grooved coupling collar connected with said shaft, a single cutter mounted on the opposite end of said shaft but constantly free to move axially independent thereof, a grooved coupling collar mounted on said shaft and loosely connected with said single cutter, a spring interposed between said single cutter and the last-mentioned coupling collar, an adjusting shaft journalled on said frame and having screw threads inclining in opopsite directions, and nuts engaging with said threads and having fingers engaging with the frooves of said coupling collars, substanifally as set forth.
22. A paper slitter comprising a supporting frame, a cutter shaft journalled on said frame and capable of axial movement, a plurality of cutters mounted on one end of said shaft so as to normally move axially therewith, a single cutter mounted on the opposite end of said shaft but constantly free to move axially independent thereof, an adjusting shaft journalled on said frame and having serew threads inclining in opposite directions, a nut engaging with one of said threads and loosely connected with said shaft, a carrier loosely coupled with said single cutter, a nut engaging with the other thread and fournalled in said carrier but held against axial movement relatively thereto, and a set screw for holding the last-mentioned nut against turning in said carrier, substantially as set forth.

## No. 100,258. Can Soldering Machine.

Murhine ì soudry les boîtes de blanc.
George H. Stewart, Los Angeles, California, U.S.A., 31st July, 1906; 6 years. Filed 5th June, 1906. Receipt No. 136,573.
Claim.-1. In a machine for soldering end seams of cans and in combination a way for the cans, means for rolling the cans thereon, a solder feed mechanism having an arm arranged to be moved by the rolling can, and controlling the feed of the solder when so moved, means for directing the solder upon the rolling can and means for heating the cans before they reach the soldering mechanism, substantially as described.
2. In a can soldering machine. and in combination a way on which the cans are rolled, mechanism for moving the cans, mechanism for controlling the feed of the solder through the movement of the cans, including a device arranged in the path of the cans and to ride over the rolling cans. and means for heating the cans before they reach the soldering mechanism, substantially as described.
3. In a soldering feeding mechanism, a ratchet wheel having spaces between its teeth corresponding to the amount of

soldering feed required, a pawl for arresting the ratchet wheel. mechanism carrying the pawl and in range of the moving cans, whereby the pawl may be released from the wheel and the feed be started and continued unltl the pawl comes into contact with the next succeeding tooth of the ratchet wheel.
4. In a machine for soldering end seams of cans, a way for the cans, means for rolling the cans thereon, solder feeding mechanism controlled by a member which rides over each can, a guide for the solder wire, to apply it to the seam, and means for heating the can before it reaches the soldering mechanism, substantially as described.

No. 100,259. Percussive Device. Appareil de percussion.

Charles Tingley Carnahan, assignee of Jeremiah Murphy. both of Denver, Colorado, U.S.A., 31st July, 1906; 6 years. Filed 10th May, 1906. Receipt No. 135,783.
C'laim.-1. In a percussive device, the combination with the cylinder thereof, a handle, a base therefor provided with a lateral extension having a slit, means for swivelly connecting the base with the cylinder, thereby permitting of the cylinder being rotated independently of the handle, means connected with the cylinder and provided with a lateral extension having a slit, and means carried by one of said extensions for coupling the handle with the cylinder, thereby enabling the handle and the cylinder to be rotated in unison
2. In a portabie percussive device, the combination with the cylinder thereof, of a handle swivelly connected upon one end of the cylinder and to permit of the cylinder rotating independently of the handle, and means carried by the cylinder for coupling the handle therewith so as to enable the rotating of the cylinder and the handle in unison.
3. In a portable percussive device, the combination with the cylinder thereof, a cap secured to one end of the cylinder, a handle, a base therefor, means for swivelly connecting the base to the cap to permit of the cylinder being rotated independent of the handle, and means connected to the cap and engaging in the base for coupling the base to the cylinder, thereby enabling the rotation of the cylinder and handle in unison.

## No. 100,260. Manufacture of Nitro-Glycerine. Fabrication de nitro-glycérine.

Deutsche Sprengshoff Aktiengeselleschaft, Nobelshof, Hamburg, Germany, assignee of Friedrich J. H. Rower, same place, 31st July, 1906; 6 years. Filed 6th June, 1906. Receipt No. 136,579.
Claim.-1. The process for the manufacture of nitro-glycerine explosives insensible to the action of cold which consists in adding to nitro-glycerine, monochlordinitroglycerine.
2. The process for the manufacture of nitro-glycerine explosives insensible to the action of cold, characterized by the addition of monochlordinitroglycerine to nitro-glycerine, substantially as described.

No. 100,261. Electrolytic Decomposition of Saline Solutions.
Décomposition électrolytique des solutions salines.

## Fig. 4.

Arthur B. Larchar and George H. Richardson, both of Oldtown, Maine, U.S.A., 31st July, 1906; 6 years. Filed 22nd June, 1906. Receipt No. 137,184.
claim.-1. The improvement in the electrolysis of saline solutions by the use of a diaphragm immersed in and separating two bodies of liquids, one containing the anode and the other the cathode, which consists in regulating the depth of the cathode containing liquid relative to the liquid in the anode chamber to control the passages of caustic soda and undecomposed salt through the diaphragm and prevent the backward diffusion of the caustic soda through such diaphragm.
2. The improvement in the electrolysis of the saline solutions by the use of a diaphragm immersed in and separating two bodies of liquid, one containing the anode and the other the cathode, which consists in controlling the passage of caustic soda and undecomposed salt through said diaphragm by the regulation during the operation of the depth of the cathode containing body of liquid, and conducting the liquid, percolating through the diaphragm, in films or thin sheets of liquid by passing the latter through narrow passages extending through the cathode as and for the purpose set forth.

## No. 100,262. Manufacture of Steel from Iron.

 Fabrication dc l'acier du fer.Fritz André, Haardt, assignee of Adam Massott, Jr., Mutterstadt, Palatinate, both in Germany, 31st July, 1906; 6
years. Filed 30th January, 1906. Receipt No. 132,405.
Claim.-1. A method of manufacturing steel from ordinary iron and inferior sorts of steel, characterised by the metal being heated in a furnace to white heat, with the addition of ferrocyanide of potassium, leather size, charcoal powder, colophony, finely screened earth and soda, substantially as described.
2. A method of manufacturing stcel from ordinary iron and inferior sorts of steel, characterised by the metal being heated in a furnace to white heat, with the aidition of ferrocyanide of potassium, leather size, charcoal powder, colophony, finely screened earth and soda with simultaneous addition of nitrate of potash and graphito. substantially as described.
3. A method of manufacturing steel from ordinary iron and inferior sorts of steel, characterised by the metal being

heated In a furnace to white heat, with the addition of ferrocyanide of potassium, leather size, charcoal powder, colosize, charcoal powder, colophony, finely screened sand and soda, and carried in a retort closed in an air tight manner. substantially as described.
4. For carrying out the method set forth, a powder chielly composed as follows, 300 grms. ferrocyanide of potassimm. 200 grms. size made from leather parings, 200 grms . charcoal powder, 180 grms. colophony, 20 grms. soda, 40 finely screened sand or earth containing silica, 25 grms. nitrate of potash, 35 grms. graphite.

## No. 100,263. Electroplating Tank.

Réservoir à électroplaquer.

Zucker and Levett and The Loeb Company, assignees of C. G. Backus and G. L. Wallace, all of New York City, New York, U.S.A., 31st July, 1906; 6 years. Filed 6th April, 1906. Receipt No. 134,665.

Claim.-1. In a device of the kind described, a tank, arms attached at one end to a side of the same and a rotatable drum supported by the outer ends of said arms, and means for raising said drum out of said tank and lowering it on, one side of te tank. substantially as described.
2. In a device of the kind described, a tank adapted to contain a liquid, arms hinged at one end to a side of the same ard a rotatable receptacle supported by the other ends of said arms and adapted to be entirely submerged in said liquid, substantially as described.
2. In a device of the knd described, a tank, arms hinged at one end to a side of the same and supporting at the other end, a second set of arms hinged thereto and a rotatabie drum supported at the ends of sald second set of arms, substantially as described.
4. In a device of the kind described, a tank, arms hinged at one end to a side of the same, a rotatable drum supported by the outer ends of the same and a crank mounted on the side of the tank and combined with transmitting mechanism to raise and lower the drum, substantially as described.
5. In a device of the kind described, a tank, arms hinged at one end to a side of the same, a rotatable drum supported by the outer ends of the same, a worm wheel in engagement with one of said arms and an endless screw in engagement with said worm wheel. substantially as deseribed.
$\boldsymbol{6}$. In a device of the kind described, a tank adapted to-contain a liquid, a rotatable drum mounted on sald tank and adapted to rotate in the said liquid. means for raising sald drum out of sald tank and to one side of the same, sald means comprising self locking mechanism for retaining the drum at any desired elevation, substantially as described.
7. In a device of the kind described, a rotatable receptacle, comprising boards forming the side walls thereof, said boards being formed of two layers secured directly to each other, one layer being of wood and the other of hard rubber, and perforations in said boards formed by oppositely disposed staggered openings connected with each other by channels, the said openings and channels forming passageways through the boards, substantially as described.
8. In a device of the kind described, a tank adapted to contain a liquid and a rotatable drum mounted on said tank and adapted to be entirely submerged in said liquid and to rotate therein, means for raising said drum out of said liquid and to one side of the tank and means for retaining it at any intermediate position, substantially as described.
9. In a device of the kind described, a rotatable receptacle ccmprising boards forming the side walls thereof, said boards being formed of two layers secured directly to each other, one layer being of strengthening material and the other of waterproof material, and perforations in said boards formed ty oppositely disposed staggered openings connected with each other by channels, said openings and channels forming passageways through the boards, substantially as described.

No. 100,264. Machine for Making Nuts. Machine pour faire des écrous.

Otto Briede, Benrath, near Dusseldorf, Germany, 31st July, 1906; 18 years. Filed 29th May, 1905. Receipt No. 125,574.
Claim.-1. In a machine for making nuts, washers, etc., the combination of shaping and retaining matrices, a punch having its axis in line with the axes of the matrices and means for reciprocating the punch.
2. In a machine for making nuts, washers, etc., the combination of dies having shaping and retaining matrices, means for opening and closing said dies, a punch having its axis in line with the axes of the matrices and means for reciprocating the punch.
3. In a machine for making nuts, washers, etc., the combination of shaping and retaining matrices, a punch, a compressing die, said punch and die having their axes in line with the axes of the matrices and means for reciprocating the punch and die.
4. In a machine for making nuts, washers, etc., the combination of holding, shaping and retaining matrices, a punch and means for moving the punch through the retaining matrix into the shaping matrix.
5. In a machine for making nuts, washers, etc., the combination of shaping matrix, mechanism for feeding a blank into said matrix and a punch having its axis in line with the axis of the blank while in feed position.
6. In a machine for makng nuts, washers, etc., the combination of a shaping matrix, a reciprocating punch, levers provided with gripping jaws, a wedge for opening and closing the jaws and shifting the levers to effect a feed movement, and means for reciprocating the wedge.
7. In a machine for making nuts, washers, etc., the combination of pivotally mounted arms, dies carried by said aims, a punch, and means for shifting the arms and punch.
8. In a machine for making nuts, washers, etc., the combination of pivotally mounted arms, dies carried by said arms, wedges for shifting the arms, a punch and means for shifting the wedge and punch.
9. In a machine for making nuts, washers, etc., the combination of a die, punch. sliding bed, a power shaft mounted on said bed, connections from the shaft to the punch and nieans for yieldingly holding the sliding bed in position.
10. In a machine for making nuts, washers, etc., the combination of a main frame, a die carried by the main frame, a punch, a bed movably mounted on the main frame, a driving shaft mounted on the bed, connections from the shaft to the punch, and means for yieldingly holding the bed in operative position.

No. 100,265. Magnetic Ore Separator.
Séparateur magnétique de minerais.

William Henry Adams, Mineral, Virginia, U.S.A., 31st July, 1906; 6 years. Filed 16th May, 1906. Receipt No. 135,967. Claim.-1. A magnetic separator comprising means for producing a revolving field of magnetic force, means for passing comminuted material through said field of force in a direction contrary to the direction of revolution of said field, and means for removing the segregated particles from the field of force.
2. A magnetic separator comprising means for producing a revolving field of magnetic force, means for passing comminuted material through said field of force in a direction contrary to the direction of revolution of said field and a conveyer for removing the magnetic particles passing through said field of force between its source and the comminuted material.
3. A magnetic separator comprising means for producing a revolving field of magnetic force, means for passing comminuted material through said field of force in a direction contrary to the direction of revolution of said field, and a belt passing through said field of force between its source and the comminuated material in an upward circular path and then horizontally whereby the magnetic particles are removed from the field of force.
4. A magnetic separator comprising means for producing a revolving field of magnetic force and a belt passing through said field of force between the source thereof and the comminuted material and adapted to retain the attracted particles by gravity as it leaves the field of force.
5. A mgnetic mineral separator comprising means for produceing a field of magnetic force, means for passing the comminuted mineral through said field of force, a belt and means for passing the belt into and through said field of force between its source and the magnetic material in a manner to first attract the material to the belt against the action of gravity and then, by the progress of the belt, to make the action of the field of force coincide with that of gravity, whereby the particles on the belt may be carried by the belt out of the field of force.
6. A magnetic separator comprising means for producing a revolving magnetic field, means for passing comminuted material containing magnetic particles through said field of force, a discharge conveyer for the segregated magnetic particles, and means for delivering the magnetic particles upon said conveyer in position for further removal by the action of said field of force.
7. The combination with a sluice box of meaus for producing a revolving magnetic field above and including a section of the path of the comminuted material flowing in said sluice box, a conveyer for the segregated magnetic particles and means for delivering and holding the segregated magnetic particles upon said conveyer by the action of said field of force, until they may be retained thereon by gravity.
8. The combination with a sluice box, of means for magnetically extracting the magnetic materials, and means for mechanically classifying the non-magnetic materials both operative simultaneously upon the materials.
9. The combination with a sluice box or conduit having a series of openings in its bottom, classifying screens covering said openings, settling pockets depending from the sluice box and each enclosing one of said openings, said pockets having controllable discharge openings, of revolving magnets placed over the screens and means for discharging the magnetic materials extracted by said magnets.
10. The combination with a sluice box having screen coverrd settling pockets communicating with the box bottom and provided with controllable discharge openings, of means for magnetically extracting the magnetic materials as they reach the screens.
11. The combination with a sluice box, of a revolving elec-tro-magnet dipping into the stream in said box, a belt and means for moving said belt about the magnet with its upper run travelling away from the magnet.
12. The combination with a sluice box, of a revolving elec-tro-magnet dipping into the stream in said box, means for adjusting the distance of the magnet from the bottom of the box, a belt and means for moving said belt about the magnet with its upper run travelling away from the magnet.
13. The combination with a sluice box having riffles therein, of revolving electro-magnets dipping into the stream in said box just below the riffles, a belt and means for moving said belt about the magnet with its upper run travelling away from the magnet.
14. The combination with a sluice box, of a revolving elec-tro-magnet dipping into the stream in sald box, means for agitating the materials flowing in said box just before it reaches the magnet, a belt and means for moving the belt about the magnet and with its upper run travelling away from the magnet.
15. The combination with a sluice box having riffles therein, of revolving magnets operative to extract the magnetic particles at the point where the stream is agitated by the riffles.
16. The combination with a sluice box having riffles therein, of revolving electro-magnets operative to extract the magnetic particles at the points where the stream is agitated by the riffles, and classifying screens in the bottom of the box at the same points.
17. The combination with a sluice box having riffles therein, of revolving electro-magnets operative to extract the magnetic particles at the points where the stream is agitated by the riffes, settling pockets communicating with the box at the same points and classifying screens covering said pockets.

No. 100,266. Shesrs. Cisailles.

Harvey L. Hopkins, Chicago, Illinois, U.S.A., 31st July, 1906 6 years. Filed 14th October, 1905. Receipt No. 129,249.
Claim.-1. In a device of the character described the con: bination with a pair of scissors or shears of a metal strip formed of a U -shaped hook, one end of said hook being bent at right angles thereto, the other end of the hook being adapted to engage the bevel on the side of the shear blade. means to secure and hold said strip in position for the purpose set forth, substantially as described.
2. In a device of the character described the combination with a pair of scissors or shears of spring actuated means. whose tension is regulated and increased through the bevel on the side of the shear blade by the closing of the shears for the purpose set forth, substantially as described.
3. In a device of the character described the combination with a pair of scissors or shears of means to regulate and in crease the pressure existing between the blades by the use of the bevel on the side of the shear blade by the operation of the shears for the purpose set forth, substantially as described.
4. In a device of the character described the combination with a pair of scissors or shears of spring actuated means to produce a pressure between the blades, which pressure shall be automatically regulated and increased through the bevel side of the blade by the operation of the shears for the purpose set forth, substantially as described.
b. In a device of the character described the combination with a pair of scissors or shears, of a strip of metal formed into a $\mathrm{t}^{-}$-shaped hook, one of the ends of which is bent $a^{\prime}$ right angles and adapted to be held in place by an extended pivot secured in such a manner that the opposite end will engage the bevel face of the shear blade for the purpose set forth. substantially as described.
6. In a device of the character described the shears 1 , the V-shaped hook having ends 6 and 7 , screws 9 , all combined and arranged substantially as set forth and described.

No. 100,267. Cathode Plate. Plaque de cathode.

Harry Cross Hubbell, East Orange, New Jersey, U.S.A., 31st July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,263.
Claim.-1. A cathode comprising a foraminous foundation, a silver oxide mass deposited upon the opposite sides thereof and keyed through the perforations therein, a sheet of asbestos filtering laterial inclosing the plate, and a wirc gauze pocket having binding straps at its edge for inclosing the parts.
2. A battery plate comprising a fcraminous nickel foundatlon, a silver oxide deposit upon its opposite sides, the edges of the foundation uncovered by the deposit, a layer of asbestos paperr surrounding the deposit, a wire gauze pocket inclosing the parts and held in place by channelled binding strips crimped upon the edges of the gauze pocket.

No. 100,268. Knife Polishing Device.
Machine d polir les couteaux.

Henry J. Hutchinson, Vancouver, British Columbia, Canada, 31st July, 1906; 6 years. Filed 5th January, 1906. Receipt No. 131.5: s .
Claim.-1. As a knife cleaning device, two parallel opposed integral resilient members, the adjacent surfaces of which are each in one uninterrupted plane and are covered with a bufling or polishing material.
2. As a knife cleaning device, two parallel opposed integral resilient members, the adjacent surfaces of which are each in one uninterrupted plane and ate covered with a butfing or polishink material, and means for securing the same to the woodwork of an article of kitchen furniture.
3. In a device of the class described, two integral opposed resillent members one of which is produced beyond the other and provided with means for attaching to an article of kitchen furnishing, and the upper edge of the other outwardly bent to form an entering flare between them, the adjacent surfaces of both members being furnished with a buffing or polishing material.

## No. 100,269. Electric Furnace Apparatus.

. Ipmaril de fournaise electrique.
Frederick Adolf Kjellin, Stockholm, Sweden, 31st July, 1906; 6 years. Filed 17th May, 1906. Receipt No. 136.601.
Claim.-In electric furnaces, where the electro-motive force is produced by a periodically varying magnetic field. the arrangement of electric conductors in such a position
with relation to the circuits and the leak fields as to induce currents in sald conductors opposing the production of leak fields, for the purpose of reducing the self induction.

No. 100,270. Apparatus for the Electrolytic De-
composition of Alkali Chlorid Solutions.
Appareil pour la décomposition électrolytique de solutions do chlorate d'alcali.

Johan Jacob Rink, Copenhagen, Denmark, 31st July, 1906; 6 years. Filed 9th May, 1906. Receipt No. 135,723.
Claim.-1. In apparatus for the electrolytic decomposition of alkali chloride solutions by means of a mercury cathode, the combination of a tank containing the mercury cathode, a vessel containing the anode, a diaphragm separating the space containing the cathode from the space containing the anode, and means for connecting the decomposition space adjacent to the cathode for connecting the decomposition space adjacent to the cathode with a special concentration receptarle free of chlorine.
2. In apparatus for the electrolytic decomposition of alkall chloride solutions by means of a mercury cathode, the combination of a tank containing the mercury cathode, a vessel containing the anode, a diaphragm separating the space containing the cathode from the space containing the anode. and means for connecting the decomposition space adjacent to the cathode on the one hand with a special concentration receptacle fre of chlorin. and on the other hand with a washing box in which several drip surfaces for the amalgam are arranged between several electro-negative conductors.
3. In apparatus for the electrolytic decomposition of alkall chloride solutions by means of a mercury cathode. the combination of a tank containing the mercury cathode, a vessel containing the anode, a separating diaphragm between the spaces containing the cathode and anode, a concentration receptacle free of chlorine gas connected with the decomposition space adjacent to the cathode, a second concentration receptacle connected with the space containing the anode, a washing box provided with vertical drip surfaces for the amalgam arranged between electro-negative conductors, and means for connecting the decomposition space of the tank with one concentration receptacle and with the washing box and the space containing the anode with the second concentration rectptacle.

## No. 100,271. Gas Generator. Gicirivtemi ì !!⿱ż

Melville Day Shaw and William Patrick Rhody, co-inventors, both of Wapakoneta, Ohio, U.S.A., 31st July, 1906; 6 years. Filed 10th March, 1906. Receipt No. 133,731.
Claim.-1. The combination with an inlet pipe and exhaust pipe of a gas engine, of a generating tank connected with the exhaust and heated thereby, a crude oil supply tank operatively connected to said generating tank, a gasometer or holder connected to said generator tank and means for feeding the gas generated in said tank and stored in said holder, from the latter to the inlet pipe of the engine.
2. The combination with an inlet pipe and exhaust pipe of a gas engine, of a generating tank connected to the exhaust, and containing generating coils, a crude oil supply tank connected to one end of said coil. a gasometer or bell connected with the other end of said coil. a purifier connected to said gasometer and a pipe connecting the purifier to the inlet pipe of the engine.
3. The combination with an inlet pipe and exhaust pipe of a gas engine. of a generating tank connected to the exhaust pipe atd heated thereby. a coil in said tank, a crude oil supply tank having a valved connection with one end of said coil, a gasometer connected to the other end of said coil and provided with a bell. an arm carried by said bell and arranged to open the valved connection between the supply tank
and the coll when the bell lowers, a blow-off for said gasometer. a purifier connected to said gasometer and provides

near its lower end with a screen designed to support purifying material, and a pipe connecting sald purifier to the inlet pipe of the engine.

## No. 100,272. Floor Polishing Machine.

Machine à polir les planchers.

Peter Sass, Vancouver, British Columbia, Canada, 31st July, 1906; 6 years. Filed 5th May, 1906. Receipt No. 135,581.
Claim.-1. In a floor polishing machine the combination with a wheeled frame carrying a motor, of a vertical hollow shaft rotatable and vertically slidable in bearings projecting from the motor carrying frame, said shaft having at its lower end an annular polishing head, a steering wheel secured to a stem movable in the center of the polishing head shaft. which shaft is endwise movable on the stem, and means for rotating the hollow shaft from the motor.
2. In a floor polishing machine the combination with $a$ motor carrying wheeled frame, of a vertical hollow shaft rotatable and vertically slidable in bearings projecting from the motor carrying frame and having at its lower end an annular polishing head, a steering wheel on the lower end of a stem passing through the hollow shaft on which stem the hollow shaft is rotatable and endwise slidable, a lever secured to the upper end of the steering wheel stem and passing toward the after end of the motor carrying frame, means for driving the hollow shaft and its pollshing head from the motor and means for endwise lifting the hollow shaft in its bearings.

## No. 100,273. Can Soldering Machine.

## Machine à souder les boites de fer blanc.

George H. Stewart, Los Angeles, California, U.S.A., 31st July 1906; 6 years. Filed 5th June, 1906. Recelpt No. 136,572. Claim.-1. In a can soldering machine the combination of means for moving a can body continuously past the solder point, means for heating the cans or bodies prior to reaching the solder point, and mechanism for feeding solder to the can in the form of wire, said mechanism being controlled by the can body in its continuous passage by the solder point to feed definite and exact lengths of said solder wire, substantially as described.
2. In combination in a can soldering machine, means for moving the cans axially, wire solder feeding means to direct

the wire solder to the side seam and means acted on by the ran and traversing the same from end to end for controlling the feeding of the solder wire, substantially as described.
3. In combination, a horn, a chain for moving the can bodies along the horn, wire soldering feeding devices for directing the solder wire to the seam, means in the path of the can body and arranged to traverse the same from end to end, said means controlling the feed of the solder wire, substantially as described.
4. In combination means for moving the can body in a substantially horizontal position with its side seam uppermost, means for feeding solder wire down upon the said side seam, whereby the end of the solder wire will traverse the can body from end to end, and means engaging the side of the can and traversing the same from end to end, parallel with the side seam, said means controlling the feed of solder wire to the side seam and engaging and disengaging the can body simultaneously with the solder wire, substantially as described.
$\bar{j}$. In combination, a horn over which the can body moves, solder wire leed means for directing wire solder to the seam and controlling means contacting with another part of the can and which traverse the same from end 10 end parallel with the path of the solder.
6. In combination, a horn over which the can body moves, means above the can body for feeding the solder wire down upon the same and means engaging the side of the can body and traversing said body from end to end, sald means controlling the feed of the solder, substantially as described.
7. In combination, a horn over which the can body moves, means above the can body for feeding the solder wire down upon the same and means engaging the side of the can body to one side of the seam and traversing said body from end to end, said means controlling the feed of the solder, and including a bell crank lever, substantially as described.
8. In comblation in a can soldering machine, means for moving the cans axially or in the direction of their length, soldering means to direct the wire solder to the side seam, and means acted on by the can and traversing the same from end to end for controlling the feeding of the solder wire, the said cans being moved continuously past the soldering point substantially as described.
9. In a can soldering machine and in combination, a solder feeding device operated by a constantly moving power, through frictional contact, and an arresting device controlled by the movement of the cans and acting intermittently on the feed device, substantially as described.
10. In combination iu a can soldering machine, means for moving a can body past the solder point, means for heating the can or body prior to reaching the solder point and mechanism for fecding the solder to the can in the form of wire, said mechanism being controlled in its feeding movement by the can body to an extent corresponding to the length of the sald can body, substantially as described.

No. 100,274. Apparatus for Producing Combustion Gag.
Appareil pour la production du gaz a combustion.
Adolf Vogt, 149 Tulse Hill, Surrey, England, 31st July, 1906; 6 years. Filed 7th March, 1906. Receipt No. 133,635.
Claim.-1. In apparatus for producing gases under pressure by the combustion of alr with combustible gas or liquid combustible, the combination with a combustion chamber, of a plurality of concentric casings surrounding the same, form-
ing concentric spaces through which the air supply for the combustion chamber is made to pass consecutively in the

direction from the outside to the combustion chamber, so 28 to take up and carry inward the heat radiated from the combustion chamber to the several casings, substautially as described.
2. In apparatus for producing combustion gases under pressure by the combustion of air with combustile gas or liquid combustible, the combination chamber surrounded by a serifa of casings of sheet nickel or other suitable material forming spaces through which the air supply is caused to pass consecutively in the direction from the outside towards the comcustion chamber, so as to take up and carry inward the heat imparted by radiation to the several casings, substantially as described.
3. In apparatus for producing combustion gases under pressure by the combustion of air with combustíble gas or liquid combustible, the combination with the discharge nozzle, of a surrounding nozzle for the supply of liquid for the purpose of transferring the kinetic energy of the gas jet to a jet of liquid, substantially as described.

No. 100,275. Bracket for Eaves Troughs.
('onsole pour larmiers.

Harry K. Flowers, Beverly, Ohlo, U.S.A., 31st July, 1906; years. Filed 25th June, 1906. Recelpt No. 137,236.
Claim.-1. An eavestrough supporting bracket consisting of a twisted wire standard portion having arms extending from its ends for bearing respectively over and beneath the trough, one of said arms terminating in an eye and the other arm terminating in a hook, and a twisted wire portion extending from said standard intermediately of the same and terminating in an eye for respectively receiving the eye and hook of said arms.
2. An eavestrough supporting bracket comprising a standard portion having an arm extending therefrom at one end and terminating in a loop and an arm extending from the other end and terminating in a hook, and a wire member folded together and twisted for a portion of its length and engaged at the fold with sald loop and with the free ends extended in opposite directions and twisted around the standard portion.
3. An eavestrough supporting bracket consisting of a twisted wire standard portion having arms extending from its ends for bearing respectively over and beneath the trough. one of said arms terminating in an eye and the other arm terminating in a hook, a twisted wire portion extending from sald standard intermediately of the same and terminating in an eye for respectively recelving the eye and hook of said
arms, in combination with an eavestrough for support between said brace member and lower arm member and formed with spaced recesses to recelve the inner portion of the intermediate member.
4. An eavestrough supporting bracket consisting of a twisted wire standard portion having arms extending from its ends for bearing respectively over and beneath the trough, one of said arms terminating in an eye and the other arm terminating in a hook, a twisted wire portion extending from sald standard intermediately of the same and terminating in an eye for respectively recelving the eye and hook of said arms, and a clip for bearing over said standard portion and having means for securing to a supporiing structure, and, provided with a notch for engaging the upper lateral member.

No. 100,276. Medicine Spoon. ('uillive ìmillwill'.

William L. Jenkins, Moultrie, Georgia, U.S.A., 31st July, 1906; 6 years. Filed 25th May, 1406 . Receipt No. 136,240.
Claim.-1. A medicine spoon embodying a bowl and a handle, the under side of the deepest portion of the bowl and the under side of the handle being in the same plane. and the bowl belng provided with interior graduation box and with a spout, the under side of which is serrated.
2. A medicine spoon having its bowl provided with a spout the free end of which is bent downwardly and provided on its underside with serrations.
3. A medicine spoon embodying a bowl and a handle. the bowl being provided with an elongated slot covered throughout a greater portion of its length and having its free end bent downwardly and provided on its underside with gerrations.

No. 100,277. Rock Drill. Forel à rochc.

John George Leyner, Denver. Colorado, U.S.A.. 31st July, 1906: 6 years. Filed 1st August, 1905. Receipt No. 137,331.
Claim.-1. A drill, a hammer piston, a striking member operationly arranged to recelve and impart the blows of the
hammer piston to the drill, a feed screw for said drill, and matans connected to said feed screw for rotating said drill.
2. A drill. a hammer piston, a striking pin arranged and adapted to recrive and impart the blows of said hammer piston to said drill, a drill holding chuck, and means conincted with said chuck for imparting rotative movement to said drill
3. A drill, a hammer piston, a striking pin arranged to receive and impart the blows of said hammer piston to said drill, a buffer device for said hammer piston, a drill holding chuck, a feed screw for said drill, and means connected with said fied screw and chuck whereby rotation of sald feed screw effects rotation of said drill.
4. A drill, a striking pin for striking the drill, a hammer p:ston for striking the striking pin, a chuck for holding the cirill. a feed screw for fecding the drill, and means inchuding focaring for connecting said feed screw to said chuck whereby rctation of said feed screw effects rotation of said drill.
$\bar{j}$. A drill, a riciprocal compensating striking pin for striking the drill, a hammer piston for striking the striking pin, a bufter device arranged to receive the inoperative blows of said hammer piston, and means for defining the reciprocal compensating movement of said striking pin relative to the cushioning of the inoperative blows of said hammer piston by said buffer device.
6. In a rock drilling eugine, a cylinder, a hammer piston reciprocally mounted in said cylinder, a drill bit supported in said cylinder and adapted to be driven by said hammer piston a chuck and gear rotatably mounted on said cylinder and arranged to support said drill bit, a gear in mesh with said chuck gear. a feed screw operatively connected to said cylinder, and means for rotating said second gear from said feed screw.
7. In a rock drilling engine, a cylinder, a supporting shell it, which said cylinder is slidably mounted, hammer piston reciprocately mounted in said cylinder, a drill bit supported ir said cylinder and adapted to be driven by said hammer piston, a rotatable drill holding chuck, a drill bit supported i:i said chuck, a gear mounted on sald chuck, a second gear rctatably journalled in said cylinder and arranged in operative mesh with said chuck gear, a sleeve projecting from said gear. a feed screw operatively connected to said cylinder and shell, and estending through said sleeve, and means conrected with said feed screw and said sleeve whereby rotation of said feed screw effects rotation of said chuck and dir:ll bit.
8. In a rock drilling engine, an operative cylinder and hammer piston and a feed screw operatively connected to said cylinder, a drill bit in said cylinder, a sleeve supported by said cylindur and surrounding said feed screw. a key way in said slieve, a feather key serured to said sleeve and projerting looscly into said key-way, a gear on said sleeve. and marans including a gear in mesh with the gear on said slecro for rotating said drill bit.
9. In a rock drilling engine, a rock drill, a motive fluid controlled hammer piston for driving the same, a gear for rotating said drill, a feed screw for feeding said drill. a sifeve feathered to sald fred screw, and a gear secured to said sleeve and in mesh with said drill rotating gear.
10. A rock drill comprising a cylinder having a piston hammer and a revoluble drill chuck. a support on which said cylinder is slidiably mounted, a feed screw in engagement with said cylindor and support, and means whereby rotation of said screw effects rotation of said chuck, as set forth.
11. A rock drill comprising a cylinder having a hammer piston and a ruvoluble drill whuck, a support on which said cylinder is slidably mounted, a feed screw in engagement with said cylindmr and support. and meshing gears rotating with said screw and chuck, as set forth.
12. A rock drill comprising a cylinder having a hammer piston and a revoluble drill chuck, a support on which said cylinder is slidably mounted. a feed screw in engagement with but slide on said screw, and meshing gears rotating with but slide on said screw, and meshng gears rotating with said sleeve and chuck, as set forth.
13. A rock drill comprising a cylinder having a hammer piston and a revoluble drill chuck, a support on which sald cylinder is slidably mounted, a feed screw in engagement with said rylinder and support, a sleeve mounted to rotate with but slide on sald screw, and meshing gears rotating with said sleere and chuck, as set forth.
14. In a motive fluid hammer niston rock drilling engine. the combination of the cylinder. the hammer piston, the drill chuck and the drill bit, with a drill bit striking pin interposed between said hammer niston and said drill bit, and adapted to recerive the blows of said hammer piston and impart them to said drill bit, and the steel sleeve. and resilient buffer devire for cushioning the inoperative blows of said hammer piston.
15. In a motive fluid hammer piston rock drilling engina. the combination with the cylinder. the supporting shell, the feed screw operatively connected to said shell and cylinder.
and the drill holding chuck, provided with a gear, of a gear rotatably mounted in said cylinder, in mesh with said chuck gear, a sleeve on said gear surrounding said feed screw, and means for rotatably and slidably connecting said sleeve to said feed screw, substantially as described.
16. In a motive fluid hammer piston rock drilling engine the combination with the cylinder, the supporting shell, the gear drill chuck and the feed screw, provided with oppositely disposed key way, of a gear rotatably mounted in said cylinder in mesh with said chuck gear, and provided with a sleeve, said gear and sleeve surrounding said feed screw, and provided with two oppositely disposed integral feather keys slidably keyed to said feed screw, substantially as described.
17. In a motive fluid hammer piston rock drilling engine, the combination with the supporting shell, the feed screw and the cylinder, having an exhaust port opening to the atmosphere opposite to said feed screw, of the gear drill chuck and the gear and sleeve surrounding the feod screw and in mesh with said chuck gear, and a circumferential row of apertures in the shell of said sleeve registering opposite the fluid exhaust port of said cylinder, adapted to admit the exhaust fluid pressure to said feed screw, substantially as described.
18. In a motive fluid hammer piston rock drilling engine a rock drill bit, having a cutting point, and a shank consist ing of a bar of any mercharitable drill tool steel in its natural merchantable state, of any form of cross section said shank being entirely free from projections, collars lugs, shoulders, notches, recesses, or any kind or character of machined or added element.
19. A rock cutting drill bit, for motive fluid controlled rock drilling engines, consisting of a bar of merchantable drill tool steel of any form of cross section having rock cutting lips at one end, and a striking shank free from lugs recesses, slots, collars, projections, or shoulders, and a chuck having a drill recelving aperture of a form to suit the cross section form of said drill bit.
20. A rock cutting drill bit for motive fluid controlled rock drilling engines, consisting of a bar of merchantable cruciform drill tool steel of any form of cross section, havilig rock cutting lips at one end, and having its shank throughout its length of its natural rolled form, and entirely free from projections or recessed elements that would act to define the length of that portion of its shank that is inserted in the drill holding chucks of rock drilling engines, and a chuck for rock drilling engines having a drili holding aper ture of cruciform shape adapted to receive and support said cruciform shaped drili bit loosely, whereby an operator can instantly insert and remove by hand said drill bits in said chuck.
21. In a motive fiuid controlled rock drilling engine, the combination with the supporting shell, the cylinder, and the feed screw of a top secured to said shell, and an arm on said cylinder arranged to engage said stod, and limit the feeding movement of said cylinder in said supporting shell 22. In a motive fluid controlled hammer piston rock drilling engine, a supporting shell, a cylinder slidably mounted in said shell, a feed screw connected to said shell and cylinder and arranged to feed said cylinder in said shell, a drill holding chuck in said cylinder, a drill bit in said drill holding chuck, a striking pin for striking the drill bit, a hammer piston in said cylinder for striking the strike pin, a buffer device for cushioning the inoperative blows of said hammer piston, and means connected to said feed screw and chuck whereby rotation of sald feed screw effects rotation of said drill bit.
23. In a motive fluid hammer piston drill, the combination with the cylinder, the shell, the feed screw, the hammer piston, and the arill bit, of a drill bit holding chuck rotatably mounted in said cylinder provided with a gear, a gear rotatably connected and slidably feathered to sald feed screw in mesh with the gear of said drill bit holding chuck, a striking pin for striking said drill bit, and a hammer piston for striking said striking pin, substantially as described.
24. In a rock drilling engine, the combination of a cylinder having a fluid inlet port, axially arranged ports in its shell. and circumferential ports in its inner periphery registering with said axial ports at predetermined intervals, and a circumiferential exhaust port in its inner periphery open to the atmosphere, with a hammer piston provided with an axial bore extending into it from its rear end a predetermined distance, a circumferential row of radial ports in its shell adjacent to its rear, having their inner entrances arranged in zigzag order, and the outer entrances arranged in a circumferential row, and arranged to register with said cylinder inlet ports, and a row of radial exhaust ports in its shell arranged to register with said cylinder's exhaust port, substantially as described.
25 . In a motive fluid hammer piston rock drilling engine the combination with the cylinder and the hammer piston. of a drill bit holding chuck mounted in said cylinder provided with an enlarged portion, a steel buffer sleeve mounted
in said cylinder.$n$ the reciprocal path of sald hammer plston, and arranged to fit over the end of said chuck, a resilient buffer ring and a steel washer mounted on said chuck betwren said steel buffer sleeve and said enlarged portion of said chuck, an axial aperture in said steel buffer sleeve, of two diameters, arranged to form a shoulder in the front end of said sleeve, a piston hammer striking pin reciprocally mounted in said sleeve, and arranged to project normally beyond the said sleeve into the reciprocal path of said hammer piston, a collar on said pin arranged to have a sliding movement between the shoulder in said steel buffer sleeve, and the adjacent end of said chuck, and adapted to define the reciprocal compensating movement of said pin relative to the reciprocal strokes of said hammer piston, and a drill bit adapted to be supported by said chuck and adapted to be held against said pin, and to be struck by said striking pin, substantially as described.

No. 100,278. Draft Appliance. Appareil de tirage.

Isalu Rancourt, Napierville, Quebec. Canada, 31st July. 1906
6 ycars. Filed 2nd February, 1906. Recelpt No. 132,511.
Chill.--1. In a device of the rharacter described the combination comprising a plurality of connecting bolts, side plates adjustably disposed on the bolts, a transverse bar disposed on the plates, means for adjustably locking the bar on the plates, and means for pivocally attaching a draft tongue to the bar
2. In a device of the character described the combination comprising a plurality of connecting bolts. plates adjustably disvosed on said bolts, a yoke pivotally disposed on one of sald bolts, a bar secured on the plates, and a draft tongue pivotally secured to the bar.
3. In a device of the character described the combination comprising a pair of plates. means for adjustably holding the plates together, a transverse bar adjustably disposed on the plates, yokes disposed over the transverse bar and extending past the plates, clamping plates disposed on the yokes, nuts disposed on the yokes beneath the clamping plates, and means for connecting the transverse bar to a draft tongue.
4. In a device of the character described the combination comprising a pair of shle plates provided with seats, means for aljustably holding the side plates together, a transverse bar disposed in said plates, means for locking the bar to said plates, a brace pirotally connected to sald bar and extending forwardly thereof, a bar pivotally connected to said transverse bar and provided with a horizontal extension in a differcnt plane. and a draft tongue secured to said horizontal extension and to said brace
5. In a device of the character described the combination comprising a pair of plates, means for adjustably holding the plates, a clevis connected to the plates, a bar on the plates. and a draft tongue connected with the bar.

## No. 100,279. Mould for Plastic Matorial.

## Moule pour matieres plastiques.

Ebenezer W. Rider, Detroit. Michigan. U.S.A.. 31st July, 1906; 6 years. Filed 20th June. 1906. Receipt No. 187.082.
Claim.-1. In a machine for moulding plastic material the combination with a mould. of means for fllling said mould with plastic material, means for subsequently depositing a second layer of plastic material above the mould, and a compression plunger for simultaneously compressing both layers of material.
2. In a machine for moulding plastic material the comblnation with a mould, of mans for completely filling sald mould with plastic material, means for superposing and holding a
second layer of plastic material above the first deposit and a plunger for compressing both layers within the mould.

3. In a machine for moulding plastic material the combination with a mould, of means for completely flling the cavity of said mould with plastic material, means for extending the mould to vertically enlarge the mould cavity thereof, means for fllling the extended cavity with a second layer of plastic material, and a plunger for compressing both layers in the mould.
4. In a machine for moulding plastic material the combination of a mould, a carrier for plastic material mounted for the lateral reciprocation across sald mould to completely fill the same, and a sscond carrier mounted for reciprocation across the mould subsequent to the operation of the first carrier, and means for enlarging the mould cavity intermediate the movements of said carriers, whereby a layer of material from the second carrier will be superposed upon the deposit from the first.
5. In a machine for moulding plastic material the combination with a mould, of a vertically reciprocating plunger, a pitman and a crank connection for actuating said plunger, a drive connection for said crank, and a clutch intermediate said drive and crank, permitting the acceleration of the descent of the plunger by gravity.
6. In a machine for moulding plastic material the combination with a mould, of a vertically reciprocating plunger, a pitman and a crank connection for actuating said plunger, and a lost motion connection for said pitman, permitting the continued rotation of the crank, after the movement of said plunger is arrested.
7. In a machine for moulding plastic material the combination with a mould, of a vertically reciprocating plunger, a pitman and a crank connection for actuating said plunger, a drive connection for said crank, a clutch intermediate said drive and crank, permitting the acceleration of the descent of the plunger by gravity, a lost motion connection for said pitman permitting the continued rotation of said crank after the arrest of said plunger in its downward movement, and means for automatically disengaging sald clutch before the limit of lost motion in the return movement of the pitman is reached, whereby said plunger remains in lowered position within the mould.
8. In a machine for moulding plastic material the combination with a mould, of a vertically reciprocating plunger, a pitman and a crank connection for actuating said-plunger, a drive connection for said crank, and a clutch intermediate said drive and crank permitting the acceleration of the descent of the plunger by gravity, a lost motion connection for said pitman permitting continued rotation of the crank after the arrest of said plunger, means for automatically disengaging said clutch before the limit of lost motion is reached in the upward movement of the pitman, means for again automatically disengaging said clutch after re-engagement before said crank has passed the upper dead center, and means for preventing backward rotation of the crank.
9. In a machine for moulding plastic material the combination with a mould, of a vertically reciprocaling plunger, a pitman and crank connection for actuating said plunger, a drive connection for said crank, a clutch intermediate said drive and crank, permitting acceleration of the descent of the plunger by gravity, means for automatically disengaging said clutch before the upward movement of said plunger, means for raising said mould to disengage the same from the
compressed brick. and means for automatically locking said plunger to hold the same from movemnt during the raising of said mould.
10. In a machine for compressing plastic material the combination with a mould, of a reciprocating plunger for compressing the material within the mould actuated by gravity in its compression stroke, means for raising the plunger after compression, means for raising the mould during the arrest of said plunger to disengage the compressed block, and means for automatically locking said plunger from movement during the raising of said mould, and for unlocking the same at the completion of the raising of said mould.
11. In a machine for compressing plastic material the combination with a mould, a plurality of pallets or bottom plates therefor, a laterally reciprocating carrier for filling the mould with plastic material, and a vertically reciprocating plunger for compressing the plastic material within said mould against the pallet, of timed mechanism for effecting successively in each cycle, the locking of the plunger in its lowered position, the raising of the mould, the unlocking of the plunger, the feeding of one pallet from beneath the mould, and another pallet in registration therewith, the raising of the plunger, the reciprocation of the carrier to fill the mould and the arrest of the timed mechanism, independently controlled means for effecting the downward movement of the plunger, and means whereby one or more succeeding operations of the plunger may be accomplished while the automatic mechanism remains stationary.
12. In a machine for moulding plastic material the combination with a bed and a vertically reciprocating plunger of slmultaneously co-operating adjustable side plates for varying the width of the space for the mould cavity.
13. In a machine for moulding plastic material the combination with a bed and a vertically reciprocating plunger, of a plurality of pallets or bottom plates, an endless chain for feeding said pallets periodically longitudinally of the bed, in and out of registration with said plunger, and a mould box containing a series of separate moulds extending longitudinally of the bed.
14. In a machine for compressing plastic material the combination with a bed, of a vertically reciprocating plunger, a laterally reciprocating carricr for the plastic material, a laterally adjustable side plate for varying the width of the mould cavity above said bed, and a wing or plate integral with said side plate forming a bottom for said carrier.

No. 100,280. Fuel. Combustible.
Andrew Schmidt. Pittsburg, Pennsylvania, U.S.A., 31st July. 1906; 6 years. Filed 7th September, 1905. Receipt No. 128,262.
Claim.-1. A composition fuel consisting of peat and burnt limestone, the limestone being slacked by the peat, and compressed into sultable forms for fuel purposes.
2. A composition fuel consisting of burnt limestone and peat, said ingredients being compressed into suitable forms for fuel purposes.
3. A fuel consisting of burnt granulated limestone and peat in the same or equivalent state.

## No. 100,281. Stopper for Bottles.

Bouchon de bouteilles.

Thomas Henry Collins, Hamilton, Ontario, Canada, 31st July, 1906; 6 years. Filed 31st May, 1906. Recelpt No. 136,445. Claim.-1. In a stopper holder device for bottles the combination with a bottle having a recess formed therein to receive the secondary closure for the bottle and means for
retaining such closure in position, as and for the purpose epecifled.
2. In a stopper holding device for bottles the combination with a bottle having a recess formed in the bottom thereof to recelve the secondary closure for the bottle and removable means for retaining such closure in position, as and for the purpose specifled.
3. In a stopper holder device for bottles the combination with a bottle having a recess formed in the bottom thereof to receive the secondary closure for the bottle and a seal designed to be fastened to the bottom of the bottle, so as to hold the secondary closure securely in the recess, as and for the purpose specified.

No. 100,282. Bottle Stopper. Bouchon de bouteilles.

August Wilhelm Cordes, New York City, New York, U.S.A..
31st July, 1906; 6 years. Filed 26th April, 1906. Receipt No. 135,301.
Claim.-1. A stopper comprising a cap having depending fingers and a clamping ring embracing said fingers and having parts co-operating with the cap whereby the ring will move axially when rotated with respect to the cap.
2. A stopper comprisin's a cap having depending fingers with exterior and interior cam surfaces, and a clamping ring having parts co-operating with the cap and adapting it to move axially when rotated and to engage said exterior cam surfaces.
3. A stopper comprising a cap having depending fingers with interior cam surfaces adapted to engage a bead upon a bottle, a clamping ring having parts co-operating with the cap whereby the ring will when rotated move downward upon the fingers to engage them in locked relation with the bottle.
4. A stopper comprising a cap having depending fingers with exterior and interior cam surfaces, and a clamping ring having a lower peripheral edge engaging said exterior cam surfaces, and having cam inclines on its upper edge adapted to engage with the cap whereby it is, forced axially into clamping relation when turned.
5. A stopper comprising a cap having depending fingers with exterior and interior cam surfaces, and a clamping ring having inclines on its upper edge adapted to engage with the cap and having a beaded central portion adapted to be forced downward upon said exterior cam surfaces by a circumerential movement of the ring with respect to the cap.
6. A stopper comprising a cap having depending fingers and having a plurality of lugs, of projections on its exterior surface, and a clamping ring having inclines adapted to engage sald lugs or projections to force the ring axially and move the fingers inward.
7. A stopper comprising a cap having depending fingers embossed with strengthening protuberances, and having exterior and interior cam surfaces, and a beaded clamping ring having cam inclines co-operating with the cap by which it is forced axially when turned so us to engage the exterior cam surfaces and force the fingers inward.

No. 100,283. Bottle Itopper. Bouchou de boutcilles.
Jemes M. Cumming. Newark, New Jersey, U.S.A., 31st July, 1906; 6 years. Filed 13th June, 1906. Receipt No. 136.839.
Claim.-1. A chambered stopper for bottles comprising a stopper body formed with bolt receiving openings, a contracted neck, an open and outwardly flaring portion, a cap or covering on said outwardly flaring portion, means for rigidly securing said cap or cover upon said outwardly flaring portion, said outwardly extending portion being provided with a key bole, a pair of pivot lugs in said contracted neck,
an arm pivotally connected with each lug, a bolt upon each arm extending into a bolt receiving opening, a spring ar-

ranged between the lower portions of said arms, and a key receiving means between the upper portions of said arms for the reception of the key for actuating sald arms, substantially as and for the purposes set forth.
2. The herein described stopper for bottles comprising a stopper body having a closed bottom and an annular shoulder, a resillent covering or shell surrounding said body and its bottom, said body and covering being provided with registering bolt receiving openings, a contracted neck, an open and outwardly flaring portion, a cap or cover on said outwardly flaring portion, means for rigidly securing said cap or ecver upon said outwardly flaring portion, said outwardly (-xtending portion being provided with a key hole, a pair of fivot lugs in said contracted neck, an arm pivotally connected with each lug, a bolt upon each arm extending into the registering bolt receiving openings of said stopper body and covering, a spring arranged between the lower portions of said arms, and a key receiving means between the upper portions of said arms for the reception of a key for actuating said arm, substantially as and for the purposes set forth.

No. 100,284. Bottle Stopper. Bouchon de bouteilles.

Henry E. Lazarus, Chicago, Illinois, U.S.A., 31st July, 1906: 6 years. Filed 25th May, 1906. Receipt No. 136,242.
Claim.-1. In a bottle stopper the combination of a cork piece, a disc thereon, and an additional piece formed up to cbtain a top and a cylindrical wall, such cyllndrical wall arranged to be forced inward into close contact with the neck of a bottle and such top cut to obtain a thumb plece, arranged to be bent into position to be seized and thereby a strip torn from the top and cylindrical well piece to release it from the bottle neck, and such thumb plece provided with a ralsed rib, tending to maintain the thumb piece in this seme plane as the remainder of the top, substantially as described.
2. The combination of a bottle stopper and the neck of a buttle, the neck of the bottle provided with an annular rib and the bottle stopper consisting of a cork piece, a disc thereon, and an additional piece formed up to obtain a top and a cylindrical wall, such cylindrical wall arranged to be forced inward into close contact with the neek of the bottle and under the annular rib thereon and such top cut to obtain a thumb piece, arranged to be bent into position to be seized and thereby a strip torn from the top and cylindrical wall of the additional piece to release it from the bottle reck, and such thumb piece provided with a raised rib tending to maintain the thumb piece in the same plane as the remainder of the top, substantially as described.

No. 100,285. Bottle Closure. Fermeture de bouteilles.

('harles Hanmer, New York City, New York, U.S.A., 31st July. 1906; 6 years. Filed 15th June, 1906. Receipt No. 136.939.

Claim.-1. A bottle or jar having a rabbeted portion, a dished dise adapted to fit said rabbeted portion, and a cap adapted to flatten said dished disc to increase its diameter.
2. A bottle or jar having a rabbeted portion, a dished disc adapted to fit into said rabbeted portion, and a cap having a depression in its end adapted to flatten the dished disc to increase its diameter.
3. A bottle or jar having a rabbeted portion, an annular rib, and a plurality of separated spiral threads extending upward from the rib, a dished disc fitted into the rabbeted portion, and a cap having a depression to flatten the dished disc, and a plurality of inclined notches in the lower edge thereof to form inward projections to engage the separated threads.
4. A bottle or jar provided with an annular shoulder and a plurality of superposed separated threads connecting at their lower ends with said shoulder, in combination with a cap having one or more inpunched projections at its lower edge to engage saıu threads, said projections being provided with inclined upper walls having an angular arrangement with relation to the lower edge of the cap forming to the angular arrangement of the threads with relation to the shoulder, whereby stops are provided at the junction of the threads with the shoulder to limit the turning movement of the cap, the relauve angular arrangement of the parts being such as to adapt the cap to be screwed down into close contact with the shoulder so that the inclined upper walls of the projections and basal edges of the inner walls thereof will respectively bear against the threads and shoulder and exert resisting pressures to prevent injury to the projections when the cap is screwed on.
5. A bottle or jar provided with an elongated neck having an annular rib or shoulder and a plurality of superposed separated threads connecting at their lower ends with said shoulder, in combination with a cap having one or more inpunched projections at its lower edge to engage said threads, said projections being provided with inclined upper walls having an angular arrangement with relation to the lower edge of the cap conforming to the angular arrangement of the threads with relation to the shoulder, whereby stops ar. provided at the junction of the threads with the shoulder to limit the turning movement of the cap, the relative angular movement of the parts being such as to adapt the cap to be screwed down into close contact with the shoulder so that the inclined upper walls of the projections and basal edges of the inner walls threof will respectively bear against the threads and shoulder and exert resisting pressures to prevent injury to the grojections when the rap is screwed on 6. A bottle or jar having a rabbeted portion, and a plurality of separated threads, a dished dise adapted to fit said rabbitud portion, and a rap having a depression to flatten said dic, and means to engage the scparated threads.

## No. 100,286. Non-Refllable Bottle. <br> Boutrille non -réemplissable,

Charles Henry White, Charlottetown, Prince Edward Island,
Canada, 31st July, 1906: 6 years. Filed 27th December, 1904. Receipt No. 121,075.

Claim.-1. In a non-refllable bottle having substantially concentric neck walls, passages leading from the interior thereof between said walls, and an inwardly projecting valve seat, in combination with a valve adapted to rest thereon a hollow stem connected with said valve, a resilient member in said stem and an insertible member adapted to bear on said resilient member.
2. In a non-refillable bottle having substantially concentric neck walls w.h passages leading from the interior thereof between said walls, and an inwardly projecting valve seat, in combination with a rotatable valve, a hollow strm on said valve, an insertible plug, a stem on the lower side of said plug, a resilient member between said stem and said valve, and means for locking said insertible plug in position.
3. In a non-refillable bottle having substantially concentric noek walls with passages leading from the interior thereof between said walls, and an inwardly projecting valve seat, in combination with a rotatable valve, a hollow stem on said valve, an inserting plug, a stem on the lower side of said plug. a resilient member between said stem and said valve, a frangible stem on said insertible plug, and means for locking said insertible plug in position.

## No. 100,287. Voltage Regulator.

Regulateur de voltage.

The Canadian Westinghouse Company, Limited, Hamilton, Ontario, Canada, assignee of Harve R. Stuart, Wilkinsburg. Pennsylvania, U.S.A.. 31st July, 1906; 6 years. Filed 13th May. 1305. Receipt No. 125,146.
Claim.-1. The combination with means for successively opurating a series of switches, of means for alternately operating two other switches.
2. The combination with means for first closing one switch of a series and then opening the last preceding switch of that series. the operation of the switches continuing to the end of the series. of means for next closing one of a pair of switches and then opening the other, the two switches being allernately opened athd closed.
3. The combination with a quill, of a shaft that is actuated thereby and has a threaded portion at one end, a stationary nut with which said threaded portion engages, and cams mounted on said shaft.
4. The combination with an operating handle and a pinioi actuated thereby, of a gear wheel meshing with said pinion, a shaft to which said gear wheel is rigidly secured, a quill loosely mounted on said shaft, and cams on said quill.
5. The combination with an operating handle and a pinion actuated thereby, of a gear wheel meshing with sald pinion, a shaft to which said gear wheel is rigidly secured, a quill loosely mounted on said shaft, and a lost motion connection between said shaft and said quill.
6. The combination with an operating handle and a pinion actuated thereby, of a gear wheel meshing with said pinion, a shaft upon which said gear wheel is rigidly secured, a quill loosely mounted on said shaft, cams on said quill, and a second quill actuated by said shaft.
7. The combination with an operating handle and a pinion actuated thereby, of a gear meshing with said pinion, a shaft upon which said gear wheel is rigidly secured, a quill loosely mounted on said shaft, cams on said quill, a second quill actuated by said shaft, and a shaft actuated by said second quill.
8. The combination with an operating handle and a piston actuated thereby, of a gear wheel meshing with said pinion, a shaft upon which sald gear wheel is rigidly secured, a quill loosely mounted on said shaft, cams on said quill, a second quill actuated by said shaft. a shaft actuated ty said second quill and having a threaded portion at one end, and a stationary nut with which said threaded portion engages.
$y$. The combination with an operating handle, a pinion actuated thereby and a gear wheel meshing with said pinion, of a shaft to which said gear wheel is rigidly secured, a quill loosely mounted on said shaft, cams on said quill, a second quill actuated by said shaft, a shaft actuated by said second quill and having a threaded portion at one end, a stationary nut with which said threaded portion engages, and cams nut with which said
mounted on said shaft.
10. The combination with a connecting rod and a link, of a lever plvoted at one end to said link, a stationary bracket to which the other end of said lever is pivoted and toggle members one of which is pivoted to said lever and the other of which is pivoted to said stationary bracket.
11. The combination with a connecting rod and a link, of a lever connected at its free end to said link and fulcrumed at its other end, and toggle members one of which is pivoted to said lever and the other of which is fulcrumed on a stationary axis.
12. The combination with a connecting rod and a link, of a lever connected at its free end to said link and fulcrumed at its other end, toggle members one of which is pivoted to said lever and the other of which is fulcrumed on a stationary axis, and a lever fulcrumed on said axis to engage said second-named toggle meniber.
13. The combination with a switch operating rod, a link connected to one end thereof and a rotatably mounted cam, of a lever connected at its free end to said link and fulcrumed at its other end, toggle members one of which is pivoted to said lever and the other of which is fulcrumed on a stationary axis and provided with a roller to be engaged by said cam.
14. The combination with a switgh operating rod, a link connected to one end thereof and a rotatably mounted cam, of a lever connected at its free end to said link. and fulcrumed at its other end, toggle members one of which is pivoted to said lever and the other of which is fulcrumed on a stationary axis, and a lever fulcrumed on said axis to engage said second-named toggle member and provided with a roller to be engaged by said cam.
15. The combination with connecting rods and links, of levers connected at corresponding ends to sald links, a shaft on which the other ends are fulcrumed, pairs of toggle members interposed between the levers and actuating devices, and cams on said shaft adapted to cause said toggle members to buckle.
16. The combination with connecting rods and links, of levers connected at one end to sald links, a shaft on which the other ends are fulcrumed, pairs of toggle members, cams on said shaft adapted to cause said toggle members to buckle. and a gear wheel loosely mounted on said shaft and baving lost motion connection therewith.
17. The combination with connecting rods and links, of levers connected at one end to said links, a shaft on which the other ends are fulcrumed, pairs of toggle members, cams on sald shaft adapted to cause said toggle members to buckle. dogs on said shaft, a gear wheel loosely mounted thereon and lugs on said gear wheel with which said dogs are adapted to engage.
18. The combination with rotatable cams, of levers adapted to engage at corresponding ends with said cams and toggle members having knuckle joint connections with said levers.
19. The combination with a quill, of a shaft that is actuated thereby and has a threaded portion at one end, a stationary nut with which said threaded portion engages, cams mounted on said shaft and switches actuated by said canus.
20. The combination with an operating handle and a pinion actuated thereby, of a gear wheel meshing with said pinion, a shaft to which said gear wheel is rigidly serured, a quili loosely mounted on said shaft, cams on said quill and switches actuated by said cams.
21. The combination with an operating handle and a pinion actuated thereby, of a gear wheel meshing with said pinion, a shaft upon which said gear wheel is rigidly secured, a quill loosely mounted on said shaft. cams on said quill, switches actuated by said cams. a second quill actuated by said shaft. a serond shaft provided with cams and actuated by sald second quill, and switches actuated by sald cams.
22. The combination with an operating handle and a pinion actuated thereby, of a gear wheel meshing with said pinion, a shaft upon which sald gear wheel is rigidly secured, a quill loosely mounted on said shaft, cams on said quill, switches actuated by said cams, a second quill actuated by said shaft, a second shaft provided with cams, and actuated by said second quill, and switches actuated by said cams.
23. The combination with an operating handle and a pinion actuated thereby, of a gear wheel meshing with said pinion, a shaft upon which said gear wheel is rigidly securen, a quill loosely mounted on said shaft, cams on said quill, switches actuated by said cams, a second quill actuated by said shaft, a shaft actuated by said second quill and having a threaded portion at one end, cams on sald shaft, switches actuated by said cams, and a stationary nut with which said threaded portion engages
24. The combination with an operating handle, a pinion actuated thereby and a gear wheel meshing with said pinion, of a shaft to which sald gear wheel is rigidly secured, a quill loosely mounted on said shaft, cams on said quill, switches actuated by sald cams, a sccond quill actuated by said shaft a shaft actuated by said second quill and having a threaded portion at one end, a stationary nut with which said threaded portion engages, cams mounted on said shaft, switches act uated by said cams, and tripping devices for said switches.
25. The combination with a switch operating road and a link, of a lever pivoted at one end to said link, a stationary bracket to which the other end of said lever is pivoted, toggle members one of which is pivoted to said lever and the other of which is pivoted to said stationary bracket, means for actuating said toggle members slowly in one direction, and means for tripping said members.
26. The combination with a switch operating rod and a link. of a lever connected at its frecend to sald link and fulcrumed at its other end, toggle members one of which is pivoted to said lever and the other of which is fulcrumed on a stationary axis, and means for operating said toggle members.
27. The combination with a switch operating rod and a link, of a lever connected at its free end to said link and fulcrumed at its other end, toggle members one of which is pivoted to said lever and the other of which is fulcrumed on a stationary axis, a lever fulcrumed on said axis to engage said second-named toggle member, and means for actuating the second lever.
28. The combination with a series of switches and toggle joint mechanisms for closing them, of a plurality of interconnected shafts provided with operating cams and a single handle for operating said shafts.
29. The combination with a series of switches and a plurality of inter-connected shafts and quills provided with cams toggle joint mechanisms actuated by said cams to close and open said switches in a predetermined order, and a single handle for operating said devices.

No. 100,288. Non-Refllable Bottle.

## Boutetlle non-réemplissable.

L. E. L. Themke, Josef Dittrick, both of Strathcona, and Franz Scheibal, Edmonton, both in Alberta, Canada, 31st July, 1906; 6 years. Filed 16 th June, 1906. Receipt No. 136,972.
Claim.-1. In a device of the character described the combination comprising a bottle, an expansible tube disposed in the neck of the bottle, a valve casing disposed in the neck below the tube and proviled with channels, a valve disposed in the casing, and means fo: limiting the movement of the valve.
2. In a device of the character described the combination comprising a bottle having annular channels in its neck, an expansible tube disposed in the neck and having portions expanded into the channels, a valve casing disposed in the neck below the tube and provided wi:h channels, a valve disposed in the casing, and means for limiting the movement of the valve.
3. In a device of the character described the combination comprising a bottle, an expansible tube disposed in the neek
thereof, means for locking the tube in the neck, a valve casing disposed in the neck below the tube and provided with channels, a valve disposed in the casing, and means for limiting the movement of the valve
4. In a device of the character described the combination comprising a bottle, an expansible tube disposed in the neck

thereof, means for locking the tube in the neck, a valve casing disposed in the neck below the tube and provided with channels, a washer disposed between the tube and the valve casing, a valve disposed in the casing, and means for limiting the movement of the valve.
5. In a device of the character described the combination comprising a bottle, having an annular shoulder in the neck thereof, a gasket disposed on the shoulder, a valve casing disposed in the neck and provided with a flange adapted to rest on the gasket and provided with channels, an expansible tube disposed in the neck and adapted to lock the casing in position, a valve in the casing, and means for limiting the movement of the valve.
6. In a device of the character described the combination comprising a bottle, an expansible member disposed in the neck thereof and provided with a bifurcated wob, a valve casing disposed in the neck and locked in position by the expansible member and provided with an opening and with channels, a ball valve disposed in the casing and provided with a projection disposed in the opening of the web and provided with a stem disposed in the opening of the casing, and a washer disposed between the expansible member and the valve casing.

No. 100,289. Bottle Stopper. Bourhon de louteilles.

The International Specialties Company, assignee of George Kirkegaard, New York City, New York, U.S.A., 31st July, 1906; 6 years. Filed 14 th June, 1906. Reccipt No. 136.909.
Claim.-1. A bottle stopper comprising a metallic cap containing packing material provided with a depending annular flange and with holding fingers extending from and below said tlange, said holding fingers having inwardly directed lugs to engage the neck of the bottle and being stiffened or rein-
forced from their lower extremities upward throughout the depth of said flange, for the purpose described.
2. A bottle stopper comprising a metallic disc, an annular depending flange and a plurality of fingers extending from the flange, said fingers having embossed or impressed therein $U$ shaped ribs the arms of which extend substantially from the edge of the disc to and around the lower extremities of the fingers, for the purpose set forth.
3. A bottle stopper comprising a metallic cap containing packing material and having a number of depending fingers around its periphery, each finger having an inwardly extending lug for engaging the neck of the bottle and also strengthening ribs surrounding said lugs and extending upward to the cap. substantially as described
4. A bottle stopper comprising a disc having an annular depending flange, a number of fingers extending downward beyond said flange, embossed lugs at the lower ends of said fingers, an embossed rib extending around said lugs and upward to the edge of the disc and an embossed surface between the arms of said rib and above said lug, for the purpose set forth.
5. A bottle stopper comprising a metallic cap containing packing matorial, a number of fingers depending from sald cap, and having holding lugs formed on their inner surfaces, and a strencthening rib surrounding said holding lug and provided with a nub adapted to be engaged by a fastening tool or machine.
6. A hottle stopper comprising a sheet metal disc having a depending annular flange. integral depending holding fingers provided with reinforcing means extending from the lower ends of the fingors across the wilth of the flange to the disc, and a handle or tailpioce extending from one of the fingers, for the purpose set forth.
7. A bottle stoppor comprising a sheet metal cap containing parking material and having a depending flange, fingers depending from the lower edge of said flange and provided with a reinforcement extending from their inwer ends upward through the width or depth of the flange, one of said fingers having a tailpiece provided with a reinforcement extending throughout its lengih and continuing through the length of the finger to which it is attached and the width of the flange, for the purpose set forth.
8. A bottle stopper comprising a sheet metal cover for the mouth of the bottle and fingers extending from the edge of said cover and adapted to hold it upon the bottle, said fingers provided with reinforcing means extending into the body of the cover beyond the edge from which the fingers extend.

## No. 100,290. Suction Gas Making Machine.

l/urhille perre faite du gaz ì suction.

Edward William Anderson and Kynock, Limited, assignee of a half interest, Witton, England, 31st July. 1906; 6 years. Filed 27th March, 1906. Receipt No. 134,321.
Clain.-1. In suction gas producing plant the combination of a generator, a water vapourizer outside the said generator. a scrubber (the said parts being united by external connections) and an automatic regulator for supplying water to the vayourizer, substantially as described.
2. In suction gas producing plant the combination of a generator, a water vanourizer outside the said generator, a scrubber (the said parts being united by the external connections) an automatic regulator for supplying water to the vapourizer and a device for injecting water spray between the flre bars, subtantially as and for the purposes described.
3. In a suction gas producing plant a vapourizer having two concentric cylinders the inner cylinder being provided with an external spiral thread or channel down which the water to be vapourized flows, the heated gases from the generator passing through the said inner cylinder and heating the
same and the space between the two cylinders being connected with the atmosphere and with the furnace so that the water vapour generated can be drawn into the said furnace, substantially as described.
4. In suction gas producing apparatus the combination with a water vapourizer of a water regulator wherein a plunger or valve is carried by a flexible diaphragm which is operated during the suction strokes of the englne working in connection with the plant, substantially as described.

No. 100,291. Signal for Telephones.
Nigual ar tílíphone.

The Bell Telephone Company of Canada, Montreal, Quebec Canada, assignee of Merritt Scott Conner, Antwerp, Belgium, 31st July, 1906; 6 years. Filed 20th May, 1902. Receipt No. 96,201.
Claim.-1. The combination with telephone lines and a trunk line for uniting them, of a signal in the trunk line and a source of current in a bridge thereof at one terminal station; a repeating coil at the other terminal, said trunk line being severed and having its severed terminals united through the windings of the repeating coil to form two conductively separated but inductively continuous circuits, and a high resistance signal controlling magnet in the portion of the trunk line leading to the first mentioned office, the sald resistance belng sufficient to prevent the operation of the signal in the circuit therewith, a source of current and a relay magnet in the other portion of the trunk line adapted for connection with the called line, and a shunt of the high resistance signal controlling magnet controlled by said relay, as described.
2. The combination with telephone lines having switches adapted to close the line circuits while the telephones are in use, said lines entering different central offices, and a trunk line for uniting said line, a supervisory signal and a trunk line and a source of current in a bridge thereof at one of the offices, a repeating coll at the other office, the trunk line thereat being severed, the terminals of the wires leading to the first-mentioned station being united through one set of windings of the repeating coil, and the terminals of the wires adapted for connection with the called line being united through the other set of windings of the repeating coll, and a source of current and a relay in the last-mentioned portion of the trunk line, a high resistance magnet in the trunk line in circuit with the aforesaid supervisory signal, a clearing out signal controlled by said high resistance magnet, a shunt about said high resistance magnet, and an auxiliary winding of the magnet therein, said shunt being controlled by the relay in the other portion of the trunk circuit, substantially as described.
3. The combination with a trunk line having a source of energy, a signalling instrument and means for closing the circuit at one terminal station, o a high resistance signalling instrument bridged across the line at another terminal station, a telephone line, provided with a switch at the substation for closing the line, in connection with the trunk line, and a shunt circuit controlled by the switch at the telephone substation around the winding of said high resistance signalling instrument, whereby the signalling instrument at the first terminal station of the trunk line is responsive to the opening and closing of the switch at the subscriber's substation without interfering with the operation of the high resistance signalling instrument, substantially as described.
4. The combination with a connecting cord containing source of energy, a signalling instrument and a terminal plug, a trunk line terminating in a spring jack at the same station with the connecting cord, a plug at another station. a repeating coil having its windings interposed in the trunk line between sald plug and spring jack, a high resistance signalling intrument in circuit with the portion of the trunk line extending to said spring jack, a shunt circuit around said high resistance signalling instrument, and means for controlling said shunt to control the signalling instrument at the distant station of the trunk line, substantially as described.
5. The combination with a telephone line, of a trunk line and a switch for uniting said trunk line with the telephone line, a signalling instrument at one terminal of the trunk line, a source of current connected with the trunk line, a high resistance signalling instrument in a bridge of the trunk line at the other terminal thereof, a shunt about said high resistance signalling instrument, said shunt controlling the operation of the first-mentioned signalling instrument, and a switch at the substation of said line controlling said shunt.
6. The combination with a telephone line, of a trunk line a switch for uniting said trunk line with sald telephone line, a source of current in a bridge of the trunk line at one terminal thereof, a high resistance signalling instrument $r$ in a bridge of the trunk line at the other terminal, a signal instrument $l^{1}$ in said trunk line between the source of current and the signalling instrument $r$, a shunt around said high resistance signal instrument, a switch at the substation of said telephone line controlling said shunt, and a signalling instrument $s$ in the shunt, whereby both signalling instrument $l^{1}$ and 8 are excited when said shunt is closed.
7. The combination with a signalling circuit including a source of current, a relay $l^{l}$ and a switch for closing said circuit, signal $k^{1}$ and a circuit therefor, controlled by relay $l^{2}$, a high resistance relay $r$ included in said signalling circuit, a signal 0 , a circult therefor, controlled by sald high resistance relay, a shunt around the winding of said high resistance relay, a relay $s$ in said shunt, a signal $u$, a circuit therefor, controlled by said relay, a relay $q$ adapted when energlzed to close the shunt about relay $r$, a circuit for said relay $q$, and a switch controlling said circult, whereby upon the enclosure of the shunt about said high resistance relay, both relays $s$ and $b^{2}$ are excited to shunt out the signals associated therewith.
8. The combination with a telephone line, of a trunk line having a source of current conected therewith a switch for uniting said trunk line with said telephone line, a signal instrument at one terminal of the trunk line, a high resistance signalling instrument in the trunk line for controlling the operation of the first-mentioned signalling instrument, a shunt about said high resistance signalling instrument, and a switch at the substation for controlling said shunt.
9. The combination with telephone lines and a trunk line for unitting them, sa.s trunk line having a source of current connected therewith, of a signal in the trunk line at one terminal station, means for conductively separating said trunk line into inductively contlnuous parts, a high resistance signal controlling magnet in the trunk line, said resistance being sufficient to prevent the operation of said signal, a shunt of said magnet, and a relay in the trunk line adapted when said trunk line is connected with the called line to control said shunt.

No. 100,282. Epeod Trangmission Device.
Appareil de transmission de vitesse.

The International Speed Automobile Company, Hamilton, assiginee of Hubert Lutz, Stoney C:eek, both in Ontario, Canada, 31st July, 1906; 6 years. Filed 12th May, 1906. Recelpt No. 135.852 .
Claim.-1. In a friction power transmitting mechanism, a cone-shaped wheel formed with a series of variable annular recesses, a shaft to carry sald wheel, a friction drive wheel made to operate in the said recesses of the cone wheel and dvices for changing the fraction wheel from one recess to the other to -roduce variable speed as desired.
2. In a friction power transmitting mechanism, a coneshaped wheel formed with a series of varlable annular recesses, a shaft to cariy said wheel rotating in a frame, a friction drive wheel made to operate in the said recesses of
the cone wheel, and carried on a shaft, a movable arm connected pivotally to the said shaft and to another shaft carried by an arm attached to the frame of the device, and means to change the position of the friction drive wheel from one annular recess to another to vary speed as desired.
8. In a friction power transmitting mechanism, a coneshaped wheel formed with a series of annular variable sized recesses, a friction drive wheel made to operate in and impinge on any of the recesses of the cone-shaped wheel to vary speed, a reverse friction wheel made to operate and impinge on the largest recess of the cone-shaped wheel, devices for causing the friction drive wheel to impinge on the reverse wheel when a reverse motion is required to be given to the main driving shaft, and devices to push the friction drive wheel into any one of the annular recesses in the large cone-shaped wheel, to vary the speed from slow, medium or fast, as desired.
4. In a friction power transmitting mechanism a coneshaped wheel formed with a series of internal variable sized annular recesses, the said wheel carried on a shaft in bearings attached to the frame of the mechanism, a friction drive wheel made to operate in and impinge on any one of the recesses of the cone wheel, and carried on a shaft constructed with two universal joints, and connected to the driving shaft, devices for entering the drive wheel in the recesses of the cone wheel and devices for holding the drive wheel in frictional acallact with the walls of the recesses in the coneshaped wheel, to rotate a shaft to transmit power at variable speed.
5. In a friction power transmitting mechanism, a coneshaped wheel formed with a series of internal variable sized right angled recesses, the said wheel carried on a shaft in bearings attached to the frame of the mechanism, a friction drive wheel made to operate $\ln$ and Impinge on any one of the internal recesses of the cone friction wheel, and formed with a series of slots on its inner end, and a series of projections formed near the center of the cone-shaped recessed wheel, to engage with the slots in the friction drive wheel, to act as a clutch device to hold the two said wheels together when the small friction drive wheel is pushed to the center of the larger cone wheel, when operated by mechanism to produce a direct and fast speed.
6. In combination with an internal friction power transmitting mechanism, of the class specified, a movable arm journalled on a shaft and carrying a friction drive wheel on the same shaft, and made to operate in a cone-shaped recessed wheel, the opposite end of the said movable arm pivotally attached to a second shaft journalled on an arm attached to the frame, a lever pivoted to the frame and to the shaft of the friction drive wheel, to cause the said friction drive wheel to engage with any one of the recesses in the cone wheel, and a second lever to hold the said drive wheel in close contact with the recessed wheel to produce either slow, medium or fast speed and a reverse wheel carried on a shaft journalled to a bracket on the frame and to the shaft of the said movable arm which is connected to the shaft of the said friction drive wheel.

## No. 100,293. Wheel. Rove.

Berton H. Sille, William S. Conger and Stanley E. Carman, each an assignee of a fourth interest, all of Belleville, Ontario, Canada, 31st July, 1906; 6 years. Filed 27th April. 1906. Receipt No. 135,320 .

Olaim.-1. In a wheel the combination of a hub divided into two concentric portions, an annular pneumatic cushion substantially circular in cross section interposed between the two parts and secured to the inner part, the other part being provided with an acute $V$-shaped groove to engage the cushlon at each slde of the tread, substantially as described.
2. In a wheel the combination of a hub divided into two concentric portions, an annular pneumatic cushion substantially circular in cross section interposed between the two parts, one part being provided with an acute $V$-shaped groove, and side flanges on one part engaging the outer sides of the other part to prevent side play, substantially as described.
3. In a wheel the combination of an inner cylindrical hub having a central annular depression or groove formed therein, and an annular depression or groove at each side of the central groove, a pneumatic cushion having its inner side lying in said central groove and provided with side flanges ongaging the side grooves, clamping bands adapted to clamp the side flanges in the grooves, an outer hub grooved to engage the outer side of the pneumatic cushion and means for holding the parts of the hub in alignment, substantially as described.
4. In a wheel the combination of an inner cylindrical hub having a central annular depression or groove formed therein, and an annular depression or groove at each side of the central groove, a pneumatic cushion having its inner side lying in said central groove and provided with side flanges engaging the side grooves, clamping bands adapted to clamp
the side flanges in the grooves, an outer hub provided with a $V$-shaped groove to engage the outer side of the pneumatio

cushion, and means for holding the parts of the hub in alignment, substantially as described.
5. In a wheel the combination of an inner cylindrical hub having a central annular depression or groove formed therein, a pneumatic cushion having its inner sido lying in said central groove and provided with side fianges engaging the side grooves, clamping bands adapted to clamp the side flanges on the hub, an outer hub grooved to engage the outer side of the pneumatic cushion, and means for holding the parts of the hub in allgnment, substantially as described.
6. In a wheel the combination of an inner cylindrical hub having a central annular depression or groove formed therein. a pneumatic cushion having its inner side lying in said central groove and provided with side flanges engaging the side grooves, clamping bands adapted to clamp the side flanges on the hub, an outer hub provided with a V-shaped groove to engage the outer side of the pneumatic cushion, and means for holding the parts of the hub in allgnment, substantially as described.

No. 100,294. Clip Lor Motal Buildings.
Tenailles pour batisses on métal.

Sarah Eliza Pedlar, Oshawa, Ontario, Canada, assignee of William Goss, Chicago, Illinois, U.S.A., 31st July, 1906; 6 years. Filed 12th June, 1906. Receipt No. 136,811.
Claim.-1. The clip for suspending cellings, etc., from I or other beams consisting of the members 6 and 7 having means for interlocking them together.
2. The clip for suspending cellings, etc., from I or other beams, consisting of two members 6 and 7, the part 6 having a depending hanger portion and the part 7 having a tongue adapted to be entered and turned in said opening to effect a locking of the two members together.

ג0. 100,295. Beam Clamp. Crampon nour poutrcs.

Homer Thomas, assignee of William H. Dillon, both of Detroit, Michigan, U.S.A., 31st July, 1906; 6 years. Filed 20th June, 1906. Receipt No. 187,079.
Claim.-1. In building apparatus of the character described, the combination with an upright, of a transverse member supported thereon, and vertical mould supporting devices upon the transverse member provided with joist seats.
2. In building apparatus of the character described, the combination with an upright, of a transverse bar thereon, vertical mould supporting devices adjustably mounted upon the bar, and oppositely extending supporting members carried by said devices forming joist seats.
3. In building apparatus of the character described the combination with an upright, of a detachable cap therefor, a transverse bar mounted upon and having detachable connections with the cap, and adjustable mould supporting devices or members upon the bar.
4. In building apparatus of the character described the combination with an upright provided at its upper end with a vertical horizontally extending opening, of a transverse member detachably arranged within said opening and complementary mould supporting devices mounted upon said member for longitudinal adjustment.
5. In building apparatus of the character described the combination with a vertical post, of a longitudinally slotted cap detachably monnted upon the upper end, a horizontal $T$ bar arranged upon the cap with its web engaging the slot. securing devices engaging the cap and the bar web, and adjustable mould supporting members upon the T-bar.
6. In a building apparatus of the character described the combination with an upright, of a transverse member detachably mounted thereon, and mould supporting devices adjustably arranged upon said member.
7. In bullding apparatus of the character described, the combination with an upright, of a detachable cap thereon, a transverse member supported upon the cap, and mould supporting devices upon said member.
8. In building apparatus of the character described, the combination of a transverse member, and complementary nould supporting devices thereon, each provided with an outwardly extending seat.
9. In bullding apparatus of the character described, a mould supporting device comprising a main section, a brace sectlon therefor, and an intermediate member carried by the sections and forming a joist seat.
10. In building apparatus of the character described, a mould supporting device comprising a main upright section, an inclined brace section therefor, an intermediate seat member connecting the lower portions of the main and brace sections.
11. In bullding apparatus of the character described, the combination with an upright, of a cap upon its upper end, a transverse bar supporting and having detachable connectlons with the cap, and mould supporting devices upon said bar.
12. In building apparatus of the character described, the combination with an upright and a cap therefor comprising a top, sides, and ends formed of spaced angle sections extending beyond the top, the sections being arranged with the openings or spaces in alignment.
13. In bullding apparatus of the character described, a post cap formed from a single sheet of metal comprising a top, sides and ends having complementary spaced sections extending beyond the cap top.
14. In building apparatus of the character described, the combination with an upright, of a detachable sheet metal oap for its upper end comprising a top, sides and onds com-
pesed of spaced angle-shaped sections oxtending upwardly beyond the top, a transverse bar arranged between the cap extensions, and complementary mould supporting members mounted upon the bar for longitudinal adjustment.
No. 100,296. Bearing for Car Journal Boxes.
Coussinet de tourillon.

The Canadian Adjustable Bearing Company, Windsor, Ontario, Canada, assignee of James McHenry Hopkins, Chicago, Illinols, U.S.A., s1st July, 1906; 6 years. Filed 9th June, 1906. Recelpt No. 136,725.
Notb-This patent is a re-issue of No. 74,193, bearing date the twenty-fourth day of December, 1901.
Claim.-1. In a car journal bearing in combination, a brass having a fiat upper surface, and a key comprising an upper member adapted to recelve the bearing surface of a journal box and having a longitudinally concave lower face, and a lower member interposed between the upper member and the brass and having its contacting faces conforming thereto and being in sliding engagement therewith.
2. In a car journal bearing in combination with a brass and a key member adapted to so interlock and to so engage a journal box that neither is capable of material longitudinal movement, an intermediate key member having a fiat bottom face and a longitudinally convex top face, the faces of the two first-mentioned members which contact with such third member conforming thereto and being in sliding engagement therewth.
3. In a car journal bearing, the combination with a brass and a key member, each adapted to be fixed againat material longitudinal movement, of a second key member interposed directly between such two first-mentioned members and having a longitudinally convex face and being capable of froe langitudinal movement, the meeting faces of the three members conforming each to the other.
4. In a car journal bearing in combination, a brass and a wedge member adapted to vary their angular relation in vertical plane, and a slidable member Interposed therebetween, the wedge member being adapted to engage a journal box to prevent its forward movement, the brass heing adapted to engage a journal box to prevent is backwird movement, and the wedge and brass being inter-angaged to prevent the backward movement of the former and the forward movement of the latter.
5. In a car journal bearing in combination, a brass adapted tu engage the walls of a journal box to llmit its backward movement. a wedge member adapted to engage a journal box to limit its forward movement, such brass and wedge member interlocking intermediate of their ends to limit their forward and rearward movement respectively, but to permit them to change their angular relation longitudinally, and a slidable member interposed between the brass and wedge member.
6. In a car journal bearing in combination, a brass, a member slldable thereupon and having pendent lateral flanges, and having its upper face longitudinally convex, and a wedge member having its lower face concave complementary to the convex face of the slidable member and belng adapted to engage the top wall of a journal box.
7. In a car journal bearing in combination, a brass, a wedge member adapted to fit within the top of a journal box so as to. be incapable of angular movement relatively thereto, and a slidable member interposed between the brass and wedge member and engaging both to prevent their relative angular movement in a horizontal plane.
8. In combination, a car journal bearing, and a wedge device comprising an element capable of a rocking motion relat!ve to the bearing, such bearing hsving projecting lugs at its sides engaging the rocking wedge member.
9. In comblnation, a car journal bearing, and a wedge device comprising an element capable of a rocking motion relative to the bearing, such bearing having lateral flanges and lugs rising therefrom for engaging the rocking wedge member.
10. In combination, a car journal bearing, and a wedge device comprising a member capable of a rocking motion relative to the bearing, such bearing having an upstanding lug at each side for engaging the rocking wedge member.
11. In combination, a car journal bearing, and a wedge device comprising a member capable of a rocking motion relative to the bearing, such bearing having lateral box engaging lugs and upstanding lugs engaging the rocking wedge member.

No. 100,297. Window Sash. Châssis de fenêtre.

William E. Daugherty, Corpus Christi, Texas, U.S.A., 31st July, 1906; 6 years. Filed 18th June, 1906. Receipt No. 137,017.
Claim.-1. The combination of a sash frame having the glass recelving opening rabbeted, one side of the rabbeted portion being provided with a longitudinal groove, retaining strips fitting in sald grooves, and spring actuated plungers operating in the frame and engaging with recesses in the retaining strips.
2. The combination of a sash frame having the glass receiving opening rabbeted, one side of the rabbeted portion being provided with a longitudinal groove, said frame having outwardly extending openings in communication with said groove, retaining strips fitting in said groove, a plate fitting over the opening in the frame, a plunger operating in said opening and engaging with the retaining strips, said plunger being provided with a stem which passes through a perforation in the above-mentioned plate, and a spring interposed between sald plate and the plunger to hold the latter normally in engagement with the retaining strips.

No. 100,298. Pump. Pompe.

A1. F. Helsel, St. Mary's, Ohio, U.S.A., 31st July, 1906; 6 years. Filed 8th May, 1906. Receipt No. 135,681.
Claim.-1. A pump comprising a barrel having an inlet opening in its lower end and an outlet opening in its upper portion, a sucker in the barrel and a valve in the lower portion of the barrel, said valve comprising a disc adapted to cover the opening and a frame comprising crossbars secured at their point of crossing upon the disc, the end portlons of the bars being bent upwardly, and means in the path of upward movement of the frame to limit such movement.
2. A pump comprising a barrel having a frusto-conical lower end portion provided with an inlet opening in its buttom, a sucker in the barrel, the barrel having an outlet opening. a disc within the frusto-conical portion and adapted to cover the opening and a frame comprising crossbars secured at their point of crossing upon the disc, the end portions of the bars being bent upwardly and toward each other and arranged to contact with the wall of the frusto-conical portion and limit the upward movement of the disc.

No. 100,299. Valve for Organg and Pianos. Soupape pour orgues et pianos.

Oscar Herrman, Brown Station, New York, U.S.A., 31st July, 1906; 6 years. Filed 25th June, 1906. Receipt No. 137,252.
Claim.-1. In a device of the class described the combination of a foot piece having a foot receiving fulcrum and provided at opposite sides of the same with valves, and valve actuating mechanism projecting from the foot piece and arranged to be operated by the foot.
2. In a device of the cfass described the combination of a foot piece having a foot receiving fulcrum and provided at opposite sides of the same with valves, and valve actuating mechanism projecting from the foot plece and embodying a reciprocatable plunger.
3. In a device of the class described the combination of $n$ foot piece having a fulcrum, front and rear valves, and vertically reciprocatable plungers mounted on the foot piece and arranged to engage the valves.
4. In a device of the class described the combination of a foot plece having an upright fulcrum, valves, and valve operating mechanism arranged to be actuated by a horizontal oscillatory movement of the foot and embodying horizontally reciprocatable plungers.
5. In a device of the class described the combination of a foot plece having a foot receiving fulcrum and provided at opposite sides of the same with valves, and valve actuating mechanism projecting from the foot piece and embodying a reciprocatable plunger, and a movable plate or member arranged to be engaged by the foot for actuating the plunger.
6. In a device of the class described the combination of a foot plece having foot receiving fulcrum and provided at opposite sides of the same with valves, and valve actuating mechanism projecting from the foot piece and embodying a reciprocatable plunger, and a plate or member hinged to the foot piece and projecting therefrom at an angle.
7. In a device of the class described the combination of a foot piece having a fulcrum and provided in advance and in rear of the same with upright and horizontal foot receiving fulcrums, valves arranged in pairs, and valve operating mechanism embodying vertically and horizontally reciprocatable plungers.
8. In a device of the class described the combination of a foot piece provided with valves, a vertically reciprocatable plunger engaging one of the valves and arranged to be directly operated by the foot, a horizontally reciprocatable plunger engaging the other valve, and a movable plate or member arranged to be engaged by the foot for actuating the horizontally reciprocatable plunger.
9. In a device of the class described the combination of a foot piece having horizontal and upright fulcrums, valves arranged in pairs. vertically and horizontally recipr, catable plungers arranged to engage the valves, the vertically reciprocatable plunger being arranged to be directly ensaged br tho foot, and movable plates or members arranged to be engaged by the foot for actuating the horizontally reciprocatable plungers.
10. In a device of the class described the combination of a foot plece having an upright supporting portlon, a transverse fulcrum mounted on the foot plece. an upright fulcrum arranged at the upright supporting portion, front and rear valves ararnged in pairs, the members of each pair being located beneath the foot plece and at the outer face of the upright supporting portion respectively, verticaliy movable plungers guided on the foot piece and engaging the valves beneath the same and arranged to be directly operated by the foot, horizontally movable plungers engaging the valves of the upright supporting portion, and plates or members movably connected with the supporting portion and arranged to be engaged by the foot for actuating the horizontally movable plungers.

## No. 100,300. Threshing Machinc.

Machine d battre.

William Thomas Madill, Highfleld, Ontario, Canada, 31st July, 1906; 6 years. Filed 13th March, 1906. Recelpt No. 133,855.
Claim.-1. In a threshing machine the combination with the frame, drum and driving mechanism, of a platform hinged thereto and extending laterally therefrom, a plurality of endless carriers running longitudinally of sald platform and supported thereby, a plurality of band cutters operating between said endless carriers, uprights secured to said platform in proximity to one end thereof, bearings supported thereby at the top end thereof, a crank shaft having a plurality of crank and journalled in said bearings, a plurality of forks journalled on said cranks, means for guiding said forks, and means for driving said crank shaft, endless carriers and band cutters, as and for the purpose specified.
2. In a threshing machine the combination with the frame, drum and riving mechanism of a platform hinged thereto and extending laterally therefrom, a plurality of endless carriers running longitudinal of said platform and supported thereby, a plurality of band cutters operating between said endless carriers, uprights secured to said platform in proximity to one end thereof, bearings supported thereby at the top end thereof, a crank shaft having a plurality of cranks and journalled in sald bearings, a plurality of forks journalled on said cranks, a guide bar extending between said uprights intermediate of their length and engaging sald forks, and means for driving said crank shaft, endless carriers and band cutters, as and for the purpose specifled.
3. In a threshing machine the combination with the frame, drum and driving mechanism, of a platform hinged thereto and extending laterally therefrom and having a plurality of openings therethrough, a plurality of endless carriers running longitudinal of said platiorm and supported thereby partially above the srface thereof, a plurality of band cutters protruding through said openings in said platform between said endless carriers, uprights secured to sald platiorm in proximity to one end thereof, bearings supported thereby at the top end thereof, a crank shaft having a plurality of cranks and journalled in said bearings, a plurality of forks journalled on said cranks, a guide bar extending between said uprights intermed ate of their length and engaging said forks. and means for driving said crank shaft, endless carriers and band cutters, as and for the purpose specified.
4. In a threshing machine the combination with the frame, drum and driving mechanism, of a platform hinged thereto and extending laterally therefrom, and having a pair of side bars and a rigid top plate said plate having a plurality of openings therethrough, bearings supported by sald side bars. shafts journalled in said bearings and extending across said
platform under sald plate, a plurality of sprocket wheels mounted on said shafts, and extending through said openings, a plurality of chain carriers on sald sprockets, a plurality of band cutters mounted on another of said shafts and protruding through said openings between the aforesaid carriers, a plurality of reciprocating forks for governing the feed into said machine between said carriers and the machine, means for overating said governing forks, and means for driving the aforesaid carriers and band cutters, as and tor the purpose specified.
5. In a threshing machine the combination with the frame, drum and driving mechanism, of a platform hinged thereto and extending laterally therefrom and having a pair of side bars and a rigid top plate, said plate having a plurality of openings therethrough, a removable plate bridging the distance from the aforesaid plate into the machine, hinged bars secured to sald frame and said platform and supporting the latter, means attached to said frame for engaging sald bars, bearings supported by said side bars, shafts journalled in aaid bearings and extending across sald platform under said plate, a plurallty of sprocket wheels mounted on said shafts, and extending through said openings, a plurality of chain carriers on sald sprockets, a plurality of band cutters mounted on another of said shafts and protruding through said openings between the aforesaid carriers, a plurallty of reciprocating forks for governing the feed into said machine between said carriers and the machine, means for operating said governing forks, and means for driving the aforesaid carriers and band cutters, as and for the purpose specifled.
6. In a threshing machine the combination with the frame, drum and driving mechanism, of a platform hinged thereto and extending laterally therefrom and having a pair of side bars and a rigid top plate, said plate having a plurality of openings therethrough. a removable plate bridging the distance from the aforesaid plate into the machine, hinged bars secured to said frame and said platform and supporting the latter, means attached to said frame for engaging said bars, berings supported by said side bars, shafts journalled in said bearings and extending across said platform under said plate, a plurality of sprocket wheels mounted on said shafts and extending through said openings, a plurality of chain carriers on said shafts and extending through said openings between the aforesald carriers, a pair of uprights rising from said platform at each side thereof in proximity to the frame of the machine. bearings supported thereby at the top end thereof, a crank shaft having a plurality of cranks and journalled in said bearings, a plurality of forks journalled on the aforesald cranks, a guide bar extending between the sald uprights intermediate of their length having slots in which said forks slide, and sultable pulleys mounted on sald shafts connected by suitable belting and connected with said driving mechanism, as and for the purpose specified.

## No. 100,301. Papor Bag Machine.

Machine pour sars de papier.

Frederick E. Strasburg, Rumford Falls, Maine, U.S.A , 31st July, 1906; 6 years. Filed 9th April, 1906. Recelpt No. 134.782.

Claim.-1. The combination of a rotatable member having a cear fixed thercon, means on the rotatable member for gripping the upper plies of a bag blank, a driving gear, two floating gears connecting the driving gear and the gear of the rotatable member and means to move the floating gears to vary the speed of the rotatable member relative to the speed of the driving gear.
2. The combination of a shaft rotatable on ixed trunnions, means mounted on the shaft for gripping the upper plies of a bag blank, a gear fixed on the rotatable shaft, a driving gear connected to the rotatable shaft gear through two intermediate floating gears, and a cam actuated arm for moving the floating gears to vary the speed of the rotatable shaft gear relative to the driving gear.
3. The combination of a revoluble folding bed, means to grip a bag blank thereto, a rotatable shaft above the folding bed, means on the shaft for gripping the upper plles of a bag blank, a gear fixed on the rotatable shaft, a driving gear connected to the rotatable shaft gear through two intermediate floating gears, links to retain the gears respectively in mesh,
and means to move the floating gears to vary the speed of the rotatable shaft relative to the driving gear.
4. The combination of a revoluble folding bed, mounted for oscillation toward and away from its axis of revolution, means to grip a bag blank to the folding bed, a member rotatable on fixed trunnions above the folding bed, means mounted on the rotatable member for gripping a bag blank, a gear on the rotatable member, a driving gear connected with the gear of the rotatable member through two intermediate floating gears, links to maintain the gears respectively in mesh and a cam actuated arm connected to one of the foating gears to move the floating gears to vary the speed of the rotatable member relative to the driving gear.

Price freo by post in Canada and the \(\{\) SINGLE NUMBERS, - - 20Cts.

\section*{NOTICE.}

All solicitors, agents or attorncys who, in circulars or advertiscments, or othervise, refer to the Commisaioner or Deputy Commis. sioner of Patents, or to any other official of the Patent Office, for cvidence of their professional standing, do so without authority.

\section*{INVENTIONS PATENTED.}

SOTF.-Patents are granted for 18 yeara. The term of yoars for which the fee has been pald, is given after the date of the patent.

No. 100,302. Envelope. Enceloppe.

Willam Swain Brown, Burghlll, Ohio, U.S.A., 7th August, 1906. Receipt No. 137,254 .

Claim.-1. The combination of an envelope comprising a back and a front, the back being formed with a slit while the front is provided with a fiap having a tongue which is adapted to be thrust through the slit in the back of the envelope and which is provided with inwardly projecting members, and a strip extending across the slit in the back of the envelope and adapted to be engaged by the inwardly projecti'ig members upon the tongue when the latter is thrust through the slit.
2. The combination of an envelope comprising a back and a front, the back being formed with a slit while the front is provided with a flap having a tongue which is adapted to be thrust through the before-mentioned slit in the back, the extremity of the tongue being provided with rearwardly bent flaps, and a strip extending across the before-mentioned slit in the back of the envelope and adapted to engage with the tefore-mentioned rearwardly bent flap at the extremity of the tongue when the latter is thrust through the slit.
3. The combination of an envelope comprising a back and front, the back being provided with a slit while the fron is provided with a flap having a tongue which is adapted to be thrust through the before-mentioned slit in the back, the corners of the tongue being bent backwardly upon themselves, and a strip extending across the slit in the back of the envelope and adapted to engage the rearwardly bent corners of the before-mentioned tongue when the latter is thrust through the slit in the back of the envelope.

No. 100,303. Envelope. Enveloppe.

Christian Liekefett, Sohlde, near Hoheneggelsen, Hanover, Germany, 7th August, 1906; 6 years. Flled 25th June, 1906 Receipt No. 137,254.
Cialm.-An envelope comprising a central portion, a portion, a back portion, adhesive flaps adapted to secure said front and back portions, and a closing flap integral with one of the latter and adapted to be folded over and secured to: the other of sald portions at the part where the postage stamp is usually affixed, substantially as described.
2. A postal envelope or wrapper comprising a tront portion, a back portion, adhesive flaps integral with the front portion for securing together sald front and back portions, and a closing flap integral with said back portion and adapted to be folded over and secured to the front portion at a part thereof where the postage stamp is usually amred, substantially as described.

No. 100,304. Envelope. Enveloppe.

julius W. Thomas, Hendersonville, North Carolina, U.S.A., 7th August, 1906; 6 years. Filed 25th June, 1906. Recelpt No. 137,260 .
Claim.-An envelope comprising a central portion, a portion connected to the lower edge of the central portion
and folded hereupon, and portions connected to the ends of the central portion, one of said end portions being folded upon the second-named portion and gummed at its lower and il:ner portions thereto, the other end portion being folded upon the first-named end portion and gummed thereto at its and and lower edge portions, and a closing flap carried by the upper edge of the central portion and extending over the outer surface of the second-named end portion, sald closing flap and adjacent portions of the envelope being adapted to receive a seal.

No. 100,305. Envelope. Enveloppc.

Robert William Vail, New York City, New York, U.S.A., 7th
August, 1906 ; 6 years. Filed 25th June, 1906. Receipt No. 137,257.
Claim.-1. An improved safety envelope of the class described, provided at its meeting portions with projecting \(r\) 'dges adapted to relatively register and overlap, and having the portion within said ridges cut away to form open portions or spaces and intervening projecting portions or strips adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
2. An improved safety envelope of the class described, provided at its meeting portions with outwardly projecting ridges of approximately annular contour adapted to relatively register and overlap, and having the portion of the paper within said ridges cut away to form open portions or spaces and intervening projecting portions or strips adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
3. An improved safety envelope of the class described, provided at its meeting portions with projecting ridges adapted to relatively register and overlap, and having the portion within said ridges cut away to form open portions or spaces and projecting tongues adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
4. An improved safety envelope of the class described, provided at its meeting portions with outwardly projecting ridges of approximately annular contour adapted to relatively register and overlap, and having the portion within said ridges cut away to form open portions or spaces and projecting tongues adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
5. An improved safety envelope of the class described, provided at its meeting portions with projecting ridges adapted to relatively register and overlap, and having the portion within said ridges cut away to form open portions or spaces and projecting tongues having outwardly turned edges, whereby said tongues are adapted to be enclosed within the mass of a plastic sealing material. substantially as and for the purpose set forth.
6. An improved safety envelope of the class described, provided at its meeting portions with outwardly projecting ridges of approximately annular contour adapted to relatively register and overlap, and having the portion within said ridges cut away to form open portions or spaces and projecting tongues, the series of tongues upon the respective meeting parts having the edges turned outwardly in a corresponding relative manner with respect to the succession of the tongues forming the complete series when the ridges meet and register, whereby said tongues are adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
7. An improved safety envelope of the class described, having at meeting portions of its surfaces relatively registering open portions or spaces forming intervening projecting portions or strips adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
8. An improved safety envelope of the class described, having at meeting portions of its surfaces relatively regis-
tering open portions or spaces forming intervening projecting portions or strips adapted to be enclosed within the mass of a plastic sealing material, and provided with a protective strip or flap underlying said open portions, substantially as and for the purpose set forth.
9. An improved safety envelope of the class described. having a portion of its surface provided with openings through which the mass of a plastic sealing material is adapted to pass, and provided with a protective strip or flap underlying said openings, substantiaily as and for the purpose set forth.
10. An improved safety envelope of the class described, having a portion of its surface provided with openings through which the mass of a plastic sealing material is adapted to pass, and provided with a protective strip or flap of absorbent material underlying said openings and adapted to be adhesively engaged by said plastic material, substantially as and for the purpose set forth.
11. An improved safety envelope of the class described, having a portion of its surface provided with openings forming intervening portions of strips adapted to be enclosed by the mass of a plastic sealing material, substantially as and for the purpose set forth.
12. An improved safety envelope of the class described, having a portion of its surface open, and provided with strips or portions projecting within said open portions and adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
13. An improved safety envelope of the class described, having a portion of its surface open, and provided with tongues projecting in said open portion and adapted to be enclosed within the mass of a plastic sealing material, substantially as and for the purpose set forth.
14. An improved safety envelope of the class described, having a portion or its surface open, and provided with tongues projecting in said open portion and having turned edges, said tongues being adapted to be enclosed within the mas of a plastic sealing material, substantially as and for the purpose set forth.
15. An improved safety envelope of the class described. having a portion of its surface open, and provided with strips or portions projecting in sald open portions and adapted to be poclosed within the mass of a plastic sealing material, said open and projecting portions being surrounded by an outwardly projecting ridge, substantially as and for the purpose set forth.
16. An improved safety envelope of the class described. having a portion of its surface open and provided with a raised portion surrounding said open portion and forming a cup for containing a mass of plastic sealing material, substantially as and for the purpose set forth.
17. An improved safety envelope of the class described. having a portion of its surface open and having strips or portions projecting within said open portion and aidutet to be enclosed within the mass of a plastic sealing material, and provided with a raised portion surrounding said open and projecting portions and forming a cup for containing a mass of plastic sealing material, substantially as and for the purpose set forth.
18. An improved safety envelope of the class described. provided in its back sheet and sealing flap with relatively registering open portions, and having strips or portions projecting in said open portions, whereby openings are provided relatively extending through said back sheet and sealing flap for the passage of a plastic sealing material under and around said projecting strips or portions, substantially as and for the purpose set forth.
19. An improved safety envelope of the class described, having a portion of its surface provided with a raised portion or ridge forming an outside cup for containing a mass of plastic sealing material, substantially as and for the purpose set forth.
20 . An improved safety envelope of the class described, having a portion of its surface open, and provided with a protective strip or flap of absorbent material underlying said open portion and adapted to be adhesively engaged by the mass of a plastic sealing material, substantially as and for the purpose set forth.
21. An improved safety envelope of the class described. having a portion of its surface provided with a raised portion or ridge, and provided with a stiffening plate or strip underlying said raised portion and having a projection entering the latter, substantially as and for the purpose set forth.
22. An improved safety envelope of the cless described, having a portion of its surface prorided with a raised portion or ridge, and provided with a stiffening plate or strip underlying said raised portion and having a projection entering the latter and with means for securing said stiffening plate or strip to the interior surface of the envelope portion. substantially as and for the purpose set forth.
23. An improved safety envelope of the class described. having a portion of its surface open and provided with a raised portion or ridge outside said open portion, said open
portion being adapted to contain the mass of a plastic sealing material, and provided with a stiffening plate or strip underlying said raised portion and having a projection entering the latter, and provided with strip or flap of absorbent material underlying said open portion and securing said stiffening plate or strip in position and adapted to be adhesively engaged by said plastic material, substantially as and for the purpose set forth.
24. An improved salety envelope of the class described. having a portion of its surface open and provided with a raised portion or ridge outside said open portion, sald open portion being adapted to receive the mass of a plastic sealing material, and provided with a stiffening plate or strip underlying said raised portion and having a projection entering the latter and a projection entering the open portion and adapted to be engaged by the mass of said plastic sealing material, substantially as and for the purpose set forth.

\section*{No. 100,306. Railway Signal.}

Eignal de chemin de for.

Nicholas Erschens, Elkton, North Dakota. U.S.A., 7 th August, 1906; 6 years. Filed 17th July, 1906. Receipt No. 137, 917.

Chaim.-In a railroad signal apparatus, main rails and crossing ralls, a rock shaft disposed between the main rails upon opposite sides of the crossing rails, each shaft including a projection, a pivoted shaft arranged between one of the rock shafts and the crossing, the pivoted shaft having an arm sccured thereto, a vertical shaft arranged adjacent the main and crossing rails, a flexible connection between the aforesaid arm and the vertical shaft, signalling elements associated with the vertical shaft, and means constructed and arranged to operate said signalling elements when either of the rock shafts is rocked.

No. 100,307. Railway Switch.
Aiguille de chemin de fer.

Ernest Fish Greene, Silver Creek, New York, U.S.A., 7th August, 1906; 6 years. Filed 17th July, 1906. Receipt No. 137,895.
claim.-1. The combination of the main track, the switch rails, means for automatically closing the switch rails, a manual shifting device for the last-named ralls, a coupling connecting the switch rails with said shifting device, a trip device connected with said coupling, and automatic setting setting or projecting means for the trip device constructed and arranged to act upon said coupling when the switch is moved from its closed to its open position, whereby the trip device is projected through the medium of the coupling, substantially as set forth.
2. The combination of the main track, the switch rails means for automatically closing the switch rails, a manual shifting device for the last-named rails, a coupling bolt detachably connceting the switch rails with sald shifting device and taking part in the movements of the switch ralls, a trip device connected with said bolt and arranged to be operated by a train on the main track, a spring applied to sald bolt and acting to retract the trip device, and automatic setting or projecting means for the trip device constructed and arranged to act upon said coupling bolt when the switch is moved from its closed to its open position, substantially as set forth.
3. The combination of the main track, the switch rails, means for automatically closing the switch ralls, a shifting device for the last-named rails, a coupling connecting the switch rails with said shifting device, a trip device connected with sald coupling and adapted to be operated by a train on the main track, and a flxed cam arranged to be engaged by the coupling when the switch is opened for automatically setting the trip device, substantially as set forth.
4. The combination of the main track, the switch ralls, a snring for closing said ralls, a manual switch shifting device, a connection between sald shifting device and the switch rails consisting of a sleeve or socket connected with one of said parts and a rod connected with the other part and entering the socket, a sliding bolt for coupling said rod and socket movable with the switch ralls, a trip device for withdrawing sald bolt arranged to be operated by a train on the main track, and a stationary cam arranged to be engaged by said bolt when the switch is openod for shifting the bolt lengthwise and setting the trip device, substantially ar set forth.
5. The combination of the main track, the switch ralls, a snring for closing said ralls, a manual switch shifting device, a connection between said shifting device and the switch rails consisting of a sleeve or socket oonnected with one of said parts and a rod connected with the other part and entering the socket, a sliding bolt for coupling said rod and socket movable with the switch rails, a trip device connected with said bolt and arranged to be operated by a train on the main track, and a fixed cam extending into said sleeve and arranged to shift the coupling bolt rearwardly when the switch is moved to its open position, substantially as set forth.
6. The combination of the main track, the switch rails, a spring for closing said ralls, a manual switch shlfting device, a connection between said shifting device and the switch rails consisting of a sleeve or socket connected with one of said parts and a rod connected with the other par: and entering the socket, a sliding bolt for coupling sald rod and socket movable with said slecve, a spring tending to move said bolt forwardly, a trip device for withdrawing the bolt arranged to be operated by a train on the main track, and a fixed cam extending through the side of said slecve and having an oblique face over which the front end of the coubling bolt rides when shifted laterally in opening the switch, substantially as set forth.
7. The combination of the main track, the switch rails. a spring for closing said rails, a manual switch shifting device, a connection between said shifting device and the switch rails consisting of a sleeve or socket connected with one of said parts and a rod connected with the other part and entering the socket, sald rod having a plurallty of bolt holes either of which is adapted to register with a hole of the sleeve, a spring pressed coupling bolt for the sleeve and the rod adapted to engage one of the holes of gaid rod in one position of the switch ralls and the other hole thereof in another position of said rails, and an actuating device connected with said bolt and arranged to be tripped by a train on the maln track, substantially as set forth.
8. The combination of the main track, the switch rails. means for automatically closing the switch ralls, a manual shifting device for the last-named ralls, a coupling connect ing the switch rails with said shifting device, a trip lever arranged to be actuated by a train on the main track, a link connected at one end with said coupling and having its opposite end attached to said lever by a pin and slot connection. and a spring applied to sald link and tending to swing salt lever to its operative position, substantially as set forth.

\section*{No. 100,308. Rail Joint. Joint de rails.}

Dennis Francis Kelly, Chicago, Illinols, U.S.A., 7th August 1906; 6 years. Filed 18th July, 1905. Receipt No. 137,932. Claim.-1. The combination with a rail end having the web thereof extended longitudinally beyond the head, of an abutting rail and having its web slotted longitudinally beneath the head and opening through the botom of the rail and adapted to recelve therein said extended web.
2. In a rail joint the combination with a rail end having the web thereof extended longitudinally beyond the ends of the head and flange and the ends of the flange and web being out of alignment with each other, of an abutting rail and
having a longitudinal slot in its web opening downwardly from the rail head through the bottom of the rail and adapted to recelve the extended web of the other rail end.

3. In a device of the class described the combination with a rail end having its head and flange ending at different points and its web extended beyond said head and flange, of an abutting rail end having its head and flange ending at different points and its web slotted to receive therein said extended web.
4. In a device of the class described the combination with a rail end having its head, web and flange terminating at different points on the rail, of an abutting rail and having downwardly opening, central slot therein adapted to receive the web of the other rall.
5. In a device of the class described the combination with a rail end having its web extended longitudinally and of a width to extend from the rail head to the bottom of the rail and having its head and flange terminating at points out of vertical alignment, of an abutting rail end having a longitudinl, downwardly opening slot in the web thereof extending from the end of the rail rearwardly beyond the ends of its head and flange and adapted to receive said extended web
6. In a device of the class described the combination with a rall end having its web extended beyond its head and its flanfe terminating intermediate the ends of the head and web, of an abutting rail end having its flange cut away for a portion of its length and its web slot ted to receive said extended web.
7. In a device of the class described the combination with a rail end having its head and web extended beyond the end of its flange and having a downwardly opening slot extending longitudinally of the web from the end thereof to beyond the end of the flange, of an abutting rall end having its web extending beyond its head, a distance approximately enual to the length of said slot, and its flange terminating intermediate the ends of its head and web.
8. In a device of the class described the combination with a rail end having a thickened web provided with a downwardly opening longitudinal slot and having its base cut away for a portion of the length of said slot, of an abutting rail and having a longitudinally extended web adapted to seat in said slot and having its flange terminating intermediate the ends of sald web and adapted to support the slotted web thereon.
9. The combination with a rall thickened at one end and having a central slot cut the entire length of the thickened portion and opening through the base of the rail, of an abutting rail having a central outwardly projecting web thereon adapted to fit in said slot.
10. A rail joint comprising the abutting ends of two rails one being thickened and having the flanges thereof cut away for a part of its length to provide parallel webs, a longitudinal slot extending the entire length of the thickened end. and a central bar or web formed on the abutting rail end of a height to extend from the bottom of the rail to the rall head and fitting in said slot.
11. In a device of the class described, a rail having its read and flanges cut away for a distance from one end forming a central longitudinally projecting web, an abutting rail having a thickened end slotted the entire length thereof and the flange cut away from a part of the thickened portion forming a pair of webs, the webs of each rail end being adapted to complimentally fit the web or slot of the abutting rail end.
12. In a device of the class described, the combination with
a rail having a thlckened web portion at one end thereof, a
recess therein opening through the rail base and aflording longitudinal parallel bars on said end of a width equal to the width of the rail web and a central longitudinal bar on the other end extending outwardly therefrom and adapted to seat in the recess of an abutting rail.
13. In a rail joint the combination with the abutting rail ends having the ends of their heads and flanges cut out of alignment transversely of the rail, of a central bar on one of sald ends adapted to extend into a recess beneath the rail head in the abutting end and parallel lateral bars on the abutting end adapted to straddle the bar of the aforesaid end.

No. 100,309. Car Conpler. Attelage de chars.

Lewis C. Cary, Chicago, Illinois, U.S.A., 7th August, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,850.
Claim.-1. In a car coupling a head comprising two jaws positioned one above the other, with inclined engaging faces, an integral rib on the back of each jaw, means for locking said head to an opposing head and a releasing heel for unlecking the heads.
2. In a car coupling a head comprising two jaws having inclined engaging faces, an integral rib on the back of each jaw, a jaw bearing abutment, means for coupling said head to an opposing head, and a releasing heel for uncoupling said heads.
3. In a car coupling a head comprising two jaws normally positioned one above the other with inclined engaging faces, an integral rib on the back of each jaw, a jaw bearing abutment with lateral arms extending therefrom, means for coupling said head to an opposing head, and means for uncoupling said heads.
4. In a car coupling a head comprising two jaws triangular in form and having inclined engaging faces, an integral rib on the back of each jaw, a bearing abutment near the rear of said jaws with lateral arms extending therefrom, pushing surfaces on the forward ends of said jaws, means for coupling said head to an opposing head and means for uncoupling said heads.
5. In a car coupling a head comprising two jaws normally fositioned one above the other with inclined engaging faces, an integral rib on the back of each jaw, a jaw bearing abutment with arms extending laterally therefrom, a pushing surface on the forward end of each jaw, a spring pressed \({ }^{\text {c }}\) ccupling lever for coupling sald head to an opposing head. and means for uncoupling said heads.
6. In a car coupling a head comprising two jaws with inclined engaging faces, an integral rib on the back of each Jaw, a bearing abutment with arms extending laterally therefrom, forward extensions on said jaw adapted to be inserted between said inclined faces and said arms to prevent lateral novement of the jaws, a pushing surface on the forward end of each jaw, a spring pressed coupling lever and a releasing reel for uncoupling sald head.
7. In a car coupling a head comprising two jaws normally positioned one above the other with inclined engaging faces, an integral rib on the back of each jaw, a bearing abutment with arms extending laterally therefrom, a spring pressed pivoted coupling lever for coupling said head to an opposing head, and a releasing heel for uncoupling said heads.

\section*{No. 100,310. Car Door. Porte de chars.}

Richard Hall, Kenora, Ontario, Canada, 7th August, 1906; 6 years. Filed 13th July, 1906. Recelpt No. 137,767.
Claim.-1. In a car door, auxillary door jambs, means for locking the jambs in position, and a door suspended from the car adapted to co-operate with the jambs.
2. In a car door, a lower door, flexible connections suspending the door from some suitable point of the car, and means whereby said door may be carried to an elevated pcsition and locked thereat.
3. In a car door, a lower door, an upper door co-operating with the lower door, means for suspending the lower door

from some suitable point of the car, and means whereby both of sald doors may be carried to an elevated position and held thereat.
4. In a car door, auxiliary door jambs pivoted in the door opening, means for locking the door jambs in position, and a door adapted to be locked against the jambs.
5. In a car door, auxiliary door jambs pivoted to the sides of the door opening, means for locking the jambs in position, a door adapted to contact with the jambs, flexible connections suspending the door from some suitable point of the car, and means whereby the door may be carricd to an elevated position and secured thereat.
6. In a car door, auxiliary door jambs pivoted to the sides of the door opening, means for locking the jambs in position, a door adapted to contact with the jambs, a second and upper door co-operating with the first, and means whereby both of said doors may be carrled to an elevated whereby both of saition and secured thereat.
7. In a car door, auxiliary door jambs pivoted to the sides of the door opening, means for locking the door in contact with the jambs, flexible connections suspending the door from suitable point of the same, and means whereby the door may be carried to an elevated position and secured thereat.
8. In a car door, door jambs, means for locking the door in contact therewith, flexible connections supporting the door, means whereby when the flexible connections are wound about the door. the latter is carried to an elevated position, and means for securing the door thereat.
9. In a car door, door jambs, a lower door adapted to contact therewith, flexible connections suspending the door, an upper door adapted to lie flat against the lower door, and guiding rods suspending the upper door.
10. In a car door, door posts, door jambs fixed to the inside of the posts, rounded corners on the door jambs. a second set of door jambs carried by the door posts, a lower door contacting with the second set of door jambs, an upper door contacting with said first-mentioned jambs, and means fixed to one of said doors for closing the openings due to said rounded corners.
11. In a car door, an auxiliary door jamb pivoted at each side of the door opening, hooks for holding the jambs in locked position, a door adapted to contact with the door jambs, and means for swinging the hooks to release the jambs and door.
12. In a car door, pivotally mounted door jambs, hooks for locking the door jambs in nosition, a door co-operating with the jambs, and means for simultaneously swinging the hooks to release the jambs and door.
13. In a car door, pivotally mounted door jambs, hooks for holding the door jambs in position. a door co-operating with the jambs, means for simultancously swinging the hooks to release the jambs and door, and means for locking the hooks.
14. In a car door, pivotally mounted door jambs, hooks for locking the door jambs in position, a door co-operating with the jambs, means for drawing the door against the jambs, and means for simultaneously swinging the hooks whereby the jambs and door are released.
15. In a car door, pivotally mounted door jambs, means for locking the door jambs in position, means for simultaneously operating sald locking means, a door co-operating with the jambs, flexible connections by which the door is suspended, and means whereby the door can be carrled to an elevated position and secured thereat.
16. In a car door, door jambs, a door co-operating therewith, flexible connections for suspending the door, a hook connected to the door, and a turn buckle carried by the hook for locking the door against the jambs.
17. In a car door, pivotally mounted door jambs, hooks for engaging the lower ends of the jambs to hold them in position, a door co-operating with the jambs, vertical shafts fixed to the hooks, and links connected to the shafts and to each other, whereby as they are operated the hooks simultaneously release the jambs.
18. In a car door. pivotally mounted door jambs, hooks for locking the jambs in position, a door co-operating with the jambs, flexible connections for suspending the door, a metal plate secured to the floor of the car, a hook attached to the door, and a turn buckle for adjusting the hook whereby the latter may be engaged under the plate and force the door against the jambs.
19. In a car door, pivotally mounted door jambs, a door co-operating with the jambs, hooks for locking the door jambs in position, vertical shafts fixed to the hooks, arms fixed to the vertical shafts, links pivotally connected to the arms and to each other, and a slotted bracket for guiding the links whereby when the links are operated the hooks are simultaneously swung to release the door jambs and the door.

Nc. 100,311. Car Door Clomure.
Fermeture de porte de chars.

Clarence Edward Roe, Winnipeg, and James Collinson, Souris, both in Manitoba, Canada, co-inventors, 7th August, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,866.
Claim.-1. A device of the class described comprising a door, a bar rigidly secured thereto, a gulde for sald bar, a centrally pivoted lever attached to said bar, and means for locking said lever in position.
2. The combination with a car door of a sllding bar secured thereto, a guide for sald bar, a centrally pivoted lever attached to sald bar by means of a pin operating in a slot in said lever, and means for locking said lever in position. 3. The combination with a car door of a sliding bar rigidly secured thereto, a guide for said bar, a centrally pivoted lever co-operating with said bar by means of a pin operating in a slot in sald lever, and means for automatically locking said door in closed position.
4. The combination with a car door of a sliding bar rigidly secured thereto, a gulde for sald bar, a centrally pivoted lever provided with a longitudinal end slot, a pin in the sliding bar operating in said slot, whereby said lever is capable of arcuate motion, and means for automatically locking said door in closed position.
5. The combination with a car door of a sliding bar secured thereto. a guide for said bar, a centrally plvoted lewar provided at its pivotal point with a longitudinal slot, a second slot in the end of said lever co-operating with a pin in said sliding bar, and means for automatically locking said door in closed position.

\section*{No. 100,312. Derailer. Itéraillcur.}

Thomas W. Linn and John H. Patrick, both of Clymers, Indiana. C.S.A.. ith August. 1906; 6 years. Filed 16th July. 1306. Rerotpt No. 137.877.

Claim.-1. The combination of a slideway, a derailing member mounted to slide on sald slideway, and means on said derailing member for clearing sald slideway of abstructions. 2. The combination with a deralling memuer adapted to move in a path toward and from a track rail, of means con-
nected with said derailing member for clearing said path of obstructions.

3. The combination of a slideway, a derailing member, and slides on said derailing member engaging said slideway, said slides being formed with cutting edges at their forward ends.
4. The combination of a slideway, a derailing member, and slides on said derailing member engaging said slideway, said slldes being formed with cutting edges, and a shield attached to said derailing member.
5. The combination of a slideway, a derailing member adapted to slide on said slideway, said derailing member being formed with a notch, a bracket, and an oar on said bracket adapted to engage said notch, said slideway being secured at one side of a track rail and said bracket being secured on the opposite side of said track rail.
6. The combination of a base, a slideway formed thereon, a derailing member riounted to slide on said slideway, a bar connected to said cerailing member, said har being formed with a slot, a locking pin adapted to engage said slot, an angle lever, one arm of said lever being connected with said bar, and the other arm of said lever being connected with said locking pin, and means for operating said angle lever
7. The combination of a base, a slideway formed thereon, a derailing member, slides on said derailing member engaging said slideway, said slides being formed with cutting edges, a bar connected to said derailing member. said bar being formed with a slot, a locking pin adapted to engage said slot, an angle lever mounted on said base, one arm of said lever being connected with said bar. and the other arm of said lever being connected with said locking pin, and means for operating said angle lever.
8. The combination of a base, a slideway formed thereon, a derailing member, slides on said derailing member engaging said slideway, said slides being formed with cutting edges, a shield attached to said derailing member, a bar conneeted to said deratling member, sald bar being formed with a slot, a locking pin adapted to engage said slot, an angle lever mounted on said base, one arm of said lever being connected with said bar, and the other arm of said lever being connected with said locking pin, and means for operating said argle lever.
9. A derailing member mounted to slide, means on one side of a rail for moving said derailing member into and out of active position, and means on the opposite side of said rail for holding said member in its active position against displacement along said rall.
10. A derailing member adapted to be moved into and out of active position, and a locking member acting automatically to lock said derailing member when the latter is moved out of active position.

\section*{No. 100,313. Car Conpler. Attelage de chars.}

Joseph Melland-Smith, London, England, 7th August, 1906; 6 years. Filed 13th July, 1306. Receipt No. 137,768.
Claim.-1. Coupling apparatus for railway and other vehicles comprising a coupling bar mounted to rotate in bearings carried by or forming a drawhead of the vehicle, a coupling hook for engaging a corresponding device on an adjacent vehicle, mounted to rotate to a limited extent on such bar, and a device adapted to hold said roupling hook in its coupling position, such device being adapted to be operated by the coupling bar in such a manner that upon rotating the coupling bar the hook is moved into its operative position and the holding device is broughe into operation. whilst to place the hook in its inoperative position rotation of the coupling bar first actuates the catch to release the hook and then moves the hook in the desired manner, substantially as hereinbefore described.
2. Coupling apparatus, according to the previous claim, in which the holding device comprises a cranked bar mounted

to rotate in bearings fixed to or formed in one with the bearings of the coupling bar, and provided with a pinion or pinions that gears or gear with a corresponding pinion or pinions on the coupling shaft, the pinions of the cranked bar beng connected thereto by a clutch so constructed and arranged that the pinions turn loosely on the shaft to a limited extent, substantially as hereinbefore described, for the purpose specified.
3. Coupling apparatus acording to claim 1, in which, when the coupling hook is in its operative positon, the couplng bar is locked against rotation in a direction to move the hook out of such position by a device adapted to be actuated by a spring pressed handle or key with which the coupling bar is furnished, substantially as hereinbefore described.
4. Coupling apparatus, according to claim 2, wherein when the coupling hook is in its operative position, a device adapted to be actuated by a spring pressed handle or key with which the coupling bar is furnished, engages and locks either the coupling bar or the cranked bar so that the coupling bar is prevented from rotation in a direction to move the hook out of its operating position, and the caanked bar is prevented from rotation in a direction to free the hook, substantially as hereinbefore described.
5. Coupling apparatus for railway and other vehicles comprising three transversely arranged bars mounted to rotate in brarings carried by or constituting a drawhead of the vehicle, a coupling hook for engaging the corresponding device on an adjacent vehicle mounted on one of such bars. alld adapted to be engaged when in its coupling position by a suitably formed portion of another of such bars, which is connected by gearing with the coupling hook bar, locking means on the third of such bars adapted to engage a part connected to cither of the other two bars, and thereby prevent their rotation, operating means for the coupling hook bar and means connected to said coupling bar operating means whereby the third bar is so actuated as to release the locking means, substantially as hereinbefore described.
6. Coupling apparatus according to claim 1 in which the coupling hook is rigidly fixed to or formed in one with an arm mounted so as to be capable of limited rotary movement upon the coupling bar, and which arm is adapted, when the coupling hook is in its operative position, to be engaged by an appropriately cranked portion of another bar geared to the coupling bar and mounted to rotate in bearings fixed to and formed in one with the bearings of the coupling bar, substantially as hereinbefore described.
7. Coupling apparatus according to claim 5 in which the three transverse bars are mounted to rotate in three bearings flxed to the vehicle draw bars, the coupling hook being mounted on the coupling bar between the middle bearing and an outer one thereof, whilst at the other side of and between such middle bearing and the other outer bearing a bracket mounted on two of the transverse bars carries a coupling link that projects away from the vehicle and which is so arranged that it can rise or fall and can move laterally tc a desirable limited extent, substantially as herelnbefore described.
8. Coupling apparatus according to the preceding claim in which the central draw bar is connected at its inner end ty a pivot to a double strap or buckle through which the draw bar spring passes, and the inner end of each of the two outer draw bars is furnished with a pin passing through a curved slot in the end portion of a crosshead which is mounted to turn on a centrally arranged pisot pin connecting the crosshead to the middle draw bar, substantially as hereinbefcre describel.
9. Coupling apparatus, according to claim 5 , in which the locking means comprise spring pressed pawls fixed to the third or locking bar adapted to engage clutch teeth fixed to either of the other bars, substantially as hereinbefore described.
10. Coupling apparatus, according to claim 5 , in which the coupling bar is furnished with a lever having a spring key adapted to so actuate a lever fixed to the third bar as to rclease the locking means thereon, whilst the coupling hook i'; being moved into its inoperative position, substantially as hereinbefore described.
11. The combination and arrangement of parts constituting the improved coupling apparatus, constructed and operating substantially as hereinbefore described with reference to and shown in the accompanying drawings.

No. 100,314. Track Fastener. Attache de voie.

Frank Smith, Lindsey, Ohio, U.S.A., 7th August, 1906 ; 6 years. Filed 17 th July, 1906. Receipt No. 137,920.
Claim.-1. In combination with a tie, a pair of chair plates provided with means at their outer ends for engaging the outer flanges of the rails and slotted longitudinally at points within the rails, an adjusting reversely threaded bolt connecting the inner ends of these chair plates, lock nuts on this bolt, a slotted clamp plate on each chair plate and provided with a lip engaging the inner flange of the rail, a short bolt clamping each pair of plates together, and a longer bolt clamping each pair of plates together and to the tie, substantially as set forth.
2. In combination with a tie, a pair of chair plates resting on the tie and adapted to support the rails and provided at their outer ends with means engaging the outer flanges of the ralls, each of these plates being slotted at a point inside \(0^{\prime}\) the rall, means for adjustably connecting the inner ends of these plates, whereby they may be drawn together or spread apart, a clamp plate upon each chair plate, means for anchoring both plates to the tie, and means for clamping each pair of plates together, substantially as described.

No. 100,315. Railway Track Flanger.
Appareil d rebord de rails de chemin de fer.

Thomas Hoar, Truro, Nova Scotla, Canada, 7th August, 1906 6 years. Filed 27 th June, 1906. Receipt No. 137,346.
Claim.-1. In a device for operating rallroad track flangers a compound lever having an operating lever at each end in combination with the stands \(i\) iand the flanger arms \(A A\), substantially as described.
2. In a device for operating rallroad track flangers, the combination of the locking bolt \(g\) having arms \(h h\), the lock stand \(i\), , with the \(\operatorname{trlp}\) lever \(;\) having the arms \(l\) and \(k k\) ? substantially as described and set forth.
3. A device for operating railroad car flanges comprising a compound lever composed of the arms \(a\) and \(b\) and the joint ring \(r\), the levers \(f f\), the trip lever \(\boldsymbol{j}\) having arms \(D\) and \(k k\), the locking bolt \(!\) adapted to engage with lever \(j\), the lock stands \(i\) adapted to carry said lever \(j\) and the locking bolt \(!\) in combination with the flanger arms \(\Lambda \Lambda_{\text {, }}\) substantially as described and for the purpose spicified.

\section*{No. 100,316. Air Brake Coupler.}

Joint de frcin à air.

Frank Hatfield Rutherford, Chicago, Illinols, U.S.A., 7th August, 1906; 6 years. Filed 19th July, 1906. Recelpt No. 137,962.
Claim.-1. An automatic coupler for air brakes comprising a longitudinally movable coupler head having a limited movement oblique to the line of draft, and a longitudinally reciprocal plunger normally pressing forward against the rear end of the said coupler head
2. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for said coupler in which the forward movement of said coupler head is limited, and a longitudinally reciprocal plunger norn:ally engaging and pressing forward against the rear end of said coupler head.
3. An automatic coupler for air brakes coinprising a longitudinally yielding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for said coupler in which the forward movement of said coupler head is limited, and a longitudinally reciprocal plunger nornially engaging and pressing forward against the rear end of said coupler head at a point back of said supporting frame.
4. An automatic coupler for air brakes comprising a longitudinally yielding coupler head winich is capable of a llmited movement oblique to the line of draft and having a transverse flange on its rear end, a hanging supporting irame having an opening therein through which said head is insfrted until the flanged end thereof engages said supporting frame, and a longitudinally reciprocal plunger normally rressing forward agalnst the rear end of said coupler head.
5. An automatic coupler for air brakes comprising a longitudinally movable coupler head having a limited movement oblique to the line of draft, and a longitudinally reciprocal Hunger having its forward end removably connected to and normally pressing forward agalnst the rear end of the said coupler head.
6. An automatic coupler for air brakes comprising a longitudinally ylelding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for caid coupler in which the forward movement of said coupler head is limited, and a longitudinally reciprocal plunger having its forward end removably connected to and normally engaging and pressing forward against the rear end of said coupler head.
7. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement cblique to the line of draft, a hanging supporting frame for said coupler in which the forward movement of said coupler head is limited, and a longitudinally reciprocal plunger hav ing its forward end removably connected to and normally engaging and pressing forward against the rear end of said coupler head at a point back of said supporting frame.
8. An automatic coupler for air brakes comprising a longitudinally yielding coupler head which is canable of a limited movement oblique to the line of draft and having a trans verse flange on its rear end, a hanging supporting frame
having an opening therein through which said head is inserted until the flanged end thereof engages said supporting frame, and a longitudinally reciprocal plunger having its forward end removably connected to and normally pressing forward against the rear end of said coupler head.
9. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement oblique to its line of draft, a longitudinally reciprocal plunger engaging the rear end of said coupler head and a spring normally pressing said plunger forward against said coupler.
10. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for said coupler in which the forward movement of said coupler head is limited, a longitudinally reciprocal plunger normally engaging and pressing forward against the rear end of said coupler head, and a spring normally thrusting said plunger forward.
11. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for said coupler in which the forward movement of said coupler head is limited, a longitudinally reciprocal plunger normally engaging and pressing forward against the rear end of said coupler head at a point back of said supporting frame, and a spring normally thrusting said plunger forward.
12. An automatic coupler for air brakes comprising a longitudinally yielding coupler head which is capable of a limited movement oblique to the line of draft and having a transverse flange on its rear end, a hanging supporting frame having an opening therein through which said head is inserted until the flanged end thereof engages said supporting frame, a longitudinally reciprocal plunger normally pressing forward against the rear end of said coupler head and a spring normally thrusting said plunger forward.
13. An automatic coupler for air brakes comprising a longitudinally movable coupler head having a limited movement oblique to the line of draft, a longitudinally reciprocal plunger having its forward end removably connected to and normally pressing forward against the rear end of the said coupler head, and a spring normally thrusting said plunger forward.
14. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for said coupler in which the formard movement of said coupler head is limited, a longitudinally reciprocal plunger having its forward end removably connected to and normally engaging and pressing forward against the rear end of said coupler head and a spring normally thrusting said plunger forward.
15. An automatic coupler for air brakes comprising a longitudinally movable coupler head having a limited movement oblique to the line of draft, a longitudinally reciprocal plunger normally pressing forward against the rear end of the said coupler head and a longitudinally reciprocal carrier tied to the car coupler by which said coupler body and plunger are sustained.
16. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for said coupler in which the forward movement of said coupler head is limited, a longitudinally reciprocal plunger normally engaging and pressing forward against the rear end of said coupler head and a longitudinally reciprocal carrier movably tied to the car coupler of the car which sustains said ccupler body, hanging supporting frame and plunger.
17. An automatic coupler for air brakes comprising a longitudinally movable coupler head having a limited movement oblique to the line of draft, a longitudinally reciprocal plunger having its forward end removably connected to and normally pressing forward against the rear end of the said coupler head, and a longitudinally reciprocal carrier suitably tied to the car coupler by which said coupler body and plunger are sustained.
18. An automatic coupler for air brakes comprising a longitudinally yielding coupler head having a limited movement oblique to the line of draft, a hanging supporting frame for said coupler in which the forward movement of said coupler head is limited, a longitudinally reciprocal plunger normally engaging and pressing forward against the rear end of said coupler head, a spring normally thrusting said plunger forward and a longitudinally reciprocal carrier suitably tied to the car coupler by which said coupler body and plunger are sustained.
19. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly from the engaging face thereof and having a laterally elongated arched mouth.
20. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly from the engaging face thereof and having a laterally elongated arched mouth and a gasket inserted in and conforming to the shape of said mouth.
21. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly from the engaging face thereof and having a laterally elongated curved mouth both the upper and lower edges of which conform to the arc of the circle.
22. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly from the engaging face thereof and having a laterally elongated curved mouth both the upper and lower edges of which conform to the arc of a circle and a gasket seated in and conforming in shape to the edges of said mouth.
23. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly from the engaging face thereof and having a laterally elongated curved mouth both the upper and lower rabbeted edges of which conform to the arc of a circle and a gasket seated in and conforming in shape to the rabbeted edges of said mouth.
24. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly and obliquely from the engaging face thereof, a stub projecting from the longitudinal side of said coupler with the bore of which said passage connects, and the bore of an emergency passage communicating with said stub at an angle to the axis of said passage and a valve at the point of intersection of said emergency passage.
25. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly and obliquely from the engaging face to the longitudinal side of the same, an emergency passage tapping said first-mentioned passage at a suitable angle, and a suitable two-way valve at the point of intersection of said passages.
26. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly and obliquely from the engaging face to the longitudinal side of the same, an emergency passage tapping said first-mentioned passage at a suitable angle, and a suitable two-way valve at the point of intersection of said passage whose axis is transverse to said coupler head.
27. An automatic coupler for air brakes comprising a coupler head having a longitudinally disposed passage extending rearwardly and obliquely from the engaging face to the longitudinal side of the same, an emergency passage tapping said first-mentioned passage at a suitable angle, a suitable two-way valve at the point of intersection of said passage whose axis is transverse to said coupler head and a spindle therefor extending transversely through said body and having means on its extremity for turning it.
28. An automatic coupler for air brakes comprising a coupler head having a plurality of longitudinally disposed passages extending rearwardly from the engaging face thereof and having laterally elongated arched mouths.
29. An automatic coupler for air brakes comprising a coupler head having a plurality of longitudinally disposed rassages extending rearwardly from the engaging face thereof and having laterally elongated arched mouths and a gasket inserted in and conforming to the shape of each mouth.
30. An automatic coupler for air brakes comprising a coupler head having a plurality of longitudinally disposed passages extending rearwardly from the engaging face thereof and having laterally elongated curved mouths both the upper and lower edges of which conform to the arc of a circle.
31. An automatic coupler for air brakes comprising a coupler head having a plurality of longitudinally disposed passages the mouths of which in the engaging face of the coupler are arranged one above the other end and are elongated laterally and conform in curvature to the arc of a circle.
32. An automatic coupler for car brakes comprising a coupler head having a plurality of longitudinally disposed passages arranged one above the other and extending rearwardly and obliquely from the engaging face of the coupler, some of which passages are deflected to one side and some to the other.
33. An automatic coupler for air brakes comprising a coupler head having a plurality of longitudinally disposed passages arranged one above the other and extending rearwardly and obliquely from the engaging face of the coupler, some of which passages are deflected to one side and some to the other, emergency passages extending at an angle into said first-mentioned passages and transverse valves intersecting the point of intersection of said passages.
34. An automatic coupler for car brakes comprising a coupler head having a plurality of longitudinally disposed passages arranged one above the other and extending rearwardly and obliquely from the engaging face of the coupler, some of which passages are deflected to one side and some to the other, emergency passages extending at an angle into said first-mentioned passages and transverse valves intersecting the points of intersection of said passages and
spindles extending transversely through said coupler head beyond the sides thereof and means for turning said spindles.
35. An automatic coupler for car brakes comprising a coupler head having a plurality of longitudinally disposed passages of unequal length arranged one above the other and extending rearwardly and obliquely from the engaging face of the coupler, some of which passages are deflected to one side and some to the other.
36. An automatic coupler for car brakes comprising a coupler head having a plurality of longitudinally disposed passages of unequal length arranged one above the other and extending rearwardly and obliquely from the engaging face of the coupler, some of which passages are deflected to one side and some to the other, emergency passages extending at an angle into said first-mentioned passages and transverse valves intersecting the point of intersection of said passages.
37. An automatic coupler for car brakes comprising a coupler head having a plurality of longitudinally disposed passages of unequal length arranged one above the other and extending rearwardly and obliquely from the engaging face of the coupler, some of which passages are deflected to one side and some to the other, emergency passages extending at an angle into said first-mentioned passages and transverse valves intersecting the points of intersection of said passages and spindles extending transversely through said coupler head and beyond the sides thereof and means for truning said spindles.
38. An automatic train pipe coupler for cars, having a flat engaging face, a portion of which is depressed, longitudinally disposed passages extending from the depressed surface of said engaging face, and gaskets for the mouths of said passages secured in place by said plate.
39. An automatic train pipe coupler for cars, having a flat engaging face, a portion of which is depressed, longitudinally disposed passages having rabbeted mouths and extending from the depressed surface of said engaging face, and gaskets for the rabbetted mouths of said passages secured in place by said plate.
40. An automatic train pipe coupler having a flat engaging face, longitudinally disposed passages extending back from said engaging faces, gaskets for the mouths of said passages, and means for retaining said gaskets in place.
41. An automatic train pipe coupling having a flat engaging face, and having a longitudinal passage extending back from said engaging lace, a gasket for the mouth of said passage, and a spring for holding the gasket in place.
42. An automatic train pipe coupling having a flat engaging face, and having a longitudinal passage extending back from said engaging face, a gasket for the mouth of said passage, and an M-shaped spring for holding the gasket in place.

No. 100,317. Fluid Brake. Frein à fluide.

Richard Dulany Whiting, New York City, New York, U.S.A.e 7th August, 1906; 6 years. Filed 14th July, 1906. Receipt No. 137,834 .
Claim.-1. In an air brake system means for the application of continuous normal pressures and intermittont excessive pressures.
2. In an air brake system means for applying a continuous and normal pressure and means for automatically applying and relieving excessive pressures.
3. In a fluid brake means for applying a constant and predetermined pressure upon the brake shoe, means for determining the amount of said predetermined pressure, and means for providing a pressure in excess of said amount and which when employed is applied with an automatic intermittent action.
4. In a fluid brake the combination of means for applying normal or predetermined brake shoe pressures, means for
applying excess pressures and means for automatically relieving said excess pressures, as and for the purposes sot forth.
5. In a fluid brake the combination of means for applying normal or predetermined brake shoe pressures, means for intermittently applying excess and relieving pressures and means for adjusting the point of entrance of the relleving pressures, as and for the purposes set forth.
6. In a fluid brake the combination of means for applying normal or predetermined brake shoe pressures, means for applying excess pressures, means for applying relleving pressures and means for automatically maintaining normal and predetermined pressures and the intermittent excess pressures at the same time, as and for the purposes set forth.
7. In a fluid brake the combination of means for applying normal or predetermined brake shoe pressures and means for applying intermittent excess pressures at the same time, with means for intermittently relleving sald excess pressures, and means for adjusting the point of entrance of said intermittent relleving pressure, as and for the purpose set forth.
8. In an air brake having an air brake cylinder the combination of means for applying normal or intermittent and excessive brake shoe pressures, means for applying intermittent counter pressures, and means for exhausting said counter pressures, as and for the purposes sct forth.
9. In an air brake the combination of a brake cylinder arranged to receive and transmit normal and excessive brake shoe pressures upon one side of the piston or diaphragm, means for applying relieving pressures upon the opposite side of the piston or diaphragm and means for intermittently exhausting said relieving pressures and re-applying the excess pressures, as and for the purposes set forth.
10. In an air brake the combination of a brake cylinder adapted to receive and transmit normal and excessive brake shoe pressures at one end and counter or relieving pressures at its other end, and means during the continuance of the excess pressure of maintaining an intermittent counter pressure in said cylinder, and means for exhausting the counter pressure, as set forth.
11. In an air brake the combination of a brake cylinder adapted to receive and transmit normal and excessive brake shoe pressures at one end, and relieving pressures at itd other end, means for conveying said air pressures and means for intermittently exhausting the relieving pressure independent of the other pressures, as and for the purposes sei forth.
12. In an air brake the combination of the brake cylinder and a source of air pressure supply, connections from said source of supply to both ends of said cylinder, means upon the forward connection for Introducing normal and excessive pressures and means upon the rear connection for introducing and exhausting by an intermittent action a relieving or countervailing pressure, substantially as and for the purposes set forth.
13. In an air brake the combination of the brake cylinder and a source of air pressure supply, connections from said source of supply to opposite sides of the piston or diaphragm, means for introducing normal and excessive pressures upon one side of said piston and relieving pressures upon the other side with an oscillator and exhaust for effecting an intermittent action in said relief, substantially as and for the purposes set forth.
14. In an air brake the combination of a brake cylinder, a source of air pressure supply, connections from the said source of supply to both the forward end and the rear end of the cylinder, a relief valve in the rear ead connection, and means in said connection between the relieving valve and the rear end of the cylinder for providing an intermittent action of the relieving pressures, as and for the purfoses set forth.
15. In an air brake the combination of a brake cylinder, a source of air pressure supply, connections from the said source of supply to both the forward end and the rear ond of the said cylinder, a rellef valve in the rear end connection. and means in said connection between relieving valve and the rear end of the cylinder for providing an intermittent action to the relieving pressures, sald means consisting of reducing valve, an oscillator, a cut-off valve, and an exhaust, all arranged substantlally as and for the purposes set forth.

\section*{No. 100,318. Boz. Boite.}

Jonathan B. Climo, Detrolt, Michigan, U.S.A., 7th August. 1906; 6 years. Filed 7th July, 1906. Recetpt No. 137,602.
C'laim.-1. A box consisting of a circular bottom, hoops and sides formed of two or more sections of veneer having overlapping edges and with the grain of the wooa running longitudinally of the box.
2. A box consisting of a circular bottom, an outside bottom hoop, sldes formed of sections of thin material with
overlapping edges and with the lower ends of the sections claimed betwen the edge of the bottom and said hoop, and

an outer hoop secured to said sections near their upper ends.
3. A cheese box consisting of a circular bottom, an outside bottom hoop of greater diameter than the diameter of said bottom, a body formed of curved sections with their edges overlapping and their lower ends clamped between the bottom hoop and the edge of said bottom, nails or rivets for securing the overlapping edges together, an outside top hoop secured to the body at a distance from its upper edge, and a top having a rim to receive the upper end of the body and engage the top hoop.
4. The combination with sections of thin material adapted to form the body of a circular box, of a curved seat for sald sections adapted to give said sections the desired form when placed therein.
5. The combination with sections of thin material adapted to form the body of a cheese box, of a rack for said sections having a curved seat the radius of which is equal to that of the radius of the box, the body of which the sections are designed to form.
6. The combination with veneer sections the grain of which extends longitudinally thereof and which are adapted to form the body of a cheese box, of a rack having a base formed with a curved seat into which said sections are adapted to be laid to give the same the desired curve, and standards extending upward from the base to engage the edges of the veneer sections and hold the same in place.

No. 100,319. Elevator. Elévateur.

Augustus Danlel Gable and John Brickley, co-inventors, both of Shenandoah, Pennsylvania, U.S.A., 7th August. 1906; 6 years. Filed 12th July, 1906. Recelpt No. 137,741.
Claim.-A safety device for elevators comprising a suitable cab or cage, spring actuating rotatable shafts, pulleys upon said shafts between the side walls of the cab or cage, flexible connections engaging the pulleys, pulleys upon the outer ends of the shafts, grooved cam brackets arranged in vertical pairs upon each side of the walls of the cab or cage, clutches arranged in pairs at the upper and lower ends of the cab or cage upon both sides thereof, each pair of said clutches being connected with each other and the several pairs to the pulleys upon the ends of the rotatable shafts whereby the clutches will operate simultaneously, substantially as and for the purpose set forth.

No. 100,320. Mould for Concrete. Moule pour beton.

Paul T. C. Dumais, Hull, Quebec, Canada, 7th August, 1906; 6 years. Filed 16th May, 1906. Receipt No. 135,965.
Claim.-1. In a mould for concrete construction the combination comprising side plates, bolts adapted to secure the side plates together, and sleeves disposed on the bolts intermediate of the side plates.
2. In a mould for concrete construction the combination comprising side plates, bolts adapted to secure the side plates together, and sleeves of tarred paper disposed on the bolts intermediate of the side plates.
3. In a mould for concrete construction the combination comprising an end section, composed of plates adjustably held together, end plates secured on said plates, and side sections comprising plates having curved ends adapted to engage said end plates.
4. In a mould for concrete construction the combination comprising end sections composed of side walls adjustably held together, reinforcing strips secured to the side walls and provided with recesses, and end plates disposed in the recesses and secured to the side walls, and side sections comprising side walls having curved ends adapted to engage said end plates.

No. 100,321. Station Indicator.

\section*{Indicateur de station.}

Jock Bedell Henderson and Jock Lee Henderson, both of Williamstown, West Virginia, U.S.A., 7th August, 1906; 6 years. Filed 11th July, 1906. Recejpt No. 137,702.
Claim.- 1 . A station indicator comprising spring wound drums, a belt having its ends secured to said drums, a drum intermediate said drums, and over which said belt passes, means carried by said intermediate drum for driving the belt, a worm gear carried by said drum, a shaft adjacent said worm gear, a worm gear carried by said shaft and meshing with the worm gear, a large bevelled gear adjacent the opposite end of said shafts. bevelled gears rotatably mounted upon said shaft and meshing with opposite sides of said bevelled gear and held against longitudinal movement upon the shaft, a clutch slidably mounted on said shaft between the gears and held against rotation, said clutch having a reduced central portion and an intermediately pivoted lever having its upper end bifurcated and resting in said reduced central portion of the clutch, means for holding the lower end of said lever in its adjusted position, the outer periphery of said large bevelled gear having ratchet teeth. a lever pivoted on the shaft of said large gear, a pawl carried by the lever and normally held in engagement with the ratchet teeth carried by the large bevelled gear and means for normally holding the lever in an upward position.
2. A station indicator comprising a belt, a drum over which said belt passes, a worm gear carried by said drum, a worm meshing with said worm gear, and adapted to drive the worm gear in either direction, and means carried by the opposite end of the drum for rotating it in either direction independent of the worm, the pitch of the worm and worm gear being such that the worm'can be driven by said worm gear.
3. A station indicator comprising a belt, a drum over which said belt passes, a worm gear carried by said drum, a worm meshing with said worm gear and adapted to drive the worm gear, means carried by the drum for rotating the same, and the pitch of the worm and worm gear being such that the worm can be driven by the worm gear, a shaft carried by the worm and a lever adapted to indirectly operate said shaft in either direction, whereby the drum may be driven in either direction.
4. A station indicator comprising a belt, a drum over which sald belt passes, a worm gear carried by one end of said drum, a worm meshing with sald worm gear, and adapted to drive the worm gear in either direction, a shaft carried by the opposite end of said carrying worm gear, and having its outer end squared to receive a key for rotating the drum in either direction, and the pitch of the worm and worm gear being such that the worm can be driven by said worm gear.

No. 100,322. Underwaist. Transparent.

Edward Henry Horwood, Hoboken, New Jersey, U.S.A., 7th August, 1906; 6 years. Filed 14th July, 1906. Recelpt No. 137,835.
Claim.-An underwaist comprising a back and front formed of two sections, and side sections, each side section being formed of outer subsections and an intermediate subsection, each outer subsection being formed of duplicate members having duplicate extenslons to constitute shoulder straps and the sides and lower side portions of the armholes, the intermediate subsections being formed of a single member whose upper edge constitutes the armpit edge of an armhole, the said single subsection extending otherwise the length of the outer subsections, the outer subsections of the side sections having their body extensions stitched together and their opposite longitudinal edges stltched to the intermediate subsections, the said side sections being also stitched directly to the back and front sections, whereby to reinforce the armhole and side portions of the garment below the armholes and provide for a thin portion beneath the armpit sections of the armholes and corresponding portions of the sides of the garment, for the purpose set forth, said thin portions of the side sections of the garment belng between the reinforced portions.

\section*{No. 100,323. Hydro-Carbon Burner. Bruleur d hydro-carbure.}

John Atkinson Hunt, Boston. Massachusetts, U.S.A., 7th August, 1906; 6 years. Filed 16th July, 1906. Receipt No. 137,867.
Claim.-1. A hydro-carbon burner comprising comparatively parallel tubes of relatively small diameter, a relatively larger mixing chamber to which said tubes are connected, both tubes entering the same end of sald chamber, a vapour discharge tube extending from sald mixing chamber on the same side as and below the point of entry of said parallel tubes, and oil and water connections for said tubes.
2. A hydro-carbon burner comprising comparatively parallel tubes of relatively small diameter, a relatively larger mixing chamber to which said tubes are connected, both tubes entering the same end of said chamber, a second
pair of comparatively parallel tubes lying about said firstmentioned tubes and connected thereto at one end, sald

tubes at their opposite end passing over the top of said mixing chamber, a vapour discharge tube extending from said mixing chamber on the same side as and below the point of entry of said parallel tubes, and oil and water connections for said tubes.
3. A hydro-carbon burner comprising comparatively parallel tubes of relatively small diameter, a relatively larger mixing chamber to which said tubes are connected, both tubes entering the same end of said chamber, a second pair of tubes substantially parallel located above said firstmentioned tubes and connected at one end therewith, said last-mentioned tubes passing over the top of said mixing chember, a vapour discharge extending from said mixing chamber near its bottom on the same side as and below the point of entry of said parallel tubes, and oll and water connections for said tubes.
4. A hydro-carbon burner comprising comparatively parrallel tubes of relatively small diameter, a relatively larger mixing chamber, said tubes being connected to said chamber and entering the same at the same end, a second pair of relatively parallel tubes lying above said first-mentioned tubes and connected thereto at one end and at their opposite end passing over said mixing chamber, a shallow pan in which said burner stands, a vayour discharge tube extending from said mixing chamber near its bottom on the same side as the point of entry of said tubes, a drain vent in said burner, and oil and water connections for said tubes.
5. In a hydro-carbon burner, a source of supply, a feeder consisting of a chamber connecting with the vapourizing pipes, and a valve controlled gravity feed connecting said feeder with sald source of supply.
6. In a hydro-carbon burner, a source of supply, a feeder consisting of a transparent chamber connecting with the vapourizing pipes, and a valve controlled gravity feed connecting said feeder with said source of supply.
7. In a hydro-carbon burner, oll and water vapourizing tubes each having a plurality of turns, each turn being slightly staggered from the vertical alternately in opposite directions.
8. In a hydro-carbon burner having oil and water vapourizers. a chamber having substantially sloping surfaces disposed in opposite directions on its upper side, and similarly disposed turns in said vapourizers adjacent to said surfaces.

No. 100,324. Teapot. Théicre.

William Boyd Irwin, Peterboro, Ontario, Canada, 7th August, 1906; 6 years. Filed 5th July, 1906. Receipt Nos. 134,820 and 137,549 .
Claim.-The combination in a teaput, of a perforated cylinder, piston and piston rod, all substantially as set forth.

No. 100,325. Loader. Chargeur.

Le Grand Kniffin, Chicago, Illinois, U.S.A., 7th August, 1906; 6 years. Filed 12th July, 1906. Receipt No. 137,746.
Claim.-1. The combination with a wheeled axle, of two upwardly extending bars mounted thereon and spaced apart, a chute located between the upwardly extending bars, and means on the upwardly extending bars and chute to elevate the latter.
2. The combination with a wheeled axle, of a chute adapted to be elevated therefrom to an inclined position and having in its upper end an opening, of stops or bearings on the upper portion of the chute, and a carrier adapted to travel thereon and having bearings or stops to engage those of the chute, whereby the carrier will be partially rotated or tilted to discharge its load through said opening and its further progress prevented.
3. The combination with a wheeled axle, of a chute mounted thereon between the wheels and having near one of its ends an opening between its sides, stops or bearings on the upper portion of the chute, means to elevate the same from the axle, a carrier adapted to travel thereon and having stops or bearings to engage those on the chute, whereby the carrier will be partially rotated or tilted to discharge its load through said opening and its further progress prevented.
4. The combination with a wheeled axle, of a chute mounted thereon between the wheels and having near one of its ends an opening between its sides, stops or bearings on the upper portion of the chute, means to elevate the same from the axle, a carrier having stops or bearings to engage those on the chute, and means to cause the carrier to travel on the chute and to be tilted when the bearings of the carrier engage those of the chute, substantially as described.
5 . The combination with a wheeled axle, of a chute mounted thereon between the wheels and having near one of its ends an opening between its sides, stops or bearings on the upper portion of the chute, means to elevate the same from the axle, a crosspiece at the upper end of said opening, a carrier adapted to travel thereon and having stops or bearings to engage those on the chute, whereby the carrier in its movement will be partially rotated or tilted to discharge its load through said opening and its further progress prevented, substantially as described.
6. The combination with a wheeled axle, of two upwardly extending bars mounted thereon and spaced apart, a chute lceated between the upwardly extending bars, brace bars pivotally secured at one of their ends to one portion of the chute and at their other ends to the axle, and means on said bars and chute to elevate the latter.
7. The combination with a chute adapted to be elevated to an inclined position and having in its upper portion an opening, of curved stops or bearings on the upper portion of the chute, and a carrier adapted to travel thereon and having laterally projecting bearings or stops to engage those of the chute, whereby the carrier will be partially rotated or tilted to discharge its load through said opening and its further progress prevented.
8. The combination with a wheeled chute having in fits upper end an opening, of means to elevate the same, curved stops or bearings on the upper portion of the chute, thes openings of said stops being presented toward the lower portion of the chute, an upwardly extending crosspiece at the upper end of the chute, and a carrier adapted to travel on the chute and having laterally projecting bearings or stops to engage those of the chute, whereby the carrier will be partially rotated or tilted to discharge is load through said opening and its further progress and rotation will be prevented.
9. The combination with a wheeled axle, of a chute mounted thereon, means to elevate the latter from the axle, and a pair of downwardly extending and spaced apart projections stcured to each side of the upper portion of the chute to engage one side of the wagon body, substantially as described.
10. The combination with a wheeled axle, of a chute mounted thereon, means to elevate the latter from the axle, a pair of downwardly extending and spaced apart projections lacated at each side of the chute, and a block swivelled on the lower surface of the bottom of the chute near each pair of said projections, substantially as described.
11. The combination with a wheeled axle, of two upwardly extending bars mounted thereon and spaced apart, a crosstar uniting said upwardly extending bars, a chute located between the upwardly extending bars and normally resting co the said crossbar and loosely connected to the axle, and means on the upwardly extending bars and chute to elevate the latter, substantially as described.
12. The combination with a wheeled axle, of two upwardly extending bars mounted thereon and spaced apart, one of said bars being provided with a rack, a crossbar uniting said upwardly extending bars, a chute located between the upwardly extending bars and normally resting on the said crossbar and loosely connected to the axle, a pinion jourralled on the chute to engage the rack on one of the upwardly extending bars, and means to turn said pinion, substantially as described.
13. The combination with a wheeled axle, of two upwardly extending rack bars mounted thereon and spaced apart, a cıossbar uniting said rack bars, a chute located between the rack bars and normally resting on the crossbar and loosely connected to the axle, pinions journalled on the sides of the chute to engage the rack bars, means to rotate said pinions, and an anti-friction roller journalled on each side of the chute near the rack bars, substantially as described.
14. The combination with a wheeled axle, of two upwardly €xtending rack bars mounted thereon and spaced apart, a crossbar uniting the rack bars, a chute located between the rack bars, brace bars pivotally secured at one of their ends to the rear portion of the chute and at their other ends oo the axle, pinions journalled on each side of the chute to engage the rack bars, means to rotate the pinions', and an anti-friction roller journalled on each side of the chute near the rack bars, substantially as described.
15. The combination with a wheeled axle, of two upwardly extending bars mounted thereon and spaced apart, a chute lecated between said bars and having near one of its ends ar opening between its sides, curved stops or bearings on the upper portion of the chute at each of its sides, means on the upwardly extending bars and chute to elevate the latter, Vrace bars pivotally secured at one of their ends to one portion of the chute and at their other ends to the axle, a carr:er adapted to travel on the chute and having laterally projecting bearings or stops on its sides to engage those of the chute whereby the carrier will be partially rotated or tilted to discharge its load through said opening and its further progress prevented.
16. The combination with a wheeled axle, of two upwardly extending bars mounted thereon and spaced apart, one of said bars being provided with a rack, a chute located between the upwardly extending bars, a stop or bearing on the upper portion at each side of the chute, brace bars pivotally secured at one of their ends to the rear portion of the chute and at their other ends to the axle, a pinion journalled on the chute to engage the rack on one of the upwardly extending bars, and a carrier adapted to travel on the chute and having stops or bearings to engage those of the chute whereby the carrier will be partially rotated or tilted to discharge its load and its further progress prevented.

No. 100,326. Shirt. Chemise.
Nilton Paul Magly. Cincinnati, Ohio, U.S.A., 7th August, 1906; 6 years. Filed 16th July, 1905. Receipt No. 137,849.
Claim.-1. A shirt having a bosom portion formed from soft and thin material and provided with a front slit or opening extended down said bosom portion and provided with fastening devices, the upper part of said bosom portion being provided upon its outer side with stiffened or thickened parts extended around the neck of the shirt and upon the shoulder portions thereof and having their sides extended from said shoulder portions of the shirt downward to the edges of said front slit or opening with their lower ends above the fastening devices for said slit or opening, substantially as set forth.
2. A shirt having a bosom portion formed from soft and thin material and provided with a front slit or opening extended down said bosom portion and provided with fastening devices, one edge of said slit or opening being provided with a facing strip or reinforce, and the upper part of said bosom portion being provided upon its outer side with stiffened or thickened parts extended around the neck of the shirt and
upon the shoulder portions thereof and having their sides extended from said shoulder portions downward and diagon-

ally toward each other and to the edges of said front slit or opening with their lower ends above the fastening devices for said slit or opening, substantially as set forth.

No. 100,327. Earrow. Herse.

Hiram Rowan, Livermore, Kentuckey. U.S.A., 7 th August,
1906; 6 years. Filed 17th July, 1906. Receipt No. 137,921
Claim.-In a harrow the combination with a draft beam, of a pair of front and rear harrow bars at each side of the beam and loosely trailing therefrom, each pair of bars having corresponding upright perforations in the top thereof, substantially U-shaped links having their sides loosely and removably received in the respective openings to maintain the bars spaced, and an adjustable spacing ionnection between the rear bars

No. 100,328. Clothes Drainer. I'ordeuse.

Franklin Plerce Sager, Maplewood, Ohio, U.S.A., 7th August, 1306; 6 years. Field 16th July, 1906. Receipt No. 137.863
claim.-The combination with a wash boller having handles at its ends, of a perforated receptacle within the boiler, provided with bails, a lever having a hook at one end for en-
gaging the bails of the receptacle, a fulcrum bar plvoted to the lever intermediate of its ends, said bar having a fork end formed of three members for engaging the upper edge of the boiler, and a rod pivoted to the lever at one side of the fulcrum bar, and having a hook at its end adapted to one of the handles of the boiler, substantially as shown and described.
No. 100,329. Stocking. Has.

George Sturgess, Mablethorpe, Lincolnshire, England, 7th August, 1906; 6 years. Filed 18th July, 1906. Receipt No. 137,934
Claim.-1. The method of knitting a patterned or shaped seamless fabric consisting in knitting a circular course of loops from which a wale or wales are omitted with their end loops suspended from their needles so that they may be drawn from the cast off course and linked to neighbouring loops of a succeeding circular course whereby the braking strain imposed upon the thread, by the action of transferring is reduced.
2. The method of knitting a patterned or shaped seamless fabric consisting in suspending a wale or wales of loops while a shorter course or courses are knitted and then transferring the suspended wales to neighbouring wales of a sucreeding course of loops.
3. A seamless hose having the leg and foot patterned in wales of plain and wales of ribbed loops in which all the ribbed wales are fashioned out or withdrawn leaving terminating courses built up of plain loops only.
4. A seamless knitted fabric in which loop wales are linked to neighbouring loop wales the transferred loop of which is crossed by a miss-stich bar of thread, of an intervening course built up of fewer loops and consequently of a shorter circle of thread than the course from which loops have been transferred.
5. A seamless knitted fabric having a loop wale of one circular course of loops carried across and linked to a loop wale, of another circular course of loops on the other side of an intervening circular course of loops.
6. A stocking having an clastic garter band or bands mor closely knitted and of a narrower pattern of rib than the fabric. of which the leg is comprised, to make it self-sup porting.
7. A stocking having two elastic garter bands more closely knitted and of a narrow or pattern of rib the fabric of which the leg is comprised, so that in wear the bands roll over cach other and make it self-supporting.

No. 100,330. Washing Machine. Machine d laver

Martin L. Winegarden, Corralltos, California. U.S.A., 7th August. 1906; 6 years. Filed 16th July, 1906. Receipt No. 137.861.
Claim.--1. A washing machine comprising a tub. opposed rubbers at the ends of the tub, dashers intermediate of the
rubbers having oppositely disposed extending overlapping portions, and oscillating arms having flared lower ends and pivotally mounted at an intermediate point to the tub, said arms having pintles upon which the extended portions of the dashers are pivotally connected.
2. A washing machine comprising a tub, opposed substantially vertical rubbers hinged at the end portions of the tub, oppositely facing dashers located between the rubbers having oppositely disposed extending overlapping portions, and oscillating arms having flared lower ends and pivotally mounted at an intermediate point to the tub, said arms having pintles upon which the extremitles of the extended portlons of the dashers are pivotally connected, said dashers having stepped surfaces opposing corresponding surfaces on the rubbers.
3. A washing machine comprising a tub, opposed substantially vertical rubbers in the ends of the tub, said rubbers being pivoted at their upper ends and being spring pressed at the lower portions, oppositely facing dashers located between the rubbers having oppositely disposed extending overlapping portions, and oscillating arms having flared lower ends and pivotally mounted at an intermediate point to the tub, said arms having pintles upon which the extremities of the extended portions of the dashers are pivotally connected, said dashers and rubbers each comprising end casting and connecting slats forming a stepped surface.

No. 100,331. Windlass. Treuil.

Jasper A. Woodworth, Jackson, Michigan, U.S.A., 7th August, 1906; 6 years. Filed 17th July, 1906. Receipt No. 137,918.
Claim.-1. In a windlass, the combination of a supporting frame, runners or shoes therefor, a scraper in the bottom of said frame, a transversely arranged axle, a driving wheel. having a groove in the periphery thereof, mounted on said axle, winding drums on the axle to each side of said whecls. a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, a draft chain. an anchor chain, means for detachably connecting said chains, a tackle consisting of a pulley block F having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a pulley block \(G\) having sheaves \(g\) and \(g^{1}\) arranged in pairs at the sides thereof, a tackle cable \(L\) passed over said sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g^{1}\) of the block \(G\), thence forwardly over the sheaves \(f^{1}\) of the block F, thence rearwardly over the sheaves \(g\) of the block \(G\), and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being of a greater width than said wheel, and a vertical guide roller arranged or said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of said wheel, all co-acting for the purpose specified.
2. In a windlass, the combination of a supporting frame, runners or shoes therefor, a scraper in the bottom of said frame, a transversely arranged axle, a driving wheel having a groove in the periphery thereof mounted on said axle, winding drums on the axle to each side of said wheel, a draft chain, an anchor chain, means for detachably connecting said chains, a tackle consisting of a pulley block \(F\) having a sheave \(t\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a pulley block \(G\) having sheaves \(g\) and \(g^{1}\) arranged in pairs at the sides thereof, a tackle cable L passed over sald sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g^{1}\) of the block \(G\), thence forwardly over the sheaves \(f^{2}\) of the block \(F\), thence rearwardly over the sheaves \(y\) of the block \(G\), and thence forwardly to the winding drums at each side of the driving wheel, said pulley blocks being of a greater width than said wheel, and a vertical guide roller aranged on said frame opposite said driving wheel to prevent the tackle cables from being drawn across the edges of sald wheel, all co-acting for the purpose specified.
3. In a windlass, the combination of a supporting frame, runners or shoes therefor, a scraper in the bottom of said frame, a transversely arranged axle, a driving wheel having a groove in the perlphery thereof, mounted on said axle, winding drums on the axle to each side of said wheel, a driving cable for said driving wheel, a guide for said cable supported on said frame opposite said wheel, a draft chain, an anchor chain, means for detachably connecting said chains, a tackle consisting of a pulley block \(F\) having a sheave \(f\) on its rear end and a pair of sheaves \(f^{1}\) at the sides thereof, a l, ulley block \(G\) having sheaves \(g\) and \(g^{1}\) arranged in pairs at the sides thereof, and a tackle cable \(L\) passed over said sheave \(f\) of the block \(F\), thence rearwardly over the sheaves \(g^{1}\) of the block G, thence forwardly over the sheaves \(f^{1}\) of the block G, thence forwardly over the sheaves \(f\) of the block \(F\), thence rearwardly over the sheaves \(g\) of the block G. and thence forwardly to the winding drums at each side or the driving wheel, said pulley block being of a greater width than said wheel, all co-acting for the purpose specified.
